*Editor's note:*

*The comments sent to FERC by citizens, local governments and organizations are meant to provide important information to FERC for use in its review of a proposed project. In this role the information flows essentially in only one direction: to FERC.*

***A less well known function is to encourage the exchange of information between citizens, groups and local governments. In my view this exchange is as important as informing FERC, perhaps more important.***

*Unfortunately, while the comments sent to FERC are made part of the public record and are placed on-line, they can be rather hard to access through FERC's somewhat opaque eLibrary interface. In practice they essentially disappear from the public eye.*

*As a consequence, much of the value of the comments is lost. While some comments are simple "I'm all for it" or "don't allow it" expressions of opinion, many others contain thoughtful discussions of costs and benefits, suggestions for studies which would be important, considerations of alternative solutions, and other valuable contributions to the public discussion. **It is a terrible waste of human effort and knowledge to allow these comments to disappear from the public discussion.***

*The intent of this document was to collect and make easily accessible the comments sent to FERC by citizens, organizations and local governments along with FERC's replies. I wanted to make the comments available as a collection in a small number of PDF files of manageable size - this meant that the comments would have to be in text form rather than as large image scans.*

*Most of the documents were scanned at FERC and then converted into text via OCR (Optical Character Recognition). While modern OCR can do a decent job, there always will be errors. The errors were compounded by the tendency of some FERC clerks to stamp the documents near to, often on top of, the text - which greatly confused the OCR and made it time-consuming to select and copy the remaining legible parts.*

***Hand-written documents are not OCR compatible and could not be converted to text. They are listed in sequence below but without text; where possible a note is made as to author and support or opposition.***

**Maps and similar graphical material are also not included.**

Also excluded are the very large document collections provided by Kinder Morgan in their application. Each update of their proposal includes almost 1,000 MB of files containing thousands of pages. These files are listed in sequence below and can be downloaded from FERC's eLibrary if you want them.

Much of the OCR'd text resulted in lines which did not match the page width of this collection; simply copying these short lines this would have at least tripled the length of this already very long document. Instead, after selecting the text I reformatted the paragraphs so that they would fill out the width. I did not attempt to also recreate indentations or tabular formats.

This project has been complicated by several factors:

I found it surprising that many documents which were fully OCR compatible were never converted, including a number which came from governmental bodies, tribes, or influential NGOs. These were either stored as (large) image scans in the PDF files or simply noted as not being convertible with no clue as to content. Some which had "SENT BY EMAIL" in their header, indicating they had been sent to FERC in digital text form were apparently converted into the much less useful scan image format. Processing at FERC seems somewhat inconsistent. Where possible I have applied my own OCR when only scans are provided.

Finally, there is pilot fatigue and error. Long and late hours provided ample occasion for errors and I'm sure I must have made some. I suspect the most likely would be deletions of parts of paragraphs (the Delete key being all too close to other keys I used). Please report any that you discover to [Garth@Mason-NH.org](mailto:Garth@Mason-NH.org) and I will repair them.

In short, expect some errors. When in doubt you can consult images of the originals in FERC's eLibrary. The bolded numbers, such as "**20140917-4001(29789308).pdf**", are the FERC document file names in which the first numbers, e.g., **20140917-4001**, are the document's "Accession Number" while the numbers in ( ) are the specific file number (there may be several files, for example a scan Image file and also a PDF version, possibly OCR'd, or not...).

You can search FERC's eLibrary at <http://www.ferc.gov/docs-filing/elibrary.asp> where you can use "advanced search" to find all files under a specific Accession Number.

G.Fletcher.

The files are listed in numerical order - which should correspond to date, beginning with the earliest.

Re: Project Docket Number PFI4-22-000

Dear Ms. Bose:

I am writing my second letter to you re the proposed Northeast Energy Direct, Tennessee Gas Pipeline project. The route, as proposed by Kinder Morgan, is slated to use the power line right of way which abuts our property. Our house, with our well and septic system, are located on part of this property.

I am including a copy of my first letter which I sent to you in February 2015. I did not have a project docket number at that time. I am writing this second letter to re-emphasize the environmental impacts which would occur should your agency approve this pipeline. However, it is difficult to know the extent of the environmental impacts when Kinder Morgan and the Tennessee Gas Company have not yet defined the exact route of the pipeline. This week they said they might reduce the size of the proposed pipeline and compressor stations, but were reserving the right to increase the size, if the demand increases in the future. Therefore, I am writing this letter based on what we have been told to date. I feel these concerns are valid, no matter what size pipeline is installed in this area or what route is followed.

1. My first concern is noise generated during the installation of the pipeline. The increased health risk caused by excessive noise has been demonstrated by studies related to noise from wind turbines in Falmouth, Mass. and other sites. The Commonwealth of Massachusetts DEP requires "that environmental sound produced on a property and transmitted to the nearest dwellings must not increase the broadband sound level by more than 10 dBA above the pre-existing ambient." When a proposal to install wind turbines in Ashfield was introduced in 2010, a group of concerned abutters hired CaVITIAIlgTocci Associates, Inc. to measure the ambient sound levels in the proposed area. Our property was chosen as one of the study sites. The Town of Ashfield has a bylaw which limits noise between the hours of 11 PM and 7 AM. When Eversource was installing new towers for the high-tension transmission lines near our house this past winter, we were bothered day after day by the noise of their large trucks, bulldozers, drilling equipment, chain saws, etc. We had moved to Ashfield for the peace and tranquility it usually provides.

2. My second concern is the effect of this pipeline on the native species, both plant and animal, which live here. I am especially concerned about the many birds which return each year to nest in our open fields and wooded areas. I am concerned about its effect on the native brook trout which live in the cold water streams, such as the Bear River, adjacent to where the pipeline is proposed to go. The endangered wood turtle is protected by the Massachusetts Endangered Species Act (MESA) and the Natural Heritage and Endangered Species Act of Mass. Fish and Wildlife. The Bear River in the northeast part of Ashfield and the Swift River in the southwest part of Ashfield, prime habitat for the wood turtle, are two Ashfield streams to be impacted by the proposed pipeline. We have seen this turtle as it travels over our property in the spring time. We are prevented from certain activities on our property in the spring by provisions of the

Natural Heritage and Endangered Species Act. This spring a family living near the proposed pipeline route by the Swift River saw a wood turtle lay her eggs at the edge of their driveway. I refer you to the Ph.D. dissertation of Dr. Michael Jones, a postdoctoral research associate at the UMass Cooperative Fish and Wildlife Research Unit, Amherst, who documented the wood turtles in these areas. The wood frog breeds in a nearby

certified vernal pool and is commonly seen in the areas to be impacted by the proposed pipeline. I refer you to Map 7, "Ecological Resources and Biodiversity," for the Town of Ashfield Open Space and Recreation Plan available at the Ashfield Town Hall.

3. My third concern is the possible effect this pipeline will have on the sources of our drinking water. The soils in this area are mostly glacial till. This means we have to drill deep wells to find water. This is a very hilly town. Therefore, the subsurface, through which the pipeline will pass, is mostly bedrock. Fissures in the bedrock control the direction and amount of water available to springs, wells, and adjacent small brooks and other wetlands. The extensive drilling and/or blasting through the bedrock, which will be required, has the potential to impact severely the supply of water to our wells, springs, and area wetlands. The proposed pipeline route is close to many septic systems, including ours. Due to the clay soil it is not easy to find a suitable location for a septic system, a fact which has limited the number of houses which can be built in certain areas of this town. See Map 3, "Soils and Geological Features," of the Town of Ashfield Open Space and Recreation Plan. How are we to dispose of our wastes and get potable drinking water to our homes, if the blasting disturbs our leach fields and disrupts our present or future water supplies? If the pipeline develops leaks, it has the potential to permanently pollute our sources of drinking water.

4. My fourth concern is the required cutting of many acres of trees which cover the proposed pipeline route. These trees shelter plants and animals, and protect the underground water resource areas which supply our springs and wells from which we draw our water. They stabilize the soil and prevent erosion. Some are tapped to provide sap to make maple products. The trees are a means of sequestering carbon to counteract climate change. What will be done with the thousands of logs produced by this cutting? Last year, with a grant from the Mass. Executive Office of Energy and Environmental Affairs (EEA), the Franklin Regional Council of Governments held meetings in many of the towns in Franklin County. The Berkshire Planning Board made similar presentations in Berkshire County. They presented a proposal to make this part of western Massachusetts a national forest, since this area is so heavily wooded. A committee of representatives from each town has recently drafted a document to support a Mohawk Trail Woodlands Partnership Project to be funded in part by the U.S. Forest Service. This document is available on their website at [frog.org](http://frog.org) under Land Planning and Zoning.

5. My fifth concern is the effect of the pipeline on our wetlands, which are recognized as valuable resources and protected by law in Massachusetts. Wetlands are protected by law in Massachusetts because they reduce flooding, remove pollutants, supply water to wells and springs, support unique ecosystems, provide recreation and increase tourism. Each town has a Conservation Commission to see that the Wetland Protection Act is upheld by its citizens. A circuit rider from the Mass. Department of Environmental Protection (DEP) works with local Conservation Commissions to make sure the Act is being enforced in each town. Any work to be done in these resource areas requires filing a Notice of Intent (NOI) or a Determination of Applicability (DOA) with the local Conservation Commission. The Commission must hold a hearing and issue Orders of Conditions to make sure any wetland is not adversely affected by the proposed work. The law requires that any wetland so destroyed must be restored or mitigated. I refer you to Mass. General Law, Chapter 131, section 40, or to the Mass. DEP website under the Executive Office of Energy and Environmental Affairs.

6. My sixth concern is the potential contribution, by the construction of this pipeline, to climate change by the removal of trees and other plants which are sequestering carbon. The EPA recently released a study by Michael C. Veres, Assistant Professor of Climatology at SUNY, Oswego, New York, titled "Climate Change in the United States: Benefits of Global Action." It blames human activities, such as pollution and deforestation, for increased carbon dioxide in the atmosphere, leading to climate change, the "biggest issue of our time." For this report see [epa.gov/cira](http://epa.gov/cira). The construction of this pipeline, with the resulting deforestation and potential pollution, will contribute greatly to increased carbon dioxide in the atmosphere. U.S. government agencies, such as the EPA and FERC, must lead the fight to increase forestation and decrease pollution, rather than allowing and/or encouraging activities which add more carbon dioxide to the atmosphere.

7. Many of the properties through which the pipeline is proposed to go, including mine, are protected by a conservation restriction (CR), agricultural protection restriction (APR), or as State Forest, etc. under the Mass. Executive Office of Energy and Environmental Affairs (EEA). The following quotes are taken from their website at [mass.gov/eea](http://mass.gov/eea). “The Executive Office of Energy and Environmental Affairs’ (EEA) legislated mission is to preserve, protect and enhance the natural resources of the Commonwealth, the economic activities dependent on those resources (agriculture, forest products and important segments of the tourist industry), and the quality of life in the Commonwealth. The right of our citizens to the quality of life that clean water and undeveloped open space can provide is mandated by Article 97 of the state constitution.” “Land protected by Article 97 requires a 2/3 vote of the Legislature before it can be disposed of. EEA has a “no net loss” policy with regards to the disposition of Article 97 protected open space.”

8. Another concern is the effect of installing this pipeline on the fields used by local farmers to grow crops. How much of the field will no longer be usable? Much of the non-wooded areas in Ashfield are prime farmland. See Map 4, “Agricultural Soils,” of the Town of Ashfield Open Space and Recreation Plan. Farmers are using these fields to pasture animals or to grow hay to feed their own cows.

9. Ashfield was first settled in the 1740s and many of the original properties are still intact. The pipeline is proposed to go near the site of the first saw mill and second grist mill, of which the foundations can be seen next to the Bear River. Many houses along the proposed pipeline route are historic structures, some built in the late 1700s. I refer you to the Mass. Historical Commission Inventory done for Ashfield in the 1980s and to recent updates at the Ashfield Historical Society. Further east along the proposed pipeline route, in the area once occupied by glacial Lake Hitchcock, there are many Native American archeological sites, which should not be disturbed by building this pipeline.

10. It has been publicized many times that the pipeline is passing through existing utility rights of way, as if this makes it more acceptable. What is not mentioned and possibly not understood is that many of these utility rights of way are on private land, and granted by the land owners for above ground transmission of intelligence and electricity. Each of these rights of way would have to be renegotiated by Kinder Morgan.

We, the concerned citizens of the Town of Ashfield, ask you to carefully consider the devastating permanent impacts this pipeline will have on our rural and historic environment, which those of us who live here have chosen to enjoy.

Sincerely yours,

Nancy Gray Garvin

Re: Project Docket number PF14-22-000

Dear Ms. Bose:

I am writing to share with you our family’s concerns about the proposed Northeast Energy Direct, Tennessee

Gas Pipeline project. The route, as proposed by Kinder Morgan, is slated to use the power line right of way which abuts our property, with our house, our well, and our septic system.

During the 58 years of our marriage, we have lived in five different states and many different communities, both urban and rural. We have lived near military bases, in the flight path of cargo planes, beside noisy highways with high volumes of traffic day and night. We chose to retire to this Town of Ashfield, where I was born and where my family has lived and farmed since 1765. The reasons we came here were many, but the most important reason is for the peace and tranquility it offers, where we can live in harmony with the many indigenous species of wildlife, farm our land, and enjoy vicariously the activities of the other farmers around us.

We have denied Kinder Morgan access to our property, as have most of the other land owners in this town and other towns through which the pipeline is proposed to go. One of our former neighbors did permit access, because they were concerned and hoped to negotiate to keep the pipeline away from their 100 acres of sugar bush, by which they and many generations before them produce maple syrup for public consumption.

Therefore, the only way this pipeline can pass through these towns in western Massachusetts is by the taking of property by eminent domain. To do this, the U.S. Government must prove that the taking of this property is for public use, and therefore it is for the safety, health, interest, or convenience of the public. Are not we, the citizens of the towns in western Massachusetts, whose lifestyle and well-being will be affected by the building of this pipeline, part of the public? Should not our health, safety, interest, and/or convenience be protected by our Government? Please explain to us, in writing, how this taking of our land for a pipeline outweighs the following historic facts, in terms of our public safety, health, interest, or convenience.

1. Massachusetts is a unique state in that there are many historic areas dating from 1620, when the Pilgrims arrived in Plymouth, and 1630, when the Puritans arrived in Salem. Both groups came to escape freedom from government oppression. We have recently seen a copy of a map of eastern Massachusetts done by a ship's cartographer in 1633. This Town of Ashfield is a proprietor town given in 1735, by the government of the Massachusetts Bay Colony, as payment for their "hardships and sufferings" to the soldiers who went to Canada from Weymouth with Captain Ephraim Hunt in 1690 during King Williams War, or to their heirs and assigns. This town was originally named Huntstown in his honor. Descendants of Ephraim Hunt still live here, as do descendants of some of the other Proprietors. The first division of lots, on which the earliest settlers built their homes and farmed the land, was in the northeast part of town, the area through which the pipeline is proposed to go. Many of these lots exist as they were in 1739, and have never been subdivided. The houses on them date back to the 1700s. We, the present owners of these properties, are the assigns of the original proprietors. The property on which my grandfather, a Proprietor and first Town Treasurer, settled in 1765 is one of the properties through which the pipeline is proposed to go. My grandfather purchased it from one of Huntstown's first settlers. As an example, I am enclosing the history of this property with this letter.

2. It is possible for officials in companies, such as Kinder Morgan, and for government officials in their urban environments, to assume that those of us who live in rural areas and farm the land are not well educated, and thus our chosen way of life is easy to ignore. However, many of the citizens of this town have college degrees, including doctorates, from well-known colleges. Among our local citizens have been people such as Mary Lyon, G. Stanley Hall, Milo Belding, George William Curtis, Charles Eliot Norton, John and Eliza Field, and Ambassador William C. Bullitt.

3. Even though the proposed route of the pipeline is along the power line right of way, due to the placement of the poles holding the high tension wires, the pipeline will have to go through adjacent property, which is privately owned. This will require removing a large number of tall trees, which presently provide Wildlife habitat, carbon sequestration, soil stabilization, and privacy screening. How is the removal of these trees in the public interest of the citizens of these towns?

4. Since this is a very rural area, all the homes in the proposed pipeline area depend on septic systems for

waste disposal and on springs or wells for their water supply. The soils in this area are mostly glacial till, which makes it difficult to find 111i area which will pass a perc test to satisfy the requirements of Title s. This is a very hilly town. Therefore, the subsurface, through which the pipeline will pass, is mostly bedrock. Fissures in the bedrock control the direction IIIId amount of water available to springs and wells, and mIIITy-adjacent small brooks and other wetlands. The proposed pipeline route is close to mIIITy-septic systems, including ours, and the extensive drilling IIIId/or blasting through the bedrock, which will be required, has the potential to impact severely the supply of water to our wells, springs, and area wetlands. How are we to dispose of our wastes and get potable drinking water to our homes, if the blasting disturbs our leach fields and disrupts our present water supply? How does this promote the public health IIIId safety of the citizens of this area?

5. Since early December the power complITly has been replacing their outdated metal towers and raising the height of the high tension wires in their right of way abutting our property. For several days, while they were drilling holes into the bedrock for the new, taller poles, our house was vibrating and the coffee was shaking in our cups. What is going to happen to our buildings and their foundations as a result of drilling or blasting through this extensive bedrock by Kinder Morgan to run the pipeline? How is this in our public interest?

6. While doing this work, the power comPIIIly often has at least ten trucks on site, all with their motors nmning continually. They back up frequently and those of us in this neighborhood hear the constllTt beep-beep as they do so. This adds to the constant noise being generated and to air pollution. This has been going on since the first week in December IIIIdthey are still not finished. As I am writing this, I am listening to the whine of multiple chain saws as they clear more land to put up new poles. How is this constant noise in the best interest of the health IIIId safety of the people who live in this area?

7. The power comPIIIly trucks include large crane trucks brought to this site over our narrow country roads and bridges, some of which are posted for smaller vehicles only. Who pays the Town for damage to its roads and bridges by the constant use of these large vehicles, such as will be required by Kinder Morgan to bring in equipment to build the pipeline? How is the increased cost of repairing these roads and replacing these bridges in the best interest of the citizens of these towns?

8. The Town of Ashfield has a noise bylaw, requiring abatement of noise between 11 PM and 7 AM. The state has 111i ambient noise level, as well. If a compressor station is placed in 11iytown in Massachusetts, as proposed, how will these noise ordiMnces be addressed? We will also be subjected to light pollution 24 hours a day. We chose to live in a rural area to avoid noise and light pollution. How are light IIIIdnoise pollution, as well as release of fumes and potential for fires, in the interest of the health of those citizens in the area of a compressor station?

9. The proposed pipeline has already made it impossible for some of my neighbors to sell their properties. Over a year ago, one of my neighbors, 111i elderly widow, had found 111i interested buyer for her historic home and organic farm. However, as soon as he heard about the proposed pipeline route, he was no longer interested in her property. It is still on the market, as are all the other properties which were for sale when this route was first proposed. If the pipeline is approved, we will be forced to put our extensive farm property on the market. Will Kinder Morgan or Tennessee Gas provide enough tax money to the Town to reimburse the citizens for the inevitable reduction in the tax base IIIIdincrease in property taxes? How is the inability to sell properties in the public interest of the citizens of these towns?

10. Many of us have placed Conservation Restrictions or Agricultural Preservation Restrictions on our property with the Franklin Land Trust. This is not because we were interested in tax incentives or reimbursement for the restrictions, but because we sincerely believed in and wished to preserve the open space value of our rural landscape "in perpetuity." There are 148 known conservation tracts, for a total of 27,837 acres of protected open space in Massachusetts, through which the pipeline is proposed to go. These restrictions are paid for with local and state tax dollars. They are protected by Article 97 of the Commonwealth of Massachusetts General Laws. Unless they are removed by a 213 vote of both bodies of the Legislature, these restrictions prevent building of a pipeline through these properties. How can the U.S. Government ignore the will of the

people to protect and maintain this open space for the benefit of future generations? We have agreed to protect the horticultural and woodland values and to maintain the "natural wildlife habitat" of these protected properties by not allowing "any activity detrimental to soil conservation, or to good agricultural or forestry management." The whole concept of open space protection is in jeopardy, if this proposed pipeline is allowed to go through these properties, How is ignoring or overriding these restrictions in the public interest of the citizens of Massachusetts?

11. Many of these properties are protected under the Natural Heritage Endangered Species Act. The species protected on our property is the endangered wood turtle. We have seen several breeding females here, so know they are present. The pipeline is also slated to go through the Swift River watershed in the western part of town, one of the most important breeding areas in New England for this endangered wood turtle. We are required by law not to disturb this area during their mating season. Will Kinder Morgan stop building the pipeline in these watershed areas during the spring mating season?

12. The soil in our neighborhood through which the pipeline is proposed to go is shown on the Town open space plan as the most productive soil in this town. Most of it is farmland, used to grow hay, corn, pasture cows, or for market gardens. How will the pipeline affect the ability of the land owners to work the soil on their properties for growing crops, as has been done for many generations? Will the proposed right of way of 50 feet or more on each side of the pipeline route be able to be used by farm machinery? If not, how is this in the best interest of the owners of this prime farmland?

13. The pipeline is proposed to pass through many protected wetlands in this Town, including Ford Pond, the site of an early and historic saw mill. The mill building is there still, one of only two historic mill buildings still in existence in this town. Our pristine streams, slated to be crossed by the pipeline, support many aquatic species, including brook trout. Why are the citizens of Massachusetts required by law to uphold the requirements of the Massachusetts Wetlands Protection Act and the Massachusetts Rivers Act, if these acts do not also apply to companies such as Kinder Morgan? Among the purposes for these acts is the protection of public and private water supplies. The pipeline with its potential for leaks, as documented for similar pipelines, could seriously disrupt or contaminate the underground streams which supply our springs and wells. How is ignoring or overriding these acts in the best interest of the citizens of the Commonwealth of Massachusetts?

14. Some of the farm and forest properties through which this pipeline is proposed to go are under the protection of Chapter 61 of the Massachusetts General Laws. These laws reduce the assessed value of the land to its potential for growing crops or timber, rather than as potential building lots. Section 8 of Chapter 61 outlines the procedure for reconversion of Chapter 61 land to residential, industrial, or commercial use. By law any notice of intent to sell or convert to other use must be sent to the Town Select Board and Board of Assessors by certified mail. The Town has 120 days to exercise a first-refusal option, to purchase this land, or to assign their option to a non-profit conservation organization. How is the public interest of the citizens of Ashfield served by removing portions of our property from Chapter 61? What if the Town exercises its right to assign our properties to a non-profit conservation organization, rather than to have it taken by eminent domain?

I strongly urge FERC to consider the recent Access Northeast proposal by National Grid, Northeast Utilities, and Spectra to expand their existing pipeline to provide more natural gas to Massachusetts, rather than unnecessarily building a new, much more expensive pipeline, as proposed by Kinder Morgan, through many historic and environmentally sensitive areas, on which many people depend for their livelihood.

I look forward to hearing from you, in detail, your justification of how the Northeast Direct Project is in the public safety, health, interest, and convenience of the citizens of the Town of

Ashfield.

Sincerely yours,

Nancy Gray Garvin

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE  
Room 1A  
Washington, DC 20426

July 28, 2015

Dear Secretary Bose,

Several days ago I was having a conversation with one of my neighbors who owns a commercial cattle farm in Temple, New Hampshire. This gentleman received a letter from Kinder Morgan in early June of this year letting him know that his cattle fields are within a half mile of the proposed NED compressor station slated for New Ipswich, NH.

He had immediate, and understandable, concerns regarding the impact this project will have upon the health of his cattle, and hence the health of the adults and children who consume his grass-fed, well-watered cattle. He wanted to understand about the health risks associated with living near compressor stations. To that end he reached out to the NH Department of Environmental Services for any information they may be able to provide on the subject.

A Supervisor for the Health and Risk Assessment Section of the NH Department of Environmental Services sent my neighbor the enclosed twenty three page report produced by the Southwest Pennsylvania Environmental Health Project. This report is titled "Summary on Compressor Stations and Health Impacts", dated February 24, 2015.

This report details the tremendous negative impact Compressor Stations have had in communities located in Pennsylvania, New York, and Texas. If the Compressor Station is built in New Ipswich, it is easy to see the impact the Compressor Station will have upon our health, the health of our livestock, the health of our environment, and the health of the wildlife that depend upon that environment here in New Hampshire.

I urge you to read this enclosed study and to come out in opposition to the Tennessee Gas Pipeline NED project. It is bad for New Ipswich, bad for Temple and bad for New Hampshire.

Sincerely, Your Constituent,

Chris Bradler  
269 East Road  
Temple, NH 03084

*{editors note: the original FERC document 20150803-0013(30786177).pdf contained only the odd-numbered pages of the above-mentioned report. The original report, which is available at <http://www.environmentalhealthproject.org/wp-content/uploads/2012/03/Compressor-station-emissions-and-health-impacts-02.24.2015.pdf>, was downloaded and substituted for the defective FERC scan}*

Summary on Compressor Stations and Health Impacts

February 24, 2015

**Compressor station emissions**

CO	2 methyl pentane
iso-Butane	3 methyl pentane
methyl mercaptan	ethyl benzene
n-Butane	benzene
n-hexane	ethane
n-octane	propane
nitrogen dioxide	methanol
nitrous-acidstyrene	naphthelene

The Texas Commission on Environmental Quality (TCEQ), as part of its Barnett Shale Formation Area Monitoring Projects found the following chemicals downwind from two monitored compressor stations<sup>6</sup>:

- Downwind of Devon Energy Company LP's Justin compressor station the TCEQ reports propane, isobutene, n-butane, ethane, cyclohexane, benzene, n-octane, toluene, m+p-xylene, n-hexane.
- Downwind of Targa North Texas LP's Bryan Compressor Station the TCEQ reports: ethane, propane, isobutene, n-butane, cyclohexane, n-octane, toluene, isopentane, n-pentane + isoprene, benzene.<sup>7</sup>

Officials in DISH, TX commissioned a study of compressor station emissions in its vicinity. Wolf Eagle Consultants performed whole air emissions sampling for VOCs, HAPs as well as Tentatively Identified Compounds (TICs). Chemicals identified as exceeding Texas's ESLs include: 8

benzene  
dimethyl disulfide  
methyl ethyl disulphide  
ethyl-methylethyl disulfide  
trimethyl benzene  
diethyl benzene  
methyl-methylethyl benzene  
tetramethyl benzene  
naphthalene 1,2,4-trimethyl benzene  
m&p xylenes  
carbonyl sulfide  
carbon disulfide  
methyl pyridine  
dimethyl pyridine

In 2011 and 2013, Earthworks, a non-profit organization, collected air samples within 0.33 miles of two compressor stations: Springhill compressor in Fayette County and the Cumberland/Henderson compressor station in Greene County, Pennsylvania.<sup>9</sup> Results from samples collected include:

1,1,2-Trichloro-1,2,2-trifluoroethane,  
1,2-dichlorobenzene  
2-butanone  
benzene  
carbon tetrachloride  
chloromethane  
dichlorodifluoromethane  
ethylbenzene  
methane  
methylene chloride  
tetrachloroethylene  
toluene  
trichloroethylene  
trichlorofluoromethane

Anecdotally, we know that people living near compressor stations report episodic strong odors as well as visible plumes during venting or blowdowns. Residents often report symptoms that they associate with odors such as burning eyes and throat, skin irritation, and headaches. These are simply anecdotes but they are fairly consistently reported. It should be noted that residents in southwest Pennsylvania where these anecdotes were collected, often live near drill pads and in some instances processing plants along with compressor stations.<sup>10</sup>

### Emissions pathways

In addition to the emissions produced during the normal operations of a compressor station there are several other ways that emissions might be dispersed from the site. These include fugitive releases, blowdowns, and accidents. Trucks play a significant role in the emissions profile during construction but are not common once the facility is complete and on line.

### ***Fugitive emissions***

Fugitive emissions are uncontrolled or under-controlled releases. They occur from equipment leaks and evaporative sources. It has been suggested that fugitive emissions will increase over time as machinery begins to wear.<sup>11</sup>

There does not appear to be a central publically available source of information of these emissions. There are, however, many opportunities for fugitive emissions to be released from a compressor station. We were able to locate only one study on natural gas compressor station fugitive emissions. In that study, conducted in the Fort Worth, TX area, researchers evaluated compressor station emissions from eight sites, focusing in part on fugitive emissions. A total of 2,126 fugitive emission points were identified in the four month field study of 8 compressor stations: 192 of the emission points were valves; 644 were connectors (including flanges, threaded unions, tees, plugs, caps and open-ended lines where the plug or cap was missing); and 1,290 were classified as Other Equipment. The Other category consists of all remaining components such as tank thief hatches, pneumatic valve controllers, instrumentation, regulators, gauges, and vents. 1,330 emission points were detected with an IR camera (i.e. high level emissions) and 796 emission points were detected by Method 21 screening (i.e. low level emissions). Pneumatic Valve Controllers were the most frequent emission sources encountered at well pads and compressor stations.<sup>12</sup>

### ***Blowdowns***

The largest single emission at a compressor station is the compressor blowdown.<sup>13</sup> They can be scheduled or accidental. As the natural gas rushes through the blowdown valve, a gas plume extends upward of 30 to 60 meters. The most forceful rush of air occurs at the very beginning, then the flow gradually slows down. The first 30 to 60 minutes of the blowdown are the most intense, but the entire blowdown may last up to three hours.<sup>14</sup> One blowdown vents 15 MCF gas to atmosphere on average. Isolation valves leak about 1.4 Mcf/hr on average through open blowdown vents.<sup>15</sup>

It is not possible to know what exactly would be emitted in a given natural gas compressor station blowdown as there is no data available. We know that it will include whatever is in the pipeline when the blowdown occurs. This would undoubtedly include the constituents of natural gas: methane, ethane, etc., and various additional constituents would be present during different episodes. We are especially concerned about the presence of radioactive material during a blowdown. Anecdotally, there are reports of odors and burning eyes, headaches and coughing associated with the events.<sup>16</sup>

An exposure to blowdown concentrations of contaminants would have different health implications than a long-term lower level exposure (i.e. yearly average) to the same contaminants when the compressor is on line.

### ***Accidents***

In addition to planned emissions, fugitive emissions and blowdowns there is also the possibility of accidents at the compressor station. There are no central national or state inventories of compressor station acci-

dents that we were able to locate. In their absence we turned to local news accounts of individual accidents (which are generally in the form of fires). Without knowing what precisely is in the pipeline nor what else (if anything) may be housed on the site, it is not possible to estimate emissions from a fire at the compressor station. The possibility, however, is very real. A gas compressor station exploded near Godley, TX. That fire destroyed the compressor station where it started and also the one next to it. The fire burned for several hours.<sup>17</sup> In a compressor station fire in Madison County, TX volunteer firefighters from four towns were dispatched to the site. First responders blocked roads near the site and evacuated three homes.<sup>18</sup> In Corpus Christi, TX a fire broke out at a compressor station which then spread to nearby brush before being extinguished.<sup>19</sup>

The possibility of fire or other accidents raises the concern over whether the localities surrounding a compressor station have the resources available to contain a fire or explosion adequately and whether first responders and hospitals are able to care for injured workers or others nearby or whether an evacuation plan could be implemented. In Wheeler County, TX four contractors were performing maintenance activities near a compressor station when a flash fire occurred. The workers were brought to a nearby hospital. Two were treated and released; the other two were transferred to a burn unit in Lubbock.<sup>20</sup> In Carbon County, UT an explosion and fire damaged a natural gas compressor station and other buildings on the site injuring two workers and engulfing the facility in flame. Firefighters from every city in the county responded to the emergency. Injured workers had to be evacuated by medical helicopters.<sup>21</sup>

Overall, there is little information on the division of responsibility between the company operating the facility and the locality. This should be clarified.

#### The question of radioactivity

A 2008 publication of the International Association of Oil & Gas Producers has laid out the discussion on radioactive material in the natural gas extraction and production process.

During the production process, naturally occurring radioactive material (NORM) flows with the oil, gas and water mixture and accumulates in scale, sludge and scrapings. It can also form a thin film on the interior surfaces of gas processing equipment and vessels. The level of NORM accumulation can vary substantially from one facility to another depending on geological formation, operational and other factors.

[R]adionuclides such as Lead-210 and Polonium-210 can ... be found in pipelines scrapings as well as sludge accumulating in tank bottoms, gas/oil separators, dehydration vessels, liquid natural gas (LNG) storage tanks and in waste pits as well as in crude oil pipeline scrapings.<sup>22</sup>

The gas which flows through the pipeline likely carries gaseous radon with it, and as radon decays within the pipeline, the solid daughter elements, polonium and lead, accumulate along the interior of the pipes. There is a concern that the gas transiting, and being compressed and regulated, will have radioactivity levels which will put at risk not only the workers at these stations and along the pipeline, but potentially also to the residents.<sup>23</sup> Radon, a gas, has a short half-life (3.8 days) but its progeny are lead and polonium, and these are toxic and have relatively long half-lives of 22.6 years and 138 days respectively.<sup>24</sup> There is no data that we can turn to in order to assess the risk of radioactive exposures in our community.

#### **Health risks from relevant air contaminants**

##### Averages, peaks and health events

As stated previously, one of our primary concerns is the poor fit of a tons per year measurement to the assessment of risk to the public's health near a compressor station. Furthermore, the National Ambient Air Quality Standards (NAAQS) used as a benchmark for air quality were not created to assess the air quality and safety in a small geographic area with fluctuating emissions. NAAQS effectively address regional air quality concerns. But these standards do not adequately assess risk to human health for residents living in close proximity to polluting sources such as unconventional natural gas development (UNGD) sites, where emissions can be highly variable.

Generally, it has been shown that:

1. Current protocols used for assessing compliance with ambient air standards do not adequately determine the intensity, frequency or durations of the actual human exposures to the mixtures of toxic materials released regularly at UNGD sites, including compressor stations.
2. The typically used periodic 24-hour average measures can underestimate actual exposures by an order of magnitude.
3. Reference standards are set in a form that inaccurately determines health risk because they do not fully consider the potential synergistic combinations of toxic air emissions.<sup>25</sup>

Thus estimates of yearly totals of contaminants released by a compressor station do not allow for an assessment of the physiological impact of those emissions on individuals.

NAAQS reflects what, over a region, over time, is deemed safe population-wide. This is very different than what is safe within for instance 1200 feet of this compressor station. As already stated, averaging over a year can wash out important higher spikes in emissions (thus exposures) that may occur at various points throughout the year. These high spikes can put residents at risk for illnesses caused by air toxics.

#### Toxicity and characterization of exposures

Toxicity of a chemical to the human body is determined by the concentration of the agent at the receptor where it acts. This concentration is determined by the intensity and duration of the exposure. All other physiological sequelae follow from the interaction between agent and receptor. Once a receptor is activated, a health event might be produced immediately or in as little as one to two hours.<sup>26 27</sup> In some instances, where there is a high concentration of an agent, a single significant exposure can cause injury or illness. This is the case in the instance of an air contaminant induced asthma event. On the other hand, after an initial exposure, future exposures might compound the impact of the first one, in time, producing a health effect. Repeated exposures will increase, for instance, the risk for ischemic heart disease.<sup>28</sup>

#### Peak exposures

Researchers have demonstrated the wisdom of looking at peak exposures as compared to averages over longer periods of time. Darrow et al (2011) write that sometimes peak exposures better capture relevant biological processes. This is the case for health effects that are triggered by, short-term, high doses. They write, “Temporal metrics that reflect peak pollution levels (e.g., 1-hour maximum) may be the most biologically relevant if the health effect is triggered by a high, short-term dose rather than a steady dose throughout the day. Peak concentrations ... are frequently associated with episodic, local emission events, resulting in spatially heterogeneous concentrations....”<sup>29</sup>

Delfino et al (2002) posited that maxima of hourly data, not 24-hour averages, better captured the risks to asthmatic children, stating, “it is expected that biologic responses may intensify with high peak excursions that overwhelm lung defense mechanisms.”

Additionally, they suggest that “[o]ne-hour peaks may be more influenced by local point sources near the monitoring station that are not representative of regional exposures....”<sup>30</sup>

Because episodic high exposures are not typically documented and analyzed by researchers and public agencies, natural gas compressor stations emissions are rarely correlated with health effects in nearby residents. However, examination of published air emission measurements shows the very real potential for harm from industry emissions.<sup>31</sup> Reports of acute onset of respiratory, neurologic, dermal, vascular, abdominal, and gastrointestinal sequelae near natural gas facilities contrast with research that suggests there is limited risk posed by unconventional natural gas development.

#### Health Effects from exposures to VOCs

VOCs, present at compressor station construction and operation, are a varied group of compounds which can range from having no known health effects to being highly toxic. Short-term exposure can cause eye

and respiratory tract irritation, headaches, dizziness, visual disorders, fatigue, loss of coordination, allergic skin reaction, nausea, and memory impairment. Long-term effects include loss of coordination and damage to the liver, kidney, and central nervous system. Some VOCs, such as benzene, formaldehyde, and styrene, are known or suspected carcinogens.<sup>32</sup> The case for elevated risk of cancer from UNGD VOC exposure has been made by McKenzie et al (2012) and others.<sup>33</sup>

The inhalation of the VOC, benzene, produces a number of risks including

[acute (short-term)] drowsiness, dizziness, headaches, as well as eye, skin, and respiratory tract irritation, and, at high levels, unconsciousness. Chronic (long-term) inhalation exposure has caused various disorders in the blood, including reduced numbers of red blood cells and aplastic anemia, in occupational settings. Reproductive effects have been reported for women exposed by inhalation to high levels, and adverse effects on the developing fetus have been observed in animal tests. Increased incidence of leukemia (cancer of the tissues that form white blood cells) have been observed in humans occupationally exposed to benzene. EPA has classified benzene as known human carcinogen for all routes of exposure.<sup>34</sup>

Benzene, which is documented at compressor stations by the States of Pennsylvania and Texas, carries its own risk, including risk for cancer.<sup>35</sup> <sup>36</sup> There is growing evidence that benzene is associated with childhood leukemia. Benzene affects the blood-forming system at low levels of occupational exposures, and there is no evidence of a threshold. It has been argued in the literature that “[t]here is probably no safe level of exposure to benzene, and all exposures constitute some risk in a linear, if not supralinear, and additive fashion.<sup>37</sup>

Another substance that is detected near compressor stations is methylene chloride.

According to the EPA:

The acute (short-term) effects of methylene chloride inhalation in humans consist mainly of nervous system effects including decreased visual, auditory, and motor functions, but these effects are reversible once exposure ceases. The effects of chronic (long-term) exposure to methylene chloride suggest that the central nervous system (CNS) is a potential target in humans and animals. Human data are inconclusive regarding methylene chloride and cancer. Animal studies have shown increases in liver and lung cancer and benign mammary gland tumors following the inhalation of methylene chloride.<sup>38</sup>

The VOC formaldehyde is also considered a Hazardous Air Pollutant (HAP) by the US EPA (EPA).<sup>39</sup> It is one of the emissions chemicals that the natural gas development industry is required to report, for instance to the PA DEP. According to these reports, compressor stations are the highest UNGD source for formaldehyde.<sup>40</sup> For the year 2012, emissions of formaldehyde from compressor stations in Pennsylvania ranged from 0.0 TPY to 22.5 TPY. <sup>41</sup>

A recent study of air emissions in the Barnett shale region of Texas found concentrations of formaldehyde at sites with large compressor stations.<sup>42</sup> Some of these concentrations were greater than the Texas Commission on Environmental Quality’s health protective levels (page 62). Formaldehyde was one of 101 chemicals found in association with methane in this study. The research showed that aromatics in particular were associated with compressor stations.

Air exposures to formaldehyde target the lungs and mucous membranes and in the short-term can cause asthma-like symptoms, coughing, wheezing, and shortness of breath. The EPA classifies it as a probable human carcinogen.<sup>43</sup> The World Health Organization classifies it as carcinogenic to humans.<sup>44</sup> It has also been associated with childhood asthma.<sup>45</sup> The California Office of Environmental Health Hazard assessment (OEHHA) has “identified formaldehyde as a Toxic Air Contaminant and gives it an inhalation Reference Exposure Level (REL) of 55 ug/m<sup>3</sup> for acute exposures and 9 ug/m<sup>3</sup> for both 8-hour and chronic exposures.<sup>46</sup> The acute REL is 74 ppb based on irritation of asthmatics.<sup>47</sup> It has also been linked with adverse pregnancy outcomes and reproductive and developmental toxicity.<sup>48</sup>

More recent investigations on formaldehyde near compressor stations are focused on the chemical reaction

between methane and sunlight.<sup>49</sup> While it is well known that stationary compressor station engines emit formaldehyde, it is less well known that formaldehyde may also be formed at these sites through this chemical reaction. While the research is ongoing, it suggests that health hazards associated with formaldehyde may be greater than previously thought. Because reported health symptoms near compressor stations, such as respiratory impacts and shortness of breath, can be caused by exposure to formaldehyde, targeted monitoring of this chemical at these sites would be recommended.

#### Effects from exposure to particulate matter

In addition to the VOC exposure presented above, PM<sub>2.5</sub> also poses a significant health concern and interacts with the airborne VOCs increasing their impact. In fact, at a compressor station PM<sub>2.5</sub> may pose the greatest threat to the health of nearby residents. Fine particles are expected to reach a total of 1.136 tons for 2015 and 2016.

The size of particles determines the depth of inhalation into the lung; the smaller the particles are, the more readily they reach the deep lung. Particulate matter (PM<sub>10</sub>, PM<sub>2.5</sub> and ultrafine PM), in conjunction with other emissions, are at the core of concern over potential effects of UNGD.

High particulate concentrations are of grave concern because they absorb airborne chemicals in their midst. The more water soluble the chemical, the more likely it is to be absorbed onto a particle. Larger sized particles are trapped in the nose and moist upper respiratory tract thereby blocking or minimizing their absorption into the blood stream. The smaller PM<sub>2.5</sub> however, is more readily brought into the deep lung with airborne chemicals and from there into the blood stream. As the particulates reach the deep lung alveoli the chemicals on their surface are released at higher concentrations than they would in the absence of particles. The combination of particles and chemicals serves, in effect, to increase in the dose of the chemical. The consequences are much greater than additivity would indicate; and the physiological response is intensified. Once in the body, the actions between particles and chemicals are synergistic, enhancing or altering the effects of chemicals in sometimes known and often unknown ways.<sup>50</sup>

Reported clinical actions resulting from PM<sub>2.5</sub> inhalation affect both the respiratory and cardiovascular systems. Inhalation of PM<sub>2.5</sub> can cause decreased lung function, aggravate asthma symptoms, cause nonfatal heart attacks and high blood pressure.<sup>51</sup> Research reviewing health effects from highway traffic, which, like UNGD, has especially high particulates, concludes, “[s]hort-term exposure to fine particulate pollution exacerbates existing pulmonary and cardiovascular disease and long-term repeated exposures increases the risk of cardiovascular disease and death.”<sup>52</sup> PM<sub>2.5</sub>, it has been suggested, “appears to be a risk factor for cardiovascular disease via mechanisms that likely include pulmonary and systemic inflammation, accelerated atherosclerosis and altered cardiac autonomic function. Uptake of particles or particle constituents in the blood can affect the autonomic control of the heart and circulatory system.”<sup>53</sup>

Ultrafine particles (<0.1) get less attention in the literature than PM<sub>2.5</sub> but is found to have high toxic potency.<sup>54</sup> These particles readily deposit in the airways and centriacinar region of the lung.<sup>55</sup> Research suggests increases in ultrafine particles pose additional risk to asthmatic patients.<sup>56</sup> Ultrafine particles are generally produced by combustion processes. They, along with the larger PM<sub>2.5</sub>, are found in diesel exhaust.

Diesel is prevalent during the construction phase of compressor station site. High levels of diesel exhaust from construction machinery as well as trucks increase the level of respirable particles. Health consequences of diesel exposure have been widely studied and include immediate and long term health effects. Diesel emissions can irritate the eyes, nose, throat and lungs, and can cause coughs, headaches, lightheadedness and nausea. Short-term exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. Long-term exposure can cause increased risk of lung cancer.<sup>57</sup>

#### PM<sub>2.5</sub> acute effects

There is an abundance of research on the health effects of short term PM<sub>2.5</sub> exposure. Mills et al demonstrate that one to two hours of a diesel exhaust exposure, which occurs during the construction phase of

development, includes reduced brachial artery diameter and exacerbation of exercise-induced ST-segment depression in people with pre-existing coronary artery disease; ischemic and thrombotic effects in men with coronary heart disease;<sup>58</sup> and is associated with acute endothelial response and vasoconstriction of a conductance artery.<sup>59</sup> Fan He et al. suggest that health effects can occur within 6 hours of elevated PM<sub>2.5</sub> exposures, the strongest effects occurring between 3 and 6 hours. Such an acute effect of PM<sub>2.5</sub> may contribute to acute increase in the risk of cardiac disease, or trigger the onset of acute cardiac events, such as arrhythmia and sudden cardiac death.<sup>60</sup>

Numerous epidemiological studies have demonstrated a consistent link between particulate matter and increased cardiopulmonary morbidity and mortality (Brook et al. 2004; Mann et al. 2002; Pope et al. 2002; Samet et al. 2009; Schwartz 1999).<sup>61</sup> Previous studies have suggested that PM<sub>2.5</sub> exposure is significantly associated with increased heart rate and decreased heart rate variability (HRV; Gold et al., 2000; He et al. 2010; Liao et al. 1999; Luttmann-Gibson et al. 2006; Magari et al. 2001; Park et al. 2005).

In addition to short term exposures and associated effects, there is evidence of health impacts from long-term exposures.<sup>62</sup> An HIA reviewing data from a number of European cities found that nearly 17,000 premature deaths from all causes, including cardiopulmonary deaths and lung-cancer deaths, could be prevented annually if long-term exposure to PM<sub>2.5</sub> levels were reduced. Equivalently, this reduction would increase life expectancy at age 30 by a range between one month and more than two years in the study cities. A Canadian national cohort study found positive and statistically significant associations between non-accidental mortality and estimates of PM<sub>2.5</sub>, the strongest association being with ischemic heart disease. Associations in this study were with concentrations of PM<sub>2.5</sub> as low as only a few micrograms per cubic meter.<sup>63</sup> Research has also shown that there is an association between PM<sub>2.5</sub> and hospitalization for COPD in elderly people.<sup>64</sup>

There is also a considerable literature on the health effects specifically from diesel emission that include PM<sub>2.5</sub> along with chemical components. Mills et al conclude that even dilute diesel emissions can induce risk and point to ischemic and thrombotic mechanisms for the adverse cardiovascular events associated with diesel exposure.<sup>65</sup>

After an extensive review the EPA concluded that

long-term inhalation exposure is likely to pose a lung cancer risk to humans. Estimation of cancer potency from available epidemiology studies was not attempted.... A noncancer chronic human health hazard is inferred from rodent studies showing dose-dependent inflammation and histopathology in rats. Short-term exposures were noted to cause irritation and inflammatory symptoms of a transient nature these being highly variable across an exposed population. The assessment also indicates that there is emerging evidence from the exacerbation of existing allergies and asthma symptoms.<sup>66</sup>

#### Children, pregnant women and air contaminants

Children and pregnant women are especially sensitive to pollution. Many studies confirm a range of adverse effects of air pollution on children's lung function and respiratory symptoms, especially for asthmatics. Recent studies have found statistically significant associations between the prevalence of childhood asthma or wheezing and living very close to high volume vehicle roadways.<sup>67</sup> Other research aimed specifically at children's PM<sub>2.5</sub> exposure has found that PM<sub>2.5</sub> and several of its components have important effects on hospital admissions for respiratory disease, especially pneumonia. The authors count among the sources for this exposure diesel exhaust, motor vehicle emissions, and fuel combustion processes.<sup>68</sup>

Health effects have been found in pregnant women from high particulate highway pollution. Such particle pollution "may provoke oxidative stress and inflammation, cause endocrine disruption, and impair oxygen transport across the placenta, all of which can potentially lead to or may be implicated in some low birth weight ... and preterm births." The consequences do not stop with low birth weight and preterm births because these conditions can negatively affect health throughout childhood and into adulthood.<sup>69</sup>

### Mixtures and sequential exposures

Mixtures of pollutants are a critically important topic in addressing the public health implications of UNGD broadly and compressor stations in this case. While this report has focused primarily on three pollutants (VOCs, formaldehyde as one example, and PM<sub>2.5</sub>), in fact, a very large number of chemicals are released together. Medical reference values are not able to take the complex nature of the shale environment, its multiple emissions and interactions into full consideration.<sup>70</sup> Although the shale gas industry is not unique in emitting multiple pollutants simultaneously, this industry is unique in doing so as close as 500 feet from residences.

Chemicals that reach the body interfere with metabolism and the uptake and release of other chemicals, be they vitally important biochemical produced and needed by the body or other environmental chemicals with potentially toxic effects. Some chemicals attack the same or similar target sites creating an additive effect. This is the case with chemicals of similar structure such as many in the class of VOCs. Some mixtures like PM and VOC act synergistically to increase the toxicity of the chemicals. Other chemicals released environmentally are rapidly absorbed and slowly excreted. These slowly excreted chemicals will interfere with subsequent actions of chemicals because the body has not yet cleared the effects from the earlier exposure.

### Noise

Excessive noise has been associated with an array of psychological and physical effects.

A review article on noise exposure and health risk published in *Noise and Health* claims that the evidence for a causal relationship between community or transportation noise and cardiovascular risk has risen in recent years. In sum, the author finds limited evidence for a causal relationship between noise and biochemical effects; limited or sufficient evidence for hypertension; and sufficient evidence for ischemic heart disease.<sup>71</sup>

According to a World Health Organization assessment of research, excessive noise can also increase risk of cognitive impairment in children, sleep disturbance, tinnitus, and high levels of annoyance.<sup>72</sup> Researchers have found associations between elevated sound levels – including community sounds levels – and hearing loss, reduced performance and aggressive behavior.<sup>73</sup> Additionally some attention is being paid to the health effects of vibration exposure which is connected with but distinct from noise itself.<sup>74</sup>

Noise exposures are associated with construction activities and during blowdown episodes. As with air exposures, the periods of extreme exposures (in this case noise exposures) can cause different and sometimes more serious effects than low-level exposures.

### Summary

In sum, we know that a number of different chemicals as well as PM<sub>2.5</sub> are present during the construction phase of compressor stations and they are present in close proximity to compressor stations that are on line. Some, although not all, have documented health effects on vulnerable populations and on the population at large. What we do not know is the precise mix and concentration of chemicals that will be released into the air. Without that information it is not possible to assess the compressor station's full impact on area residents.

### **Reported health effects specific to compressor stations**

There is a growing body of research on emissions and health impacts from UNGD generally, though few studies specifically address health impacts from compressor stations. This is partly due to the fact that many compressors are sited in proximity to other UNGD sites such as well pads, impoundments, condensate tanks and processing stations. As the infrastructure for transporting natural gas continues to expand, more pipelines, metering stations and compressor stations will be sited away from other UNGD facilities.

Recent research that has been conducted near compressor stations in different parts of the country shows consistencies in the types of symptoms experienced by those living near these sites. These symptoms are associated with health impacts on respiratory, neurological and cardiovascular body systems. It should be noted that in each of the studies cited here health survey forms were filled out by residents and, as such, the

findings are self-reported. To date there have been no epidemiological studies performed to identify health impacts from compressor stations.

A peer-reviewed article, *Investigating Links Between Shale Gas Development And Health Impacts Through A Community Survey Project In Pennsylvania* (2014) is one of the few publications that explicitly addresses health impacts from compressors.<sup>75</sup> The report states:

In the Pennsylvania study, distance to industrial sites correlated with the prevalence of health symptoms. For example, when a gas well, compressor station, and/or impoundment pit were 1500-4000 feet away, 27 percent of participants reported throat irritation; this increased to 63 percent at 501-1500 feet and to 74 percent at less than 500 feet. At the farther distance, 37 percent reported sinus problems; this increased to 53 percent at the middle distance and 70 percent at the shortest distance. Severe headaches were reported by 30 percent of respondents at the farther distance, but by about 60 percent at the middle and short distances. <sup>76</sup> P.62

Age groups also responded differently in terms of health symptoms:

Among the youngest respondents (1.5-16 years of age), for example, those within 1500 feet experienced higher rates of throat irritation (57% vs. 69%) and severe headaches (52% vs. 69%). It is also notable that the youngest group had the highest occurrence of frequent nosebleeds (perhaps reflective of the more sensitive mucosal membranes in the young), as well as experiencing conditions not typically associated with children, such as severe headaches, joint and lumbar pain, and forgetfulness.

Among 20- to 40-year-olds, those living within 1500 feet of a facility reported higher rates of nearly all symptoms; for example, 44 percent complained of frequent nosebleeds, compared to 29 percent of the entire age group. The same pattern existed among 41- to 55-year-olds with regard to several symptoms (e.g., throat and nasal irritation and increased fatigue), although with smaller differences and greater variability than in the other age groups.

The subset of participants in the oldest group (56- to 79-year-olds) living within 1500 feet of facilities had much higher rates of several symptoms, including throat irritation (67% vs. 47%), sinus problems (72% vs. 56%), eye burning (83% vs. 56%), shortness of breath (78% vs. 64%), and skin rashes (50% vs. 33%).

In sum, while these data do not prove that living closer to oil and gas facilities causes health problems, they do suggest a strong association since symptoms are more prevalent in those living closer to facilities than those living further away. Symptoms such as headaches, nausea, and pounding of the heart are known to be the first indications of excessive exposure to air pollutants such as VOCs [36], while the higher level of nosebleeds in the youngest age group is also consistent with patterns identified in health survey projects in other states [9, 10].” P.64

Earthworks, a non-profit organization, conducted the Pennsylvania study referred to above, (*Gas Patch Roulette 2012*) in which they surveyed residents about health symptoms and conducted air and water tests near residences in Pennsylvania and New York<sup>77</sup>. In their report, specific mention is given of a residence 800 feet from a compressor station. Health symptoms experienced by the residents (parents and children) were extreme tiredness, severe headaches, runny noses, sore throats and muscle aches, as well as dizziness and vomiting by one individual.

Earthworks also conducted a health survey in Dish, Texas in 2009.<sup>78</sup> The health symptoms reported to be associated with compressors were: burning eyes, nausea, headaches, running nose, sore throat, asthma, sinus problems and bronchitis. Odors experienced by residents near compressor stations were described as: sulfur smell, odorized natural gas, burnt wire, strong chemical-like smell and ether.

Wilma Subra<sup>79</sup>, an environmental chemist and consultant who is on the Earthworks Board of Directors, has compiled information on health symptoms experienced near compressor stations based on her research with communities concerned about health impacts from UNGD<sup>80</sup>. Subra has served as Vice-Chair of the Environmental Protection Agency National Advisory Council for Environmental Policy and Technology

(NACEPT), and recently completed a five year term on the National Advisory Committee of the U.S. Representative to the Commission for Environmental Cooperation and a six year term on the EPA National Environmental Justice Advisory Council (NEJAC) where she served as a member of the Cumulative Risk and Impacts Working Group of the NEJAC Council. While her research on health impacts associated with compressor stations is reported back to communities, most of the data shown here have not been published in peer-reviewed journals (she is an author on the above-mentioned peer-reviewed article on Pennsylvania data).

Subra has reported the following health impacts in association with compressor stations:

**Table 2. Most Prevalent Medical Conditions In Individuals Living in Close Proximity to Compressor Stations and Metering Stations**

<u>Medical Conditions:</u>	<u>% of Individuals (71)</u>
Respiratory Impacts	58
Throat Irritation	55
Weakness and Fatigue	55
Nasal Irritation	55
Muscle Aches & Pains	52
Vision Impairment	48
Sleep Disturbances	45
Sinus Problems	42
Allergies	42
Eye Irritation	42
Joint Pain	39
Breathing Difficulties	39
Severe Headaches	39
Swollen & Painful Joints	32
Frequent irritation	32

The full list of health impacts “Reported by Community Members Living 50 feet to 2 miles from Compressor Stations and Gas Metering Stations Along Gas Transmission Pipelines” is available at the Luzerne County Citizens for Clean Air website<sup>81</sup>. It is notable that Subra reports that 61% of health impacts are associated with the chemicals present in the air that were in excess of short and long term effects screening levels.

Subra further reports that the following units at compressor stations and gas metering stations release emissions into the air:

- |                          |                           |
|--------------------------|---------------------------|
| Compressor Engines       | Compressor Blowdowns      |
| Condensate Tanks         | Amine Units               |
| Storage Tanks            | Separators                |
| Truck Loading Racks      | Fugitive Emission Sources |
| Glycol Dehydration Units |                           |

She reports that 90% of individuals surveyed reported experiencing odor events from these facilities. Based on her analysis, the following health symptoms are associated with the chemicals detected in the air at compressor stations:

- |                      |                             |
|----------------------|-----------------------------|
| Allergies            | Difficulty in Concentrating |
| Persistent Cough     | Nervous System Impacts      |
| Shortness of Breath  | Forgetfulness               |
| Frequent Nose Bleeds | Sores and Ulcers in Mouth   |
| Sleep Disturbances   | Thyroid Problems            |
| Joint Pain           |                             |

Subra reports that both the construction and production phases of compressor stations can cause acute and chronic impacts. In the construction phase impacts come from diesel truck emissions and from dust par-

ticles. In the production phase impacts are derived from constant emissions, venting, blowdowns, accidents/malfun-  
 ctions and from the effects of noise, light and stress. She considers respiratory health impacts of par-  
 ticular concern, and vulnerable groups such as pregnant women, children, the elderly and sensitive individu-  
 als to be at greatest risk. Acute and chronic health impacts that Subra has documented are listed below.

### **Acute Health Impacts Experienced by Individuals Living and Working near Compressor Stations**

Tense and nervous	Irritates skin, eyes, nose, throat and
Joint and muscle aches and pains	lungs
Vision Impairment	Respiratory impacts
Personality changes	Sinus problems
Depression, Anxiety	Allergic reactions
Irritability	Headaches
Confusion	Dizziness, Light headedness
Drowsiness	Nausea, Vomiting
Weakness	Skin rashes
Irregular Heartbeat	Fatigue
	Weakness

### Radioactive elements: a long-term health threat

The possibility of exposure to radiation from natural gas pipelines and compressor stations is also a concern, especially for long-term health effects. The New York public health group, Concerned Health Profession-  
 als of New York, describes the problem in their report, Compendium Of Scientific, Medical, And Media  
 Findings Demonstrating Risks And Harms Of Fracking (Unconventional Gas And Oil Extraction) (July 10,  
 2014):

“Unsafe levels of radon and its decay products in natural gas produced from the Marcellus Shale, known  
 to have particularly high radon content, may also contaminate pipelines and compressor stations, as well as  
 pose risks to end-users when allowed to travel into homes.”(P.5). Health impacts from exposure to radioac-  
 tive materials in compressor station emissions have not been documented, but the risk of exposure to these  
 carcinogens are a serious public health concern.

RE: FERC Docket DG 14-380.

Dear Governor Hassan, Governor Charlie Baker and Attorney General Loretta E. Lynch:

I take this moment to jointly bring to your immediate attention the enclosed information titled "NATURAL GAS PIPELINE SAFETY SETBACK" in relation to the proposed Tennessee Gas/Kinder Morgan NED natural gas pipeline through New Hampshire and Massachusetts. I have enclosed two copies of the information for each of you.

1. A clean copy without markup is enclosed to support the integrity of the information as found on the noted internet location. I only added the website link<sup>1</sup> to the top of the first page and transferred the content into a WORD document to present it to you.
2. A marked up copy is enclosed to quickly bring focus to the innate hazards of large diameter high pressure natural gas pipelines. My markups are more directed to Governor Hassan since I live in NH, but the concerns for Massachusetts are very much the same.

The enclosed explains the conditions experienced in multiple pipeline accidents, many applicable to 30 inch diameter pipelines such as that now proposed for the NED route. They are quite telling of the inadequacies inherent to large diameter high pressure natural gas pipelines.

I bring the following three excerpts to your attention. Others are equally, if not more alarming.

#### **Excerpt 1**

SAN BRUNO, CALIFORNIA:

On September 9, 2010 at 6:11PM a 30 inch diameter buried natural gas pipeline operating at a pressure of 400 psia ruptured and burned in a single family estate home residential area in San Bruno, California. San Bruno is a southern suburb of San Francisco, about 2 miles from the San Francisco airport. The homes near the rupture location each had lot sizes in excess of one acre. San Bruno had the benefit of probably the best available municipal fire fighting capacity in North America.

There was a modest delayed ignition explosion followed by a large natural gas fire that persisted for more than two hours. Secondary fires continued for more than eight further hours. The fire scene attended by 67 fire trucks, 4 fixed wing aerial water bombers and 1 fire fighting helicopter.

#### **Excerpt 2**

When a large diameter high pressure natural gas pipeline operating at its rated working pressure develops a crack or hole more than four pipe wall thicknesses in axial length the result is a sudden full cross section pipe rupture. The escaping high pressure gas blows away the soil overburden, forming a crater. Sometime after the pipe rupture there is a large delayed ignition explosion followed by a steady state fire. This fire emits so much thermal radiation that it is impossible to approach or extinguish the fire with conventional firefighting equipment.

#### **Excerpt 3**

It typically takes the pipeline company one to two hours to close valves that isolate the ruptured section of a gas pipe.

I ask, “Where is the responsibility and accountability of pipeline companies to respond to offer safety and protection to us and our environments? “ I urge you to take notice of the enclosed information and consider how New Hampshire and Massachusetts will worsen as a result of the pipeline. Communities and neighborhoods are being broken. People are willing to walk away from their mortgages to escape to protect their families and loved ones from harm. People are no longer accepting of toxins and atomic bomb-like explosions intruding upon them.

I seek your support to push for an immediate moratorium on the pursuit of this pipeline. A rush to acceptance is inherent in the Tennessee Gas/Kinder Morgan plan. Time is of the essence to them to move forward and get this done before the resistance effort can spread the word of the dangers and costs. Tennessee Gas shows no interest in divulging these negative effects. I believe their mission is to head straight to the bank to deposit their profits.

Will New Hampshire and Massachusetts fall for this pipeline scheme? If we do, will you gather a fleet of multiple fixed wing aerial water bombers, fire fighting helicopters, and additional traditional firefighting equipment as we will need them.

The safety record shows that another pipeline mistake will occur and cause another disaster event somewhere. Will that somewhere be New Hampshire or Massachusetts?

Respectfully,

Evelyn Taylor  
213 Old Wilton Road  
New Ipswich, NH 03071

Cc: Kimberly D. Bose, Secretary, Federal Energy Regulatory Commission

J. William Degnan, State Fire Marshall, Division of Fire Safety, NH Department of Safety

*{editor’s note: as indicated, two copies of the report were included: one original and one heavily annotated with hand written notes and underlining; both were of poor OCR quality and incomplete (missing pages). The original article was located at <http://xylenepower.com/Natural%20Gas%20Pipeline%20Safety%20Setback.htm> and inserted below. Please see original file “20150803-0014(30789051).pdf” in the FERC PF14-22 Docket for the hand written annotations}*

XYLENE POWER LTD.

NATURAL GAS PIPELINE SAFETY SETBACK

CALCULATION OF SAFETY SETBACKS FROM LARGE DIAMETER HIGH PRESSURE NATURAL GAS PIPELINES

By C. Rhodes, P. Eng., Ph.D.

## **INTRODUCTION:**

An essential element of any electric power system is reliable load following generation that can be used to match the total electricity generation to the total electricity load. From a global warming perspective the ideal load following generator is a hydroelectric dam containing a large amount of storage. However, since about 1970 the Ontario government and other governments have failed to face both the political and practical issues involved in construction of major new hydroelectric dams and their associated electricity transmission lines.

Since about 2005 the Ontario Power Authority (OPA) has chosen to use natural gas fueled combustion turbines for supplying load following generation. In order to minimize electricity transmission line right-of-way requirements the OPA chose to locate the natural gas fueled power plants close to urban areas. However, the OPA failed to adequately consider the public safety issues related to the large diameter high pressure natural gas pipelines that these combustion turbine power plants require. For public safety these pipelines

should be installed in dedicated energy transmission corridors. The minimum width of these corridors is twice the minimum setback distance between the pipeline axis and the public. At present in Ontario, for natural gas pipes up to 20 inches in diameter, this minimum setback distance is municipally regulated. This web page focuses on determination of reasonable minimum setback distances, which distances are functions of both the pipeline diameter and the pipeline operating pressure.

### **DEDICATED ENERGY TRANSMISSION CORRIDORS:**

Natural gas transmission pipelines in Canada have a relatively good safety record. There have been various explosive rupture failures with accompanying major fires, but the incidence of these failures and the related loss of life has been relatively small because most natural gas transmission lines are located in rural areas and are buried in dedicated energy transmission corridors. The use of dedicated energy transmission corridors located in rural areas reduces the incidence of both accidental impact damage and long term corrosion damage and provides distance separation between the pipeline and the public.

A major error in the Ontario Power Authority's planning has been allowing routing of large diameter high pressure natural gas pipelines under public road allowances where these pipelines are subject to a high ongoing risk of damage by third parties engaged in drainage maintenance, installation or replacement of utility poles, installation and maintenance of other buried services and road construction. Furthermore, burial of large diameter high pressure natural gas pipelines beneath public road allowances eliminates much of the distance separation that is normally achieved by pipeline burial within dedicated energy transmission corridors that run through rural areas.

### **COST CONSTRAINTS:**

To minimize capital cost natural gas is transported in steel pipes.

Major high pressure natural gas pipelines are generally designed for a maximum working pressure that causes an operating pipe hoop stress of about 30% of the pipes Specified Minimum Yield Stress (SMYS). A further margin of safety can be introduced by reducing the working pressure. However, practical material cost considerations usually prevent a major reduction in working pressure.

There are pipeline sections that operate at 67% of SMYS. However, such pipeline sections provide little safety margin against local earth movement (earth quakes) or local weld or corrosion problems. Pipelines routed through urban areas should be restricted to a maximum allowable operating pressure that causes a hoop stress of 33% of SMYS.

### **CORROSION PROTECTION:**

1. To prevent external corrosion steel pipes conveying natural gas pipe are coated with a layer of electrically insulating material known as dielectric. The pipe steel is electrically or galvanically biased slightly negative with respect to the surrounding ground water. This bias is usually maintained by use of sacrificial magnesium electrodes or by use of DC power supplies that are electrically bonded to the steel pipe.
2. The negative bias attracts positive hydrogen ions in ground water toward any pipe steel that is exposed by imperfections in the pipe's external dielectric coating. The corresponding negative hydroxyl ions flow toward the sacrificial positive electrode.
3. The hydroxyl ions cause corrosion of the sacrificial electrode.
4. As long as corrosion is confined to the sacrificial electrode, corrosion of the pipe steel is prevented.
5. Eventually the sacrificial electrode will corrode away or worse, it may be accidentally disconnected or may be stolen for its scrap metal value. Under these circumstances the galvanic corrosion protection mechanism is defeated and corrosion will occur anywhere that pipe steel is exposed to ground water, such as at a coating scratch that might have been inadvertently caused by a backhoe, trenching machine or utility pole auger used for work on a nearby unrelated service.
6. A relatively new threat to buried steel pipelines is electrical ground current that results from nearby

grounded electrical equipment such as wind turbine transformers. Such ground current can aggravate otherwise minor corrosion problems. In extreme cases of soil over bed rock the region of accelerated pipe corrosion can extend as far as 1 km from the wind generator transformer. This issue must be considered when a wind farm and a buried steel pipeline are in close proximity.

### **SAFETY:**

Usually large diameter high pressure natural gas pipes are buried. The functions of the soil cover are to protect the pipe and its dielectric coating from damage due to UV radiation, external impact, thermal stress and frost heaving.

There are real risks related to long term corrosion and to damage from mechanical equipment such as trenching machines, back hoes, utility pole augers and boom trucks. In the winter, when snow is piled high or during flood conditions the operators of such equipment frequently scratch or damage other buried services, in spite of their best efforts to avoid such damage.

The risks of being scratched or damaged by mechanical equipment are greatly reduced if the large diameter high pressure natural gas pipeline is buried in a dedicated energy transmission corridor. Then almost all the risks due to installation and maintenance of utility poles, buried electrical services, drainage culverts, fresh water pipes, storm sewer pipes, sanitary sewer pipes, low pressure natural gas pipes, district heating pipes, district cooling pipes, subways, telephone multipair cables, TV coaxial cables and fiber optic cables are eliminated. Frequently a natural gas transmission corridor is located adjacent to or within a high voltage electricity transmission corridor.

Another means of improving public safety is to ensure that buildings that routinely contain large numbers of people are not constructed within a specified setback distance from the axis of a large diameter high pressure natural gas pipeline. Similarly a setback distance should be maintained between the pipeline axis and outdoor locations where large groups of people routinely assemble.

A responsible organization that focuses on pipeline safety matters is the Pipeline Safety Trust. Its website is [pstrust.org](http://pstrust.org). Its telephone number is 360-543-5686.

### **RISKS:**

The main risks to a large diameter high pressure natural gas pipeline are:

1. Improper engineering, fabrication or commissioning, including but not limited to inadequate:

- a) Provision for hoop stress
- b) Provision for thermal stress
- c) Provision for shear stress related to ground movement
- d) Provision for pipe buoyancy
- e) Mill testing of pipe steel
- f) Weld inspection
- g) Route choice (high and dry preferred to low and wet)
- h) Burial depth
- i) Pipe bedding and support
- j) Corrosion protection
- k) Hydraulic pressure testing
- l) Drainage after hydraulic pressure testing
- m) Nitrogen pressure testing
- n) Documentation of magnesium electrode locations
- o) Documentation of DC corrosion protection
- p) Provision for insertion of pigs for automatic scanning of pipe wall thickness

2. Physical damage from external human activity. eg. The gas line is directly damaged by a trenching machine, backhoe, utility pole auger or boom truck leg.

3. Physical damage due to non-human activity. eg Earthquake, sinkhole, landslide or flood.
4. Minor outside surface damage in combination with loss of galvanic corrosion protection. eg Plastic coating is scratched by a trenching machine, backhoe or utility pole auger and the scratch is not promptly repaired. The magnesium electrode then rapidly corrodes away. Alternatively a magnesium electrode may be accidentally disconnected by a backhoe or utility pole auger or may be stolen for its scrap metal value.
5. Failure of the pipeline owner to periodically check that all the magnesium electrodes are still present and connected.
6. Failure of the pipeline owner to periodically fully check the actual pipe wall thickness using a pig type electronic inspection apparatus that scans the pipe wall from the inside and measures and records the pipe wall thickness as a function of linear and angular position.

Risks #2, #4 and #5 above are greatly magnified if the pipeline is installed in a road allowance instead of in a dedicated energy transmission corridor.

Risk #6 occurs if there are pipe joints, pipe elbows, pipe fittings, valves or compressor stations that are not designed to allow insertion and axial travel of the pig type electronic equipment for measuring the pipe wall thickness as a function of linear and angular position.

Risk #6 is greatly magnified if the pipeline maintenance personnel do not have adequate time to examine the pig data and the resources to follow up risks identified via the pig data. It is essential that the pipeline owner employ sufficient staff whose first priority is pig data acquisition, analysis and followup.

#### **RUPTURE FAILURE MECHANISM:**

If one makes a small hole with a diameter less than twice the pipe wall thickness in a high pressure natural gas pipeline the immediate result is a loud hissing noise as natural gas leaks out. The leaking high pressure natural gas will blow away soil in its path. The natural gas will mix with surrounding air and form a cloud with concentrated natural gas at its center and dilute natural gas at its edges. If the edge of this cloud with a natural gas concentration in the range 5% to 15% encounters a source of ignition such as a spark made by an electrical switch, there will be a delayed ignition explosion followed by a localized ongoing fire. However, the size of this fire will be limited by the size of the original small hole in the natural gas pipe.

However, if a hole in a high pressure natural gas pipe grows to an axial length that exceeds about four times the pipe wall thickness, a very different sequence of events takes place. At the axial ends of the hole the local hoop stress will exceed the material yield stress. The pipe will then immediately rip down its axis to form a rupture that has an open area several times the cross sectional open area of the pipe. This rupture discharges natural gas at the maximum possible flow rate from both open ends of the ruptured pipe.

#### **PIPE RUPTURE SEQUENCE:**

1. The pipe wall is thinned by corrosion, by cutting, by defective welding or by impact;
2. At the thin spot a hoop stress concentration develops that exceeds the yield stress of the pipe material;
3. The pipe wall deforms in a manner that magnifies the hoop stress concentration. This process can be observed in a stretched elastic band with a nick;
4. The pipe suddenly rips down its length causing a complete rupture. This process is similar to the sudden explosive rupture of a fully inflated child's balloon that is hit by a dart.

#### **DAMAGE SEQUENCE:**

1. The escaping high pressure natural gas explosively blows away the soil over burden, forming a large crater in the ground;
2. The pipe rupture is fed with high pressure natural gas from both the upstream and downstream pipes.
3. The escaping gas makes a noise comparable to a large jet aircraft at takeoff;
4. The escaping gas mixes with the surrounding air. In regions where the volumetric natural gas concentra-

tion is in the range 5% to 15% the mixture is highly flammable;

5. When the flammable gas mixture finds a source of ignition such as a flame, hot surface or electric spark there is an explosive delayed ignition pressure pulse. This pressure pulse is deafeningly loud and can break windows in buildings over a kilometre from the pipe rupture location. In extreme cases the energy release during the delayed ignition explosion is comparable to the energy release of a small atom bomb.

6. Then there is a steady state flame that is fed by high pressure gas flowing out of both open ends of the ruptured pipeline. This flame is almost impossible to extinguish and continues burning until it runs out of fuel. It typically takes the pipeline company one to two hours to close valves that isolate the ruptured section of gas pipe. The natural gas flame typically burns for several more hours.

#### **SETBACK UNCERTAINTY:**

Due to uncertainty regarding wind conditions and the position of the nearest point of ignition it is impossible to specify a practical safety setback distance that will ensure no damage or personnel injury from concussion or shrapnel related to the delayed ignition explosion. However, the subsequent fire emits a quantifiable amount of thermal radiation for which a reasonable safety setback distance can be calculated.

#### **THERMAL RADIATION:**

1. The thermal radiation intensity from the steady state natural gas flame is easy to calculate and is the basis of minimum setback calculations;

2. The radiation level may be substantially larger than calculated if black smoke from burning oil, wood or asphalt is conveyed by natural convection into the natural gas flame;

3. For a clean lean natural gas flame I have derived a formula for recommended safe setback distance as a function of pipe diameter and maximum operating pressure;

4. The distance  $R_s$  corresponds to a thermal radiation intensity from the natural gas flame equal to the solar irradiance (the maximum solar energy intensity incident on the Earth).

5. At distance  $R_s / 2$  the thermal radiation intensity from the natural gas flame is four times as large as at distance  $R_s$ .

6. Natural gas pipeline rupture accident site photographs show that due to secondary fires everything inside radius ( $R_s / 2$ ) burns to a crisp. Municipal fire departments are not normally equipped to get closer than radius ( $R_s / 2$ ). At ( $R_s / 2$ ) the exposed surface temperature due to direct radiation from the natural gas inferno is about 200 °C. At that infrared radiation level vehicle windows crack and human flesh is quickly damaged.

#### **PRESSURE PULSE:**

The magnitude of the initial delayed ignition pressure pulse is unpredictable. The size of the delayed ignition explosion depends on the distance between the pipe rupture and the point of ignition. The larger this distance the larger the delayed ignition explosion. Depending on the location of the source of delayed ignition the pressure wave damage radius can exceed the radius of the thermal radiation damage by several fold. In extreme cases the delayed ignition explosion is comparable to the blast wave from a small tactical nuclear weapon. For this reason it is important to limit the sizes of high pressure natural gas lines in urban areas. In the Middletown, Connecticut accident the delayed ignition blast wave shattered windows over 1.6 km away from the location of the natural gas release. At Englehart, Ontario the delayed ignition explosion pressure pulse tossed a length of 914 mm OD steel pipe with 9.1 mm wall thickness a distance of 150 m from the rupture point.

#### **FORMULA FOR SAFE DISTANCE $R_s$ :**

In this document a formula is developed for the safe setback distance  $R_s$  from a natural gas pipe line required for personnel to avoid radiation related skin damage from the steady state fire that follows a high pressure natural gas pipeline rupture. It must be emphasized that the calculated safety setback  $R_s$  applies only to thermal radiation from lean combustion of clean natural gas.

A delayed ignition explosion can cause blast damage beyond the calculated radiation safety radius. Toxic gases such as H<sub>2</sub>S can cause loss of life beyond the calculated radiation safety radius. If the natural gas flame is over rich or if the natural gas burns in combination with other substances such as oil, coal, asphalt, wood, plastic resins, etc. soot forms. That soot can increase the thermal radiation fraction Fr as much as four fold and hence can double the required radiation safety radius Rs. Secondary fires can lead to a fire storm that causes damage far beyond safety radius Rs.

The formula developed herein assumes that only natural gas is burning and that there is sufficient combustion air to keep the burning air-gas mixture lean. The results of the formula are compared to the actual fire damage radius that occurred at Appomattox, Virginia where a 30 inch diameter buried high pressure natural gas pipeline ruptured and burned in a farm field on September 14, 2008. There have been other major natural gas pipeline ruptures, delayed ignition explosions and fires in urban areas such as at Middletown (suburb of Hartford), Connecticut on February 7, 2010 and at San Bruno (a suburb of San Francisco), California on September 9, 2010.

### **FORMULA DEVELOPMENT:**

Consider a long straight natural gas pipeline that is subject to a sudden rupture that opens the full cross section of the pipe. To calculate the radiant heating consequences if there is a fire it is necessary to first find the natural gas mass flow rate out of the rupture. In reality there are two flows, because the pipes on both sides of the rupture discharge natural gas into the rupture. We will calculate one of these gas flows and then double the result to obtain the total mass flow rate out of the rupture.

Let Pa = the pressure in the pipeline distant from the rupture

Let Pb = the pressure at the point of rupture after the rupture. Normally Pb is atmospheric pressure.

Let Dp = pipe inside diameter

Let Pi = 3.14159

Let En = nozzle efficiency of natural gas pressure energy to kinetic energy conversion in a long straight pipe.

Generally:

$$0.90 < E_n < 0.99$$

The uniform pipe cross-sectional area Ac is given by:

$$A_c = P_i (D_p / 2)^2$$

Let X indicate linear position along the pipe of an element of volume Ac dX.

Let Rm = natural gas mass density as a function of linear position X.

Let Rma = natural gas density at pressure Pa

Let Rmb = gas density at pressure Pb

The mass of gas dM contained in the element of volume Ac dX is:

$$dM = R_m A_c dX$$

Let T = time

Then the gas linear velocity V is given by:

$$V = (dX / dT)$$

The gas linear motion kinetic energy in element of volume Ac dX is:

$$(dM / 2) (dX / dT)^2$$

$$= (R_m A_c dX / 2) (dX / dT)^2$$

Hence the kinetic energy density is:

$$(R_m / 2) (dX / dT)^2$$

Let  $P$  = pressure at  $X$

Then the gas pressure potential energy contained in the element of volume  $A_c dX$  is given by:

$$P A_c dX$$

The pressure  $P$  is the gas potential energy density at  $X$ .

Within the pipe but near the point of rupture the gas pressure potential energy density decreases and the gas linear motion kinetic energy increases causing an increase in linear gas velocity  $V$ .

Let  $E_n$  be the nozzle efficiency with which gas pressure potential energy converts into gas kinetic energy of linear motion.  $E_n$  is complex to calculate but generally lies in the range:

$$0.90 < E_n < 0.99$$

Note that a small fraction  $(1 - E_n)$  of the pressure potential energy is converted into heat.

Conservation of energy along the pipe requires that:

$$- dP E_n = d[(R_m / 2) (dX / dT)^2]$$

or

$$- 2 E_n dP = d[R_m (dX / dT)^2]$$

Let subscript  $a$  indicate a parameter value at a point in the pipe far from the rupture. Let subscript  $b$  indicate a parameter value at the rupture location. Hence the linear gas velocity at the point of rupture is  $V_b$ . The mass flow rate from one pipe at the point of rupture is:

$$R_{mb} A_c V_b$$

Integrating from  $P_a$  to  $P_b$  gives:

$$- 2 E_n (P_b - P_a) = [R_m (dX / dT)^2]_b - [R_m (dX / dT)^2]_a$$

Assume that as a result of the pipe rupture the natural gas pipeline supervisory control system closes isolation valves distantly upstream and downstream from the pipe rupture. Then the condition at the location of each of these valves is no flow, or expressed mathematically in terms of the gas stream:

$$[dX / dT]_a = 0$$

Hence:

$$2 E_n (P_a - P_b) = [R_m (dX / dT)^2]_b$$

or

$$[dX / dT]_b = [2 E_n (P_a - P_b) / R_m]^{0.5}$$

$F_m$  = exiting gas mass flow rate from one pipe

$$= R_{mb} A_c [dX / dT]_b$$

$$= R_{mb} A_c [2 E_n (P_a - P_b) / R_m]^{0.5}$$

$$= A_c [2 E_n (P_a - P_b) R_m]^{0.5}$$

Let  $E_c$  be the combustion heat release per unit mass of natural gas. Then the total combustion heat release  $H$  per unit time is given by:

$$H = 2 F_m E_c$$

where the 2 reflects the fact that the rupture is fed by two pipes.

Let  $F_r$  be the fraction of the combustion heat that is emitted via radiation.

Let  $R_z$  = radius from the center of the flame to a surface subject to radiation damage.

Assume that the radiation is evenly distributed over a sphere with radius  $R_z$  and surface area  $4 \pi R_z^2$ .

Then at radius  $R_z$  the radiation intensity / unit area is:

$$R_z = (H F_r) / (4 \pi R_z^2)$$

Assume that to avoid skin damage the radiation intensity should be less than the most intense possible solar

radiation incident on the Earth's surface ( 1365 W / m<sup>2</sup>). This parameter is known as the Solar Irradiance. Hence, in terms of radiant energy, the safe distance Rs from the center of the flame is defined by:

$$(H Fr) / (4 Pi Rs^2) = 1365 \text{ watts} / \text{m}^2$$

or

$$Rs = [(H Fr) / (4 Pi X 1365 \text{ watts} / \text{m}^2)]^{0.5}$$

$$= [(2 Fm Ec Fr) / (4 Pi X 1365 \text{ watts} / \text{m}^2)]^{0.5}$$

where natural gas mass flow Fm is given by:

$$Fm = Ac [2 En (Pa - Pb) Rmb]^{0.5}$$

$$= Pi (Dp / 2)^2 [2 En (Pa - Pb) Rmb]^{0.5}$$

Combining the formulas for Rs and Fm gives:

$$Rs = [(2 Fm Ec Fr) / (4 Pi X 1365 \text{ watts} / \text{m}^2)]^{0.5}$$

$$= [(2 Pi (Dp / 2)^2 [2 En (Pa - Pb) Rmb]^{0.5} Ec Fr) / (4 Pi X 1365 \text{ watts} / \text{m}^2)]^{0.5}$$

$$= Dp [En (Pa - Pb)]^{0.25} [( [2 Rmb]^{0.5} Ec Fr) / (8 X 1365 \text{ watts} / \text{m}^2)]^{0.5}$$

The value of Fr can be found from a paper by J. P. Gore et al titled Structure and Radiation Properties of Large-scale Natural Gas/Air Diffusion Flames, published in Fire and Materials, Vol. 10, 161-169 (1986). These authors found that the radiation emission from a 207 MW natural gas flame measured at ground level about 11.9 m from the flame center was 6.37 kW / m<sup>2</sup>.

The surface area of that sphere was:

$$4 Pi (11.9 \text{ m})^2 = 1778.62 \text{ m}^2$$

Hence the emitted radiation was:

$$6.37 \text{ kW} / \text{m}^2 X 1778.62 \text{ m}^2 = 11330 \text{ kW}$$

$$= 11.330 \text{ MW}$$

Hence:

$$Fr = 11.330 \text{ MW} / 207 \text{ MW}$$

$$= .0547$$

This Fr value is in good agreement with other Fr data for lean burn flame retention natural gas burners provided to this author by the Canadian Gas Research Institute.

#### NUMERICAL SIMPLIFICATION:

$$Pi = 3.1415928$$

$$Rmb = 16 \text{ gm} / 22.4 \text{ lit}$$

$$= 16 X 10^{-3} \text{ kg} / 22.4 X 10^{-3} \text{ m}^3$$

$$= .714 \text{ kg} / \text{m}^3 = \text{density of natural gas at standard temperature-pressure}$$

$$Ec = (10.4 \text{ kWh} / \text{m}^3) X (1 \text{ m}^3 / .714 \text{ kg}) X 3600 \text{ s} / \text{h}$$

$$= 52437 \text{ kJ} / \text{kg}$$

Hence:

$$Rs = Dp [En (Pa - Pb)]^{0.25} [( [2 Rmb]^{0.5} Ec Fr) / (8 X 1365 \text{ watts} / \text{m}^2)]^{0.5}$$

$$= Dp [En (Pa - Pb)]^{0.25} [( [2 X .714 \text{ kg} / \text{m}^3]^{0.5} X 52437 \text{ kJ} / \text{kg} X .0547) / (8 X 1365 \text{ watts} / \text{m}^2)]^{0.5}$$

$$= Dp [En (Pa - Pb)]^{0.25} [[1.428 \text{ kg} / \text{m}^3]^{0.5} X .26266 \text{ kJ m}^2 / \text{kg-watts} X 1000 \text{ J} / \text{kJ}]^{0.5}$$

$$= Dp [En (Pa - Pb)]^{0.25} [1.195 \text{ kg}^{0.5} \text{ m}^{-1.5} X 262.66 \text{ J m}^2 / \text{kg-watts}]^{0.5}$$

$$= Dp [En (Pa - Pb)]^{0.25} X 17.71 \text{ kg}^{0.25} \text{ m}^{-.75} \text{ (J} / \text{kg-watts)}^{0.5}$$

$$= 17.71 D_p [E_n (P_a - P_b)]^{0.25} \text{ kg}^{0.25} \text{ m}^{-.75} \text{ m (watt s / kg-watts)}^{0.5}$$

$$= 17.71 D_p [E_n (P_a - P_b)]^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{0.5}$$

$$= 17.71 D_p [E_n (P_a - P_b) / \text{Pascal}]^{0.25}$$

If pipe diameter  $D_p$  is in meters and if the operating pressure  $(P_a - P_b)$  is in Pascals this formula gives the safe setback distance  $R_s$  in meters.

Units Check:

$$(\text{Pascal})^{0.25} = (\text{newtons} / \text{m}^2)^{0.25} = (\text{kg m s}^{-2} \text{ m}^{-2})^{0.25}$$

$$= \text{kg}^{0.25} \text{ m}^{-.25} \text{ s}^{-0.5}$$

For practical calculations use the assumption that:

$$E_n^{0.25} = 1.0.$$

This assumption may lead to as much as a 2.7 % error in the calculated value of  $R_s$  but this assumption simplifies the formula for  $R_s$  sufficiently to make it suitable for practical regulatory use.

### **INTERPRETATION OF RESULTS:**

At:

$$R_z = R_s$$

the radiation level from the natural gas inferno is equal to the solar irradiance, so human skin damage is confined to sunburn like effects.

At:

$$R_z = (R_s / 2)$$

the radiation level from the natural gas inferno is four times the solar irradiance. This is the maximum radiation level that normally equipped municipal fire fighters can sustain. Hence in the area defined by:

$$R_z < (R_s / 2)$$

secondary fires usually burn unimpeded unless suppressed by water bombers or other comparable specialized equipment.

At:

$$R_z = (R_s / 4)$$

the radiation level from the natural gas inferno is sixteen times the solar irradiance. In the region:

$$R_z < (R_s / 4)$$

there is rapid direct ignition of almost all combustable surfaces and there is total property loss regardless of the available fire fighting capability.

### **SECONDARY IGNITION:**

Almost immediately after the natural gas fire starts exposed combustable surfaces in the region:

$$R_z < (R_s / 4)$$

ignite. However, from a property damage perspective the bigger problem is that fires which are directly ignited within the region:

$$R_z < (R_s / 4)$$

quickly spread into the region:

$$(R_s / 4) < R_z < (R_s / 2)$$

because the thermal radiation levels in the region:

$$R_z < (R_s / 2)$$

are too high for municipal fire fighters to function in that region.

History has demonstrated that the practical way of minimizing property damage in the region:

$$(R_s / 4) < R_z < (R_s / 2)$$

is to use water bombers to minimize spread of fires via secondary ignition.

Assuming normal municipal fire fighter response not supported by water bombers, the area that will likely be destroyed by secondary fires is the ring defined by:

$$(R_s / 4) < R_z < (R_s / 2).$$

The area of this ring is about three times the area defined by:

$$R_z < (R_s / 4)$$

that burns via direct ignition.

### **DAMAGE MITIGATION:**

Both theory and field experience indicate that the most favorable condition for mitigating of damage by a burning natural gas pipeline is a deep snow cover. The snow reflects the infrared radiation up into the sky and if the snow melts the resulting water prevents most surfaces getting hot enough to ignite.

### **POTENTIAL IMPACT RADIUS (PIR):**

In the Province of Ontario the Technical Standards & Safety Authority (TSSA) has defined what TSSA terms Potential Impact Radius or PIR, where:

$$1.0 \text{ PIR} \sim (R_s / 4).$$

A technical representative of TSSA readily admitted that 1.0 PIR is not an adequate safety radius. 1.0 PIR is a compromise made by TSSA between urban pipeline corridor real estate cost and public safety. Buildings such as secondary schools, etc. that routinely contain concentrations of healthy independently mobile people should be set back at least 2.0 PIR from the pipeline axis. Buildings such as elementary schools, nursing homes and hospitals, that routinely contain people who are not independently mobile, should be set back at least 4.0 PIR from the pipeline axis. However, in Ontario the actual amount of setback from the pipeline axis is determined by the governing municipal authority, not TSSA.

The practical effect of using the TSSA PIR as a regulatory setback is to reduce the cost of natural gas pipeline rupture failure related fire damage by about a factor of three under circumstances of no wind and good municipal fire fighting capacity. Assuming these circumstances, a regulatory setback of at least 2.0 PIR is required to reduce the direct fire damage to close to zero. If the region in question has frequent wind or minimal fire fighting capacity, then a setback of 4.0 PIR should be used.

### **EXAMPLES:**

#### **ENGLEHART, ONTARIO:**

On September 12, 2009 a 914 mm OD, 9.1 mm wall natural gas transmission pipe operating at 6869 kPa ruptured about 12 km NW of Englehart, Ontario. An area of 25 hectares (250,000 m<sup>2</sup>) was totally destroyed, indicating an average radius R of total destruction of:

$$R = (250,000 \text{ m}^2 / \text{Pi})^{0.5}$$

$$= 282 \text{ m}$$

The fire was contained by use of water bombers. In spite of use of water bombers a rural home 320 m from the rupture point was damaged.

Assume:

$$E_n^{0.25} = 1.0$$

$$D_p = .914 \text{ m}$$

$$P_b = 14.7 \text{ psia} = 1 \text{ bar} = 101 \text{ kPa} = 1.01 \times 10^5 \text{ newtons} / \text{m}^2$$

$$P_a = 6.869 \times 10^6 \text{ newtons / m}^2$$

Hence:

$$\begin{aligned} R_s &= 17.71 \times .914 \text{ m} \times (6.869 \times 10^6 \text{ newtons / m}^2)^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5} \\ &= 17.71 \times .914 \text{ m} \times 686.9^{0.25} \times 10 \text{ (kg m s}^{-2} \text{ m}^{-2})^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5} \\ &= 828.5 \text{ m} \end{aligned}$$

The corresponding theoretical value of  $(R_s / 2)$  is given by:

$$R_s / 2 = 414 \text{ m}$$

and

$$(R_s / 4) = 207 \text{ m}$$

Clearly the actual destruction was in good agreement with the theoretical formula.

### **YORK ENERGY CENTRE PIPELINE, KING TOWNSHIP, ONTARIO:**

The York Energy Centre is a natural gas fueled air cooled combustion turbine based 400 MW electricity generation station located in York Region, north of Toronto. This facility is served by a dedicated 16 inch diameter 600 psi natural gas pipeline running through a mostly rural area.

Assume:

$$E_n^{0.25} = 1.0$$

$$D_p = 16 \text{ inches} = .406 \text{ m}$$

$$P_b = 14.7 \text{ psia} = 1 \text{ bar} = 101 \text{ kPa} = 1.01 \times 10^5 \text{ newtons / m}^2$$

$$P_a = 600 \text{ psia} = 40.81 \text{ bar} = 4122.4 \text{ kPa} = 41.22 \times 10^5 \text{ newtons / m}^2$$

Hence:

$$\begin{aligned} R_s &= 17.71 \times .406 \text{ m} \times (40.21 \times 10^5 \text{ newtons / m}^2)^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5} \\ &= 17.71 \times .406 \text{ m} \times 402.1^{0.25} \times 10 \text{ (kg m s}^{-2} \text{ m}^{-2})^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5} \\ &= 321.97 \text{ m} \end{aligned}$$

Application of this formula to the York Energy Centre pipeline gives a radiation safety distance of about:

$$R_s = 322 \text{ metres.}$$

At  $R_z = (R_s / 2) = 161$  metres the radiation level will be four times as high as at  $R_s = 322$  m. In practice:

$$R_z = (R_s / 2)$$

is the closest that municipal fire fighters are able to approach the natural gas inferno. Hence in the area where:

$$R_z < (R_s / 2)$$

secondary fires involving both buildings and farm crops will burn unimpeded.

In the case of the York Energy Centre pipeline a minimum 161 metre setback should be maintained from the pipeline center line to all human occupied structures and to all places of routine outdoor human assembly. This is an ongoing setback requirement that should be actively enforced by municipal authorities for the life of the pipeline. All parties should clearly understand that the radiation emitted by a pipeline rupture/fire is so intense that the only practical strategy for a municipal fire department is to let the fire burn itself out. It is also unrealistic to expect persons within radius:

$$R_z < (R_s / 2)$$

of a pipeline rupture/fire to be rescued by fire department personnel who lack equipment for working in zones of high thermal radiation.

If possible the municipality should attempt to enforce a 322 m setback instead of a 161 m setback. There could still easily be litigation related to injury and property damage in the ring:

161 m < Rz < 322 m

resulting from the fire simply overwhelming the capabilities of rural municipal fire department(s).

### **APPOMATTOX, VIRGINIA:**

On September 14, 2008 a 30 inch diameter buried natural gas pipeline that normally operates at a pressure of 800 psi ruptured and burned in a farmer's field near the intersection of Highway 26 and State Route 677 just north of Appomattox, Virginia. There was a modest delayed ignition explosion. Overhead news photographs showed the area where the crop burned. The burned area was measured using distance calibrated overhead photographs from Google maps. It was found that with reference to the pipe rupture crater the burned crop area extended 311 m to the south-west and 275 m to the north-east.

Assume:

$$E_n^{0.25} = 1.0$$

Application of the formula for the radiation safety distance Rs gives:

$$D_p = 30 \text{ inch} \times .0254 \text{ m / inch} = 0.762 \text{ m}$$

$$P_a = 800 \text{ psi} \times 101 \times 10^3 \text{ Pa} / 14.7 \text{ psi} = 549.66 \times 10^4 \text{ Pa}$$

$$P_b = 101 \times 10^3 \text{ Pa} = 10.1 \times 10^4 \text{ Pa}$$

$$R_s = 17.71 D_p (P_a - P_b)^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5}$$

$$= 17.71 \times 0.763 \text{ m} \times (539.56 \times 10^4 \text{ Pa})^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5}$$

$$= 651.25 \text{ m}$$

Thus the radius to which the crops spontaneously burned approximately conformed with:

$$R_z < (R_s / 2).$$

### **SAN BRUNO, CALIFORNIA:**

On September 9, 2010 at 6:11 PM a 30 inch diameter buried natural gas pipeline operating at a pressure of 400 psia ruptured and burned in a single family estate home residential area in San Bruno, California. San Bruno is a southern suburb of San Francisco, about 2 miles from the San Francisco airport. The homes near the rupture location each had lot sizes in excess of one acre. San Bruno had the benefit of probably the best available municipal fire fighting capacity in North America.

There was a modest delayed ignition explosion followed by a large natural gas fire that persisted for more than two hours. Secondary fires continued for more than eight further hours. The fire scene was attended by 67 fire trucks, 4 fixed wing aerial water bombers and 1 fire fighting helicopter.

Aerial photographs showing the area that burned were compared to distance calibrated Google maps. In spite of the large amount of immediately available fire fighting equipment almost all the homes (38) within a 150 m radius damage circle were completely destroyed. A further 17 homes were severely damaged and a further 53 homes sustained lesser damage. The center of the damage circle was displaced from the pipe rupture location by about 100 m. The cause of this displacement was a combination of local factors including natural gas pipeline orientation, natural gas exit velocity, wind, steep local terrain, local tree concentrations and asymmetrical application of fire fighting resources.

Assume:

$$E_n^{0.25} = 1.0$$

Application of the formula for the radiation safety distance Rs gives:

$$D_p = 30 \text{ inch} \times .0254 \text{ m / inch} = 0.762 \text{ m}$$

$$P_a = 400 \text{ psia} \times 101 \times 10^3 \text{ Pa} / 14.7 \text{ psia} = 274.8 \times 10^4 \text{ Pa}$$

$$P_b = 101 \times 10^3 \text{ Pa} = 10.1 \times 10^4 \text{ Pa}$$

$$R_s = 17.71 D_p (P_a - P_b)^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5}$$

$$= 17.71 \times 0.762 \text{ m} \times (264.7 \times 10^4 \text{ Pa})^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5}$$

$$= 544.3 \text{ m}$$

Thus the calculated area of damage to or loss of homes was the area where:

$$R_z < (R_s / 2),$$

which is a circle of radius 272 m.

It is clear from subsequent photographs and incident reports that absent the massive fire fighting resources that were immediately available close to the San Francisco Airport, including four water bombers, the actual area of total destruction would have closely conformed to the calculated destruction radius:

$$(R_s / 2) = 272 \text{ m.}$$

The practical experience at San Bruno indicates that there is a limit to the capabilities of urban municipal fire departments. Even when there is an army of immediately available emergency personnel and almost unlimited municipal fire fighting equipment, the municipal water mains and their pumping systems limit the municipal fire fighting capacity. Water bombers designed for fighting large forest fires are of considerable help because they can combat secondary fires in the ring:

$$(R_s / 4) < R_z < (R_s / 2)$$

which is not accessible to municipal fire fighters due to high infrared radiation levels.

However, the standby costs of maintaining a fleet of large water bombers that are available and ready to fly at a moments notice are prohibitive for most jurisdictions. In this respect the residents of San Bruno were particularly fortunate that there were four suitable water bombers immediately available and based only two miles away. Otherwise the fire damage losses would have likely at least tripled.

An important conclusion from the San Bruno NTSB accident investigation report was that the pipe section that ruptured was defective at the time of original installation and had never been subject to an as-built hydraulic pressure test to the Specified Minimum Yield Stress (SMYS) for the pipeline material.

### **JERSEY CITY, NEW JERSEY:**

In March 2012 this author was made aware of a plan to build a 42 inch diameter 1200 psi natural gas pipeline through a densely populated area of Jersey City, New Jersey. This author's immediate response was that this plan is stupid because that pipeline would be a long term magnet for every anti-USA terrorist in the world. This author strongly recommended that this pipeline be rerouted outside the urban area, regardless of the extra cost.

If construction of this pipeline proceeds as originally contemplated, the consequences of a rupture failure, perhaps intentionally caused, would be comparable to the air burst of a small tactical nuclear warhead. The safety radius  $R_s$  and the radius of probable total destruction ( $R_s / 2$ ) can be calculated as follows:

Assume:

$$E_n^{0.25} = 1.0$$

$$D_p = 42 \text{ inch} \times .0254 \text{ m / inch} = 1.0668 \text{ m}$$

$$P_a = 1200 \text{ psia} \times 101 \times 10^3 \text{ Pa} / 14.7 \text{ psia} = 824.5 \times 10^4 \text{ Pa}$$

$$P_b = 101 \times 10^3 \text{ Pa} = 10.1 \times 10^4 \text{ Pa}$$

$$R_s = 17.71 D_p (P_a - P_b)^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5}$$

$$= 17.71 \times 1.0668 \text{ m} \times (814.4 \times 10^4 \text{ Pa})^{0.25} \text{ kg}^{-0.25} \text{ m}^{.25} \text{ s}^{.5}$$

$$= 1009.2 \text{ m}$$

Thus the calculated area of spontaneous combustion is an area where  $R_z < (R_s / 2)$ , which is a circle of ra-

diameter 504.6 m. The perimeter length of that circle, which would be the fire fighting front length, is:

$$2 \pi (504.6 \text{ m}) = 3170 \text{ m.}$$

The only way to stop a fire of that size is to make back fires to create a fire break about 3 km long and a block wide through the center of the city. The direct and consequential damages from the natural gas fire and the back fire would be unprecedented in United States history. The fire storm and consequent loss of life and property would be comparable to the WWII fire storms in Dresden, Hamburg, Tokyo and Hiroshima.

It is the hope of this author that common sense will prevail and that senior members of the United States government will do all necessary to force rerouting of this large diameter high pressure natural gas pipeline to a longer but much safer rural route.

One practical way to force rerouting of this pipeline is to immediately enact strong legislation to require the pipeline owners to continuously carry credible third party liability insurance and reinsurance sufficient to replace everything and everyone within 500 m of any potential pipe rupture location.

It must be emphasized that no amount of hydraulic pressure testing or pig testing will protect the public from intentional sabotage of such a pipeline passing through an urban area. The stress in the pipe walls is sufficient that even a relatively small suitably shaped fast explosive charge will cause a rupture failure.

### **CONCLUSIONS:**

When a large diameter high pressure natural gas pipeline operating at its rated working pressure develops a crack or hole more than four pipe wall thicknesses in axial length the result is a sudden full cross section pipe rupture. The escaping high pressure gas blows away the soil overburden, forming a crater. Some time after the pipe rupture there is a large delayed ignition explosion followed by a steady state fire. This fire emits so much thermal radiation that it is impossible to approach or extinguish the fire with conventional fire fighting equipment.

One can define a radiation safety distance  $R_s$  from the fire at which distance the thermal radiation level is similar to the thermal radiation level at noon in the middle of the Sahara desert on a clear cloudless day. The formula for a lean burn natural gas flame is:

$$R_s = 17.71 D_p [E_n (P_a - P_b) / \text{Pascal}]^{0.25}$$

where:

$R_s$  = radiation safety distance in metres

$D_p$  = pipeline diameter in metres

$E_n$  = nozzle efficiency ( $0.90 < E_n < 0.99$ )

$P_a$  = pipeline absolute working pressure in Pascals

$P_b$  = atmospheric pressure in Pascals. Normally atmospheric pressure is about 101,000 Pascals.

In highly precise scientific measurements:

$$0.90 < E_n < 0.99.$$

However, even if the nozzle efficiency  $E_n$  is as low as:

$$E_n = 0.90$$

in the formula for  $R_s$ :

$$E_n^{0.25} = .974$$

Hence for practical calculation purposes it is convenient to simply use the approximation that:

$$E_n^{0.25} = 1.0$$

At radii  $R_z$  from the rupture in the range:

$$R_z < (R_s / 4)$$

almost all exposed combustible materials rapidly spontaneously ignite and burn. In this radius range there is

virtually nothing that can be done to prevent 100% loss of lives and property.

At radii  $R_z$  from the rupture in the range:

$$(R_s / 4) < R_z < (R_s / 2)$$

secondary ignition causes exposed combustible materials to burn. In this radius range the thermal radiation level is too high for the fire to be fought by municipal fire departments. However, in this radius range damage can be mitigated through the use of water bombers if they are immediately available.

At radii  $R_z$  from the rupture in the range:

$$R_z > (R_s / 2)$$

absent a high wind, a well equipped and well staffed municipal fire department is usually able to prevent significant secondary ignition fire damage.

It should be emphasized that the above calculations apply to thermal radiation from steady state combustion of natural gas in a clean lean flame. There is additional danger if the natural gas flame is rich or if it triggers combustion of materials that form soot. If large amounts of soot mix with the natural gas combustion air the soot could increase the radiant heat fraction  $F_r$  four fold which would double the safety radius  $R_s$ .

The damage radius from the initial delayed ignition explosion could easily be larger than  $R_s$ . Based on eye-witness reports from Appomattox the sequence of events at that pipeline rupture/fire was a large delayed ignition explosion followed by steady state combustion. The same sequence of events has occurred elsewhere.

The above calculation shows that even if someone is fortunate enough to survive the initial delayed ignition explosion, the temperature within the radiation safety radius  $R_s$  of the flame will quickly rise past the point of human tolerance.

For large diameter high pressure natural gas pipelines passing through urban areas this author strongly recommends an initial as-built hydraulic pressure test to 100% of pipe SMYS (Specified Minimum Yield Stress) and a maximum operating pressure producing a pipe material stress of no more than 30% of SMYS. Furthermore, as long as the pipe remains in service in an urban area the pipe should be retested at least every five years with a non-combustible fluid to the larger of 50% of pipe SMYS or 150% of the maximum allowable operating pressure. These safety margins have been proven through many years of pressure vessel design, construction and use and are the basis of almost all modern pressure vessel safety codes.

In theory if the pipe could be assembled in the rigorously controlled conditions of a certified pressure vessel fabrication facility with complete material control and ideal welding, initial as-built hydraulic pressure testing to 50% of SMYS might be adequate. However, under the practical conditions that natural gas pipelines are assembled and welded in the field that degree of material and fabrication control is impossible. Hence the only solution is an initial as-built hydraulic pressure test to 100% of pipe SMYS. There is no mill test, x-ray test, pig test, spectrograph test, sampling test or inspection procedure that can replace a hydraulic pressure test to 100% of SMYS.

Given the limited resources of rural fire departments it is reasonable to assume that in the event of a large diameter high pressure natural gas pipeline rupture/fire they will simply ensure that the pipe is valved off on both sides of the rupture and then let the fire burn itself out. It is also reasonable to conclude that crops, buildings and other combustibles within a distance  $R_z < (R_s / 2)$  of the pipeline rupture/fire will be totally destroyed.

The principal objective of emergency services must be to immediately evacuate humans from inside the radiation safety radius  $R_s$ . It can safely be assumed that for:

$$(R_s / 2) < R_z < R_s$$

damage to property will be significant and for:

$$R_z < (R_s / 2)$$

almost everything will be destroyed. Most municipal fire departments are not equipped to function within the high thermal radiation levels that will occur at:

$R_z < (R_s / 2)$ .

Life and property insurance coverages should reflect this reality.

### **REGULATORY ISSUES:**

To minimize potential damage large diameter high pressure natural gas pipelines must be installed near the center lines of available energy transmission corridors. This issue needs to be embedded in regulation.

With reference to Ontario Technical Standards & Safety Authority (TSSA) Fuels Safety Program, OIL AND GAS PIPELINE SYSTEMS CODE ADOPTION DOCUMENT AMENDMENT FS-196-12 dated November 1, 2012, the formula for Potential Impact Radius (PIR) should be replaced by the formula for  $(R_s / 2)$  contained herein. The issue is that the formula for PIR contained in AMENDMENT FS-196-12 yields a Potential Impact Radius that is only about  $(R_s / 4)$  whereas recent pipeline rupture fires have confirmed the validity of  $(R_s / 2)$  as being the actual impact radius.

Alternatively TSSA should modify the language in its regulations so that the general public clearly understands that the PIR, as defined by TSSA, is only about one half of the radius of 100% property loss.

The Ontario TSSA should be realistic with respect to the limited capability of municipal fire fighters working within high thermal radiation zones. In the event of a major natural gas pipeline rupture/fire the available fire fighters will likely attempt to save human lives but in so doing will likely sustain both personal skin damage and equipment damage. They will then be unable to fight or extinguish fires. Furthermore, the experience in San Bruno, California and elsewhere has been that the municipal fire fighting capacity is further constrained by the available hydrant water flow. The fire in San Bruno was in large measure contained through the use of water bombers that were stationed nearby for controlling forest fires. However, in much of Ontario there is no immediate water bomber availability nor viable chain of command for prompt water bomber dispatch.

In this matter I speak from personal experience. I grew up in British Columbia where during the 1960s major forest fires, and a major fire on the Vancouver waterfront, were contained using a fleet of WWII surplus giant Martin Mars flying boats. These flying boats were converted from military transports into water bombers. I believe that two of them are still in service today. When trying to control a big fire, there is nothing comparable to dropping 6000 imperial gallons of water/foam on the fire in a few seconds. The water/foam will not extinguish the main natural gas inferno but it will cool the surrounding exposed surfaces and thus minimize secondary fires in the ring:

$(R_s / 4) < R_z < (R_s / 2)$ .

This ring, which is not accessible to municipal fire fighters due to high thermal radiation from the natural gas inferno, may contain hundreds of homes.

It is a huge mistake to create a regulatory framework which has the practical effect of not allowing parties that build, own, operate and maintain large water bombers to financially prosper. There is no doubt that a fleet of large water bombers has a high ongoing cost that must be borne by the taxpayers and/or insurance industry and/or major forest companies. However, when there is a fire that overwhelms the municipal fire department/forest service, then every dollar invested in the water bomber fleet provides a handsome return. In hindsight, one of the benefits of leasing exclusive timber rights to large forest companies was that those companies, in their own self interest, paid the costs of ownership, operation and maintenance of the fleet of large water bombers.

There is a major problem related to both provincial and municipal land use planning. In Ontario both provincial and municipal planners have failed to provide sufficiently wide dedicated energy transmission corridors into major urban centers such as Toronto. The 400 series highways are located in corridors that are typically about 400 m wide, including the width allowance for the adjacent electricity transmission lines. These corridors are simply not wide enough to provide an adequate safety setback distance from a 36 inch diameter high pressure natural gas pipeline, even if the pipeline is on the corridor center line. However, in Toronto there are no other even remotely suitable corridors, so private property owners on both sides of

these highways are being exposed to risk related to major pipeline rupture failures.

This problem of failed governmental planning is not unique to Toronto or Ontario. There are even worse pipeline setback problems in the New Jersey - New York City area.

There is also a new class of pipeline risks related to grounded electrical equipment located near pipeline corridors. In an effort to efficiently utilize land, in some places 3.0 MVA wind turbines are being installed in or adjacent to existing dedicated energy transmission corridors. However, wind turbine transformers can cause ground currents that lead to rapid corrosion of nearby buried steel pipelines. It is crucial that the electrical codes relating to wind turbines and other distributed power equipment address this ground current issue. Every wind turbine within a wind farm must be separately isolated from its transmission/distribution line via an ungrounded low capacitance delta type transformer connection. Every wind turbine must be fitted with ground fault detection and alarm signalling. Substation transformers need to be selected for low harmonic generation.

There needs to be new legislation that makes parties that cause ground currents financially responsible for accelerated corrosion damage to nearby buried steel pipelines. In extreme cases, especially in the proximity of large unbalanced electrical power inverters, or with subsurface bed rock, the radius of such ground current induced pipeline damage can extend more than 3 km from the electrical equipment grounding point.

This web page last updated December 8, 2014.

Docket No. PF14-22-000

COMMENT FOR SCOPING MEETINGS

Good day,

I am Brice O. Hereford, a citizen of the United States and a longtime resident of the Commonwealth of Massachusetts (38 years). I claim standing to oppose the issuance of a Federal Energy Regulatory Commission (FERC) permit for the Kinder Morganfennessee Gas Pipeline Company, L.L.C.,and its Northeast Energy Direct Project

Why are the utilities capping solar net metering in Massachusetts while at the same time promoting this pipeline as the solution to the rising energy needs of the area?

Since the volume capacity of the pipeline will enable a large surplus to be collected at the terminus; what is the intended use of this surplus by the utilities? Would the plan be to export the surplus to Europe?

Wouldn't a better use for this energy investment be to increase the investment in the solar and wind generating capacity of the northeast and helping the utilities to upgrade the transmission lines to better handle this new surge of renewable energy?

Respectfully submitted,

Brice Hereford

Norman Bay, Chairman  
Kimberly Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426  
RF.:Docket 1PF14-22

Dear Chairman Bay and Secretary Bose,

The Board of Health of the Town of Conway, Massachusetts hereby submits this letter as part of the proceedings under this docket.

The Town's Pipeline Task Force is in the process of preparing comments to submit as part of the scoping hearings and have noted, the lack of complete and clear information regarding details of Kinder Morgan's proposed Tennessee Gas NED pipeline that would bisect our Town.

Kinder Morgan released a revised Draft Environmental Report (Resource Reports I through 13) and Project Scope Update of Tennessee Gas Pipeline Company, L.L.C. under PF14-22 on Friday, July 24th. We understand that the revised reports contain new information that would significantly and substantially impact the town of Conway. The areas of concern to the BOH include air and water quality, noise, public safety and emergency response.

We are writing to support the requests of Senator Stan Rosenberg, the Massachusetts Association of Conservation Commissions, and The Northeast Municipal Gas Pipeline Coalition to extend the deadline for written and electronic comments.

Specifically, we request that the deadline for written and electronic comments be rescheduled to September 30, 2015 to allow for an appropriate and careful review of the proposed project.

Thank you,

Sincerely,

Carl Nelke  
William McLoughlin  
Ann Gibson  
Margaret Burch  
Marie Iken

**20150803-0026**

July 27, 2015

Dear Senator Shaheen,

We are writing to ask that you, as our Senator, oppose the Kinder Morgan Northeast Energy Direct (NED) pipeline. This project will bring no benefit to New Hampshire and little to no benefit to New England.

The proposed compressor station will be a high-pressure, 80,000-horsepower hub of toxic chemicals and deafening noise, prone to frequent "blow downs" where volatile organic compounds and carcinogenic gases

are released into the air to reduce pressure on the pipeline. These gasses can travel anywhere from one to one hundred miles depending on how the wind blows and they can cause a host of health problems for people, ecosystems and water bodies on a day-to-day basis and will eventually cause ruin to all of New Hampshire. In the event of a catastrophic disaster, any building within a half mile radius of the compressor station, including the Temple Elementary School will likely burn to the ground along with anyone nearby. Please don't let this happen!

The property values near the pipeline and compressor station will plummet and our homes and land will be worthless. What is even worse about this pipeline - no local community will reap any benefit. Help us save our homes and New Hampshire!

Senator Shaheen, please oppose this pipeline and work with us to stop this project.

Most Sincerely,

Roger & Joan Crooker

Kimberly Bose, Secy  
Nathaniel J. Davis, SR., Deputy Secy  
Federal Energy Regulatory Commission  
888 First St. NE  
Washington DC 20426

Dear Sirs:

RE: docket PF 14-22-000

As a resident and homeowner in the Town of Lanesboro I oppose the proposed Kinder Morgan pipeline for the following reasons:

The proposed pipeline route passes through the Lanesboro water aquifer. There is a good chance that the aquifer would be damaged and we would no longer have a clean water supply.

Do we want to truck in water or drink bottled water for the rest of our lives?

Heavy equipment needed for construction would damage and destroy surface terrain.

The compressor station, proposed for a pristine natural setting and occupying up to 100 acres, would be a source of constant noise and light pollution. During ‘blows’ toxic fumes would be expelled into the surrounding area jeopardizing people, livestock and wildlife.

A meter station proposed for Lanesboro would also require blowdowns with the same deleterious effects.

Kinder Morgan has a poor safety track record.,

From 2006-2014, Pipeline and Hazardous Materials Safety Administration lists 92 Tennessee Gas Pipeline leakages and explosions - including personal injury and property damage of \$88,144,152.

The proposed pipeline is primarily for gas transport and only a small portion will service the communities through which it will pass; much will be exported out of the country.

Of the several thousand temporary jobs needed for construction of the pipeline only several hundred would be permanent. In contrast, the clean energy industry is rapidly growing, provides long term jobs, and does not destroy our planet.

As a limited liability company, Kinder Morgan is responsible only for fixing the pipeline. Property and environmental damage must be paid for by the owners.

The amount of money which would be paid to the impacted towns is dependent upon gas flow through the pipeline (fracked gas wells drop significantly in productivity after 3-5 years ) and customers to buy the gas. Kinder Morgan has already downsized the pipeline and removed a lateral because they had only half as many customers as they anticipated.

The amount of money towns would receive, as suggested by Kinder Morgan, is unrealistically high.

Let’s be visionary. Clean renewable energy is our future. No amount of Kinder Morgan money is worth the proposed pipeline damage to our property values, quality of life, health, natural habitats, air, soil, and water quality.

Please join with me and my town in opposing this unnecessary destructive pipeline.

Selma Josell

July 28, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

RE: Project docket number: PF14-22-000

Dear Ms. Bose:

Please accept this correspondence related to the Northeast Energy Direct (NED) proposal which would

impact several communities in the planning district served by the Southwest Region Planning Commission (SWRPC). As you know, scoping meetings are being conducted at this time and comments regarding impacts of the proposal are being accepted by your agency through August 31, 2015. In view of the amount of information which has been filed, including a substantial filing of new information on July 24, 2015, I ask that the previously established comment period be extended to allow more time for review of this information in order to more fully assess potential impacts associated with NED.

NED represents a significant proposal in Southwest NH and perhaps the most substantial infrastructure project in the past several decades for those communities which lie along the suggested corridor. The intent of the FERC process includes the opportunity for public input. For this process to be effective and transparent, adequate time must be allowed to review the significant volume of information which has been filed, some of which was made available only days ago. A comment deadline of August 31, 2015 does not represent sufficient time for agencies like SWRPC and the communities we serve to conduct thoughtful and detailed review of the information and develop comments which thoroughly identify resource impacts anticipated as a result of this proposal.

Thank you for the opportunity to provide input. Please feel free to contact me if you have any questions.

Sincerely,

Tim Murphy  
Executive Director

Subject: Docket No. PF14-22-000

July 28, 2015

Dear Ms. Bose,

This refers to the subject docket number and request for comments on Environmental Issues and Notice of Public Scoping. We have been following the discussions of the NED Project and its proposed route through the town of Amherst, NH. Under the initial proposed routing the installation of the pipeline diverts where from utility right of way that traverses north to cross the Souhegan River in Amherst, NH. The current route has the pipeline crossing the winding, Souhegan River no less than 4 times within one half mile.

The locations in Amherst where the pipeline will cross the river within one half mile four times are areas of wetlands and vernal pools which will be obviously impacted by construction as well as drilling and most likely impacted in the future. We are concerned about these impacts to the wildlife and their habitats in this area. We are not experts on what endangered or protected species may or may not be resident in this area

and would appreciate if this is looked into as well since there are numerous species that make their homes in this region.

Additionally, we are concerned about the effects of drilling and construction of a pipeline across the river and through an area of our aquifer as to what impacts will be immediately determined that will effect residential drinking water systems, all the properties that the pipeline will cross are on shallow well systems and septic fields. Any change in the aquifer due to drilling nearby may change the quality of water to these wells during and after construction. Our understanding is that the proposed route through Amherst, NH is 56% RESIDENTIAL

It is unclear to us how the construction and maintenance of a pipeline will affect ground water, surface water, residential drinking wells and the Souhegan River itself. It would seem that the proposed route may well have effects on soil stability and effect erosion and be a potential hazardous effect on storm water. I believe that much of the area is zoned a flood zone by FEMA. The risk of accidental spillage and/ or leaks is a major concern in these areas.

Since the proposed route through the Town of Amherst, NH is 56% Residential we are concerned about the impact on public health. This may be from ruptures of the system or from non-rupture leaks. It should be noted that the proposed route does cross roads which are cul-de-sacs and which are fairly heavily forested with old pines.

We understand that the Amherst Conservation Commission has a far better understanding of the environmental impact of the proposed route. We also understand that the Town has proposed alternate routing that would prove to be less intrusive and potentially less disruptive to the environment and citizen's public safety.

Lastly, we believe that the proposed NED pipeline will provide no benefit to the residents of New Hampshire. We believe that there are far more cost effective, prudent and less disruptive ways to meet the proposed market needs without this massive undertaking.

John and Cynthia Lobsitz  
26 Simeon Wilson Rd.  
Amherst, NH 03031

July 29, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE  
Room A1  
Washington, D.C. 20426

Dear Madame Secretary:

I regret that I cannot attend tonight's scoping meeting on the prospective Northeast Energy Direct Project. The state House of Representatives is in session, so I must be in Boston to attend to legislative business.

Please accept this letter as testimony.

I have strong reservations about the environmental impacts of the proposed gas pipeline. The materials that Kinder Morgan has provided to my office and to the public do not address these concerns adequately. I have heard many objections about environmental effects from my constituents, and even more from people who live in the vicinity of the prospective pipeline. In particular, I have heard a very persuasive case from a hydrogeologist who lives in a town adjacent to my district that we must study thoroughly the consequences of creating new manmade preferential pathways along this route. Because it alters the geomorphic structures of several unconnected watersheds, this project cannot move forward until the consequences on trophic interactions, nutrient dynamics and contaminant pathways are fully vetted.

Environmental review of this project should be a question for scientists, cartographers and land stewards, not corporate spokesmen, bureaucrats and lawyers. Please enforce a thorough review of this under-vetted project.

Yours sincerely,

Ellen Story  
State Representative  
3rd Hampshire District

Kimberly Bose, secretary  
Federal Energy Regulatory Commission  
888 First St, NE  
Washington DC 20426

Dear Sirs:

At a previous meeting with Kinder Morgan representatives, they were masterful at not answering questions. We deserve specific answers to the following questions.

The proposed pipeline will pass through the Lanesboro aquifer. Is there a guarantee by Kinder Morgan that our clean water will not be contaminated either during construction or after the pipeline is in place? Can they guarantee that there will be no leakage of gas into our water supply making it unusable?

How much noise, in decibels, will the compressor station in windsor generate?

How far away - in yards or in miles will the noise be audible?

For what distance will the lights be visible?

What products and toxins are spewed into the air during blowdowns and how much of each?

How much noise, in decibels, does a blowdown generate?

What is the radius of the impacted area?

I have the same questions about the meter station planned for Lanesboro.

Kinder Morgan states that there is a gas shortage in the northeast. What percentage of the pipeline gas will go to New England and what percentage will be exported? Will the amount of gas going to New England eliminate the shortage? What areas of New England will receive the gas?

Perhaps the pipeline is not necessary. Kinder Morgan has already downsized the pipeline for lack of customers.

We should look into renewable energy which is clean, will provide long term jobs and will not destroy our planet.

Please stand up for property owners, our future generations, and businesses who are being placed in jeopardy by this unnecessary gas pipeline. This proposed pipeline places communities in Berkshire County and all across this state in danger of undermining our property values, quality of life, health, natural habitats, air,

soil, and water quality..

Sincerely,

Selma Josell  
Silver St.

RE: Tennessee Gas pipeline proposal FERC Docket P PF14-22-000

Dear Secretary Bose,

We are writing to you to register our vehement objection to the gas pipeline and compressor station project being proposed by Tennessee Gas Pipeline, L.L.C. in our region. We own a home on sixty acres in Temple abutting the New Ipswich boundary. As property owners near the proposed compressor station cite we have been contacted by both TNC and FERC.

The industrial nature of this project is entirely out of keeping with the rural and ecologically sensitive character of this area. The facility as proposed places the compressor and pipeline within a drinking water protection area and poses a threat to wetlands, a reservoir, sensitive wildlife, farms and the children at our elementary school.

This proposal violates the tenets of our town master plan and major zoning ordinance provisions. We feel that this project presents a danger to the health and safety of our community. This project is certain to severely impact the value of our home and land resulting in a graphic loss of property as well as peace of mind.

We hope that all our elected representatives will unite to speak out aggressively against this proposal and act to halt its continued progression.

Thank you for your attention,

Richard J. Fressilli

RESOLUTION 2015-04

A RESOLUTION REGARDING NORTHEAST DIRECT PROJECT

First Reading: 07/20/2015

Adopted: 07/20/2015

WHEREAS Tennessee Gas Pipeline Company, L.L.C., (“TGP”) a subsidiary of Kinder Morgan Energy Partners, L.P., has proposed to construct a new natural gas distribution pipeline in southern New Hampshire, known as the Northeast Energy Direct Project (“NED”);and

WHEREAS TGP has filed proceedings in the United States Federal Regulatory Commission (“FERC”), Docket No. PR14-22-000, requesthg comments on environmental issues and other matters, and meetings for receipt of public comments are scheduled in New Hampshire in July; and

WHEREAS In addition, related proceedings have been or may be filed in the future with the New Hampshire Public Utilities Commission (“PUC”) and the New Hampshire Site Evaluation Committee (together, the “State Agencies” ); and

WHEREAS A portion of the proposed NED pipeline is proposed to be constructed in Londonderry; and

WHEREAS The proposed pipeline will create no direct benefit to the residents of Londonderry, and the disruption to the residents of Londonderry caused by the construction of the new pipeline may outweigh the benefits to the Town and its residents.

NOW THEREFORE BE IT RESOLVED by the Londonderry Town Council that the Town of Londonderry does not support the location of the proposed pipeline in the Town of Londonderry, and

BE IT FURTHER RESOLVED that the Town Manager is authorized to file such statements at the proceedings and meetings held by FERC snd the State Agencies as he determines appropriate to convey the foregoing resolution to TGP snd to FERC and the State Agencies.

John Farrell, Chairman  
Town Council

Sherry Farrell  
Town Clerk

Re: Docket No. PF 14-22-000- Tennessee Gas Pipeline Company, L. L. C., Northeast Energy Direct Project  
- **Delay of Scoping Sessions**

Dear Secretary Bose,

The Trustees preserve, for public use and enjoyment, properties of exceptional scenic, historic, and ecological value in Massachusetts. Since our founding in 1891, we have protected over 25,000 acres and have grown to an organization with over 100,000 members who care about the outdoors and the charms of New England. As we have previously noted, the current preferred route of the Northeast Energy Direct (NED) project crosses a portion of our Notchview Reservation in Windsor, MA. Notchview is over 3,000 acres of rolling hills and high elevation spruce/fir forest in the Hoosac Range, with wildlife habitat, scenic vistas, and Nordic ski and hiking trails. During the winter of 2013-14 roughly 12,000 Nordic skiers visited Notchview, and many hikers and walkers visit during rest of the year. It is a destination for star gazing, as its elevation and lack of light pollution make it an ideal spot. In addition to the pipeline itself, an 80,000 horsepower compressor station is proposed nearby to Notchview Reservation. This would be one of the largest compressor stations in the North East. These are loud, well-lit industrial facilities that are not at all consistent with

the character or economy of Windsor and would have a direct impact on the quality of experience and visitation to our Reservation.

As part of the review process, your Commission has scheduled National Environmental Policy Act scoping sessions for late July and August. However, in order for The Trustees, and for other conservation organizations, affected landowners, and government agencies to meaningfully participate in the scoping sessions, we need adequate time to review the scope and potential impacts as described by Tennessee Gas Pipeline (TGP) in their Resource Reports. Revised Resource Reports are anticipated, as the route has changed, but are not yet filed. Detailed information on the compressor stations is also not available.

I am writing to request that the National Environmental Policy Act scoping meetings be postponed until fall, after Tennessee Gas Pipeline files its revised Resource Reports and after there is adequate time of at least 30 days to review the reports. The deadline to file comments should also be at least 30 days after the filing of the revised Resource Reports. Additionally, late summer is vacation time and many affected landowners are likely to be unable to attend the meetings as currently scheduled.

Impacts will not be minimal. Roughly 1/4 of the current proposed NED route cuts through public or private conservation land. This will significantly fragment and devalue the network of public and private conservation land that we, along with other conservation organizations, municipalities, and the Commonwealth of Massachusetts, have worked for decades to protect.

In addition to natural resource impact concerns, we do not believe that a significant expansion of natural gas/fossil fuel infrastructure is consistent with greenhouse gas reduction goals, as put forth in the 2008 Massachusetts Global Warming Solutions Act [GWSA, Chapter 29B of the Acts of 2008). The GWSA created a framework for reducing heat-trapping emissions to levels that scientists believe give us a decent chance of avoiding the worst effects of global warming. The Massachusetts Attorney General has recently called for a study to better understand the need for additional gas capacity in the New England region and to better understand how new natural gas capacity will affect our ability to meet the mandatory GWSA goals. This study is to be completed by October, 2015.

Demonstrating need is a critical step in federal approval of natural gas pipelines. NED has an estimated capacity, according to TGP, of 1.3 billion to 2.2 billion cubic feet of natural gas per day. At this time, TGP has contracts to ship roughly 550 million cubic feet per day, which is significantly less than capacity. The MA Attorney General's study will also address other ways to meet energy needs, including energy efficiency and renewable energy generation as well as updating existing infrastructure. I also note that a recent study by London Economics International, commissioned by the Maine Public Utilities Commission, found that the benefit to consumers from NED or other projects would not outweigh costs<sup>1</sup>.

The Massachusetts Association of Conservation Commissions, Mass Audubon, Nashua River Watershed Association, and the Northeast Municipal Gas Pipeline Coalition have also requested that the scoping sessions be postponed.

Please add me to the Commission's environmental mailing list for this project.

Thank you for the opportunity to provide comment.

Sincerely,

Barbara Erickson

Washington DC 20426

Dear Sirs:

RE: docket PF 14-22-000

As a resident and homeowner in the Town of Lanesboro I oppose the proposed Kinder Morgan pipeline for the following reasons:

The proposed pipeline route passes through the Lanesboro water aquifer. There is a good chance that the aquifer would be damaged and we would no longer have a clean water supply.

Do we want to truck in water or drink bottled water for the rest of our lives?

Heavy equipment needed for construction would damage and destroy surface terrain.

The compressor station, proposed for a pristine natural setting and occupying up to 100 acres, would be a source of constant noise and light pollution. During ‘blows’ toxic fumes would be expelled into the surrounding area jeopardizing people, livestock and wildlife.

A meter station proposed for Lanesboro would also require blowdowns with the same deleterious effects.

Kinder Morgan has a poor safety track record.,

From 2006-2014, Pipeline and Hazardous Materials Safety Administration lists 92 Tennessee Gas Pipeline leakages and explosions - including personal injury and property damage of \$88,144,152.

The proposed pipeline is primarily for gas transport and only a small portion will service the communities through which it will pass; much will be exported out of the country.

Of the several thousand temporary jobs needed for construction of the pipeline only several hundred would be permanent. In contrast, the clean energy industry is rapidly growing, provides long term jobs, and does not destroy our planet.

As a limited liability company, Kinder Morgan is responsible only for fixing the pipeline. Property and environmental damage must be paid for by the owners.

The amount of money which would be paid to the impacted towns is dependent upon gas flow through the pipeline (fracked gas wells drop significantly in productivity after 3-5 years ) and customers to buy the gas. Kinder Morgan has already downsized the pipeline and removed a lateral because they had only half as many customers as they anticipated.

The amount of money towns would receive, as suggested by Kinder Morgan, is unrealistically high.

Let's be visionary. Clean renewable energy is our future. No amount of Kinder Morgan money is worth the proposed pipeline damage to our property values, quality of life, health, natural habitats, air, soil, and water quality.

Please join with me and my town in opposing this unnecessary destructive pipeline.

Re: Docket No. PF14-22-000: Proposed NED Pipeline

Dear Ms. Bose,

It is my understanding that at the present time Kinder Morgan is planning to route the pipeline through Patricia Lane, and through our churches parking lot. It is 'roposed also my understanding that to date, the final decision has not been made and you are still in an evaluation process. There are a couple of factors related to the operation of our church and the services we provide to the local communities that would be negatively impacted by the proposed pipeline routing.

Our church campus is approved and licensed by the state as for child care and has operated a pre-school and kindergarten at this facility for 23 years with an average attendance of 80 students. We suspended our pie-school operation a few years ago for a number of reasons. However, we are in the process of developing a new operational plan with the goal of reopening our school in September of 2016. Our school staff numbered 11 individual plus the church staff'f 3 on site personal.

Attending one of the Kinder Morgan presentations I observed that the proposed routes avoided schools and can only assume there is a reason for Kinder Morgan routing the pipeline considerable distances from educational facilities. We would appreciate the same safety parameters for our school that have given to the other educational facilities.

Various special events including Thanksgiving, Christmas and graduations in the past have been attended by over three hundred (300) individuals. It is my understanding the proposed pipeline route as presently proposed by Kinder Morgan will be less than fifty yards from the front doors of our facility.

No matter hcv safe Kinder Morgan claims the pipeline will be the fact is that is presents a potential risk and danger to ow studeots. In addition, the pipeline is being projected as a risk to all who have it passing through their back yards. In the event of leak, fire or explosion it would block the entrance and exits to our campus and a cause of physical injury to those present on our campus.

Our assembly area is approved for five hundred occupants making it the largest auditorium in the towns of Amherst, Milford, and Hollis.

At present our facility is used for our Sunday services, special events, i.e., concerts, seminars, interchurch events, small groups, including youth women's and including concerts, seminars, interchuih events, small groups, including youth women's and special interest groups and church events.

In addition to the above our campus houses New Hampshire Family Radio's broadcast studio and the Community Marriage Initiative. My concern is also for the inconveniences we would experience during construction and the safety issues associated with the pipeline and its impact on our school.

Thank you for your attention to above issue. Your careful consideration will be greatly appreciated.

Sincerely,

Ronald A Tannariello  
Lead Pastor

July 28, 2015

Dear Ms. Bose,

I am writing to express my ardent opposition to the proposed Kinder Morgan Pipeline running through southern New Hampshire, Docket PF14-22. I am concerned about the impact the building and maintenance of the pipeline will have on our well water, the water quality in our many lakes, our air quality and our wild-life.

- ~ That is to say nothing of the negative impact the project will have on the local highway infrastructure and the noise pollution it will produce.
- ~ The project will mostly employ highly skilled unionized labor that is brought in for the job, not our local workforce.
- ~ The gas traveling through the pipeline will not even be used in our area but rather will be sent along to Massachusetts for further dispersal. There is already an existing pipeline in eastern Massachusetts that can be expanded and used instead.

I am deeply saddened that the pipeline will run through Rhododendron State Park in Fitzwilliam part of which was designated a National Natural Landmark in 1982. The parkland was given to the Appalachian Mountain Club in 1903 with the condition that it “be held as a reservation properly protected and open to the public...forever”. In addition the contract barred the cutting down of any trees. It is difficult to think that this magnificent gift of nature from our forefathers will be forever scarred by mankind solely for the profit of big business and that their wishes for the land will be so blatantly ignored.

It is not just local residents who will be impacted by the pipeline. The 125,000 people who hike Mount Monadnock, commonly held to be the second most climbed mountain in the world, annually will be treated to the eyesore. Also impacted will be many of the lakes and hiking trails in the area that are widely used for recreation by residents and vacationers alike.

Finally, my home was built not long after Samuel Rockwood bought the property in 1792. The house has withstood all that Mother Nature has conjured up for 220 years. I have poured my life savings into renovating the house, and now it stands in the incineration zone of the pipeline. It boggles the mind that I have no control over what will happen to my property, potentially my house, my property value and all the spectacular flora and fauna that exist here with me.

I came to New Hampshire because of the natural beauty and peace the area provide, not to be situated in close proximity to a potential manmade disaster. The area does not have the infrastructure to support the building and maintenance of the pipeline let alone the resources to cope with a fire or explosion. This is terrifying to me especially given Kinder Morgan’s poor safety record and the fact that they have approval to use lesser quality materials since we are designated a rural area.

This pipeline is wrong for me, wrong for Fitzwilliam, wrong for the Monadnock region and wrong for New Hampshire!

Thank you for your consideration of this matter.

## **20150803-0060**

Project docket number (PF14-22)

July 28, 2015

Alice Spatz  
56 Bridge St., P.O. 324  
Lanesborough, MA 01237  
4134442-2969  
spatzlarryalice@verizon.net

Please extend the scoping period for the Kinder Morgan project (PF14-22) and look into the legitimacy of the need for more natural gas.

Shrouded in secrecy, the New England States Committee on Electricity (NESCOE) undertook efforts that were poised to tax electric customers to pay for bringing massive new gas pipelines into the region. Studies

commissioned by NESCOE showed that if current levels of state energy efficiency programs continue, there is no need for additional natural gas infrastructure even with economic growth taken into account Now the New England Governors are stepping away from a high-risk gamble with clean air and electric customers' money.

'NESCOE "New England Gas-Electric Focus Group Final Report" of March 28, 2014, the gas/electric industry analyst firm concluded and recommended, among other things, that, "No long-term infrastructure solutions are necessary under the Low Demand Scenario", and, "Further analysis would be required to determine whether policies that would result in a Low Demand Scenario are cost-competitive with infrastructure investments." Berkshire the edge newsletter June 11, 2015

The need for more capacity has been cited as peak demand during cold weather when gas for heating and gas for electric generation compete for existing pipeline capacity. These conditions only happen for a few hours a day, about 10-27 days a year, and it has never led to a dip into our electric generation buffer (the extra electric capacity ISO-NE likes to keep on hand), let alone actual electric demand. ISO New England actually issues Minimum Generation Emergency Warnings." These are times when consumers were using so little electricity that the grid operator had to ask power plants to NOT generate electricity. (ISO NEWS-WIRE — 12/2010)

Instead of building an enormous pipeline designed for export, and that doesn't supply gas to new local customers, a good place to start is by making wise use of our existing pipelines. We can make sure the pipeline capacity that we already have is being well utilized before leaping to build expensive new pipelines. This starts with fixing leaks and creating opportunities for storage or contracts to address the few hours of a few days of high demand in the winter.

If new pipeline capacity is added, any capacity increase should include a "system transformation charge." Similar to the energy efficiency charge, this would recapture a portion of the expected economic savings and use those funds to enable more energy efficiency and renewable power supplies. These funds would allow customers to reduce their reliance on fossil fuels each year, making the possibility of using natural gas as a "bridge fuel" a reality.

Sincerely, Alice Spatz

Lorraine Stockwell, Temple, NH.

Here are some of the reasons I have for NOT supporting the natural gas pipeline through Southern New Hampshire:

- If approved:
  - o It will cross 17 towns, 40 conservation lands, 155 wetlands, 116 bodies of water, 8 miles of state forest or parks, and the property of 822 NH households, changing the look and feel of beautiful New Hampshire forever.
  - o It will leak methane from valves, compressor, and metering stations. How will our health and the health of our children, our pets, and all animals in the area be impacted?
  - o It will endanger students at the Temple Elementary School and everyone else in the “burn zone” of the compressor station.

- The possible environmental/health impacts for humans, animals, and plants have not been adequately studied. What about the farms? What about local food?
- New Hampshire would get only a small percentage of gas. Some would go to Massachusetts. Most would be exported to Europe and Asia.
- It will not lower prices.
- It will not provide jobs

Opposition to the pipeline is strong among New Hampshire residents, especially those living in Southern New Hampshire. I am scared and appalled and saddened with the prospect of the construction of and possible existence of a natural gas pipeline and compressor station in our neighborhoods.

My family and I moved here 26 years ago because we wanted a beautiful, clean, rural, healthy place to raise our children. If the pipeline is approved, we and most of our friends, want to leave the area. Unfortunately, even the threat of the pipeline has already affected property values. Who would want to move here now? I certainly wouldn't.

I know you must weigh all costs and benefits when deciding whether or not you will support the pipeline. The costs clearly exceed any small benefits. The residents clearly do not want the pipeline.

Please make the right decision and cancel this project.

### **20150803-5002**

Amy Glowacki, Mason, NH.

Please push to schedule more scoping sessions for people impacted by the TGP NED pipeline. The two sessions in S NH were scheduled too soon after TGP-KM filed their latest report with FERC. The report was available on Friday 7/24 in the evening and the first session was 7/29. That is inexcusable and doesn't reflect fair and open dialog opportunities.

Also, two sessions in NH are not enough to accommodate all who wish to participate. The Milford location was too small. The overflow room filled up and people were turned away. This is not acceptable. The hall was not handicap accessible. How can you justify this treatment of your citizens? It is criminal. Our land and way of lives are being changed without our consent and now it is happening without opportunities to voice our concerns. Won't you stand up for your constituents? I am saddened and disillusioned in our democratic process and how our officials have seemingly sold us out to private business for profit under the guise of public benefit. What is the public benefit - I would like to see the true facts honestly presented and shared I a fair exchange where all voices are heard. Sadly this isn't happening here in NH.

### **20150803-5003**

Susan M Baxter, Appleton, WI.

07/31/2015

My scoping comments for Segment A of the NED:

Updated Areal imagery was to be captured in the spring of 2015. It is now summer. I am commenting on imagery from 2010.

This area has a proposed 36" loop, and true to form, the loop is proposed to be placed 25 ft away from the existent lines. Whether or not this offset is most protective of the wetlands and waterways on this segment should be examined by someone. I presume TGP is not insisting that the existent pipelines would be in jeopardy with a shorter distance between these two pipelines (loops).

I would suggest that the areas in the current ROW which look like they are to be used as "Additional Temporary Work space" and are planned as such should probably be accounted for as such. INGAA has tried to determine what the "safe construction work spaces limits" should be for pipeline projects, and masking ATWS requests will probably just impede their efforts. FERC has rules about protection of resource areas,

even if they are in the current ROW. I don't know when the 300-1 or 300-2 were built or if surveys have been done on this segment. Based on my experience with TGP's 200-1 and the 200-2 lines they probably go through many resource areas.

The request for ATWS-A-82 should be examined, and split up.

I don't know what to say about ATWS-A-093, except what a mess.

ATWS-A-122 should be split up and minimized.

ATWS-A-138 should be split up.

Sincerely, Susan Baxter

### **20150803-5005**

Jill, Merrimack, NH.

It pains the community of Southern New Hampshire to have to fight for our rights again Kinder Morgan and the proposed pipeline. The government is supposed to be for the people which means when the people have their land taken away, we need to look to our government and our official to help us fight the battle. It is unfair and unjust to allow a private company like this come and take our beautiful resources and land away from us. One important thing to remember is no one has proven there is a need for this resource. There are plenty of alternatives that will not damage our land or communities. No one did any research to confirm the need in NH for Natural gas. The proposed route is not well thought out. They only reason I would think Kinder Morgan is choosing this route is because MA fought against this and got it out of their state, that or is it way more expensive for Kinder Morgan to fight that battle with that state. Why should my children have to worry about their land and health. Why would you allow a private company put our kids and the future of our country in harms way? Isn't the government supposed to protect us against due harm. We need the federal government to listen to the community and neighbors affected by this pipeline. I ask you if you would be ok to have this in your backyard. I can't find one person ok with that. Not one person I know wants this in their backyard. There are plenty of studies against the damage this will cause to our land and natural resources. Not to mention the need is not there. We have constitutional rights and this would directly impact our water, nature conservation, wild life, schools to mention a few, Also, not one person from Kinder Morgan came out and stated what NH has to gain from this. This will decrease our property value, increase our insurance, put us in constant harms way of an explosion. If , KM wants to do this they should buy all our houses from us and allow us to move elsewhere. I would be in negotiation for that. I moved to Merrimack for the love of the land and all it has to offer. Now I want to leave due to the proposed pipeline but who would want to buy our land now. My house it already under value and this would just make that worse. Don't we have to consider what is best for the people and community it is impacting. Who is doing that research when you go to approve this. Does anyone care about the people impacted anymore?

### **20150803-5006**

Jill, Merrimack, NH.

New Hampshire citizens have some of the cleanest water in the nation . Any landowner who has applied for a water-related permit knows how stringent those rules can be. The question now is whether those same rules apply to out-of-state oil and gas companies.

Kinder Morgan is a multi-billion dollar company not located in NH and they want to build a huge pipeline through the conservation land, water supply, within 100 feet of our future and schools, 50 feet in my backyard. Ironically named the "NED," this corporate partnership has been granted the right of eminent domain to take private property for the purpose of carrying fracked shale gas. Employees and officers of both corporations have stated to their investors that they want to sell gas at the highest possible price on the international market.

To do that, Kinder Morgan has chosen the most destructive route and the cheapest construction methods.

Described as a "greenfield project," the Constitution Pipeline would convert pristine fields and forests into

an industrial corridor. Construction would involve clear-cutting, blasting, and digging a 124-mile-long, 125-foot-wide gash up and down hills, through cold-water trout streams, and across scores of farms and rural communities. Instead of carefully boring under fragile wetlands and streams, Kinder Morgan would maximize impacts by trenching through them, burying their pipeline just below the surface where it would be extremely vulnerable to scouring, exposure, and rupture. Critical aquatic habitat, which has never been surveyed for species of concern, would be harmed. The project would also fragment forests and wipe out more than 700,000 trees in a region known for devastating floods. Clear-cutting on steep slopes would cause massive erosion and contaminate streams and watersheds, especially during the extreme storms that have become frequent in recent years.

Under section 401 of the federal Clean Water Act, the pipeline cannot be built unless DEC certifies that the state's strict water quality standards will not be violated. The problem is that there is no way to tear through the sensitive hills, forests, wetlands, and streams where this pipeline is proposed without threatening water quality and degrading aquatic habitat. DEC must therefore deny the 401 Water Quality Certificate.

Despite the inevitable violations to the state's water quality standards, we are hearing that a deal has been made to approve the project anyway.

NH needs our Governor and Acting Commissioner on our side as well as FERC, please do not let the rubber stamp of a federal agency and pressure by the fossil-fuel industry destroy our state's most precious natural resources. You not only have the authority, but a legal obligation, to protect the water quality and safety of New Hampshire. It is impossible for the FERC to certify that this proposed pipeline complies with New Hampshire's State's stringent water quality standards. We therefore urge you to do the right thing by denying the pipeline.

## **20150803-5008**

Pixie Holbrook, Conway, MA.

(My comments were intended for the FERC Scoping Hearing in Greenfield MA on July 29th. My name was called to speak but a well-intentioned selectboard member went up instead.)

I would like to touch upon 4 topics....

First, our local Council of Governors held a public informational meeting that included a gas industry engineer, whose specialty was pipeline installation. When asked how far away a pipeline should be from high-tension wires, he quickly responded with "400, 500 feet away". Then with a lowered voice, "1000 feet..." We would like Kinder Morgan to justify the placement of this pipeline that runs parallel and only about 50-100' away from the Eversource high-tension wires. And how will it and who will be monitoring the integrity of that juxtaposition?

Secondly, last Friday KM provided us with an extremely lengthy Resource Report delineating the details of the installation and operation of this pipeline. They gave it to us only 6 days before this hearing. Clearly intentional, this is unethical behavior. I am here with many others to demand a new schedule with a full 60 days for us to review the information.

Thirdly, you should be questioning the ethics of this company, Kinder Morgan, in general. They lie about hiring 1000's of people to install this pipeline, while in fact we know historically that they bring in their own crews. They lie about building a pipeline to benefit New England, yet there are countless indications that this gas is for export. They display a photograph of a quaint barnlike building, a very small compressor station. In fact, the one planned for our neighbors in Northfield, is the largest compressor station in the nation. They say they will reduce the size, but we all know full-well that once given your approval, that that station will return to one large enough to provide ample gas to Europe!

Lastly, I want to add that in that Resource Report, we discovered that my rural, quiet Conway is the location for a Mainline Valve and a Remote Blowoff Valve. It will serve to periodically release the pressure in the pipe, sending pressured fracked gas into our air. We know that fracked gas carries countless particles of

chemicals used in the fracking process. Those particles are heavier than air, and once released, will shoot up into the air, then travel and drop to the ground...on our rivers, streams, wetlands, farms, livestock, flower gardens and swings. For years and years and years...

We don't need this pipeline and it is of no benefit to us here. Pipeline leaks can be fixed, other pipelines can be run at capacity. Gas can be stored in the warm months for cold days in winter. We can further pledge, as a state, to conservation and renewables. We ask you to tell Kinder Morgan to pack up and leave. They're not wanted or needed here. Thank you.

**20150803-5011**

Fred Teeboom, Nashua, NH.

1 August 2015

Subj: Tennessee Gas pipeline Company's Northeast Energy Direct Project

Re: Docket No. PF14-22-000

My Comments:

I am greatly in Favor of the pipeline:

1. We need this pipeline to get our energy costs under control. Please proceed with your review and approval at fast pace possible. No Delays!
2. I tried to speak at the FERC Focus Meeting in Nashua NH on 29 July, but was unable to due to my high assigned speaker number (#72).
3. The "Stop the Pipeline" people, organized in groups with signs and T-shirts and prepared comments are a bunch of NIMBYs, but scare all those in favor of the pipeline with interruptions; shouting boos and with physical intimidation; much like mass-hysteria.
4. I recommend you videotape these meetings and observe the extremely rude behavior by the "Stop the Pipeline" NIMBYs.

Sincerely,

Fred S. Teeboom  
24 Cheyenne Drive  
Nashua, NH 03063  
(603) 889-2316

**20150803-5012**

Carolyn Bosch, Dracut, MA.

Ms Kimberly D Bose, Secretary

Federal Energy Regulatory Commission, FERC

Reference: Docket number PF14-22-000. Northeast Energy Direct Project.

I am totally against the proposed pipeline. I do not believe that we need to further damage the environment by continuing to rely on fossil fuels. Other alternatives like solar and wind should be seriously considered and invested in before we continue to along the path of destroying our environment. Global warming is not a theory. It is real. I strenuously urge you to stop this proposal.

I would like to address the actual need for a pipeline. Addressing the environmental issues before addressing the Energy Needs implies that the need is real and this is already the next step. That is what Morgan Kinder wants you to believe. That is their strategy. They want to persuade FERC, our elected politicians and citizens to believe that the need is real. It isn't. There are 15 days a year that require additional energy needs that can be handled without this new pipeline. Why is a new pipeline even being considered for such a small problem? Investigate energy efficiency (fix the existing leaky gas pipes), look at solar and wind

generation, and increase the use of LNG. I believe this is more about big business and long term potential profits to sell off the “unused” gas that Kinder Morgan “says” “New Englanders” need. I don’t buy it. And FERC, neither should you.

**20150803-5013**

Richard B. Putnam, Milford, NH.

To: FERC re: Project docket number PF14-22-000

From: Richard B. and C. Victoria Putnam  
153 Jennison Road  
Milford, NH 03055

Date: August 1, 2015

We are writing to express our vehement opposition to the proposed natural gas pipeline by Tennessee Gas Pipeline Company for the following reasons:

- 1: The disruption and devaluation of property along the path of the pipeline.
- 2: The hazardous nature of the process of transporting flammable material in close proximity to homes, schools and otherwise developed areas along the path of the pipeline.
- 3: The noise and emission of toxic materials associated with the proposed compression stations.
- 4: We oppose the fact that the gas being transported was produced by hydraulic fracturing at its source; a process which is wrong by any measure of safety or respect for the environment.
- 5: We fail to see any value to our area given the fact that the end users of the product are many miles from us.

The very idea that a distant corporation feels it can run rough-shod over our environment, disrupting the lives and assets of members of our communities is reason enough to reject this proposal out of hand.

Respectfully,

Richard B. Putnam  
C. Victoria Putnam

**20150803-5014**

Janice Fiandaca, Rindge, NH.

This past week, I attended one of the two scoping meetings in our area. Many valid points were made but I’d like to repeat one regarding our water. As noted, many of the towns rely on well water and there is great concern with the effect of drilling, possible gas leakage, etc. on our water supply. The statement that I will repeat is: you can find an alternate form of energy; you cannot find an alternate form of water. I have read that much of the disease in India stems from the unavailability of clean water. We do not need to replicate this problem in southern New Hampshire. Please keep this in mind as we ask to extend the scoping period for another 60 days past 8/31/15.

**20150803-5015**

Lucie W Murray, Nassau, NY.

From:

Docket No. PF14-22-000

Lucie Murray  
110 Clarks Chapel Rd.  
Nassau, NY

Regarding the Tennessee Gas Pipeline Company, LLC Docket No. PF14-22-000

To: FERC,  
Washington, DC

8/1/2015

My name is Lucie Murray. My husband and I live on Clarks Chapel Rd. in Nassau NY and we live within the 1/2 mile “buffer zone” of the proposed 90 thousand-horse power compressor station.

When I first brought my property almost 40 years ago it was designated then, and still is, a rural zone. Our land consists of pastureland and forest land. We grow our own vegetables; we have a small apple orchard and have sold Christmas trees for many years. We built our own home and have invested all we have into this dwelling. My husband and I raised 5 children on this piece of property and thus far we have 4 grandchildren who often stay with us and who have thoroughly enjoyed their country life here with us.

One week after I retired in June of this year I received a letter from Kinder Morgan informing me they have re-zoned my property into a “buffer zone”.

My home, my property, nor my neighbor’s homes and properties, cannot “buffer” anything.

We are totally helpless to defend ourselves from anything the proposed Compressor Station will inevitably throw at us; such as their toxic wastes, constant noises (24/7), and the fear of possible bodily harm or incineration and property damage in the case of an accident or leak in the pipes and the diminution of our property value which we have worked so hard to acquire.

We believe the proposed Compressor Station on Clarks Chapel Rd. will inevitably reduce the quality of our lives, the Bald Eagle’s quality of life, our environment and the value of our property.

Our local fire department is not equipped to rescue us, or our property, from any accidents that may occur at this compressor station and Kinder Morgan has not made any provision to deal with these accidents which in all likelihood will always be catastrophic because of the volume of gas transmitted and the huge pressure generated.

From our understanding “the proposed “buffer zone” is in reality a “dumping zone” for the compressor’s wastes.

Our town has not yet recovered from the waste products dumped in our area (Dewey Loeffel) by other companies, which contaminated our drinking water and killed the animals/fish in our lakes.

The people in my neighborhood have waited 50 years for the Bald Eagle to return to our area. He was designated as an endangered species until only a few years ago. My husband and I recently witnessed the Bald Eagle’s return to our neighborhood. We saw him perched on a dead tree on the very property targeted for the Compressor Station. He was a majestic sight and we want to keep him in our neighborhood. Environmental pollutants almost led to the bald eagle’s extinction back in 1967 and now the proposed Compressor Station will again pollute his environment and possibly drive him away or kill him altogether. I took the liberty to represent him in this letter as he cannot talk for himself. Don’t forget the Bald Eagle is still protected under the Golden Eagle Protection Act, and it is a federal crime to poison the bald eagle.

My parents immigrated to this country when I was young to get away from the devastation in Europe, which resulted from one man wanting to rule the world.

And now towards the end of my life a company, that I never even heard of until a month and a half ago, is proposing to invade my private space and take away my right to peace and quiet and tranquility and my right to clean air and clean water, and my right to live without fear of bodily harm, possible incineration and possible decrease in my property value

Clarks Chapel Rd. is fairly highly populated for a rural area and although it is strictly a rural area, the proposed compressor station will adversely affect many people, including many children.

Kinder Morgan has a purchase agreement for 142 acres of pristine rural land on Clarks Chapel Rd, which is highly populated for a rural area. Just because Kinder Morgan finds it convenient to place the compressor station on Clarks Chapel Rd (and has a willing purchase agreement for 142 acres of land) does not mean it is in the best interest of the people in this neighborhood and all the other neighborhoods along the proposed pipeline.

The people's interest should take precedence over a powerful, profit driven gas companies' interests and convenience.

I and my neighbors living on Clarks Chapel Rd and surrounding areas oppose the Compressor Station to be built on Clarks Chapel Rd as this road is densely populated for a rural area. The proposed Compressor Station and pipeline if built on Clarks Chapel Rd will be devastating to the many families living on this road.

The Nassau Sportsman's Club is within a stones throw of Clarks Chapel Road and hosts many special events (such as weddings, parties etc), and has always been a large gatherings place for community events. The proposed gas pipeline will traverse this property and possible putting many lives in jeopardy should something go wrong.

In addition Section 401 of the federal Clean Water Act gives states the right to review federal projects and judge them according to state water quality standards. Any project that requires a federal license or permit requires a 401 water quality certificate (WQC), and it is supposed to be issued BEFORE the federal license or permit. Please make sure that Kinder Morgan's proposal meets NY states strict water quality regulations under the Clean Water Act and do not allow them to violate NY State's Water quality standards.

We the people here in Nassau all pay taxes, both state and federal taxes. In return we want you to protect our fundamental rights to clean air, clean water, unwanted noise and intrusions and to protect us from powerful profit driven companies from robbing us of the equity

#### **20150803-5016**

Patrick C. Austin, Pittsfield, MA.  
Saturday, August 1, 2015

From: Patrick C. Austin, MPH (Master of Public Health, Columbia University)  
46 Glenwood Avenue, Pittsfield, MA 01201

Comments regarding the proposed natural gas pipeline project through Berkshire County:

How will this project benefit the people of the small towns, farms, cities, and wilderness that are going to be affected by the pipeline and the pipeline construction process? Clearly, there must be some sort of compensation for those whose well-being and quality of life will suffer.

I would suggest that community-friendly landscaping be required along the pipeline route to mitigate the damage and suffering that the gas pipeline and its construction will bring. Such landscaping should incorporate recreational design to benefit the people affected. It might include bike paths, golf, nature trails, swimming holes, picnic tables, softball, . . . use your imagination.

Sincerely,

Patrick C. Austin, concerned citizen

#### **20150803-5019**

Garth Fletcher, Mason, NH.

I would like to correct possible misimpressions created in Mr. Teeboom's description (Docket #20150803-5011) of the July 29, 2015, FERC Scoping meeting in Nashua NH.

In his item #2 he complains that he wanted to speak but "... was unable to due to my high assigned speaker number (#72)". That could be misinterpreted to suggest that speakers were prevented from speaking.

I attended that meeting and was in the room when the last assigned speaker spoke; I believe his number was #95. In addition, and despite the late hour, Mr. Tomasi, FERC's Project Manager, then asked if any people who had not signed up wished to speak and allowed them to do so.

With 3 minutes allotted per speaker, something less than 20 speakers per hour could be accommodated. So Mr. Teeboom's #72 would have required close to a 4 hour wait as those with lower numbers took their turns.

He may have CHOSEN not to wait for his turn, but he most certainly was not prevented from speaking. In his item #3 dismisses the 600 or so people in the room who opposed the pipeline as “a bunch of NIM-BYs” but then goes on to accuse them of “...physical intimidation; much like mass-hysteria”.

He may feel “intimidated” by the realization that the great majority in the room oppose his position - as indicated by wearing bright tee-shirts or green ribbons, and by the fact that around 95% of the speakers spoke in opposition - but that hardly justifies a slander of “physical intimidation”.

Occasionally ending up in the minority is natural in a democracy and certainly no reason to feel “intimidated”; though I often have found it a reason to consider rethinking my own position.

Garth Fletcher  
Mason, NH 03048

### **20150803-5020**

victoria elson, Northampton, MA.

The Northeast Energy Direct pipeline is unnecessary, expensive, and extraordinarily destructive to pristine environments and residential areas as well.

It is baldly for-profit and does not offer benefits that offset the sacrifices being asked of Western Massachusetts -- in fact, it's not clear that it offers us any benefits at all.

It's unconscionable. STOP THE PIPELINE.

THANKS!

Graduate of UMASS Amherst, PhD - Mechanical engineering

Mid years worked in the, Advance Development Engineering section of Power Transformer manufacturing specializing in magnetic circuit design and transformer noise control.

Late years worked in the Advance Development Engineering section of Naval Ordnance department developing a prototype liquid fuel howitzer cannon in conjunction with Army Ballistic Research Lab. Activities include: hardware design and analysis, internal ballistics simulation, gun firing data analysis, and hardware failure analysis.

#### **Pipeline Safety Issue: Proximity to Dwellings**

The proposed Pipeline Path is located on the south side of the power line as it passes the base of constitution hill, thus placing several dwellings in close proximity to the pipeline while the north side is free of dwellings. After passing constitution hill eastward the pipeline then crosses over to the north side. A safer design would be to locate the crossover to the west of constitution hill.

The access road to the power line is also public access to private property. This unpaved road, composed of clay and gravel, is nearly impassible during the spring thaw, even under very limited traffic conditions.

#### **Pipeline Safety Issue: Pipe Mechanical Stress Failure from thermal expansion:**

The change in length of a piece of steel pipe a mile long exposed to a seasonal change in temperature of 70 degree is estimated to be approximately 34 inches, based on a coefficient of thermal expansion for steel of .

0000078 inch per inch per degree F.

If the ends of the pipe are restrained and the pipe cannot freely contract in length with a 70 degree F seasonal drop in temperature, an internal tensile stress will develop at every point along the length of the pipe. The maximum Internal tensile stress in the pipe wall under this condition is calculated to be approximately 19000 psi. This value was calculated assuming zero gas pressure in the pipe. This stress value is approximately 1/3 the failure strength of hot rolled steel. Adding the tensile stress from gas pressure will further increase the total tensile stress to possibly unsafe levels.

Because the pipeline is continuous over many miles with all section simultaneously expanding or contracting with changes in temperature, all sections of the pipeline are prevented from expanding or contracting by all the other adjacent pipeline sections making up the complete pipeline, thus in actual practice the pipeline will likely experience the 19000 psi stresses give in the above paragraph.

At Constitution Hill in Lanesborough the terrain in the pipeline path consists of two irregular ridges 1400 feet apart with a 135 foot deep valley in between. This configuration will require straight pipe sections welded to pipe elbows having relatively sharp turning angles at the two peaks and the valley in between. Each elbow configuration together with its welded joints acts as a stress multiplier, thus amplifying the already high stresses due to seasonal changes in temperature described above.

Additional stress intensification may arise in the joint area from surface cracks resulting from to hydrogen embrittlement, a normal byproduct of cathodic corrosion protection. Cyclic fluctuation in pipe temperature can lead to longer term fatigue failure from crack propagation at stress risers.

#### **Pipeline Safety Issue: Pipe Mechanical Stress Failure from Soil Frost Expansion:**

From my personal observations, annually, after most snow cover is melted in the spring the clay soil on my property is expanded vertically approximately 6 inches above the surrounding soil every year in the areas exposed to the winter air temperature, specifically along walkways and driveways cleared of snow cover throughout the winter.

The expansion of water in forming ice is virtually an unstoppable force able to break rock, lift buildings, and break buried pipes.

The proposed pipeline will pass through alternating clay soil and rock ledge, sometimes exposed to air temperatures and sometime covered with snow. Clay soil will expand upon freezing while the rock ledge will not. The effect of variable frost heaving along the length of the pipeline is of concern because of uneven frost heaving will apply a bending force upward in the areas where the clay soil expands upon freezing.

The 30 inch pipe has a 5 times greater surface area exposed to the heaving soil compared to the 6 inch the so the lifting forces will also be 5 times greater then in the 6 inch pipeline currently buried in berkshire county.

Stress in the 30 inch pipe will rise 5 times faster with increasing bending deflection because of the bigger diameter of the 30 inch pipe compared to the 6 inch pipe. Combining the unstoppable forces of expanding soil and the much higher rate of increase in stress brings into question the viability of a 30 inch high pressure underground pipeline in the northeast.

#### **Pipeline Safety Issue: Pipe external corrosion and failure:**

Pipe corrosion is accelerated by chemical reactions between pipe and soil, and also from externally generated current passing between soil and pipeline. The three known sources of current that can contribute to pipe corrosion are:

##### **#1. Electrochemical interaction between pipe and soil.**

The usual solution to prevent corrosion of buried pipe is passive cathodic protection which consists of zinc metal plates electrically connected to the pipe along its length. The combination of two different metals, pipe steel and zinc plate, submerged in wet soil constitutes the elements of a simple battery which generates a small direct current with a flow direction that inhibits corrosion. If the weak currents from this arrange-

ment are overwhelmed by large external current sources described on the following paragraphs below, the intended corrosion protection will be ineffective or reversed, resulting accelerated corrosion .

## **#2. Geomagnetic currents in the earth**

Geomagnetic currents in the earth are generated by the interaction of the earth's rotating magnetic field with charged particles emitted by the sun. Geomagnetic current levels as high as several 1000 amps, have been measured in some locations on the earth at peak solar activity, while lower currents occur more frequently. These current can travel on both long distance power transmission lines and pipelines. In the past these earth currents, traveling over electric transmission lines, have created major electric power outages in various places on earth.

These high currents flowing into and out from a long pipelines can exacerbate pipeline corrosion by interfering with the normal current flow generated by cathodic corrosion protection installed along the pipeline.

Compensation for this phenomenon can be achieved through high levels of active cathodic protection. However, active protection would require electric power stations along the pipeline with the result that large amounts of electric power would be consumed. Also, active protection would produce more hydrogen gas at the pipe surface leading to higher levels of hydrogen embrittlement which can increase the possibility of surface cracking ,which can then lead to crack propagation failure of the pipe.

The prediction of Geomagnetic currents in the pipeline by computer simulation appears to be impractical because of its 3-dimensional complexity, requiring as computer input, the distributed subsurface electrical and magnetic properties of the earth over the entire pipeline region, as well as the time varying voltage distribution across the earth.

## **#3. High voltage transmission line induced currents:**

An electrical transformer is created when two parallel conductors carrying current transfer electrical energy from one conductor to the other by means of the circular magnetic fields encompassing both conductors.

Fundamentally the pipeline, as one conductor, and the high voltage transmission lines as the other conductor, form a huge electric transformer extending over hundreds of miles.

The magnitude of electrical coupling between the pipeline and power line is inversely related to the spacing between the two but is directly proportional to the length of the two in parallel.

When alternating current flows in the power line an alternating voltage is induced in the pipeline by the changing magnetic field of the power line. This voltage can drive alternating electric currents in the pipeline.

Soil above the pipe being a poor conductor will not be an effective magnetic shield for the pipeline. Some of the current induced in the pipeline will circulate locally between the soil and pipe in small loops along the length of the pipeline and may accelerate pipe corrosion. Because these currents will be alternating current, passive cathodic corrosion protection may not protect the pipeline.

In conclusion, both geomagnetically induced currents and power line induced current should be investigated in detail to determine their impact on passive cathodic protection and hydrogen embrittlement at surface of the pipeline, both effects may dramatically shorten the life of the pipeline.

## **Safety Issue: Pipe internal corrosion and failure:**

Internal to the pipeline water vapor carried along with the gas can condense to liquid water and accumulate at a any low point in the pipeline. One such point is in Lanesborough at the valley floor along route 7, located under the town aquifer. A similar situation exists in the valley west of the ridge at Constitution Hill. It unclear how this accumulated water accumulation will be controlled to prevent internal corrosion of the pipeline.

## **Noise Pollution: Metering Station Noise and Compressor Station Noise**

### **Disruptive Metering Station Noise**

Placing a metering station within the community of Lanesborough could produce serious noise pollution issues due to the near proximity of houses to the pipeline and also because the frequency spectrum of the noise may contain discrete tones which are more noticeable than broadband noise.

Noise can be characterized as narrowband noise (discrete noise), or broadband noise (random noise), or a combination of both.

Narrowband noise is produced by such equipment as rotating and reciprocating machinery, electric transformers, jack hammers, engines, pumps, etc. These noise sources generate a few dominant sound frequencies. Electrical equipment generally produces noise at two frequencies, 60 Hz and 120 Hz. Because these are very low frequencies, sound waves can travel long distances without much sound attenuation and thus can be a serious annoyance problem.

Ambient background noise is generally broadband noise without a dominant frequency, examples are: turbulent water flow, ocean wave action, wind through a forest, cooling fans, tires-road noise, etc.

Since narrow band noise is much more annoying than broad band noise, proper sound analysis of the noise source requires the use of spectrum analysis to determine that adequate noise control has been achieved.

Simple measurements of Total Noise Level before and after installing noisy equipment does not properly assess the annoyance issue.

In the power transformer industry annoyance level from external noise is primarily determined by measuring and comparing the octave band sound spectrum of both noise source and ambient noise. For proper masking of annoying noise from power equipment the dominant frequency bands produced by the noise source should be lower than that of the lowest night time ambient noise level in the same frequency bands.

The above factors need to be properly addressed when locating new equipment in an otherwise quiet environment.

**Disruptive sound and vibration transmission over long distances from pipeline compressor stations:**

Transmission of low frequency sounds and subsonic vibrations are efficiently propagated over long distances along metal conduits as well as in compacted soil and rock. High pressure pumps at the compressor station may generate low frequency pulses which can propagate efficiently along the pipeline for long distances and be detected as subsonic vibration by communities a long distance from the compressor station.

Studies of existing similar systems should be performed.

Note: all numerical values in this paper are estimated from first order calculations.

August 1, 2015

The attached file (CUOMO GERSTMAN FERC FILE.pdf) requests NY DEC denial of Section 401 Water Quality Certification for Kinder Morgan / Tennessee Gas Pipeline LLC regarding (Docket #PF14-22-000). It also cites and addresses related matters.

Filed by William D. Jackson / PO Box 2758 / Stephentown, NY 12168

-----  
August 1, 2015

The Honorable Andrew M. Cuomo  
Governor of New York State  
NYS State Capitol Building  
Albany, NY 12224

The Honorable Marc Gerstman  
Acting Commissioner  
New York State Department of Environmental Conservation

625 Broadway  
Albany, NY 12233-1010

Dear Governor Cuomo and Acting Commissioner Gerstman:

In New York State, as well as parts of New Hampshire and Massachusetts, the Kinder Morgan / Tennessee Gas Pipeline LLC Northeast Energy Direct (NED) project (FERC Docket No. PF14-22-000) proposes to subject multiple communities and their citizens to numerous hazards, not the least of which – broadly framed – will be the degradation of the natural environment, public health, and individual well-being. The Constitution Pipeline Project poses all of the same negative issues for New York State’s residents.

Unfortunately – in spite of state/local laws and regulations – the Natural Gas Act continues to validate and empower the Federal Energy Regulatory Commission (FERC) in its role as an advocate for and tool of private, for-profit energy corporations. For the five FERC commissioners the question is not Will there be a NED or Constitution pipeline? but instead Where specifically will these pipelines and their related infrastructure be located? while generating the least opposition to collateral environmental damage. Put another way, “The pipelines are going to be built. It won’t hurt as much as you think, if you co-operate.”

At a recent Castleton, NY FERC Scoping Meeting, in response to questions about lower pipeline safety standards for rural areas, FERC’s NED Project Manager asserted: Where the pipeline actually goes “... comes down to a cost benefit analysis.” Consequently, even the proposed pipelines’ power grid ROW “co-location” effort is a market-driven concept – not a random act of kindness for field birds.

We have no faith in the vaguely proposed corrosion mitigation concepts or unmanned compressor stations and sector valves – all monitored and remotely controlled by personnel in Houston, TX – especially when the bulk of the NED’s projected shipped product appears headed for foreign export. (As a FERC biologist told me at a KM “Open House” in Schodack, NY, these export opportunities could help stabilize the global price of natural gas... and, as Americans, we need to support such initiatives. He seemed sincere.)

Such patriotic sounding, global initiatives aside – the potential granting of a “Certificate of Public Convenience and Necessity” has become a threat to, not an assurance of environmental justice and public safety – particularly for those who live in the pipeline “potential impact areas” and who ultimately will be forced through eminent domain to provide pipeline easements, access roads and staging areas. (We will also need to pay local taxes on these uninvited easements, as well as State and Federal taxes on any resulting compensation, based on diminished assessments. In spite of glowing, noimpact assertions in the KM/TGP LLC revised Environmental Report, property resale values will drop 30-50%, even without any pre-existing environmental contamination of lands, air, or water supplies.)

Fortunately, under Section 401 of the federal Clean Water Act, New York State DEC can regulate the state’s water quality standards. We urge the protection of our water resources -- and all the associated natural resources – through denial of 401 Water Quality Certificates to both the NED and Constitution gas pipeline projects.

Contamination of and damage to water resources is not a responsible option; despite trends in the Federal Government, NY State should not assume or condone such risks. We assert that our elected officials should not facilitate the profit motives of private/for profit industries and/or corporate shareholders. Unfortunately, it appears such highminded values are not an option. Consequently, if the fear is that State pension funds will be impacted if NYSDEC doesn’t “play ball” – then it is time to divest the offending holdings and reinvest in clean energy initiatives, ideally in-sourced by New York State and powered by our own labor force. Furthermore, water resource damage is also linked directly to airborne emissions, which stem from designed/planned releases, accidents, undetected and ignored system leaks. These issues are already in play in the natural gas transport and delivery systems.

Leaks and deliberate releases of natural gas (as in “blow-downs”) are typically industryaccepted realities. (i.e. – mere costs of doing business) Associated with pipeline gathering and transportation infrastructure, the requisite compressor stations are fixed variables; with turbines fueled by the shipped/fracked natural gas,

they EACH annually (24 x 7) produce tons of hazardous emissions, including volatile organic compounds and greenhouse gasses. The existing infrastructure already demands mitigation. Let's not add even more risk to the present exposure levels by building and expanding obsolete industrial models.

The proposed 50+ year natural gas "bridge fuel" sacrifice of public health and well-being is not moral or ethical. New York should become the leader in renewable energy and should model environmentally responsible energy policies. State submission to the same industry forces the FERC enables and advocates for will never produce the lasting, quality jobs that clean and renewable energy options can spawn.

In all of the 15+ hours of FERC scoping and multiple "open houses" hosted by KM/TGP the only pro-pipeline voices were from union labor. They need, want, and deserve good jobs! A clean energy Renaissance in New York State can provide them. We don't think they were looking for careers in pollution mitigation.

When New Yorkers do have the opportunity to set a national/international example for positive change through the design and implementation of responsible energy policies, why inadvertently or through political neglect support the generation of avoidable hazardous waste(s), water/soil/air contamination, the creation of soft target terrorist opportunities (just a few of the concerns for human and animal populations) along the proposed NED and Constitution routes?

Although presented "separately", these two proposed natural gas pipeline projects are in reality conflated. Approval of one will essentially guarantee the approval of the other. Presented as mere "transportation infrastructure" and therefore allegedly disassociated from the risk realities of the product shipped – such projects will inexorably serve as agents of widening environmental contamination.

Denial of the necessary Section 401 Water Quality Certificates will guarantee we can avoid the numerous cumulative, negative impacts on our communities, populations – born or unborn.

As abutters/stakeholders on the proposed NED path in Stephenstown, NY – my wife and I are appalled by the evasive tactics and arrogance of Kinder Morgan / Tennessee Gas Pipeline. Having attended over 15 hours of FERC Scoping Meetings, it is clear these sessions are merely mandated exercises in "feel good" politics. They have remained polite, but they don't feel good to impacted citizens. It appears the pending EIS for NED will favor KM/TGP – not guarantee protection of our air or water quality. The Constitution Pipeline is part of the same environmental risk package.

In our present era, would Hercules be jailed for the environmental impacts of his 5th Labor? With his struggles in mind, we must start to clean our own Energy Stables -- understaffed, underfunded, and clogged by decades of State and Federal Agency exemptions, segmentation, and collusion. Mitigation of these issues won't be achieved by directing the flow of radon laden, fracked natural gas into (or potentially from) New York through two giant, risk-laden high-pressure pipeline systems, serving as yet unknown and potentially foreign markets. Promotion of natural gas exports to foreign markets cannot reduce the price of energy in domestic markets, one of the primary propipeline arguments cited by KM/TGP.

The FERC asserts export licenses are not in their domain, being restricted to overseeing the sale of natural gas ultimately used in interstate commerce. KM/TGP claims their transport/delivery services are driven by "customers", wherever they may be found. Such elastic thinking has become an accepted part of our national energy policy – now a hydra that can adapt swiftly to circumvent responsible, unbiased management and public pressure. As you know, the FERC Commissioners are independent agents, who answer to no one else. Their criteria for decisions remain undocumented. Citizens must hope and trust they will "act responsibly". However, historically, the only interests of the oil & gas industries have been served predictably. We can cite the "Haliburton Loophole" for part of this unacceptable mess. The FERC advocates for and facilitates the O&G industries. Mitigation is not regulation.

The Pipeline and Hazardous Materials Safety Administration is clearly struggling to fulfill its mandate and appears either unable or unwilling to adequately address inspection protocols. This kind of enforcement vacuum places additional and critical regulatory responsibilities on states. New York is no exception.

Meanwhile, the natural gas industry continues to present the public with thousands of "to be determined"

(TBDs), actively avoiding full disclosure during the completely inadequate comment periods. Industry performance and behaviors prove that “faith” in vaguely referenced technologies cannot guarantee the same degree of security that can come with denial of Section 401 Water Quality Certificates.

My wife and I look forward to your public position statement(s) on these and the many related matters. We hope your deliberations will result in an environmentally optimal, responsible and ethical decision: Denial of the necessary Section 401 Water Quality Certificates for both the Constitution and the NED projects. This would be a brave and highly welcome step toward reframing our collective future through proactive, responsible energy policy reform.

Should these pipeline projects be allowed to transcend the jurisdiction of New York State? Please respond in detail.

Respectfully,

William D. Jackson

RE: Kinder Morgan/Tennessee Gas Pipeline Proposal/NE Direct  
FERC Docket # 14-22

Dear Tim,

I am writing to you with concerns about the DRAFT Environmental statement submitted by TGP/KM to FERC on July 24, 2015. Kinder Morgan has very little, specifically about environmentally sensitive areas in Hudson, NH or David Drive in this latest environmental report.

Kinder Morgan does not consider my property to be affected, however it will fall within a 1000 foot radius that is considered to be a blast/incineration zone that will be completely obliterated in the event of a pipeline explosion at the power lines. I have great concerns my property and the surrounding area is not more of a concern to Kinder Morgan.

My home is set in a wooded area that is a habitat for wildlife and vegetation unique to a wooded area. The vast amount of wildlife roam freely. I am an active gardener and rely on the abundant amount of bees.

My road, David Drive, is part of an 1100 acre watershed that drains into Robinson Pond.

There is an intricate piping system along the entire road, as well as into the area of the proposed pipeline. This piping system is designed to collect the run-off water and bring it down to the pond. The pipeline is proposed to cut across the road at 24 and 25 David Drive. This water shed will be greatly affected during construction and during operation of any pipeline that is installed there. Not only will the water quality of the pond diminish to the point that it can no longer be used for swimming and recreation, but the wildlife and vegetation will either be harmed temporarily or permanently. The large areas of land left devastated from the construction will leave them vulnerable to excessive erosion washing inappropriate substances into

the watershed which will ultimately will end up in the pond.

Robinson Pond, a pristine natural resource in Hudson, NH, is 88 acres of woodland habitat and hiking trails with a swimming area and boat launch. There are in fact historical and archeological areas within the Robinson Pond property including a historic and environmentally sensitive island, Sawdust Island.

Neither the watershed area, Robinson Pond, the historical, archeological nor the wildlife and vegetation appear to be noted anywhere in Kinder Morgan's report. Please find attached a map from NHDES website outlining the watershed for Robinson Pond.

My property is often visited by owls, red tailed hawks, deer, snapping turtles, wild turkeys, squirrels, chipmunks, snakes, salamanders, butterflies, dragon flies, bees, woodpeckers and an assortment of beautiful birds. This wild life comes to my property from Robinson Pond or the surrounding wooded area.

My property contains lady slippers, wild blueberries, wild raspberries, tea berry plants, oak trees, birch trees and an assortment of pine trees.

Robinson Pond and its surrounding forest is a habitat to heron, beavers, Canadian geese, fishers, turtles, bass and pickerel, water lilies, lady slippers, cat tails, teaberry, ferns, deciduous, evergreen and mixed forest.

Kinder Morgan's Resource Report 3, section 3.5.2.2 of the Environmental Report on Fish, Wildlife and Vegetation, shows an unacceptable and negligent admitted acceptance of the anticipated effects on the wildlife and vegetation during and after construction as follows.

*"Direct impacts to wildlife that are temporary in nature are associated with the active construction period of the Project. During construction, wildlife may be temporarily displaced or stressed when construction activities cause them to relocate away from the Project area. Direct impacts to species with greater mobility are expected to be minimal as they can easily avoid the construction area. Other temporary impacts associated with the construction period would likely result from placement of physical barriers. Indirect impacts are primarily associated with noise and increased human activity during the construction period. Long-term direct impacts to wildlife habitat due to construction and operation of the proposed project will be limited to clearing of upland and wetland forest. Clearing of vegetation will temporarily and permanently reduce available habitat cover and food sources for certain species of wildlife, and also may result in habitat fragmentation and loss of interior forest habitat."*

*"As previously discussed, most animals will avoid the work sites due to increased human presence and noise. The prolonged displacement of wildlife from an area may occur where the project is co-located or intersects other projects if construction occurs consecutively or within the same relative timeframe."*

Resource Report 3, section 3.2.3.1 on Wildlife Impacts and Mitigation further reiterates this negligent position of Kinder Morgan.

*"Relocating animals will expend energy finding an alternate location. Depending on the time of year, relative sensitivity of the species and its seasonal habitat selection, and other factors, such as general fitness, reproduction, and viability of young also may be impacted. However, based upon consultations and final impact assessments that will be conducted for more sensitive and/or rare species habitats, timing restrictions on tree removal will likely be implemented to avoid and minimize impacts on wildlife. These timing restrictions will likely be limited to specific areas identified as suitable habitat for a particular rare species within the project workspace."*

*"Tennessee has contracted with a company specializing in evaluating noise impacts and identifying potential nearby receptors including residential and commercial developments, and other sensitive wildlife species or habitats. Resource Report 9 provides additional information on noise impacts and assesses minimization and mitigation alternatives."*

*"Areas cleared for TWS will naturally revegetate within one to two growing seasons and provide additional open land habitat. These areas will not be maintained post-construction, and will eventually revert back to forested habitat over time. Permanent loss of trees will occur within the permanent ROW that will be maintained by mowing and periodic tree removal. Vegetation clearing between HDD entry and exit work*

*spaces will be avoided if possible. Clearing of vegetation will permanently reduce available habitat cover and food sources for certain species of wildlife that primarily rely on forested habitats. However, following a relatively short period of regeneration within the TWS and permanently maintained ROWs, there will be more terrestrial grassland and shrubland habitats that provide important cover and a greater diversity and density of food sources for a different complex of wildlife species. ROW corridors have been demonstrated to provide a greater plant species richness that provides nectar and pollen resources, important for many species of moths and butterflies and an assortment of wild bees (Wagner et al. 2014a,b). Open ROWs also exhibit a high diversity of early successional bird species, some of which have suffered long-term population declines in eastern North America (Askins et al. 2012). Recent research by Stoleson (2013) demonstrates that for a subset of interior forest birds, there is a shift in their habitat use to early-successional areas after nesting but before migration, that results in improved physiological condition.”*

*“Most species are not dependent on any one particular habitat type to provide all of their habitat requirements and many of the mammal, bird, reptile, and amphibian species are adaptive to changing habitat conditions, possessing the capability to expand or shift their home ranges to find alternative sources of food, water, and shelter until the disturbed habitats become re-established (DeGraaf et al. 1992).”*

*“One important direct and long-term effect resulting from vegetation removal is habitat fragmentation and loss of interior forest habitat. Tennessee has routed approximately 84 percent of the total pipeline Project to follow existing utility line ROWs and gas line easements (and thus follow existing forest edges), thereby minimizing the acreage of forest lands crossed and the relatively greater impacts that would be associated with clearing an entirely new ROW through a contiguously forested area. Although colocation significantly reduces the effects of habitat fragmentation, necessary widening of an existing ROW will reduce the overall patch size of adjacent interior forest habitats by transferring the edge-effect deeper into the forest patch. Potential effects of forest fragmentation associated with the Project are discussed in Section 3.2.2.6.”*

*“Similarly, impacts are being minimized associated to temporary and permanent ARs by using existing paved roads, farm roads, agricultural sites and other disturbed open lands, and developed areas where possible. AR locations were submitted to agencies in the most recent consultation request (June 2015) and are still under evaluation. Alternative access will be selected to avoid sensitive wildlife habitats when possible. Proposed ARs designated for temporary and/or permanent use during construction and operation of the pipeline facilities are listed in Resource Report 8. A final selection of facility locations and ARs will be provided in the final ER.”*

*“Tennessee and its construction contractor will strive to minimize impacts on wildlife by expediting construction to the greatest extent possible.”*

*“Restoration and revegetation will occur after construction has been completed, and the restored areas will be closely monitored until final site stabilization and re-vegetation have been achieved.”*

*According to Section 3.2.2 Significant or Sensitive Wildlife Species and Habitats several rounds of consultations with the appropriate federal and state agencies for the Project have been conducted as described in Section 3.0. As of the date of this resource report, Tennessee HAS received responses from all agencies based on the January 2015 Project route. Additional data regarding the most recent June 2015 consultations will be provided in the final ER and in subsequent filings as needed.*

*According to 3.2.3.2 Significant or Sensitive Wildlife Species and Habitats, Tennessee is working to avoid and minimize impacts on sensitive wildlife species and their designated habitats through careful Project design and site selection, including extensive colocation with existing facilities; consultation with appropriate local, state, and federal agencies and private organizations; detailed environmental surveys conducted by qualified wetland scientists, wildlife biologists, and botanists. As the Project develops during 2015, design and implementation of the Project continues and is heavily focused on avoidance and minimization of impacts to the sensitive habitats described in Section 3.2.2. As of the date of this resource report no specific requests have been made by state and federal agencies regarding avoidance, minimization and mitigation for impacts to sensitive properties. This section will be updated with details on steps taken to achieve this in*

*the final ER and in subsequent filings as needed.*

Of equal important is the fact that the residents of David Drive are all on well water that feed off of an aquifer in the area, where we access our drinking water from. We are told by Kinder Morgan in their report that they will monitor the homes within 200 feet of any blasting! Only 200 feet?! We live only four houses down from the proposed blasting, yet over the 200 feet and I am quite sure we will suffer damage to our well and the flow of water from the aquifer to and from our well. I am certain that numerous, if not all residents of David Drive and the surrounding area will suffer from irreversible damage to the aquifer, including the possibility of damage to internal plumbing as a result.

Please find attached a picture from a resident of Pennsylvania describing alternative sources of water supplies, when their wells were damaged, along with their comments.

Please find below a selection of summaries in the Responses to Comments on Draft Resource Reports, May 15, 201 further demonstrating the admitted negligence and acceptance of the damages that the pipeline project would cause.

*“An independent contractor will inspect structures and wells prior to blasting within 200 feet of the construction work area, locations requested by the pipeline Contractor, and at the request of an affected landowner. Post-blast inspections will be performed as warranted. Blasting will be performed by registered blasters and monitored by blasting inspectors. During blasting, the contractor will monitor ground vibrations at the nearest structure (or well) within 200 feet of the construction work area.”*

*“In the unlikely event that blasting activities temporarily impair well water within 200 feet of the construction work area, Tennessee will provide alternative sources of water or otherwise compensate the owner. If well damage is substantiated, Tennessee will either compensate the owner for damages or arrange for a new well to be drilled. In the unlikely event that structural damage occurs at a nearby structure as a result of construction activities, the owner will be compensated for damages or appropriate repairs will be made.”*

The map of Surficial Aquifers in Resource Report 2, page 1 of 6, page 202, does not appear to show any aquifers for Hudson.

Kinder Morgan’s Environmental Report on Water Use and Quality states the following about New Hampshire as a whole.

*Page 20 states as follows.*

*“New Hampshire has two types of aquifers: bedrock aquifers, commonly known as deep or artesian aquifers; and stratified drift aquifers, commonly known as sand and gravel aquifers. Approximately 62 percent of New Hampshire residents rely on groundwater for their drinking water (NHDES 2008). Tennessee is consulting with NHDES to determine the groundwater quality classifications within the project area. Groundwater classification in the New Hampshire portion of the Project will be submitted in the final ER”*

*Page 35 states the following.*

*“Tennessee is currently in the process of identifying and compiling information on the location of private drinking water wells and springs within 200 feet of any Project workspace. As well information becomes available Table 2.1-2 will be updated and will be submitted in the final ER. The location and closest distance from the proposed workspace of all well locations will be submitted in the final ER. Tennessee will implement mitigation measures as described in Section 2.1.6 to ensure protection of identified groundwater resources.”*

*Page 49 states the following.*

*“New Hampshire RSA 485-A:8 classifies surface waters of the state as either Class A or Class B, depending on the designated uses and water quality conditions in the waterbody. Class A waters are of the highest quality and are potentially acceptable for water supply uses after adequate treatment. Discharges of sewage or wastes into waters of this classification are prohibited.”*

*“Any discharges to a surface water resource are subject to NHDES surface water quality regulations (Env-*

Wq 1700), administered by the NHDES Watershed Management Bureau. These regulations established water quality standards for various physical, biological, and chemical parameters for the protection of aquatic life and human health that vary depending on the designated use classification of the waterbody.”

*Section 2.2.6 on Public Watershed Areas/2.2.6.1.4 New Hampshire acknowledges that residents in the vicinity of the proposed pipeline facilities in western New Hampshire rely on private wells for their drinking water. It claims that Tennessee is in the process of reviewing USGS mapping to identify surface water reservoirs identified in the Project and available NHDES water resources GIS data layers. It further claims that consultations with local officials concerning drinking water resources in the area have been initiated but no responses have been received as of the date of this Resource Report. Information on public water supply areas for New Hampshire will be submitted in final ER.*

*Section 2.2.7 on Hydrostatic Test Water talks about the conduction of hydrostatic testing on all pipeline segments prior to placing them in service. They claim that these test will be conducted in compliance with USDOT specifications. This procedure would allow the water remaining from the hydrostatic tests to be discharged to an upland area through a dewatering structure consisting of an energy dissipation device and water filtration structure. Environmental impacts from withdrawal and discharge of test water will be minimized by utilizing the measures outlined in the Tennessee’s Project-specific Plan and Procedures (Volume II, Appendix H) and incorporated into the Project-specific ECPs for each state, as well as by complying with all applicable state and federal permit requirements.*

The Environment Report actually does make a vague mention of an unnamed tributary to Robinson Pond, referring to impairments and contaminants that Kinder Morgan will work with the NHDES to determine the depth of and avoid these contaminants.

The report further states that the Project is not anticipated to impact any water quality management and improvement plans associated with listed waters, one being this unnamed tributary, in the vicinity of the project.

*Section 2.2.10 Surface Water Construction and Operation Impacts claims that where temporary impacts to surface waterbodies cannot be avoided during construction activities, Tennessee will restore and stabilize these areas upon completion of pipeline installation to pre-construction conditions.*

*Page 4 of Report 2 4 of 6 regarding Hazardous Waste Locations numerous dots throughout Hudson noting Site Remediation and Groundwater Hazards Inventory (NH) I am not sure if these refer to asbestos that is prevalent in Hudson or something else. Most are noted further away from pond and site of proposed construction/a cluster appears at the beginning and end of the Londonderry tail end of Hudson, a bit below the site of construction. Multiple EPA sights marked throughout Hudson a distance away from site of proposed construction. One site appears to be marked at the Nashua end as a SPILL SITE.*

Section 5.6 on Property Value and section 5.7 on Homeowner’s Insurance specifically claim that property values will not decrease not will insurance costs increase. I find this difficult to believe and would like to see an in depth analysis of these areas.

Kinder Morgan’s admitted plans for our environment and properties are just as unacceptable as the numerous omissions contained in their latest report submitted to Kinder Morgan.

The issues I have relayed to you are limited to the ones I am aware of. I am not an environmental expert and would like a full evaluation of the environmental issues concerning my property, my road and the pond area. A project of this magnitude with such significant environmental impact, should be allowed more attention, with a separate environmental study and report for EACH town effected. Please specifically request this in your report. I will be as well.

As the days progress, I will be talking to others along the proposed route in Hudson and reading additional portions of the environmental report. If I am able to get any feedback of any significance, I will forward them along to you.

Thank you for your assistance!

Sincerely,  
Margaret (Peggy) Huard

**20150803-5067**

Albert Lefebvre, Rindge, NH.  
Project Docket No: PF 14-22

Comments made at Nashua NH Scoping Session on July 29, 2015

My name is Albert Lefebvre and I live in Rindge NH which is along the path of the pipeline. I am a member of the Rindge Conservation Commission. As a Commission member, I request that the Federal Energy Regulatory Commission schedule new scoping sessions after we and other Conservation Commissions have had the opportunity to review and respond to the over 6500 page Resource Report prepared by Kinder-Morgan with, I might add, many items still to be decided. Those items must be completed and distributed to every affected community, Conservation Commission and other town boards in order to understand the full ramifications of the pipeline and what Kinder-Morgan has studied or is planning to study or has not properly studied. How can we as everyday citizens attempt to properly respond to this incomplete Kinder-Morgan report? It is, to say the least, unprofessional, unethical, condescending and without merit to us and you the Federal Energy Regulatory Commission.

Kinder-Morgan is a multi-billion dollar corporation with vast and varied resources at its disposal that it can draw upon and pay for. It is associated with and can draw upon the whole world-wide energy structure for assistance. Kinder-Morgan's financial resources are like a huge Goliath compared with those of the small towns along the proposed route. It seems to the people that Kinder-Morgan and the Federal Energy Regulatory Commission are using and taking advantage of the people by its actions in this regard. These small towns have significantly fewer financial and human resources to address the monumental issues confronting them with this pipeline. How can these small towns develop responsible responses in such a short period of time? How can you, a regulatory commission, allow this to happen? How is it that our government, its leaders, legislative bodies and the various arms of the government not concern itself with this issue?

The Federal Energy Regulatory Commission will certainly be looked upon negatively in NH and elsewhere if it cannot agree to an extension until all reports are completed and the towns and their people have sufficient time to respond and then to allow the Commission to ethically weigh the issues of the people of this region.

Thank you for your attention to this matter and I look forward to a response.

**20150803-5087**

Peter Feitner, Cummington, MA.

Feedback on the spending of public dollars for the direct benefit of for profit corporations (in this instance AKA: FERC, now a subsidiary of Kinder Morgan).

I recently have read the Suggested Best Practices for Industry Outreach Programs to Stakeholders and it is clearly a dedicated publication and program designed to assist industry in selling their programs to the public. This service is not described in the FERC description of its existing role: The Federal Energy Regulatory Commission (FERC or Commission) is an independent agency that regulates the interstate transmission of electricity, natural gas, and oil. FERC also authorizes the siting, construction, and operation of facilities for transporting natural gas in interstate commerce, for liquefied natural gas (LNG) import and export terminals,

and for non-federal hydroelectric projects.

The employment of staff time and agency resource in this manner, while pretending to be in the public best interest, is clearly a bleeding of the Federal system to further enhance and enrich the private industrial corporate activities to further strip resources and profit counter to the actual public good and profit.

If you are going to act as a federal agency, and want to be perceived as “independent” then where are the specific publications and programs developed in order to assist communities and landowners with their roles in these processes? For many of the communities being affected by industry profit activities, the suggested list of: “A public outreach program for any project should begin while the commercial aspects and project scope are still being determined. During this early stage of project development, the project team is created. A project team typically consists of individuals who can effectively fulfill the following roles:

- Project Developer
- Engineer
- Project Manager
- Attorney
- Regulatory Agency Representative
- Right-of-Way (Lands) Representative
- Environmental Analyst
- Government Affairs Representative
- Stakeholder Outreach Representative
- Media/Public Affairs Representative
- Local Operations Representative.

the roster is larger in most instances than the entire local governments and outstrips the financial capacity of the small communities that you recommend as targets in order to avoid more involved and complex public opposition. In addition, you are most certainly addressing the only stakeholder you hold as having of genuine value/significance to this process, which are the corporate participants in the profit venture.

Further you write: “The Commission staff suggests that companies consider working with public relations specialists in the project area that are familiar with elected officials and the local

and regional political issues. These firms can assist in disseminating project information to the media and initial key stakeholders and in developing a complete stakeholder outreach plan. It is very important to understand the culture of the project area where a natural gas facility is proposed.”

Not a suggestion that is easily viewed as being “independent” - independent of what exactly?

Clearly you have created a helpful roadmap and facilitate a process overwhelmingly created to assist industry.

I have attended public meetings where FERC staff have overseen the process, and even in those settings, while the staff is providing a process where the public concerns can be heard, they have been managed and organized in order to simplify to bullet form a compilation of “concerns” which then become a convenient time saving assistance to the industry applicant in targeting the preparation of their applications in order to demonstrate due diligence and genuine concern when there is truthfully little to none. It is all about the money.

If a private corporation wishes to engage in a profit making venture, then they should do so on their own, without the further coddling of the federal government and the application of tax dollars, which they will happily take and more happily not return via their assisted accounting finagling to avoid tax obligations.

If you believe that it is truly in the best interest of FERC to involve in this way, then you should either create and support financially programs specifically targeted to assist small communities and/or independent not-for-profit groups in development of similar strategic programs. The path you are on is not looking particularly independent.

### 20150803-5093

Peter Gill, Conway, MA.

I am a resident of the Town of Conway, MA. I oppose the Northeast Energy Direct Project that Kinder Morgan Energy and Tennessee Gas are proposing to build.

I am opposed to the hydrofracked pipeline stems for many reasons. My concerns are listed below:

- 1.) Fracked gas contains many toxic chemicals. Over time, even the soundest of pipes develop leaks.
- 2.) In rural areas such as ours, pipeline safety standards are less stringent than in more densely populated places.
- 3.) If a catastrophic event takes place, local fire departments may not be equipped to respond adequately. Insuring their readiness would require additional training and equipment. Small towns don't have the money for the kind of upgrade required.
- 4.) Homeowners who don't favor the project may be legally forced to grant a right of way.
- 5.) If damage to our infrastructure and beautiful landscape occurs during construction, repair (if possible) will cost.
- 6.) The economic vitality of our town is at stake. In a degraded, high-risk area, buying a home, business or farm would be unappealing. Property values would certainly go down.
- 7.) It is my understanding that most of the gas carried by the pipeline is to be exported overseas. It will not be used by Americans and will profit only Kinder Morgan/Tennessee Gas and their shareholders.
- 8.) The pipeline will cross in/thru/under valuable natural resources. The resources will be destroyed and/or be at risk from the building, operating and maintaining of the pipeline.
9. The pipeline will permanently scar the rural and scenic nature of Conway and other western Massachusetts towns.

### 20150803-5094

Marilyn Learner, Hollis, NH.

The FERC approval process for PF 14-22 is seriously flawed.

In December, 2014 Kinder Morgan significantly changed the route of their massive high pressure fracked gas pipeline route.

Why did the FERC approval process timeline remain the same? How does a substantially new route, which impacts different land owners, different conservation lands, different wells, aquifers, and towns NOT constitute a NEW PROJECT, generating a new docket number and a new approval process timeline?

It would appear that for purposes of rushing a project through FERC's process, corporations can and will file just about any plan, get a docket number to start the clock, and re-submit changes well into the process. "Submit and switch" chews up much of the public's time to learn and thus disadvantages more recently identified, but nevertheless, impacted land owners.

Why does FERC consider corporate needs more important than citizen needs in determining the approval timeline? If citizen needs were considered equal to corporate needs, FERC's process would guarantee a re-start of the clock if a submitter significantly changed a route and citizens, municipalities and other affected constituencies requested the re-start.

FERC is acting like a perfunctory siting agency, not a regulatory agency, and Kinder Morgan knows how to play with the rules. KM submits a plan and starts the clock, after a significant amount of time the KM drastically changes the route, essentially creating new project, but the original timeline clock keeps on ticking....

One thing FERC's process does very well; it very effectively erodes the public trust!

Peter Feitner, Cummington, MA.

Concerns and request for careful study: I am a resident of a community that will be directly impacted negatively by the proposed NED pipeline project. I have all of the concerns regarding air, soil and water quality. Specifically I am extremely concerned that this pipeline will cross a number of significant and essential rivers, streams and creeks that will effect the entire region in addition to threatening agricultural interests in this rural agricultural area.

FERC should require specific and detailed maps and watershed information, a roster of all potentially effected lands, and have the specific permission of any/all individual effected to pose that particular threat. Absence of opposition is not the same as permission. There should be extensive emergency preparedness plans developed and in place, along with the industry supplied emergency infrastructure for all effected communities.

I do not believe that there has been any genuine study into the specific public need for this new pipeline planned to disrupt irrevocably the rural area. For the application to have been amended from a 36" dia to 30" dia pipe in a short time period indicates that there is a process of dart-throwing by the industry to have their way through the permitting process. That almost 20% reduction in capacity when viewed with the further amendment to remove proposed leg lines should be a clear indicator that there is no genuine public need for this project, only a private and perhaps governmental desire. They seem to be looking for a palatable threshold whereby they can profit handsomely to the greatest extent.

There is no genuine concern by the corporate sponsors for the industrialization of this rural area. The inclusion of Compressor Stations, while necessary, would forever change negatively the rural environment via the addition of constant noise and constant light via operations.

I have a very strong concern regarding noise and the effect of placing into service industrial compressors stations which will run 24 hrs per day 365 days per year. There is absolutely no precedent for such a thing in these areas. If allowed, it will destroy the rural preserved nature of the region (which the residents of this area particularly have chosen and support). Had we a desire to live elsewhere, in a more industrialized area where noise is common and where there is compromised dark sky, then we would move. Neither I, nor anyone I know, relish the idea of needing to move in order to regain what we already have and enjoy.

I have read information regarding the determination for ambient noise and sound limits and am immediately struck by the fact that they can be simply manipulated to indicate vastly higher levels of background noise averages. There is absolutely no comparison between a noise, any noise, that is loud and intermittent in a rural area, versus a constant running industrial noise. The only way around this reality is to hide the acceptability of the noise to be produced by the compressor stations is to manipulate numbers contained in charts submitted in reports designed to placate application requirements.

Additionally, if allowed to be operated, the result is the laddering up of the noise baselines, which is the just the slippery slope to screwing up yet another of our disappearing rural areas.

I am also concerned that the preliminary reports submitted already indicate a willingness by TG to manipulate information. Not only is there no actual data in many of the TGP supplied tables (all TBD), there is inclusion/reference of studies suggested as being similar sourced from other projects in other areas which may have no actual applicability. This is a way for the corporation to favorably seed the ground, as opposed to supplying detailed or helpful information.

Then there is the matter of "blowdowns". The existence of appropriate "exhaust silencers" is utter rubbish. What is accurate is perhaps a "suppressor" which at least indicates acknowledgement that there is a noise that A) needs to be suppressed in order to be tolerable, and B) that there is no possible removal or silencing of that noise. This is rather essential in accurately understanding the impact of any constant noise on any area.

Lastly, in regard to noise, is the matter of "pure tone". There is no question that any/all turbines (or any

machinery, for that matter) produce “pure tones”. Hiding those among other noise sources does not negate that those pure tones exist, only that they are potentially palatable. You only need to have ever worked in a setting with a faulty resistor on a florescent light fixture to know that even though that hidden “pure tone” (because by the definitions to be utilized, the group of pure tones of the multi-frequency buzzing would not be considered as an identified pure tone) would be acceptable according to paper, it is intolerable in practice. No one has to endure that environment 365 days a year/24 hours per day; not even prisoners (unless being tortured).

I am sure to have more to say about this all, and will. This pipeline should not be built and forced through this area. Within the state there are areas that have already been degraded by industrial activities where pipelines, and compressor stations already exist. If there is a need for more pipeline capacity to service the residents of MA (or most probable, to export at a private corporate profit to other areas (with the end profit and benefits arriving wherever the Kinder Morgan executives live and work - AKA not in MA), then expand the capacity in those places and leave our rural and agricultural environments alone.

### **20150803-5111**

Susan Secco, Northfield, MA.

In the process of investigating the proposed NED pipeline I ask that you take my concerns into consideration.

The Commonwealth of Massachusetts does not need a new pipeline. We could satisfy our natural gas needs by repairing existing pipeline leaks and by allowing more renewable energy infrastructure. My husband and I live off the grid so we know it is possible to live comfortably with very little reliance on fossil fuels. Furthermore, a new pipeline will not enable Massachusetts to meet the goal of reducing carbon emissions.

The proposed pipeline crosses the Mill Brook in Northfield, MA within my family’s property. Drilling and blasting around Mill Brook will not only destroy the natural environment in my backyard and disrupt my home environment during construction, but will also have impact the town water supply as Mill Brook feeds into the watershed.

I am concerned that we have not been given any details as to what will happen to the many trees on our property that would need to be cut in order to make a path for the pipeline. Will they be removed from our land and will we be compensated for their value? Or will the trees and resulting brush and debris be left behind?

Warwick Road, the road leading to this section of the proposed pipeline, is a very small rural road with many small bridge crossings over Mill Brook. The impact of heavy equipment on this road will be substantial. This is the only road available to me and my family to get anywhere from our home. If it is damaged I would not be able to get to town or to work.

Finally, on a recent map it seems that Kinder Morgan proposes to use our driveway as an access road to this section of the pipeline. (Segment H,I, page 22 current Mapbook). Not only were we never contacted about this plan, we have denied access to our land for any purposes. In reality, our driveway is so steep and winding that the idea of using it for heavy equipment access is ludicrous.

### **20150803-5201**

Theresa Grant, Pelham, NH.

I am a landowner within the incineration zone for the proposed pipeline. I am vehemently opposed to this pipeline. I feel we have been blindsided by this proposal.

There are many reasons I am opposed. The first reason being I question if there really is a need for this pipeline. There are other pipeline projects that are in the works. I do not see sufficient information validating the need for NED. Access Northeast and the partnership of Algonquin Power and Utilities and Spectra Utilities are both working on other projects to provide for the “so called” demand. The NED seems to me to be primarily an export pipeline with no benefit for New Hampshire yet I see the impact on Southern New

Hampshire as being tremendous.

I originally moved to New Hampshire for the rural character. The trees, rivers, streams, brooks and lakes are all a big part of the beauty of our state. The home I have lived in for 13 years with my children has been a sanctuary for us. When I originally moved to my home I knew the power lines were close by and I truly thought that because they were there as well as Golden Brook and wetlands I would have a peaceful area with no potential for any building therefore providing a beautiful lot surrounded by nature and lots of privacy. I never in my wildest nightmares thought that there would ever be potential for a gas pipeline to come so close to the power lines, the wetlands, or my neighborhood.

The very thought of a private pipeline coming into my neighborhood is shocking. We all plan our lives. Where we live is a BIG consideration. To think that after all my careful planning and dreaming of life here with my children I could be asked to leave by eminent domain is unfathomable to me. And if not asked to leave I will have front row view of deforestation and razing of my neighborhood. We are nauseous thinking about either option. Most of us just heard about this project in January. During January and February we were buried in snow. Day to day life was shoveling snow to get to work, school, and maintaining basic life needs. This entire idea is being FORCED upon us, very fast!

I have many concerns about this project.

-The many aquifers that will be affected. How will this affect the water table in the area? How will it impact the many private and public wells along the route? Quality and supply of water?

-Blasting thru granite and the radon emitted. How does this affect the areas drinking water? The air?? How does the blasting and construction affect the houses in the area? Cracking foundations? Settling?

-The vast amount off effects on the environment. Water, plants, wild life, trees, air. Not only the construction phase but the ongoing affects after the pipeline has disrupted all of the above.

-Property values will be impacted negatively. Which in turn will affect the town's taxes. Small towns depend on real estate taxes for its budget.

Please say no to this project coming thru Southern New Hampshire. Please let us continue to preserve our beautiful neighborhoods and state.

Thank You, Theresa Grant

### **20150803-5203**

Michelle Cross, Nassau, NY.

RE: PF14-22-000 – NED Gas Pipeline

I stand before you opposing the construction of the NED gas pipeline and the 90,000 HP compressor station currently proposed for Clarks Chapel Road.

My Husband, two small children and I live within the designated 1/2 mile zone of the Compressor station and the proposed gas pipeline route will abut our property. This property has been in our family for three generations. My husband and I have certain desires and dreams for our family and raising our children in a rural residential, agricultural environment was high on our priorities. We both work 40+ hr/week jobs in addition to running our farm. We do this to maintain the quality of life that we desire, we choose to live here; to raise our children on organically grown fruits and vegetable and farm-raised beef and chicken. Not in an industrial waste zone, which is exactly what will happen to this community with the introduction of a 90,000 hp compressor station and 36" fracked gas pipeline.

My concerns for this construction, that I respectfully request FERC to fully investigate, are as follows:

The short term and long term impact, from the noise pollution from a constantly running 90,000 HP compressor station, will have on residents that are identified as living within the 1/2 mile zone.

The environmental impact and air quality impacts, both short term and long term, of the emissions of the 90000 HP compressor station. This study should include emissions from Blowdowns, Fugitive emissions as

well as accidental emissions. Even during normal operations compressor stations have been shown not to emit uniformly. The measurement of tons per year, while common in the industry and common in the environmental field where regional air quality is at issue, is not an appropriate measure to determine individuals' health risks which increase during episodes of high exposures.

The environmental impact that the proposed gas pipeline will have on the waterways that it will cross, specifically the Valatie Kill Creek. Also the surrounding bodies of water, including but not limited to the Burden Lakes, Crystal Lake, Mud Pond, Lyons Lake, Smith Pond and the Nassau Sportsman's Club pond must also be included in this study.

This study must also include the short and long term effects on ground water as the potable water for most if not all of the proposed area originates from wells. A single vein could be drilled and feeding multiple homes. Once contaminated, those contaminants will permeate and spread throughout the water table and seep further into the soil, making it nearly impossible to eradicate. It's no secret that what goes up, must come down that air pollution will ultimately result in soil and ground water contaminations. Nassau and surrounding towns are already intimately familiar with the pollutant results from big business due to the Dewey Loeffel Landfill Superfund.

I ask that FERC require Kinder Morgan to review alternative routes that would better suit the construction and access of such a pipeline and compressor station, such as along the I90 corridor or upgrading, if necessary, and utilizing existing pipelines. The sheer size of this project will unduly tax our infrastructure, and volunteer agencies. A magnitude of a catastrophe that this pipeline could bring to our backyards is unconscionable.

Currently, with the surrounding wooded areas intact, I can hear boats and jet skis on the Burden Lakes as well as the races at Lebanon Valley Speedway. With the construction of the compressor station and gas pipeline, there will be removal of natural sound barriers and buffers, the TREES and without them, the sound will be further magnified.

Should this proposal get the unfortunate nod to move forward, I respectfully request that FERC closely dictate and constantly monitor the construction and require lifetime metering and routine inspections for the entire life of the pipeline and operation of the compressor station to mitigate noise, air, water, and land pollution at all times.

Please listen to the LOUD voices of the Nassau, Schodack, Averill Park and Sand Lake residents. We live here, we raise our families here, we make our livings here, and we retire here. We are not expendable for the monetary gain of any company.

## **20150803-5246**

Susan M Baxter, Appleton, WI.

08/03/2015

The current narrative for the proposed NED (PF14-22) indicates that one of the "benefits" of the proposed project is that bees will have the opportunity to make use of the nectar and pollen resources from the ROW. RR3 Sect. 3.2.3.1

"However, following a relatively short period of regeneration within the TWS and permanently maintained ROWs, there will be more terrestrial grassland and shrubland habitats that provide important cover and a greater diversity and density of food sources for a different complex of wildlife species. ROW corridors have been demonstrated to provide a greater plant species richness that provides nectar and pollen resources, important for many species of moths and butterflies and an assortment of wild bees (Wagner et al. 2014a,b)."

Well, at least until the bees cause problems during ROW maintenance.

(See Application at #20030814-0027 "Abbreviated application requesting FERC to issue an order amending the certificates of public convenience and necessity under CP81-296 et al.")

Also from RR3 Sect. 3.2.3.1

“Long-term direct impacts to wildlife habitat due to construction and operation of the proposed Project will be limited to clearing of upland and wetland forests required for temporary workspace (“TWS”) and new permanent easement. Areas cleared for TWS will naturally revegetate within one to two growing seasons and provide additional open land habitat (i.e., shrubland and old field). These areas will not be maintained post-construction, and will eventually revert back to forested habitat over time.”

I have personally been on site visits with TGP employees who say that there is nothing they can do about the invasive species of plants which have left the ROW. Since we were looking at phragmites (obligate wetland indicators) it would seem that placing a loop in an already infested area, is a particularly unwise idea. Especially when it is acknowledged up front that TWS and ATWS not in the permanent ROW will not be maintained.

Who will be ultimately responsible for OFF-ROW maintenance activities in regard to invasive species control and/or eradication? Is TGP including permanent monetary reimbursement for any necessary maintenance to the landowners of the temporary easement areas? Staying out of wetlands completely is a potential solution, and frankly a less expensive one.

I request that since there is already twelve years of data available somewhere about ROW maintenance activities with respect to bees and invasive plants, it would be nice to see this information and perhaps an analysis of the effectiveness of the amendments made to the certificates referenced in Tennessee Gas Pipeline’s “Abbreviated application requesting FERC to issue an order amending the certificates of public convenience and necessity under CP81-296 et al.” (#20030814-0027 and maps #20030814-0029).

Sincerely, Susan Baxter

## 20150803-5253

Kimberly D. Bose, Secretary Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

August 3, 2015

Dear Secretary Bose,

This letter is in reference to Docket No. PF1422000.

How can it be that our wetlands, trails, parks and protected areas including a reservoir, along with New Hampshire citizens’ private property can be bulldozed and blasted under the banner of “Eminent Domain” by a private corporation for potential profits from the sale of natural gas transported through NH via pipeline to customers mainly overseas. How can any private corporation be given clearance to site a compressor station in close proximity to an elementary school (TES) and town drinking water supply (Tobey Reservoir) just to name two sites located in my town of residence? How can a private corporation be allowed to emit toxins through compressor station blowdowns and compromise the health of residents and wildlife throughout the region? Residents of the affected towns have local ordinances that were carefully designed to protect our air, water, land, health and natural heritage that we must observe to protect the environment for the greater good of all who reside in and visit this region. Do these ordinances not to apply to Kinder Morgan and Tennessee Gas Pipeline? Who ensures compliance?

As a net exporter of energy, NH does not need the proposed Northeast Energy Direct pipeline. We will suffer irreparable harm to our protected natural resources caused by construction of the NED pipeline and the ongoing threat it and the proposed New Ipswich compressor station pose to south western and south central NH.

I urge the FERC commissioners to say no to shortsighted fossil fuel corporate interests, specifically KinderMorgan and Tennessee Gas Pipeline, and say yes to the continued health and wellbeing of current and future generations of NH residents, our guests and our unique natural heritage that we share with visitors

from all over the world. Please deny the NED project!

Thank you for your time and consideration.

Sincerely,

Carol Mamczak

Temple, NH

cc: NH Governor Maggie Hassan, US Senator Jeanne Shaheen, US Senator Kelly Ayotte, US Congresswoman Ann Kuster

Stu Moncrieff, Merrimack, NH.

RE: Northeast Energy Direct, Docket No. PF14-22-000

I was in attendance at the FERC scoping meeting held on July 29, 2015 in Nashua, New Hampshire. Based on things discussed, I offer the following comments for the Record:

1. At this meeting, Eric Tomase, the FERC project manager for the Northeast Energy Direct project, encouraged affected landowners to grant access for Kinder Morgan to perform surveys. No government agency should advise its citizens to give up their right to protect their property from trespass.
2. It is widely reported that there is no “need” for this project at all. It is also widely reported that the fracked gas will be sent through Maine to Canada, for export to the European market. Does foreign demand constitute a “need”? Should thousands of domestic landowners (U.S. citizens!) suffer economic losses and risk of harm to satisfy a foreign “need”?
3. Speaking of “need”, Page 2 of the FERC handout from the above referenced meeting (About the Agency, How it Makes Decisions, and How Natural Gas Companies Whose Projects Are Found to Have Public Benefits Can Acquire a Pipeline Right-of-Way), under a section titled “How Do the Commissioners Determine Public Benefit and Need” states the following: “First, any new project must be financially supportable without relying on subsidization ...”. However, an electric tariff on New England electric customers has been proposed, to subsidize the construction of this pipe, with the financial benefit (profit) going to a corporation. This project’s approach appears contradictory to FERC’s stated message regarding subsidization.
4. Like many other New Hampshire landowners affected by this proposal, I obtain my drinking water from a drilled well and am EXTREMELY concerned about long-term effect on the quality of my water. We have all heard of the environmental and health damage caused by chemicals required for fracking (lead, benzene, mercury, and ethylene glycol, to name a few), and now this pipe will bring these chemicals to New York, Massachusetts and New Hampshire. These chemicals will ooze from the inevitable leaks in the pipe, and spread the environmental disaster of fracking well beyond the drill sites. The effect of these chemicals will ultimately travel well beyond the 1000’ blast radius of the pipe.
5. Further destroying our water quality is the proposed use of herbicides to stunt vegetation growth along the 400+ miles of this pipeline. Should this pipe be approved, vegetation management should be allowed ONLY by periodic mowing.

I reserve my right to provide additional comments at a later date.

Thank you.

Stu Moncrieff

FERC Scoping Hearing 7-15-2015,

Re: North East Direct pipeline proposal, FERC Docket #PF 14-22-000

Moderator Eric Tomasi;

Tonight I will speak about nitrogen dioxide (NO<sub>2</sub>) emissions originating from the burning of fracked gas at compressor stations especially the one proposed for Clark's Chapel Road in the Town of Nassau, State of New York. The federal Environmental Protection Agency lists nitrogen dioxide as one of six pollutants/toxins that EPA is trying to reduce levels of to be safe for humans.

Nitrogen Dioxide will combust, sometimes explosively. It combines readily with many compounds, such as human tissue and other hydrocarbons. Its primary way to reach human tissue is through inhalation. In small amounts it can cause dizziness, aggravate weak heart muscles, aggravate asthma, and other pulmonary conditions. In larger amounts or over accumulated time it can destroy human organ tissue.

In a Nitrogen Dioxide study in Pennsylvania at the Barto Compressor Station in Penn Township, Lycoming County, it was found the station exceeded EPA emission standards (See attached AERMOD Modeling report prepared for Mr. Jay Duffy of the Clean Air Council). Assuming the one-hour test results at Barto were an average in a twenty four hour day, and using the data in the study, I figured the total capacity of the Barto plant is 19,350 horsepower and this station could possibly emit 93 tons of NO<sub>x</sub>, per year. Extrapolating this (and not taking into account the pipeline pressure differences) with the proposed NED 90,000 horsepower proposed Clark's Chapel Road station, the 90,000 HP station could possibly emit 434 tons per year, every year.

The Barto test also illustrates that wind direction and terrain features determine where and how much NO<sub>2</sub> is deposited in the environment. At the Clark's Chapel Road compressor station the winds are predominantly from the south. There are approximately 350 single family homes within a two mile radius of the compressor station site. About 150 of those are on or very near the southern and western shores of Burden Lake within the two mile radius. The south end of the lake is about 3/8ths of a mile directly north of the compressor station site. Having the compressor station NO<sub>2</sub> emissions (and other oxides of nitrogen) blow north onto the lake year after year, may in my opinion, make the lake unsafe for swimming, fishing and the tainted water would seep into the ground ruining the well water of the homes. It also shows the percentage of emissions in excess of NAAQS standards. Tier-1 278% in excess, Tier-2 209% in excess, and Tier-3 88% in excess of standards. It also shows Tier-I samplings extended, because of the predominant west winds, up to 3,500 meters (close to 2 1/2 miles) to the east. Because of the lack of terrain features on Burden Lake the toxins and pollutants are going to blow northward up the full length of the 2 1/2, mile long lake.

Sincerely,

Clark J. Shaughnessy

Docket No.: PF14-22-000

ATTN: OEP-DG2E-G2s3, PJ11.3

Dear Ms. Bose,

Let me introduce myself. My husband and I are the present owners of land directly across the road from Gulf Road, Northfield, MA., Prospect Road, that leads to the top of Brush Mountain. The Tennessee Gas Pipeline Company is proposing to locate a new compressor station on Gulf Road ... directly across from Prospect Road.

The property was acquired from the Offingers in the late 19SIYs, 64+ acres. I aptly name it "Procupine Precipice". The Offingers used the property as their get-away. They had built a camp, blazed X-country skiing trails, maintained a ski slope, dug wells and enjoyed this property to the fullest.

My family has, and continues to enjoy this area for more than 4 generations. There is a variety of wildlife, especially deer and bears. Great hiking trails, stone walls, cellar holes (where our forefathers once lived), springs, swamps, caves and all kinds of recorded history.

Please note: In the 1875 History of Northfield oage 48, Brush Mountain is one of the places mentioned. The Indians called Brush Mountain "Mish-om-assek" as it housed colonies of rattlesnakes. It was held in veneration by the Indians. They believed an evil-spirit dwelled inside the mountain where the snakes denned. This spirit sent forth his hot breath and melted the snow and made anyone who dared inhale the poisonous air faint. Tradition has it that he once bellowed from his hiding place and shook the earth. The Indians shunned the Gulf and adjacent mountain sides fearing the rattlesnakes and the evil spirit. Could this bit of history actually be an omen?

My family and I feel that locating the pipeline and compressor in this area will create a disaster waiting to happen. Northfield could become a statistic and the dreams of current and future generations will be shattered. The pristine land could become a wasteland.

Please do all possible to insure that the Tennessee Gas Pipeline Company does not become a reality on this "sacred area of Northfield.

Sincerely,  
Rita Mefio Huber  
Native of Northfield Massachusetts and Concerned Citizen

Re: Opposition to the Proposed NED project by Kinder Morgan/Tennessee Gas

Dear: Whom it may concern

The proposal by Kinder Morgan and its subsidiary, Tennessee Gas, to build the facked gas pipeline called NED will be detrimental to the people, infrastructure, and environment of my county.

I am writing to you in the hope that you will listen to those of us who are aware of the dangers this project poses and will take whatever action you can to stop its construction.

My opposition to the NED stems fom the following facts:

1. Pipeline safety tandards in rural areas are much lower than in urban ones. People who live along the proposed mute are being treatde as if they are less worthy of protection than their fellow urban citizens because fewer of them may be harmed by the project.
2. The pipeline as proposed, will be 36 inches in diameter and will carry hydro-fracked gas at approximately 1400 psi through pristine woods and under various (currently) unpolluted rivers and streams. This land, which many of us have fought to protect, will be adversely affected by the costruction and on-going operation of the NED.
3. In addition to the possibility of rupture, pipelines like this inevitably develop leaks fom welding joints. The process of hydro-fracking gas has been banned in New York State in part bectauue of the known toxins the process produces. Yet this pipeline will transport these same toxins through leaky pipes across our state.
4. According to many reports, the federal and state agencies responsible for pipeline safety are very under-funded and under-manned.
5. Most of the residents along the pipeline route will receive no compensation for bearing the risks the NED poses. In fact, their burden is increased by potentially higher taxes and insurance rates, as well as lower property values. In addition, no New Yorker will get any of the gas or will benefit by lower gas prices, because it is most likely that Kinder Morgan's plan is to market the gas abroad.

I would appreciate your attention to this matter and thank you in advance for your help

Erica E. Magill  
149 Manrow Rd  
Averill Part, NY 12018  
7/25/15

**20150804-0039**

Dear Whomever:

Kinder Morgan and its subsidiary, Tennessee Gas, propose to build and operate a 36-inch pipeline to daily transport up to 2.2 billion cubic feet of hydro-fractured gas at a pressure of up to 1,460 pounds per square inch from Pennsylvania, through New York to Dracut, Massachusetts. The proposal is called the North-east Energy Direct pipeline project (NED) and hss been assigned Federal Energy Regulatory Commission (FERC) Docket # PF 14-22.

Please stop the NED in order to protect my family and community. I oppose this project for the following reasons:

- No New Yorkers will receive any of the gas and almost all of it will be exported to foreign markets.
- Pipeline safety standards in rural areas are much lower than in urban areas, effectively treating constituents who live in the rural communities along the proposed route as second class citizens.
- The governing federal and state regulations and the resources used to ensure pipeline safety during construction, operation and decommissioning phases are woefully inadequate.
- Only landowners whose lands abut the pipeline route may receive compensation. All other residents along the pipeline corridor, even those within the “incineration zone,” involuntarily assume the risk of death, personal injury and property damage in the event of a rupture, but receive no compensation for their risk and diminished quality of life, or the assault on the quiet enjoyment of their homes.
- Property values along the pipeline will decline and reduce assessed valuations. This in turn will increase the tax burden on properties further away from the pipeline.
- The federal process for approving and constructing gas pipelines violates the requirement of the National Environmental Policy Act (NEPA) to minimize cumulative negative impacts that federal agency decisions may have on public safety, health and the environment.
- No single federal entity oversees the NED project as a whole. For example, the Federal Energy Regulatory Commission decides whether and where the NED is built. The Department of State decides whether the gas may be exported. The Pipeline and Hazardous Material Safety Administration governs pipeline safety. Each agency pleads lack of jurisdiction to review or do anything that could be seen as falling within the jurisdiction of another agency. Oversight of the project is therefore segmented, hindering the public’s ability to effectively review and voice concerns about the NED.
- Investment in dirty 20th century gas infrastructure (thousands of pipeline miles; industrial-sized compressor stations) delays development of sustainable, safer energy sources and associated permanent jobs and gives competitive advantage to countries investing in the development of green technology and energy.

Thank you for your attention to this matter.

Dalton MacN?

 Averill Park, NY 12018

**20150804-0043**

July 20, 2015

Dear Senator Shaheen,

We are writing to ask that you, as our Senator, oppose the Kinder Morgan Northeast Energy Direct (NED) pipeline. This project will bring no benefit to New Hampshire and little to no benefit to New England.

The pipeline construction process will pollute our air, contaminate our aquifers, wells and other water resources. Over 800 NH families will lose their homes and it will destroy conservation lands. It will harm the tourist industry and rural character of New Hampshire.

The proposed compressor station will be a high-pressure, 80,000-horsepower hub of toxic chemicals and deafening noise, prone to frequent “blow downs” where volatile organic compounds and carcinogenic gases are released into the air to reduce pressure on the pipeline. These gasses can travel anywhere from one to one hundred miles depending on how the wind blows and they can cause a host of health problems for people, ecosystems and water bodies on a day-to-day basis and will eventually cause ruin to all of New Hampshire.

In the event of a catastrophic disaster, any building within a half mile radius of the compressor station, including the Temple Elementary School will likely burm to the ground along with anyone nearby. Are the children of New Hampshire not important?

The property values near the pipeline and compressor station will plummet and our homes and land will be

worthless. What is even worse about this pipeline - no local community will reap any benefit! The only one benefiting is Kinder Morgan - making tons of money off of people who are struggling on a day-to-day basis to make ends meet and now will lose everything they have worked so hard for all their lives!

Senator Shaheen, please oppose this pipeline and work with us to stop this project.

Most Sincerely,

*signature not legible*

**20150804-0046**

Hello,

As a proud and happy fifth generation family resident of New Hampshire I want to emphatically express my opposition to the Kinder Morgan Pipeline Project. Kinder Morgan will without a doubt devastate our towns if we allow them to “occupy” our state.

With the unlimited safety concerns as well as the negative environmental impacts this unnecessary project would be a monstrous disaster to our pristine state. We don’t want this in New Hampshire any more then Massachusetts residents wanted it in their state. Yet we are sadly lacking support from our representatives.

This decision will without a doubt reflect future elections, not favorably for present incumbents.

My home is located within the 1/2 mile incineration area, also named “so survivor zone”. I am told our homes equity is gone; we have lost a minimum of 50% value on our property. It is unsellable! We will be forced to leave it to the bank and walk away. The other option of remaining living with contaminated water, air, noise, and fear of explosions is not an option for anyone. And I am shocked that we in New Hampshire are being forced to endure this catastrophe. For what gain?

It’s time to support your voters and stop Kinder Morgan!

Regards,

Kathy Belanger

Comments of the Town of Salem, NH

RE: Tennessee Gas Pipeline Company, L.L.C. (“TGP”)

Docket No. PF14-22-000: Proposed Northeast Energy Direct (“NED”)

Dear Ms. Bose:

The Town of Salem, NH was notified in 2014 by Kinder Morgan (KM) that KM was planning to construct a third natural gas line that would be located within the existing right-of-way where two existing gas lines are located where possible. KM indicated that there would be locations where installing the third gas line next to the existing two would not be feasible and would require the taking of additional property.

More recently in 2015, KM indicated they had changed their original route through the Commonwealth of Massachusetts to a new route that passes partially through Massachusetts and partially (-71 miles) through the State of New Hampshire, before returning to Massachusetts to terminate at the gas Hub in Dracut, Massachusetts. This new route includes approximately two (2) miles through the Town of Salem, NH as part of the Haverhill Lateral. KM also determined that they would replace the one existing lines and replace them with a new 20” gas line.

As the duly elected Board of Selectmen responsible for directing the municipal government of the Town of Salem in line with the wishes of its residents, we have strong reservations with the NED project as proposed. Specifically, it is the judgment of the Selectmen that the proposed route through Salem is poorly cho-

sen with numerous adverse effects on our community and must be changed if this pipeline is to pass through the Town at all. The reasons for this judgment are set out below.

### **I. Character of the Town**

The possibility of expanding the current right-of-way for the proposed natural gas pipeline through conservation property, over important natural resources, through existing residential neighborhoods, and far outside the borders of our Town's existing industrial/commercial-zoned areas, conflicts with our most recent Master Plan, and with the desires of a majority of its residents.

The current pipeline route as proposed by the Tennessee Gas Pipeline Company and Kinder Morgan would:

1. Disturb and permanently diminish the quality of life in existing residential neighborhoods because of significant construction through neighborhoods that, because of permanent clear-cutting and pipeline maintenance, and because of the potential of the seizure of privately owned residential land through eminent domain.
2. Unnecessarily risk to wetlands surrounding one of the Town's most precious surface waterway — Worlds End Pond, which is a pristine piece of the Town's conservation property.

It is worth noting that New Hampshire is the second most heavily forested state in the United States (behind Maine). The people of Salem, as in many other New Hampshire communities, live here in part because the heavily forested environment is integral to the character of the town. The extensive tree cutting required by pipeline construction is therefore particularly disruptive — especially in the residential areas — and degrades the NH flavor of semi-rural character we seek to preserve.

While the Town of Salem is not opposed to new commercial and industrial development in order to broaden the community's tax base, it should not be done at the expense of our natural resources, conservation properties and existing residential neighborhoods. Please see enclosed Exhibit A for an overview of the proposed line location.

### **II. Worlds End Pond:**

Worlds End Pond is a one hundred thirty (130) acre body of water which flows southwest and joins the Spicket River. Its bottom is covered with a very deep layer of decaying vegetable matter.

Around Worlds End Pond are three parcels that the Rockingham Planning Commission rated a high priority for the Town to purchase to preserve for conservation. That recommendation is based on the soils and wildlife on the property. The properties have been identified as prime wetlands. Please refer to Exhibit B4 C for maps of the area surrounding World End Pond.

### **III. Public Safety Concerns:**

The Town of Salem shares all of the concerns other impacted communities have regarding a high pressure gas transmission pipeline passing through the community. These concerns are made more acute by the proposed route's passage through residential neighborhoods. In particular, we are concerned with its proposed bisecting of neighborhoods including Bounty Court, Hunters Run, and Theresa Avenue. Residents of these neighborhoods are concerned with potential safety risks related both to pipeline construction and with the potential for a pipeline incident that could isolate and trap residents and/or restrict access to them by emergency vehicle and services.

It is difficult to see how the concerns of these residents could be addressed with the currently proposed pipeline route.

We will defer our more general concerns with public safety, e.g. training and equipment for first responders, communications between Salem first responders and KM concerning potential incidents, incident response, etc., to a later date.

### **IV. Conclusion:**

The Town of Salem, through its Board of Selectmen, strongly opposes the currently proposed route through the Town of Salem, NH for the NED pipeline. With the possibility of needing to impact property outside of

the existing natural gas ROW, the proposed route is disruptive to the character of the town and the quality of life for its residents, threatens unacceptable harm to ecologically sensitive areas, and represents apparently irresolvable safety concerns for at least some residents on or near the proposed route. Based on the lack of any specific information provided to the Town by KM during their planning process, it does not appear that KM has explored alternative routes that would be less disruptive and have a lesser impact on the environment.

The Salem Board of Selectmen is strongly in favor of increasing our energy supply in both availability and pricing to benefit more businesses in coming to the town and region, but believes that the Kinder Morgan project is too excessive for the Town of Salem and the region. When Kinder Morgan is ready to rethink its selection of a route through the Town of Salem, the Board of Selectmen would ask that Kinder Morgan engage the Town early in the planning process. The currently proposed, unsuitable route has generated much concern and uncertainty among the residents of Salem. It would be preferable to engage early with the representatives of the Town and present a much more detailed project, rather than put together another, unsuitable route and set off additional concerns and uncertainty among Salem residents.

Thank you for considering the concerns of Salem, New Hampshire.

Sincerely,

James S. Keller, Chair  
Patrick M. Hargreaves, Vice Chair  
Everett P. McBride, Jr., Secretary  
Stephen F. Campbell, Selectman

Re: Tennessee Gas Pipeline Co.'s Northeast Energy Direct proposed gas pipeline project  
(Kinder Morgan Project)  
Project Docket number PF14-22-000

Mailed by United States Postal Service mail and sent electronically

To Whom It May Concern

This letter is being submitted by the Conservation Commission for the Town of Conway, Massachusetts. We are requesting you consider the following and the enclosed information as you review the pending Tennessee Gas Pipeline Co.'s Northeast Energy Direct (TGP/KM) project application. Our comments are made as the duly appointed Conservation Commission for the Town of Conway, Massachusetts.

Our statutory and regulatory jurisdiction is pursuant to the provisions of Massachusetts General Laws (MGL) Chapter 131 section 40 (The Massachusetts Wetlands Protection Act), Chapter 258 of the Acts of 1996 (The Massachusetts Rivers Act), The Code of Massachusetts Regulations (CMR) set forth in 310CMR 10.00et. seq., and the Massachusetts Stream Crossing Standards. Our Commission is commenting only on issues within these areas of jurisdiction.

The proposed pipeline project in its projected location will cross the entire Town of Conway from west to

east.

We have been advised, according to a notice issued by The Federal Energy Regulatory Commission (FERC) on June 30, 2015, that the Federal Energy Regulatory Commission, within its review of the TGP/KM project application, will analyze steps to “avoid, minimize or mitigate impacts” of the environment. This submission is intended to address these issues. We have attached to this letter a report we have commissioned on these issues. As you can see from the report there are multiple and significant environmental issues effecting critical habitat, the environment, wetland areas, and river areas. There are at least three substantial stream and river crossings. In the submitted report we have highlighted four (4) critical areas as examples. This report is not intended to be a conclusive as to all critical or impacted areas, but rather is to support that it will be crucial, given the highly sensitive nature of the ecosystems that may be impacted, to, before any work is commenced, carefully study and then condition any work to avoid impacts, minimize impacts, and mitigate impacts both to the aquatic system and supporting terrestrial ecosystems.

It is our Commissions conclusion, supported by the report, that these issues must be fully evaluated and addressed in a Notice of Intent (the regulatory process for permitting proposed projects) to be filed by the applicant (we have been advised that the applicant intends to comply with the regulatory authority set forth in 310CMR 10.00et. seq.). These issues should be analyzed in detail and scientifically approached, and must be fully completed and submitted to FERC prior to any FERC approval of the project in order to allow FERC to analyze steps to “avoid, minimize or mitigate impacts” of the environment as FERC has indicated needs to be done (see above).

The report, submitted by the Commission as an attachment to this letter, is not intended to be a substitute for a full evaluation of the entire proposed project location; but rather the report submitted by the Commission is intended to support our determination that a complete analysis will be needed with evaluations along the entire proposed project location.

It cannot be stressed enough that the proposed project, whatever the merits are, is planned to go through highly sensitive ecosystems and thus the proposed work must be carefully conditioned to avoid impacts, minimize impacts, and or mitigate impacts to both the aquatic systems and the supporting terrestrial ecosystems.

We thank you for your consideration.

Very truly yours,

Conway Conservations Commission

PC: Selectboard Town of Conway

Pipeline Committee Town of Conway

Franklin Regional Counsel of Governments Pipeline Advisory Board

Enc: (1)

-----  
**Stockman Associates**

July 28, 2015

Mr. John Gates, Chair

Conway Conservation Commission

PO Box 240

Conway. MA 01341

Re: Preliminary Wetland Resource Area Review

Tennessee Gas Pipeline Company, LLC.

Northeast Energy Direct Project

Proposed Pipeline Route

Conway. MA

Dear Mr. Gates and Commissioners:

Per your request, Stockman Associates LLC performed a preliminary review of the wetland resource areas located within the proposed Tennessee Gas Pipeline Company, L.L.C. (TGP) Northeast Energy Direct Project pipeline route within the town of Conway. The proposed pipeline location was provided by the Conway Conservation Commission; the majority of the footprint is within and along the existing high-tension line easement. During the review process, a potential modification of the easterly extent of the proposed footprint, veering to the north of the existing easement was indicated by the Commission. The goal of the review was to assist the Conway Conservation Commission with an initial review and inventory of protected inland wetland resource areas.

Based on a desktop review of current MassGIS and USD NRCS Soil Survey mapping as well as a field inspection of portions of the route, the proposed pipeline route crosses a number of sensitive wetland resource areas subject to protection under the Massachusetts Wetlands Protection Act (MA WPA) and its regulations, which the Conway Conservation Commission is charged with upholding. Inland wetland resources, which will be impacted by the proposed route include, Bank (310CMR 10.54), Bordering Vegetated Wetlands (310CMR 10.55), Land under Water Bodies and Waterways (310CMR 10.56), Land Subject to Flooding (310CMR 10.57), Riverfront Area (310CMR 10.58) and potential vernal pool habitat. In addition, the proposed route will impact Priority Habitat of Rare Species, Estimated I-habitat of Rare Wildlife, Core Bio Habitat and Coldwater Fish Resources designated by the Massachusetts Natural Heritage Endangered Species Program (MA NHESP) and the Massachusetts Division of Fisheries and Wildlife. The pipeline route may also contain isolated wetlands subject to federal and state protection under Section 401 and 404 of the Clean Water Act.

As stated in 310 CMR 10.00, any proposed work within protected wetland resource areas is subject to the associated performance standards set forth in the regulations for each specific inland resource areas. While certain projects may be permitted as limited projects under 310 CMR 10.53 (i.e. utilities), these limited projects must demonstrate that the proposed activity meets the regulatory definition of a limited project and meets the required performance standards to the maximum extent feasible. Avoiding, minimizing and mitigating for impacts is an essential component of the protection of wetland resource areas at the eight interests of MA WPA, which they serve.

The attached information summarizes the findings of four (4) specific areas visited along the proposed pipeline route. This information serves to provide an example of some of the unique ecosystems located along the proposed route and should not be considered as a complete inventory. On the contrary, the entire route throughout Conway contains numerous protected ecosystems, both mapped and unmapped, all of which require diligent study, delineation, and review to ensure necessary protection.

Sincerely,

Emily Stockman, M.S., P.W.S

Dear Mr. Fiedel:

Staff of the Massachusetts Historical Commission (MHC), office of the State Historic Preservation Officer and State Archaeologist, have reviewed the revised State Archaeologist's permit application submitted for reconnaissance historical and archaeological survey for the project referenced above.

The revised application is responsive to the MHC's comments on the draft research design and methodology.

Regarding the submittal of the draft reports of the investigation (pages 38 and 69), please also provide the reports to the involved federal agencies for their review and consultations.

Enclosed please find the State Archaeologist's field investigation permit issued for the reconnaissance survey.

Enclosed also is the Town of Deerfield's "Archaeological Accountability Policy" that the Deerfield Historical Commission requested be provided to permittees conducting research in the town.

These comments are included to assist in compliance with Section 106 of the National Historic Preservation Act of 1966 as amended (36 CFR 800), the Secretary of the Interior's Standard Guidelines for Archeology and Historic Preservation (48 Fed. Reg. 190 (1983)), and MGL c.9, ss. 26-27C (950CMR 70). If you have any questions, please contact Edward L. Bell, Deputy State Historic Preservation Officer at the MHC.

## 20150804-0056

Dear FERC:

Kinder Morgan and its subsidiary, Tennessee Gas, propose to build and operate a 36-inch pipeline to daily transport up to 2.2 billion cubic feet of hydro-fractured gas at a pressure of up to 1,460 pounds per square inch from Pennsylvania, through New York to Dracut, Massachusetts. The proposal is called the Northeast Energy Direct pipeline project (NED).

Please stop the NED in order to protect my family and community. I oppose this project for the following reasons:

- No New Yorkers will receive any of the gas and almost all of it will be exported to foreign markets.
- Pipeline safety standards in rural areas are much lower than in urban areas, effectively treating constituents who live in the rural communities along the proposed route as second class citizens.
- The governing federal and state regulations and the resources used to ensure pipeline safety during construction, operation and decommissioning phases are woefully inadequate.
- Only landowners whose lands abut the pipeline route may receive compensation. All other residents along the pipeline corridor, even those within the "incineration zone," involuntarily assume the risk of death,

personal injury and property damage in the event of a rupture, but receive no compensation for their risk and diminished quality of life.

—Property values along the pipeline will decline and reduce assessed valuations. This in turn will increase the tax burden on properties further away from the pipeline.

—The federal process for approving and constructing gas pipelines violates the requirement of the National Environmental Policy Act (NEPA) to minimize cumulative negative impacts that federal agency decisions may have on public safety, health and the environment.

—No single federal entity oversees the NED project as a whole. For example, the Federal Energy Regulatory Commission decides whether and where the NED is built. The Department of State decides whether the gas may be exported. The Pipeline and Hazardous Material Safety Administration governs pipeline safety. Each agency pleads lack of jurisdiction to review or do anything that could be seen as falling within the jurisdiction of another agency. Oversight of the project is therefore segmented, hindering the public's ability to effectively review and voice concerns about the NED.

Thank you for your attention to this matter.

Re: Tennessee Gss pipeline Company, L.L.C. Docket No. FF14-22-000 Northeast Energy Direct project

Dear Secretary Bose:

I want to thank the Federal Energy Regulatory Commission (FERC) for holding this scoping meeting to request comments on environmental issues regarding the Planned Northeast Energy Direct project (NBD). I regret that the House of Representatives is in session and I am prevented from attending this scoping meeting in person. However, I appreciate FERC's willingness to accept my comments in written form.

I have heard from countless constituents about their desire to extend the deadline for public scoping comments beyond August 31, 2015 in order to ensure that all available information is considered. In addition, the extension will allow for greater exploration of alternatives to this project, which will allow for the most comprehensive review possible. I applaud the efforts of Massachusetts State Attorney General Maura Healy who has recently undertaken a comprehensive study of the electric reliability needs in the New England region through 2030. Attorney General Healy's office has stated that the report is expected to be completed in October 2015. This report will provide important information that deserves consideration with regard to the entirety of the NED project.

As currently proposed, the NED project crosses miles of pristine land that has been protected by state and federal dollars. It is my strong belief that if land has been protected from development in perpetuity by pub-

lic dollars, it should be protected from the construction of a pipeline which would run directly through it. It is critically important to me that this federally regulated process is conducted in an open and transparent way. I will continue to advocate on behalf of my constituents of the 2 Congressional District in order to ensure that concerns are heard loud and clear. I will submit a more detailed scoping comment for the record prior to the August 31, 2015 deadline.

Sincerely,

James P. McGovern  
Member of Congress

Re: project Review: Northeast Energy Direct project phase IA Archaeological Sensitivity Assessment, Cheshire, Hillsborough, and Rockingham Counties, NH. Submitted by Louis Berger  
(DHR 16111)

Dear Ms. Luhman:

Thank you for providing the Division of Historical Resources (Division) an opportunity to comment on the Phase IA archaeological assessment cited above. The Division agrees with the recommendations provided for continued Phase 1B testing. We understand that many areas were not accessible and that refining the sensitivity assessment will be accomplished during the Phase 1B work as areas are opened for access.

Although you somewhat addressed our concerns with using a predictive model, once again we will remind the consultants that many of the upland areas have not been tested and we would expect that during future walkover assessments this be taken into consideration. We would disagree with your statement on page 95 since very little survey has been done in upland regions of New Hampshire, especially in the southern regions. Since little survey has been conducted it would be ill advised to dismiss the potential importance of small upland sites and the information that they might yield.

Also, we agree with the recommendations to catalogue stone walls and suggest that a protocol for recordation or assessment be developed for this project.

Once again, thank you and we look forward to continued consultation on this project.

Edna Feighner, Archaeologist  
Review and Compliance Coordinator

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/  
Kinder Morgan (FERC Docket No. PF14-22-000)

Dear Secretary Bose:

The Metropolitan District (MDC) is a public, non-profit municipal corporation that provides clean, safe drinking water to over 400,000 people in the greater Hartford, Connecticut area.

We have been following the NED Tennessee Gas/Kinder Morgan pipeline proposal with great interest, and, on behalf of the MDC, I write in order to express some concern that the proposed pipeline could potentially impact MDC's public drinking water supplies in West Hartford and Bloomfield, Connecticut. The pipeline is proposed to be constructed on critical public water supply watershed land near drinking water reservoirs at our West Hartford and Reservoir #6 facilities.

Based on the "Exhibit A" map of the "Proposed Tennessee Gas License Area," we estimate that the project could potentially disturb a large area (250 acres or more) on MDC property, and encompass a distance of approximately 5 miles running north-south, carving through the watersheds of MDC Reservoirs 12,13,15 and 16. This land is classified as Class I and Class II water company land in Connecticut and, accordingly, its use is highly regulated by the Connecticut Department of Public Health. By law, Class I and Class II water company land is protected and preserved to safeguard the state's water resources.

We have been monitoring the Federal Energy Regulatory Commission (FERC) website, and we are aware that the first drafts of the Environmental Reports (ER's) on this proposal have been submitted to FERC, including the proposal for expansion of the pipeline in Hartford County. We note that the Environmental Reports are lacking in critical resource information — including reference to and consideration of the existence of our public water supply reservoirs and watershed lands in the area of proposed expansion. In fact, Environmental Resource Report 12-Water Use and Quality, Section 2.2.6.1.5 Public Watershed Areas, incorrectly states that the project area is not located within any public drinking water or aquifer protection areas.

Therefore, it appears to the MDC that the initial environmental review process is deficient, that potential impacts to these vital water resources are not being addressed in any manner, and that more public input is essential. This is of great concern because the second draft of the Environmental Report to FERC has been reported to be targeted for submittal in July 2015, and a true public forum has not yet been held in Connecticut.

We are formally requesting that FERC compel Tennessee Gas/Kinder Morgan to conduct a well advertised public meeting be held in the West Hartford area (i.e., at Town Hall) in order to present and discuss with the public the proposed project, answer questions and address public concerns. Adequate and advance notice

of this meeting should be mandated. In addition to the issues associated with the public water supply, there are many residents from the MDC's eight member towns, as well as from throughout the state, who recreate extensively at our West Hartford and Bloomfield facilities, and the MDC is concerned that these stakeholders are not aware of this project.

Protecting the health and integrity of our public water supply reservoirs and watershed lands is the MDC's highest priority. We appreciate your cooperation and look forward to having a public meeting scheduled and advertised in the near future.

Thank you for consideration of this important request, and if you have any questions, do not hesitate to contact me at (860)278-7850 x3200.

Sincerely,

THE METROPOLITAN DISTRICT

Re: Please oppose the NED project

Dear Whom it May Concern:

The high pressure gas pipeline proposed by the Kinder Morgan and Tennessee Gas Companies called The Norlhesst Energy Direct Project (NED) would carry hydro-fracked gas from Pennsylvania through New York, Massachusetts, and New Hampshire. As a resident of New York, I object to the fact that people in my area, though burdened by the risks associated with the project, will receive no reward. Jobs will be few and temporary, the gas transported by the project will not be available to us or lower our utility bills.

I am also concerned about the detriment to our health and the risk to our safety that the project poses. In addition to the very real possibilities of: 1) insurance rates rising due to increased risk; 2) property values decreasing because of the degraded environment the project will create; 3) additional taxes imposed to support the upgraded training and equipment our fire department will need; and 4) the general nuisance and inconvenience during construction, the pipeline represents a real and present danger to all of us.

Increasingly, we hear about accidents along pipelines. Every week it seems, there are reports of leaks, ruptures, even explosions. Fracked gas contains carcinogens, neurotoxins, and endocrine disrupters that are proven promoters of disease and disability. Experts in metallurgy point out that even reasonably sound pipes develop small holes over time. The cumulative effect of even tiny leaks of these toxins on a regular basis can be devastating. The proposed location of this particular pipeline is adjacent to National Grid's massive power lines — an accident waiting to happen.

If you believe we risk the health and well-being of everyone in our community by allowing the installation of this pipeline, then I hope you will publicly say so and actively work against the NED.

Christopher Consuello

re: Tennessee Gas Pipeline Coinpany, L.L.C., Docket No. PF1422-000

Dear Secretary Bose:

I am writing in response to a proposal from the Tennessee Gas Pipeline Company that will greatly impact a home recently purchased by my daughter and son-in-law in October of 2014. Their home is located in Temple, NH, on Mountainview Road, just .1 mile from where Kinder Morgan proposes to build a compression station to push natural gas at an astounding rate of 80,000 horsepower, through the miles and miles of pipeline they are building in the area. The purchase of their beautiful home did not come without sacrifice in order to enjoy a certain way of life they have always dreamed of. They chose to endure lengthy daily commutes to Burlington and Ayer Massachusetts, as well as being an hour's drive away from family and friends. They chose Temple for the simplicity and tranquility of the surroundings, the natural beauty, unspoiled natural boundaries and the breathtaking views of Pack Monadnock. Kinder-Morgan proposes to "overtake" this small town and other surrounding towns, by building a noisy, potentially dangerous, compression station. This station is proposed to go on land that is within 10ths of a mile from the Temple Elementary School, which also doubles as an emergency shelter for the residents of Temple. They have a volunteer fire department hardly equipped to handle a disaster. What is going to happen if there is a leak, a fire, or worse, an explosion affecting the integrity of the compression station? Anything man made can have potential risks, so reading about statistics and how safe natural gas is would prove irrelevant in this discussion. Nothing is safe when you are in a so-called "incineration zone". Would you want your grandchildren to grow up and go to school there? I wouldn't, and I don't.

I have read many articles that state that the compression stations will eventually be unmanned during the evening hours. I am extremely concerned about this. If this is true, then Kinder-Morgan is making sure their employees are out of danger, and not risking their lives, while my daughter is risking hers, merely by being home. They have the audacity to say one advantage is to be able to utilize natural gas fuel alternatives. Natural gas service is currently not available in most areas of New Hampshire, how will homeowners make the transition without it costing them a lot of money? Kinder-Morgan does not currently own or operate local distribution systems, and is not in their business model. It sounds like big business to me, at the expense of these young families who work a lifetime to get the peace and tranquility of these small New Hampshire towns. They aren't getting any rewards for passing this, it is going to Dracut Massachusetts and then on to be exported out of our country. It will not create new jobs in these towns, it will not lower taxes, or allow them to sell their homes if they wanted to, not to mention environmental concerns and issues with well water. If this affects even one person's life, it is one life too many.

Please consider these points and my concerns as a citizen of New Hampshire and it would be so appreciated if you could point me in the direction of others that may help provide more information about this proposal. Thank you for your time and your vigilant investigations into all points of view involving this matter.

Sincerely,

RE: Docket number PF14-22

Dear Mr. Tomasi:

Attached herewith please find a resolution from the Town of Nassau relative to our opposition to the above-referenced project. Please note the proposal's violations of local laws and planning as well as other substantive concerns.

Additionally, attached please find a report of our Natural Resources Committee that provides detailed analysis of impacts of this project on our community. These items should be of serious concern and should be considered by FERC.

Please contact me should you have any questions relative to this material.

Thank you.

Very truly yours,

David F. Fleming, Jr.  
Town Supervisor

**Resolution of the Town Board of the Town of Nassau**

**STATING OPPOSITION TO THE KINDER MORGAN NATURAL GAS  
PIPELINE PROPOSED TO BE ROUTED THROUGH THE TOWN OF NASSAU**

Resolution No. 11

WHEREAS, a large natural gas pipeline called the Northeast Energy Direct (NED) pipeline project, has been proposed by Kinder Morgan and its subsidiary Tennessee Gas Pipeline, LLC, to be routed through Rensselaer County, including the entire width of the northern portion of the Town of Nassau; and

WHEREAS, the proposed NED pipeline would be much larger, up to 36 inches in diameter, and operate at much higher pressures, than currently operating natural gas pipelines in Rensselaer County; and

WHEREAS, the proposed NED pipeline would transport natural gas from other parts of the country for intended export out of New York State and possibly overseas, with no natural gas benefits to the residents of the Town of Nassau or Rensselaer County; and

WHEREAS, this project, as currently planned, would not follow a route through the community already impacted by a pipeline in the southern end of the Town of Nassau; and

WHEREAS, the Town Board of the Town of Nassau has endeavored to be fully informed of this project and its impacts and has requested that the Town's Natural Resources Committee review and provide a report of the natural resources impacts of this project;

NOW THEREFORE BE IT RESOLVED, that the Town Board of the Town of Nassau does hereby make the following findings:

WHEREAS, the Nassau Natural Resources Committee has completed this report and the document provides an outline of real and detrimental impacts to the biodiversity and natural areas of concern across the width of the Town of Nassau from the current route proposed for this industrial project; and

- I. as proposed, this pipeline will run across private property, directly adjacent to homes and through waterways; and
2. as proposed, this project will impact residential wells, natural groundwater recharge areas and aquifers; and
3. this proposal is expected to blast through the Rensselaer Plateau which is one of New York's largest intact forested areas that has brought economic opportunity through tourism and responsible business to many areas of Rensselaer County - including Nassau; and
4. this proposal would impact designated areas of archeological sensitivity across the community; and
5. the Town Board of the Town of Nassau has received numerous public comments during Town meetings as well as numerous calls and messages of concern from residents impacted by this project which have stated opposition to this project; and
6. the Town Board of the Town of Nassau has received letters of opposition and messages from business owners and community groups in the town expressing specific and economically damaging concerns about the impacts on business operations and programs from construction and operation of this pipeline; and
7. the loss of business activity even during this proposed project construction period could mean the closure of small operations in this fragile economy; and
8. members of the Town Board of the Town of Nassau have attended the only Rensselaer County informational meeting hosted by Kinder Morgan and Board Members have also attended community forums across Rensselaer County on this project which were sponsored by community members to collect and share information on this proposal; and
9. as currently proposed, this pipeline has a significant potential impact in the areas of public safety, home values, businesses, sensitive habitat fragmentation and further stalling of economic opportunity; and
10. the project applicant, Kinder Morgan, is seeking federal eminent domain status to allow for property to be secured for the routing of the pipeline, including properties in the Town of Nassau; and
- II. the granting of and threat of federal eminent domain status to Kinder Morgan for this project which will not benefit our residents will give the company and its affiliates an unfair advantage over property owners in this community; and .
12. as proposed, this pipeline project will result in significant amounts of private property being incorporated into this project which will lead to a decline in property values, ability to conduct business and a decrease in taxable values for the community as a whole; and
13. the proposed NED pipeline route through the Town of Nassau would closely follow the high voltage right-of-way presently owned and operated by National Grid, raising reasonable concern for the detrimental interaction between the pipeline and the electromagnetic fields established by the high voltage wires; and
14. the thickness/strength of the proposed NED pipeline, the depth at which it would be buried in the ground and the inspection methods for the necessary welds are proposed to be significantly less for our rural area than those required for urban areas; and
15. the proposed NED pipeline could cause disruption and undue burdens for emergency services and would significantly increase the potential for catastrophic damage to lives, property, roadways, streams, wells, aquifers and wetlands in our small, rural community; and
16. the Town Board of the Town of Nassau believes the level of compensation and mitigation that may potentially be offered by the developers of the proposed NED pipeline would not outweigh the long term fis-

cal, health, safety, business, environmental and quality of life impacts to our community; and

17. the proposed pipeline project is contrary to the rural residential character of the community and will fail to follow the already existing pipeline corridor; and

18. the proposed use of lands of the town of Nassau for an industrial compressor station necessary to operate this pipeline, in any portion of the community, would have dramatic and long term, environmental, social and economic impacts on the rural residential character of the community; and

19. the construction and operation of such a gas compressor station is contrary to Town laws as well as the Town of Nassau Comprehensive Plan as developed and approved by the community in July 2011;

and, be it further RESOLVED, that based on the above findings, the Town Board hereby declares its strong opposition to the construction of the proposed NED pipeline through the Town of Nassau; and, be it further RESOLVED, that the Town Board of the Town of Nassau requests that, because of the abundant unanswered questions, impacts, and concerns brought forward by our residents, the Federal Energy Regulatory Commission (FERC) deny a certificate of public convenience and necessity to Kinder Morgan and the Tennessee Gas Pipeline Company for the construction of the proposed NED pipeline; and, be it further RESOLVED, that the Town Board of the Town of Nassau does hereby oppose the granting of eminent domain status for the Kinder Morgan natural gas pipeline proposed to cut through the community; and, be it further

RESOLVED, that the Town Board of the Town of Nassau does hereby oppose the use of lands of the Town of Nassau for an industrial compressor station in any portion of the community as such usage would be in violation with local planning documents and local laws; and, be it further

RESOLVED, that the Town Clerk of the Town of Nassau is hereby directed to transmit copies of this resolution to United States Senator Charles. Schumer, United States Senator Kirsten Gillibrand, Congressman Chris Gibson, Congressman Paul Tonko, Governor Andrew Cuomo, New York State Senator Kathy Marchione, State Assemblyman Steve McLaughlin and Rensselaer County Executive Kathy Jimino.

Upon motion made by Supervisor David Fleming, and seconded by Ms. Richards, the foregoing resolution was duly adopted by a majority of the members of the Town Board of the Town of Nassau at its Regular Meeting held on May 14, 2015, by roll call vote as follows:

Ronald Sears, Councilmember	No	Yes_X	Absent	Abstain
Lani Richards, Councilmember	No	Yes_X	Absent	Abstain
Jonathan Goebel, Councilmember	No	Yes_X	Absent	Abstain
Robert Rings, Councilmember	No	Yes_X	Absent	Abstain
David Fleming, Supervisor	No	Yes_X	Absent	Abstain

Said Resolution was duly adopted: May 14, 2015. IN WITNESS WHEREOF, I have hereunto set my hand and the seal of the Town of Nassau, Rensselaer County, New York.

Sandra L. Rings, Town Clerk Dated: May 22, 2015

Re: Request for Comment on NOI to Prepare EIS for the Planned Northeast Energy Direct Project,  
Docket No. PF14-22-000, Tennessee Gas Pipeline Company, LLC. (DHR 161 I I)

Dear Secretary Bose:

The Division of Historical Resources (Division) has received the Notice of Intent to prepare an Environmental Impact Statement for the planned Northeast Energy Direct project as cited above. To the Division understanding this project will include approximately 71 miles of pipeline, plus approximately 7 miles of laterals, one compressor station and one meter station located within a number of towns in Cheshire, Hillsborough and Rockingham Counties. The Division understands that this notice is being used to initiate Section 106 of the National Historic Preservation Act with the applicable State Historic Preservation Offices (SHPOs). To date the Division has not participated in the development of the Area of Potential Effect (APE) for either direct or indirect effects.

With this letter the Division is requesting Section 106 consultation on project-specific APEs as the project develops. At a minimum the Division agrees with an APE that encompasses all areas subject to ground disturbances, including the width of proposed mainline and lateral corridors.

Once again, we look forward to consultation on this project.

Sincerely,

Edna Feighner, Archaeologist  
Review and Compliance Coordinator

Cc: Michael Letson, Tennessee Gas Pipeline Company LLC

UNITED STATES OF AMERICA  
**FEDERAL ENERGY REGULATORY COMMISSION**  
INTERAGENCY PRE-FILING CONFERENCE CALL

Tennessee Gas Pipeline Company, LLC

Docket No: PF14-22-000

NORTHEAST ENERGY DIRECT PROJECT

June 11, 2015

**Agencies in Attendance (list of attendees is attached):**

- Federal Energy Regulatory Commission (FERC)
  - Cardno (FERC 3rd Party Contractor)
- U.S. Environmental Protection Agency (USEPA)
- U.S. Fish and Wildlife Service (USFWS)
- PA Department of Environmental Protection (PA DEP)
- NY State Department of Environmental Conservation (NYSDEC)
- NY State Parks and Recreation
- NY Department of Transportation
- NY State Department of Public Health
- MA Attorney General's Office
- Southwest Region Planning Commission
- Berkshire Regional Planning Commission
- Nashua Regional Planning Commission
- Delaware River Basin Commission
- Franklin Regional Council of Governments
- Tennessee Gas Pipeline (Tennessee Gas)
- AECOM (Contractor for Tennessee Gas)
- Hatch Mott (Contractor for Tennessee Gas)
- Louis Berger (Contractor for Tennessee Gas)

**Meeting Summary**

The conference call was conducted to provide an overview of the FERC's role for the Northeast Energy Direct (NED) Project as well as to review the general status of the schedule, field surveys, landowner coordination, and the National Environmental Policy Act (NEPA) process. Topics discussed included:

- Resource Report Review and NOI Status
  - o Environmental Comments on the draft resource reports issued on Friday, May 15th. Tennessee Gas is required to incorporate responses into its next set of draft resource reports.
  - o Cumulative impacts request sent to agencies on May 15th.
  - o Tennessee Gas filed compressor station information on June 1st. One June 2nd Tennessee Gas filed information describing deletion of Worcester Loop and Stamford Loop from the project. This information was sent to agencies by FERC on June 11th.
  - o Tennessee Gas planning to file second set of Resource Reports the week of July 20th.
  - o Notice of Intent (NOI) currently being drafted by FERC and will likely be issued next week. Issuance of the NOI will open the comment period. The comment period will likely be 60 days or longer due to the number of scoping meetings.
  - o FERC determining venues for approximately 14 scoping meetings. The meetings are generally planned for the following locations:
    - Towanda, PA
    - Great Bend, PA

- Oneonta, NY
- Schoharie, NY
- Rensselaer County, NY area – meetings will be held two successive nights at this location
- Pittsfield, MA
- Greenfield, MA
- Dracut, MA
- Lunenburg, MA
- Cheshire County, NH
- Milford, NH
- Nashua, NH
- Bloomfield, CT

o FERC will accept both written and verbal comments at the scoping meetings.

o The meetings in PA and NY are planned for the week of July 13th. Meetings are planned in CT, MA, and NH for the week of July 27th. Two meetings are planned the week of August 10th in MA. FERC will give specific dates and times for the meetings once venues are scheduled. FERC anticipates most meetings will be well-attended due to the size of the project. These dates/locations are subject to change as we get more information regarding the venues.

o FERC plans to schedule agency meetings during the scoping period.

#### • **Tennessee Gas Status update**

o Surveys

- Wetlands and Threatened and Endangered (T & E) species surveys are continuing in NY and PA. Crews have begun surveys in MA and NH.
- Cultural resource surveys are being conducted in PA and NY. Tennessee Gas is waiting for approval from MA and NH agencies before conducting cultural resource surveys in those states.
- Approximately 721 segments along the ROW have been identified for acoustic surveys. Surveys have been conducted on 65 of these segments. Indiana Bat and Northern Long-Eared bat hibernacula was found in four locations within the 65 surveyed segments. These four locations were all in NY. Upcoming acoustic surveys to be conducted in CT and NH.
- Tennessee Gas has conducted a horizontal directional drill (HDD) geotechnical analysis and borings for the Hudson River crossing. It will take approximately one month to complete the analysis.
- Tennessee Gas continued to work on contracting with the Tribes for their participation in cultural resource surveys.
- Survey access continues to remain at approximately 30 – 40%. Tennessee Gas is continuing with centerline and staking surveys where access has been granted.

o Meetings

- Tennessee Gas met with the MA Natural Resources and MA Environmental Policy Act (MEPA) regulatory agency staff.
- Tennessee Gas is coordinating with NH on the NH siting process
- Additional meetings are planned with state Natural Heritage agencies and State Historic Preservation Offices (SHPOs).
- Tennessee Gas plans schedule Tribal meetings during the scoping period.

#### **Discussion**

- FERC sent out cumulative impact question to all of the agencies to get feedback on appropriate Region of Influences for each resource. FERC will be sending guidance to Tennessee Gas.

#### **Next Call**

- Agency call will be held every 2 weeks

- Next call tentatively scheduled for June 25th, 2015.

## Meeting Summary

The conference call was conducted to provide an overview of the Northeast Energy Direct (NED) Project as well as to review the general status of the schedule, field surveys, landowner coordination, and the National Environmental Policy Act (NEPA) process. Topics discussed included:

- NOI Status and Meetings
  - o Still confirming venues and will be issuing NOI as soon as they are set.
  - o 14 scoping meetings. Dates may still move due to venue scheduling
    - NY/PA scoping meetings will be in about 3 weeks
      - State of NY meeting tentatively for July 15.
    - CT scoping meeting tentatively at the end of July
      - CT agency meeting tentatively anticipated on July 30th
    - NH scoping meetings in about a month
      - NH agency meetings July 29th or 30th.
    - MA meetings around August 12
      - MA agency meeting pending NOI finalization
    - Tribal meeting July 16 in Oneonta, NY
- Tennessee Gas Status update
  - o Surveys
    - Wetlands and Threatened and Endangered (T & E) species surveys are continuing in NY and PA.
      - Bog turtle survey has begun in Rensselaer County, NY.
      - Cultural resource surveys are being conducted in PA and NY. Starting CT this week or next week.
      - Plant surveys have begun in NY, PA, CT. Surveys in NH to be initiated next week.
      - Bat surveys are continuing on in MA, NY, and PA. About 8% of the areas have been surveyed.
      - Mussel survey plan in development
      - Landowner survey access

- Market Path
  - o 20-30% access in NH and MA
  - o Unknown from Wright, NY to NY/MA state line
- Supply Path
  - o 46% access in PA/NY

**Discussion**

- Letter being sent from Tennessee Gas to the agencies regarding the compressor stations field surveys.
- Interstate 88 and Interstate 90 Alternatives being further evaluated by Tennessee Gas, and the updated assessment will be included in the next round of draft Resource Reports.

**Next Call**

- Agency call will be held every 2 weeks
- Next call scheduled for July 9, 2015.

**20150804-5002**

Stephen Hussey, Greenfield, MA.

Dear Sirs:

Kinder Morgan's Draft Environmental Report for the NED project, due on June 28th, was made public on July 24th, only days before the first of the public scoping meetings. In the shamefully shortened time people in the Greenfield area had to study this filing before our July 29th scoping meeting, we found that the pages regarding horizontal drilling under Interstate-91, under commercial rail lines, under a tainted aquifer, under both the Connecticut and the Deerfield rivers were, all of them, blank, labeled "To Be Determined."

In terms of environmental impact, nothing is more problematic than horizontal drilling. Nevertheless Kinder Morgan presented blank pages. Is this incompetence? If Kinder Morgan cannot develop and finalize plans for one of the most critical components of this project, despite taking an extra month, how can they possibly be trusted with the actual implementation?

The other possibility is that the blank pages represent contempt, Kinder Morgans' arrogant assumption that, finally, they can get away with playing fast and loose, that finally there is someone with enough leverage to protect them and get their project through the process regardless of how they flaunt rules and requirements.

Contempt of the public is a given within the America's corporate world. American citizens have abided, largely in silence, the absurdity of corporations being declared equal to humans in terms of rights. We have allowed our tax dollars to be used to bail out corporations that demonstrated, under the great silent hand of the marketplace, that they were monstrously incompetent. What are we to say though of Kinder Morgan's contempt for FERC and the civil process? The purpose of FERC's report/scoping process is to provide all parties in our society the opportunity to examine the full spectrum of information so that, as a greater community, we can work out a consensus regarding the concerns and disagreements that a project of this scope will necessarily produce. Kinder Morgan's demonstrated unwillingness to respect this process, to respect your role in helping us remain a civil society, is indefensible and should not be tolerated.

FERC has established expectations for the licensing process and Kinder Morgan needs to be held to them without exception. If I were to file my taxes a month late, I would, without question, be penalized. Kinder Morgan, as a US "citizen" needs to either meet all filing requirements, in a timely manner, with full disclosure, or they have their right to proceed withdrawn. You stand as fellow citizens, our best protection against such corporate incompetence and arrogance.

With best regards

Stephen Hussey

**20150804-5005**

Stephen Tirrell, Litchfield, NH.

I recently attended the scoping meeting in Nashua and intended to speak, but was unable to stay long enough to do so. I wanted to discuss this issue, that came to light after my written comments had been submitted. Eversource has been maintaining the vegetation level on the existing power line installation in Litchfield using mechanical means that would not be suitable for use in a pipeline installation. The spark hazard from a tracked vehicle that can pick up and shred rocks and boulders will just not be safe to employ. In fact, power line clearing has been a controversial subject in New Hampshire for a long time. Kinder Morgan uses a method dependent on the use of defoliant applied by a variety of contractors. In the eastern seaboard it seems to be the standard orange truck outfit that gets all of the contracts. In New Hampshire that is just not going to happen, especially since NED is running within feet of a lot of dwellings. Like I said, in the meet-

ings I have been to and the social media I have been exposed to this discussion has not come up, but when it does it will be a storm. People are starting to connect the dots on this one so you can expect this soon. Since Kinder Morgan is trying to build something here that they will never be able to maintain even to their lax standards I do not think we should allow them to go forward with this. I am sure that they will claim to be willing and able to solve this, but with the water and population issues there is no solution that will work. I doubt that I will be attending the next scoping meeting in the western end of the state, I expect the attendance to be substantial, so I wanted to submit this now.

Thanks for your consideration.

Steve Tirrell

Washington, D.C. 20426

Re: Tennessee Gas Pipeline Company, L.L.C.

Proposed Northeast Energy Direct Project, FERC Docket No. PF14-22-000

Dear Secretary Bose,

The Town of Warwick, MA Conservation Commission (ConCom) hereby notifies FERC of its great concern on Compressor Station (CS) in Franklin County, the erection of which is proposed by Tennessee Gas Pipeline Company, LLC (TGP).

The Warwick ConCom is responsible for the protection of the Town's natural resources as well as administering the Massachusetts Wetland Protection Act. Some of the Conservation Commission's jurisdiction overlaps interests that are subject to review under several federal laws including the Clean Water Act, Clean Air Act, and the Endangered Species Act. The Warwick ConCom also reviews projects which require review by the Massachusetts Natural Heritage and Endangered Species Program under provisions of the Massachusetts Endangered Species Act.

TGP has proposed to locate the CS in Northfield, MA, our neighboring town. Proposed location is adjoining Warwick State Forest (see the document "Compressor station Locations – Aerial Maps", 06/ 01/2015). Said CS will be powered by several extremely large gas turbine engines 120,000 HP in total (see pages 1-23 and 1-25 of Draft Environmental report/Resource report 1, 11/2014). There are very few, if any, compressor stations of such a scale in the country. More than 97% of the stations, currently working in the USA are less than 60,000 HP.

Negative influences from natural gas CS, including noise, air and water contamination to natural resources, are well documented. Since these structures are a major source of broadband noise pollution and methane emission across the US landscape, their environmental impacts have been specially studied by many scientists. There is stark and well proven evidence that CS functioning removes wildlife habitat, alters connectivity, causes mortality, and introduces ecological pollutants. The format of this letter prevents us from wide citation of special studies performed around tens of CS sites. Just 3 examples:

- Insects, birds and mammal densities decline in close vicinity and significantly deteriorate within 5 km zones of compressor stations sites (C. Solomon. When Birds Squawk, Other Species Seem to Listen. New York Times, May 18, 2015);
- Bat species activity level decrease over 70%, even due to considerably low-intensive constant noise of

50-75 dB, produced by small scale compressor stations (J. P. Bunkley et al. Anthropogenic noise alters bat activity levels and echolocation calls, *Global Ecology and Conservation*, 3 (2015), p. 62–71);

- Floral resources are significantly suffer from methane emission, which rate had been measured as  $1.7 \pm 0.2$  SCFM from the lowest emitting site to  $880 \pm 120$  SCFM from the highest emitting site (R. Subramanian et al. Methane Emissions from Natural Gas Compressor Stations in the Transmission and Storage Sector: Measurements and Comparisons with the EPA Greenhouse Gas Reporting Program Protocol. *Environmental Science and technology*, 49, 2015, p. 3252–3261).

We would like to stress that such terrifying findings were made during the studies of CS, which are by far less powerful than the scale of 80,000 - 120,000 HP Franklin County compressor station, proposed by TGP. Over half the land area of the Town of Warwick is comprised of mostly contiguous lands under public and private ownership—including State Forests, Wildlife Management Areas, and land under conservation restrictions held by state agencies, town, and public land trusts — all of which are protected under Article 97 of the Massachusetts Constitution. The majority of this land was conserved in perpetuity using federal and state funds. This large landscape, which stretches into adjacent towns and beyond, provides unbroken habitat for wildlife and delivers a corridor for species migration and diffusion. Warwick State Forest has many wetland resource areas, streams, freshwater wetlands, and groundwater resources used by the public. There are tens of certified vernal pools in Warwick State Forest and, in particular, near proposed CS location. Many wetland resource areas in the Town of Warwick are still not mapped or catalogued in generally available map layers and databases. ConCom continuously finds new vernal pools in Warwick. The latest letter with three vernal pools certification had been received from Massachusetts Natural Heritage and Endangered Species Program just two weeks ago.

Based upon prior experience, ConCom believes that there are populations of species listed under the federal Endangered Species Act and the Massachusetts Endangered Species Act in the Town of Warwick.

The Warwick ConCom is deeply concerned that the establishment of a super powerful natural gas CS in close vicinity of the State Forest will result in unbearable damage to natural recourses of the Town of Warwick. In particular, we are alarmed about the environmental impacts from air/water pollution to water resources and wetlands, as well as from air pollution, noise and odor to vegetation and wildlife. The cumulative impact to the unique non-fragmented protected land can be huge and irreversible.

The Warwick ConCom believes that under any circumstances CS site should not be situated closer than four miles (5 km) to protected land per the studies.

It is generally known that there are tools available now for avoiding, minimizing and mitigating impacts of this kind. Among them are: extensive implementation of soundproof technologies and materials, use of electric motors instead of turbines, erection of small stations instead of a super large one, etc.

Warwick ConCom is very concerned about proposed pipeline wetland crossings within Warwick. We have several certified vernal pools in the vicinity of the proposed pipeline route. The excavation and other construction activity will very likely destroy these habitats, which are protected under Massachusetts and Federal laws, including the current Massachusetts General Permit of the Federal Clean Water Act (03/09/2015).

In light of the above The Town of Warwick, MA Conservation Commission request to be included in environmental mailing list for this project. Information request for EIS draft is enclosed to this letter. We intend to become an Intervenor to the project and ask to be kept informed about the application process.

Sincerely on the behalf of the Commission,

Gregory Brodski, Co-Chair

Re: Tennessee Gas Pipeline Company, L.L.C. (“TGP”)  
Docket No. PFI4-22-000: Proposed Northeast Energy Direct (“NED”)

Dear Ms. Bose:

The Town of Amherst is in receipt of the attached letter from the Amherst Christian Church, located at 134 Hollis Road, expressing concerns with the proposed route of the NED Pipeline.

On behalf of the Amherst Christian Church, I respectfully ask that the attached comments be included as part of the public record.

Thank you for your consideration of this information.

Sincerely,

Colleen P. Mailloux, AICP  
Community Development Director

Attention: Pipeline Task Force  
John D'Angelo, Vice Chairman

Reference: Kinder Morgan proposed pipeline.

Dear Mr. D'Angelo

It is my understanding that Kinder Morgan is planning to route the proposed pipeline through Patricia Lane, and our churches parking lot located at the address noted on our letterhead. It is also my understanding that to date, the final decision has not been made and you are still in an evaluation process. There are a couple of factors related to the operation of our church and the services we provide to the local communities that would be negatively impacted by the proposed pipeline routing.

Our church campus is approved and licensed by the state as for child care and has operated a pre-school and kindergarten at this facility for 23 years with an average attendance of 80 students. We suspended our pre-school operation a few years ago for a number of reasons. However, we are in the process of developing a new operational plan with the goal of reopening our school in September of 2016. Our school staff numbered 11 individual plus the church staff of 3 on site personal.

Attending one of the Kinder Morgan presentations I observed that the proposed routes avoided schools and can only assume there is a reason for Kinder Morgan routing the pipeline considerable distances from educational facilities. We would appreciate the same safety parameters for our school that have given to the other educational facilities.

Various special events including Thanksgiving, Christmas and graduations in the past have been attended by over three hundred (300) individuals. It is my understanding the proposed pipeline route as presently proposed by Kinder Morgan will be less than fifty yards from the front doors of our facility.

No matter how safe Kinder Morgan claims the pipeline will be the fact is that it presents a potential risk and danger to our students. In addition, the pipeline is being projected as a risk to all who have it passing through their back yards. In the event of leak, fire or explosion it would block the entrance and exits to our campus and a cause of physical injury to those present on our campus.

Our assembly area is approved for five hundred occupants making it the largest auditorium in the towns of Amherst, Millford, and Hollis.

At present our facility is used for our Sunday services, special events, i.e., concerts, seminars, interchurch events, small groups, including youth women's and including concerts, seminars, interchurch events, small groups, including youth women's and special interest groups and church events.

In addition to the above our campus houses New Hampshire Family Radio's broadcast studio and the Community Marriage Initiative. My concern is also for the inconveniences we would experience during construction and the safety issues associated with the pipeline and its impact on our school.

Thank you for your attention to above issue. Your careful consideration will be greatly appreciated.

Sincerely,

Ronald A Tannariello  
Lead Pastor

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission  
Washington, DC 20426

Re: Regional Economic Consequences of the Northeast Energy Direct Pipeline (PF14-22-000)

Dear Secretary Bose,

I am writing to urge FERC to reject the Northeast Energy Direct (NED) proposal identified in PF14-22-000. Contrary to the assertions of the pipeline's sponsor, there is mounting evidence that the net result of NED could be to dramatically raise natural gas prices in the region, with a devastating impact on jobs and the region's economy.

To support that thesis, we need only to review FERC's June 2015 data, showing that the "landed" price of LNG in the United States was \$1.86 per mmBtu, compared to circa \$7 in Europe and \$8 in Asia. It appears irrefutable that the significantly lower cost in the U.S. is due to the heretofore restrictions in export distribution infrastructure. If approved, NED could change that metric significantly by "unlocking" U.S. gas and making the price rise to the fungible world market. While Kinder Morgan (KM) and fracking drillers may find that prospect desirable, it's doubtful that consumers and businesses would be similarly enthralled.

When you review the public relations data from companies such as Kinder Morgan (KM), we find public pronouncements such as "[i]f the NED Project natural gas pipeline is constructed, it will benefit the Northeast Region...from the standpoints of energy prices" and "[t]he NED Project will increase the capacity of natural gas..., thereby lowering energy costs for both businesses and consumers and alleviating the current market stress."

KM apparently will not discard the potential of exporting large volumes of gas with NED. Therefore, public officials, including governors and Congressional representatives – as well as FERC - have an obligation to acknowledge the potentially devastating 300-400% price increases that could result from export pricing fungibility. It would be a tragic deception for officials to publically support such a controversial project, with its significant negative impact on the environment and risks of harm or death to our families, while failing to prominently identify the very real possibility that it could also monumentally harm the economy.

FERC's policy of proportionality requires the consideration of "adverse impacts." The downside economic risks to the New England region from NED exports should be prominent on that list.

C: NH Governor, NH Congressional Delegation

#### **20150804-5070**

Kathleen Graham, Dracut, MA.

The building of the compressor station in Dracut is very concerning to me. It will be placed near many farms and within a mile of an elementary school and would have negative impacts to soil quality. There is also the potential for explosions. I am concerned this plant will lower the value of my house. Im also very concerned with road closures during the pipe laying snd building process. I am very much against the pipe-line in Dracut.

#### **20150804-5081**

Richard Crane, Groton, MA.

Dear FERC,

I would like to restate my objection to the Northeast Energy Direct Project. My opinion is that Kinder Mor-

gan and TGP, LLC has not demonstrated the need for this pipeline.

They have worked to address concerns regarding the proposed route. In doing so, they have changed the primary route from a completely “greenfield” route through Massachusetts to one that goes along existing utilities through Massachusetts and New Hampshire. If this pipeline were to be built, the new route along existing utilities has the least amount of impact to the people of New England.

Regarding the originally proposed route, I have included my comments from November 2013 which highlights the impact to my family (see below). My family’s entire financial well being, health, and quality of life will be impacted. It will be devastating.

Regards,

Rich Crane  
Groton, MA

\*\*\* Comments To FERC from November 2013 \*\*\*

I am a landowner in Massachusetts directly affected by the Northeast Energy Direct Project proposed by Kinder Morgan and the Tennessee Gas Pipeline Company, LLC. As currently proposed the Northeast Energy Direct Project is a “greenfield” pipeline that will cross Massachusetts having a devastating affect on homeowners, conservation land and the environment. There is no natural gas pipeline that has this level of impact and devastation that I could ever support. Please help the people of Massachusetts by getting Kinder Morgan to change their route so that pipeline goes through existing rights of way designated for public use to minimize the impact to Massachusetts. Until this can be achieved we urge the Federal Energy Regulatory Commission to deny this project.

I come from a poor working class upbringing. At the age of 11 I took several jobs to help support my mother, a single parent who raised three boys on just a secretary’s salary. I have worked hard all my life to get an education and build a career to support my family. The culmination of my life’s effort was to find our dream home where my wife and I could raise our kids in a healthy and safe environment. It took us over 10 years from the time that we started looking to find our home. It is the perfect home in a neighborhood of homes surrounded by conservation land located in the Town of Groton Massachusetts, a quaint New England town. We risked everything financially to get our home. By some miracle we were able to purchase our home. It is our primary investment for our kids’ well being and our eventual retirement. This pipeline will significantly decrease our property value and devastate us financially. There are many other families throughout Massachusetts in the exact same situation. All of us are concerned about the devastating impact this pipeline will have on our families’ financial wellbeing and financial future.

On February 6, 2011 we held our first Super Bowl party at our new home. This day was a disaster for both the Pittsburgh Steelers and our air conditioning system. Ice dams destroyed our back deck and air conditioning system. Fortunately we had insurance that paid for the repairs. After seeing the massive repair costs we realized that this was a blessing in disguise and replaced our air-conditioning with geothermal. Geothermal is a clean renewable energy solution. This was easy to do in Massachusetts since our state leads the way in clean renewable energy solutions. This pipeline impacts many things on our property including our geothermal wells. It is unimaginable that a fossil fuel solution such as a natural gas pipeline can take precedence over a clean renewable energy solution such as geothermal. We need to continue to be leaders in clean renewable energy and reject this project.

Our kids enjoy the benefits of living in a neighborhood bordered by conservation land. Often they walk the conservation land behind our homes to get exercise and enjoy nature. During the summer months they venture over to Wattles Pond to go fishing where they have always caught a fish. Then there is the “Save the Bullfrog” campaign my kids embark upon every year. For about a month at the start of summer they fish bullfrogs out of our pool that migrate from the wetlands behind our house. As parents we enjoy sitting on the back deck looking out at the trees and watching the deer and turkeys traverse our property. Of course there is the occasional porcupine, fisher cat, or bear, but we like seeing them too. If this pipeline project were to continue as-is all of the wetlands and conservation land that surround our neighborhood will be gone

forever. The residents of Groton will have lost something precious that can never be replaced.

Conservation land is scarce in Massachusetts. Ours is just a piece of the conservation land that remains in our state. Massachusetts passed Article 97 in our state constitution to protect conservation land and open space from being developed. This pipeline is a “greenfield” project that affects conservation land throughout the state. It also impacts wetlands, priority habitats, core habitats, farmland, water supplies, protected water resources, scenic rivers, and wellhead protection areas all while going through peoples’ homes. It is imperative that Massachusetts be able to preserve what conservation land and open space they have left. Kinder Morgan knows that this project would never be approved as-is if it were brought directly to Massachusetts. That is why they are using federal eminent domain to push through a project that the public would never agree too.

**20150804-5086**

John Lewicke, mason, NH.

In January of this year (2015) I denied KM/TGP access to my property at 928 Starch Mill Road in Mason, NH. Their agent, Narramore, acknowledged receipt of and intent to comply with my denial. This message is to put my denial of access on FERC’s record.

John Lewicke

Re: Tennessee Gas Pipeline Company, LLC  
Docket No. PF14-22-000  
Northeast Energy Direct Project

Dear Secretary Bose:

The New York State Department of Transportation (NYSDOT) has an agreement with, and an obligation to, the Federal Highway Administration (FHWA) on how utility facilities are accommodated on controlled access highways throughout New York State. This agreement is the “Accommodation Plan For Longitudinal Use of Freeway Right-of-Way By Utilities.” NYSDOT’s Accommodation Plan is based upon Title 23 Part 645 of the Code of Federal Regulations and applies to any designated freeway or other controlled access highway. Pursuant to the Accommodation Plan, communication utility facilities are the only utilities that can longitudinally occupy New York State freeway rights-of-way within the control of access. Any non-communication utility must request an exception to the Accommodation Plan for a longitudinal occupancy.

Any requests for a non-highway use of controlled access highways such as Interstate 88 require FHWA approval. NYSDOT has an established procedure for exception requests under which NYSDOT reviews any requests prior to submission to FHWA for consideration and approval or rejection. FHWA and NYSDOT

require a NEPA review (includes SEQRA and FHWA regulations) for each and every feasible alternative. All alternatives must be adequately analyzed before NYSDOT will forward an exception request to FHWA for consideration. Enclosed please find the requirements and the procedure for requesting an exception that Tennessee Gas Pipeline LLC would have to comply with in order to utilize any controlled access highways along with the Accommodation Plan,

As stewards of Federal Highway funds, NYSDOT must ensure compliance with federal laws, regulations and requirements. Failure to comply will result in a sanction issued by FHWA and could result in the entire affected highway facilities becoming ineligible for any federal-aid funding.

Please contact me at 518-457-2411 if you have any questions on the material provided. ‘

Sincerely,

DONNA K. HINTZ  
Associate Attorney  
Office of Legal Services

-----  
APPENDIX 138  
ACCOMMODATION PLAN FOR LONGITUDINAL USE  
OF FREEWAY RIGHT-OF-WAY BY UTILITIES  
October, 1995

A. This Accommodation Plan is submitted pursuant to 23 CFR §645.209 and is subject to 23 CFR §645.211 and 645.215. It is applicable only to the occupation of freeways by lines, facilities or systems used for communications to the extent provided by 23 CFR §645.207(m) (hereinafter referred to as communications facilities or facilities). The longitudinal use of freeways by utilities shall not be allowed except in accordance with 17 NYCRR Part 131 and in particular §131.6, which requires a case-by-case evaluation of individual requests, and with the above federal requirements as implemented below. In no case shall any installation be allowed within the median of the freeway. In all cases, occupation of the right-of-way is subject to a use and occupancy agreement issued by the Department of Transportation under 17 NYCRR 131.16(d), containing the conditions of occupancy.

B. In recognition of the fact that certain public authorities, public benefit corporations and municipalities have exclusive jurisdiction and control of certain designated freeways covered by the above-mentioned FHWA Regulations, this Accommodation Plan shall apply to those designated freeways only to the extent that such public authority or public benefit corporation has not received FHWA approval of its own Accommodation Plan. When consummated, an informational copy of any formal agreement between the Commissioner and any responsible local officials, public authorities and/or public benefit corporations concerning the applicability of this (or other) utility accommodation plan to federally-aided freeways not under the Department's jurisdiction and control shall be provided to the Federal Highway Administration.

Such agreement shall insure that the utility accommodation policies of the public authorities, public benefit corporations or municipalities shall provide at least the same measure of protection as provided by Part 131 NYCRR Title 17.

### 1. General Policy

The Department will make available the rights-of-way of freeways for the installation of communications facilities where they can be safely installed, operated, and maintained. For purposes of this plan install, operate and maintain shall include but not be limited to: construction, service, repair, replacement, inspection, etc.

Parties interested in using portions of the right-of-way of a freeway for longitudinal installations of communications facilities are encouraged to make their general interest known. Expressions of interest should be directed to the Director, Real Estate Division, Building 5, State Office Campus, New York State Department of Transportation, Albany, New York 12232.

### 2. Application Process

Where there is a reasonable expectation of interest in the installation of communications facilities within a portion of the right-of-way of a freeway, as evidenced by expressions of interest received by the Department and excess fiber optics capacity installed in the freeway right-of-way is not already available from another source, the Department will offer the right to install, operate, and maintain communications facilities within the right-of-way of specific portions of freeways through an open competitive process which involves advertisement, evaluation of proposals negotiation of an agreement with a selected proposer, and award of a contract.

#### a. Request for Proposals

The Department will advertise in the New York State Contract Reporter and in periodicals normally used for such purposes, a request for proposals for the installation, operation, and maintenance of communications facilities within the right-of-way of specified portions of freeways. Although requirements may vary between locations in some respects, each proposal will be required to include:

- (1) a plan and schedule for initial installation, including a traffic control plan in conformance with the Manual of Uniform Traffic Control Devices (MUTCD);
- (2) a plan for access to the communications facilities for operation and maintenance including traffic control plans in conformance with the MUTCD;
- (3) information regarding the general capacity of the facilities proposed to be provided and an analysis that shows how projected demand will be served by the proposed installed capacity; (Note: The Department is fully aware of the desire for confidentiality and will make every effort to proceed in that regard.)
- (4) a statement of the degree to which facilities, will be available, if at all, for the use of others and the terms and conditions of such use; and
- (5) the proposed payment to be made for occupancy of the freeway rights-of-way.

b. Review and evaluation of proposals will be by committee in accordance with criteria specified in the Request for Proposals. The committee will be composed of members designated by the Department. The committee may consult with the Public Service Commission and the Department of Economic Development in evaluating proposals. The criteria for evaluation will include:

- (1) The relative degree of disruption of the right-of-way during installation as shown in plans and schedules and the extent to which such disruption will affect traffic flow and safety, landscaping, and protected resources, as well as the freeway's appearance, its structural and controlled access integrity and its ability to be maintained, widened or otherwise modified. To minimize the disruption of the right-of-way during installation, all proposals must be in accordance with the following guidelines:

- (a) All elements of a facility are to be installed in a designated “utility strip” to be established by the Department. The utility strip shall be approximately 10 feet wide and shall generally be established along the edge of the right-of-way. The utility strip shall fall within the edge of the right-of-way and the “roadway”. Roadway is defined in the Department’s design manual as “that portion of the highway included between the outside edges of the graded width of shoulder.” The Department may authorize installation within the roadway in exceptional situations (e.g., to provide access to a bridge which is needed to carry the facilities over natural barriers). The location of the facilities shall be such as to minimize impact on highway use, safety, maintenance, aesthetics, and future highway improvements.
- (b) Except as provided elsewhere in this document, facilities shall generally be installed in underground ducts or conduits and no part of the facility shall be visible from the roadway.
- (c) The initial installation shall include all appurtenances necessary or incidental to the operation of the facility, and shall include manholes or other duct/conduit access points at appropriate spacings to permit the pulling of additional cables into the duct system without further excavation. Any electrical service necessary to operate repeater/booster stations or similar appurtenances shall be placed in underground ducts or conduits running from crossroads or frontage roads adjacent to the required point of access or from easements the utility owns. No longitudinal electrical line installation on the freeway right-of-way will be allowed. The utility shall furnish and pay for all materials, equipment, and labor required for the proposed installation.
- (d) Installations of any part of a facility crossing the freeway, an interchange ramp roadway or any roadway shall be by a trenchless technology and shall be installed in a manner so as virtually to preclude any necessity for disturbing the roadways and their clear zones for installation, operation or maintenance. To the extent feasible and practicable, such crossings should be on a line generally normal to the roadway alignment.
- (e) At bridge crossings or where unusual terrain, environmental, or other conditions warrant, the Department may authorize installation of a portion of the facility above ground, or under conditions which differ from those specified in this Plan, if it is found that there is no practicable alternative inside or outside the right-of-way and that the installation will not impair freeway safety or the aesthetic quality of the land traversed. However, no above ground facility that constitutes a fixed object will be allowed within the clear zone, nor will installation be allowed within the median.
- (f) Where a facility installation must cross a major valley or river, such installation may be carried on an existing freeway structure only where the Department finds that such use of the structure will not interfere with the use or maintenance of the freeway and that denial of such use would result in significant harm to the environment. Similarly, such installation shall not be allowed to occupy vehicular tunnels without such a finding by the Department.
- (g) In scenic areas, the Department may authorize installations only when they do not require extensive alterations of trees or terrain features visible to the highway user or impair the aesthetic quality of the land traversed. When installation of a facility is authorized, trees within nine feet of the center line of the designated facility area within the freeway right-of-way may be removed. This area may be kept clear of trees during the period of its use and occupancy by the facility.
- (h) All methods of installation, as well as methods of erosion control and other details of installation of the facility, shall be subject to the review and approval of the Department.
- (i) Upon completion of installation, all disturbed areas shall be returned to their original topography and all steps necessary to prevent future erosion shall be taken. Backfill shall be tamped and vegetation, other than trees, replaced. The Department may specify the type and location of replacement vegetation. The Department may require the completion by the selected proposer of an approved mitigation plan for replacement of tree loss created by the construction of the facility. The survival of all replacement trees and vegetation for a period of two (2) years following planting shall be guaran-

teed.

(j) Longitudinal occupancy of freeway rights-of-way shall be for transmission type facilities only. Service connections to adjacent properties will not be allowed from the freeway rights-of-way, including service connections at repeater/booster stations located on the freeway right-of-way.

(k) The proposal shall take into account planned or likely improvements or alterations in the nature or configuration of the highway and planned or likely improvements in the nature or configuration of facilities.

(1) The proposal shall also identify the direct and indirect environmental and economic effects of the loss of productive agricultural land or the productivity of any agricultural land which would result if the facility is not located within the freeway right-of-way. It shall also identify the potential impact upon freeway landscaping.

(m) Safety of the driving public and protection of the State rights-of-way for future use are of primary importance in allowing longitudinal occupancy by any facility. In no case will occupancy or access be permitted that will adversely affect safety.

(2) Measures to be taken to provide access to facilities from outside the right-of-way.

(a) To the greatest extent possible in light of the locations designated for the facility, access for installing, operating or maintaining a facility along or across a freeway should be limited to access via nearby frontage roads (where available), adjacent public roads and streets, or trails along or near but outside of the freeway right-of-way line, connecting only to an intersecting road, from any one or all of which entry may be made to the outer portion of the right-of-way.

(b) A locked gate along the freeway control-of-access fence may be utilized to meet periodic access needs. Where a gate is allowed, the use and occupancy permit shall include adequate provision against unauthorized use.

(c) The Department shall impose conditions for policing and other controls as are necessary to assure the safety of highway travelers and to avoid interference with freeway use. During installation, operation and maintenance, barriers and/or signs and/or other warning devices conforming to the MUTCD shall be installed as required and approved by the Department to alert and protect highway travelers to utility activities within the right-of-way. Where signs conforming to the MUTCD are placed in the vicinity of the through roadway or clear recovery area, they shall be collapsible upon impact from a vehicle. Additional maintenance and protection provisions shall be as stated in the "general conditions" clauses of the Highway Work Permit. The Department reserves the right to require more stringent measures when it deems it necessary, as provided by Sections 126, 128, and 129, of NYCRR Title 17.

(d) Lane closures on the mainline or ramps of the freeway will not generally be permitted during the installation, operation, or maintenance of facilities.

(e) Access to facilities for installation, operation and maintenance within a freeway right-of-way will only be allowed in accordance with the provisions of a traffic control plan which is specified in the negotiated contract.

(3) The total capacity being installed. Installation of facilities shall be of a character and capacity to preclude the programmed need for any additional disruption. Absent compelling circumstances, the Department will not permit installation of additional ducts or conduits for a minimum of 10 years from initial construction. The Department will, however, allow installation of additional cable and/or replacement of existing cable within a previously installed duct or conduit to the extent it can be accomplished without direct or indirect interference with freeway traffic.

(4) The degree to which facilities, will be available, if at all, for use by others and the proposed terms and conditions of such use.

There is a presumption that it is in the public interest for the competing utilities to provide service

within the available corridors. In order to protect and encourage such competition and ensure minimum future intrusion into the right-of-way and to avoid disturbance to traffic by installation of multiple facilities, the proposer is required to provide a description of the facilities, which will be available to others and how others will be provided access to the facilities proposed to be installed, if any. An outline of the terms and conditions under which the proposer would make such facilities available to other services shall be provided.

(5) Proposed payment or payments to be made for use and occupancy of the freeway right-of-way.

The Department may charge an assessment for the privilege of permitting installation of facilities and using the freeway right-of-way.

### 3. Contract Award

Award of a contract to a selected proposer in accordance with the general terms outlined in the proposal will usually be made within 90 days of the deadline for receipt of a complete proposal by the Department. Contract awards are subject to the negotiation of an acceptable contract and approval by Department Counsel, after consultation with the Division of the Budget, the Attorney General, and the Comptroller.

a. Contract Provisions - Contracts may vary but will generally include the following provisions:

(1) The Department reserves the right to restrict the use of freeway right-of-way. Such restrictions may include but not be limited to: number and types of facilities allowed; physical space occupied by the facilities or by equipment used for installation, operation and maintenance; time restrictions on installation, operation or maintenance; provisions of a traffic control plan for the maintenance and protection of traffic; system expansion, etc. The selected proposer may be required to make installations concurrent with others, so as to limit such work to one installation operation.

(2) Except where payment is required by Section 10, Subsection 24-b of the New York State Highway Law, any relocation of any fiber optics facility allowed to be on the freeway right-of-way, made necessary as a result of highway construction or maintenance operations, or changes in Department policy or design standards, shall be made promptly and at the expense of the selected proposer.

(3) The use of the freeway right-of-way shall be by a "Use and Occupancy Agreement" or other similar agreement obtained from the Department. Such Permit will require that a "Highway Work Permit" be obtained prior to actual installation. In addition an "Annual Maintenance Permit" must first be secured prior to the undertaking of any maintenance activity on the right-of-way. A Department approved traffic control plan for installation, operation and for future access is a prerequisite to issuance. Application and general conditions for such "Highway Work Permit" and "Annual Maintenance Permit" are explained in Title 17 Part 131 NYCRR.

(4) No permit to allow installation of a facility on freeway right-of-way will be issued nor will work commence until a contract is awarded to a selected proposer.

(5) Violation of the "Use and Occupancy Agreement", "Highway Work Permit", "Annual Maintenance Permit", or of any other law or rule at any time by the permit holder or its agent(s) in the installation, operation or maintenance of facilities within freeway rights-of-way shall be the basis for denial of use, imposition of fines, or physical removal of the offending party and/or the permit holder's facilities as designated in such permit, or as provided by law.

(6) The permit holder shall be responsible for obtaining all necessary permits, approvals, etc. required by any Federal agency or other State agency and shall furnish to the Department copies of such permits and approvals.

(7) Being permitted to use freeway rights-of-way does not automatically mean permission to use bridges. Any proposed use of bridges must be evaluated and approved by the Department as per Section 131.20 of 17 NYCRR. Any desire to install facilities on bridges or other structures must be stated in the initial application for any permit, together with whatever installation details the Department indicates are necessary to evaluate the proposal.

(8) The selected proposer shall be required under the Highway Work Permit to provide the Department with a log of each entrance onto the freeway rights-of-way with personnel and/or equipment to include date, time, duration, location of entrance onto and exit from the rights-of-way, and the reasons for such entrance and exit, the equipment and personnel involved, etc.

(9) The selected proposer shall install along with any buried facilities a system of continuous plastic ribbon or marking tape. Such marker shall be installed at a level no less than 12 inches below the surface of the ground. The marker shall include a metal thread or other system capable of reliably emitting a signal readable by located equipment operated on the surface. The selected proposer also shall install adequate permanent buried cable markers showing the approximate horizontal and vertical location of its underground facility. Such post markers shall not interfere with highway operations or maintenance and shall be offset from the actual location of the facility where necessary to avoid such interference. The selected proposer shall also maintain records that describe the facility, its location, depth, size, and other relevant data, which shall be available upon request to the Department and to other interested agencies. Within 120 days following the completion of the work authorized under a location permit, the selected proposer shall file with the Department one complete set of “as built” plans showing the locations of all parts of the facility. The selected proposer also shall file with the Department at that time one complete set of said plans on microfiche or other form of information storage system as determined by the Department.

(10) Except where this Plan or the use and occupancy permit calls for different procedures, the selected proposers shall comply with the construction standards, location standards, and special marking techniques established by the most recent publication of 23 CFR 645.

(11) The Department shall have authority to place inspectors on site to monitor and observe the selected proposer’s activities, and/or to request the presence of state or local police to assure the safety of freeway travelers, at such times and for such periods as the Department deems appropriate. All costs thereof shall be borne by the selected proposer.

(12) Upon issuance of a permit and from time to time during any installation, operation, or maintenance periods, the selected proposer shall pay to the Department those amounts representing all of the costs of processing the application and administering the permit, including without limitation any costs relating to the need to relocate the facility in connection with any other work performed by the Department.

(13) Acceptance of a permit by the selected proposer shall constitute an agreement by the selected proposer, notwithstanding any other provision of law, to assume all liability for any loss, cost, damage, or harm arising out of or relating to the installation, operation or maintenance, of its facility and to the presence of its facility in the freeway right-of-way. Further, acceptance of a use and occupancy agreement shall constitute an agreement by the selected proposer to indemnify and hold harmless the State of New York, its officers, agents, and employees from all loss, cost, damage, and harm, including attorney’s fees, arising out of or relating to the foregoing.

DRAFT

**Accommodation of Non-Communication Utilities on New  
York State Freeway or controlled Access Rights-of-Way**

**I. INTRODUCTION**

The New York State Department of Transportation (NYSDOT) has an agreement with the Federal Highway Administration (FHWA) on how utility facilities are accommodated on freeways in New York State. This agreement is “Accommodation Plan for Longitudinal Use of Freeway Right-of-Way By Utilities” which is

available at [www.nysdot.gov](http://www.nysdot.gov). Currently, the only utilities which are allowed to longitudinally occupy New York State freeway rights-of-way or controlled access rights-of-way are communication utility facilities. A highway with full control, of access is a highway on which entrances and exists are controlled or limited at designated interchanges; all other intersection or connections are prohibited. NYSDOT's Accommodation Plan is based upon title 23 part 645 of the Code of Federal Regulations (CFR) which permits states to establish their own policies, subject to FHWA approval, with regard to longitudinal accommodation of utilities on controlled access rights-of-ways. This policy applies to any designated freeway, regardless of ownership, i.e. freeways owned by NYS Office of Parks, Recreation and Historic Preservation are also included in this policy. -

Any interest in a longitudinal occupancy of a controlled access right-of-way by a noncommunications utility must be submitted as a request for an exception to the current approved Accommodation Plan. Pursuant to 23 CFR 1.23, when a State Highway Agency acquires property for a highway project, it must dedicate use of said property exclusively to highway purposes except under strictly controlled conditions. Any request to use said property for non-highway purposes is considered a request for an exception. Both NYSDOT and FHWA must approve these requests. Since FHWA is involved and therefore, federal action is required, the National Environmental Policy Act (NEPA) applies and requires an extensive and detailed evaluation of all possible alternatives pursuant to 23 CFR 771. NYSDOT procedures to fulfill NEPA requirements are available at [www.nysdot.gov](http://www.nysdot.gov). All exception requests must demonstrate that the accommodation will not adversely impact the design, construction, operation, maintenance, or stability of the highway and that it will not interfere with or impair future expansion of the highway. Any installation shall comply with 23 USC 111 and 23 CFR 645.209 as noted below. In addition exception requests must show that alternate locations will cause unacceptable adverse environmental impacts or cannot be implemented from a standpoint of providing efficient utility services in a manner conducive to safety, durability and economy of maintenance and operations.

Specifically under 23 CFR 645.209 (c)(2), any accommodation plan shall assure that installations satisfy the following criteria:

- (i) The effects utility installations will have on highway and traffic safety will be ascertained since in no case shall any use be permitted which would adversely affect safety.
- (ii) The direct and indirect environmental effects of any loss of productive agricultural land or any productivity of any agricultural land which would result from the disapproval of the use of such right-of-way for accommodation of such utility facility will be evaluated.
- (iii) These environmental and economic effects together with any interference with or impairment of the use of the highway in such right-of-way which would result from the use of such right-of-way for the accommodation of such utility facility will be considered.
- (iv) A utility strip will be established along the outer edge of the right-of-way by locating a utility access control line between the proposed utility installation and the through roadway and ramps. Existing fences should be retained and, except along sections of controlled access rights-of-way having frontage roads, planned fences should be located at the controlled access right-of-way line. The State or political subdivision is to retain control of the utility strip right-of-way including its use by utility facilities. Service connections to adjacent properties shall not be permitted from within the utility strip.

In addition to the federal law and regulations, any accommodation would have to satisfy NYS Finance Law and Highway Law Requirements for use of State property. There will be a fee charged for use and occupancy of the controlled access right-of-way. Each accommodation will be reviewed on a case by case basis.

It is imperative that NYSDOT be contacted and included early in the planning process due to the complicated legal and operational issues that need to be considered when seeking longitudinal accommodation on a controlled access right-of-way.

Freeways or controlled access rights-of-ways are the State's most important and highest volume roadways. The NYSDOT plans and maintains right-of-way along these roadways to accommodate future changes to

the highway and service demands. The flexibility to improve our freeways is critical. A sound transportation system is crucial to the State's economic viability.

## **II. 2006 LOBBYING LAW REQUIREMENTS AND COMPLIANCE**

Pursuant to NYS finance Law §§139-j and 139-k, a request to use NYSDOT freeways, controlled access highways or rights-of-ways imposes certain restrictions on communications between NYSDOT and the requesting party during the procurement process. The requesting party is restricted from making contacts during the procurement process through final award and approval of the procurement by NYSDOT and, if applicable, Office of the State Comptroller ("restricted period") to other than designated staff unless it is a contact that is included among certain statutory exceptions set forth in NYS Finance Law §§139-j(3)(a). The restricted period is defined as 'the period of time commencing with the earliest written notice or solicitation of a request for proposal or other method of soliciting a response from officers intending to result in a procurement contract with a governmental agency. The term "contract" is defined by a statute and refers to those oral, written or electronic communications that a reasonable person would infer are attempts to influence the governmental procurement. Designated staff shall be identified for each project. NYSDOT employees are also required to obtain certain information when contacted during the restricted period and make a determination of the responsibility of the requesting party pursuant to these two statutes. NYS Finance Law §139-k(4) obligates every governmental entity, such as NYSDOT, during the restricted period of a procurement contract to make a written record of any contacts made. Procurement contract is defined as any contract or agreement for an article of procurement involving an expenditure in excess of fifteen thousand dollars. In addition to obtaining the required identifying information, the governmental entity must inquire and record whether the person or organization that made the contact was the offerer or was retained, employed or designated on behalf of the offerer to appear before or contact the governmental entity. An offerer would be a utility company seeking to use NYSDOT freeways or controlled access highways for the siting of its facility. Certain findings of non-responsibility can result in rejection for the contract award in the event of two findings with a 4 year period, the requesting party is debarred from obtaining governmental procurement contracts. Further information about these requirements and the required forms may be found at [www.nysdot.gov](http://www.nysdot.gov).

The requesting party must file an Affirmation of Understanding and Agreement pursuant to NYS Finance Law §139-j(3) and §139-j(6)(b), disclosure of Prior Non-Responsibility Determinations and Certification of Compliance with NYS Finance Law §139-k(5). A termination clause requiring compliance will be added to any contract, use and occupancy agreement, or highway work permits. The forms and the termination clause may be found at [http://ags.nY\\_9av/](http://ags.nY_9av/).

## **III. TRANSPORTATION CORPORATION RIGHTS**

A transportation corporation is a company organized under NYS Transportation Corporations Law. Transportation corporations are typically gas, electric, telephone, water and sewage companies. Such companies have certain legislated rights to occupy the State's highway rights-of-way (ROW) without payment of a use and occupancy fee, but this does not apply to controlled access rights-of-way.

## **IV. APPLICATION OR PROPOSAL CONTENT**

Any request submitted to NYSDOT for longitudinal accommodation shall include, at a minimum, the following:

### **(a) Organizational Overview**

Identify the overall project organization for the proposed project or action, include the firm(s) which will be involved and their respective relationships, roles and responsibilities and whether they are considered Transportation Corporations or incorporated under other laws. Provide proof of Transportation Corporation status. Provide a description of the relevant corporate experience of all involved firms including examples of current/prior involvement in efforts of this type.

Identify the management team, including key personnel and their respective relationships, roles and responsibilities and specifically the individual(s) who will be responsible for communicating with NYSDOT on project matters. -

(b) Project Development and Public Need

Provide a description of the overall public need. Identify any research and/or analysis performed which supports the planned facility, including any projected trends in how the market(s) may develop over time. Describe any involved statewide planning process and include any resulting plans or reports. Provide a copy of any certificates issued by New York State Public Service Commission (NYSPSC) or Federal Energy Regulatory Commission (FERC)\_

Provide an overall schedule for the proposed installation which indicates the best estimate of the time frame(s) associated with all major project activities.

Identify potential problems to successfully implement the proposed facility and a discussion, as applicable, of your approach to resolving such potential problems.

(c) Alternatives

Provide detailed description and evaluation that is in full compliance with NEPA and SEQRA requirements for all alternatives, including impacts to the transportation system. The alternatives analysis should include environmental, social, physical impacts and a cost analysis. Provide specific engineering deficiencies for each alternate route.

(d) Capacity and Availability

Provide description of the proposed facility's general capacity .... Demonstrate how projected demand will be served by the project.

Provide description of the extent, if any, of the proposed facilities that will be made available for the use of others, including how such access will be provided. Outline the terms and conditions under which such facilities would be made available to others.

There is a presumption that it is in the public interest for the competing utilities to provide service within the available corridors. In order to protect and encourage such competition and ensure minimum future intrusion into the controlled access right-of-way and to avoid disturbance to traffic by installation of multiple facilities, the applicant is required to provide a description of the facilities, which will be available to others and how others will be provided access to the facilities proposed to be installed, if any. An outline of the terms and conditions under which the applicant would make such facilities available to other services shall be provided.

(e) Installation

Provide design and initial installation plans of the facility. Include a traffic control plan, in conformance with the NYSDOT Manual of Uniform Traffic Control Devices (MUTCD). Indicate the extent to which the installation will affect traffic flow and safety, landscaping and protected resources, as well as the freeway's/corridor's appearance, its structural and controlled access integrity and its ability to be maintained, widened or otherwise modified. These plans should clearly delineate the proposed construction limits.

Include discussion of any planned or likely improvements and/or upgrades to the utility facilities and time frames.

(f) Constructability

Provide a feasibility study of access routes required to mobilize and transport specialized equipment and materials. Identify potential work to be scheduled during time of reduced traffic volumes. Describe impacts on existing utilities in the project area.

(g) Access for Operations and Maintenance

Provide plan for access to the utility facilities for operation and maintenance, including traffic control plans in conformance with NYSDOT MUTCD, a description and frequency of routine maintenance work and

emergency call procedures.

(h) Financial

Provide a pro-forma revenue and expense statement for the proposed project which identifies all assumptions underlying the statement.

Provide an explanation to assess the financial capacity of the entity, seeking this accommodation, to fulfill its commitments and responsibilities.

(i) Fair Consideration Proposal

Provide a description of the consideration (monetary and/or service) being offered to the State, if any. Identify the total dollar amount(s) and terms of payment and a description of the type(s), level(s) and extent of any service(s) being offered. Include all assumptions.

## **V. CRITERIA FOR EVALUATION OF PROPOSAL**

In addition to compliance with NEPA and SEQRA requirements, the proposal shall meet the following evaluation criteria:

(1) Project supports a strategic need within the project area and is in accordance with local and state planning efforts.

(2) Review the relative degree of disruption of the controlled access right-of-way during installation as shown in plans and schedules and the extent to which such disruption will affect traffic flow and safety, landscaping, and protected resources, as well as the freeway's appearance, structural and controlled access integrity and ability to be maintained, widened or otherwise modified in the future. To minimize the disruption of the controlled access right-of-way during installation, all proposals must be in accordance with the following guidelines:

a) All elements of the facility are to be installed in a designated utility strip to be established by the NYSDOT. The utility strip shall be approximately 10 feet wide and be located along the edge of the right-of-way; the final location will be determined during the planning process pending FHWA approval. The NYSDOT and FHWA may authorize installation within the roadway in exceptional situations (e.g., to provide access to a bridge which is needed to carry the facilities over natural barriers). The location of the facilities shall be such as to minimize impact on highway use, safety, maintenance, aesthetics, and future highway improvements. .

Being permitted to use controlled access rights-of-way does not automatically include permission to use bridges or other structures. Any proposed use of bridges must be evaluated and approved by the NYSDOT and FHWA as per Section 131.20 of Title 17 NYCRR (New York Codes, Rules and Regulations). Any request to install facilities on bridges or other structures must be stated in the initial application for any permit including all installation details the NYSDOT and FHWA indicate are necessary to evaluate the proposal.

b) Except as provided elsewhere in this document, facilities shall generally be installed underground with no part of the facility visible from the roadway.

c) The initial installation shall include all appurtenances necessary or incidental to the operation of the facility, and shall include manholes or other access points at appropriate intervals to permit operation and maintenance without further excavation. Any electrical service necessary to operate stations or similar appurtenances shall be placed in underground ducts or conduits running from crossroads or frontage roads adjacent to the required point of access or from easements the utility owns. The utility shall furnish and pay for all materials, equipment, and labor required for the proposed installation and maintenance.

d) Installations of any part of a facility within the controlled access right-of-way including an interchange ramp roadway shall be by a trench less technology and shall be installed in a manner to preclude or minimize disturbing the roadways and their clear zones for installation, operation or maintenance. To the extent feasible and practicable, such crossing should be on a line generally perpendicular to the centerline of the

roadway alignment

e>, At bridge crossings or where unusual terrain, environmental, or other conditions warrant, the NYS-DOT and FHWA may authorize installation of a portion of the facility above ground, if it is found that there is no practical alternative inside or outside the right-of-way and that the installation will not impair controlled access right-of-way safety or the aesthetic quality of the land traversed. However, no above ground facility that constitutes a fixed object will be allowed within the clear zone.

f) Where a facility installation must cross a major valley or river, such installation may be carried on an existing controlled access right-of-way structure only where the NYSDOT and FHWA find that such use of the structure will not interfere with the use or maintenance of the controlled access right-of-way and that denial of such use would result in significant harm to the environment. Similarly, such installation shall not be allowed to occupy vehicular tunnels without such a finding by the NYSDOT and FHWA.

g) In designated scenic park preservation areas, the NYSDOT may authorize installations only when they do not require extensive alterations of trees or terrain features visible to the highway user or impair the aesthetic quality of the land traversed. .

h) All methods of installation, as well as methods of erosion control and other details of installation of the facility, shall be subject to the review and approval of the NYSDOT.

i) Upon completion of installation, all disturbed areas shall be returned to their original topography and all steps necessary to prevent future erosion shall be taken. Backfill shall be tamped and vegetation replaced. The NYSDOT may specify the type and location of replacement vegetation. The NYSDOT may require the completion of an approved mitigation plan for replacement of tree loss created by the construction of the facility. The survival of all replacement trees and vegetation shall be guaranteed by the utility for a period of two (2) years following planting.

j) Longitudinal occupancy of controlled access rights-of-way shall be for transmission type facilities only. Service connections to adjacent properties shall not be permitted from the controlled access rights-of-way.

k) The proposal shall take into account planned or likely improvements or alterations in the nature or configuration of the highway and the impact of planned or likely improvements in the nature of the utilities.

l) Any occupancy or access that adversely affect safety will not be permitted as the safety of the traveling public and protection of the State rights-of-way for future use are of primary importance in allowing longitudinal occupancy by any utility or facility.

(3) Review measures taken to provide access to facilities from outside the controlled access right-of-way.

a) Access to the facility for installation, operation or maintenance along or across a controlled access right-of-way should be limited to access via nearby frontage roads (where available), adjacent public roads and streets, or trails along or near but outside of the controlled access right-of-way line, connecting only to an intersecting road, from any one or all of which entry may be made to the outer portion of the controlled access right-of-way to the greatest extent possible.

b) A locked gate along the controlled access right-of-way line (control-of-access) fence may be utilized to meet periodic access needs. Where a gate is allowed, the use and occupancy agreement shall include adequate safeguards against unauthorized use. FHWA approves all breaks in access. A break in access means any activity which enters onto highway right-of-way which has been designated as controlled, includes but not limited to vehicular, pedestrian, or utility occupancies at, above or below ground. This also includes any airspace occupancy of controlled access highway rights-of-way.

c) The NYSDOT shall impose conditions for policing and other controls as are necessary to assure the safety of highway travelers and to avoid interference with controlled access use. During installation, operation and maintenance, barriers and/or signs and/or other warning devices conforming to the NYSDOT MUTCD shall be installed as required and approved by the NYSDOT to alert and protect highway travelers to utility activities within the controlled access right-of-way. Where signs conforming to the NYSDOT MUTCD are placed in the vicinity of the through roadway or clear recovery area, they shall be collaps-

ible upon impact from a vehicle. Additional maintenance and protection provisions shall be as stated in the “general conditions” clauses of the required Highway Work Permit as discussed in Section VIII. The NYSDOT reserves the right-of-way to require more stringent measures when it deems it necessary, as provided by Sections 126, 128, and 129 of NYCRR Title 17.

d) Lane closures on the mainline, service roads or ramps of the controlled access right-of-way will not generally be permitted during the installation, operation or maintenance of facilities unless the utility will be within 12 feet of the edge of the shoulder or travel way. In accordance with NYSDOT engineering instruction (EI) 96-027 and any applicable Regional” policies, NYSDOT may require the installation to be completed at night. All lane. closures must be proposed to NYSDOT in writing at least one month before the beginning of the work and must be approved in writing by the Region before the work can begin. . .

e) Access\_to facilities for installation, operation and maintenance within a controlled access right-of-way will only be allowed in accordance with the provisions of a traffic control plan specified in the highway work permit and use and occupancy agreement as discussed in Sections VIII and X.

(4) The initial installation of a facility shall be of a character and capacity to preclude the programmed need for any additional disruption .. Absent compelling circumstances, the NYSDOT and FHWA will not permit additional installations after initial construction. If future expansion will be needed, this should be noted in the initial request.

## **VI. TIME FRAME**

Actions classified as Class I projects under NEPA require an Environmental Impact Statement and typically take 2-4 years to reach an environmental determination for NYSDOT Projects. Actions classified as Class III projects under NEPA require an Environmental Assessment and typically take 1-3 years to reach an environmental . determination for NYSDOT Projects. Actions classified as Class II projects under NEPA require a Categorical Exclusion and typically take 6-18 months to reach an environmental determination for NYSDOT Projects.

## **VII. NYSDOT ACTIONS AND SUBMISSION TO FHWA**

The NYSDOT reviews, comments and determines if the exception request is adequate and appropriate for submission to FHWA. If NYSDOT determines that the application meets the minimum criteria and does not conflict with NYSDOT operations, NYSDOT makes the formal request for an exception and forwards the project documentation to FHWA. Please be advised. that compliance with all submittal requirements does not guarantee final approval from NYSDOT or FHWA.

The FHWA reviews and issues their recommendation. If the request is approved, all related Use and Occupancy agreements and breaks in access must also be approved by FHWA.

If FHWA denies the request, the utility must reevaluate its project on the basis of the --response

## **VIII. ACTIONS TO PROGRESS A UTILITY PROJECT AFTER AN EXCEPTION HAS BEEN GRANTED BY FHWA**

Any utility permitted to occupy NYSDOT controlled access right-of-way (ROW) must comply with 17 NYCRR Part 131, which is available at [www.nysdot.gov](http://www.nysdot.gov) .

Award of any agreements and use of NYSDOT property is subject to negotiations of acceptable terms and approval by NYSDOT counsel, after consultation with the NYS Attorney General, and the Office of the NY State Comptroller. Permits or agreements may vary, but will generally include the following provisions:

(1) The NYSDOT reserves the right to restrict the use of controlled access right-of-way. Such restrictions may include but not be limited to: number and types of facilities allowed; physical space occupied by the facilities or by equipment used for installation, operation and maintenance; time restrictions on installation, operation or maintenance; provisions of a traffic control plan for the maintenance and protection of traffic; system expansion, etc. The applicant may be required to make installations concurrent with others so as to limit such work to one installation operation. Applicants shall provide the NYSDOT with copies of all

inspection- reports.

(2) Except where payment is required by Section 10, Subsection 24-b of the NYS Highway Law, any relocation of any facility allowed to be on the controlled access right-of-way, made necessary as a result of highway construction or maintenance operations, or changes in NYSDOT policy or design standards, shall be made promptly and at the sole expense of the utility applicant.

(3) The use of the controlled access right-of-way shall be by a Use and Occupancy Agreement or other similar agreement obtained from the NYSDOT including a fee for the use of the property. Generally, this agreement must be executed prior to the issuance of a Highway Work Permit and will require that a Highway Work Permit be obtained prior to installation or construction. In addition, an Annual Maintenance Permit must be secured prior to the undertaking of any maintenance activity on the controlled access right-of-way. A NYSDOT approved traffic control plan for installation, operation and for future access for maintenance activities is a prerequisite to issuance of both permits. Application and general conditions for Highway Work Permits and Annual Maintenance Permits are explained in Title 17 Parts 122-129 NYCRR.

(4) Violation of the Use and Occupancy Agreement, Highway Work Permit, Annual Maintenance Permit, or of any other law or rule at any time by the permit holder or its agents(s) in the installation, operation or maintenance of facilities within controlled access rights-of-way shall be the basis for denial of use, imposition of fines, or physical removal of the offending party and/or the permit holder's facilities as designated in such permit, or as otherwise provided by law.

(5) The permit holder shall be responsible for obtaining all necessary permits, approvals, etc., required by any Federal, State or local agencies and shall furnish copies to the NYSDOT of such permits and approvals.

(6) The applicant shall be required under the Highway Work Permit to provide the NYSDOT with a log of each entrance onto the controlled access rights-of-way with personnel and/or equipment to include date, time, duration, location of entrance and exit from the controlled access rights-of-way, and the reasons for such entrance and exit, the equipment and personnel involved, etc.

(7) The applicant shall install along with any buried facilities a system of continuous plastic ribbon or marking tape. Such marker shall be installed at a level no less than 12 inches below the surface of the ground. The marker shall include a metal thread or other system capable of reliably emitting a signal readable by equipment operating on the surface. The applicant also shall install adequate permanent buried cable markers showing the approximate horizontal and vertical location of its underground facility. Such post markers shall not interfere with highway operations or maintenance and shall be offset from the actual position of the facility where necessary to avoid such interference. The applicant shall also maintain records that describe the facility, its location, depth, size and other relevant data which shall be available upon request to the NYSDOT and to other interested agencies. Within 120 days following the completion of the work authorized under a location permit, the applicant shall file with the NYSDOT one complete set of "as built" plans showing the locations of all parts of the facility stamped by a Professional Engineer. The applicant also shall file with the NYSDOT at that time one complete set of plans on microfiche or other form of information storage system as determined by the NYSDOT.

(8) Except where a use and occupancy permit calls for different procedures, the applicants shall comply with the construction standards, location standards, and special marking techniques established by the most recent publication of 23 CFR 645.

(9) The NYSDOT shall have the authority to place inspectors on site to monitor and observe the applicant's activities, and/or to request the presence of state or local police to assure the safety of controlled access right-of-way travelers, at such times and for such periods as the NYSDOT deems appropriate. All inspector costs thereof shall be borne by the applicant.

(10) Upon issuance of a permit and from time to time during any installation, operation, or maintenance periods, the applicant shall pay to the NYSDOT those amounts representing all of the costs of processing the application and administering the permit, including without limitation any costs relating to the need to relocate the facility in connection with any other work performed by the NYSDOT including design review.

(11) Acceptance of a permit by the applicant shall constitute an agreement by the applicant, notwithstanding any other provision of law, to assume all liability for any loss, cost, damage, or harm arising out of or relating to the installation, operation or maintenance of its facility and to the presence of its facility in the controlled access right-of-way. Further, acceptance of a use and occupancy agreement shall constitute an agreement by the applicant to indemnify and hold harmless the State of New York, its officers, agents, and employees from all loss, cost, damage, and harm, including attorney's fees, arising out of or relating to the foregoing. This permit shall not be effective unless accepted and approved in writing by the State.

## **IX. APPLICABLE FEDERAL AND STATE LAWS, REQUIREMENTS AND POLICIES**

NYSDOT Engineering Instruction (EI) 96-027

[www.nysdot.gov](http://www.nysdot.gov) .

This EI is based on Chapter 361 of the Laws of 1995 amending the NYS Transportation law by adding a new §20, "Nighttime work on major capital construction projects on highways, expressways and parkways".

23 CFR 645

23 CFR 771

Title 23, USC Chapter 1, Section 111

NYS Finance Law, Section 112

NYS Highway Law, Sections 10(24) and 10(24-b)

NYS Highway Law, Section 52

NYS Transportation Corporations Law

NYS Transportation Law, Sections 13 and 16

NYS General Obligations Law, Section 11-102

Title 17 Part 131 NYCRR

Title 17 Part 15 NYCRR

NYSDOT Manual of Uniform Traffic control Devices (MUTCD)

## **X. NYSDOT RIGHTS-Of-WAY REQUIREMENTS**

Pursuant to NYS Transportation Law, Sections 13 and 16, NYSDOT has established rules and criteria to approve the use of rights-of-way under their jurisdiction. The instrument typically used to allow the use of NYSDOT rights-of-way is a Use and Occupancy Agreement. If the value of this property is in excess of \$15,000, the use must be approved by NYSDOT Executive Management, the Office the NYS Comptroller - and the NYS Attorney General.

## **XI. HIGHWAY WORK PERMIT REQUIREMENTS**

Any work, including installation, maintenance and upgrades of utility facilities, within a state highway right-of-way requires the issuance of a highway work permit pursuant to Highway Law Section 52. The forms and requirements are described as follows.

There are various options available to a municipality or public service corporation/public authority to provide insurance through an Undertaking Agreement.

Undertakings are described in Title 17 Part 127.2;

"Any municipality may pay the insurance fee or may furnish one policy of protective liability insurance annually, and one policy or endorsement of completed operations liability insurance annually as may be required; and public service corporations may comply in like manner or they may furnish the usual form of undertaking that provides full indemnification for the State without specifying amount of coverage."

The following forms are typically required for the types of requests discussed in previous sections of this document. Pertinent information about each form is included.

PERM 17 (11/05) - CERTIFICATE OF INSURANCE FOR SPECIAL HAULING, DIVISIBLE LOAD OVERWEIGHT, AND HIGHWAY WORK PERMIT INSURANCE REQUIREMENTS

- This is to be prepared by an insurance agency or insurance company.
- This PERM needs to be filed and kept current with the Permittee's information and submitted to:  
NYS Department of Transportation  
Central Permit Office  
50 Wolf Road  
Albany, NYSDOT 12232

**PERM 32m (2/00) - HIGHWAY WORK PERMIT APPLICATION FOR UTILITY WORK AND ANNUAL MAINTENANCE PERMIT**

- This form is to be prepared by the permittee for work to be performed. Applications should be submitted to the Permit Engineer in the appropriate Region.
- Authorized subcontractors, acting as agents of prime contracts, under the permit to the Prime Contractor, are bound by the agreements of the prime contractor. If, however, both parties are named as co-permittees, they have equal responsibility and NYSDOT requires a PERM 17 from BOTH parties.
- After construction is complete, the PERM 32m should be completed under the Maintenance/Annual type of operation to perform any maintenance of existing towers/utility poles. New construction/installations cannot be performed under the annual permit; they require an individual permit for original installation.

**PERM 36 (2/06) - ATTACHMENT TO HIGHWAY WORK PERMIT FOR MAJOR PROJECTS .**

- The NYSDOT requires the permittee to provide a consultant to inspect the permit work when the duration, of the work, is three or more days. The inspector is intended to act as the NYSDOT's agent on the work site. When a consultant inspector is provided PERM 36 should be completed.
- PERM 36 is to be completed and signed by the Permittee and the consultant providing the inspector/so . .

**PERM 41-d (4/88) - METHOD OF PERFORMING WORK WITHIN THE STATE RIGHT-OF-WAY**

- Provides general conditions as well as design and construction method requirements for installation.

**PERM 44e (8/01) - SURETY BOND (PERFORMANCE) .**

- The NYSDOT requires the Permittee to provide a bond or letter of credit to ensure and guarantee the timely and workmanlike completion of work undertaken with a Highway Work Permit.

**PERM 51 (11/90) - PAYMENT AGREEMENT FOR HIGHWAY WORK PERMITS DESIGN REVIEW**

- The permittee will be billed on a periodic basis for the costs incurred by the NYSDOT to process a highway work permit.

**PERM 50e (9/93) - INSPECTION AND/OR SUPERVISION PAYMENT AGREEMENT FOR HIGHWAY WORK PERMITS**

- The permittee will reimburse the NYSDOT for inspection and/or supervision of any permit work by NYSDOT employees which exceeds one hour of work on a highway work permit. ‘

**PERM 52b (/93) - INSPECTION AND/OR SUPERVISION PAYMENT AGREEMENT FOR HIGHWAY WORK PERMITS FOR PUBLIC UTILITY COMPANIES**

- The permittee' will reimburse the NYSDOT for inspection and/or supervision of any permit work by NYSDOT employees which exceeds one hour of work on a highway work permit.

**,XII SPECIAL HAULING PERMIT REQUIREMENTS**

Many utility projects require equipment or materials to be delivered to project locations which require special hauling permits. For additional information, see the following website: [www.nypermits.org/](http://www.nypermits.org/). A Complete Plan Submission for a special Hauling Permit must include in detail the following:

- PERM 17 (11/05) - CERTIFICATE OF INSURANCE FOR SPECIAL HAULING, DIVISIBLE LOAD OVERWEIGHT, AND HIGHWAY WORK PERMIT INSURANCE REQUIREMENT

- Delivery Plan
- Cable Pulling Plan
- Pick Plan
- Maintenance and Protection of Traffic Plans (M&PT)
  - o Detours schemes for night delivery
  - o Shoulder closure and temporary concrete barrier schemes that will remain in place until reels are emptied and pulling and cradles are removed.
- Site details for temporary staging area for each ‘pit location (i.e., limits of vegetation removal, details for cut and fill areas for level working pads, placement of Recycled Concrete Aggregate (RCA) bedding, erosion controls etc.) necessary to safely support dispensing operation equipment in soft shoulder.

### **XIII. ATTACHMENTS**

- 2006 Lobbying Laws
  - o Offerer Disclosure of Prior Non-Responsibility Determinations
  - o Offerer’s Affirmation of Understanding ‘of and Agreement pursuant to NYS Finance Law § 139-j(3) and § 139-j(6)(b)
- Use and Occupancy Agreement (ROW 75n (10/06))
- Highway Work Permit Forms
  - o PERM 17 (11/05)
  - o PERM 32m (2/06)
  - o PERM 36 (2/06)
  - o PERM 41-1d (4/86)
  - o PERM 44e (8/01)
  - o PERM 50e (9/93)
  - o PERM 51 (11/90)
  - o PERM 52b (9/93)

6/20/07

11/15/12

5/8/15

*{end of 20150804-5100}*

### **20150804-5103**

Richard Crane, Groton, MA.

I am writing you regarding the Northeast Energy Direct Project.

In February 2013, Kinder Morgan (KM) and Tennessee Gas Pipeline, LLC (TGP) made several abutters aware of this project. I was not one of the abutters listed at that time even though my property was significantly impacted.

In May 2013, I informed KM and TGP that I was impacted. They told me that I was not impacted.

In October 2013, KM and TGP informed me that I was an abutter to the project. This is the first (and only) correspondence that I have ever gotten regarding the pipeline and its potential impact to me.

In December 2013, KM and TGP informed the public that they changed the primary route to be along existing utility lines through Massachusetts and New Hampshire. Their reasons were to minimize the impact to residents of New England. We agree that the current route along existing utility lines through Massachusetts and New Hampshire achieve this goal.

We have not heard anything from KM or TGP since October 2013. Our understanding is that Kinder Mor-

gan has abandoned the originally proposed route for a new route which minimizes the number of people affected. Their lack of communication with us regarding the impact to our property is a clear indication that they abandoned the original route.

What is known is that the original route goes through densely populated areas including neighborhoods, churches, schools, playgrounds, farms and much more. The new route minimizes the impact to populated areas greatly.

I am against the pipeline project because I do not believe it is of any interest to the people of New England and Massachusetts. However, if it is approved, I request that you keep the route that goes along existing utility lines in Massachusetts and New Hampshire to minimize the impact to populated areas.

Rich Crane

PF14-22

To whom it may concern:

As a concerned parent and a resident of the beautiful town of Nassau, I urge you to help us put a stop to Kinder Morgan's proposed pipeline project.

In December 2014, Governor Andrew Cuomo announced his decision to ban fracking in NYS based on health concerns. Studies have shown chemicals such as Methane, Radium and Formaldehyde can be emitted into the air and ground, potentially putting the public's health in jeopardy. Transporting fracked gas is just as dangerous as drilling but transporting the gas is still legal and needs to be stopped for the same reasons.

Recently, Kinder Morgan has proposed installing a pipeline and a 90,000 horsepower compressor station to transport fracked gas into Canada. The pipeline will travel through our quiet, serene, wholesome town of Nassau and into Massachusetts and New Hampshire ending in Canada, where the gas will then be exported. While I am uncertain of the locations in Massachusetts and New Hampshire, here in New York the compressor station, as well as the pipeline, will be in close proximity to homes, farms, lakes and, most importantly, children playing in their backyards – my children to be exact.

I am deeply concerned with the effects the compressor station and the pipeline will have on my children, as well as our community. Compressor stations are loud; the noise is constant and very disruptive. Members of communities where compressor stations already exist compare the noise to an idling truck, which occurs twenty four hours a day, seven days a week. Compressor stations also have blow downs - the industry term given to venting or flaring natural gas during maintenance periods or in the event of an emergency. The noise from a blow down is deafening. Many compare it to ten to twelve jets taking off, which can last hours. This can happen any time during the day or night. I fear it will keep my children up at night. Lack of sleep can effect a child's behavior, may lead to weight gain and negatively impact school grades. All children deserve a chance for a bright future and this may limit their chances. What studies have been done to prove compressor stations and pipelines do not have a negative impact on children's physical development, emotional development, and behavioral development, as well as education/ learning disabilities?

Another leading concern is air pollution. I am worried about the health effects from air emissions, air pol-

lution and the VOCs that will certainly impact our community. As you may or may not know, fracked gas carries hundreds of chemicals some of which are cancer causing carcinogens, while others are just plain awful for brain function and the human body. When the blow down occurs all of those chemicals are spewed into the air causing my family to inhale these deadly gases. Everyone, but especially children, deserves to breathe clean air. What studies have been done to prove that compressor stations and pipelines do not cause air pollution? What studies have been done to prove the emissions from the compressor station does not cause Lung cancer or any other cancers?

Children also deserve to drink clean water. All of the houses in the half mile buffer zone from the compressor station draw water from a drinking well. We do not have town treated water system. This is an utmost fear that the chemicals from the gas will be released into our drinking water. We will not only be inhaling these chemicals, we will be ingesting them as well. What studies have been done to prove that drinking wells adjacent to pipelines and compressor stations are clean and chemical free? How will we know if our water is safe to drink? Will Kinder Morgan or FERC pay for monthly water testing? One of the reasons we choose to live in a zoned rural residential area is to keep our children away from industrial fumes and pollution. In case you were unaware, Nassau is zoned rural residential.

Another sizable concern of mine is the value of our homes. How much will our homes devalue if the pipeline and compressor station is built in our community? I think I speak for the majority of our community when I say – WE HAVE WORKED HARD FOR OUR HOMES. WE HAVE SPENT COUNTLESS HOURS AND A LOT OF MONEY TO BUILD, MAINTAIN AND UPDATE OUR HOMES. WE HAVE SPENT COUNTLESS HOURS AND A LOT OF MONEY TO KEEP THESE HOMES SAFE HAVENS FOR OUR CHILDREN. If this compressor station is built here our homes and children are no longer safe.

My last concern is the safety of the pipeline/compressor station. I live within the half mile buffer zone, which means if the compressor station/pipeline explodes all of the houses and families within that zone explode with it. This is extremely frightening to me and my children. How is putting a pipeline right next to power lines safe? If for any reason there is a gas leak the power lines/spark will act as an igniter. I can't even tell you how many times throughout the year a tree falls on the power line causing the line to spark. We live in the northeast where in the summer there are nasty storms bringing down trees and in the winter the snow and ice bring down trees or the lines just cannot handle the weight from the snow and ice. If there is a gas leak when that spark happens...kaboom. Placing the pipeline underneath or anywhere near the power lines does not seem logical. What studies have been done to prove this is the safest place to put a pipeline? In addition, what plans have been created to make sure the fire can be extinguished so our houses can be saved? We all know water and gas don't mix well, how will the fire be extinguished or will the fire just burn?

The pipeline and the compressor station are putting unnecessary risk to me, my family and my community with absolutely nothing to gain. Will there be any benefits to us? What is Kinder Morgan's incident rate? Has anyone other than Kinder Morgan looked into how many incidents occur each day, month or year?

I ask you to please consider denying Kinder Morgan's proposed pipeline project. This pipeline/compressor station will ruin the quality of life in our small upstate community. Would you want your family to live in close proximity where fracked gas is being transported? Would you want to endanger your child knowing that the pipe could explode at any given time? Would you want to breathe air filled with Methane, Radium and Formaldehyde? Would you want to drink water filled with cancer causing carcinogens? Would you want your home to devalue? Please help the people of Nassau; please stop Kinder Morgan from ruining our beautiful community.

Thank you for your help with this matter.

Respectfully,

Kristin McCullen

“Preserving the future, one Newfoundland Pony at a time.”

Ms. Kimberly D. Bose,  
Secretary Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426  
Docket No. PF14-22-000

Ladies and gentlemen,

My name is Emily Chetkowski. I represent Villi Poni Farm, a federally qualified charitable organization, a sanctuary for the critically endangered Newfoundland Pony. There are only 250 breeding ponies of this protected native species left in the world. We are a designated safe haven for a breeding herd of those ponies, ponies who are key to the recovery of this breed that was nearly exterminated at the hands of uninformed people. Our mission is to protect and repopulate the breed while educating the public.

This preserve is located less than 1 mile from the New Ipswich compressor. Our board of directors as well as the entire Newfoundland Pony breeders community and rare breed specialists world wide are against Kinder Morgan’s plans to locate the pipeline, especially the compressor, anywhere near the sanctuary. These are our reasons:

- In a compressor emergency/accident, evacuations occur in a one mile radius or more. Not only are the ponies at risk but we are unable to evacuate a entire herd in an emergency.
- One rare line breeding stallion, due to a disability, we have no way to evacuate.
- Emissions from the compressor are known to cany elements that are toxic to livestock within a 2 mile radius, causing neurologic, gastric, respiratory issues as well are infertility, sterilization, and death. Compressors have been found to cause more toxic damage than Frecked gas wells. They have been labeled as the worse pollutant in the entire Gas infrastructure. This puts our herd in even graver danger.
- Our breeding program includes bloodlines no longer found anywhere else in the world.
- We cannot take risks, we cannot take someone’s word that they will be safe. You cannot guarantee their safety. Money cannot replace any losses. Once the genetic material is gone, it is GONE, forever.
- We are one of two conservation breeders of the Newfoundland pony in this country and the only registered charity sanctuary in the world. Right nqw we are the only active conservation program, our efforts have a significant impact on the entire breed.
- However, with this new threat, we cannot knowingly risk our mares, therefore NO breeding will take place.
- Our Apprentice Steward program that cultivates local conservation homes for the foals we breed, is therefore also on hold.
- Our Equine Assisted Learning program that offers programs on Anti-bullying, Anti-drug, Leadership programs to name a few, has also been put on hold. Parents have told us they will not bring their children here, being so close to the compressor.
- The threat of this compressor has already impeded both our short and long term planning. We cannot grow our future and our sustainability has already been compromised.

- Basically, the Compressor and the Newfoundland Pony cannot coexist. We cannot stay here yet by what means can we leave? We are financially entrenched to this location.
- This is a HUGE environmental issue. Members of FERC, you have a responsibility to ensure mitigation of impact. The future of this preserve and its mission to save the pony is now in your hands.

Sincerely,

Emily Chetkewski

Reference: Docket PF 14-22

Dear Ms. Bose,

We the undersigned our writing as a result of learning that the property where we live and call home is now threatened by the Kinder Morgan Northeast Energy Direct (NED) Project. Our home provides shelter to six individuals ranging in age from 4 to 90. All six of us are at risk of losing the land (and possibly home) we love as a result of NED.

We purchased our property due to its beauty-the flora and fauna. We definitely cannot be characterized as “tree huggers” ut we love the trees and the wildlife. We see so many different animals and just this week learned that the bear we call “the Timbertop bear” now has a cub. We could fill these pages with all that we love about our home and our land, but understand that FERC really is only interested in the environmental impact, based on the recent hearing on 7-16-2015 in Oneonta NY, where paul Friedman, the Federal Energy Regulatory Commission’s project manager for the Kinder Morgan, Tennessee Gas pipelines “Northeast Direct” project (NED) stated that he “didn’t hear any comments about the environment”. So we will attempt to keep our comments in this letter solely based on the environmental impact of NED on our home and land.

Our property was purchased with two easements. The first easement was in regards to the power lines. These lines run parallel to our property line, but are unseen from our home due to the beautiful hardwoods that surround our property. If the NED project is successful, this statement will no longer be true, as the tree line will be destroyed in order to provide for the pipeline. Our home would have no barrier between the building and the power lines.

The second easement is a conservation easement, which we gladly welcomed when purchasing the property. Even though this easement limits what we may and may not do with our land, we understood the importance to protect the fragility of our surroundings. We purchased this home because we loved the environment, an environment now threatened by the NED project.

We cannot understand nor comprehend how a publicly traded partnership (that due to tax loop holes pays no tax), can take land (land for which we have timely paid all property tax as required) —and take this land against our wishes.

Our naivety in thinking that our Government would protect us now appears laughable. The educational journey we have been on since learning of the NED project has shown us how our Government has allowed other private companies to take land for Corporate profit. We are convinced that the NED project will not benefit us or our neighbors. We are told that if this pipeline goes through, it is recommended that we annually perform a comprehensive test of our well —a test that is quite expense and for which we will need to pay. We have been told that our mortgage company can call our mortgage as our property is now being used for commercial purposes. We are told that our homeowners insurance may skyrocket or be cancelled.... But back to the environment.

We are convinced that Kinder Morgan will not uphold the conservation easement on our property, but that they will propose alternatives that may or may not effectively protect the fragile environment the conservation easement was put into place to protect. Past performance is indicative of future behavior. Based on

Kinder Morgan's past record, they will not protect the land that we love. We cannot find any guarantees that Kinder Morgan will protect the environment as their application is riddled with so many "to be determined"; we cannot assess the viability of how they propose to protect the environment as their application is essentially incomplete.

please use your influence to deny Kinder Morgan's Northeast Energy Direct project, as the environmental impact far outweighs the benefits this project will provide to the landowners and residents of New Hampshire.

Sincerely,

Thomas J. Thompson  
Neal A. Beauregard

Vivian A. Smith-Thompson

RE: FERC docket number PF14-22

Dear Secretary Bose:

In regard to the proposed Kinder Morgan/TGP natural gas pipeline, when is FERC going to hold its Scoping meetings in the towns of New Ipswich, Temple, Greenville, and Mason, NH?

All of these towns would be affected by the potential compressor station.

### **20150805-0036**

July 23, 2015

Ms. Kimberly Bose  
FERC  
888 First Street  
NE Room 1A  
Washington, DC 20426

Dear Ms. Bose,

I am writing to let you know of my opposition to the Kinder Morgan Pipeline project, Docket PF 14-22.

As a resident of Pelham, I am most specifically worried about the potential of the pipeline to cause pollution to our underground well water. While the pipeline will not go through my property or neighborhood, I am "down river" of many of the areas proposed to host the pipeline. The underground water flow requires further study. Chemicals used to protect the pipeline could leach into my well water, and that of my neighbors and the entire town. The town is not prepared to provide water to individual homes, and my dependence on my well is paramount. I have 2 children and a dog - will they be harmed by drinking our tap water? Will my husband or I?

I am also concerned by the potential of an accident - will an accident also affect my well water? "Incineration Zone" sounds like it might have the potential to destroy my source water.

I require assurance that this project will not wreak havoc with my water sources. Water is becoming a commodity in today's world, almost as much as energy, and the cavalier potential threat to my water sources is

unacceptable.

There are other renewable energy sources that can be used to provide energy to our area, without the potential environmental damage of the Kinder Morgan project. please give the potential environmental damage your full attention. The threat to our health, to the health of our families and community is worrying, and avoidable.

Please say “No” to the Kinder Morgan proposal. Please use your influence and position to encourage planning and investment in renewable energy sources.

Thank you for your attention to this matter.

Sincerely,

Anne Bodenrader  
82 Wyndridge Circle  
Pelham, NH 03076

**20150805-0037**

July 30, 2015

To Whom it may concern:

I am writing to appeal the pipeline coming to Richmond, NH.

We are a rural community whose land rights, values, environmental impact and safety are of great concern.

We wish to express our shock and frustration over the planned pipeline installation and respectfully request that you to stop all efforts to install any pipelines here.

Thank you,

Katharine Bednar

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Northeast Energy Direct Project (“NED Project” )

Hearing July 29, 2015 in Greenfield, MA

Dear Chairman Bose:

Your staff and the stenographer are commended for their good humor, endurance and poise at the July 29, 2015 FERC Hearing in Greenfield, MA for the NED project. It was one of the hottest days of the Summer, the 700 seat auditorium was at capacity and there was no air conditioning and no wind. The conditions were brutal. Your staff started with sign-ups at 5:30PM and the hearing started at 6:00 PM. I had intended to stay until the end, but the heat drove me out at 10:30PM. They were at speaker number 38. A friend was speaker number 67, and there were probably more.

Our town is strongly opposed to NED, and suspicious of FERC, and that probably will not change. However, you can be proud of the high standard of your staff at this hearing. I never expected to write a letter of

commendation to FERC, but in this case your staff deserves it.

Yours truly,

Edwin B. Cady, Jr  
Chair, Warwick Planning Board

July 30, 2015

Dear Ms. Bose:

I am writing you concerning the Kinder Morgan proposal to construct a compressed natural gas pipeline through New Hampshire. LDocket PF 14-22) My purpose in this letter is to express my profound opposition to this project, not only because of the disruption it will cause to the lives of people living in the pipeline's path, but in the Monadnock region as a whole. It's a bad project and it's bad economic and bad energy policy.

Supporters claim that the Pipeline will be part of a regional energy policy, and that it would provide potential tax relief and more affordable energy for New Hampshire residents. But as we now know, this pipeline is primarily intended to transport compressed natural gas from Pennsylvania wells to Dracut, MA. And then to the Canadian Maritimes and to Europe, where there is demand for it (and where there is widespread existing infrastructure to support it). There is some infrastructure in New Hampshire, some dating to the time when coal gas was a light and power source. There are existing pipelines for natural gas in the State and two more that are in a much more advanced stage of planning and design than is the Kinder Morgan proposal. Bearing mind that New Hampshire exports about 50% of its natural gas production, mainly to Massachusetts, the major importer of natural gas, it is difficult to see how siting the pipeline in New Hampshire —and adding about 80 extra miles to the project—shows any benefit to New Hampshire, nor how this could justify taking lands and endangering the delicate hydrological resources of New Hampshire, nor in the end, how it makes any sense to site the pipeline as Kinder Morgan plans it. With two other pipelines in the works, there is neither need in New Hampshire, nor does this project serve the convenience of the citizenry now faced with this massive project.

Moreover, exporting the natural resources of the United States abroad is unsound economic and environmental policy, though it may show some limited advantage in US balance of payments. The latter is only a short-term gain, one that does little else to build a strong US energy policy As I understand it, there is a group of Senators formally questioning this sort of use of US natural resources. I applaud their efforts and hope that FERC will take this matter very seriously.

This project is especially troubling because it does not seem to account for the economic and cultural costs to the affected citizenry. This project has already had a negative impact on the lives of people in or near the path of the pipeline. People with houses on the market have seen interest in their homes disappear. I live in New Ipswich. The Town Office here reports that realtors and potential homebuyers have been calling with questions about the pipeline. Realtors report that potential buyers have cancelled their appointments to be shown a house here because of the pipeline. The long-term downward pressure on the housing market will also be felt in tourism, which will suffer if this mammoth project gets underway.

The arguments in favor of the pipeline are also disturbing because they assume that a coherent energy policy in the region would include burning natural gas to produce electricity as well as heat But burning natural gas to produce electricity is an impractical direction in which to turn because there is little infrastructure to do that in these parts. And it is especially unwise to turn in that direction when there are viable alternatives at hand, ones that are environmentally wiser and that are renewable and cleaner than natural gas. Specifically I mean hydropower from Canada, here called the "Northern Pass." There is some controversy here concerning the cutting of trees for the right of way, but the details of the transmission across the North Country

can be worked out. The disruption of the forests—trees cut and high-tension lines strung through forests—is a much less intrusive and environmentally destructive process than a huge underground pipeline trench and tunnel that Kinder Morgan proposes. And Northern Pass in no way threatens the water resources of the State, as Kinder Morgan’s project will. They promise mitigation for environmental damage, but there is no mitigation possible if an aquifer is contaminated or if the geological substrate is disrupted (by blasting or leakage). Drilled wells (the most common form here) disappear or are rendered permanently contaminated by such construction events. Anyone who knows anything about hydrogeology knows this—and so does Kinder Morgan, though one would never know it from the 6500+ study, released January 24.

I write this as a committed environmentalist with a long track record teaching environmental history, as an author of a major historical and environmental work (*Wood Craft, Culture, History*, 2006), thirteen years on the New Ipswich Conservation Commission, a long-time supporter of the Society for the Protection of New Hampshire Forests, and the Monadnock Conservancy. I was a consultant on the biography of John Muir for PBS series, *The American Experience*. I believe, as did Theodore Roosevelt, Gilford Pinchot, John Muir and other conservationists, that the forests and wilderness areas must be managed for the long-range health of the planet and its peoples. Opting for natural gas when hydropower is available just doesn’t make sense. And we haven’t even discussed solar and wind power.

My other major area of professional expertise for nearly forty years is in Cultural Resources Management, a term with which I am sure you are familiar. It’s what undergirds the work of the National Park Service, the Bureau of Land Management, and the Forest Service, among other Federal agencies. I have written, evaluated, and read many environmental impact statements and been a consultant for many projects that involved cultural resources, including historic and archeological sites, architectural history and historic preservation. I have so far examined in detail only these areas of the latest Kinder Morgan report.

The problem of Kinder Morgan’s proposal in even this limited examination is that it contains almost no information. Not only is the acronym “TBD” ubiquitous, what passes for information and analysis of cultural resources and the impacts of the project is either incomplete, reliant on very old and limited reports, or irrelevant. This work is sloppy and so obviously thrown together quickly that it makes the rest of the report suspect.

At last night’s meeting in Nashua, New Hampshire the audience was advised to allow Kinder Morgan surveyors on their land so that FERC can know what resources are on each parcel. Do these survey crews know anything about historical, archeological or any other cultural resources? Having taught at a university with a strong civil engineering program, I can tell you in no uncertain terms the answer to that is little or nothing. And who pays the surveyors? Kinder Morgan and/or Tennessee Gas. How can anyone know or even believe they can or will be objective? Town officials in Merrimack reported that Kinder Morgan refused to allow town officials to be present when surveyors did their work. Now why would they do that? Only someone born yesterday could not answer that question.

Furthermore, Kinder Morgan’s safety record is highly suspect. All of this is well documented in Federal agency oversight documents, and in media such as the *Wall Street Journal* and *New York Times*. I assume you have this information at your disposal.

Finally, there is this: Massachusetts, which stands to benefit more than any other state in New England from the pipeline, stopped it in their state. State officials from the governor down opposed it. The wealthier towns (Groton, Concord, etc.) in the path of the Massachusetts proposed path threatened legal action. You will note, I am sure, that Kinder Morgan has carefully avoided Vermont, and the wealthy towns in Southeastern New Hampshire. But it’s OK for the hayseeds and the poorer towns such as New Ipswich, Mason, and Rindge? Kinder Morgan’s proposal has the sulfurous odor of class snobbery and the notion that they can sell their wares to the clowns of New Hampshire, aka “Cow Hampshire” as the state is known in some quarters in Massachusetts. I know about that, having taught for 25 years at Northeastern University in Boston. This pipeline proposal is freighted with the danger of leakage and explosion, the blowing of the excess methane (polluted with benzene and toluene from the fracking process) and the absurdity of planning an underground

pipeline through a state full of granite ledge. They seem oblivious to dramatic effects their pipeline will have on the towns through which it proposes to pass, not least of which are the liabilities towns will face as the health and safety effects of the pipeline take their toll on residents. When asked directly they are unable to speak about the security issues and emergency preparedness issues that will face all the towns in the pipeline's path. I interpret this behavior not as a sign of ignorance or incompetence on Kinder Morgan's part, but as a sign of arrogance —that this is some sort of "done deal." This, I think, cannot be the case, since it would make a mockery of FERC's mission and the good work you do.

There is neither need nor convenience demonstrated in this proposal. Kinder Morgan's behavior—as opposed to their words—demonstrates that they are unfit to undertake this project in a manner that protects either environmental or cultural resources. Their actions reveal a cavalier attitude toward due process and equal treatment under the law. On those latter grounds alone this siting and proposal should be denied. The former grounds should leave no doubt. Should the FERC commissioners approve this project I have no doubt that a court battle will ensue.

I am grateful for this opportunity to comment on this proposal. I wish you all good luck in what I understand is both an important and difficult process.

Sincerely,

Harvey Green

RE: Project Docket Number: PF14-22~

REQUEST TO EXTEND COMMENT PERIOD through October 23, 2015

Dear Ms. Bose:

The proposed Northeast Energy Direct (NED) project will directly impact eight of the 13 member municipalities served by the Nashua Regional Planning Commission (NRPC) including Mason, Brookline, Milford, Amherst, Merrimack, Littlefield, Hudson and Pelham New Hampshire. For the NRPC region as a whole, the NED proposal represents a significant expansion of gas pipeline infrastructure through relatively rural and undisturbed landscape, including significant environmental resources and residential areas.

On July 24, 2015, Kinder Morgan/Tennessee Gas submitted updated draft Environmental Resource Reports to the FERC docket. It is critically important for NRPC and its member communities to review and understand these documents so that they may provide valuable input to the FERC pre-filing process. NRPC's Commissioners will convene on September 16, 2015 to revisit issues relative to the NED, and they need adequate time to synthesize all available information. For these reasons, I ask that the previously established comment period be extended through October 23, 2015 to allow more time for review of this information in order to more fully assess potential impacts associated with NED. Further, additional scoping meetings should be held to allow the public more opportunity to address the additional information.

An effective and transparent environmental process must allow all parties adequate time to review the

significant volume of information which has been filed, some of which was made available only days ago. NRPC echoes the collective position of the Southwest Region Planning Commission that a comment deadline of August 31, 2015 does not represent sufficient time for agencies like NRPC and the communities we serve to provide thoughtful and detailed comment. NRPC respectfully requests that the public comment be extended to close of business on Friday, October 23, 2015.

Thank you for the opportunity to provide input.

NASHUA REGIONAL PLANNING COMMISSION

Tim Roache  
Executive Director

RE: Docket 1PF1422

Dear Chairman Bay and Secretary Bose,

The Board of Health of the Town of Conway, Massachusetts hereby submits this letter as part of the proceedings under this docket.

The Town's Pipeline Task Force is in the process of preparing comments to submit as part of the scoping hearings and have noted, the lack of complete and clear information regarding details of Kinder Morgan's proposed Tennessee Gas NED pipeline that would bisect our Town.

Kinder Morgan released a revised Draft Environmental Report (Resource Reports 1 through 13) and Project Scope Update of Tennessee Gas Pipeline Company, L.L.C. under PF14-22 on Friday, July 24th. We understand that the revised reports contain new information that would significantly and substantially impact the town of Conway. The areas of concern to the BOH include air and water quality, noise, public safety and emergency response.

We are writing to support the requests of Senator Stan Rosenberg, the Massachusetts Association of Conservation Commissions, and The Northeast Municipal Gas Pipeline Coalition to extend the deadline for written and electronic comments.

Specifically, we request that the deadline for written and electronic comments be rescheduled to September 30, 2015 to allow for an appropriate and careful review of the proposed project.

Thank you,  
Sincerely,

Carl Nelke  
William McLoughlin  
Ann Gibson

## 20150805-4002

From:  
Sent: Tuesday, August 04, 2015 5:12 PM  
To:  
Subject: Call

A gentleman called in today concerning PF14-22-000 Kinder Morgan Northeast Energy Direct Pipeline Project.

The public comment period is coming to a close on August 31st, I would ask that the commissioner consider extending that date in light of the fact that Kinder Morgan did a complete project re-write project 6,500 page document last week.

It changed the project significantly, there are tremendous amounts of information to be determined, and sections are being withheld.

Fred Nuffer

## 20150805-5001

Louise . Delehanty, Pelham, NH.  
Dear Secretary Bose,

I am writing in response to those who would call me a “NIMBY”. I am proud to be thought of as such. As a NIMBY I possess the following characteristics:

1. I do not want the NED Pipeline in my back yard (Not In My Back Yard) because my trees will be cut down and my land dug up.
2. I do not want the pipeline in my backyard (NIMBY) because the wildlife I love (birds, deer, fox, chipmunks, etc.) will die (be killed) after their habitats (homes) are destroyed.

Aside, for the FERC, please know that Kinder Morgan is aware (or doesn't want to recognize) that I have endangered and threatened species on my land in Pelham, New Hampshire. These include the NE Cottontail, Blanding's Turtle, Northern Black Racer, all of which were sighted, with photos and locations registered through the New Hampshire Reptile and Amphibian Reporting Program.

I am a “NIMBY”.

3. My well water will be poisoned by hazardous materials, such as asbestos, a by-product of machinery and materials used to devastate our lands due to digging a trench for the pipeline. Is asbestos still allowed in any phases of construction today?
4. My home will be devalued. Insurance non-existent. Who would want to buy a home abutting the pipeline? Maybe the non-NIMBY. That person thinks it's ok to have a pipeline on THEIR property and to happily accept the fact that you are in constant danger of explosions, pollutants, and accidents along the pipeline route. What about living in the incineration zone? That non-NIMBY must believe it's ok to have a company reap huge profits for gas that will not benefit New Hampshire.
5. Please FERC Commissioners, have Kinder Morgan build the pipeline where the proponents want it--on THEIR property!
6. Last, my husband and I worked a combined total of 73 years, retired to a home we love, hoping for a

tranquil way of life. We, and thousands of other “NIMBY”s are men, women, parents, children, and grandparents. We are citizens of America who face a horrendous project, Docket #14-22-000. We oppose this project and are called “NIMBY”s.

I hope the FERC Commissioners are “NIMBY”s at heart.

I am proud to be a “NIMBY”>

If you oppose this NED project, please let the FERC know that you, also, are a “NIMBY”.

Thank you.

Louise Anne Delehanty

## 20150805-5017

Lies, Damned Lies and Statistics

Periodically FERC hosts an “Interagency Pre-Filing Conference Call” that includes a rotating roster of FERC staff and contractors, Kinder Morgan staff and contractors and members of a variety of other NED-affected services, commissions, bureaus, etc. The purpose of these calls is to allow Kinder Morgan to report on the current NED pre-filing status. Reports of these conference calls are then filed with FERC, though the filings happen weeks after the calls themselves are completed. One statistic typically reported on these calls is the percentage of landowners who have given survey permission to Kinder Morgan.

Having had my own property directly threatened by the earlier NED route through Massachusetts, I’ve always paid close attention to this survey approval statistic. My own feeling is that denying survey permission is one of the few ways available to send a direct message to Kinder Morgan (and hopefully to FERC) for them to please withdraw from New England and to take their pipeline with them. I planned to fight them tooth and nail and they could stay the h-e-double-hockey-sticks off of my property.

In the report filed on May 20 regarding the April 30, 2015 conference call (<http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=13881265>), Kinder Morgan had this to say about survey permissions:

Approved landowner access is approximately:

- o Supply Path – ~51% of landowner approval
- o Market Path – ~38% approved including 23% in NH

And in the just-filed report regarding the June 25, 2015 conference call

(<http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=13947860>), Kinder Morgan reported these numbers:

Landowner survey access

- o Supply Path
  - 46% access in PA/NY”
- o Market Path
  - 20-30% access in NH and MA
  - Unknown from Wright, NY to NY/MA state line

I’ll give KM’s 20-30% estimate a value of 25%, halfway between 20% and 30%. Taken at face value, these figures indicate that the percentage of landowners who have given survey permission has decreased along the Supply Path by five percentage points (from 51% to 46%, one tenth) and decreased along the Market Path by thirteen percentage points (from 38% to 25%, fully one third).

These numbers are very significant, both statistically speaking and also for anyone following the “progress” of this pipeline proposal. Kinder Morgan’s percentages of survey approvals appear to have dropped very significantly in the months of May and June. At this rate, the approval percentages should be approaching zero when KM files their application this fall.

The possibilities that I see for explaining these changing numbers are as follows:

- KM is receiving survey denials from landowners who previously gave approvals.
- KM is conceding that they had earlier grossly under-counted affected landowners.
- KM inflated the earlier numbers, hoping to hit them before the June 25 call.
- KM is incompetent and can't be trusted to accurately make this calculation.

Note that KM is not required to make public its list of affected landowners, much less the KM collection of survey permission/denial forms – and so it is difficult to fact check their data. I have previously called upon FERC to require that KM share with FERC the verified data that supports these approval percentages. The latest (June 25) set of percentages make it appear that the earlier skepticism was justified.

At the recent FERC scoping meeting in Nashua, an elected official from Rindge, NH reported that KM counts 73 directly affected landowners in that town, but that town officials count over 150 (using the most detailed maps that KM has supplied). Such under-counting of the total number of affected landowners by KM would certainly boost their calculation of percentage of landowners approving surveys. This is a very good reason to mistrust the unverified KM percentages.

There are numerous reports of KM surveyors entering the property of landowners who have denied survey approval. This seems like a good reason to question whether KM is accurately tracking survey denials. There are also numerous reports of landowners who seem very directly affected on the most recent KM maps, but who have never been contacted by KM.

Kinder Morgan has always tried to convince the public of the inevitability of this pipeline, hoping to foster the belief that resistance is futile. But it surprised me when Eric Tomasi, the FERC project manager for NED, encouraged landowners to allow surveys during his opening remarks at the Nashua scoping meeting. The Boston eminent domain lawyer that I consulted when my property was directly threatened by NED strongly recommended that landowners not have any official dealings with Kinder Morgan or its contractors, and certainly not allow surveyors on their property. His explanation was that if you later meet Kinder Morgan in the courtroom as they are proceeding with an eminent domain taking of your land, they will use any and all information gleaned from the survey to strengthen their case.

FERC has indicated in the past that one factor that would weigh against approving a pipeline is the total of the eminent domain takings that would likely occur if a certificate of public necessity and convenience is awarded for that pipeline. I submit to FERC that the survey approval percentage is perhaps their best predictor of the extent to which takings by eminent domain will accompany an approval of the NED pipeline. And I therefore call upon FERC to force Kinder Morgan to prove that the data that this calculation is based upon is accurate.

Dear Sir:

On 14 April 2015 the Board of Trustees of The Andover Village Improvement Society (AVIS) met for our

regular monthly meeting. During that meeting we discussed your request for survey permission on the following parcels:

Town of Andover, MA

LL# MA Lynnfield Lateral: 45 & 49

Map/Block/Lot: 227-39 & 227-1

In the end, the Board voted unanimously to continue to deny TGP permission to survey our land.

Sincerely,

Michael P. Timko

President

jason graham, Dracut, MA.

I live in Dracut, MA, where the pipeline would end and a compression station would be constructed. I would be directly impacted by this proposed pipeline and I do not want it in my town. There are no positives to this pipeline.

### **20150805-5141**

Marilyn Learner, Hollis, NH.

I am writing in response to Commissioner La Fleur's comment regarding President Obama's clean energy plan. Her comments may apply to regions that are heavily dependent on coal for electricity generation, but not New England, where the use of coal as a power source has diminished to less than 6%. The gas flow into New England may need some tweaks and enhancements, but the flood that is envisioned by the fossil fuel industry is counter productive and destructive.

Gas may be seen as a "bridging" fuel, but the challenge facing New England will not be solved by building gas "gangplanks" to the future. The challenge for New England is to move beyond gas to the next level; reducing or replacing the use of gas with hydro, wind, solar, and smarter management of our grid. Adding some gas/LNG to already existing pipelines can help accomplish the transition.

Approving construction of massive pipelines such as NED will move New England backwards, and will foster and perpetuate lopsided reliance on gas. It will significantly stall movement forward toward widespread use of renewables and smart grid technologies.

In addition, building massive pipelines implies endorsement of the destruction and pollution caused by fracking and the transmission of fracked gas. The process of fracking and the resultant waste and by-product pollutants at well-heads and in pipeline and appurtenant emissions are indisputably harmful to public health and the environment and can not longer be ignored in the calculus of national cost.

NED, in particular, offers the wrong path to New England's energy future; it will catapult New England into the abyss of more pollution and stalled innovation. It will lead toward a lopsided dependence on fracked gas for electricity and it runs contrary to the intent of President Obama's carbon reduction initiative.

New England doesn't need any more than a "footbridge" to a cleaner, sustainable energy future. That is the help New England needs, and the help that New Englanders expect!

### **20150806-0011**

July 27, 2015

Dear Congressman Guinta,

We are writing to ask that you, as our Congressman, oppose the Kinder Morgan Northeast Energy Direct (NED) pipeline. This project will bring no benefit to New Hampshire and little to no benefit to New England.

The pipeline construction process will pollute our air, contaminate our aquifers, wells and other water resources. Over 800 NH families will lose their homes and it will destroy conservation lands. It will harm the tourist industry and rural character of New Hampshire.

The proposed compressor station will be a high-pressure, 80,000-horsepower hub of toxic chemicals and deafening noise, prone to frequent “blow downs” where volatile organic compounds and carcinogenic gases are released into the air to reduce pressure on the pipeline. These gasses can travel anywhere from one to one hundred miles depending on how the wind blows and they can cause a host of health problems for people, ecosystems and water bodies on a day-to-day basis and will eventually cause ruin to all of New Hampshire.

In the event of a catastrophic disaster, any building within a half mile radius of the compressor station, including the Temple Elementary School will likely burn to the ground along with anyone nearby. Please don't let this happen!

The property values near the pipeline and compressor station will plummet and our homes and land will be worthless. What is even worse about this pipeline - no local community will reap any benefit. Help us save our homes and New Hampshire!

Congressman Guinta, please oppose this pipeline and work with us to stop this project.

Most Sincerely,

Nat & Holly Crooker

July 28, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street NE, Room 1A,

Washington, DC 20216

Re: Docket No. PF14-22, TGP Northeast Energy Direct — Scoping; Alternatives dk Impacts

Dear Secretary Bose:

On June 30, 2015, the FERC posted Notice of its intent to prepare an Environmental Impact Statement (“EIS”) for the planned Northeast Energy Direct Project (“NED” or “Project”) proposed by the Tennessee Gas Pipeline Company, LLC (“TGP”). In its June 30, 2015 Notice, FERC indicated that it had scheduled “scoping hearings” and the scoping process had begun in an effort to determine if the Project is in the “public convenience and necessity.”

Having followed the public docket on this Project, I have noted the overwhelming public opposition to it from almost every Town that has considered the impact of the Project. Of course, the opposition expressed by virtually every Town or City that has considered the question is joined by a chorus of opposition from elected officials (state, local and federal), boards of health, conservation commissions, conservation groups, local farmers and citizens of all political persuasions.

Recently, as you must know, Senator Rosenberg and others have asked FERC to delay the scoping process to allow the citizens of Massachusetts, New Hampshire and New York sufficient time to analyze to most recent multi-volume filing by TGP on July 24, 2015. The Attorney General of the Commonwealth has convened an independent study group to report on the question of need. Nevertheless, FERC and TGP, seem determined to push forward even though the public has had insufficient time to review TGP’s recent filing. This decision certainly undermines FERC’s repeated assertion that its review will be “both accessible and transparent to the public.”

For the record, I am counsel to a number of landowners who are adversely impacted by the NED. Two of my clients are working farms in Western Massachusetts; one of which dates back to the French and Indian War in the 18 century and the second farm just celebrated its 100 anniversary as a working fruit farm. My other clients are homeowners who have already seen their ability to sell their houses stymied because of the proposed Project.

On behalf of my clients, I join the chorus of opposition to TGP’s Project and, specifically, request that the scoping process announced by the FERC be delayed. There is simply insufficient time to review and analyze the July 24, 2015 filing by TGP.

If FERC is to maintain its credibility, it must allow the public adequate time to review the most recent filing.

Very truly yours,

Mark H. Bluver

FERC comment form: Walter J. Pasko, 65 Bridge St, Lanesborough, MA 01237, with attached 4 page response presented at July 28, 2015, Scoping Meeting held in Pittsfield, MA

**Major Concerns About Kinder Morgan Gas Pipeline**

Walter J Pasko, 65 Bridge St, Lanesborough, Ma, 01237

Work Experience:

Worked 35 years for General Electric power transformer and Naval Ordnance Departments

Graduate of General Electric Toolmaking Apprentice Program

Early years, hands on, fabricating machine tools and equipment for GE manufacturing facility.

Graduate of UMASS Amherst, PhD - Mechanical engineering

Mid years worked in the, Advance Development Engineering section of Power Transformer manufacturing specializing in magnetic circuit design and transformer noise control.

Late years worked in the Advance Development Engineering section of Naval Ordnance department developing a prototype liquid fuel howitzer cannon in conjunction with Army Ballistic Research Lab. Activities include: hardware design and analysis, internal ballistics simulation, gun firing data analysis, and hardware failure analysis.

**Pipeline Safety Issue: Proximity to Dwellings**

The proposed Pipeline Path is located on the south side of the power line as it passes the base of constitution hill, thus placing several dwellings in close proximity to the pipeline while the north side is free of dwellings. After passing constitution hill eastward the pipeline then crosses over to the north side. A safer design would be to locate the crossover to the west of constitution hill.

The access road to the power line is also public access to private property. This unpaved road, composed of clay and gravel, is nearly impassible during the spring thaw, even under very limited traffic conditions.

**Pipeline Safety Issue: Pipe Mechanical Stress Failure from thermal expansion:**

The change in length of a piece of steel pipe a mile long exposed to a seasonal change in temperature of 70 degree is estimated to be approximately 34 inches, based on a coefficient of thermal expansion for steel of .0000078 inch per inch per degree F.

If the ends of the pipe are restrained and the pipe cannot freely contract in length with a 70 degree F sea-

sonal drop in temperature, an internal tensile stress will develop at every point along the length of the pipe. The maximum Internal tensile stress in the pipe wall under this condition is calculated to be approximately 19000 psi. This value was calculated assuming zero gas pressure in the pipe. This stress value is approximately 1/3 the failure strength of hot rolled steel. Adding the tensile stress from gas pressure will further increase the total tensile stress to possibly unsafe levels.

Because the pipeline is continuous over many miles with all section simultaneously expanding or contracting with changes in temperature, all sections of the pipeline are prevented from expanding or contracting by all the other adjacent pipeline sections making up the complete pipeline, thus in actual practice the pipeline will likely experience the 19000 psi stresses give in the above paragraph.

At Constitution Hill in Lanesborough the terrain in the pipeline path consists of two irregular ridges 1400 feet apart with a 135 foot deep valley in between. This configuration will require straight pipe sections welded to pipe elbows having relatively sharp turning angles at the two peaks and the valley in between. Each elbow configuration together with its welded joints acts as a stress multiplier, thus amplifying the already high stresses due to seasonal changes in temperature described above.

Additional stress intensification may arise in the joint area from surface cracks resulting from to hydrogen embrittlement, a normal byproduct of cathodic corrosion protection. Cyclic fluctuation in pipe temperature can lead to longer term fatigue failure from crack propagation at stress risers.

#### **Pipeline Safety Issue: Pipe Mechanical Stress Failure from Soil Frost Expansion:**

From my personal observations, annually, after most snow cover is melted in the spring the clay soil on my property is expanded vertically approximately 6 inches above the surrounding soil every year in the areas exposed to the winter air temperature, specifically along walkways and driveways cleared of snow cover throughout the winter.

The expansion of water in forming ice is virtually an unstoppable force able to break rock, lift buildings, and break buried pipes.

The proposed pipeline will pass through alternating clay soil and rock ledge, sometimes exposed to air temperatures and sometime covered with snow. Clay soil will expand upon freezing while the rock ledge will not. The effect of variable frost heaving along the length of the pipeline is of concern because of uneven frost heaving will apply a bending force upward in the areas where the clay soil expands upon freezing.

The 30 inch pipe has a 5 times greater surface area exposed to the heaving soil compared to the 6 inch the so the lifting forces will also be 5 times greater then in the 6 inch pipeline currently buried in berkshire county.

Stress in the 30 inch pipe will rise 5 times faster with increasing bending deflection because of the bigger diameter of the 30 inch pipe compared to the 6 inch pipe. Combining the unstoppable forces of expanding soil and the much higher rate of increase in stress brings into question the viability of a 30 inch high pressure underground pipeline in the northeast.

#### **Pipeline Safety Issue: Pipe external corrosion and failure:**

Pipe corrosion is accelerated by chemical reactions between pipe and soil, and also from externally generated current passing between soil and pipeline. The three known sources of current that can contribute to pipe corrosion are:

##### **#1. Electrochemical interaction between pipe and soil.**

The usual solution to prevent corrosion of buried pipe is passive cathodic protection which consists of zinc metal plates electrically connected to the pipe along its length. The combination of two different metals, pipe steel and zinc plate, submerged in wet soil constitutes the elements of a simple battery which generates a small direct current with a flow direction that inhibits corrosion. If the weak currents from this arrangement are overwhelmed by large external current sources described on the following paragraphs below, the intended corrosion protection will be ineffective or reversed, resulting accelerated corrosion .

## **#2. Geomagnetic currents in the earth**

Geomagnetic currents in the earth are generated by the interaction of the earth's rotating magnetic field with charged particles emitted by the sun. Geomagnetic current levels as high as several 1000 amps, have been measured in some locations on the earth at peak solar activity, while lower currents occur more frequently. These current can travel on both long distance power transmission lines and pipelines. In the past these earth currents, traveling over electric transmission lines, have created major electric power outages in various places on earth.

These high currents flowing into and out from a long pipelines can exacerbate pipeline corrosion by interfering with the normal current flow generated by cathodic corrosion protection installed along the pipeline.

Compensation for this phenomenon can be achieved through high levels of active cathodic protection. However, active protection would require electric power stations along the pipeline with the result that large amounts of electric power would be consumed. Also, active protection would produce more hydrogen gas at the pipe surface leading to higher levels of hydrogen embrittlement which can increase the possibility of surface cracking, which can then lead to crack propagation failure of the pipe.

The prediction of Geomagnetic currents in the pipeline by computer simulation appears to be impractical because of its 3-dimensional complexity, requiring as computer input, the distributed subsurface electrical and magnetic properties of the earth over the entire pipeline region, as well as the time varying voltage distribution across the earth.

## **#3. High voltage transmission line induced currents:**

An electrical transformer is created when two parallel conductors carrying current transfer electrical energy from one conductor to the other by means of the circular magnetic fields encompassing both conductors.

Fundamentally the pipeline, as one conductor, and the high voltage transmission lines as the other conductor, form a huge electric transformer extending over hundreds of miles.

The magnitude of electrical coupling between the pipeline and power line is inversely related to the spacing between the two but is directly proportional to the length of the two in parallel.

When alternating current flows in the power line an alternating voltage is induced in the pipeline by the changing magnetic field of the power line. This voltage can drive alternating electric currents in the pipeline.

Soil above the pipe being a poor conductor will not be an effective magnetic shield for the pipeline. Some of the current induced in the pipeline will circulate locally between the soil and pipe in small loops along the length of the pipeline and may accelerate pipe corrosion. Because these currents will be alternating current, passive cathodic corrosion protection may not protect the pipeline.

In conclusion, both geomagnetically induced currents and power line induced current should be investigated in detail to determine their impact on passive cathodic protection and hydrogen embrittlement at surface of the pipeline, both effects may dramatically shorten the life of the pipeline.

## **Safety Issue: Pipe internal corrosion and failure:**

Internal to the pipeline water vapor carried along with the gas can condense to liquid water and accumulate at a any low point in the pipeline. One such point is in Lanesborough at the valley floor along route 7, located under the town aquifer. A similar situation exists in the valley west of the ridge at Constitution Hill. It unclear how this accumulated water accumulation will be controlled to prevent internal corrosion of the pipeline.

## **Noise Pollution: Metering Station Noise and Compressor Station Noise**

### **Disruptive Metering Station Noise**

Placing a metering station within the community of Lanesborough could produce serious noise pollution issues due to the near proximity of houses to the pipeline and also because the frequency spectrum of the

noise may contain discrete tones which are more noticeable than broadband noise.

Noise can be characterized as narrowband noise (discrete Noise), or broadband noise (random noise), or a combination of both.

Narrowband Noise is produced by such equipment as rotating and reciprocating machinery, electric transformers, jack hammers, engines, pumps, etc. These noise sources generate a few dominant sound frequencies. Electrical equipment generally produces noise at two frequencies, 60 Hz and 120 Hz. Because these are very low frequencies, sound waves can travel long distances with out much sound attenuation and thus can be a serious annoyance problem.

Ambient background noise is generally broadband noise without a dominant frequency, examples are: turbulent water flow, ocean wave action, wind through a forest, cooling fans, tires-road noise, etc.

Since narrow band noise is much more annoying than broad band noise, proper sound analysis of the noise source requires the use spectrum analysis to determine that adequate noise control has been achieved

Simple measurements of Total Noise Level before and after installing noisy equipment does not properly assess the annoyance issue.

In the power transformer industry annoyance level from external noise is primarily determined by measuring and comparing the octave band sound spectrum of both noise source and ambient noise. For proper masking of annoying noise from power equipment the dominant frequency bands produced by the noise source should be lower than that of the lowest night time ambient noise level in the same frequency bands .

The above factors need to be properly address when locating new equipment in an otherwise quiet environment.

#### **Disruptive sound and vibration transmission over long distances from pipeline compressor stations:**

Transmission of low frequency sounds and subsonic vibrations are efficiently propagated over long distances along metal conduits as well as in compacted soil and rock. High pressure pumps at the compressor station may generate low frequency pulses which can propagate efficiently along the pipeline for long distances and be detected as subsonic vibration by communities a long distance from the compressor station.

Studies of existing similar systems should be performed.

Note: all numerical values in this paper are estimated from first order calculations.

File Code:2700

Date: AUG 4, 2015

Ms. Kimberly D. Bose  
Secretary, Federal Energy Regulatory Commission  
888 First Street NE, Room IA  
Washington, DC 20426

Dear Ms. Bose:

This responds to your June 30, 2015, Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project involving construction and operation of facilities by Tennessee Gas Pipeline Company, L.L.C. (Tennessee Gas) in Pennsylvania, New York, Massachusetts, New Hampshire, and Connecticut.

To date, we have nor received a request from Tennessee Gas to construct facilities across National For-

est System lands in the Eastern Region. The pipeline routes identified in the maps included in the June 30, 2015, Notice of Intent do not indicate National Forest System lands in the Eastern Region would be crossed. For these reasons, we are not seeking cooperating agency status for this project at this time. However, should Tennessee Gas propose different routes crossing National Forest System lands, they will need to submit a Special Use Application and we would seek cooperating agency status for that project.

Thank you for the opportunity to review and comment on this project.

Sincerely,

signed: Mary Beth Borot for

Kathleen Atkinson

Regional Forester Eastern Region

Enclosure *{a copy of FERC's June 30, 2015, Notice of Intent (20150630-3044 above) was attached}*

UNITED STATES OF AMERICA  
**FEDERAL ENERGY REGULATORY COMMISSION**  
INTERAGENCY PRE-FILING CONFERENCE CALL

Tennessee Gas Pipeline Company, LLC

Docket No: PF14-22-000

NORTHEAST ENERGY DIRECT PROJECT

July 09, 2015

Agencies in Attendance (list of attendees is attached):

- Federal Energy Regulatory Commission (FERC)
- Cardno (FERC 3rd Party Contractor)
- U.S. Environmental Protection Agency (USEPA)
- National Oceanic and Atmospheric Administration (NOAA)
- PA Department of Environmental Protection (PA DEP)
- NY State Department of Environmental Conservation (NYSDEC)
- NY Department of Transportation (NYDOT)
- NY State Parks and Recreation
- NY State Department of Public Health
- MA Attorney General's Office
- MA Department of Environmental Protection (MA DEP)
- MA Department of Public Utilities (MA DPU)
- NH Fish and Game Department (NH FGD)
- NH Department of Transportation (NH DOT)
- NH Division of Historical Resources (NH SHPO)
- CT Metropolitan District - Hartford
- Nashua Regional Planning Commission
- Berkshire Regional Planning Commission
- Delaware River Basin Commission
- Southwest Region Planning Commission
- Franklin Regional Council of Governments
- Tennessee Gas Pipeline (Tennessee Gas)
- Hatch Mott (Contractor for Tennessee Gas)
- Louis Berger (Contractor for Tennessee Gas)

**Meeting Summary**

The conference call was conducted to provide an overview of the Northeast Energy Direct (NED) Project as well as to review the general status of the schedule, field surveys, landowner coordination, and the National Environmental Policy Act (NEPA) process. Topics discussed included:

- NOI Status, Meetings, and NEPA
  - o NOI issued June 30, 2015.
  - o First scoping meetings will be in NY and PA the week of July 13th.
    - PA meetings will be run by Paul Friedman – FERC Senior Archeologist. He will also run the Oneonta, NY meeting
    - NY meetings in Rensselaer County (2 meetings) and one in Schoharie County will be run by Eric Tomasi.
  - o All meeting locations are detailed in NOI. One more meeting will be added in southwestern NH in the next few weeks.
  - o Comment period has opened for the project – 60 day comment period based on NOI issuance on June 30th.
    - Tennessee Gas will have 14 days from the close of the comment period to reply to comments filed within the 60 day timeframe.
    - FERC will review agency comments submitted outside of the comment period and will reference agency letters as part of future comments/data requests. Tennessee Gas is not required to formally respond to these comments.
    - If FERC receives a comment from an agency outside of the 60-day comment period, FERC can request a response from Tennessee Gas, particularly for information FERC does not have internally or cannot acquire from its contractors.
  - o Cumulative impacts – FERC has received feedback from several agencies and is planning to file a data request the week of July 20th.
  - o NY agency meeting upcoming on July 15th in Albany, NY. About 20 participants anticipated to attend. Most information presented by FERC at this meeting will be similar to information presented on the first bi-weekly agency conference call.
  - o Tribal meeting scheduled in July 16th in Oneonta, NY. Paul Friedman will be leading the meeting.
  - o FERC planning agency meetings in NH, MA, and CT during upcoming scoping weeks.
    - CT and NH meetings last week of July.
    - MA meeting week of 10th of August.
  - o Tennessee Gas planning to file formal application in October.
    - Once formal application is filed the bi-weekly agency conference calls will cease. Calls with FERC will only include cooperating agencies.
    - FERC requests to be notified by agencies as soon as possible in an email, or in a letter on the docket to FERC, if they would like to participate as a cooperating agency.
  - o Cooperating agency process
    - Any agency can comment on the FERC documents.
    - NEPA allows any federal or state agency to become a cooperating agency
    - Cooperating agencies may have specific permitting responsibility or an expertise that is useful in development of the Environmental Impact Statement (EIS).
    - Cardno will prepare preliminary draft EIS to submit to FERC. FERC will review EIS and make edits and will send to cooperating agencies to review.
    - Cooperating agencies are able to work closely with FERC before the EIS is released to the public.

They participate in the draft and final EIS process and can edit/revise/make conditions/etc. to the document.

- Tennessee Gas Status update

- o Planning to file all 13 resource reports electronically in July.

- o Surveys

- Wetlands

- ≠ NED East from Wright to Dracut - about 57 miles surveyed.

- ≠ NED West - approximately 58 miles surveyed.

- Cultural Resources

- ≠ About 30 miles on NED East surveyed

- ≠ About 82 miles on NED West surveyed.

- ≠ Most surveys have been concentrated in PA, NY and CT.

- Continue to plan and have interaction with the tribes on fieldwork.

- Bat Surveys

- ≠ Continuing acoustic bat surveys, primarily focused in PA and NY, some in MA and NH. Approximately 22% of area slated for survey completed.

- Threatened and Endangered (T & E) surveys

- ≠ Ongoing T & E plant surveys in NY and CT. Gearing up for bog turtle surveys in Rensselaer County.

- o Survey Access

- 39% Survey access from Wright to Dracut – Approximately 10 % access roads granted survey access

- Approximately 20% survey access granted from Wright to Dracut for bat surveys, about 27% of this area has been surveyed. From PA to Wright about 54% permission of ROW, bat surveys about 67%, and access roads about 43%

- Most of the compressor stations have been sited. Working on land options for compressor stations

- Tennessee Gas estimates they will have about 40% access for bat surveys

- o Ongoing efforts in aerial photointerpretation. Tennessee Gas will use this data for various permits and FERC filing

- o The next submittal of draft resource reports will not include field data or aerial resolution data because of the timing of the submittal and ongoing surveys/data processing. The final application will include aerial photography and survey information up through August 1st.

Next Call

- Agency call will be held every 2 weeks

- Next call scheduled for July 23, 2015.

NE Energy Direct Pipeline

We are gathered here, again, to hear views about the upcoming plans to deal with natural gas. Tonight it is about allowing natural gas to be piped through NY state to New England.

Our neighboring state, Pennsylvania, has been smart enough to allow drilling and fracking. In Bradford county, among others, where the farms were once as sad as ours, there are now new fences, rooves, buildings, vehicles and affordable taxes.

We, on the other hand, continue to loose jobs, see our taxes increase and watch our neighbors move away. Now we are to consider a pipeline. So what will that be?

A long ditch will be dug, a sturdy well-made pipe line will be placed in it and the ditch backfilled. The animals who moved away from the ditch digging will move back. Plants will regrow as anyone who mows understands. There will be minimal long term impact on the areas. I do suppose building construction will be restricted from the pipeline right of way. But Bambi and his mother won't care. They will graze over the finished pipeline. The birds will still hunt worms, overfly and nest in the trees. And new bridle paths will be available for horse and human walking.

Why go through all the trouble to make the pipeline?

Civilization requires energy of some type to function. At bare minimum we require heat, lights and transportation no matter where we live. For those who believe that the world as we know it will end if we continue to produce carbon dioxide.- leaving aside the fact that humans can not prevent CO2 production by Mother Nature ..Natural gas should be the desired fuel. It is the cleanest fuel available. It is available in abundant quantities right under our feet. It works regardless of time of day, condition of the atmosphere, amount of sun or wind present. It requires no bird- roasting or bird -killing hardware to be gathered. It can be relied on at all times. If wells are dug and fracked carefully, there is no damage to land or water.

But the product, natural gas, must be made available to it's users. And a pipeline is the surest way to move that gas.

Pipelines have been in this area for over 60 years. There are countless miles throughout the country, over 2,500 trouble-free miles in the state. The royalties and ad-valorem taxes enrich the areas where the wells are productive.

#### **20150806-4004**

To: FERC

From: Mary Ellen Collier  
927 Henry Edwards Road  
Franklin NY 13775

I am here tonight because you invited me to address this hearing. Nearly half of my 21 acre home in Franklin is within the 'buffer zone' of the siting of the NED compressor station. I am here to express my anger. This compressor station endangers the value of my property, my only significant asset, and it endangers my health and the tranquility of my chosen home. I am a citizen of the United States, and I look to this commission, to respect my concerns and protect my well being.

According to your website, one of your functions is to “ ..oversee(s) environmental matters related to natural gas... “ projects. A fact sheet assembled by the group, Compressor Free Franklin, states that “Pipeline construction will put at risk the Village of Franklin's (water) supply, as well as private wells and springs along the Ouleout aquifer.” My water is provided by our spring, which lies close to the buffer zone. We have had that spring dry up in the late fall frequently in the years we have lived here. All my neighbors will attest that the waterfall at the head of Henry Edwards Road reduces to a dripping trickle most years. Some years we have been without water for over a month before sufficient rain fell. I don't believe that an industrial site like a compressor station won't have a negative impact on the reduction of the water table at my elevation in dry seasons. This station should be sited in an area of less residential densltv, or at a lower elevation nearer the river.

Other environmental concerns I have include noise and light pollution, and toxic emissions. The Compressor Free Franklin fact sheet also states that” Recent monitoring of compressor stations throughout the country has documented, in addition to methane, emissions of carbon dioxide, carbon monoxide, volatile organic compounds, benzene, toluene, and formaldehyde, a known carcinogen.” Further, “ Compressor stations' turbine power plant and compressor produce continuous noise and low frequency vibration while in operation. “ ..equipment breakdowns, routine maintenance and testing require rapid venting of up 15,000 cubic feet of methane from a segment of the pipe, causing a sound equivalent of a rocket blasting off.” I have followed news stories about gas pipeline infrastructure for more than five years, since our area was first targeted for these pipelines, and I know that news comes out daily that corroborate these claims, and report station fires and accidents, often with photo and video documentation. Who will want to buy my property, with these conditions evident within a fraction of a mile? No one! I don't even want to live that close to a compressor

station! It's evident that the value of my property will fall, and I will have difficulty selling it when the time comes. The recent report of a 500/0 devaluation of homes near the Hancock compressor stations supports my concerns as well. If my property devalues to that extent I will be upside down on my mortgage.

Your website also states that FERC " ...regulates transmission and sale of natural gas for resale in interstate commerce." I am angry that you are approving new infrastructure in this time of instability in the commerce of fossil fuels. I believe that Kinder Morgan does not have contracts for all of the gas it proposes to transmit, and may likely export a large percent of it. It does not seem like 'meeting the public good', to enrich KM-stockholders and executives at the direct expense of hundreds of landowners- individual citizens who bear the financial and health risks. A recent Carbon Tracker report suggests that many of the proposed pipeline projects may not be feasible if " ...emissions are cut to keep global temperatures rise below the internationally agreed target ..." They state that " ..many LNG projects being considered will not be needed.", including up to \$71 Billion dollars worth of projects in the U.S. This report concludes that increasing action to cut carbon emissions, combined with falling renewable energy prices, will put some fossil fuel investments at risk. Last Tuesday's report from the Brookings Institute draws the same conclusion. This conclusion highlights that new infrastructure and investment should be directed to renewables.

I am here because I am angry. My assets and my quality of life are being threatened by a hazardous project that mayor may not enrich a corporation. My time and energy have been co-opted by combating this project and the previous pipeline for years now. As the world moves away from fossil fuel towards investments in renewable energy, my town is being torn apart by conflict brought by a dirty industry, hoping for a last stand profit from a changing energy industry. Stand up for me! Stand up for an ordinary citizen, trying to live a quiet life! Say NO to this project and YES to the environment.

Hand written FERC comment form, Thomas V. Coleman, 1103 Pin Valley Road, Towonda, PA 18848, supporting.

#### **20150806-4007**

More than half the homes in the US are heated with gas. That's over 100 million homes. Some of them are in new England. 54% of New England buildings are heated with gas.

Electric plants are switching from coal to gas. In fact, gas surpassed coal earlier this year. Gas generation was 21% in 2008. It's 31% today ... and growing. In New England, 52% of electricity comes from gas. Expect that to increase as nuclear plants age out. Because of the switch from coal to gas, CO2 has been reduced in the US to the lowest levels in 20 years. We're down to 1994 levels. All this with a growing population and a growing GDP.

CNG cars and truck fleets are on the rise. This option cuts automotive mileage in half and emits 30% less CO2 than gasoline. Manufacturing is moving back to the USA. Costs of production and costs of feedstock are lower here.

24 LNG terminals are in the planning or construction phase. Once built, gas from the United States will offset Putin's chokehold on Europe. Gas will reduce the use of coal in the Far East.

The New England pays a premium for natural gas Last year -- over \$5 a MCF. Currently, New England gas comes from Canada and the Gulf Coast. Marcellus gas sells at less than half that price and comes from a field only a few hundred miles away.

The cost and the convenience of natural gas creates the demand. Meeting that demand depends on a delivery

system. Kinder Morgan's Northeast Energy Direct pipeline is part of that delivery system.

Let's build it -- the sooner the better. Better for our homes, businesses, factories, and quality of life. Better for our local, state, and national governments. And better for the world.

Let's get this pipeline built -- NOW!

Thank you.

#### **20150806-4008**

Eugene Marner, 1245 Oak Hill Road, Franklin, NY 13775

Comments to FERC scoping hearing, Oneonta, NY July 16, 2015

My name is Eugene Marner and I live in Franklin, New York

You, FERC, are required by law - under the National Environmental Policy Act-to consider cumulative impacts of projects reviewed by you. During the scoping hearings for the misnamed Constitution pipeline and during the hearings on the Draft Environmental Impact Statement for that same pipeline, you were repeatedly called upon to consider such cumulative impacts. Many commenters observed that the construction of an open-access pipeline through the Marcellus and Utica Shales region of New York could lead to hydro-fracking in New York State. That threat has been temporarily blocked by the Cuomo administration. But a future administration could easily alter that decision. Your final EIS did not examine the potential impact of the fracking build-out that could accompany the Constitution Pipeline.

Furthermore, you were warned that permitting one massive industrial project like the Constitution Pipeline would change the rural, agricultural region traversed by the pipeline from a "greenfields" area to an already industrialized one. No sooner have you approved the first pipeline than Tennessee Gas Pipeline has come along to propose another to run parallel to the first. Tennessee Gas Pipeline has also proposed a 30,000 horsepower compressor station for the Town of Franklin, a compressor station that will spew carcinogenic pollutants into the air breathed by citizens of Franklin, Otego, Oneonta and wherever else the winds carry them.

#### **20150806-5001**

Tyrone Perrault, Windsor, MA.

August 5, 2015

Hello,

My name is Tyrone Perrault and I live at 915 High St Hill Rd in Windsor, MA 01270. My wife and I purchased this lovely and serene property this past March and have since unfortunately learned that the NED pipeline, proposed by Kinder Morgan under Docket 14-22-000, not only plans to have a large gas pipeline passing right by our house, but worse yet plans to include a huge compressor station less than 2 miles away from our quiet home in this pastoral town.

My wife Kellie Perrault and I stand with all of Western Massachusetts and beyond in our extreme opposition to this proposed unnecessary project. The reasons why this is a very bad idea are so plentiful that it actually amazes me that it could even be considered.

First and foremost, fracked gas and fossil fuel in general is an outdated fuel source, proven to be detrimental to the environment and known by all to worsen the global warming situation. We should be looking at renewable energy, like solar and wind, for our energy needs. The state of Massachusetts is a leader in the alternate energy field, and for the sake of our children and our future generations we need to get away from fossil fuels, not expand our use of them.

Secondly, this project would represent a blatant violation of Article 97 of the Commonwealth of Massachusetts Constitution, which grants all residents of our great state the right to clean air and water, and freedom from excessive noise. Residents in rural towns like Windsor, while less plentiful per square mile, are covered by this Article just as much as the people living in the large cities.

Kinder Morgan has not proven a definitive need for this large project. They do not have enough customer demand for it. Also, their 6,500 page report was delivered at the 11th hour and is incomplete. Their maintenance and safety record is abysmal. They are not to be trusted.

Many residents have concerns over the pipeline construction itself, concerning both the inferior materials being used in our area, as well as the depths and location that the pipe will be laid.

Contamination of well water and precious aquifers, the disruption to birds and animals, air and noise pollution from the compressor station, the potential for a disaster that no one is equipped to handle, the lowering of property values that we all have worked a lifetime to accumulate, watershed contamination upon snow melts, damage to forests and our unique ecology, the list of detrimental impacts of the proposed NED project goes on seemingly forever.

Please consider all of the great points that everyone has been making against this project. Please hear the voices of the people and deny this damaging project. There is virtually no one in favor of it, except Tennessee Gas and its investors. And this is about so much more than making money for an energy giant.

Thanks for your time on this matter,

Tyrone C. Perrault

#### **20150806-5008**

William elwell, Shelburne falls, MA.

I am very much apposed to the gas line going through anywhere in the state of Massachusetts.

FERC has no,baseline for monitoring water quality, springs,,wells, streams,,rivers and lakes.

FERC is obviously catering to the gas companies and NOT protecting the citizens of this country.

SHAME ON FERC!!!!!!!L

#### **20150806-5022**

reenfield, Scoping meeting July 29, 2015

Comment had been made at the meeting

Protected land of the town of Warwick represents one of the few unbroken wildlife habitats in Massachusetts.

Many natural resources on our land are still unknown. Just one example: each year Warwick Conservation Commission finds and certifies several new vernal pools on Warwick territory.

Did TGP studied natural resources before proposing the pipeline route? Obviously not. There are wetlands in half mile zone from pipeline route as shown on latest map provided by TGP.

The example with Compressor Station in Northfield even more stark. Super powerful station proposed to be located just next to protected land of our neighboring town of Northfield and approximately 1 mile apart Warwick State Forest.

There are scientific proves of pipeline construction's devastating impact to wetlands as well as critical compressor station impact to birds, insects and other wildlife in 5 miles radius.

Warwick Conservation Commission strongly believes that on DEISR stage all natural resources in 5 miles surrounding from proposed pipeline construction activity should be carefully and objectively studied and documented. Without this no objective EISR is possible.

I also request that contractors employed for said studies of 5 mile zone have to file NOI with local Conser-

vation Commissions. This will ensure use of local knowledge and objectivity of studies outcome.

I would like to give just one example of non-objective reporting, which makes me very concerned on the quality of data submitted to FERC by TGP.

In acoustic report filed with FERC last week, vol. 9, p. 9-45 one can read: “Area sound sources included vehicular traffic, wildlife (birds and insects), and distant aircraft.” Using these sources contractor managed to measure existing noise level in town of Northfield as 57.4 db. This is 8 times higher than normal level for rural communities. I assume that with this kind of science contractor tries to show that his activity will make no significant impacts since town of Northfield is already noisy. But this is not true. Town of Northfield is very quiet.

I believe FERC decisions should be based on real facts, not on ‘distant aircraft’ measurements. I would like to stress that FERC decision is not about the pipeline of economic benefits which the region may get or not get.

You decide on our life standards. You decide on the existence of one of the very few unbroken wildlife habitats in Massachusetts.

Sincerely on the behalf of the Commission,

Gregory Brodski, Co-Chair

Warwick, MA Conservation Commission

### **20150806-5053**

Dennis Gauvin, New Ipswich, NH.

Copy of document read at Nashua NH scoping session 7/29/15

Docket #PF14-22 NED

Hi, my name is Dennis Gauvin and I live in New Ipswich, NH

Given the incomplete nature of Kinder Morgan’s Resource reports and recent changes to the scope of the project, these scoping meetings are being conducted prematurely and, therefore, failing to provide information that would benefit the National Environmental Policy Act process.

- New Ipswich has no public drinking water supply
- We are all on private wells
- The pipeline will segment three Stratified Drift Aquifers and an UNKNOWN number of Bedrock Aquifers
- The NH Department of Environmental Services report of 2010 titled “Rock Blasting and Water Quality Measures That Can Be Taken To Protect Water Supply and Mitigate Impacts” states “Ensuring safe and adequate drinking water supplies requires maintaining the quality and availability of present and future water supply sources, because in the long run it is less expensive and more protective of public health to prevent contamination than it is to treat water to meet health standards and it is less expensive to use existing sources than it is to develop new ones.” “Municipalities and water suppliers have crucial roles in managing activities that affect source water quality and availability. Effective protection relies on the combined efforts of the state, water suppliers, municipalities, business institutions and individuals whose activities have the potential to affect source water quality and availability”
- Blasting of crystalline bedrock can contaminate water resources. There are 2 primary methods by which the quality of groundwater could be changed due to blasting.
  1. Contamination resulting from a release of regulated or unregulated substances to the groundwater
  2. Agitation of the subsurface may cause turbidity in groundwater to increase
- Blasting should be avoided until this can be studied properly
- Consideration should be addressed to alternatives such as drilling or cutting
- The proposed pipeline will pass a short distance behind a piece of land where a good many years ago

a pig farm existed. This farm was found to be polluting a great many wells in town. Our house is about a mile from that site. The farm was ordered cleaned up by officials and subsequently went out of business. Once the area was cleaned up we had to drain our wells, pour in bleach, run the bleached water through all our pipes and drain the well again. Our drinking water did return to normal. We expect blasting in this same area during construction will cause us additional issues with our drinking water.

- Did I mention that we live in the center of New Ipswich! The population in the aforementioned area has grown considerably since that time
- Should this project move forward we will be forced to test our wells on a regular basis, at our own expense to monitor for contaminants. Then what is the process to determine the cause? This needs to be studied
- When our daughter's family lived next door in Temple several years ago they had to install a reverse osmosis filter system to remove the arsenic that naturally occurs in that area. What impact will this construction have on arsenic levels in the area? Again, this needs to be studied
- Kinder Morgan says they will replace any contaminated wells. Well I for one do not want the replacement to be a multi-hundred gallon plastic tank sitting next to my house with a tanker periodically filling it up! This will be horrendous for property values and how do you keep it from freezing in winter? What other alternatives would there be?

Asking us to identify what needs to be "avoided, mitigated, minimized or compensated" without the adequate resources or time to do so can only assure that the Town of New Ipswich will suffer irreparable harm from this project.

What FERC does: (amongst a great many other things)

- Oversees environmental matters related to natural gas and hydroelectricity projects and other matters
- Promote Safe, Reliable, Secure, and Efficient Infrastructure

I would expect that these concerns for further study would be recognized and acted upon by FERC

Thank you,

Dennis Gauvin

## 20150806-5095

Kathleen Gauvin, New Ipswich, NH.

Information for Nashua, NH Scoping Meeting, July 29, 2015

Private Wells-Dug Wells

Hi. My name is Kathleen Gauvin and I live in New Ipswich, NH

Given the incomplete nature of Kinder Morgan's Resource Reports and recent changes to the scope of the project, these scoping meetings are being conducted prematurely and, therefore, failing to provide information that would benefit the NEPA, the National Environmental Policy Act process.

New Ipswich has no public drinking water supply.

We all have private wells. Many of our wells are dug wells. What effect will blasting and drilling have on our dug wells?

How can pipeline blasting contaminants in well water be detected? How close do private wells need to be in order to be impacted? This is a concern that needs to be studied before it can be addressed.

We urge FERC to study Best Practices for the alteration of terrain in order to avoid change in water flow. We urge FERC to follow RSA 485-A: Water Management and Protection including Water Pollution and Waste Disposal as it relates to protecting our water quality and water monitoring processes. We urge FERC to investigate the best practices dictated by NH Dept. of Environmental Services: because it is less expensive and more protective of public health to prevent contamination than it is to treat water to meet health

standards. We also want our wells tested quarterly for contaminants.

There are numerous dug wells that are in close proximity to the planned compressor station and its emissions. What will the effect be on these wells when toxins are released in the air, fall to the ground and seep into the wells? This is a concern that needs to be addressed prior to initiating the project. Who will monitor Kinder Morgan/Tennessee Das to make sure that “best management practices” are used to protect the water quality of our town’s private wells? This is our concern. This needs to be addressed.

We request and urge that no herbicides be used along the pipeline route. We know that herbicides can potentially harm the environment and our own health. Herbicides can reach water-bearing aquifers below ground. What are the effects of these herbicides in our drinking water? This needs to be studied. This needs to be addressed.

We are demanding that independent studies be conducted by FERC not by Kinder Morgan.

Asking us to identify what needs to be “avoided, mitigated, minimized or compensated” without the adequate resources or time to do so can only assure that the Town of New Ipswich will suffer irreparable harm from this project.

### **20150807-5002**

Richard P Murray, Nassau, NY.

Tennessee Gas Pipeline Company recently submitted documents totaling 6,500 pages +/- . The time period for comments in the scoping process is August 31, 2015. Three weeks is not enough time to adequately review and comment on these documents.

I request that FERC extend the comment period for at least 60 days and preferably 90 days.

### **20150807-5005**

Lucie W Murray, Nassau, NY.

Please extend the August 31st deadline to submit comments to FERC on the Kinder Morgan Proposed compressor station and pipeline proposal for Nassau NY and the recently added 6,500 page documents. My neighbors and I need more time to review and study these documents. It is unfair to give us such a short time period to review these documents which took Kinder Morgan years to prepare. I received my letter of notification from Kinder Morgan on June 5th of this year when they informed me they had re-zoned my property into a “Buffer Zone”. I have been away for the past several weeks due to the birth of my grandson so I have not had any time to review Kinder Morgans proposals and documents and how this Compressor Station and Pipeline would affect me and my property so how can I intelligently comment on their proposal. I had never even heard of Kinder Morgan prior to receiving their letter on June 5th. So please do the right thing and extend FERC’s comment deadline period for at least another 3 months.

### **20150807-5007**

glynn graham, wilton, NH.

Dear FERC members,

I am grateful that you are soliciting comments from NH residents at the 3 meetings you have arranged.

I am NH resident, I am a mother of NH born and bred children and grandchildren, I am a teacher and my family runs a farm that supports 100 other local families.

I have the following questions:

“Why on earth would we agree to spoiling our beautiful State and endangering our residents by agreeing to an accident prone pipeline that does not even benefit us?”

“Why on earth would we agree to creating noise pollution and risking our fresh water?”

“Why on earth would we agree to making Southern New Hampshire a place to avoid?”

“ Why on earth would we want to become allies and partners with Kinder Morgan?”

“Why on earth would we risk all this when there are no real gains even in terms of cheaper energy? Have we not learnt from history that cheap now may be expensive later?”

This pipe line proposal has been rejected by other states for good reason. It is wrong to now try to dump it on NH.

\*The sales pitch for the pipe line claims that it will bring cheaper energy to NH but that is not part of the deal or plan

\* the sales pitch claims that it will create jobs: the bulk of these are quite temporary and related to the work of installation

\* The sales pitch claims that they will remediate the environmental mess they make: too late and not possible in many cases

\*The sales pitch tries to hide the environmental damage by claiming they will use existing power line strips: their swath is much bigger than what exists and is only in a few places anyway.

AND IT IS ALL CLEARLY A SALES PITCH..... no mention is made of accidents and leaks which have been proven to happen again and again.

The damage caused by this to the land and peoples' lives is being proposed by a corporation wanting to make money. Would any of you on the commission making this decision want this in your back yard?

We trust that if you would not want your family to live beside a noisy compressor or be subject to the risk of a pipeline leak and poisoned water and if you did not want to have your land stolen by eminent domain and given to a for-profit company that you would not decide that it is OK for anyone else.

Respectfully,

GG

Wilton, NH

I hope that you listened well at the two Scoping Meetings that took place in New Hampshire. NO NEED FOR NED

Do you already have the date, location and time scheduled for the next Cheshire County Scoping meeting? Are you planning on telling the public that information on the Friday before the meeting like Kinder Morgan/ Tennessee Gas did with the Resource Reports ( that appear to be pretty useless with all the TBD's listed) I thought that FERC had / has Procedures to follow. I don't understand how this "so-called application" has made it this far - Applications are a filled out document - not a bunch of blanks - TBD after approval.....

**20150807-5009**

Richard P Murray, Nassau, NY.

Please consider the noise levels which will be heard at our house from the proposed compressor station on Clarks Chapel Road in Nassau, NY. The State of New York, Department of Environmental Conservation (DEC) limits an increase in noise levels over the background levels to 6 db. I request that your noise person or persons who will prepare the EIS noise section take background noise levels at our house, which is within the "1/2 mile FERC Identification Boundary" for this compressor station and compare that background level to that anticipated from the compressor station. Those background levels should be taken at all hours of the day and night.

RE: Northeast Energy Direct Project  
Tennessee Gas Pipeline Company LLC  
FERC Docket No. PF14-22-000

Comment by Stockbridge Munsee Mohican Tribe on Draft Environmental Report

Dear Ms. Bose:

I am in receipt of the Draft Environmental Report for the Northeast Energy Direct (NED) project forwarded by consultant Louis Berger. We have reviewed the materials per our cultural resource responsibilities for Section 106 of the National Historic Preservation Act and are replying to you as the Federal contact for the project in keeping with our Government-to-Government consultation.

On behalf of the Stockbridge-Munsee Mohican Tribe, I offer the following comments:

- In reviewing the Unanticipated Discoveries Plan contained in Resource Report 4, we confirm our satisfaction that the draft Plan adequately incorporates the views of Stockbridge-Munsee Mohican Tribe and we have no further changes. These views had been communicated to Louis Berger via previous correspondence, including ensuring that THPOs are contacted at the same time as the SHPOs, and including the Stockbridge-Munsee Inadvertent Discovery Policy in full as an appendix.
- We confirm that the Resource Report 4 accurately reflects the nature of our tribe's involvement in the consultation process to date, such as issuing comment letters, participating in fieldwork, and participating in in-person group consultation meetings with FERC and other federally-recognized tribes.
- We will continue to stay apprised of the archeological fieldwork and findings and when a complete picture is known of the impacted cultural sites and proposed treatment plans, we will issue comment.

Thank you for your review of the comments of Stockbridge-Munsee Mohican Tribe.

Kind regards,

Bonney Hartley  
Tribal Historic Preservation Officer

Lucie W Murray, Nassau, NY.

The following Web site lists Environmental violations by Kinder Morgan posted by the EPA

These violations are numerous. Please deny Kinder Morgan's Proposal for the NY pipeline.

I live on Clarks Chapel Rd within the 1/2 mile designated "Buffer Zone". The proposed compressor station is slated to be built on pristine farm land and is very close to recreational lakes and clubs such as the Sportsman's Club, the Golf Club and sensitive environmental areas such as Mud Pond Pond which will be adversely affected by the proposed Clarks Chapel Compressor Station and pipeline. Kinder Morgans proposal will have a devastating effect on my quality of life and health and property value. Please take these important factors into consideration in your review. Please deny Kinder Morgans proposal.

RE: Docket No. PF14-22-000  
NORTHEAST ENERGY DIRECT PROJECT

Dear Sir or Madam:

The Tennessee Gas Pipeline Company, L.L.C. has begun the process to design, construct and maintain a gas transmission pipeline and associated facilities from Pennsylvania, through New York and New Hampshire and ending in Massachusetts. The gas will be transported through this pipeline to markets not completely known at this time. It is proposed to be located within 1/2 mile of our house. We are also within the "1/2 mile FERC IDENTIFICATION BOUNDARY", as shown on the Kinder Morgan (KM) (owner of the Tennessee Gas Pipeline company, L.L.C.) MARKET PATH MID STATION 1 drawing dated 06/04/2015 sent to us. This boundary is outside the location of the land proposed for a 90,000 hp compressor station.

I have a number of comments and/or questions which I request that FERC consider when evaluating this project.

A cursory review of the proposed pipeline route shows that it will not impact Vermont in any way, even though it appears that going through Vermont would be a more direct route, impacting less land and people. Why has KM avoided Vermont?

As I understand it, KM proposes to use the thinnest pipe thickness for their pipeline in our area. Why is this so? I've been told that this is due to the pipeline traversing rural areas. I beg to differ with KM. In their plan noted above, there are 64 residences (yellow dots) located within the 1/2 FERC boundary, and that is just for the proposed compressor station. What about all of the residences along the way? Why isn't KM being required to use the thickest pipe domestically available. That's another question: is KM being required to utilize domestic steel pipe? This would certainly help the US economy. Many, if not most, of the residences noted above contain children. I request that KM take an accurate count of the people living in those 64 residences to determine the actual impact of the pipeline and 90,000 hp compressor station.

The area proposed for the pipeline and compressor station (in Nassau in particular) is rural and, as such, the residents enjoy a peaceful, tranquil and safe environment for ourselves and our children and grandchildren. That is not to say that we do not smell odors from manure from our animals. I believe that these are "clean" smells which will not harm us in any way. That cannot be said of the odors which WILL emanate from the pipeline (leaks or ruptures) and the compressor station (blow offs, diesel odors, etc.). Please review all available literature on these types of issues.

The site selected for the compressor station in Nassau is one of convenience only. The landowner suggested this site to KM because KM's initial location was across the street from his house. He must have suggested that his land on Clarks Chapel Road would be better. The station would be located in what is now a gravel pit. That sounds good, except for the location affects many families as note above, both from a safety aspect, but also from an environmental one. These stations are built to run constantly, 24/7 and 365/366 days per year. They must have lights which will, most likely, operate all night. We live on a hill overlooking the gravel pit. There are no lights there during the night. This extraneous light emanating from the compressor station will seriously affect our quality of life.

The compressor station will also generate noise, also 24/7 and 365/366 days per year. This issue MUST be studied in detail. There is a droning noise, which usually is taken as an average. It must be compared to the noise levels which exist right now. I request that KM and their noise consultant evaluate to worst case scenario of night noise levels at our house and compare these to the projected levels of all types of noise (droning, low frequency, impact, regular maintenance activities and potential disaster). Our bedroom windows look down towards the gravel pit and we should not have to listen to the compressor station noises at all hours and all days.

As I said previously, the location of the compressor station is for convenience only. I request that KM be required to investigate other locations which will have less impact on the residents. If they were to move it a few miles east, just east of Firetower Road, it appears to me that the impact will be almost negligible on homes. Sure, they will be required to negotiate for this land with another land owner. They might be required to build an access road through the woods. But those a small prices to pay to protect 64 families. You asked us to provide alternatives, well, here is one.

There have already been many comments made to FERC concerning this proposed pipeline. Emotions are running high. However, emotions are a natural occurrence whenever people's lives are on the line. You, as a federal commission, are mandated to protect the citizens from unnecessary interference from outside influences. KM's proposal for this new pipeline is one of those unnecessary occurrences. I ask that you protect us.

Sincerely,

Richard P. Murray

**20150807-5048**

Elizabeth Reilly, Nassau, NY.

My Farm, Business and residence is located adjacent to the Clarks Chapel Road compressor station which starts right across the street from the corner of my land. My Parcel should be considered a "HIGH CONSEQUENCE" area in regards to the compressor station. We have thousands of people here from November through December for our Christmas tree farm operation. We host elementary field trips, birthday parties and other events throughout the year. In the event of an emergency at the compressor station, there is no quick way to evacuate people off the property. Having the station in such close proximity will elevate the casualties if a rupture were to occur. Not only should compressor stations not be allowed in a residential neighborhood, but they should not be located next to areas of gathering, especially when they are outdoors. Please take this into consideration when the environmental impact report is being generated.

**20150807-5053**

Elizabeth Reilly, Nassau, NY.

Please extend the commenting period for at least an additional 60 days past the August 31 st. deadline. Kinder Morgan's resource report that was due in June has just recently been published. This project will have a devastating blow on our community if it is approved. Time needs to be given to allow us residents to analyze the 6,500 pages of information. These community's have taken generations to build, now Kinder Morgan would like to uproot the environment many of us chose to live in for the environment it provides. This decision should not be rushed in any way, homeowners are due the respect of additional time to read though the reports and have adequate amount of time to comment on them. Most residents work jobs on top of now fighting for our most valuable asset, our homes, health and safety. Please extend the commenting period.

**20150807-5150**

Barry Pfannebecker, South Deerfield, MA.

To: Federal Energy Regulatory Commission

e. FERC #2323.

The purpose of this letter is to draw your attention to both the Environmental Construction Plan for Massachusetts (Ref: b) and related documents as referenced above regarding 2 rivers in Massachusetts that are in the path of the Pipeline, specifically the Deerfield River and the Connecticut River in Franklin County (Ref: d). The proposed Plan lacks design information that must be used to evaluate the efficacy of the construction of the Pipeline to meet environmental considerations for each river. Any preliminary document that has such a wide scope of construction should include sufficient design information to permit a review and comment phase before a final submittal in order to assess viability of the construction and to request further

details as required.

1. Deerfield River. The Deerfield River has changeable characteristics with regard to the flow, depth, and amount of its current. The springtime flow can be sufficiently imposing to prohibit any type of water sport. There are areas where a scouring of the river bottom are evident. Additionally, the Harriman Dam in Wilmington, Vermont (Ref: e) has the right to have an emergency drawdown to manage its reservoir level. By agreement, it impounds the Deerfield River. This drawdown is under the control of Trans Canada Corp. and the effect of which was very evident as a consequence of Hurricane Irene in 2011. Coupled with the rains from the storm, a drawdown occurred and caused a massive amount of water flow into the Deerfield River, extreme flooding of adjacent land, and restructuring of the river. Effects such as these must be considered in the design for “waterbody crossings” since the river and/or river bottom may be altered.

It is known that both temperature and pressure vary along the length of natural gas pipelines. There has been no indication in the Pipeline construction as to the expected temperature gradient in the Pipeline under or near the Deerfield River and whether or not this will have a long term impact on the associated environment.

The Pipeline report states that “dry crossing techniques” for the majority of the “waterbodies” (i.e., rivers) crossed by the project will be buried with a minimum cover of 5 feet over the pipe. Whether a dry crossing technique or horizontal directional drilling (HDD) is used, it is unrealistic to state a minimum of 5 feet since no unbiased third party studies have been cited to indicate what is acceptable to maintain the quality and integrity of the river bottom given the nature of it and expectations for emergencies as noted above. The 5 foot minimum may end up being the maximum unless the studies indicate otherwise.

2. Connecticut River. The same discussion applies here as with the Deerfield River. Since the Deerfield River feeds the Connecticut River, exceptional waterflow may be expected due to a Harriman Dam drawdown in addition to springtime water flow.

3. Other Information. There are other examples of either insufficient design details or lack of clarity in properly addressing environmental issues that pertain these rivers.

- There are statements such as “...to the extent practicable...” . This general clause only implies that something might be done if it fits a company budget. This is not an environmentally responsive approach. Clearly specified approaches must be given to indicate that the particular problem is known and there is a manner in which to solve it responsibly.
- The identification of “project sponsor” and an “Environmental Inspector” (Ref: c) is applied to someone performing certain activities without defining the professional credentials to do so. Any in-company representative used to perform these functions may not provide effective assurances for the environment they are traversing. An unbiased, accredited environmentalist acting as a third party must be used.
- Sensitive waterbody information is stated to have been “defined” (Ref: a , Comment ID 17, p 9). However, Appendix H (Ref: c) and Appendix L (Ref: b) do not do so as claimed in Comment ID 17. The 2 rivers noted above are indeed sensitive and must be addressed.

The absence of design details for the Pipeline construction regarding the aforementioned rivers suggests there could be design omissions for other rivers elsewhere in the proposed Pipeline route. These details must be disclosed before a final submittal to FERC in order for an assessment of the efficacy of the construction to address environmental concerns for these rivers. The present documentation is too casual in its approach to the Deerfield and Connecticut Rivers, and likely elsewhere. The lack of facts and the misleading answers in the Data Response Matrix as noted (Ref: a) indicate that technical merit is lacking in this Pipeline proposal. This Pipeline construction extends significantly beyond the digging of a trench and the design details to protect the traversed environment should be required by FERC. There cannot be a meaningful review without the information.

Submitted on FERC comment form:

(Testimony given at 7/28/15 hearing at Taconic High School, Pittsfield MA)

My name is Ken Kipen, from Ashfield MA, a community resolved to oppose the pipeline through our town. I've come here tonight specifically to protest FERC's all-too-obvious advocacy of the Kinder-Morgan pipeline project.

At the Natural Gas Roundtable luncheon in Washington DC on July 21" just a week ago, FERC Chairman Norman Bay announced that his agency would soon issue a 'Best Practices Manual' to help the gas industry win permits for fracked gas infrastructure projects.

That FERC operates as a de facto arm of the fracked gas industry comes as no surprise to many communities that have contended with FERC's biased project-approval. It is well-illustrated by the fact that FERC holds free, three day interactive seminars where it teaches the industry how to successfully navigate the FERC process. It goes so far as to invite the industry to sponsor snack-times and evening social-gatherings. FERC also holds 'pre-conference' sessions where it's staff asks, "Do you have conflict in your pipeline work, maybe with a property owner," offering to "strategize for dealing with difficult behavior." It is thus obvious that FERC looks at communities, at people who are adversely affected by these projects, as mere 'problems'.

Emblematic of this attitude, and little-known to those who attended last Tuesday's luncheon, three organizers with the group Beyond Extreme Energy were not allowed to attend the seminar, despite having registered. The luncheon, held at the University Club, was monitored by FERC's internal security personnel, who escorted the three out. Once removed, the building's doors were locked and five security officers were stationed at the entrance.

Fracking infrastructure exacerbates climate change, but it also leads to documentable air- and water-pollution and a slew of human health impacts... headaches, respiratory problems, and cancer are very real dangers of living near fracking infrastructure, plus the ever-present possibility of explosion.

On the first-displayed slide this evening, FERC's list of 'Identified Public Concerns,' here is no mention of pipeline leaks, a PRIME concern in all the towns along the proposed route, based upon Kinder-Morgan's very poor record of preventing or attending to them. And inexplicably, FERC authorized construction allows Kinder-Morgan, a non-governmental entity, to take private land by eminent domain.

Can there be any doubt that FERC is NOT advocating in the interest of public health or safety or property rights, but rather for Corporate America?

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Dear Secretary Bose:

please oppose the Northeast Energy District (NED) project and the extension of Kinder Morgan' Tennessee Gas Pipeline.

New Hampshire cannot expect monetary benefits to outweigh the monetary and environmental burdens on residents and towns and in looking at the proposed figures, I am not convinced gas and electricity prices will be lower. I understand we will incur a surcharge for this project.

There are more environmentally and economically responsible ways for bringing natural gas to New England such as imports to the Distrigas LNG facility located in Everett, MA which has significant excess capacity to accommodate the storage.

The shale oil and gas industries are not sustainable and may be causing seismic and toxic problems that will last far into the future.

The claims of NED project employment for New Hampshire residents is all but nil. This project will rely on out-of-state experts.

Locally our town of Fitzwilliam can expect a negative impact on our aquifer system, local schools and roads, wildlife and wildlife habitat and lower property values. Health and safety in light of this project is frightening. What kind of economic impact can Fitzwilliam expect? Our population almost doubles in the summer months due to the lake and Rhododendron State Park. Have you seen the route of the proposed pipeline? And what of people's right to their land? Some citizens will be losing their homes.

Please support expanding current coastal pipeline infrastructure instead of the current NED project plan.

Respectfully yours,

Kerry P. Gagne

Ref.: High Pressure Compression Sabon 8 Pipeline in Dracut, MA 01826

Tennessee Gas Pipeline Company, L.L.C./ Kinder Morgan  
NORTHEAST ENERGY DIRECT PROJECT

Good Morning

Please stop the High Pressure Compression Station & pipeline, we are a residential area.  
Per Geography Division U.S. Census Bureau letter, Dracut MA is a High Consequence Area.

Combine this with Kinder Morgan/Tennessee Gas Pipeline Co. has the worst safety record for its type of business, according to self-reported filings of significant incidents with a regulatory agency. How safe will our hundreds of families be if this plant is built?

In 2009, the Pipeline and Hazardous Materials Safety Administration (PHMSA) cited Kinder Morgan for violating safety standards regarding the distance between a natural gas pipeline and a "high consequence area/urbanized areas" such as a school or hospital; the pipeline was too close for safe operation in case of a leak

Reference: <http://www.pipelineawareness.org/wp-content/uploads/2014/05/Kinder-Morgan-Accidents.pdf>

Our police and fire station is in the blast zone. They mislocated the structures on their blast zone map. Other structures on their blast zone map are homes with families not empty structures.

Also, Kinder Morgan has been cited by the U.S. government in 24 incidents which led to five federal enforcement actions from 2006 to 2014.

In 2011, PHMSA cited Kinder Morgan for these safety violations:

- ~ failing to maintain update maps showing pipeline locations,
- ~ failing to test pipeline safety devices,
- ~ failing to maintain proper firefighting equipment,
- ~ failing to inspect its pipelines as required, and
- ~ failing to adequately monitor pipes' corrosion levels

Reference: <http://www.pipelineawareness.org/wp-content/uploads/2014/05/Kinder-Morgan-Accidents.pdf>

Question - Would you want your family to live in the blast zone of a plant built by a company with the worst safety record in its industry with a great many government violations?

Please stop them

John Yurka

Re: Denial of access to my property

As evidence mounts that high volume fracking & horizontal drilling causes earthquakes and health issues for surrounding communities, and the western US faces droughts that are putting food farms out of business, I don't know how the planners and executives at Kinder Morgan can sleep at night. In NY and the Northeast, we have options for renewable energy NOW, and Kinder Morgan is pushing a pipeline that I'm CERTAIN is intended for the Bear Head Export project and then overseas. It is 100% WRONG to take personal property through eminent domain for what will largely be private gain.

As the owners of property located at 263 Radley Road, Averill Park, NY 12018, we hereby deny to Kinder Morgan and its subsidiaries and affiliated entities, including without limitation Tennessee Gas Pipeline Company and its subsidiaries and related entities, as well as NYSEG, National Grid or other electric utility company with whom any of them co-locate or propose to co-locate any pipeline, and their respective employees, agents, representatives and contractors, permission to enter our property identified above, to perform surveys or for any other purpose (other than for access by my utility company directly related to the supply of electricity to my property) without prior written notice specifying the purpose of such access and my express consent.

Any entry on our property without our consent will be considered unauthorized and treated as trespass.

**20150810-5001**

SUSAN A DUHAMEL, NEW IPSWICH, NH.

I am very concerned about the toxins that will be released from the compressor station that might be built one mile from my home. I will not be able to live here if it is built. We cannot afford to move. What do you suggest we do? Please do not approve this project. It is already ruining our lives.

**20150810-5004**

Terry Nord, Rensselaer, NY.

Please address the following in the EIS:

Impacts to asthmatic children from compressor emissions near recreational lakes (Nassau).

Impact on wounded warriors who use Burden Lake for recreation.

Impact on inner city children who have a summer experience at Burden Lake if exposed to toxins in the air, water, noise pollution.

The cumulative effect of a compressor station located in the Town of Nassau where there is already a Super Fund site very close to the location of the compressor station and also a proposed gravel mine where blasting will occur.

Well water studies before and after the project.

Air quality studies before and after the project.

Improved safety standards with thicker pipe.

The lack of adequate fire/rescue services in the event of an accident or explosion.

The lack of a burn unit near by (Town of Nassau)

Noise and light pollution impacting wildlife, circadian rhythms, causing stress.

Vibrations from the compressor station damaging home foundations.

The risk of increased radon exposure in Rensselaer where there are already high radon levels.

The impact of nitrous oxide and VOCs on ground level ozone, and it's impact on crop growth.

The impact of benzene, toluene, sulfuric oxide, and formaldehyde in emissions to residents living in close proximity. The impact of the same on the water quality of Burden Lake which is about 2000 feet north of the planned compressor station.( winds over the lake are most often from the south\_)

The impact from emissions blown over a cooler body of water (Burden Lake)

The research indicating that 20 years after methane is released it is 79 times more powerful than CO2 at destabilizing the climate.

The public health risks identified in the Compendium of Scientific, Medical, and Media Findings Demonstrating Risks and Harms of Fracking (Unconventional Gas and Oil Extractions) 2nd edition December 11, 2014.

The article in the May 10, 2011 American Journal of Public Health that speaks to the chemicals used in fracking (same as released at compressor stations) cause damage to lungs, liver, kidneys, blood, and brain.

The risks that home values will decrease, mortgages will be difficult to get, reverse mortgages for the aging population will be impacted, home owners insurance will be questioned.

Blasting during the project will disrupt our aquifer.

A report released as part of the US EPA's Office of Inspector General recognizes that leaks from pipelines account for more than 13 million metric tons of CO2 equivalent emissions, are almost 100% methane, and are more than 10% of the total emissions from natural gas systems. Who will monitor the leaks from NED pipes running through our streams and into our water supply and lake.

Studies done with people living near compressor stations identify problems with nose bleeds, rashes, eye problems, respiratory problems. The compressor station planned for the Town of Nassau is one of the largest in the country. What will this impact have on our population in a rural recreational area.

The impact of emissions, noise, light pollution on farm animals, wildlife, and the MANY people living near this location.

Please deny this project.

There are no benefits to our community.

This gas is for export.

Many of the volunteers in our fire department live near the proposed pipeline /compressor station in the Town of Nassau and in the event of a fire/explosion would be injured or helping family and unable to respond. We cannot handle this type of emergency.

The light pollution will obscure the beauty of our star lit sky, cause migration of wildlife, and disrupt sleep.

The roads around the construction site are narrow and already in poor shape. The construction process would be disruptive in a rural community and the Town already struggles to maintain roads.

In many areas of the Town of Nassau the pipeline would be buried 3 feet below ground on rock. This winter our frost was 5 feet deep. Metal on rock above the frost line! How would this impact the integrity to the pipe and welds.

It is my understanding that compressor station engines are cleaned with oil that can spray into the atmosphere in a mist. Will this mist drop into the waters of Burden Lake. What will the impact to fish, wildlife, swimmers, and people who utilize the lake water for bathing and showering be.

The Town of Nassau Environmental Committee indicated that the southern route for the pipeline if it had to exist was preferable. If the Town prefers this route why would you consider moving it closer to a recreational area.

ational area.

## 20150810-5006

Terry Nord, Rensselaer, NY.

Please address the following concerns in the EIS for the Town of Nassau - Burden Lake portion of this project:

### Water Quality Concerns

Burden Lake is directly in line with the prevailing winds from the proposed site for the NED compressor station in the Town of Nassau. Given the topography of the immediate area, emissions from the compressor station are frequently going to be directed over the lake. When unfavorable meteorological conditions exist, both wet and dry pollutants from the compressor station are going to fall-out into Burden Lake. I am concerned about the adverse impact the compressor station will have on water quality and aquatic habitat in Burden Lake. FERC should undertake all necessary meteorological and air quality modeling studies to determine potential impacts and must identify how they will require Kinder-Morgan to take appropriate steps to prevent negative water quality and aquatic habitat impacts from occurring in Burden Lake and the Valatiekill and their its surrounding watersheds.

The proposed route of the NED through the Town of Nassau will impact many headwater streams and wetland areas of the Valatiekill and the Tsatsawassa Creek. Both of these streams are protected C(t) streams. In the most recent rule changes to the Clean Water Act the EPA and the US Army COE have indicated that they intend to extend protection to the headwater segments of protected streams. The proposed route of the NED will also cross over a major unconsolidated aquifer in the Town of Nassau and Stephentown. The aquifer roughly follows the Tsatsawassa Creek as it meanders through Dunham Hollow, both above and below State Route 43. This aquifer and its re-charge zones provides the water supply for many homes in the Town of Nassau and the Village of East Nassau. Protection of this aquifer is critical to the Town and is afforded such protection in Town law. FERC should consult with and seek in-put from the Town of Nassau and the Town of Stephentown on the proposed route of the NED on the Rensselaer Plateau as it relates to impacts on streams, wetlands and groundwater quality and quantity. FERC should address this issue in the EIS they are preparing and delineate how these headwater streams, wetlands and groundwater aquifers will be afforded protection both during the initial construction and post construction phase.

### Habitat Bio-diversity Concerns

New York State has identified the Rensselaer Plateau as an important area for protection due to its diversity and bird breeding features and the Audubon Society has designated the Rensselaer Forest Tract as an important bird breeding area. The Audubon Society specifically sites the high diversity and abundance of forest breeders on the Plateau, including many at-risk species. Many birds are experiencing declining population numbers in the Northeast due in part to loss of large blocks of forest. The Plateau has also been the focus of conservation efforts by the Rensselaer Land Trust and The Nature Conservancy. I am concerned about the impact the pipeline and its supporting infrastructure will have on breeding bird populations in the Rensselaer Plateau area as well as the areas surrounding Burden Lake and the Valatiekill watersheds. FERC should consult with and seek input from the NYS Chapter of the Audubon Society, the Rensselaer Land Trust and the NY Chapter of the Nature Conservancy on the impact the proposed NED project would have on the Rensselaer Plateau and the areas surrounding the Burden Lake and Valatiekill watersheds

Burden Lake is a stop-over and nesting sight for migrating water fowl. I am concerned that the noise and light pollution from the proposed compressor station will have a significant, negative impact on the migrating and nesting waterfowl populations. FERC must identify how it will mitigate the impact of noise and light pollution of the proposed compressor station on migrating and nesting waterfowl on Burden Lake and surrounding wetland areas.

Burden Lake, in recent years, has been a feeding site of a bald eagle population. Bald eagle nesting sites are potentially located within the watershed area. I am concerned that the noise and light pollution from the

proposed compressor station will have a significant, negative impact on the bald eagle population within the Burden Lake watershed area. FERC must identify how it will mitigate the impact of noise and light pollution of the proposed compressor station on the bald eagle population found in the Burden Lake watershed area.

## **20150810-5007**

Terry Nord, Rensselaer, NY.

Please address the following in the EIS as related to the Town of Nassau-Burden Lake portion of this project.

PFERC must identify how it will mitigate the impact of noise and light pollution of the proposed compressor station on the bald eagle population found in the Burden Lake watershed area.

The Nassau Town Board recently requested that the Town's Natural Resources Committee (NRC) prepare a report of the potential natural resource impacts that a proposed natural gas pipeline would have. The report was completed and submitted to the Town Board in May, 2015. It compares and contrasts the air, water, noise, cultural, archeological, historic preservation, visual, aesthetic impacts of two proposed routes for the NED within the Town. This report can be viewed at the Town of Nassau web site: [townofnassau.org/contents/Boards/View/6](http://townofnassau.org/contents/Boards/View/6) . Included in this report is a detailed habitat and bio-diversity report that was conducted by Dr. David Hunt, one of the State's pre-eminent authorities on bio-diversity. The report enumerates the likely impacts on the ecosystem of the Plateau from the NED, even with various mitigation efforts. The area of the Plateau that the NED proposes to cross is referred to as the Pikes Hill Block. This area has been identified as one of the 14 highest priority ecosystem sites within the Rensselaer Plateau due to the block's rocky summit/slope complex. It has associated high quality examples of State and county-rare natural communities including cliff, talus and rocky summit, and several county-rare plant species characteristic of these communities. Pikes Hill has 7 county-rare plant species, 3 of which are "actively tracked". Pikes Hill Block is one of 35 relatively large and important areas within the plateau without roads bisecting it. It is about 1,500 acres in size, with about 1,200 acres of contiguous forest centrally located within it. This un-fragmented forest provides habitat for forest interior species and large mammals, as well as state significant plant communities and concentrations of rare plants. FERC should review the Town of Nassau NRC May, 2015 report found at web site: [townofnassau.org/contents/Boards/View/6](http://townofnassau.org/contents/Boards/View/6) and the accompanying report by Dr. David Hunt entitled "Important Biodiversity Sites Along the Proposed Kinder-Morgan Pipeline" and address how it will mitigate the numerous potential impacts identified within the report.

### Land Use, Recreation and Aesthetics

The current proposed NED pipeline route will cut across the Rensselaer Plateau, one of the most unique geologic and bio-diverse areas in Rensselaer County and the New York State. The ecological distinctiveness of the Rensselaer Plateau has led it to be given priority project status in New York State's 1998 and all subsequent Open Space Conservation Plans and includes the fifth largest un-fragmented forest in New York. The boundaries of the Rensselaer Plateau can be viewed on the website <http://www.rensselearplateau.org/> . FERC should consult with and seek input from both the NYSDEC Division of Lands and Forests as well as the NYS Office of Parks, Recreation and Historic Preservation on the impact the proposed NED project would have on the Plateau as it relates to the goals and objectives of the Open Space Conservation Plan.

The U.S. Department of Agriculture's (USDA) Forest Service has designated the Rensselaer Plateau as a Forest Legacy Area. The USDA has awarded a \$5.5 million grant to the NYSDEC to work with the Rensselaer Plateau Alliance to create a program designed to protect forest lands from conversion to non-forest uses. This program will assist landowners within the Plateau through financial incentives designed to ensure that property remains dedicated to traditional forest uses, including logging, hunting, trapping, snowmobiling and open space. FERC should consult with and seek in-put from the USDA, Forest Service on the impacts of the proposed route of the NED on the Rensselaer Plateau.

The current proposed route of the NED through the Town of Nassau will impact many headwater streams

and wetland areas of the Valatiekill and the Tsatsawassa Creek. Both of these streams are protected C(t) streams. In the most recent rule changes to the Clean Water Act the EPA and the US Army COE have indicated that they intend to extend protection to the headwater segments of protected streams. The proposed northern route of the NED will also cross over a major unconsolidated aquifer in the Town of Nassau and Stephentown. The aquifer roughly follows the Tsatsawassa Creek as it meanders through Dunham Hollow, both above and below State Route 43. This aquifer and its re-charge zones provides the water supply for many homes in the Town of Nassau and the Village of East Nassau. Protection of this aquifer is critical to the Town and is afford such protection in Town law. FERC should consult with and seek in-put from the Town of Nassau and the Town of Stephentown on the proposed route of the NED on the Rensselaer Plateau as it relates to impacts on streams, wetlands and groundwater quality and quantity. FERC should address this issue in the EIS they are preparing and delineate how these headwater streams, wetlands and groundwater aquifers will be afforded protection both during the initial construction and post construction phase.

## **20150810-5008**

Terry Nord, Rensselaer, NY.

Please address the following concerns in your EIS statement particularly as it relates to theTown of Nassau-Burden Lake portion of the project.

The REnsselaer Plateau supports several unique wetland communities (including sedge meadow, dwarf shrub bog, spruce-fir swamp, and kettle hole bog), an impressive mammal diversity not typical of the greater Capital District (including black bear, fisher, otter, bobcat, and moose), and is included on National Audubon Society's list of Important Bird Areas in New York, which specifically mentions a high diversity and abundance of forest breeders, including many State listed species. Protecting this area would not only serve to secure these significant features, but would also contribute to a long-term vision shared by a number of organizations to establish an open space corridor and trail system across the Plateau, connecting Dyken Pond Center to Grafton Lakes State Park, Pittstown State Forest, Capital District Wildlife Management Area, Dickinson Hill Fire Tower, and other recreation and environmental education facilities. FERC should consult with and seek in-put from the managers of Dyken Pond Center, Grafton Lakes State Park, Pittstown State Forest, Capital District Wildlife Management Area, and Dickinson Hill Fire Tower on the impacts of the proposed route of the NED on the Rensselaer Plateau.

### **Air Quality and Noise Pollution Concerns**

Thousands of residents of Burden Lake and surrounding community (Including Glass, Crystal, Crooked Lake) residents are directly in line with the prevailing winds from the proposed site for the NED compressor station in the Town of Nassau. Emissions from the gas-fired turbines, periodic planned and unplanned pipeline releases and blow-downs will negatively impact the air quality for everyone in the immediate area of the compressor station. As part of a New York air permit application, dispersion modeling must show compliance with Annual Guideline Concentrations (AGC) and Short-Term Guideline Concentrations (SGC) air concentration limits for Hazardous Air Pollutants (HAPs).FERC should undertake all necessary meteorological and air quality modeling studies to determine potential air quality impacts and must identify how they will require Kinder-Morgan to full meet annual and short-term air concentration emission limits.

The proposed compressor station located within the Town of Nassau on Clarks Chapel Rd. will have at least two gas-fired turbines, sized at 41,000hp. Potentially additional turbines would be added, if Kinder-Morgan expands the project as stated in their most recent submission to FERC. These gas fired turbines will generate a significant amount of noise, every minute of every day of the year. Periodically, extremely loud releases of venting gas will occur to equalize or reduce pressure in the pipeline. This industrial compressor station is incompatible with the rural residential setting of the surrounding community. I am extremely concerned with the potential for constant, loud noise from the compressor station and its potential impact on mental and physical health, property values and habitat impacts. The FERC must follow the NYSDEC guidelines on noise impacts and "evaluate the potential for adverse impacts of sound generated to residences outside of the property." The NYSDEC requires measurement of ambient sound levels at adjacent residential parcels,

and states that in a non-industrial setting, such as the residences surrounding the compressor station in the Town of Nassau, that the new sound level should not exceed the ambient level by more than 6 dBA at the receptor.

I am deeply concerned about the potential short and long term health impacts posed by the proposed Kinder-Morgan NED compressor station in the Town of Nassau on Clarks Chapel Rd. The Medical Society of the State of New York (MSSNY) and the American Medical Association (AMA) both are on record as raising significant issues of concern about the human health risks that compressor stations and other gas pipeline infrastructure poses to individuals in areas immediately around these sites. FERC should review the positions taken by the MSSNY and the AMA and the resolutions that they passed. FERC should take the issues that they've raised in these resolutions and look to mitigate these concerns in the location, design and operation of this proposed compressor stations along with all other compressor stations proposed along the NED project.

#### **20150810-5009**

Peggy Huard, Hudson, NH.

Kinder Morgan, we the people of the State of New Hampshire do hereby put you on notice. You can not and will not put your pipeline through or any where near, above, below or around out drinking water supplies!

Any FEDERAL law that you feel gives you the privilege of overriding and/or ignoring the most important local and state laws in place to protect our precious sources of water, especially drinking water, as well as our air, has in fact been passed criminally and negligently by lawmakers. Therefore, these FEDERAL laws that you feel give you the privilege to ignore our environmental laws are NULL and VOID, making our local and state environmental laws the highest in hierarchy of competing laws.

Kinder Morgan, if you, your subsidiaries, your employees or subcontractors or anyone else associated with you, should so much as trespass on, around, through, near, above, below or around our drinking water, you WILL be prosecuted to the highest extent our local and state laws allow!!

#### **20150810-5010**

Representative Charlene Takesian, Pelham, NH.

I am a New Hampshire State Representative representing District 37 of Hillsborough County which includes the Towns of Pelham and Hudson, and a resident of the town of Pelham. I am submitting this letter on behalf of myself and my constituents.

This project is a major impact to the Town of Pelham with absolutely no benefit to its residents. It goes through conservation districts, watershed and aquifer districts and more importantly right through backyards of residential homes. Pelham is probably the most impacted Town on the route of this pipeline. We are not complaining with the "not in my backyard" attitude. We already have a pipeline running right through our Town, which includes in between school buildings and right through Parks & Recreation areas. And, by the way, no house in Pelham has or will have access to the existing pipeline or to the proposed pipeline. There is no natural gas fuel offered to any house or business in Pelham.

What should be considered is the impact this project will have on the budgets of the Towns affected. In New Hampshire, our tax structure is such that we rely heavily on local property taxes to fund our local Fire and Police departments. We get little or no money from the State, unlike most of the other States. The State has limited resources and funds continue to dwindle as ever demanding needs of the State budget lessens the amount of money it can share with the cities and towns of New Hampshire. Having said that, we are all wondering how we will get the additional resources that we need in order to be able to respond to a pipeline emergency. Most of the Towns along the route have volunteer on-call fire departments or minimal personnel at the Station. We do not have the money to be able to purchase new equipment or add additional fire and rescue personnel to our already strained departments.

Also, most Towns along the route do not have a municipal water system, meaning that there are no fire hy-

drants in the Town. In an emergency, the fire department responds with a pumper truck filled with water and when that water runs out, the truck leaves the scene to refill the truck.

Most Towns along the route do not have a hospital or medical emergency facilities in the Town and injured people have to be transported miles to receive treatment.

I hope that you will please consider how many homes and families will be affected by the construction of this pipeline before giving them permission to ruin the beauty and disrupt the lives of so many residents of New Hampshire.

## **20150810-5011**

Representative Charlene Takesian, Pelham, NH.

The following are questions I would like answers to, made public before any formal decisions regarding the precedent agreement between Liberty Utilities and Tennessee Gas Pipeline are finalized:

I would like to know the size of the existing pipelines of the Tennessee Gas Pipeline system through Massachusetts. Are these pipeline already carrying natural gas from the Marcellus shale to the New England region?

Where on the Concord Lateral pipeline system in New Hampshire are “bottlenecks” occurring? I would like these areas delineated on a detailed map of the entire Concord Lateral pipeline network beginning in Dracut, MA with all of its accompanying laterals and distribution lines. The map must be current as of 2015 and show all of the most recent area development alongside the Concord Lateral.

Nashua, New Hampshire has 25, 276 residential natural gas customers and 2, 497 commercial natural gas customers (numbers from Nashua Regional Planning Commission website). The existing lateral line that services Nashua, New Hampshire is 8-inches in diameter. I suspect this might be one of the “bottlenecks.” Is that assumption correct? Is the Nashua Lateral, off the Concord Lateral considered a “bottleneck?” Would that “bottleneck” be fixed if the 8-inch pipeline were upgraded to a 12-inch or even a 14-inch pipeline? Kinder Morgan representatives have told residents in Hudson, Pelham, Londonderry and Windham that the Concord Lateral easement has been built up against too much to allow any expansion. Is that true? Is that true for the Nashua lateral running through the town of Hudson, New Hampshire? Is that true for the existing Tennessee Gas Pipeline transmission main lines through Massachusetts?

If there is a smaller-cost solution to remedy a situation for price spikes which occur literally only a few days out of the entire year, is the Federal Energy Regulatory Commission the regulatory body that oversees bringing the people the smallest cost alternative? Is the Public Utilities Commission the state regulatory body responsible for ensuring the smallest cost alternative for the people? Have either of these agencies asked Kinder Morgan / Tennessee Gas Pipeline where the Nashua plan for the Northeast Energy Direct pipeline has gone and why? To be clear I am not recommending routing through Hollis, NH again. I am merely pointing out that plans for reaching Nashua and all points out from Nashua are seemingly missing from the preferred proposal being set forth by Kinder Morgan. In missing that, we are having difficulty with understanding how, regardless of whether the Liberty Utilities docket DG 14-380 is approved or denied at the PUC, service to these areas will be “made more reliable.”

Incremental upgrades, such as a replacement of 8-inch pipe with 12-inch, should be made to the pipeline systems already in place in New Hampshire and Massachusetts before the multi-billion-dollar construction of a new and very large transmission pipeline. How will a new and very large pipeline remedy price spikes if it will do nothing to correct “bottleneck” points on the existing pipeline system? When the Northeast Energy Direct project was to be routed in Massachusetts, there was a new Nashua lateral proposed. It was the only piece of the Northeast Energy Direct pipeline system that poked up into our state. Now that such a large portion of the Northeast Energy Direct has come north of the state border I can’t help but notice the proposed Nashua lateral has disappeared. We would like a descriptive explanation about how the Northeast Energy Direct project as it stands now, is planning on getting more of the gas to Nashua. Is that still a priority?

Are there concrete plans for Liberty Utilities customer expansion at this time? I have read that a mile of new distribution pipelines costs about \$1 million. Is that figure accurate? Kinder Morgan has told Pelham, New Hampshire that Liberty Utilities is planning on servicing our town, that Liberty Utilities has told Kinder Morgan very clearly that Pelham is on their radar and that they are taking action to serve our town already. Is that statement accurate? (made by Curtis Cole at our March 26 Pelham Town Hall meeting) Is natural gas distribution for home heating feasible for small towns zoned for one-acre lots?

We keep hearing from Kinder Morgan representatives that their project is in response to “demand.” With 27, 773 natural gas customers in Nashua, does that city constitute a large piece to what Kinder Morgan is calling a “demand?” Of the towns represented by the Nashua Regional Planning Commission, Hudson, New Hampshire is the second largest for natural gas customers with a total residential and commercial customers combined of 5, 218. Is Hudson, New Hampshire also fed off of that 8-inch existing Nashua lateral? Is Merrimack, New Hampshire with 3,742 natural gas customers fed off of that 8-inch existing Nashua lateral? BAE Systems is located in Hudson, Merrimack and Nashua. BAE has been specifically sited by Kinder Morgan in their Town Hall informational meetings as part of the region’s “demand” for natural gas. Would BAE Systems also be fed off of that 8-inch existing Nashua lateral? In addition to Hudson, Merrimack and Nashua, there are 534 natural gas customers in Amherst, 29 natural gas customers in Hollis, 116 natural gas customers in Litchfield, and 1,025 natural gas customers in Milford. Are all of those 38,437 customers fed from the existing 8-inch Nashua lateral?

## **20150810-5012**

Representative Charlene Takesian, Pelham, NH.

I would like to see a very detailed and up to date map issued for the Concord Lateral and its accompanying distribution lines; a comprehensive map of the Concord Lateral in its entirety with the capability to zoom in to see all of the houses and structures along the way. I would also like a compiled package of every PUC and FERC filing and ruling regarding every upgrade made on the Concord Lateral pipeline system over its lifetime to date to be made public within this docket DG 14-380. In 2008 Pelham, New Hampshire became the site for compressor station 270B. I would like to know why this compressor station is “rarely in use” as we have been told at numerous town hall meetings with Kinder Morgan. Is the Concord Lateral pipeline system being fully utilized? This is a question that must be examined before new agreements are made that will lead to construction of a new and expensive pipeline through our state. Where are the storage facilities along the Concord Lateral pipeline system? Are the storage facilities being fully utilized? Would another storage facility in New Hampshire (sited near Granite Ridge natural-gas fired power plant in Londonderry, for example) be a more cost-effective solution to the winter-reliability of energy in New Hampshire than a multi-billion-dollar pipeline construct would be?

For the sake of transparency, we must all in New Hampshire understand this Concord Lateral pipeline system’s deficiencies before we can decide the level of investment we should make into expanding natural gas infrastructure in our state. Or should we instead be making appropriately sized upgrades to the Concord Lateral for winter-reliability? For this reason, I am hoping that my request for answers to all of my questions and detailed maps are presented and made public within this docket PF14-22-000, preferably with a chance for cross-examination by the PUC staff, OCA, and PLAN NE attorney, for accuracy.

Thank you for your consideration,

Representative Charlene F Takesian  
114 Jeremy Hill Rd.  
Pelham, NH 03076  
603-635-7215

**20150810-5014**

Amy Glowacki, Mason, NH.

Slow down this process. Why is there a rush to approve the proposed NED pipeline? A project of this magnitude with so little public stakeholder support (less than 23% survey permission on the Market Path in NH) that will ultimately take private and public conservation land by eminent domain for a private for profit project demands further review that addresses specific questions of water quality, water supply, Conservation Land protection and public benefit and need. New England may need more energy. However, New Hampshire, being a net exporter of electricity, does not.

What New Hampshire does not need is the over-sized multi-billion dollar natural gas pipeline proposed by Kinder Morgan, a project that could cause over-dependence on distant and limited energy sources for electric generation, risk the security of NH's energy supply and energy future by diverting investment to ill-advised short-term plans, and significantly degrade the quality of our state's natural environment and endanger the water supply.

We've asked for more scoping sessions in larger venues that can hold all who wish to participate and more time for review. Slow this process down. Too much is at stake to rush this. Listen to those affected - there are reasons we protest the project and we only get one chance to get this right.

Debra Austin, Averill Park, NY.

August 8, 2015

Regarding: Northeast Energy Direct Docket #PF14-22

Subject: FERC Filing #1, Request to Restart Scoping Period

I would like to request that FERC restart the scoping period for the proposed Nassau, NY Compressor Station with regard to the above. As you are aware, Kinder Morgan recently submitted an entirely new 6,571 page Resource Report four days prior to the MA & NH Scoping meetings for a different sized project than was initially submitted, rendering any comments from PA & NY irrelevant. I would request that the scoping process be restarted, the current August 31, 2015 date deemed null and void and that a new Notice of Intent be issued, in order to give citizens the opportunity to review the new report and respond accordingly.

I only recently found out about the proposed Nassau, NY Compressor Station and NED Pipeline Project. It has a great impact on people in our community and people elsewhere along the proposed pipeline. It adversely affects our health, lifestyle, wildlife, property values, well being, and the list goes on....! Surely, more consideration for citizen input for a project of this magnitude, which would take people's property by Eminent Domain and offers the people of NY and NH no benefit, is deserved.

This request has also been made via phone calls to:

Governor Andrew M. Cuomo

Senator Kirsten Gillibrand

Senator Charles Schumer

Congressman Chris Gibson

I have also requested they support the citizens they represent, in getting the NYS Department of Environmental Conservation involved immediately!

FERC Filing #2 is to follow...

**20150810-5016**

evelyn taylor, new ipswich, NH.

How would people escape from a fire or explosion? Our homes are in wooded areas with few escape routes. Why hasn't Tennessee Gas or Kinder Morgan discussed safety, evacuation and protective measures? Where is the plan? We need to see a plan before this project can go forward.

**20150810-5017**

evelyn taylor, new ipswich, NH.

Our existing electric grid is supported by wooden posts. If a fire occurs along the power line corridor these posts will burn and cause a massive failure that will complicate response, evacuation and containment activities. What is the plan to protect us from this increased risk?

**20150810-5018**

evelyn taylor, new ipswich, NH.

A very large compressor station is expected in New Ipswich, NH.

If a fire ensues, the electric grid is supported by wooden posts. The grid is sure to come down. Live wires would start more fires. How will Kinder Morgan control such massive fire spread?

**20150810-5019**

Evelyn Taylor, New Ipswich, NH.

Kinder Morgan had another pipe failure in Falfurrias Texas on Aug 3. Richard Wheatley commented that ruptures are often accompanied by a loud boom and a "concussion effect". Concussions can cause permanent brain damage and death. Kinder Morgan has not disclosed the hazards, especially to those in the 1/2 mile radius of the compressor station. You need to make Kinder Morgan expose all toxins and other hazards as how else can we receive accurate and rapid treatment from injuries if health care providers are unaware of the hazards?

**20150810-5020**

evelyn taylor, new ipswich, NH.

How is Kinder Morgan training health providers? We are not safe if they can not recognize the effects of each hazard to properly diagnose and treat us. Who pays the cost of our diagnosis and treatment? We may end up having more tests than are needed or incorrect treatments. All this confusion can cause additional illness or delays or death. We need to see Kinder Morgan's plan and compensation arrangements before you approve this pipeline.

**20150810-5021**

evelyn taylor, new ipswich, NH.

At the Milford, NH, scoping session on July 30 we were told over 3,000 comments had been received. We know we have submitted more than that. We asked for a clarification and were told that is ecomments. How many comments in total has FERC recognized? How about all our postcards? Have these been counted or have they been ignored or discarded? How about other paper mail receipts? We want FERC to prove they have counted and are tracking and considering all comments no matter how they were received. We want numbers from the FERC for this docket PF14-22 for the NED /Kinder Morgan/Tennessee Gas pipeline project. We also want to know how the counts are segmented - is it by state, by town? We know this project has far more than comments than the numbers given to us by the FERC

**20150810-5022**

evelyn taylor, New ipswich, NH.

We had originally been told by Kinder Morgan that the project was to use a 36 inch diameter pipe and the compressor station would be 80,000-90,000 hp. Now, the compressor station is half the size and the pipe is also reduced in size. So what happened to this essential need for so much capacity and power to serve the growing demand in the northeast United States? This is a plan intended to deceive.

A statement from the June 4 letter to those within a 1/2 mile from the compressor station, says the pipeline is to serve the growing demand for interstate natural gas transmission in the northeast and New England, it

does not say it is to serve the growing demand for interstate natural gas use. In other words the need is to transmit this gas through the northeast region and then outside of the United States as quickly as possible to capture greater overseas profits.

- This is clearly proof this is a project of greed, not a project of need.
- This is clearly proof of abuse of power to use eminent domain as there is no public need; this is a Kinder Morgan need and they will stop at nothing to make it happen.
- This is clearly proof of an irresponsible and reprehensible attack on the public and private spaces, the environment, the ecosystems and the people of New Hampshire. It is a catastrophe in the making for which Kinder Morgan has no ability to avoid or restore once destroyed. If the FERC approves this pipeline, it is clearly proof the FERC is not independent at all and that they are incapable of finding the truth about pipeline project submissions.

### **20150810-5023**

evelyn taylor, new ipswich, NH.

Where does Kinder Morgan expect to get the water for the compressor station in New Ipswich? I live in the 1/2 mile radius of the compressor station and when 2 new houses were built across the street from my home my well dropped 20 feet. The compressor station is going to surely destroy the water supplies to our home and it may be that the compressor station won't have sufficient water, either. How can Kinder Morgan know they will have sufficient water? The FERC should not approve the pipeline without Kinder Morgan showing unquestionable evidence that they can serve their water needs without destroying ours. It is not just for ANY REASON to turn our town into a community of homes with tanks of water as our only supply. This has happened and will happen again if the FERC approves this pipeline. What is wrong with the FERC to support such outcomes? The FERC must finally step up and say no to the mounds of evidence how destructive this project will be. The toxins will invade our aquifers and we will be the largest superfund site ever imagined. These toxins can flow downhill into water supplies that provide life to thousands of people. How much more does the FERC need to wake up to the dangers here?

### **20150810-5024**

evelyn taylor, New Ipswich, NH.

FERC must prove the public need. There is none, so I can't wait to see what FERC does.

### **20150810-5025**

Susan Williams, New Ipswich, NH.

On your own website, you have laid out the EIS Pre-Filing Environmental Review Process, which begins with receipt of the applicants request for a review of its project, moves through formal approval of the pre-filing process and issuance of a docket number. The next step in the process is given as "Participates in Applicant's Open House," then it proceeds to a scoping meeting(s).

Recently, Tennessee Gas announced additional public open houses for the proposed NED Pipeline in New Hampshire, scheduled between September 9-17 in five different towns. This would seem to constitute a RESET of the process, correct?

Respectfully submitted,

Dr. Susan Williams  
New Ipswich, NH

### **20150810-5029**

evelyn taylor, New Ipswich, NH.

Kinder Morgan has not considered health needs of those within the 1/2 mile radius of the proposed compres-

sor station in New Ipswich, NH. The construction and operation of the compressor station may impose death on these individuals. The FERC should not proceed to approve the pipeline until the negative health aspects of this pipeline project are fully disclosed to the public and health care providers so we can assess how to prevent harm or premature death of those living or working or spending significant time at least 2 miles from the pipeline construction or operation. A 1/2 mile is an incineration zone whereby no matter what a person's health, they are apt to be harmed or perish should an accident occur. To grant permission without that information and time to study is irresponsible and an act of neglect. We cannot continue to allow human abuses for projects that are purely for profit of a private entity.

**20150810-5031**

Sean Radcliffe, Temple, NH.

8/9/2015

I live within 1/2 mile from the proposed New Ipswich compressor station associated with the NED export pipeline. I am a runner and frequently run by the exact location of the proposed compressor station. Running involves breathing air deeply into your lungs. Any contaminations in air will have a magnified effect on runners. I once ran along a few miles of a New Jersey highway. After running a few miles, the carbon monoxide made my lungs feel like they were half their size. I began wheezing. After I was away from the highway a few miles, my lungs seemed to return to normal.

The health impacts reported by community members living 50 feet to 2 miles from compressor stations and gas metering stations along gas transmission pipelines is alarming: 61% of Health Impacts Associated with Chemicals present in Excess of Short and Long Term Effects Screening Levels in the air.

The symptoms reported are:

- Nasal Irritation
- Throat Irritation
- Eyes Burning
- Frequent Nausea
- Allergies
- Sinus Problems
- Bronchitis\*
- Persistent Cough
- Chronic Eye Irritation
- Shortness of Breath
- Increased Fatigue
- Muscle Aches & Pains
- Severe Headaches
- Frequent Nose Bleeds
- Sleep Disturbances
- Joint Pain
- Difficulty in Concentrating
- Nervous System Impacts
- Irregular/Rapid Heart Beat\*
- Strokes
- Dizziness\*
- Forgetfulness
- Easy Bruising

Please make the Compressor station safe for runners who live in the shadow of the compressor station.

Why can't the compressor station capture the blow down gases?

Why can't the compressor station be electric powered (eliminating the combustion exhaust and toxins)?

If people cannot stay healthy around compressor stations, why are they allowed?

Sean Radcliffe

Temple, NH 03084

August 8, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

Washington, DC 20426

Re: Dissemination of deceptive information by Tennessee Gas Pipeline (PF14-22-000)

Dear Secretary Bose,

I am writing to urge that FERC immediately sanction Tennessee Gas Pipeline, a Kinder Morgan (KM) company, for their dissemination of deceptive information in the matter of PF14-22-000. Further, I ask that FERC order KM to correct that improper information via new mailings overseen by FERC, and to delay any further action in PF14-22-000 for a period of one year while consumers assimilate and comment upon the corrected information.

Specifically, on or about August 7, 2015, I received a glossy mailing from KM stating, in part, that "North-east Energy Direct (NED) is designed...to help alleviate the high costs of electricity and natural gas in New England..." However, it is my understanding that KM has refused to rule out the export of natural gas to fungible global markets via NED. Utilizing FERC's own June 2015 data, indicating the dramatic disparity in price between the currently "locked" U.S. market and global markets, the export of gas via NED could increase the cost to New Englanders by 300-400%.

Thus, until and unless KM issues a legally-binding pledge to disavow the export of gas via NED, I urge FERC to intervene in KM's deceptive public relations campaign in the manner suggested above. Instead of KM being allowed to proffer deceptive "puff" public relations literature, the public should be informed about how this pipeline could drive prices upward and wreak havoc upon the New England economy and the jobs we depend upon. I am doubtful that any resident would support this project, and the taking of private land by eminent domain, for a purpose that could prove to be so harmful to our communities and employers.

Thank you for your consideration.

Sincerely,

Jon L. Bryan

Mason, NH 03048-4803

Tennessee Gas Pipeline

Company, L.L.C.

a Kinder Morgan company

NORTHEAST ENERGY DIRECT NEWSLETTER

August 2015

*{note: poor quality OCR at FERC}*

The Northeast Energy Direct Project (NED) is designed to supply natural gas—a critical energy resource—to help alleviate the high costs of electricity and natural gas in the West and Midwest caused by the limited natural gas transportation capacity in the region. AIED will be an extension of the Kinder Morgan's Tennessee Gas Pipeline (ITGPI) which has safely delivered natural gas to the West for more than 50 years.

The project is currently in the pre-filing process with the federal Energy Regulatory Commission (FERC), which includes conducting surveys to gather information about the proposed route of the pipeline, and provides Tennessee the opportunity to interact with landowners and stakeholders.

#### WHAT IS INVOLVED WITH A PIPELINE SURVEY, AND DOES MY GIVING PERMISSION TO SURVEY ME IF I AM GIVING PERMISSION TO BUILD THE PIPELINE ON MY PROPERTY?

Survey crews will be identifying property boundaries, distances to surface features and other underground utilities, and fine-tuning the route and construction workspace requirements.

Additionally, survey crews will be revising the route for any environmental or culturally sensitive resources. The crews will be hand-digging small holes during their survey efforts, as required by the various regulatory agencies, to help identify sensitive environmental resources. All holes will be backfilled immediately upon completion of the survey.

Granting of survey permission does NOT grant permission to build the pipeline on your property. If the project moves forward and receives regulatory approval, separate negotiations will occur with TGP right-of-way staff in order to secure an easement on a landowner's property allowing for construction of the pipeline.

#### WHAT IS THE SURVEY PROCESS FOR THE NORTHEAST ENERGY DIRECT PROJECT?

During the survey process, TGP collects information on the following:

- ~ Environmental resources i.e., archaeological, water bodies, threatened and endangered species)
- ~ Location of any dwelling or homestead in proximity to TGP's proposed work area
- ~ Location of any wells and Septic systems in proximity to TGP's proposed work area,
- ~ Location of unique features, topography, and sensitive areas that are specific to individual landowners' properties
- ~ Location of potential access routes to the permanent easement, or right-of-way and the proposed construction work area
- ~ Landowners' specific concerns regarding construction on their property
- ~ Potential construction techniques specific to each property

The information gathered during the surveys will be used by TGP when determining temporary construction and permanent operational impacts to individual properties. The impacted areas identified during the surveys will be shared with the landowners for their comments. It will also be used to determine the design criteria that should be implemented to minimize the impacts of the project, and will be provided for consideration to FERC and other federal and state regulatory agencies as part of the certificate application and permitting process.

#### WHAT IS THE BENEFIT OF COMPLETING THESE INITIAL CIVIL AND ENVIRONMENTAL SURVEYS? WHY IS IT BENEFICIAL FOR LANDOWNERS TO ALLOW SURVEY OF THEIR PROPERTY?

The pre-filing process provides TGP the opportunity to interact with landowners and other stakeholders, and allows FERC and other regulatory agencies to receive feedback on the proposed project scope. TGP's participation in the pre-filing process began in September 2014 and will end when TGP files its application for a certificate of public convenience and necessity from FERC, which is anticipated to be in the fourth quarter of 2014.

Among other benefits, such as gathering comments from interested landowners, government officials, regulatory and other affected stakeholders, FERC's pre-filing process gives TGP time to address issues that are

identified during the surveys performed on properties. When survey access is denied by landowners, TGP has limited ability to identify and review features that have unique qualities or present sensitive issues on properties and develop avoidance, minimization or mitigation measures for those features.

The pre-filing stage of the NEO Project is the appropriate time to determine impacts and issues and work to resolve them. Without the benefit of the survey data from each property, TGP will continue to pursue its currently proposed alignment for the NEO Project. In the process of identifying and reviewing unique landowner issues and concerns regarding special features and resources, as well as construction techniques that may be available to address those particular landowner issues and concerns will be delayed. TGP's ability to make changes to the proposed alignment in order to avoid, minimize or mitigate landowner concerns decreases as the NED Project matures.

#### 20150810-5043

Nancy Woodward, Fitzwilliam, NH.

For too long, decisions related to energy have been unduly influenced by corporations and individuals motivated by financial and political interests rather than by the public good.

This project is more of the same. The prospective benefit to the fossil fuel industry is clear, but the alleged public need has not been demonstrated.

Thank you.

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street, N.E.

Washington, DC 20426

RE: Tennessee Gas Pipeline Company, L.L.C.: Federal Energy Regulatory Commission  
("Commission") Docket No. PF14-22-000

Dear Secretary Bose,

The Conservation Commission for the Town of Merrimack New Hampshire; a properly established Conservation Commission in accordance with New Hampshire State Law RSA 36-4, appreciates the opportunity to submit these scoping comments in conjunction with the pre-filing phase of the Tennessee Gas Pipeline Company's (TGP) proposed Northeast Energy Direct pipeline ("NED Project"), Docket No. PF14-22.

The Conservation Commission already commented (accepted March 18, 2015 - 20150318-5072) on the need and appropriateness of placing a pipeline as proposed in our managed and owned conservation properties so I will not duplicate those comments at this time.

These comments today are in response to the guidance provided by your Commission in the June 30, 2015 Notice of Intent to Prepare an EIS for the planned NED project. Given the limited time to speak, my comments will highlight our concerns but will not be all-inclusive of our concerns. The Conservation Commis-

sion will be filing a more complete submittal in the near future.

I will now comment on each of the environmental impact headings:

### **Geology and Soils**

New Hampshire is known as “Granite State” and that is for good reason. Granite is very prevalent and found in all areas of our State. It lies on the surface and under the surface in most locations within our Town. There are significant granite formations within the proposed pipeline route. Those formations are not only picturesque but also contribute greatly to the hydrology of these properties. They form the underground channels and holding areas for the aquifers that provide more than 80% of the water needs of our community.

With this prevalence comes the burden of removal when a buried pipeline is being constructed. Typical methods are blasting, pulverizing, and digging. Each of these processes creates the opportunity for unintended consequences on the land, soils, water resources, vegetation, and wildlife nearby. The Town of Merrimack has developed ordinances to guide contractors during this type of activity. The Conservation Commission requests you stipulate TGP follows our ordinances and processes even if they appear more burdensome than State or Federal rules and regulations. The Town has local experience and has developed these ordinances to balance the environmental and health needs of our community with the needs of the business community. Our local experience and knowledge should not be underestimated and if nothing else, any other resident or commercial entity would be required to do the same. We are asking no more of TGP than we would require of any other business.

### **Water Resources and Wetlands**

As commented previously, Merrimack is nearly completely dependent on subsurface ground water through both private and large municipal wells. As this is a resource that cannot be easily replaced, protection of our underground water resources needs to be of the utmost concern. The Conservation Commission requests you stipulate to TGP that it must map, sample, and monitor all wells within the construction area and outside that area to a minimum distance of 1000 feet to be able to know if their activities have had any negative impact to these water resources. The sampling and monitoring should address both water quality and water quantity with baseline measurements done before activity starts. The results of the testing and subsequent monitoring should be independently confirmed and provided to the landowner of record.

Our conservation and other open space properties (both private and public) have ponds, streams, brooks, rivers, jurisdictional wetlands, and numerous vernal pools. The most elusive of these are the vernal pools. Vernal pools by nature appear and disappear every year. They provide life to some of the smallest wildlife in our Town. That wildlife then provides life to other species, including State rare and threatened species. Proper mapping of these vernal pools before construction is essential to assure the overall health of our properties and its inhabitants. This mapping should be done in different seasons leading up to construction to ensure all vernal pools are identified and cataloged. Once mapped, avoidance is the next request. Something often not considered is the avoidance of the trails, pathways, and connecting channels for these pools. If the connections are disturbed or blocked by the construction or the placement of a pipeline, the effectiveness and health of the vernal pools and wildlife dependent on them is of great concern. Vernal pools therefore cannot be viewed on an individual basis but must be considered, avoided, or properly mitigated when viewed as part of a larger ecosystem. The Conservation Commission requests that you stipulate TGP follows the New Hampshire Method (<http://nhmethod.org>) and all applicable State Laws and Merrimack ordinances when mapping all types of wetlands and makes that information fully available to the impacted landowners. Providing this information prior to construction will allow affected landowners to refute irregularities and educate both TGP and regulatory agencies associated with the project. This will help ensure potential wetland and vernal pool impacts are not missed in the process.

The proposed pipeline will have temporary and permanent wetland impacts within Merrimack and across the State. State Law (RSA 482-A) provides guidance on how these impacts should be mitigated and it is referred to as compensatory mitigation ([http://des.nh.gov/organization/divisions/water/w\\_etlAlr4sl'wmpA](http://des.nh.gov/organization/divisions/water/w_etlAlr4sl'wmpA)).

One aspect of that mitigation is a payment in-lieu doing physical protection or mitigation activities. This payment opportunity should be viewed as a last resort. The Conservation Commission requests that you stipulate TGP must act in good faith and make every reasonable effort to provide physical compensatory mitigation in each community where wetland impacts are made. The use of a payment should only be a last resort whose determination is solely allowed to proceed if the New Hampshire Department of Environmental Services has determined no mitigation project is possible in an impacted community.

### **Vegetation and Wildlife**

Merrimack's open space and conservation areas impacted by this pipeline are teeming with life of all types including plant, insect, amphibian, reptile, rodent, mammal, and human. We have professionally documented cases of NH rare and threatened species within the TGP study area for the proposed pipeline. This includes both plant and animal species. Some of this information has been found more recently and we are working with NH Fish and Game and NH Natural Heritage Bureau to have them be formally documented. Given these occurrences and their vicinity to the pipeline project" the Conservation Commission requests you stipulate TGP must do on-the-ground studies for rare and threatened species of both plants and wildlife and require them to avoid those areas where they are found and the general habitat areas where they live. Some of these species are mobile. They move and live in different habitat depending on the time of year, mating season, and for hibernation. Avoidance of these areas is crucial for their ongoing survival. This is one key reason why the Town of Merrimack has spent literally millions of dollars to preserve these open space areas.

The proposed pipeline project is intended to run adjacent to existing high voltage power lines. These power line corridors require vegetation maintenance which is likely similar to a natural gas pipeline. Eversource is our local power line company and they use mechanical methods to control vegetation along the route in our Town. They have been doing this work when the ground is frozen during what are normally the winter months. Doing this activity during the winter ensures most animal species are in hibernation or have migrated and are not likely directly harmed by the activity. They also avoid certain plant life if it has been identified as needing protection. The Conservation Commission requests that you stipulate TGP must only do mechanical vegetation control and that those activities only happen once the ground is frozen during the months of December through February. Also, that TGP work with each landowner to ensure rare or threatened species identified anytime during pipeline construction or operation are protected from any form of vegetation control.

### **Cultural Resources**

The Town of Merrimack was chartered before our great country came into being. It has a long history dating back to the 1600s. The proposed pipeline will inevitably cross or come into close contact with these historical treasures in our Town. Some of those treasures will be directly impacted if the proposed primary route is taken. This includes an historic roadway used by our Founding Fathers and original settlers who helped to incorporate, live within, and farm our community. Those homesteads, foundations, and roadways are precious to our Town and are currently protected by the Conservation and Heritage Commissions in our Town along with many private citizens. The Conservation Commission requests that you stipulate TGP maps all these treasures, avoids them once mapped and where avoidance is not possible, that best management practices for historical preservation be performed to ensure artifacts are not lost, removed from our Town, and not damaged. When an historical item is encountered anywhere along the construction route, we request you require the Town to be immediately notified and appropriate action be taken to preserve the item. We further request that historical artifacts found on properties that TGP may purchase as part of this project be offered free of charge to the prior property owners or the Town of Merrimack if those owners do not wish to have them.

### **Land Use, Recreation, and Visual Resources**

Many members of our Town and the surrounding communities utilize our conservation and open space ar-

eas. They are a treasure and are held in high regard. The Town of Merrimack has designated millions of dollars over the years to purchase and maintain these properties. We actively manage our parcels and have committees whose sole purpose is to manage them for all their intended uses. Wildlife, rock formations, flora and fauna only add to the visual appeal of our properties. Our open spaces have multi-use trails, fields, and support outdoor water recreation. Hunting, trapping and fishing is also deeply revered and an important part of our community as well as away to control certain animal species. A pipeline coming into our community will impact our way of life. The Conservation Commission requests that FERC reviews each of these activities, assesses the impact to them, and stipulates that TGP work with the Town and each landowner to minimize an interruption the pipeline may make as well as ensures that pipeline infrastructure is not located so as to impede these activities in our open spaces and conservation areas. Infrastructure items beyond the actual pipeline (metering stations, pig related items, blow off valves, etc.) often entail support roadways and other items. They should be specifically sited out of these open spaces and conservation areas to avoid interruption to the users and inhabitants and ensure the safety of the infrastructure.

### Socioeconomics

This is not an area where a Conservation Commission as defined by State Law would be active in. But it is something we do consider when making decisions. We feel our conservation properties and our oversight of water/aquifer projects within our Town certainly have a socioeconomic impact. We endeavor to ensure our properties add to the quality of life for our residents and businesses. Disruptions of these open spaces, visual interruptions, and the safety fears of people as they relate to a pipeline cannot be minimized. The Conservation Commission recognizes that State and Federal regulations may dictate certain signage, painting and marking schemes, etc. The Conservation Commission requests that you stipulate that TGP further adheres to our local ordinances for these types of things when they do not conflict with these other regulations. When local regulations add further precision, local ordinances should be adhered to and not be ignored because they add cost of any form or time.

### Air Quality and Noise

Air quality is a deep concern for the Conservation Commission. Blow-offs, venting, and other activities that allow gas to leave the transmission pipeline are both a fact of life and an area of concern. The gas that will flow through this pipeline is known as a green house gas and will likely contain many other gases that are part of how the gas is extracted from its initial source. Some are known to disturb and affect humans. Not to be missed is their impact on plant and animal species as well as when or if this gas becomes part of our wetlands or aquifers. The Conservation Commission realizes there are Federal regulations that dictate and mandate how air quality is measured and impacts should be mitigated. We do request that you stipulate TGP does not place potential gas emitters (valves, stations, outlets, etc.) within wetlands, near existing trails or commonly used areas by humans, or where if they were ignited could cause a significant loss of our forests and open spaces. It should not be lost on your Commission that our Town has only a limited public safety capability and a pipeline of this proposed size can cause significant damage before safety mechanisms react.

### Cumulative Impacts

The proposed pipeline is primarily being sited to run adjacent to the existing Eversource power lines. The power lines have already left a visual scar on our communities. Adding an adjacent scar on the landscape, will have a significant visual impact and will directly interfere with usability of both private and public property. Eversource likely has a long planned capital power line improvement plan. We are seeing evidence of this in one of our neighboring communities as Eversource is upgrading its own infrastructure. The Conservation Commission requests that FERC contact Eversource and review those long-term plans. We further request that where those plans may potentially, be in conflict with or along the same proposed route of the pipeline (and within the pipeline's intended operational life) that you consider those impacts when making your siting adjustment requests. Balancing these conflicts must be considered a part of your charter as you go through your approval process.

## **Public Safety**

The Conservation Commission is very concerned about pipeline and public safety during both the construction and operational phases of this project. Terrorism, natural disasters, weather, seismic changes, negligence, and ignorance can all lead to a public safety incident. The Conservation Commission requests that you stipulate TGP must not only work with local safety officials but that it must bear the cost of planning and implementation for any relocation of current public or private use trails that may be impacted by the pipeline project or be of a safety concern by TGP or Merrimack public safety officials.

In conclusion, the Commission has contracted with a professional ecological company to assist us in understanding two of our potentially impacted properties. We have allocated over \$30,000 for this study with the results due by early fall. Unfortunately this may leave us with no time to further clarify our scoping comments to your Commission before your current scoping deadline.

The speed at which this NED pipeline process is moving makes it very difficult for our community to be adequately prepared and do adequate research. It is not that we have delayed our activities or are using this as an excuse. We have been very proactive and engaged our contractor within one month of the New Hampshire alternative route becoming the primary proposed route. The simple fact is that our properties are large (~600 acres). The different seasons of the year provide both challenges to performing a study and provide for new or not previously seen species of all kinds to be found, identified, and studied. Proper science following best management practices has a time aspect that cannot simply be ignored.

Given these concerns and our sincere desire to be an active stakeholder in the project, we request your Commission extends the scoping period by 60 days so we can provide you even better guidance and further that your Commission holds a scoping meeting and site visit within the Town of Merrimack to allow specific input on any impacted parcels as they relate to the NED project.

Sincerely,

The Merrimack Conservation Commission

Timothy Tenhave, Chairperson

## **20150810-5085**

James L Giddings, Greenville, NH.

Driving south on route 45,

I feel drawn to overhead wires.

They criss-cross the sky everywhere,

follow every country road,

disappear into groves of trees.

How did it get this way?

In 1935, the year of the Rural Electrification Act,

wind turbines were popping up everywhere;

they were getting cheaper.

Where did the grid of black wires

bearing coal energy from afar come from?

It didn't have to be this way.

Now, as wind and solar are growing,

getting cheaper,

FERC is the new REA,  
selling the supposed need for fracked gas,  
for supersizing, networking, poisoning  
the way we get light, heat, communication  
far into the future.

It doesn't have to be this way.

It mustn't be this way this time!

**20150810-5087**

Julia V Stockwell, Townsend, MA.

Dear FERC Members,

I am sorry I am not able to attend the hearing on August 12th in Lunenburg. I am a 70 year old single woman trying to survive without any financial support from the state or the Federal governments. Of course my income is fixed since I am retired, social security, which I supported while working and savings; and I manage by funds and life style according to what I can afford. I do have several acres of land, two parcels already have an easement by Unitil for power lines. All of the property I own as a caretaker are predominately wetlands and two parcels are classified as Chapter 61. The parcels are either landlocked or not marketable properties. The only way I can manage to retain the properties is through Chapter 61 and recreation classification due increasing yearly taxes. Believe me I would rather not manage this land as it consumes much of my time. However, it does provide clean oxygen and a habitat for wildlife. I am explaining this to give you an idea of what I accomplish without state or federal aid. I burn wood and supplement it with oil. I would love to convert to solar energy and I may in the future with the new technology and if costs become more reasonable. This is where we should be putting our energy towards developing. It is safe and will take us into the future as long as the sun continues to exist.

I guess caring for the environment comes with age. As Americans we relied too much on oil and now it seems we are heading towards that same path with natural gas regardless of the effects it has on our environment and the people. I am 70 so I do not expect to ever see, at least I hope, the repercussions from transporting gas and its added chemicals across our land, providing damage to our pristine water systems, air, wildlife and fire safety. We do not need to experience forest fires like the west coast. Additionally, We need to take a lesson from Nova Scotia in predicting their gas field would last for twenty years and it ran out in five. It is exactly what they are predicting the Pennsylvania shale fields will supply, twenty years. Most of the land the pipeline will be built on is wetlands, conservation land, forests and in people's back yards. There is already an existing pipeline in the southern part of Massachusetts that actually extends into Fitchburg. If it is not large enough to transport the volume of gas they say they need, then they need to think about enlarging that line rather than building another separate line impacting more of our environmental resources. From the hearings I have attended I have not received a clear answer from Kinder-Morgan - the catch phrase is the area is too densely populated from the time the pipeline was built in the 1950s. The real problem is the money since the existing pipeline is old and most likely more expensive to rebuild. Besides they already have existing easements and would not have to take anymore land by eminent domain. The other area they have not addressed is once the gas no longer exists, then how do they propose to eliminate the existing vacated pipelines and restore the areas to their original condition, or will it be like the railroad tracks that are left abandoned across our state.

Kinder-Morgan, or should I say the Tennessee Gas Pipeline Company, has diverted their plan for the pipeline to encompass more of lower New Hampshire than Massachusetts. I can tell you that is probably the result of the impact our local towns people had on making their voices heard loud and clear that we will fight this invasion to the end. The Revolution began in Massachusetts in 1775 to make our country, we still have that same spirit to defend it against unjust invasion of a dangerous element to our lives. I am whole

heartedly against this pipeline, it is not needed and it is too dangerous. Our energies need to be put towards renewable energy resources like solar and wind power that does not damage our environment and our lives. Please consider this proposal carefully, eminent domain was not originally created to assist companies in making a profit over the rights of the people, it was meant to acquire land for public good. Putting another pipeline across virgin land is not a necessity! Companies hide under the umbrella of public domain and eminent domain because government lets them get away with it. It is time to stop this nonsense!

Respectfully,

Julia Stockwell

#### **20150810-5091**

Wendy Juchnevics-Freeman, New Ipswich, NH.

I live in New Ipswich, NH and we have no public drinking water. We rely on private wells, many of which draw water from the three stratified drift aquifers the pipeline is proposed to segment. I draw water from one of these and, if we ever required a public drinking water source, it would likely be one of these aquifers. Please AVOID these aquifers. If not, please identify the wells which draw from these aquifers, regardless of location, and test these wells for flow and contamination prior to construction and then quarterly after construction until the pipeline is removed.

#### **20150810-5092**

Wendy Juchnevics-Freeman, New Ipswich, NH.

I live in New Ipswich, NH and we have no public drinking water. We rely on private wells, many of which draw water from bedrock aquifers. The pipeline is proposed to segment an unknown number of bedrock aquifers. In order to protect our private wells, please AVOID blasting. Please consider alternatives such as drilling and cutting. Please do a hydro-geological study to identify the bedrock aquifers proposed to be impacted by the pipeline. Please identify the wells drawing water from these aquifers. Please test these wells, regardless of distance from the pipeline, before construction and quarterly after construction until the pipeline is decommissioned and removed. Please test these wells for flow and contaminants, both naturally occurring (e.g., radon and arsenic) and those found in fracked natural gas.

Kimberly D. Bose, Secretary

Nathaniel J. Davis, Sr., Deputy Secretary

Federal Energy Regulatory Commission

888 First Street, NE

Washington, DC 20426

DOCKET NO. PF14-22-000

Re: Tennessee Gas Pipeline Company, LLC, Proposed Northeast Energy Direct Project

Dear Secretary Bose:

On behalf of the Merrimack River Watershed Council, Inc. (“MRWC”), the Emmett Environmental Law and Policy Clinic (“ELPC”) at Harvard Law School<sup>1</sup> welcomes the opportunity to comment on the Tennessee Gas Pipeline Company’s (“TGP”) proposed Northeast Energy Direct Project (the “Project,” FERC Docket No. PF14-22-000). The MRWC is a nonprofit organization that was formed in 1976 by local activists and regional planning commissions to involve citizens in cleaning up the Merrimack River, which, due to its long urban and industrial history, was then one of the ten most polluted rivers in the country. After decades of efforts by MRWC and others to improve and preserve a healthy ecosystem throughout the river valley, the Merrimack River now provides important economic and environmental benefits to humans and wildlife. The MRWC continues to combine science, policy, and citizen action to protect, improve, and preserve a healthy ecosystem for the mutual well-being of the people and wildlife in the Merrimack River watershed.

Today, the Merrimack River is the second largest surface-water source of drinking water in New England; after treatment, the river provides drinking water to nearly 360,000 people in Massachusetts and New Hampshire; an additional 150,000 are projected to soon use the water in New Hampshire.<sup>2</sup> The River is also a recreational resource, including for boaters, hikers and fishermen, and provides habitat for numerous terrestrial and freshwater species, including the endangered Shortnose sturgeon (federally and state listed) and the threatened bald eagle (state listed).<sup>3</sup> Despite the River’s current role as a significant source of drinking water, it is still at risk from historic contamination and ongoing development. For example, a 2009 study by the United States Forest Service ranked the Merrimack River watershed as the 4th most threatened in the country for impacts to water quality by increased housing density on private forest lands.<sup>4</sup>

MRWC does not support the Project, either as originally proposed or as defined by TGP’s amended preferred route, outlined in a December 8, 2014, filing with FERC. As a general principle, MRWC believes that co-locating new pipelines along existing pipeline or utility routes is preferable to greenfield development, and recognizes that TGP’s revised preferred route would increase the percentage of new pipeline that would be located “adjacent to, and parallel with, existing utility corridors” and cross fewer Article 97 properties.<sup>5</sup> However, TGP’s revised preferred route (i.e., the New York Powerline Alternative and the New Hampshire Powerline Alternative for the Market Path Component of the Project) will continue to have impacts on the Merrimack River (which it crosses twice), four of the River’s tributaries (including the Souhegan River, Shawsheen River, Spicket River, and Nashua River) and other Massachusetts’ public lands, areas subject to conservation and other preservation restrictions, and waterways (collectively, “Conservation Areas”)<sup>6</sup> that must be appropriately considered in FERC’s review of the Project.<sup>7</sup> These Conservation Areas provide important environmental benefits as well as significant economic value to land owners and surrounding communities.

Massachusetts and New Hampshire have dedicated significant resources to protecting the Merrimack River, its associated tributaries and other Conservation Areas in order to protect their economic, environmental, health and social benefits. FERC must, and should, consider the impacts of the Project on these resources when determining if the Project serves the public interest. Should FERC proceed with a full National Environmental Policy Act (“NEPA”) analysis or issue a Certificate of Public Convenience and Necessity (“Certificate”) for the Project, its determinations of environmental impacts, required mitigation and Certificate conditions should account for the benefits of Conservation Areas that will be impaired by the Project.

Although the Natural Gas Act (“NGA,” 15 U.S.C. § 717 et seq.) may preempt some of the state laws that protect Conservation Areas, FERC’s analysis should still be informed by the strong legal system that the Commonwealth has developed to protect the benefits provided by, and public and private investment in, Conservation Areas.<sup>8</sup>

## **I. THE PROPOSED PROJECT WOULD HAVE A SIGNIFICANT NEGATIVE IMPACT ON MASSACHUSETTS AND/OR NEW HAMPSHIRE CONSERVATION AREAS AND THE BENEFITS THEY PROVIDE**

According to TGP, the revised preferred pipeline route in Massachusetts would consist of approximately 64

miles of 36-inch-diameter pipeline and 51 miles of new delivery lines and laterals with diameters ranging from 12 to 30 inches.<sup>9</sup> Approximately a third of the new pipeline in Massachusetts would be located outside of existing powerline or pipeline corridors.<sup>10</sup> The revised preferred option for the Project would traverse several dozen municipalities and affect over 1,600 acres of land during construction (not including additional acreage for temporary workspace during construction).<sup>11</sup> Alternative pipeline locations proposed by TGP would cross waterbodies and/or lands that MRWC works to protect.

The Project's proposed crossings of the Merrimack River and four of its eleven tributaries (the Souhegan River, Shawsheen River, Spicket River, and Nashua River) threaten the public and environmental benefits supported by the River. For example, sediment pollution is one of the primary sources of non-point pollution in the watershed,<sup>12</sup> and dredging could disrupt historically contaminated sediment, thereby releasing harmful chemicals and heavy metals from the Merrimack River's industrial past in proximity to public water supplies<sup>13</sup>. Specifically, the Project's proposed crossings of the Merrimack River, the Souhegan River, and the Shawsheen River are segments that the Commonwealth has designated as impaired or threatened for one or more uses, due to the presence of mercury, aluminum, iron, lead, polychlorinated biphenyls ("PCBs") in fish tissue, and/or phosphorus.<sup>14</sup> Drilling in the riverbed would also disrupt fish and wildlife habitat.

TGP's original preferred route for the Project would have also crossed Pine Island, a Conservation Area owned by MRWC, which provides public benefits ranging from recreation to turtle nesting habitat, and is subject to a conservation restriction administered by the MRWC. The conservation restriction prohibits a wide range of activities, including construction of any conduits, lines or permanent structures, excavation or dredging, activities detrimental to water conservation, water quality, erosion control or soil conservation, cutting or removal of any trees or any other vegetation within 100 feet of the water line surrounding the property, or any other uses of the land or activity thereon which is inconsistent with the purpose of the conservation restriction.<sup>15</sup> The Project, which would entail clearing tracks of land between 75 to 100 feet wide along the entire length of the pipeline,<sup>16</sup> would have violated this conservation restriction and exacerbate existing erosion conditions at Pine Island. It is therefore important that Pine Island remain outside the scope of the Project, as it is proposed now or changed in the future.

Conservation Areas like the Merrimack River, its associated tributaries, and Pine Island provide a wide range of economic, public health and environmental benefits to Massachusetts and New Hampshire communities, property owners, economies and ecosystems; the Trust for Public Land estimates that every \$1 invested by Massachusetts in land conservation returns \$4 in natural goods and services to the Commonwealth's economy.<sup>17</sup> The environmental benefits of Conservation Areas also contribute to property values in surrounding communities, quality of life and the scenic beauty of the state, all of which impact the state's ability to attract business and labor. For example, one study found that property located 200 meters closer to the Great Meadows Wildlife Refuge increases the sale price of the average property by almost \$2,000 (in 2007 dollars).<sup>18</sup> Other studies found that homes near the Minuteman Bikeway and Nashua River Rail Trail sell on average 45 percent faster than other comparable homes and closer to their list price.<sup>19</sup>

Conservation Areas provide a wide range of economic and nonmaterial benefits whose value should be taken into account when evaluating whether projects that would impair such benefits are in the public interest. Examples of such benefits include the following:

- **Water Supply and Quality**: Conservation Areas play an important role in providing drinking water and preserving water quality. For instance, forests and wetlands purify water by stabilizing soils and filtering contaminants, which prevents pollutants from developed areas flowing into drinking water sources. This is particularly important in Massachusetts, where approximately 80 percent of the population receives its drinking water from surface water sources.<sup>20</sup> Conservation Areas such as wetlands and other pervious surfaces may also capture and store water, thereby helping to control flooding and regulate supply.

The natural characteristics of Conservation Areas provide a cost effective alternative to expensive water treatment facilities. For example, a study of 27 water supplies found that, "[f]or each 10 percent increase in forest cover on the watershed surrounding a drinking water reservoir, water treatment costs were reduced by

20 percent,” and noted that, “while increased treatment costs must be paid each year, the cost of conserving land is a one-time expenditure.”<sup>21</sup> Similarly, the Trust for Public Lands calculated that the \$130 million spent on land acquisition by the Massachusetts Department of Conservation and Recreation over a 20 year period resulted in the ability to forego additional filtration and savings of approximately \$200 million.<sup>22</sup>

- **Critical Habitats:** Habitat destruction is a significant threat to species, and the impacts of habitat destruction, even in small amounts, may be exacerbated when the alteration creates fragmentation in habitats, which can interrupt normal animal movement within habitats and isolate species.<sup>23</sup> Large intact ecosystems, such as wetlands, forests or river networks, “generally support larger populations of native species, a greater number of species, and more intact natural processes than small, isolated examples.”<sup>24</sup> Connected tracks of land are also better suited to help plants and animals survive the types of extreme conditions that are expected to increase due to climate change.<sup>25</sup>

- **Air Quality:** Conservation Areas can contribute to the removal of pollutants from the air, including by supporting trees and other plants that filter pollutants through their leaves and diffuse them into their cells. In Massachusetts, five of the counties that the Project would traverse have yet to reach attainment with the national eight-hour standard for ozone – a pollutant that can interfere with respiratory functions and worsen conditions like asthma, which resulted in hospitalization charges of \$89 million in 2006.<sup>26</sup>

- **Flood Control:** Conservation Areas with water storage capacity, e.g., wetlands, can reduce flooding and subsequent damages and recovery costs. Maintaining such areas is particularly important in flood prone areas and will become more important as climate change leads to increased precipitation events.<sup>27</sup> For example, a one-acre wetland can typically store about one million gallons of water, and wetland vegetation can slow the speed of floodwaters.<sup>28</sup>

- **Recreational Value:** Conservation Areas are a significant draw for outdoor enthusiasts in Massachusetts and New Hampshire, and are used for activities such as hiking, skiing, biking, fishing, bird watching, swimming and boating. In addition to the personal enjoyment derived from such activities, the money spent on recreational activities, and associated travel, lodging, food and other goods and services, is a direct benefit to the Massachusetts economy. Outdoor recreation generates \$10 billion in consumer spending and \$739 million in state and local tax revenue each year, and supports 90,000 jobs and \$3.5 billion in wages and salaries.<sup>29</sup>

Even when the benefits of Conservation Areas cannot be monetized, they should be considered in determining the impacts of the Project and whether it serves a public need.

## **II. MASSACHUSETTS LAWS AND POLICIES PROMOTE PRESERVATION OF CONSERVATION AREAS**

Routing the pipeline through Conservation Areas would directly contravene Massachusetts laws and policies that protect and expand Conservation Areas. The Commonwealth’s commitment to public lands can, and should, inform FERC’s evaluation of the proposed Project, even if the normal implementation of certain statutory protections is preempted by the Natural Gas Act.<sup>30</sup> At a minimum, should FERC issue a Certificate for the Project, we urge the Commission to implement the Massachusetts Executive Office of Energy and Environmental Affairs’ (“EOEEA”) policy of “no net loss” of Article 97 properties (discussed below), and to apply that objective to all Conservation Areas as a condition of its approval of the Project.

In Massachusetts, the right to a clean environment and the government’s obligation to protect natural resources are embedded in the Constitution, which provides that:

The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose.

Mass. Const., Art. XCVII (hereinafter, “Article 97”). As explained by the Massachusetts Supreme Judicial

Court, “conservation and environmental protection are express obligations of the government in Massachusetts.”<sup>31</sup>

Article 97 enables the Massachusetts legislature to acquire lands, including via takings, in furtherance of the purposes outlined in the provision (“Article 97 properties”). Once acquired, these lands are subject to procedural safeguards regarding disposition or change in use. In brief, a two-thirds vote by the Massachusetts legislature is required before any (i) disposition of Article 97 land, i.e. a change in legal or physical control such as easements to private parties, or (ii) change in use, even to another Article 97 use if inconsistent with the prior Article 97 use. According to TGP, the Project would cross Article 97 lands in a manner that would normally require a two-thirds vote by the Massachusetts legislature.

EOEEA’s implementation of Article 97 includes an “Article 97 Land Disposition Policy,” which iterates that EOEEA, and its agencies, shall not, as a general rule, “sell, transfer, lease, relinquish, release, alienate or change the control or use” of any right or interest of the Commonwealth in and to Article 97 properties.<sup>32</sup> A condition for an exception to EOEEA’s general rule of non-disposition is that “real estate of equal or greater fair market value or value in use of proposed use, whichever is greater, and significantly greater resource value as determined by [EOEEA] and its agencies,” must be granted to the party disposing Article 97 property.<sup>33</sup> This “no net loss” policy of Article 97 helps protect the constitutional rights of the citizens of Massachusetts.<sup>34</sup>

The Constitutional right to a clean environment is further reflected in the Commonwealth’s laws, which create substantive and procedural protections that may apply to Article 97 properties and other Conservation Areas, including state and/or municipal-level review and approval of changes in use of such areas. For example, M.G.L. c. 184 § 32 establishes procedural requirements that must be met before the release of conservation, preservation, or watershed preservation restrictions held by governmental entities, charitable corporations or trusts. With respect to conservation restrictions, for instance:

- A government-held restriction cannot be released without public notice, hearing and vote by the governmental body holding the restriction;
- A restriction held by a charitable corporation or trust cannot be released without a vote by the relevant mayor, city manager, city council or town selectmen; and
- A restriction that was initially approved by EOEEA cannot be released without approval from EOEEA.

In addition, M.G.L. c. 40 § 15A provides that lands owned by a municipality (excluding land acquired for park purposes) with a designated specific purpose may only be subjected to another purpose upon a two-thirds vote of the city council, with the approval of the city manager or mayor, or a two-thirds vote at a regular or special town meeting.

Massachusetts common law also provides procedures that govern changes in use of certain public lands. Specifically, the public trust doctrine and the doctrine of prior public use both offer protections for public lands and certain water resources. In short, the public trust doctrine in Massachusetts provides that navigable waters (e.g., the Merrimack River), great ponds (>10 acres) and the lands beneath them are held in trust by the Commonwealth for the benefit of the public.<sup>35</sup> Lands protected under the public trust can be relinquished only by a vote of the legislature in furtherance of a “proper public purpose.”<sup>36</sup> The prior public use doctrine applies the concepts of the public trust doctrine from waterways and submerged lands to upland resources, providing that “land devoted to one public use may not be diverted to another inconsistent use without plain and explicit legislation authorizing the diversion.”<sup>37</sup>

The Commonwealth’s commitment to the protection of Conservation Areas is reflected in its significant financial investment in the acquisition and preservation of such areas. For example, between 1998 and 2011, Massachusetts funded the conservation of 131,000 acres, including lands protected through conservation easements and direct acquisitions.<sup>38</sup> Federal funds may have also been used in the acquisition or protection of Conservation Areas.

In addition to directly investing in the protection of these properties, the Commonwealth offers incentives

for private landowners to dedicate their properties to conservation purposes, including via a number of tax benefit programs. For example, the Commonwealth Conservation Land Tax Credit grants tax credits of up to \$75,000 for donations of conservation land, (301 C.M.R. 14.00), and the Massachusetts Current Use Program gives preferential tax treatment to property maintained as open space for the purposes of timber production, agriculture or recreation (M.G.L. c. 61, c. 61A, c. 61B). In some instances, the sale or conversion of land enrolled in such tax programs is subject to a right of first refusal to purchase vested in either the relevant municipality, Commonwealth or nonprofit conservation organization (e.g., M.G.L. c. 61, §8).

### **III. THE COMMISSION MUST CONSIDER THE BENEFITS OF CONSERVATION AREAS AND MITIGATE THE RISKS TO SUCH RESOURCES**

As explained below, throughout its assessment of the Project, the Commission must account for the impacts of the proposed pipeline on Conservation Areas and the benefits they provide. Should FERC determine, even in the face of these lost benefits, that the Project is in the public interest, it must ensure that such harms are mitigated. Specifically, FERC should consider the impacts to Conservation Areas and the benefits they provide when:

- (1) Balancing the Project’s projected benefits against adverse consequences to determine if the Project is “necessary or desirable in the public interest;”
- (2) Conducting the NEPA analysis of alternatives to the proposed route, including the no action alternative, and developing mitigation measures (if the Commission determines the Project is in the public interest); and
- (3) Imposing conditions on the Certificate (assuming the Commission determines the Project is in the public interest and complies with NEPA).

#### **A. FERC’s Public Interest Assessment**

Before approving the Project, FERC must determine that it is “necessary or desirable in the public interest” (15 U.S.C. § 717f (c)). This process includes balancing the Project’s projected public benefits against potential adverse consequences; the Commission only proceeds when the benefits outweigh the adverse effects, i.e., when FERC determines that a project is in the public interest.<sup>39</sup>

As touched upon above, the Project could impair the many benefits provided by Conservation Areas. The Commission must adequately account for the harm to Conservation Areas and the benefits they provide, including to owners of Conservation Areas and surrounding communities, when balancing the Project’s projected benefits against potential adverse consequences. The Conservation Areas and related benefits that would be lost due to the Project are resources that cannot be easily replaced, if at all, even with mitigation. In this instance, the impacts on Conservation Areas and the benefits they provide weigh heavily against authorizing the Project.<sup>40</sup>

Conservation Areas provide benefits that have significant direct economic value and contributions to property owners and the Commonwealth’s economy. However, FERC’s consideration of adverse consequences to Conservation Areas and the benefits they provide should not be limited to values that are directly quantifiable in monetary terms. Many of the benefits that Conservation Areas provide to property owners and surrounding communities, e.g., better health from cleaner air and water, might not be easily quantified, but avoided costs, like reduced asthma cases, are economic interests, the impairment of which should be included in FERC’s analysis of the Project’s impacts.<sup>41</sup> In addition, as discussed above, Massachusetts’ historic economic investment in Conservation Areas, including by direct investments and foregone taxes, need to be weighed against any benefits of the proposed Project.

In assessing whether the Project is in the public interest, FERC must also consider the extent to which TGP will exercise eminent domain authority to obtain access to land required for the Project. (Assuming FERC issues TGP a Certificate, Section 7(h) of the NGA grants the company the right to condemn private property for the Project as a public use). According to FERC, the strength of the Project’s benefit showing must be proportional to TGP’s proposed exercise of eminent domain.<sup>42</sup>

A pipeline route that goes through Conservation Areas will require an increased exercise of eminent domain. Many Conservation Areas are subject to restrictions, often held by nonprofit organizations, that limit the holder's right to grant permission for activities such as excavation or uses that would conflict with existing uses. For example, the Commonwealth of MA EOEEA's sample conservation restriction prohibits holders from authorizing any construction or other activity that is inconsistent with the purpose of the restrictions.<sup>43</sup> Even if the holder of a conservation restriction is not contractually prohibited from granting access for a pipeline, providing such authorization might be contrary to an organization's purpose, thus preventing it from allowing access to its land absent an eminent domain taking. Likewise, given the number of municipalities that have adopted resolutions against the Project, TGP would likely need to exercise eminent domain authority to take much of any municipal land required for the Project. FERC should assume that the Project would require a significant exercise of eminent domain, thus increasing the required level of public benefits that the Project must supply in order to be in the public interest.

## **B. NEPA Environmental Review Process**

The National Environmental Policy Act (42 U.S.C. §4321 et seq.) requires federal agencies to consider potential environmental impacts of an action or authorization of an action.<sup>44</sup> With respect to the Project, FERC has stated that it will prepare an Environmental Impact Statement ("EIS") as part of the NEPA process.<sup>45</sup> Should the Commission determine that the Project would be in the public interest, the EIS must consider the significant environmental value of Conservation Areas that would be impacted by the Project when evaluating alternatives to TGP's proposed route and when determining mitigation requirements.

Project impacts that must be considered as part of the NEPA analysis include ecological effects, including on "natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative." (40 C.F.R. § 1508.8). In evaluating required mitigation, FERC must consider opportunities for:

- (a) Avoiding an impact altogether by not taking a certain action or parts of an action.
- (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
- (c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.
- (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action. [and]
- (e) Compensating for the impact by replacing or providing substitute resources or environments.

40 C.F.R. § 1508.20. According to the Council on Environmental Quality ("CEQ") the need to mitigate impacts is not limited to major effects:

Mitigation measures must be considered even for impacts that by themselves would not be considered 'significant.' Once the proposal itself is considered as a whole to have significant effects, all of its specific effects on the environment (whether or not 'significant') must be considered, and mitigation measures must be developed where it is feasible to do so.

A full set of mitigation measures cannot be identified until TGP presents further information about the Project and its impacts. However, by way of example, potential mitigation measures could include requiring TGP to:

- Monitor water quality in areas where construction could disrupt contaminated sediment;
- Pay for impacts to public drinking water supplies, including increased treatment costs;
- Replace lost or impaired storm water storage capacity; and
- Fund the creation of "travel lanes" or corridors of sufficient width for animals where habitat is fragmented.

The EIS must also address how inconsistencies between the proposed Project and any State or local law will be reconciled.<sup>46</sup> Thus, the EIS should examine the Project's compliance with state laws, such as, but not limited to, the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40), The Massachusetts Rivers

Protection Act, Chapter 258 of the Acts of 1996, Endangered Species Act (M.G.L. c.131A), Global Warming Solutions Act (M.G.L. c. 21N) and Clean Waters Act (M.G.L. c. 21, §§ 26-35), and local laws, including, but not limited to, municipal wetlands ordinances and bylaws.

### **C. Conditioning the Certificate of Public Convenience and Necessity**

FERC has the authority to issue Certificates with “reasonable terms and conditions as the public convenience and necessity may require” (15 U.S.C. § 717(f)(e)). Should FERC issue a Certificate for the Project, we urge the Commission to include conditions to minimize adverse impacts on Conservation Areas and surrounding communities. A full set of conditions cannot be identified until TGP provides a draft environmental report, but an example of an appropriate condition would be to condition the Certificate on TGP’s compliance with mitigation measures spelled out in the EIS.

In addition, FERC should condition the Certificate on TGP’s compliance with Article 97 of the Massachusetts Constitution. This would be consistent with TGP’s commitment to seek an Article 97 vote from the Massachusetts legislature.<sup>47</sup> At a minimum, FERC should condition the Certificate on TGP’s compliance with Massachusetts’ “no net loss” policy for Article 97 land.

Such a condition would be consistent with FERC’s general expectation that natural gas companies will “comply with state and local requirements, to the extent that doing so does not interfere with actions that the Commission has determined are required by the public convenience and necessity.”<sup>48</sup>

\* \* \*

The protection of Conservation Areas is critical in order to preserve the economic, environmental, health and social benefits they provide. The Project’s impacts on such areas and benefits must be fully considered in FERC’s evaluation of the Project, and weigh against finding that the Project is in the public interest. Thank you for your consideration of these comments.

5 Letter from J. Curtis Moffat, Deputy General Counsel and Vice President, Gas Group Legal, TGP, to Kimberly D. Bose, Secretary, FERC (December 8, 2014).

6 The term “Conservation Area” is used broadly in these comments to encompass a range of preservation tools, including conservation restrictions, preservation restrictions and watershed preservation restrictions as defined in M.G.L. ch. 184, §31, and agricultural and forestry restrictions.

7 Beyond the Project’s impacts on Conservation Areas, there is also a significant question as to the need for, or appropriateness of, the Project from either a capacity or public interest perspective.

8 These comments focus on certain procedural protections for Conservation Areas, but do not address all environmental aspects of the Project or laws with which the Project must comply, such as, but not limited to, the federal Clean Water Act and its anti-degradation provisions. The MRWC may submit additional comments regarding these and other obligations.

Ms. Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE: Northeast Energy Direct Project, Docket N. PF-14-22-000

Dear Ms. Bose:

Thank you for the opportunity to comment on the proposed Northeast Energy Direct Project (NED). As you know, the Forest Society is New Hampshire’s oldest and largest land trust. We hold more than 750 conservation easements permanently protecting more than 120,000 acres of privately owned land statewide. In addition, we own more than 53,500 acres of forested lands in 180 separate reservations in 101 New Hampshire municipalities. Three of our forest reservation parcels are located in the route of the NED: the 55 acre Heald Tract parcels in Greenville and Mason, and the 45 acre Bockes Forest in Hudson. As such, we are in the process of assessing the potential negative impacts the project may have on them and their natural resources, and will be providing a full report upon completion of this study.

Because the 71 mile proposed route in New Hampshire will cross significant land and water resources as well as wildlife habitats, SPNHF requests FERC undertake a thorough and transparent review of the impact the entire NED Project will have on natural resources on the ground. As you determine whether it provides a public benefit, we believe FERC must equally weigh the project’s adverse effects, especially over the long-term. These natural resources provide benefits to public drinking water supplies, agricultural and forest soils,

public recreation including hunting and fishing and the forest products industries. It is therefore incumbent for the agency to take this approach during its review.

Specifically, we would urge the agency to develop alternate proposals that will avoid and minimize impacts to protected conservation lands and other sensitive natural areas. As you recall, the Nature Conservancy asked FERC to give special consideration in the EIS of how to avoid, minimize impacts to, or offset impacts to critical habitats. We strongly support TNC's request and would expect to see information in the Draft EIS that addresses the following categories: large, intact forest patches; floodplains, wetland and vernal pool complexes, seeps, bogs, and fens; fragile habitats; rare species habitats, both freshwater and terrestrial; migratory bird habitat. As you develop these alternate proposals, we would also ask FERC to consider options that use existing transportation rights of way.

The Natural Gas Act grants private natural gas companies that have received a FERC certificate of public convenience and necessity the power of condemnation. This authority is a powerful tool and provides those companies a significant regulatory advantage over landowners. Therefore, FERC must exercise extreme diligence and restraint before granting such power. We would ask FERC to set a high a review threshold for determining if the NED Project will provide a substantial benefit to the people of New Hampshire before granting the power of condemnation.

In closing, if you determine this project is necessary, we would also ask you to require the developer to avoid impacts the most ecologically significant natural resources and minimize impacts on other important environmental areas. Thank you for your consideration of these comments. We look forward to your response.

Sincerely,

Matt Leahy, Public Policy Manager

re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Dear Secretary Bose:

I have reviewed the Alternatives Analysis for the proposed Fitchburg Lateral in Resource Report 10 released in July 2015 and have several serious concerns to share with your staff and consultants.

While the proposed route of the lateral differs from the one identified in the December and March Resource Reports, there is no specific description of the changes that were made or why they were made. The original route does not appear as one of the Alternatives still being considered. The Kinder Morgan Land Agent explained privately to some Townsend residents that the route change was to avoid crossing one parcel of state land, which would have required Article 97 approval. The requirement for such approval represents additional process, but not necessarily additional environmental impact. The revised route is also part of the Squannassit Area of Critical Environmental Concern, contains critical wildlife habitat, and is a high quality water resource area. Additionally, the proposed Fitchburg lateral will still involve Article 97 approval since it proposes to take other Article 97 lands including large swaths of Willard Brook and Pearl Hill Brook State Parks.

Only one alternative route for just one section of the lateral was described, that was co-locating with Route 31 for part of the way. Clearly more alternatives are needed such as coming down roadways through Mason, Townsend and Lunenburg to avoid critical lands and habitats.

Additionally, the land crossing statistics in the Table 10-3-12 comparison for the one alternative presented

are very misleading. For example, “crossing” by forested land in the alternative route’s roadway is hardly the same as cutting a new swath through forested land in the proposed lateral. This calls into question all impact analyses provided by Kinder Morgan throughout all the Resource Reports.

The Fitchburg Lateral requires its own No Action Alternative. The purpose and need for the Fitchburg Lateral has still not been described despite. Many people have publicly raised this issue of the need for this particular part of the project to Kinder Morgan and to FERC.

Finally, at least seven new homeowners would be affected by the revised lateral route. While Kinder Morgan mailed survey requests to these homeowners in late May and visited with many during June, none of the newly affected landowners were provided notice about the July and August Scoping Period and local Scoping Meetings. One has to wonder how many other property owners across the 400 mile route have also not been notified about the Scoping Period and meetings.

Sincerely yours,

Carolyn Sellars  
Townsend, MA

### **20150810-5216**

Richard Kinnas  
Box 1692  
Pittsfield, MA 01202

August 10, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington DC

Dear Secretary Bose:

Please reference Project Docket PF14-22-000

My name is Richard Kinnas, live on Adams Road in Hinsdale, MA and am an impacted landowner.

Here are comments, questions and concerns about the project as requested:

Adams Road is located between 2 reservoirs, which are, Cleveland to the south and Windsor to the north. They are both public water supplies.

Our entire neighborhood is now water shed.

I ask if the electric power lines pre-existed the water shed. In the area of Windsor Reservoir there is evidence (in the form of camp site signs on trees) of an abandoned state run camp ground. Its use is now restricted and wonder if the water shed was a factor. I also remember as a child some 40 to 50 years ago, the power lines being a part of our community.

Have the dynamics of the area changed since the construction of the power lines and is it appropriate to construct a pipeline there? Is it a good idea to collocate a pipeline in an existing utility corridor within a water shed?

In addition, our neighborhood supports the Town of Dalton’s proposal to relocate the pipe so as it does not cross MA State Route 9.

However, we are also asking that you consider an additional route proposal.

My neighbors, also impacted landowners, and I are asking FERC to make an exception and spare the people of our Town. Please make a minor route deviation and place the pipeline slightly to the North and East. This is in Segment G.

The reasons are as follows:

1. When Kinder Morgan announced the ‘preferred’ route, our local newspaper reported that the number of affected landowners would be reduced from 1468 to 522 or about 65%. It was reported as a positive achievement by them, meaning it is “fair game” for us. The deviation we are requesting would reduce the affected landowners in Hinsdale by 60%. Berkshire Eagle, March 17, 2015.
2. Regarding safety: The pipe passes well within the theoretical blast radius of our homes. More importantly, the pipe passes within an uncomfortable proximity to the electrical substation. Could a natural or manmade event at either one also impact the other and what would the consequences be? Consider the recent FBI arrest of an alleged terrorist tied to ISIS in our little county.
3. The deviation removes approximately 0.5 mile of pipe. Would you agree that’s a benefit considering what may be a ten million dollar a month construction operation?
4. Lastly, the current route impacts 6 streams, 5 wetlands, and 2 vernal pools. The deviation impacts 3 streams, 1 wetland, and 0 vernal pools. These statistics are based upon information found in the Massachusetts Department of Environment Protection’s Wetlands Viewer. This is a web based resource used by local Conservation Commissions and is also available to the general public.

Can you conclude, this is a benefit for landowners, Kinder Morgan, and the environment?

Attached is an annotated map of the area showing the deviation in red.

In addition, there are other impacts:

Our septic systems and wells are in close proximity. People rely on their private water supplies and septic systems for daily life.

What are Kinder Morgan’s plan’s to prevent disturbances? If these systems are disrupted, will we still be allowed to inhabit our properties until repairs are made? What are the plan’s to provide for us in the event these systems are disrupted? What would the time frame be for repairs? Who would be liable?

How willing would Kinder Morgan be to “own up” and not use it’s might to refuse to address these issues?

What about our streets? Old Windsor Road and Adams Road are deteriorated. Starting from MA Route 8 to the last house on Adams Road (2 miles), please consider, the asphalt is crumbling and sections are turning to dirt, possibly due to the extra ordinary stress of heavy vehicles due to the previous Windsor Dam restoration effort. Adams Road has a developing water drainage issue. It’s apparent by a drive down these streets.

Can these country roads support the heavy equipment and level of traffic? Please consider the under road drainage pipe at the end of Adams Road. That intersection is the only practical access to properties on Adams Road as the west end of Adams is not cleared of snow in the winter and is impassable during the spring, summer and fall due to ruts and obstructions.

Will these roads be repaired and re-graded with fresh asphalt?

During what hours and days will construction workers and activity be taking place? Will we have time off to enjoy our properties or get some sleep?

Will Kinder Morgan erect a temporary barrier between the temporary easement and our houses to prevent our animals from inadvertently wandering into the construction zone and having issues arise? They are accustomed to using the area.

Regarding the temporary easement, Will trees beyond the temporary easement also be taken, simply because of the overhang of branches? What height quantity of overhang is permitted?

Can the temporary easement be moved to under the wires or on the other side of the wires? I point out the pipe does cross under the wires in other locations. Can the pipe be moved to the other side of the wires? It is more palatable there.

I do not support wood chips being left on our properties in any quantities.

Lastly, I call your attention to what appears to be a proposed access road located between Old Windsor Road and the power lines.

It is located on sheet 14 of a set of maps somewhat entitled 'NED QUAD MAPBOOK, Segment G, Berkshire County, Massachusetts' with .pdf file name: NED\_Vol-II\_App- E\_USGS\_072415\_MKT. There is no formal title page.

It is near mile post 13.5 and does not have a label (of sorts) NED\_TAR\_G\_xxx.

The map key also indicates it is a proposed access road.

If you look closely, you see it is an aqueduct supplying Cleveland Reservoir from Windsor Brook and from a well head on Cady Brook.

I have first-hand knowledge of this. It is a large diameter concrete water pipe most likely unable to support light or heavy vehicle traffic.

What is Kinder Morgan's rationale for this? I now have to question their knowledge and capability.

If this aqueduct is disrupted, what will be the impact? Please investigate.

Respectfully,

Richard Kinnas

RE: Docket PF 14-22 (Kinder-Morgan /  
Tennessee Gas Pipeline proposed Northeast Energy Direct (NED) pipeline)

Dear Secretary Bose,

Enclosed is Testimony I provided at the Scoping Meeting held on July 30, 2015 in Milford, New Hampshire

I would like to express my grave concern regarding the negative environmental effects caused by the noise generated at and in the vicinity of compression stations.

Compression Station Noise: Noise levels associated with natural gas compressors vary with the size of the compressor and distance from the compressor; and change with shifts in wind direction and intensity. For these reasons accurate assessment of decibel levels is challenging. According to the Powder River Basin Resource Council in Wyoming, "Depending on the wind direction, the roar of a field compressor can be heard three to four miles from the site. Near the compressor stations, people need to shout to make themselves heard over the sound of the engines." And this is under normal operation. Noise levels during blowdowns have been measured as high as 120 decibels(dbA). Industry standards require that noise levels in the vicinity of compression stations be no higher than 55 dbA. However the reasoning for setting the standard at that level is problematic.

Evaluating Noise: Noise levels vary during operation, so evaluating an "average" level of noise does not accurately document the noise emitted on an ongoing basis every day. And levels of noise during blowdowns far exceed the standard. Additionally, decibel level alone does not capture the potential negative effects of noise. Infrasound, sometimes referred to as low-frequency sound, is sound that is lower in frequency than

20 Hz (hertz) per second, the “normal” limit of human hearing. Low frequency sound is commonly emitted by gas compression stations. Samuel Matteson, professor of physics at the University of North Texas and a specialist in acoustics, has stated that low-frequency sound transmits easily through the soil and can travel great distances. It is extremely difficult to protect oneself from low frequency sound as buildings are not designed to insulate from it and it is easily transmitted from the ground by sound waves originating underground or near the surface. Given these factors, the utilization of a maximum standard of 55 dbA is a flawed mechanism of measure and does not take into account the quality of noise emissions.

Negative Effects of Noise: There is a large body of research documenting negative health effects from high decibel noise as well as low frequency noise.

High Decibel Noise Effects: A European study conducted by Deepak Prasher of University College, London concluded a chronic nighttime exposure of 50 dbA was the noise threshold for at which there was a higher risk for cardiovascular problems. Prasher states “Many people become habituated to noise over time. The biological effects are imperceptible, so that even as you become accustomed to the noise, adverse physiological changes are nevertheless taking place, with potentially serious consequences to human health.”

Physician Louis Hagler, who coauthored a review on noise pollution in the March 2007 Southern Medical Journal concluded “Noise pollution contributes not only to cardiovascular disease, but also to hearing loss, sleep disruption, social handicaps, diminished productivity, impaired teaching and learning, absenteeism, increased drug use, and accidents. The public health repercussions of increasing noise pollution for future generations could be immense.”

In 1999 The World Health Organization published a report called “Guidelines for Community Noise” to standardize risk assessment and management of noise dangers... Researchers found that “acute noise exposures [can lead] to temporary changes such as increased blood pressure, increased heart rate, [artery] constriction, hypertension, and ischemic heart disease.”

The Environmental Protection Agency website provides research articles outlining the dangers of acute noise, including high blood pressure, coronary disease, migraine headaches, and low-birthweight newborns. A number of studies of noise effects on children conclude that noise-exposed children have difficulties in concentrating in comparison with children from quieter schools. Children exposed to chronic environmental noise have been found to have poorer auditory discrimination and speech perception as well as poorer memory requiring high processing demands. Finally, chronically exposed children tend to have poorer reading ability and school performance on national standardized tests. I do not need to remind you that the proposed location of the New Ipswich compressor station is within 1/2 mile of the Temple Elementary School.

The World Health Organization has stated that “Noise is an underestimated threat that can cause a number of short and long-term health problems, such as sleep disturbance, cardiovascular effects, poorer work and school performance, hearing impairment. Their recommendations state that exposure over the following levels pose a danger: Indoor noise level at night: less than 30 dbA; outside levels less than 40 dbA; in classroom settings less than 35 dbA to allow good teaching and learning conditions.

While these findings are of significant concern and certainly substantiate justification for FERC to require noise dbA levels that align with WHO guidelines, of equal or greater concern are Low Frequency Sounds that are emitted by compression stations during normal operation

Low Frequency Noise Effects: Infrasound, sometimes referred to as low-frequency noise (LFN), is sound that is lower in frequency than 20 Hz (hertz) or cycles per second, the “normal” limit of human hearing. Psychologist Richard Wiseman of the University of Hertfordshire conducted an experiment with young adul

## **20150811-5002**

Karen Sullivan, New Ipswich, NY.

The Tennessee Gas Pipeline company/Kinder Morgan/NED will file an Application for a Certificate of Public Convenience & Necessity with FERC.

I was at the FERC Scoping Meeting held in Nashua, NH on Wednesday, July 29, 2015

I was at the FERC Scoping held in Milford, NH on Thursday July 30, 2015

At the Nashua Scoping meeting there were about 28 elected officials speaking before the FERC members. Not one of these elected officials agreed that the TN Gas Pipeline/Kinder Morgan/NED project was necessary. I do not know how many private individuals spoke. I would guess that only 5 or 6 individuals spoke for the pipeline to be built. These individuals were all union members who wanted union jobs. I am not anti union. I have been a member of my union since 1973. I am pro union. I am anti pipeline.

At the Milford Scoping meeting there were 28 elected officials speaking before the FERC members. Not one elected official spoke in favor of the pipeline. There were 43 private individuals who spoke at the Milford Scoping meeting. Not one of those private individuals was in favor of the pipeline project.

If the Federal Energy Regulatory Commission is not a "Rubber Stamp" for the fossil fuel companies when the Tennessee Gas Pipeline Company/Kinder Morgan/NED files an Application for a Certificate of Public Convenience & Necessity I request that FERC DENY this application from the TN Gas Pipeline Co/Kinder Morgan/NED.

This pipeline is NOT for "public convenience". This pipeline is NOT for "necessity". This pipeline is strictly for PROFIT by a private company.

There are three other pipelines that can transport this gas from the Marcellas Shale in Pennsylvania to/through New England.

FERC's own rules state that the public benefits of a pipeline must exceed the costs to society. The upgrades already in various planning stages to existing pipelines provide alternative gas infrastructure projects that have a smaller impact and costs to landowners, communities and the environment.

I urge FERC to just say no and DENY the Tennessee Gas Pipeline Company/Kinder Morgan/NED project slated to come through southern NH with a compressor station planned for New Ipswich, NH (Docket # PF14-22)

Thank you for your time.

### **20150811-5003**

Sullivan Family, New Ipswich, NH.

I am writing to you today because I am very upset about the Tennessee Gas Pipeline Company/Kinder Morgan/NED proposal for a gas pipeline through southern New Hampshire. I am upset about the proposal for the compressor station that is slated to be built on the property known as the "SkinnyKat" property located on the border of New Ipswich and Temple, New Hampshire at 40 Skinny Cat Road.

I am within 1/2 mile of this compressor station. I am in what is known as the "blast zone".

This is a huge piece of land, almost 300 acres that is right now woods and wet lands. Having a compressor station, no matter what size it may end up being, on this property will devastate the rural character of the area. It will devastate the wildlife and flora species of the area. It will devastate the human population. It will bring noise, water and air pollution into the area.

I have the spotted salamander on my 10 acres of land in New Ipswich. I understand that several states have already named the spotted salamander a "Species of Special Concern". Check out Welcome to The Vernal Pool and [www.maine.gov/dep/blwq/docstand/nrpa/vernalpools](http://www.maine.gov/dep/blwq/docstand/nrpa/vernalpools))

On Temple Road in New Ipswich, NH, just feet from the edge of the SkinnyKat property where the proposed compressor station will be built, there is a sign warning of hazardous spills on the water shed area. It gives a special phone number to call in case of a hazardous spill. I consider the proposed compressor station to be a "hazardous spill".

I have well water as do all the citizens of New Ipswich. This proposed gas pipeline and compressor station will effect the water supply of not only New Ipswich but Temple and Greenville, New Hampshire as well. In

my opinion it is criminal to effect negatively the water supply for humans as well as wildlife.

My husband & I looked for over 1 & 1/2 years to find our dream home in New Ipswich, NH. We signed for our house in October of 2012. This was our little piece of heaven for our remaining years. We came for the clean rivers, lakes, streams, brooks, wet lands & water ways, clean well water, peace & quiet. The natural beauty of the area. It is rapidly becoming just the opposite. All due to the Tennessee Gas Pipeline company/ Kinder Morgan/NED. We are heart sick in hearing that we will be living within the incineration zone of the compression station & pipeline. This was/is our last move. We are both senior citizens & just do not have the resources nor the energy to move again.

Please do not allow the Tennessee Gas Pipeline/Kinder Morgan/NED, for lack of a better word, rape our country side here in southern New Hampshire.

Sincerely,

Sullivan Family

155 Old Wilton Road

New Ipswich, New Hampshire 03071

Ellen Gugel, Westborough, MA.

Re: Northeast Energy Direct pipeline project docket number PF14-22-00

Dear Kimberly D. Bose, Secretary, Federal Energy Regulatory Commission

I want to make clear my unconditional opposition to this project. I speak from the perspective of a member of the land trust community in Massachusetts and one who worked professionally in land conservation for a number of years.

This pipeline project would destroy decades of efforts by conservationists, environmental advocates, local farmers, and ordinary citizens who enjoy local food, wildlife habitat, scenic views, clean water and air. These lands were protected with federal and state funds, private donations and are held in trust in perpetuity.

I urge you to deny, not recommend this project that would interrupt thousands of lives, people's homes and communities, all for profit to a large corporation. The last thing we need is to perpetuate the unequal distribution of wealth into the hands of a few at the expense of the many.

Massachusetts does not need this project either. Most of the gas would eventually be for export, the real reason behind the proponent's proposal.

Please stop this now, and forever, to the extent you have the power.

Thank you for strongly taking into account the overwhelming opposition, including mine. The people of Massachusetts do not want, do not need this pipeline. Please deny.

### **20150811-5032**

sandra rourke, FORT EDWARD, NY.

To whom it may concern:

The damage placing this pipeline through the proposed route in Schoharie County, NY far out weighs any benefit, especially to the residents of Schoharie County.

You have already agreed to Constitution taking land from my family's farm, and this pipeline will cause further danger to the residents and wildlife living on Bixby Rd. Much of this land is protected wetland; with water fowl, deer, turkeys, eagles, beaver, and many more species living here for years. Some of this land is forested steep hills and clearing even more trees will clearly path the way for erosion and landslides. My family depends on well and spring water for everything and studies have shown this will endanger their water supply.

Gas companies try to gain support by speaking of all the economic benefit. Workers on pipeline construc-

tions are not local workers. This is demonstrated by the orange shirted union workers that travel from out of area to your informational meetings. There is no documented data showing this a valid benefit.

Schoharie County has struggled to survive through floods and harsh economic times. Please do not add to their struggles. Please deny any further pipeline proposals.

Thank you.

Respectfully,

Sandra Rourke

**20150811-5064**

Peter Salera, Temple, NH.

I am deeply concerned about the effects of this project on local aquifers and water bodies, specifically in their relation to the proposed compressor station in New Ipswich, NH. My household, like all others in the region, obtains water through underground wells that will be affected by this pipeline. When chemicals build up in the pipe and have to be released, these can negatively affect local aquifers and wells, and the construction of the pipeline itself will put aquifer structure in peril. I urge you to deny this project.

**20150811-5088**

Peter, Temple, NH.

I am writing to make known my opposition to this project, and to share my disdain for the proposed economic “benefits” of it. At the core of the argument over the benefits or drawbacks of this pipeline is if we, the energy customers of New Hampshire, need it. This argument is wholly invalid. The NED pipeline is a hose, and the natural gas that is pumped through it is the water. The water comes in abundance from a Pennsylvania shale field, and it flows through the hose on the way to Dracut, MA and foreign markets. The water in the hose has already been bought by other energy customers and those who have the pipeline running through their backyard are simply hosts of the hose. Whether we are thirsty or not doesn’t matter, as the water is being used to fill someone else’s glass. Kinder Morgan and Tennessee Gas have not shown any evidence that this gas is going to natural gas customers in New Hampshire, but continue to make the argument that we NEED it. Those who will be buying the natural gas need it, but we don’t. There has yet to be a contract reached between Tennessee Gas and a New Hampshire utility company for the purchase of the gas, and there is no talk of any offshoot pipeline to accommodate said contract. New Hampshire is comprised of informed, environmentally conscious citizens, of which I am one. The largest solar operation is soon to come online in nearby Peterborough, New Hampshire, just 15 miles from the proposed compressor station. In Antrim, there is talk of a wind farm. Renewable energy is gaining momentum in the state, and more projects will be supplying renewable energy to the electric grid in the coming years. Therefore, any “energy crisis” we may have will be solved in a much more sustainable way than the natural gas that will flow through the pipeline. I wholeheartedly oppose this project because I do not support the environmentally disastrous effects of hydraulic fracturing to obtain natural gas from shale deposits, and I believe in the clean and economically viable option of renewable energy from the sun and wind. And I especially do not support this project as I will not reap any benefits.

**20150811-5102**

Nancy Belt, Sonoita, AZ.

I am writing concerning the compressor station proposed on Clarks Chapel Road, Nassau, NY. My family has lived on Clarks Chapel Road for five generations. My dad was born in a house on Clarks Chapel Road. My family lives all up and down the roadway and I own a portion of the farm where I grew up. I am all for creating new sources of energy and I am not opposed to this but what I am opposed to is the creation of an environmentally unsafe facility being plopped down right in the middle of a residential area without regard to the protection and safety of the families living in the area or to the devaluation of their property. I have

been involved in real estate, development and zoning issues for practically all of my adult life. Zoning laws were put in place so that incompatible uses would not be allowed to the detriment of an adjoining property. It is designed to guide and protect the growth of community so that quality of life and property values would be protected. Clarks Chapel Road is a rural, residential community with farming and families. How is a compressor station that emits toxic emissions, loud noises and safety hazards compatible with the surrounding community. This type of plant under normal circumstances would never be allowed in this type of community. It appears that there are other forces at play and I am requesting that you use your authority and influence to put a stop to this travesty. These compressor stations either need to be moved to a more appropriate location or they need to be stopped until there is technology in place that will make them compatible with their surroundings. I am making this request as a property owner on Clarks Chapel Road. While I live in Arizona, my family plans on constructing a summer home on the farm that I grew up on. The construction of this plant will affect the heritage that I plan to leave to my daughter and will affect the value of my property in addition to that of many other family members.

Sincerely,

Nancy A. Belt

### **20150811-5105**

Sullivan Family, New Ipswich, NH.

The following is a list of Pipeline concerns as expressed by the New Ipswich Police Chief, New Ipswich Fire Chief, New Ipswich Emergency Management Director and New Ipswich Road Agent. This list expresses my initial concerns and is not meant to be all inclusive or final.

We would like a copy of the emergency response plan.

Will Kinder Morgan be installing an Active (CO<sub>2</sub>?) or passive fire suppression system?

Will Kinder Morgan Install gas leak detectors at the Compression station?

The fire department would like Kinder Morgan to provide Gas meters for responders.

What are your plans for a Cistern or water source for dissipation of vapors because there is no municipal water supply?

Will you provide and pay for initial and ongoing Training for all first responders (police, fire, ambulance, emergency management and highway)?

What kind of Special protective gear is needed for first responders at an incident and will Kinder Morgan provide and maintain it?

Manpower/ mutual aid response

Scene security at incident

What security monitoring will be implemented at the compression station and on the length of the pipeline (alarms, fences, manpower, cameras, patrols)?

Will Kinder Morgan provide an ATV or like vehicle for access to the pipeline by emergency responders.

Evacuation routes and scene access

Shelters for displaced residents and supplies to support the shelters

Preplanning of response

Periodic meetings with compressor pipeline operator or designee

We would like a detailed site plan that is kept current.

Will Kinder Morgan provide Medical equipment for a mass casualty incident?

Develop a mass casualty plan including ambulances and hospitals

What is the plan to protect the pipeline from a Soft Terrorism threat?

Will Kinder Morgan provide a messaging system for notification of an incident or training (including message boards)?

Will Kinder Morgan provide and maintain a foam bank for fire suppression at the Compression Station?

The lack of 24 hour police coverage needs to be addressed.

The fire department in New Ipswich is a call department with minimal manpower during the daytime. This needs to be addressed.

Will Kinder Morgan maintain road access to the compression station and Pipeline? This would include snow removal and roadway maintenance and upkeep so that emergency vehicles can respond.

What will the state involvement be in an incident?

Does FEMA region 1 have a plan for response to an incident?

Where is the closest service field rep located and what is their response time to New Ipswich?

Where does funding come from to reimburse for emergency response (including alarm activation and full blown incidents) and how soon is it available?

Will Kinder Morgan be paying for security details for surveyors and workers during the initial phases of the project?

FERC's own rules state that the public benefits of a pipeline must exceed the costs to society. Just by reading the above list of concerns tells me the answer to this is a resounding NO!

There are upgrades already in various planning stages to existing pipelines to provide alternative gas infrastructure projects that have a smaller impact and costs to landowners, communities and the environment.

I respectfully request that FERC says NO to the Tn Gas Pipeline Company/Kinder Morgan/NED that have proposed a pipeline and compressor station through southern New Hampshire.

Thank you

## **20150811-5106**

Rachel Hobbie, S.Deerfield, MA.

The Proposed TGP/Kinder Morgan pipeline NED is 101.3 miles right here in MA of new gas pipeline laid across private and public lands, under vital rivers and via power lines owned by utilities to route a for-profit, for export, pipeline through the Pioneer Valley, PA, NY, CT, & NH. What!? That sounds completely wrong. What?

Our farmers and townspeople cannot recover from a pipeline coming here- or anywhere along proposed route-either from land it will take or from results of a man-made or natural disaster - explosion, fouled waters and loss of lives in the mapped "Incineration Zone" a mile wide, across our valley which is served by Volunteer Fire departments which lack resources or personnel to battle a fire of any size, let alone a 200 foot high fireball that has to burn itself out under our power lines, across our water pipes and wells on a route that includes historic homes, artifacts, burial grounds, protected and endangered species and family farms all across the valley and beyond.

We simply cannot allow this pipeline in to set a precedent for further destruction under a "Certificate of Public Convenience and Necessity" from FERC when it flies in the face of logic and violates our inalienable rights here in Mass. and beyond.

Consider that our families and friends, people's livelihoods, homes, their health and their children's children's lives will be in danger via NED siting a 30% thinner pipe-thinner than is even required in Urban areas- in our Rural/Agricultural land that is subject to flooding, notable seismic shifts and Cat 3/4/5 Hurricanes, which churn up the floor of our valley from edge to edge of the proposed route. This will create a disaster of epic proportion, no doubt.

We have farmers who are still dealing with what Hurricane Irene did to soil composition on their fields,

several years after the fact!

No town on this line could bear the added burden on town coffers, or state coffers, and on our lands, our health, river health, on our own wallets.

Residents will face tariffs and rate increases when they are forced to pay for mitigation or disaster-related services on our rivers, lands and homes, or through rate increases passed along to customers of Spanish-owned Berkshire Gas. My town, Deerfield, like so many along the route, cannot even use the gas the lines will carry, since it is an interstate transmission line - leading ultimately to export out of US. It is for profit and for export, at the expense of our most vital resources - our lands, our waters, our people, our creatures, fish and organisms needed for farming the land, and historic, irreplaceable artifacts that line the valley. My family lives less than 500 feet from the proposed line on the south where it crosses under a field, under the hill, under Lower Rd., under Route 91, and under the rail road. It also runs along in back of my sibling's home after coming across other fields from East Deerfield rail road side, via Woolman Hill, under Route 5 & 10, and across private lands. We are flanked. We will be dead if we are home and it blows up near us. We are residing in a mapped "unable to be aided in disaster - Incineration Zone" here on Lower Road in Deerfield, MA, in an historic farmstead, a former B and B we bought in 2014 to try to find a sensible life here in Mass.

It goes far beyond just my family. It is so many people, our rivers, farms and all of our lands. It is the whole valley and our future viability-here and at large- as the agricultural center of Mass. which stands to be forever altered and degraded beyond possible repair here, if NED gets built. Fracking the Marcellus Shale is wrong, supporting or considering proposed NED pipeline is plain wrong. The valley economy is based heavily on agriculture ( mainly small family farms ) and tourism both of which could never recover from the impact of a pipeline being installed or God forbid, a catastrophic explosion anywhere on the line. The residents of Deerfield and ALL of the surrounding communities value their lives, and the health and safety of all members of the landscape here in the valley. I am urging, no pleading w/ the FERC members to comprehend the incalculable damage that the pipeline would bring to these towns and their inhabitants. Our right to clean water is undeniable! The planned compressor stations along the route will threaten both public and private water supplies for all our residents, NO company has the right to destroy a water system for private financial gain!

Thank you FERC members for reading this document.

Rachel Hobbie

a life long Deerfield resident

## **20150811-5111**

Edward McCarthy, Greenfield, MA.

To Whom it May Concern:

I would like to state my support for the NED Gas Pipeline proposal through western Massachusetts. As a veteran of the Iraq War I believe strongly in supporting reliable domestic energy sources. I also support moving our energy demands away from coal and oil and towards cleaner and renewable energy sources. That said, I believe that natural gas is the best way to achieve those ends and shipping that gas by way of pipelines is the safest, most effective and environmentally appropriate way to convey that product to markets here in New England. I support the NED pipeline as part of the solution to the aforementioned concerns and as a bridge to cleaner solar and wind energy in the future.

I do however insist that the NED pipeline be installed using the least invasive and destructive methods possible and that the contractors involved adhere strictly to all State and Federal environmental regulations with regard to storm water discharges and wetland protection guidelines. To that end I believe that the proposed project should be subject to robust oversight in order to assure that environmental rules are followed for the entire duration of the project.

Thank you,  
Edward McCarthy  
748 Country Club Road  
Greenfield, MA 01301

**20150811-5112**

Elizabeth Lareau Whitcomb, Northfield, MA.  
To Whom It May Concern:

I am writing to urge you to restart the scoping process for the proposed Kinder Morgan pipeline through northern Massachusetts. Kinder Morgan's latest plan was submitted too late for a detailed study of it prior to the recent hearings in Greenfield. In addition, the report as submitted leaves far too many unanswered questions, which in turn means an unacceptable level of uncertainty as far as safety matters are concerned.

The pipeline threatens to destroy wildlife habitats, taint our drinking water, and disrupt our public safety. It would be ideal if the project is denied. It is mandatory that the scoping process not be put on a fast track, with approval granted before all the details are known.

I thank you for your time and consideration of this matter.

Elizabeth Lareau Whitcomb  
Northfield, Massachusetts

**20150811-5113**

k sullivan, New Ipswich, NH.

FERC's own rules state that the public benefits of a pipeline must exceed the costs to society. The Tennessee Gas Pipeline Company/Kinder Morgan/NED proposed site of the pipeline and compressor station in southern NH and New Ipswich does not follow FERC's own rules.

There are upgrades already in various planning stages to existing pipelines provide alternative gas infrastructure projects that have a smaller impact and costs to landowners, communities and the environment.

We need to keep fossil fuels in the ground, and move to 100 percent renewable energy — and we need to act immediately.

Please just say NO to the Tennessee Gas Pipeline Company/Morgan Kinder/NED proposal through southern NH.

Thank You.  
K Sullivan

**20150811-5114**

Sulli Sullivan, New Ipswich, NH.

The Tennessee Gas Pipeline company/Kinder Morgan/NED will file an Application for a Certificate of Public Convenience & Necessity with FERC.

I was at the FERC Scoping Meeting held in Nashua, NH on Wednesday, July 29, 2015

I was at the FERC Scoping held in Milford, NH on Thursday July 30, 2015

At the Nashua Scoping meeting there where about 28 elected officials speaking before the FERC members. Not one of these elected officials agreed that the TN Gas Pipeline/Kinder Morgan/NED project was necessary. I do not know how many private individuals spoke. I would guess that only 5 or 6 individuals spoke for the pipeline to be built. These individuals were all union members who wanted union jobs. I am not anti union. I have been a member of my union since 1973. I am pro union. I am anti pipeline.

At the Milford Scoping meeting there were 28 elected officials speaking before the FERC members. Not one

elected official spoke in favor of the pipeline. There were 43 private individuals who spoke at the Milford Scoping meeting. Not one of those private individuals was in favor of the pipeline project.

If the Federal Energy Regulatory Commission is not a “Rubber Stamp” for the fossil fuel companies when the Tennessee Gas Pipeline Company/Kinder Morgan/NED files an Application for a Certificate of Public Convenience & Necessity I request that FERC DENY this application from the TN Gas Pipeline Co/Kinder Morgan/NED.

This pipeline is NOT for “public convenience”. This pipeline is NOT for “necessity”. This pipeline is strictly for PROFIT by a private company.

There are three other pipelines that can transport this gas from the Marcellas Shale in Pennsylvania to/ through New England.

FERC’s own rules state that the public benefits of a pipeline must exceed the costs to society. The upgrades already in various planning stages to existing pipelines provide alternative gas infrastructure projects that have a smaller impact and costs to landowners, communities and the environment.

I urge FERC to just say no and DENY the Tennessee Gas Pipeline Company/Kinder Morgan/NED project slated to come through southern NH with a compressor station planned for New Ipswich, NH (Docket # PF14-22)

#### **20150811-5122**

Comment No 1

I tried to attend the Nashua and Milford New Hampshire public scoping meetings. I was unable to get into the buildings that the meetings have been held. It was obvious that there were more people in the buildings that legally allowed by fire codes. As a citizen I have the right to be heard, but I was not given the opportunity along with lots of other people. I request that FERC reschedule the scoping meeting in the safe facility so that I can voice my option and concerns

Comment No 2

Does FERC normally permit compressor stations that less than a half mile from an elementary school/emergency shelter?

Comment No 3

Do you consider a compressor station that within less than a half mile of an elementary school in Temple a significant impact to the community?

Comment No 4

Would you permit a compressor station that has a significant impact on a well known migratory bird fly route?

#### **20150811-5147**

kaela law, Pelham, NH.

Please read the following submission made to the NH PUC by Representative Takesian: <https://www.puc.nh.gov/Regulatory/Docketbk/2014/14-380/COMMENTS/14-380%202015-07-14%20C%20TAKESIAN%20COMMENT.PDF>

We would like to mirror many of her questions made to the PUC here with your agency as well.

We require the company (Kinder Morgan or Tennessee Gas) and the FERC to provide answers to all of these questions regarding the Concord Lateral pipeline system.

Thank you.

**20150811-5174**

Steven McGettigan, Temple, NH.  
Steven and Niki McGettigan  
PO Box 101  
Temple, NH 03084

August 6, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

Re: Project Docket Number PF14-22-000

Dear Ms. Bose:

We are writing to voice our opposition to the Northeast Energy Direct (NED) pipeline that is being proposed by Kinder Morgan/Tennessee Gas Pipeline.

Kinder Morgan and Tennessee Gas Pipeline have put the cart before the horse in their rush to gain FERC's approval for this project. When their original pipeline path proposed for northern Massachusetts met with too much costly opposition they responded by creating a new path circumventing that area and re-routing the pipeline into southern New Hampshire. After crossing 17 New Hampshire communities, this newly proposed path eventually routes the pipeline right back down into northern Massachusetts where it again continues onward toward its original destination in Dracut.

Kinder Morgan and Tennessee Gas Pipeline are attempting to push through this project with little concern for protecting our fragile environment and conservation lands, for the long-term health of our citizens, and for New England's actual need for natural gas. Instead, they are showing major concern for minimizing their own corporate costs and creating huge profits for their shareholders.

There has been essentially no public need demonstrated for constructing this massive-sized pipeline that can't be met with our already existing pipeline infrastructure. I believe that after two years of trying, not a single contract has been signed to purchase any of this natural gas for electricity generation. The only potential New Hampshire customer contracted to purchase even a small amount of this natural gas is Liberty Utilities whose parent company is the Algonquin Power and Utilities Corporation (APUC) based in Canada. Interestingly, according to APUC's 2014 Annual Report, Algonquin formed a development partnership in Kinder Morgan's Northeast Energy Direct pipeline project in November 2014. It appears the company is essentially contracting to purchase gas from itself, pretending there is an actual need. New Hampshire is already a net exporter of the electricity we produce here.

Experts who understand far more about how Kinder Morgan and Tennessee Gas Pipeline operate, explain that the companies' real intention is to build this pipeline in order to transport this highly-contaminated, natural gas into Canada where it will be converted into liquid natural gas and then exported at a higher price than American companies are willing to pay. Along the pipeline, some of the largest compressor stations in America ever to be constructed will blow off this contaminated gas, causing all kinds of health and pollution issues in this up-to-now, beautiful unspoiled part of America. We do not understand how exporting this natural gas will make America energy independent.

We respectfully ask FERC to deny approval for this pipeline that would provide huge corporate profits for Kinder Morgan and Tennessee Gas Pipeline at the expense of New Hampshire's citizens and environment.

Sincerely,

Steven and Niki McGettigan

**20150812-0008**

7/28/2015

DOCKET 1PF14-22-000 NE Energy Direct Project - Kinder Morgan Pipeline

Federal Energy Regulatory Commission

888 First Street NE, Room 1A

Kimberly D. Bose, Secretary

Ms. Bose,

It is with significant anxiety that I am writing to you regarding the proposed NE Energy Direct Project involving the construction and operation of facilities by Tennessee Gas Pipeline Company, LLC.

My name is Katherine M. Guilmette. I live at 42 Boyd Road in Hudson, NH. Since relocating from Massachusetts in 1993, I have spent the past 22 years renovating my property to create a home. It is a secluded site of nearly 12 H acres consisting of a small ranch house set back 400'rom the street, 2 car garage with detached barn. The property parallels the high-tension wires although they are not Vjsible due to the natural tree barrier. My two main objectives for reloca'.irg to Hudson, NH were for privacy and to be in the country. The location of this particular parcel allowed me to continue my employment due to a manageable commute, renovate a suitable dwelling surrounded by land providing pastures for my horses while maintaining my privacy.

Based on the proposed route for the NE Energy Direct Project gas pipeline, my property will be adversely impacted. I may even lose my home. The trees will disappear. My artisan well maybe contaminated or destroyed. The animals including but not limited to silver fox, deer, red-tailed hawks, pileated woodpeckers, wild turkeys, fisher cats, ducks, salamanders, turtles, frogs, the occasional meandering skunks and a myriad of migrating birds including the Rose-breasted Grosbeaks and hummingbirds, will be displaced. I'm certain you will agree that this environmental destruction is not in support of NH's state slogan, "Live free or die" or is it?

In working for nearly 42 years to make a home, this proposed gas line will devalue my property significantly. If my land is taken by eminent domain, it will force my relo ation. If the line is installed I could be the victim of incineration should there be an explosion. No one, including Kinder Morgan, can guarantee my safety.

I understand the need for clean energy however; based on my research, this gas line is not required by NH residents to meet their energy needs but for other states including export. Why should NH subject itself to environmental destruction for the benefit of shareholders? Perhaps, wind, hydro and solar options should be NH's avenue for providing its residents with clean renewable energy versus destroying our precious landscape

I ask that you consider the substantial environmental impact this proposed gas line wi'.I create not only for me but others who live in the affected areas or have relocated to NH for the reasons stated above.

Thank you for your time.

Sincerely,

Katherine M. Guilmette

NIKI TSONGAS  
3rd DISTRICT, MASSACHUSETTS

July 20, 2015

Chairman Norman C. Bay  
Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

Dear Chairman Bay,

I write to express some of the concerns my constituents and local advocacy groups have raised with me relating to the scheduling of Federal Energy Regulatory Commission sponsored scoping meetings regarding the Northeast Energy Direct Project. As FERC released the Notice of Intent to Prepare an Environmental Impact Statement for the Northeast Energy Direct Project on June 30, 2015, the FERC sponsored scoping meetings are currently scheduled along the project's impacted communities throughout July and August.

The initial release of resource reports by Kinder Morgan were voluminous, with hundreds of pages of information for my constituents and other interested parties to read through to determine how the proposed Northeast Energy Direct project may affect their communities. As is common for projects of this size, some key pieces of information were left incomplete and are likely to be clarified in the second round of reports which Kinder Morgan plans to release in late July. However, holding the scoping meetings only weeks after the newest round of resource reports are released does a disservice to my constituents who wish to attend the scoping meetings fully informed of the potential impacts and prepared to ask knowledgeable questions in order to better inform FERC of local issues that must be examined in the Environmental Impact Statement.

As Kinder Morgan will be releasing the second round of resource reports in late July 2015, I respectfully request that the FERC sponsored scoping meetings be held 30 days after the second round of resource reports are publicly released. I ask that you give this request every appropriate consideration. If you have any questions please do not hesitate to reach out to me directly, or your staff can contact my Economic Development Representative, Russell Pandres at 978-459-0101 or russell.pandres@house.gov.

Sincerely,

Niki Tsongas  
Member of Congress

**20150812-5005**

Alan Austin, Averill Park, NY.

I am a resident of Nassau, NY, and I am requesting that FERC issue a new Notice of Intent, schedule new

Scoping Meetings, and allow a new, full 60-day Comment Period for the NED Pipeline Project.

This is because Kinder Morgan submitted a brand new 6,571 page set of Resource Reports for a different sized project than that which was discussed in the original Scoping Meetings. These new reports were filed AFTER the PA and NY Scoping Hearings, and 4 DAYS PRIOR to the MA and NH Scoping Meetings.

Because of this late submission with major changes, there has not been sufficient time for anyone to evaluate the new Reports. All comments from the Scoping Hearings are without a proper basis, and therefore meaningless and incomplete.

The Scoping Hearings are a necessary and crucial part of the review process, and a correct and complete statement of the proposed project is an absolute requirement for a fair and complete review. Please reset the timeline for new Scoping Hearings, based in fact, on the new set of Resource Reports.

Thank you for considering this important matter.

Sincerely,

Alan Austin

Nassau, NY

Comments

Re: Northeast Energy Direct Project (NED)      FERC Docket # PF-14-22

Definitions:

The NED is purported to be a “natural gas” pipeline project. Natural gas is defined as consisting mostly of methane with varying amounts of ethane, propane, butane, and nitrogen.

According to 15 U.S. Code § 717a natural gas means either natural gas unmixed, or any mixture of natural and artificial gas.

Nowhere in the law does the meaning of natural gas include the addition of specified and unspecified hydraulic fracturing chemicals, as well as radioactive compounds such as radon, which this pipeline will carry. This raises the question of whether current law can apply to pipelines carrying these chemicals. One may conclude that since the carriage of hydraulic fracturing chemicals is not defined in current Federal law, that regulation of these substances falls to the states and is outside the scope of FERC regulation of interstate natural gas pipelines.

Chemical contained in fracturing liquids may be regulated under Massachusetts 301 CMR 41.00: TOXIC OR HAZARDOUS SUBSTANCE LIST which is governed under M.G.L. c. 21I, §§ 4(C) and 9.

These include methanol, ethylene glycol, naphthalene, benzene, xylene, toluene, ethylbenzene, formaldehyde, and sulfuric acid, dimethyldisulfide, ethyl-methylethyl disulfide, trimethyl benzene, diethyl benzene, tetramethyl benzene, carbon disulfide, naphthalenes, methyl pyridine, carbonyl sulfide, some of which are known to be toxic, carcinogenic, neurotoxic and associated with reproductive harm. Many of these compounds are also regulated in other industries under the Safe Drinking Water Act (SDWA) and the Clean Water Act (CWA) as hazardous water pollutants (Safe Drinking Water Act of 1974; Clean Water Act of 1972; US HOR 2011).

This is clearly not “natural gas” under the meaning of the law.

Necessity:

What is the demonstrated need for additional gas supply in the Northeast?

Is there data from non-industry, scientific sources which quantify that need?

What percentage of the transported gas is intended for export?

What will be the effect on retail prices from exportation of large quantities of gas?

The financial press which covers the energy industry indicates that exportation of gas will lead to large swings in seasonal prices of gas. It is also reported that Kinder-Morgan is purchasing and developing numerous gas liquification plants at numerous East Coast locations. The implication of this is a clear intent to export.

Furthermore, the current gas distribution infrastructure in the Northeast is aged and leaky. Estimates for the Boston area, based on a Duke & Boston University study demonstrated 3,356 methane leaks in greater Boston. This translates to 300,000 metric tons of natural gas leaks — about 2.7 percent of all natural gas delivered to the region. This is enough to supply 200,000 homes per year. Repair of these leaky pipelines, now mandated by law, will reduce the overall energy needs of the region substantially and needs to be factored into the actual projected need for natural gas.

Looking into the CO<sub>2</sub> emissions averaged over all sources of electric generation in MA, the average per source is 910 lb. per MWh. The average natural gas generation plant is 1,210 lb. per MWh. Natural gas has done its “bridge” work. With renewables phasing in at an unprecedented rate, adding more natural gas would now take us in the wrong direction for achieving the state’s greenhouse gas emissions goals – based on CO<sub>2</sub> output alone.

Natural gas is also primarily methane, a greenhouse gas over 86 times more powerful than CO<sub>2</sub>. When a full accounting of methane’s impact is taken into consideration, studies show that it has no benefit over coal or oil in reducing greenhouse gas effects.

Routing:

The overall planned route of the NED pipeline in the northwestern tier of the state will traverse what is arguably the last pristine region of Massachusetts. The route is planned to cross many environmentally sensitive and constitutionally protected lands.

It intersects 206 Wetlands, 15 Outstanding Resource Waters, 13 public water supplies, 2 scenic/protected rivers, 4 wellhead protection areas, 34 certified

Vernal Pools, and 12 aquifers.

It intersects 72.2 miles of “core habitat” lands, including areas identified as necessary for wildlife protected under the Massachusetts Endangered Species Act or State Wildlife Action Plan, Critical Natural Landscapes, and Areas of Critical Environmental Concern (ACECs), as well as over 37 miles of secondary habitat including open recreational spaces and areas that MassGIS characterizes as “

extensively forested portions of the Massachusetts landscape where forest cover is relatively unfragmented by human development.

It passes through close to 10 miles of primary or secondary social protection areas, including primary school lands, areas protected by the state’s Environmental Justice (EJ) policies, areas protected by the Massachusetts Community Preservation Act (CPA), and places identified in the Massachusetts Historic Commission inventory.

The pipeline will cross many areas identified in the Massachusetts BioMap2 as Core Habitat and Cortical Natural Landscape. The routing proposed will, by necessity, disrupt much of the critical ecosystem in its path, both during construction and operation.

The pipeline will also cross Westfield Brook and the West Branch of the Westfield River by drilling under those waterways. These streams contain populations of naturally reproducing trout species, which is a rarity in Massachusetts. As such, it is an invaluable resource to the entire state.

The Westfield watershed is one of 3 federally-designated Wild & Scenic River in Massachusetts. Will it be able to maintain this designation in the face of a pipeline?

How will Kinder-Morgan ensure the safety not only of the fish populations in these streams, but the inver-

tebrate life upon which they depend, such a mayfly & caddis fly species? Trout and the insect life on which they depend require clean, cold water for survival.

How will Kinder-Morgan ensure that the spawning area for these fish is not disrupted?

Will they monitor the health of the resident trout to ensure that they are safe for human consumption? Trout, being salmonid species, have abundant adipose tissue. These tissues will accumulate contaminant hydrocarbons in their environment. These are the kinds of chemicals found in “fracking fluid”, which has the potential to leak from the pipeline.

Will they monitor the health and populations of the invertebrate species in these watersheds? They are just as sensitive as trout to hydrocarbon contaminants.

The pipeline route will also interrupt the migratory and local routes of mammalian wildlife such as moose, deer and bear. How will Kinder-Morgan assure that the impact on these species is minimized?

Safety & Maintenance:

Kinder-Morgan is probably the wrong company to undertake this project. It has a long history of pipeline accidents and compressor station explosions. Of the major pipeline companies, they are reputed to spend the least on maintenance and safety per mile of pipeline. In comparison, Spectra Energy spends

From the financial research firm Hedgeye in 2013:

“We believe that Kinder Morgan’s high-level business strategy is to starve its pipelines and related infrastructure of routine maintenance spending in order to maximize Distributable Cash Flow...

In our view, Kinder Morgan cuts, defers, and eventually finances the [Limited Partnership’s] maintenance spending...

A broader, and more important concern is the reliability and safety of Kinder Morgan’s pipeline’s. In 2012, Kinder Morgan acquired El Paso, then the largest natural gas pipeline company in the US, in a +\$30B deal; Kinder Morgan has already cut maintenance expenses by 70-99% and maintenance [capital expenditures] by ~60% on most of those assets. In our view, it is alarming that Kinder Morgan supporters believe that this is a sound business practice.”

Kinder Morgan’s pipelines are plagued by leaks and explosions, including two large and dangerous spills in residential neighborhoods in Canada. One hedge fund analyst has accused the firm of “starving” its pipelines of maintenance spending.

Kinder Morgan was convicted on six felony counts after one of its pipelines in California exploded, killing five workers.

A review of accidents on Kinder Morgan pipelines across the country shows more than 20 since 2003 that were serious enough to be reported to the Pipeline and Hazardous Materials Safety Administration. Here are some examples:

August 2003: Kinder Morgan 26-inch diameter natural gas pipeline exploded in a farming area in Caddo County, Okla., throwing a 54-foot long section of pipe 30 feet from the ditch.

May 2005: Kinder Morgan 30-inch diameter natural gas pipeline exploded near Marshall, Texas, sending a giant fireball into the sky and hurling a 160-foot section of pipe onto the grounds of an electric power generating plant. Two people were hurt, 40 evacuated.

July 2006: Kinder Morgan Tennessee Gas pipeline exploded near Campbellsville, Ky., blowing a 25-foot chunk of pipe out of the ground and sending it 200 feet away.

September 2008: Kinder Morgan gas pipeline manifold exploded and burned for more than 10 hours in Pasadena, Texas, injuring one employee. The Houston Chronicle reported the blaze “could be seen for miles.”

August 2011: A flash fire at a Kinder Morgan gas pipeline south of Herscher, Ill., sent five employees to the hospital.

November 2011: A weld failed on a 36-inch diameter Kinder Morgan Tennessee Gas Pipeline near Glouster,

Ohio, leading to an explosion that caused a blast crater 30 feet across and 15 feet deep. Three homes were destroyed by the fire.

June 2012: A 26-inch Kinder Morgan natural gas pipeline failed in Gray County, Texas, blowing a crater 30 feet in diameter, burning two acres of agricultural land and closing State Highway 152 for several hours.

June 2013: in Louisiana, a 30-inch diameter Kinder Morgan pipeline ruptured and exploded in a rural area of Washington Parish. No one was seriously hurt, but 55 homes were evacuated. - See more at: <http://www.unionleader.com/article/20150208/NEWS05/150209202&template=mobileart#sthash.9FvM39bm.dpuf>

In 2009, the

Pipeline and Hazardous Materials Safety Administration (PHMSA) cited Kinder

Morgan for violating safety standards regarding the distance between a natural gas pipeline and a “high consequence area” such as a school or hospital; the pipeline was too close for safe operation in case of a leak.

PHMSA letter to Richard Kinder, September 1, 2009,

[http://primis.phmsa.dot.gov/comm/reports/enforce/documents/520071008/520071008\\_FinalOrder\\_09012009\\_text.pdf](http://primis.phmsa.dot.gov/comm/reports/enforce/documents/520071008/520071008_FinalOrder_09012009_text.pdf), accessed 2014-06-18.

In 2011, PHMSA cited Kinder Morgan for these safety violations:

failing to maintain update maps showing pipeline locations,

failing to test pipeline safety devices,

failing to maintain proper firefighting equipment,

failing to inspect its pipelines as required, and

failing to adequately monitor pipes’ corrosion levels.

Pipeline and Hazardous Materials Safety Administration (PHMSA) letter to Hugh

Harden, Kinder Morgan, Feb. 28, 2011,

[http://primis.phmsa.dot.gov/comm/reports/enforce/documents/520115005/520115005\\_NOPV%20PCO\\_02282011\\_text.pdf](http://primis.phmsa.dot.gov/comm/reports/enforce/documents/520115005/520115005_NOPV%20PCO_02282011_text.pdf), accessed June 2014.

In 2013, the headline “Wall Street Worries About Kinder Morgan’s Safety Record: BC pipeline operator slashes and defers maintenance spending” was a concern to anyone who lived or worked near a Kinder Morgan pipeline.

On May 7, 2015, Peabody Citizens United discovered an email from Kinder-Morgan in which a person working for KM’s Boston-based lobbyist reveals that the company will pay people in our communities to advocate for the pipeline. The email says that they are looking to recruit people who are active and well-known. They’re looking for former elected officials, PTO officers, youth sports league presidents, etc. They are also looking for coordinators in central and western Mass.

Here are some excerpts from that email:

“I am helping coordinate this Pipeline campaign, and have been asked to recommend County Coordinators (pays more), and Community Coordinators (pays less). I have been asked to recommend (or find) good potential coordinators in the central and western MA. I need to find a County Coordinator for Essex County, and Community Coordinators for Andover, Lynnfield, Methuen, Danvers, Middleton and Peabody.

“Again these are paid coordinators (not a lot of money) but should last for a significant amount of time, at least a year.

“These coordinators should have some kind of political and community resume (former Selectman, Little League President, American Legion Commander, PTO President, Chamber Executive, former Campaign Manager etc.). Another [sic] words people that have respect and clout in their community.”

Is this the kind of company Massachusetts can afford to do business with?

In further regard to pipeline safety, K-M plans to use the thinnest walled pipe permitted in the sections

traversing rural areas. These pipes will be at higher risk of corrosion, rupture and shorter life-span. Much of the western Massachusetts route will run alongside existing high-tension transmission lines. The electric fields generated in proximity to the lines have been demonstrated to accelerate the corrosion inherent in steel pipes.

Aggravating the electromagnetic effects are thermal fluctuations which occur at the higher elevations in Berkshire County. These will add thermal stress as an additional risk factor. I routinely note an 8-13o F difference from Dalton to Windsor along Route 9. Metals heated or cooled at different temperatures will expand or contract at different rates. This differential response has the potential to cause small defects in the pipe or weld to enlarge, possibly catastrophically.

What is the engineering response of K-M to these environmental stressors on their metal pipes?

In the pipeline cleaning process a robotic “pig” is sent through the line to scrub it and when it exits the pipe substantial amount of fracking chemicals are spilled into the environment.

What is the engineering response of K-M to containment of these toxic chemicals?

Potential Terror Target:

We have recently had in Adams, MA the arrest of young man who is alleged to have plotted a terror attack using home-made bomb material, found in his home. The pipeline, and particularly the compressor stations, may make an inviting target for terrorists, local or foreign. What steps will Kinder-Morgan take to ensure the security and resistance of its facilities to bomb and other attacks?

Disaster Management:

Given the reasonable chance of a catastrophic event, such as a pipeline or compressor explosion, it is important to be aware of the limited resources available in the Berkshires to respond to such an event. Access to remote areas, particularly in winter, is severely limited. The potential for wide-spread and/or uncontrollable environmental destruction, such as fire, exists.

How will K-M respond to such an event? Or, is it the problem of the local communities affected?

In the event of multiple human casualties associated with such an event, it may be beyond the capacity of local medical resources to handle such an event. I am the Trauma Medical Director at Berkshire Medical Center and sit on our Emergency Management Committee. In that capacity, I can assure you that an event involving more than 4 or 5 synchronous casualties will rapidly exceed our resources.

Will K-M arrange to immediately bring in the resources needed to cope with such a disaster?

Water Supply:

This issue has been addressed in more detail by others, but suffice it to say that any upstream event can lead to contamination of the main drinking water resources for the larger downstream communities. Basically, everything east of Dalton is upstream to the drinking water for Pittsfield and Dalton.

“abandoned in place”:

Given the uncertain nature of the economic viability, due to market conditions, and long-term availability of supply, of hydraulically fractured gas, there is a real risk that the pipeline may be abandoned after it has been constructed. The natural fate of steel in the ground is to corrode. If conventional natural gas was what was in the pipeline, that may not be such a great problem. However, the presence of fracturing chemical left in the pipeline presents a different set of issue. The material is likely to leach into the ground and groundwater over time.

Will K-M be required to remediate this environmental time-bomb? Or will they be allowed to “abandon in place”- as described in FERC’s literature?

Noise, Air Pollution, Toxic Releases:

My home is located less than 3 miles north of the proposed site for a compressor of yet to be specified power (anywhere between 80,000 to 44,000 hp). The standard operation of compressors involves “blow-

downs”, where material in the pipeline is released into the air. This will include the toxic materials from fracking chemicals. In the heavy snowpack experienced in Windsor, the fallout will accumulate in the snow and released into the ground during thaws.

How does K-M intend to monitor and mitigate the release of toxic material from its compressors?

High-power compressors emit noise, as high as 100 dBs. What steps will K-M take to mitigate noise pollution? Will they consider locating the compressors underground? Or with a large containment wall? How will they measure the effect on local wildlife of the noise emission?

Clash of Values:

At the end of the day, the proposal to run the Northeast Energy Direct pipeline through northwestern Massachusetts and the opposition engendered by it represents a fundamental clash of values. Massachusetts has made a commitment to reduce its carbon footprint as a matter of state policy. We have led the country in the changeover to renewable resources for electric generation for the last 4 years. The introduction of a fracked gas pipeline flies in the face of those efforts. We have made a commitment to preserve and protect our endangered natural resources and landscapes. A pipeline running through those environmental treasures, for the sake of the profitability of one company, would be an utter abrogation of the public trust. Yes, Massachusetts may need more energy, but we have not accurately determined the extent of that need and how we should best go about obtaining it. Until we do, a pipeline represents one of the worst solutions to a problem that may be resolved by much simpler means, such as conservation, repair of gas infrastructure and expanding the capacity of existing pipelines, such as the Algonquin Incremental Market project. Of interest, Spectra Energy, the owner of Algonquin, has publicly stated that the increased capacity will not be used for export, but to supply southern New England.

In terms of jobs, one argument used in favor of the pipeline is the creation of new jobs. However, most of these will be of short-term during the construction and, if K-M stays true to form, not many will be employed for pipeline safety & maintenance. Energy jobs are more likely to be long-term in Massachusetts in the manufacturing and installation of solar and wind equipment. These will be more sustainable in the long-term.

Massachusetts stands at a juncture which will test its commitment to sustainable energy growth. It may also be called upon to stand up for its sovereign rights as a state versus the considerable power of the federal government.

Alternatives:

Do not issue permits to cross waterways or near drinking water supplies or across constitutionally protected lands.

Remove all fracking chemical from the pipeline at the source or before it enters Massachusetts

Decrease the size of compressors and consider increasing the number of smaller compressors, which can be housed underground and require containment of all blow-down emissions.

In lieu of a new pipeline ... the 2 billion dollar price tag of the Massachusetts section of the Tennessee Gas Pipeline could more prudently be spent installing 4KW rooftop solar systems on 100,000 homes, which would collectively generate 80 million dollars' worth of electricity annually — without compromising the land or our atmosphere. An alternative infrastructure investment such as this at this scale, 400MW, would provide numerous benefits to the public interest while avoiding both critical losses to one hundred years of prior investments in land conservation and exacerbations of climate volatility being experienced today and projected to worsen.

Katie A Wallace, Andover, MA.

I am writing in regards to the Tennessee Gas Pipeline Company's Northeast Energy Direct pipeline expansion project, Docket # PF14-22. I am a resident of Andover, MA and have continued to express our strong opposition to this entire project. My husband and I are along the first proposed route. Our understanding is that in order to proceed with a project of this size, FERC must deem that this project is within the public's best interest. Our greatest concern is that this project is still NOT in the "public's best interest" as a means of satisfying our energy needs. It is imperative that alternative energy solutions be considered. Replace old existing pipeline with new infrastructure consisting of pipeline that meets 2015 standards. This should negate the need for this NED project. Can you confidently advise that these old pipelines meet the safety standards for 2015? Replacing old pipes, even if slightly enlarged, should account for the current energy needs.

Not only does the current customer demand not justify the desired size of the compressor stations, but it also doesn't support this project as a whole. Safety concerns exist for abutters to this pipeline project as all of these proposed routes to date are within a close vicinity to residential areas. Again, along the lines of public safety, what are the safety concerns with having the compressor stations of this size within such a close vicinity to residential areas, especially with the population being more densely packed than it was years ago? Are we at all concerned about public safety related to all aspects of this project, and levels of methane emissions?

I ask that the people from FERC please listen to our concerns and deny TGP the ability to create a new pipeline system. Please ask yourself who is really benefitting from this pipeline project? Is it the citizens in the towns along the routes or this Texas gas company?

**20150812-5009**

C Elizabeth Gibson, Nantucket, MA.

Please accept this comment as a wholehearted objection to any further consideration of this project in its entirety and especially through Massachusetts and New Hampshire. The environmental damage likely to occur, not to mention the extremely critical and documentable health and safety concerns of nearby abutters is beyond alarming. This project should absolutely not proceed. In no way would this project benefit "public convenience and safety". Certainly not for anyone who lives around it - especially someone in an "Incineration Zone"! If homes are going to be placed in "Incineration Zones" as part of this project - that alone should be a resounding NO! Thank you.

**20150812-5010**

Alan Austin, Averill Park, NY.

I am a resident of Nassau, NY. My wife and I moved here 17 years ago for the tranquility, fresh air, lack of noise, rural atmosphere, and the beauty and recreational value of Burden Lake, which we are situated adjacent to. We stretched financially to buy a large house on a large property. It has always felt like our own estate in an ideal community. It has been our dream home, complete with our horses and Koi Pond.

Suddenly, our world has been turned upside down, as we have learned that Kinder Morgan and Tennessee Gas Pipeline plan to build a Compressor Station Complex just 1.6 miles from our home.

Our initial research about the health implications of living near a Compressor Station was enough to make us horrified that this could even be a real possibility in a rural residential zoned recreational area with a beautiful lake and a nearby golf course and country club.

There are dozens of homes closer to the proposed ground zero than we are, and we feel horrible for all of those people who have established roots here. Every home, including ours, will be greatly devalued. Some families will undoubtedly feel a need to leave, including us.

The question for us is who would want to buy our home, 1.6 miles from this toxic spewing monster? Our

home is our largest asset by far, and we had planned on using it to fund our retirement years when we were actually ready to sell and downsize. Will we be devalued by 50%, 80%, or more? Will we have to just give it away and leave? Who knows? Can FERC tell me the financial consequences?

It is just inconceivable to me how FERC could approve this NED Pipeline, and specifically this Compressor Station to be built in a rural residential, recreational neighborhood like ours, with little or no regard to how many peoples' lives it will ultimately destroy.

We have read about the many toxic emissions that these Compressors produce during normal operation, and also during blowdowns, and accidents. There are dozens and possibly hundreds of toxic compounds that are known to be routinely vented to the air during operation. Some are known carcinogens, neurotoxins, and other volatile organic compounds. And there are countless other compounds that have not even been studied to determine their effects on humans.

We need to have more scientific studies about how human health is affected by these noxious emissions.

FERC should not grant licenses to build large Compressors within heavily or moderately populated areas. If these things must be built somewhere, they should be limited to desolate areas, largely unpopulated. Does FERC have any guidelines regarding this?

In our own case, I would like to see Kinder Morgan be required to map out a Corridor of Feasibility for the location of this particular Compressor Station. Make them map out and show alternate areas where the pumps could be placed and still move the gas sufficiently along the NED Pipeline.

I am not wishing to just push the problem onto someone else I don't know, but surely there must be some truly desolate areas of wilderness within reach, to at least minimize this unbelievable problem.

Thank you for considering this important matter.

Sincerely,

Alan Austin  
Nassau, NY

#### **20150812-5011**

Katie Miller, Medford, MA.

The proposed pipeline route will take at least a 125-foot wide easement over both public and private land. With nearly 2.5 miles of pipeline proposed to go through Hudson, NH alone, over 15 acres of land will be permanently lost to this project. The risks of pipeline leaks, explosions, and damage to homeowners' wells from installation blasting are significant environmental risks that would not be voluntarily chosen by area residents. I oppose the pipeline as it is an unnecessary risk to the health and safety of all residents along the proposed route.

#### **20150812-5012**

shannon K Johnson, Averill Park, NY.

My name is Shannon Johnson. I am a year-round resident at Burden Lake, on Lakeshore Drive, in the township of Nassau, less than a mile north of the proposed compression station for the Kinder Morgan fracked gas pipeline. My concerns are the following:

There have been numerous studies on the health impacts of fracking around animals, but none regarding the potential health-effects of off-gassing from compressor stations and pipeline leaks / spills in the vicinity of ecologically sensitive areas such as wetlands containing federally protected species like bald-eagles and loons. Howard Zucker, "Would I live in a community with [fracking] based on the facts that I have now? Would I let my child play in a school field nearby? After looking at the plethora of reports behind me ... my answer is no."

A recently completed study by two Cornell researchers indicates the process of hydraulic fracturing deep shale to release natural gas may be linked to shortened lifespan and reduced or mutated reproduction in

cattle—and by extension humans. i ask that further study be done to confirm the findings in this report related to compression station off-gassing and pipeline leakage both on the ground and into our groundwater systems. <http://is.gd/etLdS8>

I request studies on the impact of a 80K compressor station on humans with auto-immune diseases and compromised respiratory systems within the radius of the off-gassing reach of the station. I request studies on the wind currents that will carry the off-gas elements that settle in lower areas, such as lakes. I request a study on the impacts of the compressor station on our low-lying water areas, Burden Lake in particular including how the water-quality and chemical composition be effected over a long period of time? 5 -10 - 20 years out.

i ask for studies on the impact of protected species living in our area such as the bald-eagle—who eats fish from our lake—the common loon, osprey, box + snapping turtles, all the amphibians and macroinvertebrates that live in these waters and all the waters of the surrounding area (such as tasawasick creek). What will the effect be on our local fisheries and macroinvertebrates? on insects such as honeybees? i ask a study be done on the impacts of constant background noise on the habitats of local species such as the barred owl.

i ask that studies be consulted on the effect of light pollution on both human and animal species and full cut off fixtures be mandated. NED is slated to operate under much greater pressure than other local pipelines, i ask that studies be executed on incidents of documented spills, of pipe failures, compressor station explosions, and other hazards on a pipeline of 32" @ 1400psi. I ask that there be an investigation into the construction impact on the entire region for laying the pipeline and the construction of the compressor station.

The proposed location of the Kinder Morgan compressor station on Clark's Chapel Road is only a mile from a super fund site the "Dewey Loeffel Landfill". I would ask that the impacts of the construction of the proposed project, including blasts, earth removal and truck traffic, be fully investigated as per its potential impact on the contained toxic chemicals in the "Dewey Loeffel Landfill". Also the affects of the construction on well water quality.

The proposed project is expected to have a negative impact on local property values. This is an unfair burden given there will be no benefit to NY'ers who will assume all of the risk. This is unacceptable.

I also request a study to be conducted on the costs to repair road damage from the increase truck traffic due to construction. Our infrastructure is already weak – and roads have potholes that are sorely in need of repair. And increase of heavy vehicular traffic to service the construction of the compression station and the pipeline will increase the wear and tear on the roads in the area. I request a study that will lay-out the costs of that impact.

We also have an increase in summer vacation population on Burden Lake where our numbers double. Among the people who will be affected by the light, noise and air quality pollution include participants in the "Wounded Warriors" program and kids from "Camp Adventure" (serving urban underprivileged children). Fracked gas can contain any number of toxic and radioactive contaminants. The presence of these contaminants in our natural gas system is new, and epidemiological studies have not yet been conducted (although the human health effects of the contaminants themselves are well documented and provide cause for serious concern). Therefore, NED would also expose the people of New England [and NY State] to health risks that have not been quantified.– "Burden of Proof - The case against the proposed NED fracked gas pipeline" Prepared by Michael Feldstein and Kathy Kessler. According to the EPA, ozone components "can travel hundreds of miles on air currents, forming ozone far from the original emissions sources." [1] Therefore, ozone pollutants from Marcellus fracking fields in New York and Pennsylvania should be capable of traveling to Massachusetts and Connecticut with sufficient wind. We are not aware of any studies regarding the potential increase in ozone exposure for the people of New England that could result from the increased fracking activity necessary to keeping NED "full". It is an unquantified health threat. (- Ibid\_ I also request that the FERC scoping hearing period be extended. Please do not close the scoping comment period until 60 days after Kinder Morgan files new, complete Resource Reports.

What would be the impacts of NOT BUILDING A PIPELINE?

For the cited reasons, I respectfully request that FERC deny a certificate of public convenience and necessity for the proposed Kinder Morgan pipeline. There is significant, strong, and growing local opposition to the project as evidenced by four local resolutions against it.

Thank you.

## 20150812-5013

Kathy High, Averill Park, NY.

My name is Kathy High. I am a year-round resident at Burden Lake, on Lakeshore Drive, in the township of Nassau, less than a mile north of the proposed compression station for the Kinder Morgan fracked gas pipeline.

I ask that an investigation be done by FERC on the environmental impact of off-gasing by the proposed compression station on Burden Lake and the water systems in the area. There are various small lakes in the region, as well as streams and marshlands. These are environmentally sensitive areas, where there are delicate eco-systems in place. In my time living on Burden Lake (12 years) we have seen the return of bald eagles (on the “threatened” list of the NY State DEC <http://www.dec.ny.gov/animals/7494.html>), various migrating birds, such as loons and osprey (on the “special concerns” list of NY State DEC), and many reptiles such as turtles including Eastern Box Turtles (also on the “special concerns” list of NY State DEC), snapping turtles and many other species. I also request studies on the wind currents that will carry the off-gas elements that settle in lower areas, such as lakes.

I ask that there be an investigation into the construction impact on the entire region for laying the pipeline and the construction of the compressor station. The proposed location of the Kinder Morgan compressor station on Clark’s Chapel Road is only a mile from a super fund site the “Dewey Loeffel Landfill”. I would ask that the impacts of the construction of the proposed project, including blasts, earth removal and truck traffic, be fully investigated as per its potential impact on the contained toxic chemicals in the “Dewey Loeffel Landfill”. Also the affects of the construction on well water quality.

I also request that FERC conduct studies into the environmental effects on insects and plant life. I am a honeybee keeper and own one of the few surviving hives in our area after the extremely harsh weather last winter. These bees are sensitive to any environmental disturbances – and will soon be extinct if we do not monitor closely the environmental impact. Last year 42% of all bees in the USA perished.

I also request a study to be conducted on the costs to repair road damage from the increase truck traffic due to construction. Our infrastructure is already weak – and many roads here have potholes that are sorely in need of repair. And increase of heavy vehicular traffic to service the construction of the compression station and the pipeline will increase the wear and tear on the roads in the area. I request a study that will lay-out the costs of that impact.

We also have an increase in summer vacation population on Burden Lake where our numbers double. Among the people who will be affected by the light, noise and air quality pollution include participants in the “Wounded Warriors” program (vets with PTSD) and kids from “Camp Adventure” (serving urban underprivileged children).

I moved to this upstate neighborhood from Brooklyn, New York, because of health reasons – I have a series of autoimmune diseases. I request a study on the public health and safety impacts on the health of citizens living within a one mile radius of a compression station – particularly to those who have lung diseases, bowel diseases and cancers. Those of us living in proximity to the compression station will bear the brunt of health impacts from it.

Fracked gas can contain any number of toxic and radioactive contaminants. The presence of these contaminants in our natural gas system is new, and epidemiological studies have not yet been conducted (although the human health effects of the contaminants themselves are well documented and provide cause for serious concern). Therefore, NED would also expose the people of New England [and NY State] to health risks that have not been quantified.

– “Burden of Proof - The case against the proposed Northeast Energy Direct (NED) fracked gas pipeline” Prepared by Michael Feldstein (michael@mfeldstein.com) and Kathy Kessler (kathy.kessler@gmail.com), with support from Berkshire Environmental Action Team and No Fracked Gas in Mass.

Also,

According to the Environmental Protection Agency (EPA), ozone components “can travel hundreds of miles on air currents, forming ozone far from the original emissions sources.” Therefore, ozone pollutants from Marcellus fracking fields in New York and Pennsylvania should be capable of traveling to Massachusetts and Connecticut with sufficient wind. We are not aware of any studies regarding the potential increase in ozone exposure for the people of New England that could result from the increased fracking activity necessary to keeping NED “full”. It is an unquantified health threat. (- Ibid\_

I also request that the FERC scoping hearing period be extended. Please do not close the scoping comment period until 60 days after Kinder Morgan files new, complete Resource Reports.

What would be the impacts of NOT BUILDING A PIPELINE?

**20150812-5034**

### **FERC – Do Your Job**

I am here this evening to ask all FERC commissioners and other personnel to please – DO – YOUR – JOB. You are employed by FERC, the Federal Energy Regulatory Commission. The “R” in “FERC” stands for “Regulatory” and not for “Rubberstamp”.

The definition of Regulatory is “To control or direct according to rule, principle or law”.

The definition of Rubberstamp is “Giving automatic approval or authorization to the decisions of others, without proper consideration”.

Your job is to regulate this industry and the interstate pipelines that it proposes. But instead, you are acting more as a pipeline siting agency – as if your job was simply to decide where a pipeline should go and what remediation should be done along the pipeline path.

A true regulator must first determine the actual need for a pipeline and whether that need outweighs the harm that will be done to the environment, to property rights, to property values, and to the public’s belief that the Federal government is indeed of the people, by the people and for the people.

Massachusetts Senator Elizabeth Warren seems to agree. She has said of FERC: QUOTE “I am very concerned about a regulatory agency that is only able to say ‘yes, yes, yes.’ That’s not the job of a regulatory agency.” UNQUOTE

I am here to ask that FERC:

**One.** Examine the actual need for each pipeline that the energy companies propose to build. The market alone does not determine need – especially when that market consists largely of companies that are themselves pipeline investors and companies that have corporate ties back to the pipeline company.

**Two.** When there are proposals to build multiple pipelines in one region, as there currently are in New England, do not simply consider each pipeline in isolation. Step back and consider the total, cumulative impact of all of the proposals upon the region. Do not blindly approve a massive overbuild of natural gas pipelines.

**And Three.** When you are weighing the impacts of a proposed pipeline against its possible public benefits, consider all of the negative impacts, not just those along the pipeline corridor.

NEPA rules require that you consider the direct, indirect and cumulative impacts of a pipeline. And the December 2014 draft guidance from the Council on Environmental Quality insists that both “upstream” and “downstream” impacts on greenhouse gases and climate change be included in all NEPA reviews.

Unfortunately FERC seems to spend more time explaining why it can’t follow these guidelines than it spends trying to honor them.

In closing, I again remind you that you are a regulatory agency. Please do your job and regulate. The people are depending upon you.

Thank you.

Nick Miller Groton, MA

**20150812-5037**

kaela law, Pelham, NH.

According to the federal register order of notice for the Environmental Impact Statement for the Concord Lateral ( <http://www.gpo.gov/fdsys/pkg/FR-2000-08-21/pdf/00-21148.pdf> ) your agency prepared an Environmental Assessment for the proposed Londonderry 20-inch Replacement Project through the towns of Dracut, Pelham, Windham, Hudson into Londonderry, to expand the capacity of the Concord Lateral. That was in 2000. According to this document again from 2000: <http://www.nhsec.nh.gov/projects/2000-01/documents/decision.pdf> the 20-inch Replacement Project was also approved by the New Hampshire Site Evaluation Committee and was, as we understand, placed into service.

I'm bringing attention to the 20-inch diameter Concord Lateral line because I find it concerning that Kinder Morgan has it marked as a 16-inch diameter pipe in Windham on their July filed Resource Reports.

There are too many discrepancies such as this, within these filings to respond appropriately or to move forward with this project. If the company continues this process of filing with so much erroneous information, the Federal Energy Regulatory Commission must use its leverage to ask the company to freeze the initial project design and restart the entire pre-filing process with all the updates and corrections. Otherwise, the FERC must NOT approve this project as it is being presented.

I would also request a much more thorough examination of the Concord Lateral pipeline system in the state of New Hampshire. An upgrade to certain sections that may count as bottlenecks along this EXISTING system could be an alternative to the Northeast Energy Direct Project and I would request that it is evaluated as such. We have been told by company reps that the Concord Lateral is not presently running at capacity. If this is the case, we would first like to be given a solid number for the capacity on the Concord Lateral as well as the flow rate or psi, and second, if necessary, we would rather see actual incremental upgrades for natural gas along the Concord Lateral –such as a storage facility beside the Granite Ridge power plant in Londonderry as an example, to ensure that the Concord Lateral is being properly and fully utilized, rather than to see the excessive build-out of a brand new pipeline through the region.

In closing, I would request that Kinder Morgan or Tennessee Gas be required to complete and make public through this docket, a thorough analysis and report, subject to independent expert checks for accuracy, on Concord Lateral bottlenecks or restrictions, mitigation of any such bottlenecks or restrictions, and the environmental impacts and costs of doing that versus the large environmental impacts and costs of building the Northeast Energy Direct. The same analysis should be made for smaller improvements to any of the existing lateral lines where flow restrictions exist. If these improvements were made, gas requirements in the New England region could be met with the NO-BUILD option for Northeast Energy Direct.

**LEGACY ENVIRONMENTAL GROUP**  
Michael Hootstein, Principal Hydrogeologist  
PO Box 158  
Shutesbury, MA 01072

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission (“FERC”)  
888 First Street NE, Room 1A  
Washington, DC 20426

August 10, 2015

Dear Secretary Bose,

I have reviewed proponents' July 24, 2015 Draft Resource Reports that refer to mapping data compiled and catalogued by Massachusetts Geographic Information System ("GIS") and the United States Geological Survey ("USGS"). The Massachusetts state legislature established "MassGIS" as the official state agency assigned to the collection, storage and dissemination of state geographic data. It is the single best collection of geographic, geological, and environmental data in Massachusetts.

The Northeast Energy Direct Project proposal to dredge, horizontally drill, and blast an west-east trending tunnel (large enough to contain a 30" diameter pipe), would perforate and hydraulically connect sixty-four (64) miles of north-south trending Massachusetts sand aquifers, aquitards, streams, wetlands and water-yielding bedrock strata. The dredging/drilling/blasting of such an extremely large manmade preferential groundwater pathway for contaminant transport is likely to cause a foreseeable harmful impact to drinking water and human health, and "Damage to the Environment" as defined by Massachusetts Environmental Policy Act ("MEPA") regulations (310 CMR 11:02):

"Any destruction or impairment ... , actual or probable, to any of the natural resources of the Commonwealth including, but not limited to... water pollution ... reduction of groundwater levels, impairment of water quality... [of] rivers, streams, flood plains, lakes, ponds or other surface or subsurface water resources... wetlands, natural areas, parks."

Therefore, it is essential that the EIS include comprehensive scientific assessment of foreseeable (direct, indirect and cumulative) pipeline and compressor station impacts to drinking water, human health and the environment. Scientific assessment should transparently incorporate essential Massachusetts GIS and USGS mapping data. Given the heterogeneous (nonhomogeneous) variable nature of the surficial (glacial) geology and deformed bedrock underlying all of Massachusetts, the proponents should be required to construct individual threedimensional conceptual models for each individual town, of the extremely large manmade preferential groundwater pathway for contaminant transport that would be located in each individual town.

The attached Indiana Technical Guidance Document, "Investigation of Manmade Preferential Pathways for Contaminant Transport" defines "preferential groundwater pathway" ([http://www.in.gov/idemlfiles/remediation\\_tech\\_guidance\\_investigation\\_mpp.pdf](http://www.in.gov/idemlfiles/remediation_tech_guidance_investigation_mpp.pdf)) as:

"The route of least resistance for fluid flow, or a more permeable feature than the surrounding materials. The pathway may extend vertically or horizontally and be derived naturally or by human activities. The feature may also be oriented such that fluid flow could go in an unexpected direction. Generally, they are limited in width from microscopic to a few tens of feet but are often extensive in length. Examples include sediment grain size changes from fine to coarse; buried stream channels; fractured or dissolved bedrock; desiccation fractures in sediments; improperly sealed wells ... buried utility lines ... If the regional and local geology is known, then the potential effects of these ... [preferred] pathways can be explained during site investigation ... Once subsurface materials have been disturbed, they are usually more permeable than naturally deposited sediments ... Manmade preferential pathways can transmit contaminants tens to hundreds of feet away from the release point as pure product, in a vapor phase, or dissolved in water ... Vapors may move great distances through porous conduits and backfill ... In addition, preferential pathways can provide a vertical migration route to deeper levels in the aquifer by intersecting and breaching so-called confining layers."

Proposed pipeline risk assessments should be performed in accordance with the Energy Policy Act of 2005 Title XIV Subtitle A, Section 1401 Amendment "Sense of Congress on Risk Assessments":

"Federal Agencies conducting assessments of risks to human health and the environment from energy technology ... transport, transmission, distribution ... shall [writer's emphasis] use sound and objective scientific practices in assessing such risks, shall consider the best available science (including peer-re-

viewed studies), and shall include a description of the weight of the scientific evidence concerning such risks.”

Disturbingly, the proposed pipeline project defies the National Environmental Policy Act (“NEPA”), 42 USC §4331 Sec. 101 “Congressional Intent”:

“(a) The Congress recognize[s] the profound impact of man’s activity on the interrelations of all components of the natural environment, particularly the profound influences of ... resource exploitation ... recognizing further the critical importance of restoring and maintaining environmental quality to the overall welfare and development of man, declares that it is the continuing policy of the Federal Government, in cooperation with State and local governments ... to use all practicable means and measures ... in a manner calculated to foster and promote the general welfare, to create and maintain conditions under which man and nature can exist in productive harmony, and fulfill the social, economic, and other requirements of present and future generations of Americans.”

“(b) In order to carry out the policy set forth in this Act, it is the continuing responsibility of the Federal Government to use all practicable means [to] ... fulfill the responsibilities of each generation as trustee of the environment for succeeding generations ... [and] assure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing degradation, risk to health or safety, or other undesirable and unintended consequences.”

The proposed pipeline project, if constructed, would violate Massachusetts citizens’ human and civil rights granted by the Massachusetts Constitution, Declaration of Rights Article XCVII (97):

“The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose.”

“Best available” scientific inquiry requires the proponents to provide, individually for each Massachusetts town, a series of same-scale Massachusetts GIS and USGS data layer maps and a corresponding same-scale proposed pipeline CROSS-SECTION (three-dimensional conceptual model) for each town delineating: 1) surface elevations and locations of compressor stations; and 2) depth below grade and thickness of: a) surficial (glacial) strata; b) bedrock strata; c) aquifers or aquitards; d) naturally occurring or manmade contaminants; and e) proposed pipeline trenches/tunnels (denoting where trenched, drilled or blasted).

“Best available” scientific inquiry requires the proponents to provide, individually for each Massachusetts town, a series of the following same-scale Massachusetts GIS and USGS data layer maps upon which the proposed pipeline route through each town, and compressor stations, is/are unambiguously delineated:

- Topographic Contours w/Rivers/Streams/Lakes/Access Roads, Etc.
- Soils
- Surficial (Glacial) Geology
- Bedrock Lithology
- Public & Private Water Supplies & Wells
- Assessor Parcels Denoting Individual Private Residences & Wells
- Parcels protected under Massachusetts Constitution Article 97
- Watersheds
- Wetlands
- Aquifers, Water Availability & Yield of Bedrock Wells
- Hydrography Water Features
- Water Quality
- USGS Study Maps by Town: “Probability of Exceeding the Arsenic Drinking Water Standards in Pri-

vate Drinking Water Wells” ([www.mass.gov/eealdocs/dep/water/drinking!aulautownmaps.pdf](http://www.mass.gov/eealdocs/dep/water/drinking!aulautownmaps.pdf))

- USGS Study Maps by Town: “Probability of Exceeding the Uranium Drinking Water Standards in Private Drinking Water Wells” ([www.mass.gov/eea/docs/dep/water/drinking!aulautownmaps.pdf](http://www.mass.gov/eea/docs/dep/water/drinking!aulautownmaps.pdf))
- Protected and Recreational Open Space & Town Forests
- Areas of Critical Environmental Concern
- Massachusetts DEP Oil and/or Hazardous Material Sites with Activity and Use Limitations (AUL)
- Massachusetts DEP Tier Classified Chapter 21E Sites
- Massachusetts DEP Wellhead Protection Areas (Zone IIs, IWPA)
- Surface Water Supply Protection Areas (Zones A, B, C)
- Title 5 Setback Areas
- Underground Storage Tank Locations
- FEMA National Flood Hazard Layer
- BioMap2
- NHESP Priority Habitats of Rare Species
- NHESP Estimated Habitats of Rare Wildlife
- NHESP Certified Vernal Pools
- NHESP Potential Vernal Pools
- NHESP Natural Communities
- MHC Historic Inventory

In conclusion, it is essential that the EIS include comprehensive scientific assessment of foreseeable (direct, indirect and cumulative) pipeline and compressor station impacts, to drinking water, human health and the environment, that transparently incorporates essential Massachusetts GIS and USGS mapping data.

The Northeast Energy Direct Project proposal to dredge, horizontally drill, and blast an west-east trending tunnel (large enough to contain a 30” diameter pipe), would perforate and hydraulically connect sixty-four (64) miles of north-south trending Massachusetts sand aquifers, aquitards, streams, wetlands and water-yielding bedrock strata. The dredging/drilling/blasting of such an extremely large manmade preferential groundwater pathway for contaminant transport is likely to cause a foreseeable harmful impact to drinking water and human health, and “Damage to the Environment” as defined by Massachusetts Environmental Policy Act (“MEPA”) regulations (310 CMR 11:02).

Please consider alternatives to this dangerously proposed pipeline project, especially the “no action alternative” under which the project is not permitted. Thanks for your consideration.

Respectfully submitted,

Michael Hootstein

## **Background**

The following facts, observations, and examples are based on multiple scenarios encountered by IDEM in which manmade conduits have greatly influenced the ground water hydraulics and/or the distribution and extent of subsurface contamination. This listing does not cover every potential scenario or investigative technique. It is intended for informative purposes only.

Preferential Pathway: The route of least resistance for fluid flow, or a more permeable feature than the surrounding materials. The pathway may extend vertically or horizontally and be derived naturally or by human activities. The feature may also be oriented such that fluid flow could go in an unexpected direction. Generally, they are limited in width from microscopic to a few tens of feet but are often extensive in length. Examples include sediment grain size changes from fine to coarse; buried stream channels; fractured or dissolved bedrock; desiccation fractures in sediments; improperly sealed wells; field tiles; buried utility lines; and building foundations.

Variability exists in all natural materials. Perfectly regular grain size, distribution, and shape rarely occur in naturally deposited sediments. Thus paths of lesser resistance for movement of fluids naturally exist in almost every geological environment. These pathways range from the intuitively obvious to the very subtle. Well known natural preferential pathways include such features as karst, fractured bedrock, and lithologic changes. More subtle kinds of pathways include vertical fractures in clay soils, angled bedding planes in sands, and millimeter thick silts in clay-rich glacial tills. Natural pathways can range in size from tens of feet (abandoned stream channels), to less than an inch (fractures in clay tills), to microscopic (changes in grain orientation or shape). Most of these heterogeneities can be addressed with a clear conceptual geologic site model and/or a well-designed remedial strategy. If the regional and local geology is known, then the potential effects of these natural pathways can be explained during site investigation and compensated for in remedial action.

Unfortunately, most remediation sites are also located in developed areas where the original subsurface environment has been altered. Even areas that do not appear to be developed have often been changed by human activity. Soils in these areas may have been disturbed by drainage improvements, subsurface utilities, leveling of the ground surface, or excavation for building. Often these features are completely unknown to the investigator.

### **Why are Manmade Preferential Pathways Important?**

Once subsurface materials have been disturbed, they are usually more permeable than naturally deposited sediments, regardless of their composition and grain size. For example, sand used for fill is more permeable than naturally-deposited sand because fill is simply poured into a void rather than sorted by water or compacted by glaciation. Textbook porosity and permeability values assume that materials are uniform and compacted, and these values cannot be used to estimate the nature of backfill.

Manmade preferential pathways can transmit contaminants tens to hundreds of feet away from the release point as pure product, in a vapor phase, or dissolved in water. This movement can often be in directions up-gradient or cross-gradient of a release. Manmade pathways can be an issue regardless of depth to ground water. In areas where ground water is deeper than a pathway, vapors may move great distances through porous conduits and backfill. Where shallow ground water is present, product and dissolved phase plumes can travel quickly and without attenuation beyond the property boundary. In addition, preferential pathways can provide a vertical migration route to deeper levels in the aquifer by intersecting and breaching so-called confining layers.

Manmade preferential pathways can act as both a conduit and a barrier to migration. For example: Borings are placed on both sides of a conduit. The up-gradient area is contaminated but the down-gradient area is not. The initial conclusion is that the site characterization is complete. This is not necessarily accurate. If the backfill is transmissive, the contaminant may have just taken a turn and becomes a very long, narrow plume

moving along the conduit. If the backfill is finer grained than the surrounding soils (which can happen) or a subsurface structure is present, the obstacle may deflect or be a barrier to contaminant transport, and contaminants may pool behind the barrier until they find a release point.

As part of the conceptual site model, it is not enough to know only that manmade preferential pathways may exist. It is also imperative to know where they are located horizontally, vertically, and with respect to the release area. The conceptual site model should also seek to understand how preferential pathways may affect the hydraulic properties of the subsurface. This preferential pathway survey typically involves a more comprehensive view of the site layout, the site's surroundings, the local and regional geology and topography, and the degree and age of urbanization in the area.

### **Identification of Preferential Pathways**

Identification and evaluation of preferential pathways should begin before or run concurrently with the investigation of a release. Often, an investigation proceeds forward with delineation from a 'source' but considers neither the mechanism of the release nor the property's characteristics or prior history. This can lead to wasted effort by misinterpreting the distribution of contamination. In order to prevent this from happening, the investigator should step back from examination of the release, and view the site as a whole.

The purpose of this section is to present a list of the common, subsurface elements which can influence soil source geometry, vapor intrusion, and contaminated ground water flow. One or more of these elements are present at nearly every site.

1. **Storm/Sanitary Sewers**: These are the most common preferential pathways associated with subsurface releases of contaminants. Sometimes, they are the actual source area, because wastes have been poured down a drain or the storm sewer has received run-off from a surface spill. Storm sewers and some older sanitary lines are designed to allow leakage into the subsurface as they move water away. Lines installed prior to the 1980s are usually vitrified clay tile and are prone to breakage and cracking. Sewers should always be at least initially assessed, as they are present at nearly all sites. Not only should the main line(s) be identified, but the lateral(s) into the site buildings need to be located. If there are floor drains within buildings, they need to be diagrammed as well.

Even if the overall ground water table is below the sewer lines, the sewer may still be influencing contaminant distribution. Vapors can travel along conduits and create indoor air issues. Additionally, localized perched aquifers may be associated with the lines, and in some areas sewer main lines can be as much as 30 feet deep. So, it is not enough to know where the sewer is located; the depth is also vitally important. The sewer should be shown, to scale, on cross sections. In addition, it is very important to understand what direction the sewer flows and if it flows constantly or intermittently (i.e. near a lift station) as the conduit can move contaminants in directions different from the ground water gradient.

Although sewers are the feature most commonly associated with manmade preferential pathway flow, there are other kinds of subsurface conduits which may affect contaminant distribution:

2. **Energized subsurface utility lines** (Gas, Water, Electric, Fiber Optic, etc.): These subsurface features are usually not primary pathways because they are usually not as large, not buried as deeply, and are not designed to leak as sewers are. However, they are still surrounded by porous backfill which can intercept contaminants. Sometimes they are located in the same trench as the sewer lines, which can complicate an investigation. Depending on the size, depth, and location of the lines, they may explain contaminant distribution. The investigator should determine the locations of energized or pressurized lines in order to safely drill at a location (or use a water or air knife, see below).

3. **Septic Systems and other localized wastewater management systems**: These have many names including "concrete vaults", "dry wells", "oil/water separators" or "water distribution pits." Much like sewer lines in urban areas, these are common pathways noted in rural or semi-rural areas. At most sites which have these, the researcher can assume that they are at least a partial source of contamination. Recently

urbanized or suburban areas may still have the structure in place even if it is not currently being used for wastewater management. They are handy locations to pour other wastes, especially waste oil and waste solvent.

4. Field Tiles and French Drains: These are a system of clay pipes (tiles) or gravel-filled trenches (drains) typically installed from the late 1700s to present day that are intended to lower the water table of an area to make it amenable for development or farming. In many cases, these intercept or directly connect to the existing storm sewer lines or nearby streams. Tank vaults and other structures can also intersect these features. In older buildings, floor drains may be connected into these instead of a sewer or septic system. These are usually not a factor at small sites or in heavily urbanized areas but historical drainage improvements can cause problems at large urban, suburban, or rural facilities that do not realize the history of the area.

Almost all soils of glacial origin in Indiana have been extensively field-tiled or ditched to allow drainage for building. In rural and suburban areas, the county surveyor's office might be able to provide some information on the type and density of tiles. A review of the county soil surveys will also list the natural depth to saturation, and thus the probability of drainage lines.

5. Large Areas of Fill: Almost all sites have been cut or filled to make a level surface. All disturbed areas tend to transmit water, vapors, and contamination more readily than natural soils. Large areas of fill can be a source of contamination or control ground water hydraulics. Estimating the distribution and nature of fill around a site takes a more wide-ranging investigation. Boring logs are sometimes not enough. A thorough Phase I investigation can be invaluable. Reviewing the topographic maps for the area can be a great help, as can current and historical aerial photographs. If they are available, Sanborn maps provide an excellent description of historical structures and property usage. Sometimes intermittent drainage ways have been filled in. Sometimes, perennial streams have been channelized under urban development and there is no surface expression. Slopes along creek valleys might have been filled to grade. Many cities in Indiana were originally connected by a canal system. Research may find that the "Water Street" next to the site used to actually be the canal.

How much fill material affects the contaminant plume depends mostly on the following:

- a. The contrast between the fill and the native materials. If there is sand fill adjacent to coarse-grained or poorly sorted sand, the pathway is less pronounced. However, well-sorted, fine-grained sands (i.e. dunes) are much more resistant to flow than poured-in backfill. The interface between sandy fill and clayey soils is often an obvious, primary pathway. There can be a large amount of source material present in the gravel sub-base of parking lots, storage areas, and buildings.
- b. The location of the sources of contamination with respect to the fill.

Contamination released into the fill tends to want to stay in the fill. Surface releases are much more susceptible to this. Contamination released into natural soil may then collect in areas of fill down-gradient of the source.

- c. The distribution and thickness of fill across the site. If the whole site is covered with fill, the investigation is simpler than if only portions of the site are covered with fill. Typically, if only portions of the site are covered, it is to fill in low spots or to make high spots, and these create pools and drainage pathways for contaminants.

6. Existing Foundations: Existing subsurface structures are typically affected by contamination in the fill material surrounding the walls and floor. Most commonly the sub-base is contaminated by seepage through concrete floors in process and storage areas. Thorough site investigation can characterize their effect on contaminant distribution. The existing foundation sub-base, often in concert with interconnected utility lines, is a primary source of vapor intrusion in commercial facilities.

7. Abandoned Foundations, Basements, and Cisterns: These can act as pathways or barriers to migration.

- a. As a barrier: Outside the source area, abandoned basements and subsurface structures can act as islands of clean(er) soil/ground water. Borings placed within or directly down-gradient of these areas may lead to misidentifying the extent of contamination.
- b. As a pathway: These can act as pools of continuing source from a process or disposal area which has been long abandoned.

8. Improperly abandoned or installed wells (water, oil, or gas): This includes monitoring wells. Improperly abandoned or installed wells are usually discovered when contamination shows up in a deeper zone unexpectedly. If an investigator is lucky, historical research and a thorough site walk through may turn up such information as an abandoned pump house, neighbors with wells, or pipes present at the surface. The Department of Natural Resources should be notified when abandoned wells are found (312 IAC 13-10-2).

## **Investigation of Preferential Pathways**

### **General Subsurface Characterization**

As described in the identification section, every developed site may contain manmade alterations which could influence the distribution and migration of contamination.

However, not every site needs to evaluate their property beyond basic identification and mapping of subsurface utilities (including the depth).

At the majority of sites with subsurface contamination, a properly completed preferential pathway survey would likely consist only of on-site utility location, a thorough site and vicinity walk through, and (potentially) a telephone call to the municipal department of public works.

Basic preferential pathway information should be presented on site maps and discussed briefly in the characterization report as a part of the elimination of potential exposure pathways for closure.

The need for further study is initially based these factors:

- The location of the source with respect to known sewer main lines and laterals: Active sewer lines and laterals are usually obvious, but their hydrologic effects are often ignored. If the contaminant source is adjacent to the sewer or directly discharges to the sewer, an investigation of the lines and backfill for source material (regardless of the depth to ground water) is needed. If heavily contaminated ground water flows toward a sewer line which is below the water table, the backfill around the sewer trench should be investigated to determine if it is directing dissolved or vapor phase contaminants off-site.
- Irregular distribution of contamination: Contaminant transport through a porous media creates a plume of a generally predictable size, shape, and concentration gradient based on the hydraulic conductivity and ground water gradient. If contamination is much more widespread than the known geology would tend to allow, contamination suddenly “disappears”, the magnitude of contamination is disproportionate to known source, or heavily contaminated soil, ground water, or vapors are detected in unexpected places, there is a possibility that a preferential pathway could be influencing contaminant travel.
- The development and operational history of the site: If the property has changed usage, added and/or removed buildings, or relocated process areas, it is possible that the historic subsurface alterations and drainage may still be in place. For example, sites which were originally residential may still have sewer laterals, cisterns, and water wells left in place. There may have been pre-development dumping at the site. The site may lie in an area of historic sand and gravel mining where pits were filled back in with waste. Additionally, if the site operations historically used contaminants in solution or had to store and dispose of chemicals once they were “spent,” the sewer or other on-site wastewater management areas need to be fully investigated.

Most of the listed preferential pathways are not obvious in the field and may be nearly impossible to detect with a traditional investigation consisting of soil boring methods. A thorough site walkthrough can some-

times find evidence of septic systems, drainage tiles, old foundations, and wells.

Sometimes there is simply no obvious surface expression at all. The site may be completely paved or altered beyond recognition, but areas of fill are found by chance during investigation or a pre-development clay tile is penetrated during boring. The development history of the site and the vicinity become very important at this point in the investigation.

Historical research is the key to finding abandoned subsurface structures. Careful review of aerial photographs and historic maps of the property can be very helpful. An assessment of the building construction may find built-on areas and added parcels. These features are common at industrial facilities where processes have changed or moved and in areas which were previously residential prior to commercial development. A telephone call to the department of public works may provide both historic and current utility locations. If those desktop methods are not sufficient, or they cannot satisfactorily explain what is happening, then a non-invasive investigation of the subsurface may help determine whether there are manmade disturbances influencing contaminant travel.

Geophysical surveys are generally the most reliable way to find disturbed areas and subsurface pathways without excavating the entire site. Two types of surveys are commonly used to find and map non-metallic subsurface features.

- Ground Penetrating Radar (GPR): This technique is better for finding subsurface structures such as tanks, wells, and foundations but can find most features. It is also more suited to smaller areas and locations with surface obstructions.
- Resistivity/Conductivity: This technique is better for finding changes in soil structure and composition such as trenches and filled areas but can find most features. This method is better suited to large open areas.

If large areas of the site are covered by concrete with rebar, most geophysical methods are unlikely to be successful.

If unexpected pipes or tiles are found during the investigation, there are several methods available to determine if these features need further investigation.

- Smoke Tests: Smoke testing will show where air flows through a pipe. It is especially useful for finding open drain traps and near-surface breaks. Usually the fire department and nearby neighbors need to be informed before completing a smoke test.
- Vacuum Tests: Vacuum tests are useful if there are multiple conduits which may or may not be connected to a nearby source or receptor.
- Dye Traces: Dyes can determine if water entering a drain is connected to sanitary or storm sewers.
- Sewer cameras: These are useful if the line is completely filled with water, a break in the line is a suspected source, or if trying to precisely locate where an active or inactive line goes.

#### Invasive Site Investigation \*

\*This discussion is limited to active utility lines because the most difficult part about investigating the other kinds of preferential pathways is actually finding them!

Typically, a well-researched site conceptual model, combined with thoughtfully placed soil borings and monitoring wells, can indirectly explain how a manmade preferential pathway affects contaminant distribution. However, it is sometimes necessary to physically sample the subsurface vapors, soils, and ground water adjacent to active utility lines. When this becomes necessary depends on the nature of the release, the objectives of the investigation, and the closure strategy. Common reasons to directly sample within an active conduit include:

- Determination of source area concentrations for site characterization and risk assessment.
- Determination of soil and ground water quality to complete a pathway elimination assessment.
- Measurement of soil gas concentrations moving along a conduit.

Investigating around sewer lines is complicated by the slight risk of encountering an active line. Often, multiple utilities are located in the same trench. If there are known active water, sewer, or gas line trenches that need to be investigated, the municipality will need to be informed. City utility workers can be an excellent source of information about location and construction of active utilities. Private utility locators will show only the location of subsurface lines, but tell nothing about depth, construction, or quality of the conduits. Options which pose little risk to the lines themselves are readily available. The methods listed below are not typically part of a standard drilling program. Common tools include:

- Hand auguring: This drilling tool is turned into the ground by muscle power. They have a maximum depth of about 20 feet, depending on soil type. They may not be effective if the utility backfill is very coarse or heterogeneous.

The other two methods require a mobilization with a separate drilling machine. This nearly guarantees that the lines will not be harmed. If there are multiple areas that need to be investigated, this is often the fastest way to investigate and requires the least physical effort.

- Water knife: This machine is similar to a power washer and uses high pressure water to remove unconsolidated material. However, the addition of water can leach adsorbed contamination into the ground water. For this reason, these tools are not very commonly used at contaminated sites.
- Air knife: This machine works almost exactly like a water knife, but uses high pressure air to remove soil. The loose sediment is collected with a vacuum on the back of the truck. However, they might not be as effective in tightly compacted or heterogeneous backfill. Also, they may not be effective in cold weather when shallow sediments or fill material may be frozen. There is a large amount of waste soil generated by an air knife, and this may be a consideration if the corridor is suspected to be highly contaminated. The investigator also needs to account for potential VOC loss due to the high pressure air.

Occasionally, it is simply not possible to directly sample due to factors such as fragile water lines, high pressure gas lines, high voltage lines, or interstate pipelines. It may be difficult or impossible to acquire a right of way access permit from a municipality or individual. Situations like this are handled on a case by case basis.

#### Examples of the Influence of Preferential Pathways on Contaminant Transport

Contamination source in sewer pipe or utility trench backfill: This scenario occurs at sites where wastes were poured down the drain either as pure product disposal or as a result of poor housekeeping. Sewer disposal often leads to disconnected, high concentration contaminant source areas with very small source footprints. Once on-site investigation has shown there is source material in and around drains, the evaluation needs to continue in the flow direction of the pipe. Pure product can travel some distance through competent pipes, so common disconnected source locations are at T and L junctions, nearby lift stations, and any saddles in the gradient. Once dissolved or adsorbed contamination has been found in the conduit, an investigation of potential ground water receptors and the potential for vapor intrusion is needed in the vicinity of each source area.

Dissolved contamination intercepted by utility trench: This scenario occurs when a release into the subsurface travels down-gradient with ground water flow until it intercepts disturbed soils in contact with the water. This situation leads to plumes which apparently ‘end’ on-site despite having high concentrations near the property line. In order to confirm the extent of contamination, the investigator may need to drill directly adjacent to the trench in the down-gradient direction of flow within the preferential pathway (this is not necessarily the same direction as ground water flow). If investigation shows that contamination is traveling along the trench, there is the potential for discharge of contaminated ground water or vapor intrusion at nearby receptors.

Utilities that control ground water hydraulics: This scenario is probable in urban areas with shallow ground water, low ground water gradient and large diameter sewer lines. It is particularly notable in areas with fine-grained subsurface materials. Common indicators of utility-influenced hydrology include unexplained low

or high water levels in wells next to the utility trench, and wells off-site and outside the utility corridor that dramatically change on-site ground water flow direction.

Fill creates ephemeral water table for contaminant movement: Although the perennial water table may be well below filled areas, the contrast in materials' permeability tends to allow for horizontal fluid transport until there is sufficient head pressure to drive it downwards. If there is an above ground release, this mechanism spreads the source material outward and increases the footprint of the contamination. This is a probable cause when there is a very small contaminant source (i.e. sink sized degreaser) but a horizontally extensive shallow soil source. In this scenario, depending on the contrast between native and manmade materials, ground water contaminant concentrations may be low to moderate, while vapor contamination is extremely high. This is a primary concern in buildings with large areas of interconnected, coarse grained sub-base.

Contamination source or transport in drain tiles: Unlike other pathways, drainage tiles usually discharge to nearby perennial or ephemeral surface water features. Once contaminated drainage tiles are found on a site, there needs to be an evaluation of surface drainage areas for contaminated sediments or contamination discharging into surface waters.

Cross-contamination due to wells: This scenario usually occurs at large industrial facilities with multiple production wells. Typical cross-contamination problems come from wells installed prior to current DNR grouting and abandonment requirements outlined in 312 IAC 13. Properly installed wells will not allow cross-contamination.

### **Closure Strategies**

This guide is not intended to be a comprehensive discussion of remedial or closure methods. Not every site will need a specific remedy to remove the risk from contamination in preferential pathways. However, if preferential pathways are significantly affecting the ground water hydraulics or vapor flow, they can create difficulties for both active and passive closure strategies. A good investigation using the principles noted above should determine if and how pathways might be affecting the contaminants. Sometimes, the pathways can make remediation easier, because contamination has been contained within a structure or is being funneled to a single discharge point. Some of the more common difficulties with remediation of preferential pathways are listed below:

#### How do contaminated pathways affect cleanup and closure strategy?

- Overestimation of radius of influence: This is one of the most common issues caused by preferential pathway flow and is a typical reason active remedial systems can fail. Things to monitor during pilot testing are:
  - o One or more distant observation points show a much greater effect than points nearby.
  - o All extraction influence is concentrated in one direction.
  - o Testing is performed only in areas of disturbed soil or backfill rather than native materials.
- Short circuiting: This will show up as nearly instant vacuum or drawdown in a well. Also, unusually rapid arrival of injectate in distant wells for in-situ remedies is a sign of a conduit.
- Underestimation of source area:
  - o Removal of a known source such as USTs or a septic tank is planned. During excavation, contaminated clay tiles or a building foundation are discovered and have to be removed.
  - o A remediation system is installed, without understanding the distribution of high contaminant levels in the on-site sewers. After several years of operations, contaminant levels remain much higher than predicted because the source has not been effectively treated. Additional operation and possibly a different corrective action are necessary.

Both these scenarios equate to a large, unexpected expense. It is much less costly to know what is going on before starting remediation.

- Vapor intrusion: The existence of a direct conduit into a building invalidates vapor intrusion models or

attenuation factors which assume that contaminants rise through a porous media. Borings around a site can indicate low conductivity soils but do not account for manmade alterations. A common way which vapors can affect buildings is through sewer lines and drains. The presence of coarse-grained fill under and around buildings can also lead to underestimation of risk.

- **Plume stability:** Continued flow of water through a conduit can destabilize contamination. The presence of conduits can also influence the accuracy of perimeter of compliance wells. If the contamination is leaving the site through a preferential pathway rather than through down-gradient flow, then the pathway is where monitoring needs to be concentrated.
- **Fate and transport models:** The assumptions for uniform, homogenous subsurface conditions rapidly break down in the presence of conduit flow. If they are not taken into account, the risk can be underestimated.

#### How is remediation of a preferential pathway accomplished?

As previously noted, many times specific remediation of a preferential pathway is not necessary to achieve closure. The conduit may be simply directing residual ground water contamination, and once the source is addressed, it will attenuate without additional measures. However, if the conduit is allowing contamination to discharge to a receptor at an unacceptable risk level, it needs to be included in the remedial strategy. As an example, at a site where the tail of a contaminant plume intersects a sewer, the sewer would not specifically need to be addressed unless vapors above acceptable risk levels were present in nearby structures or contaminated water was discharging to the surface. The remediation of pathways can be as simple as adjusting the location of a few extraction wells/injection points or as complex as a separate, specifically designed remediation system for the conduits. Usually, contaminated pathways not associated with active utility systems are most effectively remediated by targeted removal.

Cheryl A. Barret, Dracut, MA.

August 11, 2015

Federal Energy Regulatory Commission

Re: Negative environmental impacts of Kinder Morgan , TGP, NED project

Ms. Bose,

I would like someone to hear my comments on the TGP project. Not simply as a formality in your process but because you are seriously trying to determine if the adverse consequences of this project outweigh any benefit. Because you are taking the public comments into consideration in making a determination and not just pushing the project along.

My name is Cheryl Barret, I live at 80 Pelczar Road in Dracut, MA. My property is one of many in Dracut that has an easement by the power company. The energy corridor runs down the entire length of Pelczar Rd from Parker Rd. to just beyond 85 Pelczar Rd. and then turns up through many properties on Sesame street and beyond. Trout Brook also runs through my property in close proximity to the existing power lines. We get our drinking water from a well on the property less than 40 feet from Trout Brook .

We have wood turtles that nest on my property, which according to National Heritage, have a state status of "Species of Special Concern". They overwinter in Trout Brook on my property. In addition we have deer, wild turkey, and salamanders, and many other species of wildlife. It is my understanding that it will be necessary for TGP, during their construction period, to clear 50-100 feet of land next to the existing power lines. This would put them within "feet " of Trout Brook or in Trout Brook and necessitate clearing many 100 year old trees from my property. These trees are my sightline to my side and backyard. TGP promises to repair or restore the premises to its original state after they're done with their construction. How can they replace 100 year old trees? How can they assure they will not contaminate the brook and my well, the source of my drinking water ? How can they restore the wildlife habitat they will be destroying? Will they get a baseline test on my well prior to beginning construction and multiple times after their construction ? Who will be financially responsible if my well should become contaminated from the installation of the pipeline? Will they pay to relocate us while we wait to be hooked up to a water supply? Will they pay to have us connected to the town water supply? Last summer the power company contacted me prior to doing their maintenance to determine if there was a well on the property and whether or not they could use herbicides. They did not. Will TGP continue to monitor the impact they will have on my property ?

There is a quarry close to me whose call list I am on. They notify me prior to blasting since their blasting shakes my house , actually knocking things from the walls. How will TGP protect their pipeline against this and does this put the pipeline at greater risk of fracture and possible leaks, or worse, explosion ?

TGP'S answer to this is that they allow for sway in their pipes. This is not very consoling when my home will be mere feet from their pipeline.

Who is holding TGP responsible for their existing pipelines, which if maintained and repaired would increase the current capacity? If they cannot be responsible for existing pipeline, why would they be allowed to build new pipeline?

There are currently three other projects of lesser magnitude that could be considered to resolve the lack of gas capacity noted on very few days of the year.

There are many current reports available about the true need for additional natural gas capacity. We don't need an infrastructure project this oversized. The following is from research done by R. Cowan, another member of Dracut Pipeline awareness: " PIPELINE USAGE CHARTS FROM THE SPECTRA ENERGY WEBSITE prove that all existing pipelines are not at maximum capacity. The existing pipeline coming into Dracut from the north had at least 300 million cubic feet of spare pipeline capacity on all but 8 days of winter 2014 - 2015. Spare pipeline capacity exists in Westbrook , Maine ( which goes all the way to Dracut and Beverly, Ma) and could be supplied more gas from PNGTS. "

If I can access these reports, surely FERC is aware of these statistics.

The planned route of this Mega infrastructure is going through densely populated residential areas, farmlands, church property, and the very center of our town. Isn't it your responsibility to protect the public interest or does FERC just condemn property for public use.

Another area of concern is the fact that our one small town will be overburdened with not only the pipeline but a huge compressor station and 3 metering stations whose emissions threaten the health and wellbeing of our population. In addition to hundreds of homes and businesses, our fire department and police station are in the 1/2 mile radius of the compressor station. In the event of any accident who will respond?

We should be stewards of this earth, not destroyers for the sole benefit of Kinder Morgan and their pending licenses to export natural gas to other countries. Licenses now pending at the DOE office of fossil energy for Downeast LNG, in Maine, and Goldboro LNG in Nova Scotia. Both terminals would be served by the Canadian Maritimes pipeline from Dracut.

My comments represent just one of hundreds of homeowners with the same or greater concerns who are in Dracut in the direct path, abutters, on this current route of a pipeline that is of much greater capacity than we need. Please consider the other alternatives that are out there now and underutilized or currently under construction.

The consequences of the Kinder Morgan project to the environment, to human life, far outweigh any of the benefits. Please deny this project.

Respectfully,

Cheryl Barret

Alice Spatz, Lanesborough, MA.  
Project docket number PF14-22

August 12, 2015

Alice Spatz  
56 Bridge St., P.O. 324  
Lanesborough, MA 01237  
413-4442-2969  
spatzlarryalice@verizon.net

Please extend the scoping period for the Kinder Morgan project (PF14-22) and look into the legitimacy of the need for more natural gas. This issue is vitally important if we are serious about reducing CO2 emissions.

Shrouded in secrecy, the New England States Committee on Electricity (NESCOE) undertook efforts that were poised to tax electric customers to pay for bringing massive new gas pipelines into the region. Studies commissioned by NESCOE showed that if current levels of state energy efficiency programs continue, there is no need for additional natural gas infrastructure even with economic growth taken into account. Now the New England Governors are stepping away from a high-risk gamble with air pollution and electric customers' money.

"NESCOE "New England Gas-Electric Focus Group Final Report" of March 28, 2014, the gas/electric industry analyst firm concluded and recommended, among other things, that, "No long-term infrastructure solutions are necessary under the Low Demand Scenario", and, "Further analysis would be required to determine whether policies that would result in a Low Demand Scenario are cost-competitive with infrastructure investments."

-Berkshire the edge newsletter June 11, 2015

The need for more capacity has been cited as peak demand during cold weather when gas for heating and gas for electric generation compete for existing pipeline capacity. These conditions only happen for a few hours a day, about 10-27 days a year, and it has never led to a dip into our electric generation buffer (the extra electric capacity ISO-NE likes to keep on hand), let alone actual electric demand. ISO New England actually issues "Minimum Generation Emergency Warnings." These are times when consumers were using so little electricity that the grid operator had to ask power plants to NOT generate electricity. (ISO NEWS-

WIRE – 12/2010)

Instead of building an enormous pipeline designed for export, and that doesn't supply gas to new local customers, a good place to start is by making wise use of our existing pipelines. We can make sure the pipeline capacity that we already have is being well utilized before leaping to build expensive new pipelines. This starts with fixing leaks and increasing storage facilities to address the few hours of a few days of high demand in the winter.

“Rather than more investments in fossil fuel-based energy, then, let's instead invest wisely in energy efficiency and long-term contracts for renewable energy. And where the use of natural gas is currently necessary, let's use LNG to supplement natural gas supply during periods of peak usage. Expanding our natural gas pipelines and our reliance on this carbon intensive and price volatile fuel should be New England's last resort.”

- Caitlin Peale Sloan, Constitution Law Foundation, May 15, 2015

The Council of Scientific Society Presidents—which represents 1.4 million scientists from more than 150 scientific disciplines - reported to the Obama administration: “some energy bridges that are currently encouraged in the transition from GHG-emitting fossil energy systems have received inadequate scientific analysis before implementation, and these may have greater GHG emissions and environmental costs than often appreciated.” The development of unconventional gas from shale deposits, the Council warns, is an “example where policy has preceded adequate scientific study.”

Building new and massive infrastructure for fracked gas is not in the best interest of the country. There are dangers inherent in the technology that threaten air, water and soil quality, as well as the quality of all life on this planet. There are alternative, renewable energy sources that, in conjunction with conservation measures, can meet our energy needs.

Sincerely, Alice Spatz

## 20150812-5088

Reba-Jean Shaw-Pichette, Deerfield, MA.

Dear FERC -

After being present at the FERC hearing in Greenfield for 7+ hours, (with the final hour not televised), I am writing concerning the (one would hope) as yet “To Be Determined” plan presented by Kinder Morgan, the Parent Company to TGP.

Kinder Morgan should not be permitted to operate its own studies to determine the land that they intend to use. This is a conflict of interest and much like asking a big sugar cane farm if sugar is good for us. They are sending letters to residents and land-owners that are worded to sound as if these ‘studies’ are to be done on our behalf but they do not use third parties that are disinterested to decide whether our land is wetland/archaeologically important or whether their activity will hurt our wells, etc. These studies done by them on their behalf should be considered null and void regardless of whether they obtained the landowners permission through coercion.

The plan is woefully incomplete and those of us who have served on planning/zoning boards recognize that much pertinent information has been omitted or avoided (indeed, they have omitted required information of private individuals or companies that do not have powerful lobbyists). The amount of land to be taken for the project is continuously misrepresented with the acreage of trees to be permanently removed in constant flux as are the numbers, placement, and size of access roads (always these are TBD). The presented information is frightening in its inaccuracies and borders on fraud.

And now, From the Lorax:

The present estimate of 6000+ acres of trees to be permanently removed is a crime against our part of the state for character, health and economic reasons.

These are mostly located along the ridges along powerlines - helping to shield the powerlines from view

while simultaneously protecting the land from erosion, baking, washout into our river and washout of the roads that are currently protected.

Further - the clear-cutting of these trees opens us to further invasion by invasive species that are endangering the native plants (such as the purple loosestrife that is obliterating cat-tails (the supermarket of the swamp) and milkweed (and so the monarch).

Our neighbor, Patricia Kelly, whose land includes much of the powerlines, and so has had personal visits from KM representatives, recently clear cut the wetland and it is now full of loosestrife. Invasive species wipe out our local edibles - necessary for animals and for humans. It is native edibles that saved the lives of many during the Great Depression. We have planted and encouraged the local native plants within our own garden to help with this depletion and to be there for the variety of healthy frogs and salamanders that regularly appear.

The removal of the trees severely depletes the fresh air, the cooling of temperatures, and the cleaning of our water that these guardians of the earth perform and it also changes the landscape away from the appeal that draws tourists to "leaf peep" in New England

There is no mention of where these trees will go - who will take the profit from our lands of thousands of acres of renewable energy, good cordwood, good protection for - and here I mention only the life that I have seen (and filmed) in my yard that comes out of the trees in the incineration zone: Canada lynx, bobcat, wolf, moose, turkey, deer, coyote, fox, bear with three cubs, and a multitude of others that we should be speaking out for as this is their home as well!

And, finally: Water - the word which continues to arise in many discussions. Fracking contaminates aquifers and wells and ground water. This is a recognized fact. Yet KM does not offer chemical or contaminate benchmarks to study our water. There is already war over water in parts of the world and even in our western states droughts have become the norm and communities are fighting over water access and there is even theft of clean water. NOTHING - no bottom line of a corporation, no perceived 'fuel need' should be considered that threatens clean water. WATER is a necessity of life - not fossil fuels - not money - not electricity. Water trumps them all. TO disturb or threaten the good and plentiful water that is available in one of the last parts of the country not over-paved is a crime not just against our part of Massachusetts but against humanity, the earth, the future.

"Plant trees" J. Sterling Morton

"The Wonder is that we can see these trees and not wonder more" Ralph Waldo Emerson

"Between every two pines is a doorway to a new world" John Muir

"I contribute to Peace when I respect Nature and preserve it for generations to come." The Rosicrucian Order

sincerely ("we are here, we are here, we are here!" - Dr. Seuss),

Re: Tennessee Gas Pipeline Company – Northeast Energy Direct Project  
Bradford and Susquehanna Counties, PA

Dear Ms. Bose,

Thank you for the submission of the Pennsylvania Natural Diversity Inventory (PNDI) Environmental Review Receipt Number 22412 for review (formerly 22378). PA Department of Conservation and Natural Resources screened this project for potential impacts to species and resources under DCNR's responsibility, which includes plants, terrestrial invertebrates, natural communities, and geologic features only.

This project was reviewed on February 13, 2015. A Potential Impact was anticipated and a botanical survey was requested. A copy of this correspondence is attached for your information.

Should you have any questions or concerns, please contact Jason Ryndock, Ecological Information Specialist, by phone (717-705-2822) or via email (c-jryndock@pa.gov).

Sincerely

Greg Podniesinski, Section Chief  
Natural Heritage Section

Re: Tennessee Gas Pipeline Company, LLC  
Northeast Energy Direct Proposed Pipeline Request #2; Update of 22378  
Bradford and Susquehanna Counties, PA

Dear Mr. O'Sullivan,

Thank you for the submission of the Pennsylvania Natural Diversity Inventory (PNDI) Environmental Review Receipt Number 22412 for review. PA Department of Conservation and Natural Resources screened this project for potential impacts to species and resources under DCNR's responsibility, which includes plants, terrestrial invertebrates, natural communities, and geologic features only.

### **Potential Impact Anticipated**

PNDI records indicate species or resources under DCNR's jurisdiction are located in the project vicinity. Based on a detailed PNDI review, DCNR determined potential impacts to the following threatened or endangered species or species of special concern.

### **Survey Request**

There are species known nearby that use habitat type may be present on the site; therefore, we are requesting a qualified botanist conduct a survey for the species in the attached chart at the appropriate time of year and then submitted to our office for review. In the attached pdf files "22412\_NortheastEnergyDirect\_ResourcesLists," "Species Targets by Municipality" lists all resources in project vicinity and can be sorted by resource or township. The "Plant and Lepidoptera Info" pdf provides habitat and flowering time information

from The Plants of Pennsylvania, 2nd Edition, by Rhoads and Block and information about Lepidoptera gathered from the internet. Plant community information can be found under the “Community Info” pdf. Please note that the Lepidoptera species and communities noted are listed for informational purposes and are not targets for a survey.

- A survey for the above species should be conducted by a qualified botanist at the appropriate time of year and then submitted to our office for review. Your botanist should carefully review the new DCNR Botanical Survey Protocols available at <http://www.gis.dcnr.state.pa.us/hgis-er/Login.aspx>. These protocols are recommended to ensure that the all necessary information is collected and that survey reports are prepared properly. It is the expectation of DCNR that these protocols will be followed when conducting surveys for species under our jurisdiction.
- Your botanist should fill out the field survey form while performing their survey: [http://www.gis.dcnr.state.pa.us/hgiser/hgis/Internet%20Field%20Survey%20Form\\_2007.pdf](http://www.gis.dcnr.state.pa.us/hgiser/hgis/Internet%20Field%20Survey%20Form_2007.pdf). Contact our office prior to the survey for detailed information about the species, or for a list of qualified surveyors.
- Any target and non-target state-listed species found during the site visit should be reported to our office. Mitigation measures and monitoring may be requested if species or communities of special concern are found on or adjacent to site.
- If the land type(s) does not exist on site, a survey may not be necessary; please submit a habitat assessment report which describes the current land cover, habitat types, and species found on site.

This response represents the most up-to-date review of the PNDI data files and is valid for two (2) years only. If project plans change or more information on listed or proposed species becomes available, our determination may be reconsidered. For PNDI project updates, please see the PNHP website at [www.naturalheritage.state.pa.us](http://www.naturalheritage.state.pa.us) for guidance. As a reminder, this finding applies to potential impacts under DCNR’s jurisdiction only. Visit the PNHP website for directions on contacting the Commonwealth’s other resource agencies for environmental review.

Should you have any questions or concerns, please contact Su Ann Shupp, Ecological Information Specialist, by phone (717-783-7990) or via email ([c-sushupp@pa.gov](mailto:c-sushupp@pa.gov)).

Sincerely,

Rebecca H. Bowen, Section Chief  
 Bureau of Forestry, Ecological Services Section  
 Pennsylvania Natural Heritage Program

Tennessee Gas Pipeline  
Northeast Energy Direct Project

Federal Energy Regulatory Commission  
Tennessee Gas Pipeline Company’s  
Northeast Energy Direct Project  
Docket No. PF14-22-000

Regarding: FERC docket Number PF14-22

I urge the Federal Energy Regulatory Commission to adopt a not approved position on the above mentioned project.

As a resident of Dracut Ma., and a homeowner near the proposed site of the Kinder-Morgan 23,000 horse-power compressor station, I feel strongly that the pipeline and its associated impacts to the environment, property, public safety, and possible accident danger far outweigh any short term energy benefits possibly received from this pipeline.

It can be shown that current energy needs can be met through a combination of conservation efforts, and the development and deployment of a number of renewal energy alternatives.

The science and manufacturing of alternative renewal energy sources like bio-mass, solar, hydro, and wind have developed to the point where each is feasible, and in total, could provide abundant clean energy for this area into the foreseeable future.

People speak of an increase in jobs as a potential benefit of the pipeline, but jobs created by the development, deployment, and maintenance of all the above mentioned renewal energy alternatives could more than offset the short term jobs created by the pipeline.

For these reasons I urge the Federal Energy Regulatory Commission take a bold stance to reject this project. A stance that will drive the future of this areas’ energy needs away from the use of the ever dwindling and dirty fossil fuels and towards unending and substantially cleaner renewable energy.

Thank You:

Bruce R. Cote  
107 Lexington Rd.  
Dracut, Ma. 01826

Subject: A White House Office

Message: FERC is broken and not working for the tax payers. NH is subject to a major natural gas pipeline project from the Tennessee Gas -Kinder Morgan pipeline pmject. 17 NH towns will be majorly impacted by this project. Towns have requested Scoping meetings and FERC denied these requests and is only offering a few county meetings. This project is opposed in large numbers by NH impacted property owners. We deserve to be heard in a proper forum. FERC is not meeting the needs of all. FIX FERC and stop dumping on the tax payers and forcing private projects on us in the make of public gain. We deserve to be heard. FERC is broken. Please fix it.

-----  
THE FEDERAL ENERGY REGULATORY COMMISSION

August 13, 2015

Ms. Amy Glowacki

660 Sand Pit Road

Mason, New Hampshire 03048

Re: Northeast Energy Direct

Docket Number PF14-22-000

Dear Ms. Glowacki:

The White House forwarded correspondence from you regarding the Northeast Energy Direct Project (Docket No. PF14-22-000), whose pre-filing for a natural gas pipeline is currently before the Federal Energy Regulatory Commission.

Although our Commission was not able to hold as many scoping meetings in New Hampshire as you would have liked, anyone can file comments in the docket and those comments will carry the same weight as any statement made of those public meetings. We would encourage you to file your comments. Please be assured that I have entered this correspondence into the official record for this proceeding on your behalf.

Sincerely,

Sarah McKinley

Attn: Kimberly D. Bose, Secretary

Docket: PF14-22-000

Dear Commission,

The above referenced project appears to be grossly oversized for the projected energy needs of New Hampshire and New England in general. With New Hampshire a net exporter of electricity, gains in efficiency and renewable energy production growing, the real need for this pipeline appears to be less about access to gas and more about reaching export markets. What will be the net benefit to the rate payers and gas consumers if the pipeline is built? Will this be another Seabrook Power Plant gone over budget that the ratepayers got stuck with the bills

The projected route is through many conservation and sensitive areas, but with all the To Be Determined's in the Tennessee Gas draft application, how can private, local, state and federal entities analyze the impacts to avoid, minimize or mitigate them? Please study the route and a 500 R buffer along each side to determine the impact on water, air, vegetative and natural species.

What will be the end impact of such a major large scale construction through a pristine New England landscape that depends on its natural beauty and preserved history as a base for a healthy tourist and retirement business sector? What will be the economic loss to the area in general as the pipeline decreases the desirability of people visiting or relocating here?

Thank you for your consideration.

David G. Drouin

Tennessee Gas Pipeline Company, LLC: Docket No.PF14-22-000  
Northeast Energy Direct Project, Scoping for Environmental Impact Statement by June Varner  
August 7, 2015

US Federal Energy Regulatory commission  
888 First Street, NE  
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C: Docket No PF14 22 000

Northeast Energy Direct Project (the Project), Scoping for Environmental Impact Statement

Ladies and Gentlemen:

I am June Varner, 393 Coldwater Tavern Road, East Nassau, NY 12062. I moved from Minnesota to Nassau Township, New York in August 2012. I am 77 years old, a retired farmer, a widow living on my retirement and the income I get from a rental property I bought five years ago at 117 Firetower Road, Stephentown, NY, which is in the northeast corner of Nassau Township. This property lies less than a thousand feet from the proposed pipeline. When I became aware of the change in the route of the pipeline along the National Grid R/W, my first thought was that the fracked gas will have to be pushed over the mountain and the compressor station would be located on or near Firetower Road. Since the current site at Clarks Chapel Road and Burden Lake Road is only a proposal, perhaps the site may change to where it is closer to the crest of Firetower Mountain.

### **IS THERE A NEED FOR THIS PIPELINE**

While it might not be appropriate at this time to address whether the Project is in the public convenience and necessity, I believe in view of the current market conditions, there is no need for any pipeline and “No Build” should be your decision.

<http://www.washingtonpost.com/news/energy-environment/wp/2015/03/20/obama-administration-tightens-federal-rules-on-all-gas-fracking/> Obama administration tightens federal rules on all-gas fracking By Jaby Warrick March 20. Energy industry groups immediately filed suit to block the measures. The Independent Petroleum Association of America and Western Energy Alliance called the rules a “reaction to unsubstantiated concerns,” and warned that the U.S. natural gas boom could fizzle..... Barry Russell, the IAA president, said in a statement. Is the Industry at the beginning of a ‘fizzle’

See also <http://gva.wibloarnberg.net/sudden-drop-in-crude-all-prices-rolls-u-s-energy-firms-rebound-2/> and <http://www.all-price.net/en/articles/falling-all-price-slows-us-fracking.php>

In “Interstate Pipeline Forum For Local Officials” a powerpoint presentation by Rebecca F. Zachas of BCK Law, P.C., FERC Application: Standard of Review, she states that the Threshold question to find the project to be in the public convenience and necessity, “it must be financially prepared to stand on its own without subsidies from existing customers.” Also that the project must meet the Balancing Test: “Do overall public benefits outweigh adverse impacts.” <http://nashobatrust.org/what-is-it/> what is the ‘Northeast Energy Direct’ pipeline project? It states: “At this time, a state tariff is being discussed that would pass the cost of this proposed \$2.7+ billion project on to Massachusetts residents — ISO NE-Tariff. This is an unprecedented move to request ratepayers to fund a privately-owned company’s infrastructure project. National Grid and other regional energy suppliers have agreed that this strategy should be used. (see: EDC Letter Reanal Infrastructure 22 April 2014)”

### **IS THE PROJECT FISCALLY WISE**

The New York State Utilities Code Chapter 37, Subchapter B. Electric Utilities, Sec. 37.051, (e) states: before granting a certificate under this section, the commission must find, after notice and hearing, that: (1) the applicant has the technical ability, financial ability, and sufficient resources in this state to own, operate and maintain reliable transmission facilities.’

In a financial analysis on Kinder Morgan Energy Partners LLP (KMP), owner of Tennessee Gas Pipeline Company, Analyst JOS L. BuStamante, in Fall 2013 states: “In addition to the concerns with governance, in mid-2013 analyst inquiries arose with regard to insufficient maintenance of infrastructure, or sustaining capital expenditures. Critics claim that KMP allows current infrastructure to deteriorate. The aim is to replace dilapidated pipeline with higher capacity pipeline and classify it as expansion. The practice directly increases quarterly distributions since sustaining cap-ex is a subtraction in the distribution (dividend formula, while expansion cap-ex has no effect (see Appendix Ij).

If allegations of insufficient maintenance prove accurate, then significant threats can arise from litigation, governmental fines, civil lawsuits and cleanup costs associated with under-maintained pipeline and storage facilities. In addition to threats from insufficient maintenance, adversities caused by uncontrollable factors, such as weather and natural disasters, can result in leaks of pipelines and storage terminals. Leaks pose

significant operational disruptions in addition to potential punitive repercussions. Investors must realize that KMP is responsible for its organically grown infrastructure and any legacy and future issues that arise from acquired operations.”

Having lived through an era where public subsidy bailouts of ultra-large corporate entities have become commonplace, it appears there is additional risk that KMP will be financially unable to operate and maintain the Project.

Analyst Jose L. Bustamante, also states “Lastly, potential leaks and mechanical problems could lead to environmental pollution, impairment of operations, loss of human life and property damage. Such risks can lead to punitive fines and civil lawsuits, which could result in considerable financial losses. Risks present themselves from natural disasters and from recently scrutinized controllable factors such as maintenance, monitoring and protection against terrorism.” This indicates that the Project will have a significant adverse impact on the public environmental safety which should be addressed in the EIS.

## **ENVIRONMENTAL IMPACT**

FERC needs to take a hard look at the environmental risks of this project. I understand that FERC has never turned down a project although some of them have been withdrawn which is what I believe that should happen with this Project. However, if a pipeline is approved regardless of where it is sited, improvements can and should be made to eliminate the risks

The industry acknowledges the high risk of fire and explosion.

<http://www.ofexsystems.com/Industries/oil-gas-energy/?gelid=Clr2mIDigscCFdySHwodXBOFmQ DII>, GAS A ENERGY Protect Your Frac Pumps, Slenders, and Diesel Gensets The physical layout of the average hydraulic fracturing spread or drilling operation is a logistical nightmare when it comes to fire. The vehicles operating side-by-side with little room between them create an environment where fire can easily spread and access for fire fighting is nonexistent. Frac pumps, blender units, and diesel generator sets all present a significant fire risk and a fire on a single machine can rapidly spread and burn through the millions invested in the site. Thankfully, there is already an established way to combat fire on heavy equipment. AFEX fire suppression systems are a proven safety and productivity product that stand ready to fight a vehicle or genset fire at a moment's notice, attacking the source of the flames before they have a chance to become established and spread to your other machines. Safeguard your personnel and the environment, protect your investment, and keep your profits flowing by investing in AFEX fire suppression systems today.

## **THE METHANE RISK**

Much of the fire and explosion risk comes from the flammable gasses such as methane that leak from the pipeline. These are due to poor installation, degradation of the system, negligent maintenance, all of which are acknowledged failures of KMP, who has proposed this Project.

<http://www.nytimes.com/2015/08/05/science/methane-leaks-may-greatly-exceed-estimates-report-soys.html> Methane Leaks May Greatly Exceed Estimates, Report Says By JOHN SCHWARTZ AUG. 4, 2015 “Mr. Howard found that under some conditions, unless the sampler is carefully and frequently recalibrated, the switchover from the first sampler to the second can fail. When that occurs, the device does not measure the amount of methane that the second sensor would capture, and so it underrecords methane leakage rates.” “Complicating the issue, he wrote, is that when the device malfunctions, “there is no way to determine the magnitude” of the error without independent measurement at the time, so the missed emissions could be extremely high — perhaps tenfold to a hundredfold for a particularly large leak, he said. Researchers have found that a relatively small number of leaks produce most escaped methane, he wrote, so an instrument that underreports large leaks might skew official assessments like the EPA’s overall methane inventory. Mistakenly low leak readings could also create safety issues in industrial settings, he noted.”

Methane is the main component of natural gas, and the expansion of techniques such as hydraulic fracturing, known as fracking, has greatly increased the amount of natural gas being extracted, sold and transported around the country.”

The pipeline regulations were revised in 2002 because of tragic incidents that were occurring and certain oversights in the existing law. In one of these incidents twelve campers were incinerated when the gas pipeline exploded, they were camped 675 feet away.

Carol M. Parker, Lead Articles Editor, Natural Resources Journal; Winter 2004 reviews the 2002 pipeline regulations in The Pipeline Industry Meets Grief Unavoidable: Congress Reacts with the Pipeline Safety Improvement Act of 2002. In Parker's review Page 271, 'The Department of Transportation's Research and Special Programs Administration (RSPA) issued a final rule defining "high consequence areas" on August 6, 2002. The managers strongly support RSPA's regulation defining high consequence areas, although recognize that the definition could be subject to alteration by future regulatory action by RSPA...In...July 2002...RSPA made clear its intent to include in its definition known areas where people gather, such as the Pecos River pipeline crossing near Corlsbad, New Mexico which was commonly used by campers and fishermen and was the location of a pipeline rupture in August 2000 that resulted in 12 fatalities. The managers support is expressed for this new definition of high consequence areas....229. This statement suggests that the conferees supported an interpretation of "high-density population area" that included remote areas where people were known to gather.'

KMP has stated that since the pipeline is going through a rural area they can use a lighter schedule pipe. In some places the pipeline is within 150 feet of a family dwelling which defines them as being in a "high consequence" area. If this Project is approved, regardless of where it is located, at a minimum, the strongest schedule pipe must be used.

## **LOCAL CONTROL**

In addition this Act gave greater authority to individual states. Since this pipeline stops within New York and will be commingled with other sourced fracked gas, it should come under the authority of the NY PUC where it should be heard and decided. In Natural Resources Journal; Winter 2004 on page 249, reference 51. Reauthorization of Dep't. of Transp. office of pipeline Safety: Before the Subcomm. on Highways and Transit of the House Transp. Comm. (Feb. 13, 2002) (statement by Chuck Mosher, Chairman, Washington State Citizens Committee on Pipeline Safety, "We believe it is critical that OPS be directed in law to establish partnerships with willing states and delegate to these states authority to oversee interstate pipelines. This is our number one priority.").

In response to a Wall Street Journal article in 2011, "Pipeline Soils Put Safeouards Under scrutiny" (front page, sept. 10) RAY LBHQD, secretary of Transportation wrote: "while the Pipeline and Hazardous Materials Safety Administration, part of the Department of Transportation, directly regulates most hazardous liquid pipelines in the nation, states take over when it comes to intrastate natural gas pipelines." Is the 36" to 42" diameter of this pipeline a way to store fracked gas without meeting the New York State requirements for storage facilities?

## **CONTROL THE COMPRESSOR**

The proposed site of the compressor station is also a few hundred feet from several families. Since there is a considerably higher risk of explosion and a continual discharge of effluent from the burnoff, this site poses an even greater risk to the environment and personal safety. In Cedar Rapids I lived near a corn processing plant. When the management learned that there was off-site drift of particulate from a stack, they installed air scrubbers to eliminate the problem.

Regardless of where a compressor station is sited, a contained return of the gasses should be used and scrubbers in every stack must be installed. There is no reason why any particulate and the accompanying health hazards should leave the site. In addition, the noise from the motors must be baffled so it is eliminated. Driving by a compressor station should be no more hazardous than a walk in the park. The technology is available and the environment should not be sacrificed for maximizing profits.

## **AVOID ADVERSE ENVIRONMENTAL IMPACT**

At the July 15th FERC Scoping hearing a couple of young ladies mentioned the impact that particulate from the compressor station would have when it fell on the pastures where their families' cattle grazed, that it would pose a risk to the animals and their farm operation. New York State Department of Environmental Conservation 6NYCRR211.1 states: plus regulation requires that no person shall cause or allow emissions or air contaminants to the outdoor atmosphere of such quantity, characteristic or duration which are injurious to human, plant or animal life or to property, or which unreasonably interfere with the comfortable enjoyment of property. Clearly compressor stations in the Project violate this law. This is a critical point.

### **ENOUGH ABUSE**

Nassau Township already has a superfund site, there are household wells with water too hazardous to drink. You cannot swim in or eat the fish from Nassau Lake. Do not kill our Town or any other. Under 1500PSI, with 42" pipe, the "high consequence area where everything would be incinerated, including people, would be at least 1200'. Find that the environmental impact of this Project is too great a risk.

Re: Opposition to the proposed Tennessee Gas Pipeline natural gas pipeline and compressor installation in New Hampshire

As the owner of the property located at:

1 Page Hill Rd

New Ipswich, NH 03071

I am opposed to the proposed Tennessee Gas Pipeline natural gas pipeline compressor installation in my community.

*{hand written text stating strong opposition}* See attached

I am writing to ask FERC to plan a Scoping Meeting in my Southern New Hampshire town of New Ipswich

Paula J. Gribus

Stephen R. Gnibus

-----

I am appalled with the Kinder Morgan plan for a gas pipeline and transfer station in the eastern Monadnock region. The plan totally disregards the effects the pipeline and transfer station will have on the several small towns along the New Hampshire border. The Kinder Morgan plan is being presented to the area residences as being good for the economy. Whose economy is it going to benefit? It will not benefit the town's people who live along pipelines route. A lot of the local economy is derived from the natural resources in the area. Income is supported by visitors to the many parks and recreation activities such as mountain climbing, hiking, cross country skiing, irma and resturants. People have chosen to live here as a way of life. They come for the peace and quiet. We are very conscientious in the way we treat our environment and our resources.

The proposed pipeline is slated to run through several wetlands, watershed land, conservation lands, streams in addition to three mountains. The ground waters will be disrupted; destroying wells and has the possibility of contamination of the drinking water.

The proposed transfer station planned for New Ipswich is within walking distance of a convent, several homes, a densely populated area and two miles &om of two town centers. The transfer station is located two miles &om a middle school in New Ipswich and the town playground, pool, library, stores, gas station, and a church. The center of the town of Temple is located two miles on the other side of the transfer station and of critical concern the planned transfer station borders the back yard of Temple Elementary School The Kinder Morgan Project will adversely change lives and environment of these picturesque small towns

The promise of financial benefits is hollow at best. There is no amount of money that would compensate for the losses~ifthe proposed pipeline becomes a reality.

The residents of the town that are affected have chosen to live here because of the way of life and the natural beauty of the areL It is a devastating thought of the possibility our way of life will come to an end.

The callousness with which decisions are being made show that Kinder Morgan has no regard for the communities and way life being totally destroyed. The construction will be destructive and threatening the delicate ecosystem. The mind set is this is a rural area so not many people will be affected. The same attitude was recently stated after a report was published about the tremendous increase in earth tremors in the areas where bucking was being used; the area was sparsely populated so it did not matter.

This plan has all the~of political pressure from our Siends in Texas. Our suspicions are raised by the plan that resulted by the purchase of PSNH by Eversource and Eversource selling all of it's power plants. To whom are they being sold'? There is a gas line in Fitchburg; Unitil purchases their natural gas from Kinder Morgan. We have been down this road before with the promise of lower electric rate, remember Seabrook Power Plant? The New Hampshire customers paid to have the plant built, we were promised lower rates that never happened. It should also be noted that our electric bills is paid to a Texas address.

I am sure that Kinder Morgan has made assurance of safety. Their track record is shaky at best. Accidents do occur, unfortunately for this project any accident spells death to our community. I implore you to disapprove the Kinder Morgan or any other gas pipeline project. It is interesting to note not one of our government represcetatives have attended any of the town meetings.

Hopefully,

Paula and Stephen Gnibus

Cc: SarakMcKjnlevfere.aov

Dear Sarah McKinley and Eric Tomasi,

The planned KinderMorgan/IN(J project &vill affect not only the wilderness I'ores&a, rivers, the native animals and rare plants existing here, but will completely alter the lives of more than 100,000 residents living within this 71 mile arena of la&mes. I'arms, mountains, lakes, rivers, schools and seclusion (when desired). The people living here request the opportunity to speak & to listen: to publicly share their personal experiences ...of the inordinate dangers to their lives, their ecosystems and the future for their/our children and wildlife.

It is too obvious an act of favoritism for the KMfrN(i Project to hold PFRC's Scoping sessions in VERC chosen arenas, far distant from the people who already are being impacted by the workings/pressures of this pipeline-project. Our people need a fair chance to speak publicly.

I and others are requesting that the CHESHIRE FAIRGROUNDS ARENA be assigned as the location for the premier FERC Scoping Session in this area, for southern NH towns targeted for this project. This location will be an easy place to access for several thousand affected landowners. Above all. This choice will show FERC's honorable intent to Act in A Fair way with our affected southern NH people. Thank You,

Jean Tandy  
Richmond NH

Date: August 11, 2015 at 11:21:16 PM EDT  
To:  
Subject: Stop the proposed gas compressor station in Nassau, NY  
Federal Energy Regulatory Commission

My name is Meg Parascandola. I reside at 1291 Burden Lake Rd., Averill Park, NY 12018. I live there with my husband, two children, pets, and egg laying chickens. The proposed compressor station would be within four miles of my home. My home is downhill from the site. This compressor station would greatly affect property values, which will also impact our schools and funding. There is risk for harm to our lake ecology, local farms, and forests.

On behalf of my family we are petitioning the town, county, and state officials to take action to stop any construction of a gas compression station in Rensselaer County.

Your support of this petition is greatly appreciated.

Sincerely,

Meg Parascandola

family1291@aol.com

#### **20150813-5003**

Dennis Ryan, Averill Park, NY.

In its letter of July 24, 2015 to FERC, Tennessee Gas Pipeline stated the pipe size for this project would be reduced from 36" to 30", and the compressor station in Nassau would be reduced from 90,000hp to 41,000hp. However, in this same letter, the applicant states "Tennessee will continue to evaluate the needs of

the market and reserves the right to amend the Project scope...”

Given this open-ended reservation, what assurance does the Public have that the pipeline will ultimately be downsized, and the compressor station reduced by more than 50% of its original proposed size. We do not believe it is possible to evaluate the environmental impact of this project when such important design decisions apparently have not been actually finalized. Given the applicant’s documented history of manipulating the “process”, we request this very important decision on pipeline/compressor station capacity be finalized prior to any approval actions on the part of FERC.

#### **20150813-5005**

Richard Crane, Groton, MA.

We are writing regarding the recent notice sent to impacted landowners regarding the intent to prepare an environmental study.

<http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=13917801>

Our property is located at 95 Overlook Drive, Groton, MA. We received a notice that we were impacted by the previously planned route back in October 2014 from the Tennessee Gas Pipeline company. Since then we have not heard anything from Kinder Morgan or the Tennessee Gas Pipeline company. It is our understanding that they changed the route.

We had hoped to continue to receive notices so that we can voice our concerns regarding the devastating impact that this project will have on the environmental and our communities. We have not received any notices since October 2014 from Kinder Morgan or the Tennessee Gas Pipeline.

Just this past week we were made aware of an environmental meeting that FERC is conducting in Lunenburg, MA. This is the first we have heard about this meeting. We never received any notices even though we were listed as an abutter on the previous route. We can only assume that the previous route is no longer a viable option and that the current route is preferred. We agree that the route that runs along and/or coincides with existing utility easements is a much better route. It minimizes the impact to the environment and goes over already disturbed land. It is a much better choice.

However, given that we were previously identified as an abutter on the original route, we would expect that we would continue to receive notices. We have not!

So you know, we have grave concerns over the wetlands, pond (Wattles Pond) and vernal pools in the conservation land located behind our house. We also have storm drainage from our neighborhood that drains into an area behind our property. If the pipeline were to use the original route, not only would it destroy tons of forest that is surrounded by neighborhoods, but a pond and wetlands. All of these properties are conservation land protected by Massachusetts law.

Again, we ask that you not approve this project. We don’t think it is in the benefit of anyone in New England. Instead, we see this as a way to export natural gas overseas which will drive up the cost of natural gas here at home. What we have also seen is a ton of political manipulation to increase the fuel mix here in Massachusetts to predominately natural gas. Two years ago we had a healthy mix of hydro, nuclear, coal, natural gas and renewables. No one energy source was dominant. Today I looked on the ISO-NE website and saw that our natural gas percentage is 61%.

Please, please, please stop this project. We don’t need more natural gas when there are already other natural gas projects that will bring more than enough natural gas to the region. We don’t need our environment and our communities decimated by this project.

#### **20150813-5012**

Marilynn Acker Ezell, Temple, NH.

I have been blessed to live on Mountain View Rd. in Temple, NH for 34 years. The only reason I got the opportunity to live here was that my land is considered too sensitive for certain uses. The dairy farmer who had

his cows grazing here was told that he had to close the dairy because it was too close to the Tobey Reservoir and the manure could pollute the water. So the land became available for sale and my husband and I bought it, with the understanding that we could never have farm animals here. No problem. We designed and built our dream home here. Over the years we have established 5 gardens here, which we maintain organically. We have a 17' deep dug well with pure water in it. We've always been careful with the land, knowing that anything we put on the land could end up not only in our well, but also in the drinking water supply for the Temple Elementary School and the town of Greenville, served by the Tobey Reservoir. We have no problem with the fact that the town is not allowed to put salt on the road here because that too could end up in the same places. We know that protecting the reservoir serves to protect us too.

Does this sound like an appropriate place to put a compressor station? Well, that's where Kinder Morgan/TGP want to put it, just 1000' uphill to our south, on the same watershed. So a place that is too dangerous for manure and salt, is OK for radon-222, lead, and polonium? I think this sounds very unwise. If our well is polluted, who will pay for us to buy water for drinking, washing, watering our gardens?

## **20150813-5049**

We represent four voices from Franklin County testifying to specific ways that the fabric of our society would be destroyed by the proposed pipeline. It's inevitable upheaval and destruction would affect every member of our community gravely. We beg you to take the comments below seriously because we deserve to be heard.

We want to speak personally about Woolman Hill in Deerfield – a location where the powerlines are yards away and are slated to be used for the pipeline. This decades-old conference center would no longer be able to function. Renters include local colleges, social service agencies, and ourselves. We are counselors at a summer program there called Journey Camp that runs each summer. Woolman Hill has become a safe haven for many people in our community, especially children, and a pipeline would be extremely invasive. We want to testify on behalf of all the children who would be personally affected by this construction. How do you expect us to tell the children we work with that the place of learning, nature, and safety--the only place where some of them feel safe, a place where they find support and comfort--the place they return to summer after summer, will be desiccated by the pipeline? The world needs more educational places and programs for children, and this pipeline would put some of them in jeopardy. One of us also works at a program that rents the space at Woolman Hill, Wolfree Programs. Wolfree is a nature based education program that through nature connection works to cultivate children's strengths, confidence and passions as leaders and stewards of their communities. Both Journey Camp and Wolfree programs, in addition to other valuable and innovative educational programs would be destroyed by the proposed pipeline, and this is a very grave concern for us.

The people of Franklin County have been working for decades to preserve the land here. There is a lot of conserved territory and protected marshland that should not be disturbed. It is vital that we continue to guard this land because it is an important tourist attraction that fuels the economy, and our county is one of the few places left on earth with clean drinking water and fertile farmland. Agriculture is central to our community, and a pipeline would be devastating to the farmers here. Please don't destroy the farms that have taken decades to build. We grew up believing in democracy and are outraged that a wealthy company owner could trump the needs of citizens. So many towns have voted against the pipeline, and yet somehow it is acceptable to you that their votes don't matter. What is the purpose of democracy if the people's voices aren't heard?

There is a strong collective voice speaking out against this pipeline. We are just four of the many people who care deeply about this land and this community. Each of us has a personal connection to this area. We speak on behalf of the children of our programs, of the land we call home, of the farms that sustain us, of the cleaning drinking water that is vital to us, of land that has been protected and unharmed for hundreds of years, and of all the people whose lives will be devastated by this pipeline. Massachusetts as a state would be thrown into inconsolable grief, unnecessary loss and travail. Every landowner whose land is used or whose land is near by would have their life upended. The decision to install a pipeline would damage our

program and organization, our homes, our land, our economy, our community, our stability, and our safety. Do not ignore us any longer.

**20150813-5052**

### **FERC – Help Me Out Here, I Just Don’t Get It**

I don’t believe that the NED pipeline is needed. If approved by FERC, the pipeline will likely become part of a massive overbuild of natural gas pipeline capacity in New England - one that will surely lead to the export of gas from the region. And export sales will then put upward pressure on our local natural gas prices. But Kinder Morgan may convince FERC that New England needs this pipeline. Why is that? Because when FERC considers a pipeline proposal, they use only a market-based definition of need. If an energy company can produce long-term contracts for a portion of the capacity of a pipeline, that’s all FERC requires when determining need.

For many reasons, I believe that this is a faulty definition of need. It doesn’t take into account the many other natural gas pipelines being proposed for New England. It doesn’t take into account the corporate ties between the pipeline company and the gas companies willing to sign these contracts. And it doesn’t take into account renewable energy options, additional peak shaving, increased conservation and many other possibilities that could help to meet our New England energy needs.

But for the moment, I’m going to set aside my objections and accept FERC’s distorted definition of need. So, for the next couple of minutes, I’ll agree with FERC that signed contracts equals need for a pipeline.

And with this definition of need in mind, let’s now turn our attention to the so-called Fitchburg lateral. Can someone at FERC please explain to me the need for this lateral? There is no apparent demand for any of the gas the lateral might supply. The local gas distribution company at the end of the lateral has stated that they do not need additional capacity. No gas utility has approached the DPU with the required notification that they are interested in any of this gas. So please, FERC - explain it to me. Why is it that when we get to this lateral, your definition of need suddenly evaporates?

If a market-based definition of need is used to justify the construction of the main NED pipeline, despite all of the damage and downsides that that pipeline will bring with it - how can Kinder Morgan then be allowed to simply add laterals to that pipeline willy-nilly, without there being a clear need for them? When FERC gets to Mason on the pipeline map, why do they suddenly abandon their market-based definition of need?

Let’s imagine for a minute that the Fitchburg lateral was a separate, standalone pipeline proposal. Because it runs from New Hampshire into Massachusetts, it would still be an interstate pipeline, under FERC’s control. But the project would not be in the pre-filing stage and there would not be any scoping meetings such as the one we’re attending here tonight. And why not? Because Kinder Morgan would never have applied to FERC for a certificate just for the Fitchburg lateral. The pipeline company knows that this lateral would simply not meet FERC’s definition of need. The project would be a non-starter.

So again, I am asking FERC to please help me out here. Explain the need for this lateral and exactly how you determined that need. Because even when I try to play by your own rules, I just don’t get it.

Nick Miller Groton, MA

**20150813-5085**

Carol Hammond, Townsend, MA.

I attended the FERC scoping meeting in Lunenburg last night and I agree 100% with those speakers opposing the project. You make decisions that affect people’s physical well being. You make decisions based on the facts that are presented to you from experts and well documented materials. Those facts show that the environment would be adversely affected, water supplies contaminated, landscapes destroyed, protected species even more endangered. Your decisions have meant that honest, hard working people have and will be forced to have their homes stolen from them. For WHAT???? Gas they will never see??? Private profit...

that's all it is. It's well know how FERC is funded. There is no gas shortage...please look at the numbers more carefully...Please let human lives matter

Carol Hammond

## **20150813-5086**

Russell C Bennett, Averill Park, NY.

Re: Scoping Notice; Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000  
Northeast Energy Direct Project

I am submitting these comments for purposes of scoping in relation to the proposed Northeast Direct Pipeline.

Hudson River crossing. The Hudson River is a Superfund site for two hundred miles from Fort Edward south to NYC. The crossing at Coeyman's Landing and Schodack is just 20 miles south of the Troy dam, where General Electric has performed an expensive dredging and cleanup operation of PCB deposits in the sediments to prevent their further downstream migration. The river is over 1400 feet wide at the proposed crossing point. It should be determined whether and how Kinder-Morgan's river crossing method will disturb and re-suspend PCB deposits at the crossing site. FERC should study the effect on downstream communities such as Rhinebeck and Poughkeepsie which use the Hudson River for drinking water. Additionally, the Town of Bethlehem uses wells adjacent to the Hudson at its Clapper Road treatment facility, in very close proximity to the proposed pipeline crossing. The Hudson is an estuary river which changes its direction of flow four times per day. The danger to the public water supply requires a hard look.

Nassau compressor station (Market Path Mid Station 1). The proposed 90,000hp compressor station is just 2800 feet from the southern tip of Burden Lake in an area that is otherwise extremely quiet. Portions of the lake are within the half-mile buffer from the compressor. Once sound reaches the lake, there is no topographical barrier to attenuate the noise or prevent its travel over the water. The extremely loud sounds produced by blow downs will be carried far further than in other locations, particularly since the prevailing winds are from the south and running directly to the lake. As pointed out in NYSDEC's SGEIS on the Oil, Gas and Solution Mining Regulatory Program in New York State, even a six decibel increase in sound pressure can be annoying against existing rural background levels of only thirty decibels. (See Final SGEIS, May 2015, Vol. 1, page 6-301.) FERC should study the effect on the sound impact of the topography, prevailing winds and quiet background.

Burden Lake hosts a children's summer camp and Wounded Warriors events for recreation and recovery of severely disabled veterans. It is inconceivable that we would subject these veterans, many of whom may be suffering from post-traumatic stress syndrome or traumatic brain injury, to constant, sudden and extreme noises or to force them to find another host site after forging a strong community connection for so many years here in an ideal site.

Aside from hosting a nesting population of bald eagles and numerous osprey, Burden Lake is a regular stopover for migratory waterfowl in the spring and fall. These include large numbers of Canada geese, bufflehead ducks, mergansers, loons, wild swans, and mallards, etc. FERC should study the impact of the compressor station on resident and migratory birds.

The sound from the compressor station could be mitigated by employing a number of smaller stations with electric motors instead of natural gas engines, installing silencers and mufflers, erecting sound containment structures, moving the facility to a less sensitive location, or, preferably eliminating it altogether.

Pipeline compressor stations typically employ stadium type lighting for security purposes, despite the fact that these stations are generally hidden from view by the topography and are unattended. Lighting of the sort contemplated would pollute the night sky, preventing any view of the stars from Burden Lake and unnecessarily interfering with activities of night animals such as bats and owls. FERC should study these impacts and whether there is a reason why night vision security cameras could not be employed as a mitigation measure. There is no reason why the facility cannot meet Dark Sky guidelines for shielding of glare.

The proposed compressor station is 9,000 feet from Eastfield Village, a collection of colonial buildings in an historically authentic setting, used for educational and study purposes at 104 Mud Pond Road in East Nassau. The constant sound would be incongruous with the site's mission and purpose.

The pipeline would run just north of the former Dewey Loeffel landfill, a Superfund site. FERC should study the compound effect on the affected lands and the waters of Nassau Lake of a potential leak from the pipeline flowing through the landfill area.

Rensselaer Plateau. The pipeline would bisect the 105,000 acre Rensselaer Plateau, one of the largest and most ecologically intact native habitats in New York State. The pipeline would isolate and fragment wildlife on either side of the line, defeating the goals of the Rensselaer Plateau Alliance's conservation plan, recently ranked #5 nationally by the U.S. Forest Service Legacy Program. Running the pipeline adjacent to existing electric power easements exacerbates the problem by widening the gap separating contiguous habitats. The impact on the Plateau's animal and plant life should be closely studied. Consideration should be given to burying the pipeline deep enough to permit reforestation.

The Plateau is characterized by steep topography. Construction across such areas creates a potential for flash flooding, affecting lakes and streams at lower elevations. Glass Lake and Crooked Lake are particularly vulnerable to flows from higher elevations in high volume storm events. The dams along Wynantskill Creek are not capable of withstanding additional loads. Catastrophic collapse would threaten communities as far away as the City of Troy.

Thank you for the opportunity to comment.

Sincerely,

Russell Bennett

To: Patty Quinn

Percheron Field Services, LLC

Right of Way Agent for Tennessee Gas Pipeline Company, L. L. C.

603-303-9731

I am in receipt of your letter dated August 2015 where you and/or KM and/or TGP appear to remain in confusion, where you state:

“We understand that you do now wish to allow survey..”

Although you have been informed several times in no uncertain terms you absolutely do not nor will EVER have access to my land, you choose to ignore this prohibition, state contrived falsehoods, and continue to harass me with pro-survey propaganda and futile attempts to subvert this standing prohibition.

Once again anyone associated with Kinder Morgan and/or Tennessee Gas Pipeline is and has been denied any an all access to Lot K-10-1, Jackson Road, Mason NH 03048 for any purpose whatsoever.

Violating this Prohibition of Access to the stated property will be treated as willful acts of both criminal trespass and vandalism, and will be prosecuted to the fullest extent of the law.

The Mason Police are hereby notified of your persistent intent to violate the law and your continued harassment has been recorded in FERC case PF14-22-000.

Regards,

John Cooper

The Denial of Property Access below was sent to nedinfo@kindermorgan.com on 1/16/2015 and again on 1/28/2015. To date it has not been acknowledged by Kinder Morgan. As such this notice is being forwarded to you as the stated "Contract Land Agent to Tennessee Gas Pipeline Company", to inform you any and all access to LOT K-10-1, 437 Jackson Road, Mason NH 03048 has been denied as of Jan 15th 2015 as stated below. Furthermore under your declared role as Contract Land Agent to Tennessee Gas Pipeline Company, you are hereby engaged in your fiduciary responsibility to inform both Kinder Morgan and Tennessee Gas Pipeline Company of the property access prohibition which has been in effect since Jan 1, 2015.

Note carefully this Denial of Property Access is definitive and final, is not subject to your interpretation, and is not open for negotiation nor further discussion whatsoever. As such the Mason Police are hereby informed of the stated prohibition denying Kinder Morgan, its representatives, contractors, sub-contractors, or associates land access, and that entry to the associated land in violation of this prohibition shall be treated as criminal trespass.

Regards,

John Cooper

Re: Denying Property Access

As the owner of the property located at LOT K-10-1, 437 Jackson Road, Mason NH 03048, after careful consideration and upon legal consultation I hereby DENY ACCESS TO MY PROPERTY and furthermore declare my opposition to the Northeast Energy Direct Project, Docket No. PF14-22-000, which Tennessee Gas Pipeline Company, L.L.C. proposes to extend into my property. I oppose this intrusion onto my prop-

erty for (but not limited to) the following reasons:

Natural gas transmission pipelines pose a very serious risk due to possible explosion and fire with potential injury and loss of life.

A natural gas transmission pipeline is considered storage of hazardous material and would violate provisions in my mortgage, put me in default and expose me to foreclosure.

A natural gas transmission pipeline is considered storage of hazardous materials and would violate the terms of my homeowners insurance agreement and expose me to litigation risks due to the previously mentioned fire hazard.

The existence of a natural gas transmission pipeline on my property, based on real estate value assessments from similar properties with similar easements, poses a demonstrable loss of property value, which would be unrecoverable.

The existence of a natural gas transmission pipeline on my property could prevent sale or sub-division of the property due to the potential inability of the buyer to obtain a mortgage.

Based on the facts and obligations stated above, I am denying permission to the Tennessee Gas Pipeline Company, LLC (a Kinder Morgan Company), its representatives, contractors, sub-contractors, or associates to enter my land or to perform surveys, or for any other purpose in furtherance of a pipeline infrastructure project. Any such physical entry onto my property from the date of this letter forward will be considered unauthorized, and treated as trespass.

### **20150813-5113**

Marilyn Learner, Hollis, NH.

There is a NEED for additional Scoping meetings for the NED project. At the Lunenburg scoping meeting, Project Manager Eric Tomasi stated FERC holds scoping meetings to learn. He related that he learned about concerns he had never considered before. I would suggest FERC has a responsibility to ensure that learning about a massive invasive infrastructure project also occurs for the impacted public.

CITIZENS learn at Scoping meetings too. Many people, particularly residents just learning they will be impacted by NED and those who do not have consistent internet access don't even know what they don't know.

Hearing others voice their concerns enables people to learn from each other. Many left Scoping meetings better informed and more able to articulate and write their concerns after listening to fellow citizens. Not scheduling more Scoping meetings, and justifying that by saying that citizens can write and send concerns, deprives citizens of the opportunity to listen, consider, and learn collectively.

Mr. Tomasi stated that Scoping meetings are not town meetings. FERC ought to value the educational and deliberative process that town meetings facilitate, and schedule additional scoping meetings.

## **20150813-5119**

Joann Donnelly, Northfield, MA.

I am writing to you to express my grave concern regarding the proposed NED Project. To begin, there are many procedural challenges that I take issue with and some examples include: the disallowance of full intervenor status by the DPU for our legislators, e.g. Stephen Kulick, and organizations which represent us, the refusal by the FERC to respond to multiple requests by citizens, legislators and Attorney General, Maura Healy to slow the process to allow for time to complete a needs analysis for electricity and fuel which includes review of all available resources which may address this issue as well as allow for a regional plan which meets the needs and is in compliance with federal, state and local initiatives to reduce reliance on fossil fuels in order to promote more "green" and sustainable practices( due in October 2015), the fact that Kinder Morgan has submitted a pre-filing environmental impact document which was sorely lacking in information and was submitted 5 days before the FERC hearing leaving insufficient time for review. The document had thousands of TBDs ("to be determined") and there was no information regarding: the plan for horizontal drilling across the Connecticut River, Deerfield River nor Millers River. It also gave no information regarding whether the proposed compressor station in Northfield, Ma was going to be manned or remotely controlled. In the event of an "incident", the nearest Kinder Morgan Office is in Agawam,MA - more than an hour away. This is noteworthy because in the event of an incident my local emergency responders would be prohibited from entering the property until a Kinder Morgan employee arrives.

A major concern regarding this project is that Kinder Morgan has yet to demonstrate sufficient need. To date they have obtained approximately 30% of projected customer commitments. The size and scope of this project, even with the modified smaller capacity-scaled back from proposed 86 horsepower to 41 horsepower compressor station, still far exceeds regional need. Clearly the majority of this gas is headed for export. Kinder Morgan says natural gas is needed to meet domestic needs and to keep prices down. However, we know from past history with liquid gas, once traded on the world market, prices rose domestically. There is no reason to believe it would be any different with natural gas. I take issue with the prospect of the FERC granting Kinder Morgan the opportunity to take property by eminent domain for the profits of a private company for "goods" being sold abroad. I do believe it exceeds the scope of the FERC and is morally and politically abhorrent. How does this serve the public? ...And to then possibly impose a tariff for citizens to pay for this private venture is more than outrageous. Kinder Morgan has submitted plans for two segmented parts of the plan—NED and Connecticut Expansion Project. These plans should be reviewed together given that they are part of the same project. When considered together, Kinder Morgan has even less than 30% of customer commitments. FERC please take note. Kinder Morgan has not demonstrated the need.

I urge you to advocate that the FERC cease and desist this process pending the results of a study ( expected in October 2015) sponsored by Attorney General, Maura Healy which is assessing the electricity and fuel needs for Massachusetts and is looking at all options to meet the need which include, repairing and expanding existing pipelines and leaks, use of conservation measures and renewables, liquid gas and natural gas options. I do believe when making decisions about regional needs one must look at not only all the potential resources and options but also consider other proposals on the docket. Spectra has a proposal on the Docket for retro- fitting existing pipeline along the southern tier of Massachusetts. It seems a far better option to

repair and expand along existing pathways than taking additional lands. This should be factored in to any decision making regarding regional needs. Authorizing both the NED and the Spectra project would further over build infrastructure....Why and how does this serve the public? All proposals should be considered in concert as an answer to the regional need and not as independent projects devoid of cumulative effect on air, water, habitat, safety, economy, culture, etc.

### **20150813-5120**

Joann Donnelly, Northfield, MA.

As a resident of Northfield, I live a mile from the proposed compressor station. I am touched with grief and fury on behalf of my neighbors who live a 1/2 mile closer for they have received letters from Kinder Morgan advising them they were in the “zone” and were encouraged to consider selling their houses to Kinder Morgan or face losing them by eminent domain should FERC approve the proposal. We who live up here on the hill have done so by choice. Regardless of political beliefs, myself and my neighbors all choose to live here because we love the beauty, wild life and history of this place. We do so at great inconvenience...no cell service, frequent power outages, steep terrain which can make travel in bad weather dangerous –generally an exercise in getting stuck at home rather than stuck at the bottom of the hill. There are few means of egress. It was not until November 2014 that Cable service became available to residents on the hill. We live here in spite of these challenges because we love this area. Now these challenges may become true dangers should this proposed compressor station be built. The implications and questions are already delineated in documents submitted by the Select Board of Northfield, Ma. As much as I have sympathy for my neighbors I am beginning to think that those who live within the 1/2 of the proposed compressor station may in some respects be “luckier”. At least they may have the opportunity to sell their house and leave. Once this proposal becomes “real”, who would buy my house ( 1 mile from a compressor station)? Would I really get a tax abatement given the possibility of declining property values? That’s not been the experience of residents of towns where existing compressor stations reside. Indeed there have been increases in need for police, emergency preparedness etc. What would I and my livestock drink should the private water supply be shifted or poisoned as a result of nearby blasting or contamination associated with the building, ongoing use of the pipeline and compressor station or “accidents”? Who and how will the atmosphere be “restored” given the constant addition of methane by this proposed compression station? There are only 2 means of egress from my home, left or right. Should there be an “incident”-defined by minimally \$50,000.00 loss, would I even be able to get out? I submit to you that fracked gas and all of it’s associated businesses represent the “Gold Rush” of this 21st century with none of its’ profits and few benefits going to the public. Please stop the “Feeding frenzy” and say, ”NO” to this project. Please advocate for a perhaps boring, less “sexy” but more measured and thoughtful plan for meeting energy needs, while transitioning away from fossil fuels. Climate change is here. Don’t make it worse.

Joann Donnelly  
616 Gulf Rd  
Northfield, Ma 01360

### **20150813-5130**

Christine N. Turner, Montague, MA.

The proposed TGP/Kinder Morgan pipeline would travel through, dramatically disrupt and potentially destroy my town and surrounding environs. I cherish my and my neighbors’ quality of life. I strongly oppose this project for safety, economic, protection of natural resources and cultural reasons. This project smells of corporate greed at the expense of democratic principles and local welfare. Please prove me wrong.

### **20150813-5131**

Joann Donnelly, Northfield, MA.

As a citizen in Northfield, Ma who lives approximately a mile from a proposed compressor station there are

numerous environmental, economic and cultural concerns—please see document submitted by Northfield Select Board. I have additional concerns to add when considering the document submitted by Northfield Select Board. The EPA states,” “ Pound for pound, the comparative impact of methane (CH4) on climate change is 25 times greater than carbon dioxide (CO2) over a 100 year period.” The EPA also states, “Upgrading the equipment used to produce, store and transport oil and gas can reduce many of the leaks that contribute to methane(CH4) emissions”. Taken from [www.EPA.gov.climatechange/ghgemissions](http://www.EPA.gov.climatechange/ghgemissions)

Kinder Morgan voluntarily participates in the Natural Gas Star Program of the EPA. The Program Manager from the EPA assigned to Kinder Morgan is Jerome Blackman( [Jerome.Blackman@erg.com](mailto:Jerome.Blackman@erg.com)) and the Customer Service Representative assigned to Kinder Morgan is Allison Berkowitz ([Allison.Berkowitz@erg.com](mailto:Allison.Berkowitz@erg.com)). The EPA Star Program has outlined a number of strategies to reduce and recoup methane emissions from compressor stations. What strategies is Kinder Morgan going to implement to recoup methane emissions, reduce methane emissions and monitor both planned and incidental emissions at the proposed compressor station in Northfield, MA and where in the proposal to FERC is that delineated? Given that Kinder Morgan voluntarily participates in the Star Program does that include voluntarily participating in EPA or other independent monitoring of methane emissions? How often will that be monitored? How will ongoing-incidental emissions, and “Blowdowns” ( planned emissions) be monitored and by whom? How will that information be made public and how often? Given their participation to date, to what extent has Kinder Morgan met any existing targeted goals regarding reduction of methane emissions? I urge you to advocate that the FERC mandates Kinder Morgan to clearly delineate a response to these questions regarding methane emissions and that in addition to any monitoring provided by Kinder Morgan that an independent evaluator ( paid for by Kinder Morgan) be determined to assess on an ongoing basis, minimally on a quarterly basis.

## 20150813-5137

Marilyn Learner, Hollis, NH.

I request that FERC endorse the NO ACTION alternative. Kinder Morgan’s (and their NH LDC partner, Liberty Utilities) track record regarding complete, truthful information is tainted. If there really is a valid need for additional gas in NH, less invasive alternatives to NED can be considered.

Although KM’s recent Resource Report suggests otherwise (Resource Report section 10.1), the NHPUC has yet to decide on the merit of the 20 year Precedent Agreement contract between KM and Liberty Utilities, the sole LDC in NH attempting to contract with NED. (Liberty Utilities is a wholly owned subsidiary of Algonquin Power and Utilities, a partner with Kinder Morgan in setting up Northeast Expansion LLC, an investor in NED. While this relationship and investment entity are legal, questions of bias and conflict of interest are legitimate.)

On August 15, 2000 on Docket CP00-48-000 FERC approved a 19.3 mile expansion of the Concord Lateral (owned by TGP) from Dracut MA to Londonderry NH. This project collocated a 20” pipeline with necessary appurtenances with a 12” pipeline. Liberty Utilities, which completed its purchase of Energy North in 2012, in concert with TGP, owned by Kinder Morgan since 2012, now asserts that the Concord Lateral is constricted/bottlenecked and must be supplanted and/or supplemented by NED. KM’s numbers regarding the Concord Lateral are confusing at best, deliberately inaccurate at worst, and mostly absent.

What is the maximum capacity of the Concord Lateral? What is the optimal capacity and how is this determined? When/how often is capacity stressed? When/how often is capacity underutilized? Where is the so-called bottleneck? How big is the bottleneck? How often does it occur? When does it occur? Why can it not be addressed in place? Can small routing loops mitigate the bottleneck? Do population increases around the expanded pipeline corridor require the pipeline to run at lower capacity? If so, how can a building massive pipeline through the same growing area be considered? The option and data are missing and need to be considered as part of alternatives to NED.

Kinder Morgan does not list remediation of the Concord Lateral in its list of Alternatives in Resource Re-

port, section 10. That is an interesting omission, as Liberty Utilities was required to address that option in the Precedent Agreement hearing NHPUC Docket 14-380. Liberty Utilities, the sole NH LDC claiming pipeline constriction, and thus the sole provider of the “need/20 year firm transportation contract” justification for NED via FERC’s definition of need, summarily dismissed that option. Kinder Morgan apparently informed Liberty and Liberty informed the PUC that Concord Lateral remediation was “too costly.” The question is, “Too costly for who?”

Given the 71 miles of greenfield construction required for NED in NH vs the already existing pipeline corridor from Dracut MA to Concord NH, I request a full environmental impact analysis of options based on remediating “constricted” sections of the Concord Lateral vs the environmental impacts of constructing NED, and a comprehensive comparison of the environmental impacts of each project. Additionally, a cost benefit analysis of each project including CSS costs to assure that climate goals are met should be completed.

Liberty Utilities proposes to MORE THAN DOUBLE its present contracted capacity, from 50Dth/day to 115Dth/day, with 65Dth/day being incremental. That is clearly a speculative venture designed to jucreTe, then justify “need” for NED in NH. While some increase in gas capacity might help assure reliability, natural gas usage is considered a “bridging” measure; the ultimate goal being a total phase out. 71 miles of greenfield construction fosters permanent reliance on a fossil fuel and creates a permanent scar across NH. If some additional gas is truly needed, remediation of parts of Concord Lateral make more sense than a super pipeline. Liberty Utilities has contracts in place from Dracut now, and additional gas will be coming into Dracut from various projects. Liberty is not without contractual options for additional gas. Liberty Utilities has an indirect, but clear, financial allegiance to Kinder Morgan, but that is insufficient reason to justify blasting and trenching through NH to serve Kinder Morgan’s corporate goals. Less invasive options must be thoroughly investigated and considered in comparison to the environmental impact of NED. FERC would be negligent not to require KM and Liberty Utilities to do so.

## **20150813-5195**

John Seakwood, Hancock, MA.

Re: Docket # PF14-22-000, Northeast Energy Direct Proposed Pipeline

I am a resident of Hancock, MA, and a citizen who has followed energy issues closely for many years, including serving for a time on the Berkshire Renewable Energy Collaborative at the invitation of my State Representative.

I join with the near unanimous majority of my fellow Hancock residents, and with the overwhelming majority of residents of neighboring towns in New York and Massachusetts, as evidenced by town meetings held and resolutions passed throughout the area, in standing in opposition to the Northeast Energy Direct Proposed Pipeline. We are joined by our State Representatives and Representatives in the US Senate and Congress in opposing this pipeline.

You have asked for the public’s input and you are receiving a clear message saying “NO”.

I attended the Scoping Session FERC held at Taconic High School in Pittsfield on July 28. In the 3+ hours I was there, I heard dozens of comments against the proposed pipeline, and only 2 speak in favor of it. I would have commented myself at that meeting, but drew number 57 for my turn. I left at about 10:30PM and there were still many scheduled to speak before me. So I am making my comments in writing now.

I believe that the pipeline is not necessary, because the energy needs of the region can be met by repairing the existing natural gas infrastructure, by increased energy efficiency and conservation (demand side management), and promoting increased reliance on clean, renewable energy sources such as solar, wind, geothermal, tidal and small scale hydro.

The future belongs to these new clean energy technologies, not with the extraction of fossil fuels with their concurrent negative effects on our climate and environment, and ultimately on our economic well being. I believe that prosperity will flow to those nations that embrace and pioneer these new clean technologies, and see great possibilities for new energy sector job growth (jobs that by their very nature cannot be ex-

ported overseas). I am not naive enough to believe that the transition to the new energy technologies will not be without their challenges, but the example of other industrial countries such as Germany, Denmark, etc, shows that it is possible, and that we have much to do to catch up or be left behind in the decades ahead.

As to the FERC process so far: the July 28 FERC Scoping Session was fundamentally flawed by Kinder Morgan's release on the previous Friday of a 6,500+ page, highly technical but still incomplete document about the proposed pipeline. There is no way that citizens can reasonably comment on the proposal with such a brief time period to absorb that "dump" of information.

For that reason, I strongly urge FERC to restart the Scoping process, giving the public time to respond intelligently. Anything less than starting over would make a mockery of the public comment process.

As to the scope of FERC's review of the proposed pipeline, I would urge FERC to consider the better alternatives for meeting our growing energy needs I outlined above; to take renewable energy's current and potential Distributed Generation into account when calculating the region's load forecast; to consider the impact to human residents, flora and fauna of the noise, air pollution, and disruption from the construction and operation of the pipeline, and of the threat to health and safety posed by leaks, gas releases at compressor stations, and the accidents that might occur over time.

The communities in this area are defined by their rural nature. It is why we, the residents of this area, live here, and it is something we treasure and are determined to protect. This rural character is also fundamental to our economy, since many people visit from nearby population centers to enjoy the natural beauty. Therefore, I further ask FERC to consider the effect on the economy, culture, and sense of community in our area from the industrialization the proposed pipeline represents, and from its literal bifurcation of our communities.

I am also especially concerned by the proposed pipeline's impact on sensitive lands in its path, including lands that have been put aside for preservation. Reversing such preservation efforts is an affront to our communities. I urge FERC to consider these impacts as well.

As a resident of a rural area, I also take exception to the thinner pipeline, the greater distance between shut-off valves, and the acceptance of small leaks that might be permitted here but not elsewhere. The well being of our lives and communities is no less important than those living in a more densely populated area.

I also stand in solidarity with those rural communities where fracking is occurring, where residents are subjected to serious degradation to their water supplies, their roads, and to the quiet enjoyment of their property. The rural areas of our nation are a source of clean food & water, a place where the natural world has a chance to recover and endure in a world facing mass species extinction. They are places worthy of protection, not sacrifice zones for industrialists to profit from.

My town, Hancock, MA, is in the path of the proposed pipeline. We have a population of 717 as per the 2010 census. We are already contributing to the energy needs of our state and nation: the Berkshire Wind Project, located here, is the second largest wind farm in Massachusetts. It can produce enough electricity to power 6,000 homes without threatening our water, air, and quality of life. That is the standard that energy development needs to meet. The proposed pipeline falls way short.

Listen to the people.

I stand in opposition to the Northeast Energy Direct Proposed Pipeline. Much better alternatives exist.

Out of simple fairness, I call upon FERC to restart the Scoping process.

**20150813-5218**

Sheila DS Foraker, Nassau, NY.

July 15, 2015

FERC

re: Docket Number PF14-22

## ENVIRONMENTAL IMPACT

I represent a non-profit religious organization incorporated in California. In 2005 we relocated from Napa, California to Nassau, NY at great cost and sacrifice. I donated nearly 40 acres of land that has been in my family for almost 100 years to build a center for our organization. The headquarters are located at 202 China Hill Road, Nassau, NY. The center is used by local, national and international members and non-members to come for retreats in a peaceful rural setting. It has been an ideal location with its contemplative environment offering a place for silence, serenity to meditate and pray. It has been a safe place. The air is pristine, the spring water is clean and pure, and the atmosphere is peaceful and quiet. We have an organic garden and we raise honeybees.

If a 90,000 horsepower compression station were to be built on Clarks Chapel Road, within walking distance of our property, all this would change. We would be bombarded by noise pollution 24 hours a day as the fracked gas aided by three Titan 250 gas turbines would be pushed along the pipeline, which is proposed to be on our property. The light and noise and off-gases periodically to regulate pressure will disrupt our peaceful environment 24 hours a day, a Public Nuisance. The compression station would pollute the air and the water. We would no longer be in a safe environment. The noise alone would inhibit our ability to practice our faith. The dangers that a pipeline in our backyard and a compression station very close to our property would make it an unsafe place to hold retreats, let alone to live.

We also protest the robbery of the community's wealth by Kinder Morgan through their proposed compression station and pipelines. As soon as they would be established all the property values will go down to nothing. After all who wants to live next to a pipeline and a compression station?

Would any of you members of FERC, members of our government, anyone from Kinder Morgan live in a place where there is a fracked gas pipeline and a compression station of 90,000 horse power in your backyard? I think not. Well, we don't want it in our backyard either. We want the same right to peaceful quietude as the decision makers. Please find another place that is not populated to put your fracked gas pipeline and your compression stations.

FERC, we know that you have never denied a pipeline application. But now you should for the first time deny Kinder Morgan's pipeline and compressor stations application. There is no place for them in our populated area. We know that the truth is hard to accept. But look at the truth, the scientific evidence, and the track record of safety of Kinder Morgan and other pipelines and compressor stations. You know that the pipeline and compressor stations will be devastating to our communities and it will destroy us. If we are to survive, then we must not be consumed by corporate greed, money, and power. You must make a decision that will be for the good of the people, for humanity, for the environment, for our government, which is of the people, for the people, by the people. After all as the Declaration of Independence says, "...we are endowed by the Creator with certain inalienable rights, that among these rights are life, liberty, and the pursuit of happiness." Do not take away our life, liberty or our ability to pursue happiness. Deny the application for the pipeline and compressor stations in our communities.

Humbly submitted by a peaceful homeowner and board member of our non-profit religious organization  
Sheila DS Foraker

### **20150813-5224**

Marla Hirsch, Lunenburg, MA.  
Docket No. PF14-22-000

Federal Energy Regulatory Commission,

We call on you to pursue clean renewable energy policies and prevent new natural-gas pipelines and new fossil-fuel infrastructure from being built in the Commonwealth.

In all considerations of energy policy, we must give top priority to the incalculable costs of climate disruption on our economy, our world, our children, and our grandchildren. We are deeply alarmed by the propos-

als to build new natural-gas infrastructure in our state, such as Kinder Morgan's proposed pipeline. You must prioritize clean/green/sustainable energy policies for Massachusetts that support healthy communities and protect the environment. To thrive, our communities need the local and regional economic growth that a clean-energy economy and energy-efficiency projects have already proven they can provide.

Specifically, the Kinder Morgan Tennessee Pipeline Northeast Energy Direct (NED) Project, Fitchburg Lateral is proposed to be installed through our property and will directly negatively affect us. Not only is the pipeline proposed to cut through protected conservation land, but it will also destroy the natural beauty of our privately wooded property that is home to a thriving wildlife population. The proposal will put the pipeline within a stone's throw of our shallow well, rendering it unsafe for continued use. Also, surrounded by wetland area and high ledge, a close underground installation may permanently and severely impact the natural drainage around our home, the effectiveness of our leach field septic system, and feasibility of well water in general.

Beyond the environmental impact of this pipeline, the increased health risks associated with natural gas pipelines, as well as natural gas wells and stations, are alarming. Please refer to the following information online for examples of such negative health and environmental impacts as well as alternatives to this natural gas pipeline:

<http://nhpipelineawareness.org/wp-content/uploads/2014/09/Northeast-Direct-White-Paper.pdf>

<https://pennsylvaniaallianceforcleanwaterandair.files.wordpress.com/2012/05/list-of-the-harmed63.pdf>

[http://www.ucsusa.org/clean\\_energy/our-energy-choices/coal-and-other-fossil-fuels/environmental-impacts-of-natural-gas.html](http://www.ucsusa.org/clean_energy/our-energy-choices/coal-and-other-fossil-fuels/environmental-impacts-of-natural-gas.html)

<http://documents.foodandwaterwatch.org/doc/NatGasPipelines.pdf>

Further, we are concerned about the increased liability and unknown safety risks, as well as decreased land and home value, that we are being forced to assume. The affect on property insurance rates, or even availability, remains uncertain. The resale value of our home and land will greatly decline. A main selling point of our property has always been its natural surrounding; installing a natural gas pipeline through it will most certainly turn away many prospective buyers and destroy our pride of ownership.

Thank you for your attention to this critical regional, state, and national energy, environmental, and safety issue.

Sincerely,

Marla and James Hirsch  
916 Northfield Rd  
Lunenburg, MA 01462  
978-582-9024

#### **20150813-5225**

Dennis McCann, Albany, NY.

I am contacting you to ask for your support in opposing the construction of a gas compression station in Nassau, New York. The station will be a major intrusion on the residents of Nassau and surrounding communities. It will be tremendously noisy, constantly lite up like a major league ball park, and will pose air, water and ground environmental issues leading to potential health problems for residents. Thank you.

#### **20150814-0011**

Hand written letter, 2 pages, Gail Abbott, Ashfield Lake, Ashfield, MA, opposing

#### **20150814-0012**

Hello,

I am a home owner on five acres of land located in New Ipswich New Hampshire.

I was notified by Kinder Morgan that they intend on invading and contaminating my home and property with the monster compressor station that will be located within a half mile of my home. Fittingly called the “incineration zone”

I am extremely opposed to the Pipeline Project in the state of New Hampshire!!!

I find the thought of complete strangers in Washington considering allowing a privately owned business with only its own monetary interests permission to “Occupy” property that my husband and I have over twenty years vested in, an outrage. How can ANYONE contaminate my land, force us to live in an extreme danger zone without any compensation? How can you at FERC expect us to not be compensated? This is totally illegal! If Kinder Morgan along with FERC find a need for my properties, then do the right thing, purchase it. Don’t steal it!!

I say “no build” to Project:PF14-22 Northeast Energy Direct.

Regards,

Katherine Belanger

Project Docket #PF14-22

Lawrence Spatz

56 Bridge St

Lanesborough MA 01237

413-442-2969

spatzlarryalice@verizon.net

This is the wrong project at the wrong time, in the wrong place and by the wrong company.

It is the wrong project at the wrong time because we have to realize right now that the realities of global warming dictate that we cannot continue to extract carbon (coal, gas, oil) from the earth nor make further investments in the infrastructure for moving these products around. We are in the midst of a global species extinction that threaten to be as massive as the extinction of the dinosaurs, with a major rise in sea level that will flood our cities (NYC, Boston). We are already experiencing record heat and drought in parts of the country that will compromise our ability to feed ourselves. These will only grow more intense if we do not curb our emissions of CO2 and methane. Building pipelines does only one thing: it permits the extractive industries to conduct their businesses more efficiently and profitably and does nothing to curtail global warming. The Roman emperor Nero is a figure of derision because he supposedly “fiddled while Rome burned”. If we do not take actions to limit carbon use we will all be like Nero, fiddling while the earth burns.

Natural gas has been proposed and defended as a “bridge” fuel that is cleaner than coal or oil but it is a bridge to nowhere. It is true that natural gas burns with higher efficiency than either coal or oil but this efficiency at the point of use is more than offset by the releases of methane (34X more potent than CO2 as a greenhouse gas) that inevitably occur at wellheads and from leaks in the distribution system (measurements of methane levels in the air in the Boston area show that 3-4% of the natural gas supply there is lost to leaks). If you look at the entire fuel cycle, natural gas is actually worse for global warming and the environment than coal. Nor does this take into account the large volumes of water that are injected into the earth

during fracking and that then return to the surface contaminated with the undisclosed witches' brew of chemicals that are required to make fracking possible (the exact mix of chemicals is unknown as it is information that the drilling companies choose not to divulge). Some of the chemicals remain underground to contaminate aquifers and poison wells. There is now conclusive evidence that the disruption of geologic strata by fracking increases the number of earthquakes with possible damage to buildings. "Natural" gas produced by fracking is in fact a misnomer as there is nothing natural about the process used to produce it. I propose that it be renamed unnatural gas.

Because of the potentially catastrophic effects of global warming, I urgently request that FERC consider in its deliberations on the pipeline the best estimates of our true energy needs in New England, what the pipeline's contribution to global warming will be and how our energy needs might be better met by renewable energy projects that do not contribute to global warming.

Because of its abysmal safety and environmental record, Kinder-Morgan is the wrong company to construct any pipeline anywhere. Below is a summary of some of the "problems" that have been encountered at their pipelines in the US and Canada.

**Kinder Morgan's subsidiary was convicted in California of six felony counts regarding the deaths of Javier Raulos, Isruel Jleruudez, Tae Chin, Victor Rodriguez and Miguel Reyes.**

**Kinder Morgan was cited by the Hazardous Materials Safety Administration for violating its regulations five times in 2011.**

In Texas, alone, from 2003 to 2014 Kinder Morgan experienced 36 "significant incidents" resulting in fatalities or hospitalization, fires, explosions or spills

**Kinder Morgan Has a Record of Bribery, Pollution, Fraud, Seams, Thefts, Deaths, Felonies, Environmental Disasters, Labor Violations, Unsafe Working Conditions, and Influence Buying.**

Kinder Morgan's operations in Portland, Oregon, have been home to pollution, law-breaking, and even bribery.

The Federal Bureau of Investigations determined that between 1997 and 2001 "Kinder Morgan systematically scammed some of its customers, including the Tennessee Valley Authority ('TVA'), a publicly owned provider of electricity in the mid-South".

The same federal investigation found that at its Grand River Terminal in Kentucky, Kinder Morgan officials took coal from a customer's stockpiles and resold nearly 259,000 tons.

In another case the US Environmental Protection Agency ("EPA") fined Kinder Morgan \$613,000 for violations of the Clean Air Act after "regulators discovered that the company had been illegally mixing an industrial solvent described as a 'cyclohexane mixture' into unleaded gasoline and diesel".

In 2010 the federal government fined Kinder Morgan \$1 million for repeatedly violating the Clean Air Act. The US Department of Justice found that "among other crimes" Kinder Morgan managers lied in permit applications, stating that the company would control its pollution when all the while they knew the control equipment was not being operated or even maintained properly.

Currently, Kinder Morgan is under investigation by the EPA for violating the federal Renewable Fuels Standard. Officials believe that Kinder Morgan purchased conventional fossil fuels while filing falsified documents certifying that the fuels came from renewable sources

**Kinder Morgan's Pipelines Have Endangered Lives in Many Communities across the United States and Canada**

In 2007 a Kinder Morgan pipeline ruptured in Burnaby, British Columbia, forcing 50 families to evacuate their homes as oil rained down on a residential neighborhood.

In January of 2012 a Kinder Morgan storage facility in British Columbia spilled roughly 29,000 gallons of crude oil into the community of Abbotsford.

In April of 2004 a long stretch of a Kinder Morgan corroded pipeline ruptured, spilling 123,000 gallons

of diesel fuel into a sensitive saltwater wetland on San Francisco Bay. Kinder Morgan pled guilty on four counts relating to that spill as well as an unrelated spill in Los Angeles Harbor.

In November of 2004 an oil pipeline of a Kinder Morgan subsidiary burst in the Mojave Desert, sending a jet of fuel 80 feet into the air. The break closed the nearby interstate highway and contaminated more than 10,000 tons of soil in the habitat of the federally endangered California Desert Tortoise.

In 2005 Kinder Morgan spilled 70,000 gallons of fuel into Oakland's inner harbor, and then 300 gallons into the Donner Lake watershed in Sierra Nevada And in 2007 the City of San Diego sued Kinder Morgan for falsifying records of the clean-up of a fuel leak that contaminated the aquifer.

In May of 2011 the US Pipeline and Hazardous Materials Safety Administration announced a proposed \$425,000 fine against Kinder Morgan for safety violations following a federal investigation into Kinder Morgan's having spilled 45,600 gallons of hazardous liquids in New Jersey.

In December of 2011 a two-year-old Kinder Morgan natural gas pipeline leaked in Ohio, spewing 127,000 cubic feet of natural gas and forcing residents to evacuate their homes.

The town of Deerfield, MA held a public hearing on September 9, 2014 at which all of the above were placed in the public record. Kinder-Morgan was notified about the meeting by email and by certified mail but declined to attend. They were then given a 15 day period after the meeting to comment on all matters and exhibits presented at the hearing. They failed to respond in time, but two days past the deadline, they sent a letter alleging that FERC "will be the government agency responsible for reviewing" the projected pipeline. They chose to ignore all the facts introduced into the record of the Board of Health hearing of Sept 9, 2014. The Deerfield Board of Health then ordered Kinder Morgan and any of its subsidiaries or affiliated companies to cease immediately all its activities in Deerfield related to construction of the proposed pipeline within the boundaries of the town, acting under the provision of Massachusetts state law that empowers local boards of health to order a cessation of all activities that are a threat or potential threat to the health and safety of its citizens.

Because of the above unrefuted facts in the public record, the Lanesborough Board of Health, of which I am a member, took the same action on June 8, 2015 and ordered Kinder Morgan and its subsidiaries or affiliates to cease all its activities within the boundaries of Lanesborough related to construction of the Northeast Direct Pipeline. Previous to this, at a Board of Selectmen meeting on May 18, 2015, the Selectmen voted to deny Kinder Morgan access to survey any town property for the proposed pipeline and at the Town Meeting on June 9, 2015, the town voted overwhelmingly to oppose the construction of the pipeline.

In its assessment of this project, I request that FERC consider Kinder Morgan's record: its many violations of environmental laws, its many leaking pipelines and many ethical failures, and that this assessment be given full weight as a grounds for rejecting the project. These failures call into question the company's ability to complete the project successfully and without mishap.

In addition to the above reasons for opposing this project I have specific concerns about the proposed path of the pipeline through Lanesborough: it transects the recharge area for the two wells that supply the Lanesborough Fire and Water District that provides water for most of the homes around Pontoosuc Lake and up and down Rte 7. These wells are not very deep (67 and 54 feet). There are also other private wells that draw from the same recharge area (including my own). My concern is that the pipeline, both during its construction and its ongoing operation, may cause contamination of this indispensable water source. At a minimum during construction, there is the potential for gas and oil leaks from the heavy equipment used and from the materials used in welding. Once installed there may be concerns about chemicals released from the anti-corrosion coating on the outside of the pipeline. And once the "unnatural" gas starts flowing there is the possibility of leaks from the pipeline itself. Since the wells are so shallow the distance contaminants have to travel to infiltrate the water is not very far. With leaks from the pipeline there is no way to know, without testing, what chemicals in addition to methane are present. There may be sulfur compounds both naturally occurring and added as odorants; there may also be residual chemicals from the fracking process; and methane itself can, under some conditions of temperature and pressure, form a hydrate (methane clathrate) that

then moves freely through water.

The safest way to avoid these problems is to not build the pipeline at all. If a decision is reached to construct it, then the path must be moved out of this critical recharge area by at least 5 miles either north or south. If this is not done and the present path is ~ the EIS must address these issues in detail. It must list all the possible contaminants that may arise during construction and operation and must detail testing methods of sufficient sensitivity to be used for assessing all of them in the ground water. The required testing should begin prior to any construction so that baseline levels are known and it must continue on a regular basis during the lifetime of the pipeline. In addition, the EIS should address what actions will be taken if contaminants exceed defined levels, what mitigation is possible for removal of contaminants and, if mitigation is not possible, there must be a robust plan in place to supply potable water to any affected households. The cost of all of this is to be borne by Kinder Morgan and a surety bond must be secured by Kinder Morgan and paid in full to insure that funds are available for these activities in the event that the company fails during the pipeline's lifetime.

In summary, I believe that building this pipeline is not in the best interests of my town or our country and that, because of global warming, we need to pursue renewable energy sources instead of creating a new piece of infrastructure for extracted energy. I believe that Kinder Morgan is a dangerous and unreliable company that should not be permitted to construct pipelines anywhere. If the decision is made to allow this proposed pipeline in spite of my objections, then, at the very least, the possible contamination of Lanesborough's major water supply by the pipeline must be addressed.

Washington, DC 20426

Aug 5th, 2015

John Yurka  
63 Cranberry Rd  
Dracut, MA 01826

Ref.: High Pressure Compression Station in Dracut, MA  
Tennessee Gas Pipeline Company, L.L.C./ Kinder Morgan  
NORTHEAST ENERGY DIRECT PROJECT

Good Morning

We attended the Dracut town meeting last night 8/3/2015 and was told to send a letter listing all our concerns and FERC will address all of them.

#### 1. Communication

- a. Communication must be better. The letter that we were told was sent to the Dracut residence - Myself and other people I talked to did not get this letter. Why? All of us live in the blast zone.
- b. Dracut's web site said nothing about this meeting, why?
- c. Dracut's portable signs around town said nothing about the meeting, why?
- d. Lowell Sun is a poor way to keep people informed. Most people in our area do not get the Lowell Sun.
- e. Why isn't there a single web site with all the information, meeting dates, deadline dates, proper addresses/phone numbers for us to contact, latest Kinder Morgan proposal, blast zone map, etc? This web

site should be mailed to all Dracut.

f. Why is Kinder Morgan being allowed to make so many changes and giving the people/town very little time to respond to the changes or is this part of Kinder Morgan plan to keep us all in the dark?

## 2. Kinder Morgan blast zone map

a. Has a number of errors. The police station was mis located on the map. Its actually in the blast zone.

b. Fire station is also mis located and is in the blast zone.

c. The other structures on Rt 113 are actually 40 to 60 town houses/homes

d. Approx. 50 to 100 homes are not shown that are behind the VFW

e. Blast zone map should note the number of homes, business's and people that live in the blast zone area so every one will easily know how many of us that could be blown up.

f. Shouldn't the wet lands also be pointed out on the map?

## 3. In the Blast zone

a. Police station are first responders and a center for communications.

b. Fire station also first responders, in the blast zone

c. Water pumping station on Rt 113 is also in the blast zone. Where will the water come from to put out the fires?

d. Cell tower is also in the blast zone that could also hamper communications.

e. Rt 113 is the main road through Dracut, in the blast zone

f. 200 to 500 homes in blast zone

g. Approx. 1000 people live in the blast zone

## 4. High Consequence Area (HCA)

a. Per a letter from the Geography Division U.S. Census Bureau says Dracut is a High Consequence Area (urbanized area) based on the 2010 census. 2010 to 2015 many more new homes (50 to 100) in the Regency Dr area & more in the process of being built. Most of those homes not shown on the blast zone map.

b. (from web) In 2009, the Pipeline and Hazardous Materials Safety Administration (PHMSA) cited Kinder Morgan for violating safety standards regarding the distance between a natural gas pipeline and a "high consequence area/urbanized areas" such as a school or hospital; the pipeline was too close for safe operation in case of a leak.

Ref <http://inquiries.srs.nrc.gov/Wo-content/hjolsdst2014/05/tender-Morosn-Accidents> odf

How is Dracut different?

c. The blast zone map should be corrected to show ALL the homes/police/fire/ wetlands/ etc that will be effected in a gas blast so the people and government can make their decision. Also list the area as a HCA before so everyone will know.

## 5. Tennessee Gas Pipeline Company, LLC./Kinder Morgan HISTORY

Kinder Morgan talks about the positive things the pipeline will be for the people. History is an excellent way of finding what is in store for Dracut. Please do the searches.

a. Google search; Kinder Morgan violations - safety record - explosions - violations

b. Google search; Tennessee Gas violations - safety record - explosions - violations

c. You will see a long list of violations, explosions both big and small, lawsuits, death, water pollution, air pollution, millions in property damage, decrease in property values, etc. from the Gulf coast to New England.

d. This is what faces Dracut. Why add Dracut to this long list?

## 6. Safety

- a. Who is going to train Dracut & surrounding towns to handle a huge gas blast?
- b. Does Dracut & surrounding towns have enough personal/equipment to handle a half mile radius high pressure gas fire?
- c. Is there enough water supply to handle a huge gas explosion. Keep in mind that most years Dracut is on a water band for months due to insufficient water supply. Also the water pump station on Rt 113 is in the blast zone.
- d. How does Kinder Morgan plan on evacuating the town in case of an explosion?
- e. Automating the High Pressure Compression Station is a potentially a life threatening error. Where hundreds of homes and 1000 or more lives are at stake - what happens if there is a electrical short - lightning strike - vandalism - wildlife get into the wires/ controls system - water leaks causing a short - storm damage - malfunction of a valve - lost of internet - back up generators fail to start - or a number of other real life problems that can happen? Having a computer totally in control of so many lives is wrong, very wrong.
- f. At the meeting people gave examples of actual gas explosions that took 1 to 5 hours to turn off the valves. How does Kinder Morgan plan to handle that?
- g. Kinder Morgan should be made to give a DETAILED emergency plan before they get a license to build. Very important that its a detailed not just generalization. List the actual resources etc.
- h. Kinder Morgan should supply actual noise and omission readings from existing same size plants that is independently verified. What are the actual gases and levels? Noise levels from next to the plant - 1/4 mile - 1/2 mile - 1 mile.
- i. (from web) Kinder Morgan has been cited by the U.S. government in 24 incidents which led to five federal enforcement actions from 2006 to 2014. Rel. [https:// en.wikloedia oro/wiki/Kinder Moroen](https://en.wikipedia.org/wiki/Kinder_Morgan) (from web) In 2011, PHMSA cited Kinder Morgan for these safety violations:
  - ~ failing to maintain update maps showing pipeline locations,
  - ~ failing to test pipeline safety devices,
  - ~ failing to maintain proper firefighting equipment,
  - ~ failing to inspect its pipelines as required, and [23]
  - ~ failing to adequately monitor pipes' orrosion levels

Rel [http I/hhoioelineawareness.org/Aa~ntent/ttloads/m4/05/Kinder-Moroan-Accidents.odf](http://hhoioelineawareness.org/Aa~ntent/ttloads/m4/05/Kinder-Moroan-Accidents.odf)

k. (from web) In 2013, the headline "Wall Street Worries About Kinder Morgan's Safety Record: BC pipeline operator slashes and defers maintenance spending" was a concern to anyone who lived or worked near a Kinder Morgan pipeline. Ref <http://hhoioelineawareness.org/orasa~ntent/uoloadsO014/05IKinder-Moroan-Accidents.odf>

I. (from web) By at least one measure, the Tennessee Gas Pipeline Co. has the worst safety record for its type of business, according to self-reported filings of significant incidents with a regulatory agency. Among pipeline transmission companies, Tennessee Gas reported more significant incidents to the Pipeline and Hazardous Materials Safety Administration than any other operator over the last decade, The Courier-Journal has found. See link for rest of article dated May 2015- [http I/wwwcourierjournal.com/story/tech/science/environment/2015/04/05/tennesseegas-pipeline-poor-safety-record/25543049/](http://www.courierjournal.com/story/tech/science/environment/2015/04/05/tennesseegas-pipeline-poor-safety-record/25543049/)

## 7. Environment

- a. History has shown that fracking/drilling when putting in the pipeline contaminates our wetland, water supplies, food supplies, ect. How does the company plan to handle that?
- b. Who will be the independent inspectors to verify all regulations are followed? A schedule list of inspections and check off points for both pipeline, material carts, and plant should be supplied.
- c. All the protection for wetland and protected areas should be enforced per the constitution.

## 8. Property Values and Insurance

- a. A detail list of expected property value drops should be given before the ok to build is give. This should be based on actual drops from other similar towns. It would not make sense for the people of Dracut to loose millions in property value.
- b. It mams that our home owner insurance premiums are going to up big time if we can get insurance at all. Kinder Morgan should provide proof we can insure our homes at the SAME rate/values we are currently paying.
- c. People with in the blast zone should have the option of having Kinder Morgan buying their home at current values not after the plant is built.

## 9. Disclosure Y

- a. Kinder Morgan should make public record any gifts/donations or anything of value to the town of Dracut or officials of Dracut. Kinder Morgan should be made to take out a bond to cover any explosions/contaminationl or any other items that may go wrong so Dracut or state federal tax payers do not have to pay for Kinder Morgan problems/errors/etc.

If property values decrease, will our taxes decrease?

### Comment

Please consider Kinder Morgan's past history of violations - explosions - lawsuits contaminations - death - safety and all the other things before giving them the ok to build a half mile radius blast zone plant among hundreds of homes.

John Yurka

cc: Barbara L'Italien, Senator, Energy Facilities Siting Board

RE: FERC Docket 1 PF14-22-000

**THIS IS TO REQUEST THAT FERC DENY THE KINDER MORGAN NED PIPELINE.**

I am a property owner directly affected by the proposed Kinder Morgan NED pipeline. I live in Ashfeld, Massachusetts. My home at 225 Smith Road (the only State designated Scenic Road in Ashfield) is over 200 years old and is registered in the MACRIS data base of Historic Massachusetts homes with the Commonwealth of Massachusetts Historical Commission. My home is a candidate eligible for listing on the National Register of Historic Places under Chapter 106 of the National Historic Preservation Act.

My property will be totally destroyed by the pipeline as it will pass about 50 to 75 feet from my door and require the following:

- extensive blasting-the entire area is solid rock ledge —horizontal drilling is not possible.
- removal of over 200 trees (500 cords of wood; over 13000 feet of linear lumber; many 300 year old maple trees)
- destruction of drinking well water supply —deep water artesian well within 100 feet of pipeline
- destruction of extensive in-ground septic system within 100 feet of proposed pipeline
- destruction of underground propane feeds and 1000 gal. tank
- removal of underground 400AMP electric service
- removal of underground 16 line phone service
- removal of distribution electric transformer
- destruction of drive to home making access impossible
- destruction of historic stone walls
- violation and contamination of wetlands (during construction alone not to mention gas contaminants) providing drinking water to Ashfield Town Wells and Ashfield Lake for Ashfield citizens
- destruction of wetlands themselves and vernal pool
- disruption of the unique ecosystem under power lines (where no pesticide spraying is currently permitted)

as documented by studies by the Audubon society

- destruction of road frontage along the only State designated Scenic Road in Ashfield
- violation of the Massachusetts Historic Trails corridor
- introduction of pesticides (currently prohibited under agreement with Northeast and Eversource electric utilities) on property aquifer feeding the Town of Ashfield and its lake
- termination of overhead 14000 volt electric distribution lines currently servicing the residents of Smith Road —these lines run perpendicular to the proposed pipeline route and they have fallen numerous times spontaneously and under adverse weather conditions- Northeast Utilities and Eversource has advised that such an event could trigger an explosive event- last incident April 2015.
- displacement and killing of wildlife on the property

Mitigation of damages is not an option for this property. I have officially served Tennessee Gas with a no trespass notice and am currently denying surveying on my property —see Exhibit 8.

I strongly endorse the following previous submissions to FERC by:

The Commonwealth of Massachusetts —Massachusetts Historical Commission letter dated November 5, 2014 RE:Tennessee Gas Pipeline Company LLC, a Kinder Morgan Company, Northeast Energy Direct Project, PA, MA, CT, NH. MHC 3RC. 56771. FERC Docket RPF14-22-000.

The Massachusetts Association of Conservations Commissions electronically filed letter dated February 6, 2015 RE: Tennessee Gas Pipeline Company., Docket No. PF14-22-000

The National Audubon Society and other members of the environmental community, conservation organizations, land trusts; etc.

The continuing efforts and prosecutions of the Conservation Law Foundation to deny this pipeline

All affected towns and citizens who have passed anti-pipeline resolutions

Elected Officials Including State Senators and Representatives and United States Senators and Representatives to numerous to mention but including the following notable comments:

*I oppose the current Kinder-Morgan proposal and share many of the concerns that have been raised by Massachusetts families, businesses, conversation commissions and towns about the pipeline's impact on their land and the environment. We must upgrade our energy infrastructure in ways that are consistent with Massachusetts' ommitment to environmental conservation, clean energy and energy efficiency.*  
—U.S. Senator Elizabeth Warren, July 30, 2014.

*I oppose this pipeline as it is now proposed because it raises serious questions about whetherit is too massive for Massachusetts'nergy needs, does not respect the rights and wishes of local residents, would worsen climate change, and could lead to the export of natural gas to foreign countries, raising prices for Massachusetts business and consumers.* —U.S. Senator Edward J. Markey, July 31,2014.

This is to request that you deny all applications/permits by Kinder Morgan/Tennessee Gas to build the proposed Northeast Energy Direct gas pipeline. To further insure that prior to any consideration whatsoever of any applications/permits this is to request that Kinder is in exhaustive compliance and agreement with the affected landowners, Towns, State of Massachusetts Laws/Regulations, Conservation Commissions, Historical Commissions, Army Corps of Engineers and public on all levels and prior to any further considerations:

1. They are to provide an extensive, detailed and more importantly complete EIS study, subject to timely review and comment by all interested parties, to include but not limited to:
  - a. Impacts on wetlands, vernal pools, native and endangered species habitats, construction impacts, safety considerations, displacement of historical stone walls, the harvesting of thousands of trees including 200 year old Massachusetts maple trees, destruction of historic byways and State Scenic Roads, impacts on telecommunications, propane and oil supplies to affected properties.
  - b. Impacts of construction on Town wells and public/private water supplies require review on an indi-

vidual basis. There is certainty in Westerns Massachusetts that construction which, will require extensive blasting, (these are not the flatlands of the Midwest) of heavy rock ridges and formations will render Town and private wells and water supplies, even with company professed mitigation, unusable in perpetuity. Towns will be trucking in water for their citizens. No potable water will remain. As far as lakes are concerned both fish and waterfowl will die and be displaced and the lake waters contaminated by construction waste, not to mention any additional pollution through periodic pigging operations, will be unusable for recreation. In addition, the possibility of pipe rupture and explosion due to rural class of pipe, icy winters, ground frost heaves, falling high-voltage power lines (collocation) and minor earthquakes can be devastating with extensive loss of property and life.

c. Impacts on State protected Conservation Properties protected by Chapter 97 of Massachusetts State Law.

d. On-site reviews with the Department of the Army Corps of Engineers on all town, individual landowner and ancillary property affected by the path of the proposed pipeline.

e. Impact on Historic Districts: The Massachusetts Historic Byway significantly compromised, the Congressionally designated/approved Silvio O. Conte conservation area, designated State Scenic Roads destroyed, landowner properties currently included/recognized a in the Massachusetts Historical Properties database and candidates for inclusion in the list of National Historic Properties under Chapter 106 of Federal National Historic Preservation Act. The latter requires reporting and discussion and property avoidance in coordination with Massachusetts Historical Commission, landowners and company official and will have significant effects on the routing of any proposed pipeline route. Impacts on the previously mentioned Congressionally approved Silvio O. Conte 7.2 million acre protected Northeast area, by themselves, should be enough to render a no vote for pipeline installation. In 1991 Congress passed the Silvio O. Conte National Fish and Wildlife Refuge Act (P.L 102-212). The Act authorized the U.S. Fish and Wildlife Service (Service) to establish a national fish and wildlife refuge to protect the diversity and abundance of native species within the fourstate Connecticut River watershed. The 7.2 million-acre watershed is contained within the states of New Hampshire, Vermont, Massachusetts and Connecticut. The Silvio O. Conte National Fish and Wildlife Refuge (Conte Refuge) is one of over 538 national wildlife refuges in the United States. The respect for this legislation and the effect that the Kinder Morgan NED will have on this designated area is of serious concern and moving against such legislation with the granting of Kinder Morgan applications/permits will be tantamount to nullifying an Act of Congress.

f. Direct impact on landowners. Notwithstanding arguments to the contrary, the threat of the Northeast Energy Direct Pipeline has already negatively affected property values and resulted so far in withdrawal of sales agreements for senior citizens properties, the inability of anyone to sell property at all, cancelled/foreclosed mortgages, cancelled property insurance coverage and the loss of total homeowner equity. With approval of a pipeline application and notwithstanding the misuse of eminent domain proceedings by a private corporation, homeowners will be forced to avail themselves of legal recourse to obtain value for property et al. Approval of Kinder Morgan NED will have a direct and devastating financial impact and loss of property value for over 250,000 U.S. Veterans and their families

g. Exhaustive examination of safety issues. Proximity and collocation to high tension power lines have already been proven in studies to represent a formula for disaster. Every landowner Is entitled to a property-by-property analysis In the EIS. To characterize Western Massachusetts with a broad brushstroke would be inappropriate and not thorough. No grant of application should be made without this thorough study.

2. The well-documented adoption and misuse of the US Department of Defense Counter Insurgency manual used in Iraq to disassemble the populations affected by the proposed pipeline need to be examined, exposed and prosecuted before any consideration can be given to approval of an application. Kinder Morgan remains empowered by their own prior and continued national behavior which has been historically characterized by above the law actions followed by reparations in the form of fines that they can easily afford. The Kinder

Morgan modus operandi asking for forgiveness rather than permission will result in environmental devastation, loss homeowner equity and threat to human life throughout the proposed pipeline corridor. Affected landowners are considered collateral damage in the wake of the Kinder Morgan juggernaut.

3. A thorough examination of the need for additional natural gas in the Northeast needs to be independently verified and, in any event, the delivery of any gas should not be for export (not in the public interest). Extensive comparative studies must be made of gas delivery from alternative supply routes including import facilities.
4. With the allocation of monies set aside for maintenance of pipeline facilities diverted from that purpose to satisfy investor perceptions the incidents of pipeline failures has been escalating. Close examination of corporate accounts and financial fiduciary responsibilities relative to the security of any pipeline must be demonstrated particularly with any pipeline being a high profile for terrorists as has been documented by the Department of Homeland Security.
5. Richard Kinder as former Enron executive placed the Enron Corporation on its infamous road to collapse. He has adopted the Enron accounting principles and techniques of Mark to Market and hired the former Enron Chief Financial Officer to orchestrate the same aura of deception as that which led to the failure of Enron throwing thousands of investors/shareholders into poverty. The accounting principles must be independently analyzed by the FERC to determine the integrity of Kinder Morgan prior to any granting of any pipeline applications.
6. The viability of fracking needs to be assessed on all levels, financial, environmental, necessity, and compliance with all legal and moral guidelines before any applications should be granted.
7. The timing/orchestration of the release of the 79 volume Environmental study in an attempt to confuse and confound affected states and landowners should be considered for what it is—a timing device to overwhelm those seeking reasonable answers and protections from a proposed pipeline program. In any event, it should be expected that all FERC commissioners be thoroughly conversant with the Kinder documents and public/private input presented before ruling on Kinder Morgan applications.
8. Requiring Kinder Morgan to be fully subscribed for gas volumes delivered to customers and demonstrating that those contracts are United States based, Arm and in good standing. Scaling back the size of the pipe and the amount gas throughput while retaining the right to return to scale up the operation to its original specifications at a later date is a subterfuge to gain FERC approval. Current contracts for Kinder gas as a percent of their original volume proposal Is too low to grant FERC application approval. Scaling back raises the percentage of same customer gas volume commitments to total gas throughput in an effort to provide window dressing to meet more acceptable benchmarks required for application approval. Many of the customer commitments are contrived to gain furtherance of the pipeline and their gas take away from the pipeline is not required to meet their long range plan objectives. (see for example, Berkshire Gas Long Range Plan in Western Massachusetts.)
9. The effects of methane (natural gas) release from compressor stations and from any pipeline leaks need to be highlighted and avoided. Methane has been proven to be more highly toxic to the environment than carbon dioxide and has been shown to cause and contribute to many health hazards. There are numerous independent studies reaching these conclusions. The impact on the environment and on human life must be considered In FERC decisions. There are no benefit to risk ratios acceptable where a certain percent of humanity (even one human life) is considered to be collateral damage sacrificed unwillingly to “the public interest”. To construct an unneeded pipeline for private profit injurious to citizens is to exercise the legal doctrine of “Depraved Heart”.
10. Kinder Morgan NED is designed to facilitate the export of LNG. Concerns about the dramatic increase of U.S exports of LNG and the impacts on citizens including but not limited to higher prices for natural gas are articulated in a letter signed by numerous U.S. Senators from the United States Senate to Secretary Ernest Moniz, United States Department of Energy, February 11,2015-copy of this letter is attached as Exhibit A. The need to rush to export LNG to Europe is contrived. Europe’s power depends 3096 on natural gas but

only 20% of that comes from Russia; hence, Europe relies on only 696 of natural gas from Russia. Russia is currently building a new pipeline structure to service the European community directly and not through the Ukraine. Kinder Morgan's proposed pipeline is designed to channel most of its natural gas as LNG for export through the Canadian Maritimes. This is not in our public interest and only in the Interest of profits and a larger agenda of world dominance of the energy sector. In that regard, focus and inquiry should be made regarding Iberdrola, the multibigion Spanish corporation. Iberdrola has operations in 30 countries and owns part or all of natural gas regasification facilities in Spain, UK and the Netherlands. It owns four underground natural gas storage facilities in the U.S. and Canada. This Spanish company owns 100%of six electric utilities in the Northeast: Central Maine Power, Maine Natural Gas, New York State Electric and Gas Corp, Rochester Gas and Electric, New Hampshire Gas Corp- and now Berkshire Gas. On June 2, 2015 FERC approved a merger enabling Iberdrola to Acquire Berkshire Gas, a player subscribing for delivery of natural gas from the proposed Kinder NED pipeline. Iberdrola has tentacles reaching into the US in the form of these acquisitions of companies subscribing to Kinder Morgan gas. Iberdrola is also a potential foreign customer of that gas—while supporting subscriptions in the US to the Kinder proposal they are also ensuring their purchases of that liquefied gas from Canada, a definite conflict of interest and one designed to ensure that Kinder has the right percentages of subscriptions for their gas to enable FERC to proceed with approval of Kinder applications/permits. The Kinder Morgan NED project is primarily for the profit of global players and their local supporters.

11. Further to the foreign need for gas and the need to comply with the laws of the United States In developing gas pipeline Infrastructure an approval of the Kinder Morgan NED proposal would signal FERC complicity in the furtherance of the Transatlantic Trade and Investment Partnership (TTIP), a secret EU/US trade agreement that puts the right to profit above all other rights. Like its cousin, the Trans Pacific Partnership, TTIP is being negotiated by trade officials and industry reps, without any oversight from elected legislators and without and participation by citizens'roups, environmental groups or labor groups. And like TPP, it is expected to arrive with Investor State Dispute Settlement provisions that allow offshore corporations to sue our government to overturn the democratically enacted environmental, labor and safety laws that undermine their profitability. FERC approval of the Kinder Morgan NED would further this agenda.

12. The movement toward renewal energy and away from fossil fuels needs to be supported by FERC actions now and in the future. FERCs support of such movement can be mirrored in the action to limit any marginal pipeline requests by companies such as Kinder Morgan. In the US international agreement to curb the use of fossil fuels and expand renewal energy projects, China announced that in 15 years it will be producing enough renewal energy to power the entire United States. We need to reflect this positive approach to renewals in all our actions and FERC must limit approvals for additional fossil fuel sourcing and transportation and enter an era providing a moratorium on all new fossil fuel infrastructure. Denying the Kinder Morgan NED pipeline is a logical and aggressive way to start.

13. FERC needs to deny application for Kinder Morgan NED pipeline by giving voice to organizations opposing it. These include but are not limited to organizations and elected representatives providing written objections to the pipeline: Conservation Law Foundation, Nolumbeka Sovereign Indian Nation, Massachusetts Conservation Commission, Massachusetts Historical Commission, Audubon Society, nofrackedgasin-mass.org, Franklin Land Trust, Mount Grace Land Trust, MassPlan.org, Rep. Kulik, Rep. Mark, Sen. Rosenberg, Congressman Sullivan, Rep O'Neal, Northeast Energy Solutions (NEES), the broad-based coalition Pipeline Awareness Network for the Northeast (Plan-NE) many others not to mention the resolutions of 54 Massachusetts towns rejecting the NED pipeline.

14. The Attorney General of Massachusetts has ordered an independent study to be made by the Barr Foundation to determine the need in the Northeast for additional natural gas. The study will be completed in the October/November timeframe. This study is paramount to FERC granting any applications/permits for additional pipeline infrastructure in Massachusetts on the basis of comparative analysis and the use of the Ansbacher Doctrine to determine appropriate supplier configurations if necessary. It may be concluded that the repair of existing leaks (of which there are currently over 22,000 in Boston alone,) the availability of im-

ported LNG (through but not limited to Distragas and GDF Suez), the better utilization of existing pipelines and compressors is all that is required to meet the public interest for current and future natural gas needs in Massachusetts.

15. At this time, and not limited to the following, Kinder Morgan proposes to bulldoze 110 Conversation parcels under Massachusetts Article 97, 15 conserved farms, Five State forests, five State Wildlife Management areas, five sections of National Scenic Trails and eight conserved drinking supply watersheds.

16. In addition, the Kinder Morgan NED proposal runs counter to the Federal Water Pollution Control Act (Clean Water Act), the 1986 Emergency Wetlands Resources Act, the International Ramsar Treaty, the National Environmental Policy Act (NEPA) and others.

17. Notwithstanding the 2008 “Halliburton Loophole” the composition of all gas shipped through the proposed pipeline should be fully disclosed flagging toxic elements including but not limited to the amount of radioactivity present in the frecked gas.

18. Over 250,000 U.S. Veterans will experience substantial loss of property value and, in many cases, loss of entire equity resulting in forced relocation.

**IN SUMMARY:** In addition to the above, at this time, and not limited to the following, Kinder Morgan proposes to bulldoze 110 Conversation parcels under Massachusetts Article 97, 15 conserved farms, Five State forests, five State Wildlife Management areas, five sections of National Scenic Trails and eight conserved drinking supply watersheds.

Finally, a word about civil liberties. Massachusetts was formed on the basis of civil liberties, including but not limited to, the right to security and liberty, the right to life, the right to own property, the right to defend oneself, the right to privacy and the Massachusetts Constitution provides the framework and content for the U.S. Federal Constitution. Massachusetts no longer wanted to be a colony of Great Britain. It certainly will not tolerate becoming a colony of Kinder Morgan. Despite what has become possibility through a labyrinth of legal machinations, it behooves FERC commissioners to see through the corporate influences that have shaped a landscape that enables a private company to usurp individual civil liberties and rights under the Constitution and to uphold their fiduciary responsibilities to citizens in denying the Kinder Morgan quest for this pipeline. As stipulated in Section 1 of Executive Order 13406 by the President of the United States: it is the policy of the United States to protect the rights of Americans to their private property, including by limiting the taking of private property by the Federal Government ....not for the purpose of advancing the economic interest of private parties to be given ownership or use of the property taken.

-----

## **EXHIBIT A**

**United States Senate**  
Washington, DC 20510

February 11, 2015

Secretary Ernest Moniz  
United States Department of Energy  
1000 Independence Avenue, SW  
Washington, DC 20585

Dear Secretary Moniz:

We are writing to express our concerns about the pace at which the United States Department of Energy (DOE) is approving large volumes of liquefied natural gas (LNG) exports. We are concerned that LNG exports will disproportionately benefit the natural gas industry, at the expense of households and industries that will suffer from higher natural gas and electricity prices. In addition, we do not believe enough consideration has been given to regional impacts, particularly for states that are not large producers of natural gas, rely heavily on natural gas intensive industries, or have limited access to natural gas. Given the potential for

long-term negative impacts on many regions and industries in the United States, we ask the DOE to address the following major concerns, and to reconsider the pace at which it is approving LNG exports to non-free trade agreement (FTA) countries.

To date, the DOE has issued final authorizations for four LNG export projects, and conditional authorizations for four additional projects. Approved export volumes for these projects include 10.56 billion cubic feet per day (bcf/d) to non-FTA countries, and an additional 1.63 bcf/d to FTA countries. The total approved exports for these projects represent 16.5 percent of our domestically produced natural gas, which will be sold overseas to countries such as South Korea and Japan, where LNG prices are three to four times higher than in the United States. Exporting to countries with higher LNG prices will drive up domestic prices, which should be a key consideration in your public interest determination. We commend the DOE for exploring this issue by commissioning two studies on the economic impacts of LNG exports, which were performed by the DOE's Energy Information Administration (EIA) and NERA Economic Consulting (NERA). But we are concerned with the conclusions you draw from these analyses, which we believe demonstrate that large volumes of LNG exports are not consistent with the public interest.

First, we are concerned that large volumes of LNG exports will hurt American industries. The DOE has argued that LNG exports are in the public interest because they will increase the net gross domestic product (GDP) of the United States. This argument is rooted in the analysis performed by NERA, but the same study found that LNG exports preferentially benefit natural gas property owners and producers, at the expense of other industries. For example, NERA states that the agricultural, electricity, and paper, pulp, and primary metal manufacturing sectors will suffer disproportionately negative economic impacts: output in these industries decreases in all export scenarios, and labor income across all industries could decline by up to \$25 billion in 2035.

We are also concerned that large volumes of LNG exports could hurt American families and households. According to the NERA and EIA studies, wage income decreases while the price of residential natural gas increases in all export scenarios. In the most extreme case, residential natural gas expenditures increased by 10 percent before 2025. Such a rapid and dramatic increase, coupled with a decrease in wage income, would be damaging, particularly for low-income households that rely on natural gas for heating and cooking.

EIA also expects supply prices to rise at the producer level, with a maximum predicted increase of 23 percent. This will translate to higher electricity prices for American households and industries, because natural gas currently accounts for more than 30 percent of electricity generation in the United States. Further, the Environmental Protection Agency's draft Clean Power Plan encourages the growth of natural gas-powered electricity, so the domestic demand for natural gas is likely to increase over the next 15 years. The combination of increased demand for natural gas in the electricity sector, and decreased domestic supply due to LNG exports, suggests that the cost to American consumers is likely even higher than predicted by EIA's analysis.

Finally, we urge you to consider the cumulative volume of approved natural gas exports as you finalize your decisions for pending LNG export applications. The maximum LNG export volume that is considered in detail in your commissioned economic studies is 20 bcf/d. But to date, nearly twice that amount has been proposed for LNG exports to non-FTA countries. While many of these projects may not ultimately be built, these LNG export volumes also do not include the large quantities of natural gas that have already been approved for export via pipeline. Moreover, NERA's analysis of unlimited LNG exports showed that the negative impacts described in this letter would grow with increasing volumes of LNG exports. Therefore, the burden on American households and industries could be even greater than we have described if you continue to approve LNG exports at such a rapid pace.

Given the long-term nature of your authorizations, which typically extend for twenty years, we believe that these predicted negative impacts on the majority of the American economy are too great a risk. Therefore, we ask that you reconsider the pace of your approval, in light of the following questions about the regional, sectoral, and social impacts of LNG exports:

1. How do you weigh the impact of the predicted widespread increase in consumer natural gas and elec-

tricity prices—particularly for low-income households and states that are not large producers of natural gas, rely heavily on natural gas-intensive industries, or have limited access to natural gas—against the concentrated economic benefits for the natural gas industry?

2. How do you balance the predicted widespread loss of manufacturing and jobs against the concentrated economic benefits for the natural gas industry?

3. How would your analysis and conclusions change if you took into account the growth in natural gas-powered electricity generation that is encouraged by the Environmental Protection Agency’s draft Clean Power Plan?

4. In your review of pending and future applications for LNG exports to non-FTA countries, do you plan to consider the cumulative volume of approved LNG exports, and the corresponding cumulative economic burden on American households and industries?

5. In order to ensure consistency in future reviews of LNG export applications, how should the definition of “public interest” be clarified? Do you think such a definition should consider the economic impacts on certain regions and sectors?

To summarize, we are concerned about the pace at which the DOE is approving large volumes of LNG exports. Your own commissioned studies have shown that LNG exports would disproportionately benefit the natural gas industry, while driving up natural gas prices, reducing labor compensation, and decreasing output in all other domestic industries. These negative regional, sectoral, and social impacts suggest to us that large volumes of LNG exports are not consistent with the public interest, so we ask that you address our major questions and concerns, and reconsider the pace at which you are approving LNG exports to non-FTA countries.

Thank you for your attention to this matter. We look forward to your responses to these important questions.

Sincerely,

Marilynn Acker Ezell, Temple, NH.  
My husband is an amateur astronomer. When he was in high school, he won the Westinghouse Science Talent Search award for the state of Washington for original astronomy research. When he went to MIT, he intended to study to be an astrophysicist until he found out that there were very few jobs available for astrophysicists at the time. Given how important the study of space is to him, you can understand why he wanted to live where we do. The skies are DARK at night. He built an observatory in our yard with a roof that opens to allow his telescope to record what he sees in the sky. Last night we watched the Perseids meteor shower. Now Kinder Morgan/TGP intends to build an enormous compressor station in New Ipswich, NH, less than a quarter of a mile to our south. I understand from seeing compressor station descriptions in other locations, they light them up like a city at night. This light pollution is completely unacceptable. No one else in the area is allowed to have lights that light up the sky. If they want to see what goes on at night on the site, why don't they use infrared cameras? Or, better yet, don't build this thing at all, since we expect to get nothing good from it, only bad!

**20150814-5012**

Mary S King, Orange, MA.  
Northeast Energy Direct Docket #PF14-22  
Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Dear Secretary Kimberly Bose,

The **Orange Revitalization**, (ORP) is non-profit organization concerned with the economic development of the town of Orange Massachusetts and the surrounding North Quabbin region. As a designated environmental justice community, the town of Orange has suffered more than it's share of decline due to past environmental problems. Our organization is dedicated to improving the social and economic well-being of residents and we view the preservation of habitat as one and the same mission. Since our years of incorporation,

ORP has contributed to efforts to restore ecology, support sustainable production of area resources (such as organic farming, and low intensive forestry) and promote the tourist industry that has become an essential part of the local economy.

These efforts have begun to pay off with an increase in visitors to our scenic trails, waterfalls, rivers, lakes and forests. We are seriously concerned that, should the proposed Northeast Energy Direct (NED) project be built, it will have lasting adverse affects on our environment and the economy that depends upon it. We were especially alarmed by former FERC Chairman Laffleur's comments, reported in the Worcester Telegram on October 14, 2014, suggesting that local opposition to the NED project is because residents don't want, "a pipeline running through your backyard or a transmission line going by your summer home." These words seem calculated to give the impression that residents are wealthy obstructionists whose primary concern is the view from their vacation property. Such statements raise doubts about the impartiality of the decision making involved in siting the project. We are asking FERC to conduct a full and transparent review process, including a thorough consideration of the following concerns that may disproportionately impact our low-income community.

The town of Orange is situated down-wind of the proposed Northfield compression station. We are asking for a full and complete, third-party evaluation examining the potential impact of exposure to chemical releases from the site on residents living in the vicinity. Furthermore, such an investigation needs to include consideration of the increased risk to those within the local population already suffering from elevated rates of lung disease, particularly children, elderly and the infirm. This requires a complete review of the affects of methane, benzene, sulfide, nitrogen oxides and other chemicals associated with fracking and compression station emissions, using the best available scientific data. Our population is particularly sensitive to adverse health effects, we therefore expect any investigation to apply strict and thorough procedures for examining potential impacts with an eye toward reducing risk. It is likely that new baseline data will need to be collected, since there has been an increase in the town's population and its health disparities since 2010.

We are expecting a full evaluation of the potential for water contamination, both during the construction phase and also during the proposed operation of the compression station. This includes pollution from emissions, spills or other avenues of release that may enter the groundwater. Many of our residents rely on well water. Moreover, the town of Orange relies on aquifers, town wells, streams and rivers for its water supply, the likes of which are recharged by sources that may be impacted by the pipeline construction / and or affected by contamination from releases in the neighboring towns. We are asking for a full review of potential threats to town water supplies.

Also in regard to water resources, a growing segment of the local economy relies upon tourism related to recreational water activities, such as fishing, boating, swimming and additional outdoor experiences conducted in the vicinity of water. Residents of Orange and the Greater North Quabbin take their stewardship roles very seriously. The area boasts one of the state's most active watershed councils, local citizens regularly engage in volunteer clean up tasks to preserve the integrity of the water supply. More specifically, residents rely upon clean water, even as local economic development is dependent on maintaining access to such a resource. We expect any proposed project to be in complete compliance with the Clean Water Act of 1972 and the Safe Drinking Water act of 1974 - during all phases of the project. If there is any question of compliance, FERC should render judgement based on the precautionary principle.

The future growth of our town and the surrounding region is contingent on the free utilization of common recreational and farming areas, commonly accessed forest lands and the continued viability of shared water resources. This relationship is complex and not easily discernible to outside observers. Many businesses, civic, community organizations, and individual households depend on ready access to commonly held resources. For example, organic farms hold partnership agreements with land trusts and state owned properties in order to produce and deliver agricultural products to residents throughout Western Massachusetts. There are a number of recreational businesses that rely upon the utilization of state forests, waterways and town lands. In addition, many households subsist on low intensive farming and procuring from shared foraging, fishing and hunting grounds. Low intensive harvesting methods include, small-scale forestry, mushrooming,

and the gathering of woodland materials for crafting, among other activities. A growing portion of population relies upon these subsistence activities (both for supplemental and primary household nutritional consumption and / or primary and supplemental household income). Many of the harvesting sites exist along the planned pipeline route or where compression stations are being proposed. It is important that access to such resources not be interrupted, destroyed, or restricted. Should such resources be jeopardized, it is necessary to know what manner of compensation exists for damages to communities and resources held in trust against potential accidents or incidents that might impair the town resident's means of self-sufficiency. A full economic impact review would consider such threats and should be part of any decision-making.

The Town of Orange Fire and Rescue Department is not set up to handle the scale of disaster posed by a serious natural gas incident. By municipal arrangement, Orange will be called to assist if a serious incident occurs in Northfield or one of the towns along the proposed pipeline route. As a low-income town, Orange lacks the resources to effectively handle such a situation. As with other area towns, Orange has a mostly volunteer force. First responders do not have specialized training to handle such emergencies and do not have the advanced equipment needed to address a catastrophic incident. Moreover, the town is situated fourteen miles from the proposed compression station, and the volunteer nature of force translates into a delayed response time. We expect a full review of the town's disaster response capabilities, and also a review of the adequacy of the compensation regime meant to address harm and losses stemming from a serious natural gas incident.

Last October, the town of Orange voted a resolution against the NED project by unanimous decision. Like all of the towns in Massachusetts that will be most affected, the resolution stated clearly that the risks of the project far outweigh the purported benefits. The members of our organization, the Orange Revitalization Partnership, have also been unanimous in opposing this project, deeming it unnecessary and of no economic benefit to our region. At the recent scoping hearing in Greenfield, MA on August 29th however, a number of union representatives spoke, giving the impression of support for the project. This is a misrepresentation, since the union speakers were from a different state. Local labor union members do not support the project, as evidenced by the over fifty town resolutions against the pipeline. Because ours is a poor town that relies greatly on its environment, the potential effects will disproportionately harm our town's ecology and economy. All we have is our land. We are expecting FERC to conduct a fastidious review of the economic and environmental impacts to Orange in accordance with Clean Water Act, Safe Drinking Water Act, Resource Conservation and Recovery Act and the Community Right to Know Act. We are confident that a thorough and impartial review will find that the Northeast Energy Direct Project is unnecessary and excessive. As the principal regulatory authority, we expect FERC to give the vulnerabilities more weight than the profit incentives of the company and its investors. Accordingly, we are counting on FERC to critically weigh the company's unproven economic claims against the very real health and economic risks this project will bring to the town of Orange if allowed to go forward.

Sincerely yours,

Dr. Mary Sterpka King, President  
Orange Revitalization Partnership

#### **20150814-5017**

D Arotsky, New Ipswich, NH.

The Tennessee Gas Pipeline company/Kinder Morgan/NED will file an Application for a Certificate of Public Convenience & Necessity with FERC.

I was at the FERC Scoping Meeting held in Nashua, NH on Wednesday, July 29, 2015

I was at the FERC Scoping held in Milford, NH on Thursday July 30, 2015

At the Nashua Scoping meeting there where about 28 elected officials speaking before the FERC members. Not one of these elected officials agreed that the TN Gas Pipeline/Kinder Morgan/NED project was necessary. I do not know how many private individuals spoke. I would guess that only 5 or 6 individuals spoke

for the pipeline to be built. These individuals were all union members who wanted union jobs. I am not anti union. I have been a member of my union since 1970. I am pro union. I am anti pipeline.

At the Milford Scoping meeting there were 28 elected officials speaking before the FERC members. Not one elected official spoke in favor of the pipeline. There were 43 private individuals who spoke at the Milford Scoping meeting. Not one of those private individuals was in favor of the pipeline project.

If the Federal Energy Regulatory Commission is not a “Rubber Stamp” for the fossil fuel companies when the Tennessee Gas Pipeline Company/Kinder Morgan/NED files an Application for a Certificate of Public Convenience & Necessity I request that FERC DENY this application from the TN Gas Pipeline Co/Kinder Morgan/NED.

This pipeline is NOT for “public convenience”. This pipeline is NOT for “necessity”. This pipeline is strictly for PROFIT by a private company.

There are three other pipelines that can transport this gas from the Marcellas Shale in Pennsylvania to/ through New England.

FERC’s own rules state that the public benefits of a pipeline must exceed the costs to society. The upgrades already in various planning stages to existing pipelines provide alternative gas infrastructure projects that have a smaller impact and costs to landowners, communities and the environment.

I urge FERC to just say no and DENY the Tennessee Gas Pipeline Company/Kinder Morgan/NED project slated to come through southern NH with a compressor station planned for New Ipswich, NH (Docket # PF14-22)

**20150814-5018**

SUSAN A DUHAMEL, NEW IPSWICH, NH.

it is quiet here right now. I would like it to stay that way. Deny this project.

do not build a compressor station one mile from my house.

**20150814-5019**

SUSAN A DUHAMEL, NEW IPSWICH, NH.

Do not build a compressor station near my house. Deny this project. I do not want my environment polluted.

Kinder Morgan should be put out of business.

**20150814-5052**

August 13, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission (FERC)

888 First Street, N.E.

Washington, DC 20426

RE: Environmental Impact Statement under FERC Docket No. PF14-22

Dear Secretary Bose,

Kinder Morgan has continually promoted “co-location” as the preferred route for the NED pipeline.

The FERC has conditionally approved the Constitution pipeline and already Kinder Morgan is proposing co-locating the NED pipeline in the Constitution pipeline right-of-way. Kinder Morgan claims they will restore the Constitution Pipeline construction area to a condition similar to what it was before construction yet they propose co-location construction for the Northeast Energy Direct (NED) in this regrowth area. Regrowth cannot be accomplished if the right-of-way would be considered for NED and future Kinder Morgan co-location. The environmental impact for NED must consider that this corridor may never be allowed to return to a condition close to what it was previously as it would always be Kinder Morgan’s preferred route

for future co-located pipelines.

1. Please investigate the cumulative environment impacts of co-location should a right-of-way undergo construction a 2nd, 3rd, or 4th time. a. Study the effects of multiple co-location constructions to all humans, wildlife, vegetation, and water resources.

b. Study the socioeconomic effects of multiple co-location constructions to towns with emphasis on population growth or loss, business growth or loss, recreational growth or loss, and tourism growth or loss.

2. Please investigate the cumulative environment impacts to humans, wildlife, vegetation, and water resources should right-of-ways sustain back-to-back co-location constructions lasting 2, 5, and 10 years.

a. Study the effects of prolonged co-location construction to all humans, wildlife, vegetation, and water resources.

b. Study the socioeconomic effects of prolonged co-location construction in towns with emphasis on population growth or loss, business growth or loss, recreational growth or loss, and tourism growth or loss.

Please weigh these environmental impacts against the No Build Alternative and help New England convince the Commission to deny the certificate of public convenience and necessity for NED.

Sincerely,

Rob Chesebrough

Hon. Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street NE

Washington, DC 20426

Re: Matter of Tennessee Gas Pipeline Co., Northeast Direct Project

FERC Docket PF14-22

Filing by TGPL dated July 24, 2015

Dear Secretary Bose:

On July 24, 2015, Tennessee Gas Pipeline (TGPL) filed a massive update to the earlier draft Resource Reports and mapping files for the NED project, constituting thousands of pages of information and map sheets providing seemingly significant updates to previous submittals. The submitted files amount to over one gigabyte of electronic files that are publicly accessible, as well as hundreds of pages of text and maps that are not accessible due to TGPL claims of their containing "Critical Energy Infrastructure Information" not to be disclosed for public review. This information is of vital interest to and may have a dramatic impact on the community that I represent.

**INFORMATION PROVIDED IN THE TGPL JULY 24, 2015 SUBMITTAL TO FERC IS AN UPDATE TO PREVIOUS SUBMITTALS, BUT IS INCOMPLETE PENDING FURTHER UPDATES**

While the July 24, 2015 publicly accessible filing includes a large amount of new information, there are significant amounts of additional information either not yet provided, or inaccessible for public review, which include information essential for understanding the TGPL proposal for a major compressor station at Clarks Chapel Road in the Town of Nassau, New York. Information such as: a compressor station site layout plan; an indication of the location of the 30-inch pipeline to and from the station site from the mainline route; an indication of the proposed vehicular access

route to the compressor station from public roadways; location, external dimensions and finish materials of compressor station enclosure building, fence-line, emergency blow-down vent facility; location and extent of buffer areas around proposed compressor station facilities; and the location and extent of non-jurisdic-

tional infrastructure that may be subject to siting and site plan review by the Town of Nassau. Without access to much of this information, some of which is indicated on the 73 pages of “Responses to Comments” and “Responses to Letters” on Draft Resource Reports, dated May 15, 2015, the Town of Nassau cannot fully comment on the appropriate scope of studies appropriate for studying the proposed project, its impacts, alternatives and potential mitigation measures that should be evaluated in the Environmental Impact Statement.

Furthermore, the matrix of “Responses” is replete with indications of information that will be “provided in the October, 2015 filing” or “TBP in Final ER.” Examples of this information include: locations of HDD installations; specification of communication system and whether communication towers will be proposed to be sited and proposed locations of these towers; sensitive groundwater resources in relation to compressor station sites; fisheries resource protections and mitigation proposals; wetland delineations; groundwater aquifer information and details; sites of contaminated sediments; project operational effects on surface waters; interior forest ecological impacts; environmental justice information for aboveground facilities locations; seismic fault information; NYS § 480-a forest lands affected by the proposed facilities; visual resources information (including regarding any as-of-yet unidentified communications towers); emissions data from compressor stations, including methane and exhaust from compressor facility operations; and acoustical analysis of compressor station operations, including sound emissions and mitigation measures necessary.

#### REQUEST FOR EXTENSION OF THE SCOPING PHASE COMMENT PERIOD

The deadline for submitting comments on the Scope of Studies for preparation of an Environmental Impact Statement should be extended until after the CEII information is made available to Town of Nassau officials, and information to be provided by TGPL in the forecasted October environmental report is available for consideration.

Town officials and committee members are making great efforts to review the Resource Reports and associated information submitted at a late date in July, only a few weeks prior to the close of the Scoping Period. This is a huge undertaking for these officials, given the large amount of information that was provided. However, the large amounts of information not yet provided or only provided under protected status, make it infeasible for the Town of Nassau to provide a full evaluation of the information necessary to develop relevant Scoping Comments by the August 31 deadline. The listed incomplete or “to be provided” information includes many topics of specific concern to the Town of Nassau, given the proposal to site the large, 41,000 horsepower compressor station in a Rural Residential area, far from any similar industrial or major utility station use; and the pipeline traversing the rural landscape of northern Nassau. Additional time should be added to the Scoping Period schedule to provide a realistic opportunity for review of the Resource Reports, including information submitted by TGPL as Critical Energy Infrastructure Information, and for development of reasoned comments on the Scope of Studies appropriate to evaluate the proposed major transmission facility project.

Additional time will not represent a burden to the applicant, given that the Resource Reports as filed do not fully provide the requested baseline information as spelled out in many sections of the FERC GUIDANCE MANUAL FOR ENVIRONMENTAL REPORT PREPARATION, dated August 2002.

#### REQUEST FOR IMMEDIATE ACCESS TO CRITICAL ENERGY INFRASTRUCTURE INFORMATION

Pursuant to FERC’s Critical Energy Infrastructure Information (CEII) regulations at 18 CFR § 388.113(d)(4) the Town of Nassau, New York, requ

#### **20150814-5061**

David F Fleming, JR, Nassau, NY.

Completion of comments:

#### REQUEST FOR IMMEDIATE ACCESS TO CRITICAL ENERGY INFRASTRUCTURE INFORMATION

Pursuant to FERC’s Critical Energy Infrastructure Information (CEII) regulations at 18 CFR § 388.113(d)(4)

the Town of Nassau, New York, requests access to certain information submitted by TGPL on July 24, 2015, regarding the Northeast Direct Market Path Pipeline and Market Mid-station 1 Compressor Station proposed to be located within the Town of Nassau, Rensselaer County, New York. Town of Nassau officials should be provided access to the confidential files submitted BY TGPL on July 24, 2015, without reservation and on an expedited basis.

CEII submittals regarding details proposed for the Compressor Station site should be provided on a confidential basis for review and development of Scoping Comments by the Town and its representatives. The requested information includes:

- the Compressor Station site plan;
- compressor station facilities arrangement plans;
- ‘non-jurisdictional facilities’ to be located at the Compressor Station property.

The individuals to be granted access to this information would include the following:

David Fleming, Nassau Town Supervisor

Fred Nuffer, Chairman, Town of Nassau Natural Resources Committee

Lani Rafferty, Councilperson, Nassau Town Board

As identified above, the details of the proposed facilities currently hidden from public view are critical to the Town understanding the TGPL proposal within the Town of Nassau, and in developing reasoned comments and consideration of potential impacts on natural and cultural resources, land uses and most importantly on the health, safety and lives of residents within the impact zone around the proposed compressor station site. The Town asserts that this request is a legitimate request for access to information essential to the Town’s review of the NED Project proposal and

development of Scoping Comments for FERC’s pending development of a final Scope of Studies for the Environmental Impact Statement. The Town willingly will assent to execution of a non-disclosure agreement and take reasonable precautions to maintain security and integrity of any CEII information provided pursuant to this request.

In closing, the Town respectfully requests that the FERC immediately grant the relief requested herein.

Thank you in advance for your assistance in this matter.

Very truly yours,

David F. Fleming, Jr.

Town Supervisor

## 20150814-5079

Cathy Kristofferson, Ashby, MA.

The August 6th filing of the United States Forest Service to Docket PF14-22 remains broken a week later. I have emailed to notify but received no assistance. The 5,486 character FERC generated PDF is of the “File 30792003\_1.tif cannot be converted to PDF” variety, and the 17 individual .TIF files are unopenable once downloaded.

Please repair this filing so that we can all see what our US Forest Service has submitted.

On 8/6/2015, the following Filing was submitted to the Federal Energy Regulatory Commission (FERC), Washington D.C.:

Filer: FOREST SERVICE, UNITED STATES

Docket(s): PF14-22-000

Lead Applicant: Tennessee Gas Pipeline Company, L.L.C.

Filing Type: Government Agency Submittal

Comment on Filing

Description: U.S. Department of Agriculture, Forest Service submits comments re the Notice of Intent to Prepare an Environmental Impact Statement for the Northeast Energy Direct Project under PF14-22.

To view the document for this Filing, click here

## 20150814-5085

SUSAN A DUHAMEL, NEW IPSWICH, NH.

I really think you should stop this pipeline project that Kinder Morgan has proposed. You are ruining our lives. I would much rather be enjoying my summer than worrying about what my life is going to be like if this project gets approved. I already have some serious medical issues. This compressor station that they are planning on putting in down the road from my house is not something I can live next to. Even if someone doesn't have a problem they'll probably end up with at least one. I cannot afford to move. But even if I could I was here first. Kinder Morgan is not welcome in my town. They have absolutely no right to even think of coming through NH. They are not welcome in any of the towns this pipe is going through. You FERC should be ashamed of yourselves for even having to think about what to do. Just tell them no. The more I learn about all of this the more disgusted I get. This fracking of gas is so bad. I will not back down on opposing this. I hope we can stop Kinder Morgan. We will probably have to keep up our good fight because you people just don't seem to care. I care about the kids, the adults, the animals, the air I breathe and the food I eat. Whoever you are who ends up reading this should go look in a mirror and wonder why you work for an agency that is turning it's back on us. I worked damn hard for what I have. We cleared our land and built our house 32 years ago. I am not walking away. Kinder Morgan just wants to make money any way they can and they do not care about any of you either. I hope they lose a lot of money fighting us.

## 20150814-5157

### **Eric Tomasi - NED “Product Manager”?**

It was no doubt a combination of the high school auditorium acoustics and my aging ears, but I could have sworn that Eric Tomasi introduced himself as the NED “Product Manager” for FERC at a recent scoping meeting. His title, of course, is “Project Manager”. But once I had “Product Manager” in my mind, I started thinking about it – and in many ways it seems to fit.

A project manager oversees a specific project to accomplish some task. A product manager helps to develop products and design the marketing for them. The former is interested in good management and the latter has something to sell you. Which do you think is a better job title for Mr. Tomasi?

I get the distinct impression that FERC in general and Mr. Tomasi in particular see the NED pipeline as a done deal – a “product” that Kinder Morgan will soon deliver to us. Resistance is futile. After all, FERC has apparently only denied a single application for a natural gas pipeline in its entire history. And according to one FERC contractor, that pipeline was laughably sited through an endangered coral reef in Florida.

Mr. Tomasi ran the recent NED scoping meeting in Nashua, NH. During his opening remarks, he encouraged affected landowners to allow Kinder Morgan contractors to survey their land. Mr. Tomasi suggested that these surveys would allow Kinder Morgan to consider such items as “a tree planted by your grandmother or grandfather” as they nail down the specific pipeline route. This FERC mindset seems to accept the NED pipeline “product” as a reality. I have news for Mr. Tomasi – the affected landowners that I speak with (and I was one on the original pipeline route) have much, much greater concerns than protecting a single tree. They are worried about their families’ health and safety, about the environment and about the pipeline company that is threatening these things. They consider this company to be the enemy. And they are not about to give the enemy permission to do anything, much less to come onto their land. They want to deliver a strong message to Kinder Morgan and to FERC that they do not accept this pipeline and will fight it however they can.

I don’t think that Mr. Tomasi truly understands the misery that the NED pipeline will bring with it. Or perhaps he has accepted that resistance is futile and he therefore feels that his job is simply to ease the populace into a similar timid acceptance of the NED pipeline.

By the way, Mr. Tomasi, here is a clue for you as you continue your visits to New England to shill for the NED “product”: “Dracut” is pronounced with a hard “a”, not a soft one, with the emphasis on the first syllable. You really should take the time to learn how to pronounce the name of a town before hosting a meeting there. A product manager such as yourself should understand that. Not understanding that gives the strong impression that you don’t care at all about the local populace or the impact that the NED “product” will deliver to them. And if you don’t understand that, you might also not understand the animosity that they feel towards anyone who might appear to be smoothing the way for that pipeline to be built.

Nick Miller Groton, MA

## **20150814-5202**

Teresa Caldwell, Shelburne, MA.

To whom it may concern,

I am deeply opposed to the proposed NED pipeline being considered for western Massachusetts.

My objections are on many fronts. My first concern is for the the environment, especially drinking water. I’m concerned for the drinking water of the folks where the “ fracked” technique of drilling is used to extract the gas, (& with the undisclosed chemicals used in the drilling process). I’m also worried about the safety of my well water in Shelburne, Mass. ( near the proposed route of the pipeline). Drilling horizontally underneath the Deerfield and Connecticut rivers also sounds like a very risky endeavor.

My second concern is about the concept of taking land for eminent domain. Has it been clearly established that this pipeline is necessary for peak gas consumption in the winter? Why should private citizens loose their land or have their property values decreased so that a corporation can profit financially? Especially egregious is the concept that we would be a host community for a pipeline that would ship gas overseas!

Another concern is that of protected land. I contributed money to the local land trust to keep land undeveloped and pristine for wildlife and for future generations to come.

Conservation areas should be left undisturbed by human activities.

Lastly, given the reality of global warming, I don’t want my tax dollars to support expanding infrastructure for fossil fuels.

I want my money spent on conservation and renewable energy. I’m also concerned about the democratic process with FERC arbitrarily deciding intervenor status, declining to postpone the environmental scoping

process and dismissing the voices of local and state elected officials and local residents, all of whom overwhelmingly oppose the NED pipeline.

In conclusion, I strongly urge FERC to reconsider their position in support of this pipeline project.

Sincerely,

Teresa Caldwell  
93 Bardwells Ferry Rd.  
Shelburne, Ma. 01370

**Commonwealth of Massachusetts  
House of Representatives**

BRADLEY H JONES. JR.  
STATE REPRESENTATIVE  
MINORITY LEADER

August 10, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room IA  
Washington, DC 20426

Dear Secretary Bose:

I am writing with respect to Project Docket Number PF14-22-000, the Tennessee Gas Pipeline Northeast Energy Direct (NED) Project, which includes the so-called "Lynnfield Lateral".

I appreciate FERC's efforts to schedule a series of public scoping meetings on this project in Massachusetts, and to make staff available to answer the public's questions at these forums. However, I am extremely concerned that none of these meetings have been scheduled in the communities impacted by the so-called "Lynnfield Lateral" or in any of the communities bordering it. I represent communities whose residents will be directly impacted by the proposed pipeline as well as neighboring communities.

My constituents in Lynnfield, North Reading and Reading have made it very clear to me that they still have significant concerns about this project. Some of these concerns relate to the environment and the possible harmful impact the pipeline will have on surrounding waterways and wetlands, as well as its potential disruptions and negative impact on local property owners.

One of the biggest concerns, however, relates to Kinder Morgan's lack of openness and transparency throughout this process. Many of my constituents in North Reading were visited by company representatives last year asking for permission to conduct on-site surveying on their properties, even before the company had notified the Board of Selectmen or any other town officials about their plans to move forward with the proposed pipeline. This lack of transparency is simply unacceptable for a project of this magnitude.

I believe a face-to-face meeting in my district with FERC representatives would be most helpful in giving local residents an opportunity to express their concerns, and to obtain answers to their questions. I am willing to personally help facilitate such a meeting and to assist in making the necessary arrangements to secure an appropriate local venue. Please feel free to contact me directly by calling 617-722-2100 or by e-mailing me at [bradley.jones@mahouse.gov](mailto:bradley.jones@mahouse.gov). I look forward to hearing from you.

Sincerely,

Bradley H. Jones, Jr.  
Minority Leader

Rev. Cynthia C. Willauer and Professor George J. Willauer  
55-1 Beaver Brook Road  
Lyme, Ct. 06371

August 8, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street N.E. Room 1A  
Washington, D.C. 20426

Dear Secretary Bose:

We write in opposition to the Northeast Energy Direct Project proposal to pipe natural gas through 412 miles of new conduits connected by 14 new meter stations from Pennsylvania through New York, Connecticut, Massachusetts, New Hampshire and on into Canada.

We have come to believe that fracking in itself is a bad idea and thus piping fracked gas through the Northwest USA a very, very bad idea. We have many reasons for having come to the conclusion that fracking is an environmental hazard rather than benefit, a primary one the release of methane into the environment during the excavation process. This release cancels any plus claimed for use of natural gas in lieu of coal or oil to power our economy.

We petition FERC to support investment in renewable energy and also to rigorously support conservation of energy, the latter woefully overlooked in the wastelands of our present energy economy. If a higher percentage of the energy presently produced were put to use rather than wasted there would be power aplenty to meet New England's need for increased electrical capacity in periods of extreme draw on the grid.

A positive move in New England is our Town governments' help of homeowners to "solarize" their homes. This is clearly a step in the right direction for care of the planet. By contrast, a crushing step in the wrong direction is the utilities' response: penalize all customers by raising the cost of electricity.

We are both Pennsylvania-born- and-raised, so we weep to see the devastation wrought by fracking on the hills and dales of the land of our birth. We appeal to FERC to refuse extension of the disaster: disallow the piping of fracked gas through the woodlands, wetlands, towns and cities of New England.

Sincerely,

**20150817-0020**

August 4, 2015 To: FERC, Concerning: Northeast Energy Docket PF14-22

There is no rational argument for compromise with toxic pollution.

Period.

We all know the facts, the terrible pollutants we have been subjecting the earth to, our beautiful, fragile, irreplaceable planet. We have all become more conscious that a change is in order; that we are responsible for what transpires in this time and place. What is the right thing to do? We have the ability now to use clean forms of energy. The big energy companies have seen their earnings decrease and are desperate. They see the writing on the wall but insist on sucking every last bit of gas out of the ground, no matter the cost. They, and all of us, and future generations would be better off if those companies made the switch to solar, wind and water power. Wouldn't it be amazing if our government (remember that one — of the people, by the people, and for the people) helped them?

A progressive step in that direction was taken by our own Senator Ben Downing on July 23—his amendment to increase the state's solar net metering cap and promote future solar development throughout Massachusetts, was adopted by the senate. He listened. We applaud him for his work in creating a long-term framework for solar growth.

I read of a town in a Pennsylvania area with a compression station. This facility was permitted a total of more than 80 tons per year of emissions, (NOx, VOC, CO. nitrogen oxides, volatile organic compounds, carbon monoxides) We do not want these toxins raining down upon our land, This is a residential and farming community. Did you see the sign as you enter Windsor from the east on Route 9? “Welcome to the Berkshires, America’s premier cultural resort. Somehow a 40,000 horsepower compressor station does not seem compatible with that message. We ask you and Governor Baker to listen as well. Community shared solar, not a compression station for fracked gas, is what the residents of Windsor want.

Thank you

Valerie C. Kahn  
522 High St. Hill  
Windsor, MA 01270

**20150817-0021**

August 10, 2015

Dear Governor Hassan,

We are writing to oppose the pipeline proposed by Kinder Morgan. The Northeast Energy Direct (NED) pipeline will bring no benefit to New Hampshire.

It feels like the negative effects of this pipeline do not matter to elected officials. Well it matters to all of us who are being asked to live near a compressor station’s hub of noise, light pollution, toxic chemicals and frequent “blow downs.”

Not only are homes affected, but the compressor station is proposed to go near Temple School where children are. We can prevent the compressor station going in New Ipswich if we find endangered species of animals living there — well isn’t this endangering our children of New Hampshire who will be exposed to the harmful effects of this compression station! What if it blows up? I ask you, are children no longer valuable in the eyes of the American government?

If you want this to go through we highly recommend that in your agreement with Kinder Morgan they must offer to buy out the Temple School and the homes in the “burn zone” for fair market value if the owner wishes to sell! If you don’t do this all homes will become worthless, it won’t sell for fair market value and many people will eventually have to walk away with nothing — because home owners in the burn zone will not be able to live in the type of safe, clean environment that everyone in New Hampshire is entitled to!

After doing the research I am convinced the pipeline construction process will pollute our air, contaminate our aquifers, wells and other water resources. Over 800 NH families will lose their homes and it will destroy conservation lands. It will harm the tourist industry and rural character of New Hampshire. Stand up and stop the greed of Kinder Morgan from ruining our way of life!

Thank you for your consideration,

Most sincerely,

*{signature not legible}*

Definition of GREED: A selfish desire for more than one needs or deserves, as of food, wealth or power;  
avarice

Definition of Kinder Morgan:

Greedy  
Ecosystems destroyed  
Habitats destroyed  
Wildlife destroyed  
Water supplies destroyed  
Homes destroyed  
Neighborhoods destroyed  
Communities destroyed  
States destroyed  
Economic sustainability destroyed  
Families destroyed  
Health destroyed

Lives destroyed  
Sacred places destroyed  
The ability for life to sustain itself destroyed  
I WILL NOT FORFEIT MY HUMAN RIGHTS FOR ANY CORPORATION OR  
GOVERNMENT.

Kinder Morgan cannot cover me with poisons that have been proven to cause illness and death. Kinder Morgan cannot deny me pure drinking water. Kinder Morgan cannot make my home unsafe. Kinder Morgan cannot harm me. Kinder Morgan cannot torture me. I have the right to the pursuit of happiness. I have the right to be a human being.

Definition of the state of the U.S. Government: Woefully inadequate.

Dear Recipient:

I live in New Ipswich, New Hampshire, near the proposed site of a large compressor station for the Kinder Morgan/Tennessee Gas NED gas pipeline from the fracking fields in Pennsylvania to a distribution hub in Dracut, MA. The permanent destruction this pipeline will do to New Hampshire (and other states) is unimaginable so I am writing to you to seek your support to stop this pipeline.

As a resident within the 10 mile radius of a compressor station, I received a mandated letter dated June 4, 2015 that said the NED project was to expand the Tennessee Gas pipeline system “to serve the growing demand for interstate natural gas transmission in the northeastern United States and more specifically, the New England region.”

By Tennessee’s own admission the purpose of this pipeline is transmission, not use. The letter also states, “The northeast region as a whole stands to benefit from the Project as it will enable the region to sustain its electric grid and lower energy costs to compete on a more level economic playing field with other regions of the nation with access to reliable, low-cost gas supplies”. The letter further says “the Project will provide additional access to diverse supplies of natural gas to expansion customers in the northeast region, including New England”.

Are residents of the northeast “expansion customers” or is this term applicable to energy suppliers, such as Liberty Utilities? The rocky, mountainous, remote terrain through much of the northeast doesn’t present an economical, practical or logical opportunity to ever route piped gas into our homes for heating or any other purpose so where is the evidence of benefit of low-cost gas to residents of the northeast region as a whole?

Kinder Morgan recently reduced the pipe size from 36 inches in diameter to 30 inches and reduced the New Ipswich compressor station size by 50% from 80,000+ hp to about 41,000 hp without explanation, so what suddenly happened to the essential need for so much capacity and power to serve the growing demand of the entire northeastern United States? Did the northeast region suddenly reduce their need by 50% since June 4, 2015?

I believe the above statements from June 4 clearly prove the only need for this project is Kinder Morgan’s need to transmit the gas as quickly as possible out of the U.S. to more profitable overseas markets.

I believe the statements in the June 4 letter indicate the intent of this project is greed, not U.S. public need.

I believe the statements in the June 4 letter indicate abuse of power to threaten eminent domain when there is no U.S. public good associated to this project.

I believe this project has the intent to deplete limited U.S. non-renewable energy resources that should be used sparingly and conservatively to benefit the people of the United States during a period of transition to renewable sources. What are the people in the United States supposed to use after Kinder Morgan gets rich exporting our rapidly dwindling nonrenewable supplies’

I believe this project demonstrates an irresponsible and reprehensible attack on U.S. public and private spaces, U.S. environments, U.S. ecosystems and the people of New Hampshire and other states solely to satisfy a corporate executive zest for additional personal profit.

As for the reduced pipe and compressor size, Kinder Morgan indicated that decision could be changed at any time. What does that mean? Kinder Morgan is moving forward to seek approval from the Federal Energy Regulatory Commission (the FERC) yet the residents being threatened with eminent domain and toxins and rural destruction of New Hampshire are being presented with a mysterious plan that can change at will. We are unable to properly assess or evaluate this pipeline due to this evolving nature of the proposal and Kinder Morgan's refusal to provide information. Pipeline companies often expand compressor sites over time. We have not been told where backup compressors will be built to keep operations running while primary compressors are undergoing maintenance. Is this recent reduction of pipe size and compressor station purely temporary as an effort to facilitate approval and will Kinder Morgan later decide to add more compressor stations, additional power or increased pipe size at a later date? It seems to me a company with the experience and expertise Kinder Morgan claims to have would not be so indecisive of what's required so close to their proposed FERC filing date. This indecision does not provide a reasonable opportunity for affected residents to investigate the plan as it remains very incomplete. Our New Hampshire communities are at risk of destruction. People have been issued notices of expected eminent domain. Others are facing financial ruin due to loss of value of their properties. Still others have health risk and safety concerns that are not being addressed. This indecision has not offered proof of need. This indecision is causing great and unrelenting stress and strain with no proof of service the public good or serving a need to U.S. residents.

Here are points to consider regarding the great hazards this pipeline poses. We have expressed our concerns to the FERC but the FERC's record shows disregard for concerns as all but one request has been approved. Many of the existing electric power lines the pipeline will roadside are supported by large wooden tree trunk posts, including those at the proposed compressor site in New Ipswich. If a fire erupts, these old dry posts that have stood for years will burn hot and wild and the grid will quickly come down. The downed live wires could touch off additional fires. The response time for pipeline companies to shut off valves and respond to the site of failure is typically 1-2 hours. This could be considerably more to reach the remoteness of New Ipswich where roads are few, narrow and winding. In fact, it is the nature of those roads that will also contribute to blocking access to the primary site as fire can easily jump across those narrow roads to spread in all directions through the forests. That horror aside, consider this:

- ~ New Ipswich has no water bomber planes or water helicopters or any other equipment to fight pipeline fires. How does Kinder Morgan expect to arrive and control a situation?
- ~ When Kinder Morgan arrives, where will they get water? New Ipswich has no public water supply; we are 100% reliant upon wells. That's right- 100% reliant on wells.
- ~ Where will our local fire equipment get water to help fight secondary fires? We fight our fires with tanker trucks. If roads are blocked from a large pipeline fire or secondary fires from downed power lines, we can't respond.
- ~ What will be the final toll in lives lost and pristine ecosystems destroyed from an accident? It is unthinkable.
- ~ The compressor station site can flow toxins and pollutants downhill into the towns of Greenville, Wilton, Milford, Merrimack, Nashua and beyond. We all hear about toxic flows on the news that have traveled over a hundred miles across multiple states. Be in denial or be prepared, but truthfully, the only proper preparation to avoid this scenario is NO PIPELINE.
- ~ And for that matter, where will Kinder Morgan get water for the compressor station and pipeline operations? When two new homes were built across the street from mine, my well dropped 20 feet. Millions of gallons of water are needed by these pipelines. Where is Kinder Morgan going to get that water and what will be left for us'?

I believe it is incorrect to dilute the number of pipeline accidents by measuring against the number of miles of pipeline because one event is all that's needed to destroy everything that's currently right about New Hampshire. An explosion and large fire is undeniably unimaginable, yet it is possible. We do not need to sit long before another pipeline accident demonstrates the lack of control within this industry. Just last week, on

August 3, 2015, a Kinder Morgan gas pipeline ruptured in Falfurrias, Texas.

1. A preliminary report filed with the Texas Commission on Environmental Quality estimates 7,476 pounds of volatile organic compounds were released into the air in less than two hours from a ruptured 16 inch diameter pipeline.
2. Per reported news coverage of this rupture, Richard Wheatley, spokesman for Houstonbased Kinder Morgan Inc. noted that pipeline ruptures are often accompanied by a loud boom and a “concussion effect.”
3. Wheatley said the company immediately detected the rupture along the 16-inch pipeline and quickly coordinated a response by law enforcement officials, emergency responders and state regulators. Wheatley also said, “After securing the area and isolating the pipeline, our personnel, along with local emergency responders, continue to work together to seek to ensure the safety and well-being of the community.”

Let me comment on these three points.

1. Legislation exempted gas pipeline companies from the Clean Air Act. U.S. government and judicial officials gave gas pipeline companies the right to not disclose the toxins in the gas nor monitor blow downs. They are free to shower us with toxins as they please. We, the public, for which these pipelines are supposed to serve our collective good, are left to succumb to property loss, financial ruin, destruction of wetlands and ecosystems, illness, trauma and death. How can we possibly receive prompt and accurate health care for illnesses brought upon us by undisclosed agents? Toxins, vibrations, noise, light, and stress all contribute to complete disruption of our life-essential biological processes. How can health care providers and facilities learn and prepare for health impacts when the list of suspect chemicals is kept secret, known only to the perpetrators who use them against us?

Where are those 7,476 pounds of volatile organic compounds released in Falfurrias now? Is the U.S. government or Kinder Morgan required to go find them? Or is all simply forgotten and forgiven now that the event has subsided? If a penalty is assessed to Kinder Morgan, does that clean up the hazards left behind? Does that identify those who may have suffered or will suffer biological damage from being exposed to the toxins? And what were those toxins? Is it still a secret?

This Falfurrias accident was a 16 inch diameter pipeline. The NED pipeline will be 30 inches in diameter; at least for now. Kinder Morgan stated the right to change the parameters at any given time. Like a ticking time bomb, only Kinder Morgan knows what explosive circumstances and toxins will come forth at any given time. The public, for which the project is supposed to deliver collective good, is expected to sit back and succumb to whatever Kinder Morgan decides to be our fate.

2. Concussions, as the NFL was finally forced to bring forth, can cause long term and permanent life altering illness, disability, depression and death. I certainly do agree with Mr. Wheatley that a loud boom and a concussion effect often accompany one another. I can't imagine what I and others who are located near the planned compressor station in New Ipswich will feel if the 30 inch pipe or the 41,000 hp compressor station ruptures and burns, nor can I imagine what the children and teachers at the nearby Temple Elementary School will feel.

I'm sure I won't survive an explosion event like that as I'm less than a /~ mile away and it's simply not enough. Some of my neighbors are less than a thousand feet, but who cares? Regulations don't exist to save us. We are just statistics. We are disposable pawns that Kinder Morgan doesn't need to remove out of harm's way, so they don't. Some estimates suggest 4 miles as a minimum relief distance from large high compression pipeline or compressor station failures.

3. Immediately detecting and quickly coordinating a response does not equate to ensuring the safety and well-being of a community. Though a breach in the pipeline may be 'quickly' detected by a change in pressure at a remote command center, the Kinder Morgan response to shut down valves and arrive at the site to address the spread of gas, toxins or fire typically takes 1-2 hours, during which local emergency response

teams are instructed to stay away, stand down, and do not approach the scene. No one can approach such a scene at that point, not even Kinder Morgan because there is extreme thermal radiation, uncontrollable release of toxins, unpredictable events, and lack of equipment and manpower to deal with what essentially is a scene equivalent to an atomic bomb explosion. During that 1-2 hour period when no one can help people are trapped, poisoned, burned, and killed. Left to die, so to speak.

Despite what Mr. Wheatley said, during this period of such extreme uncontrollable hazard, the ability to ensure the safety and well-being of the community is inherently impossible.

Let me say it again. During this period of such extreme uncontrollable hazard, the ability to ensure the safety and well-being of the community is inherently impossible.

If you harbor the mindset that a catastrophic event in New Hampshire is unlikely, look up “San Bruno”. It too had the same unlikely odds that New Ipswich will have, yet San Bruno did happen, and as bad as San Bruno was, New Ipswich can be even worse.

San Bruno had the very best fire-fighting equipment at the ready. Four fixed-wing aerial water bombers, one aerial water helicopter and 67 fire trucks and still people died and many homes were lost. San Bruno also had a 30 inch diameter pipeline, the same size proposed for New Ipswich.

New Ipswich has no aerial water bomber planes or helicopters or 67 fire trucks. New Ipswich does have old, dry wooden supports on the electric grid, surrounding forests, narrow roads, no fire hydrants or public water supply, blocked escape routes on dead end streets, and a dedicated handful of volunteer fire fighters that work miracles but will have to stand down for this event else they add their own lives to the tragedy. New Ipswich will not fare well from an event similar to San Bruno.

In closing, I present this message to all who have granted unusual and dangerous rights to Kinder Morgan, Tennessee Gas and all other similar entities who pursue their business without virtue or responsibility or respect for the harm they cause.

To officials who have contributed to these injustices, you may have stripped us of our citizen rights by granting corporations permission to use eminent domain for private profit, by allowing exemption from the Clean Air Act, by setting aside EPA sanctions, and by permitting toxins to be rained upon us, but you are not able to strip us of our human rights.

~ As human beings, we are entitled to a life-sustaining supply of clean water.

~ As human beings, we are entitled to prevent life-threatening health hazards from being bestowed upon us for any reason, never mind for private profit greed.

~ As human beings, we are entitled to prevent unjustified harm to our children

~ As human beings, we have the right to construct a legal lifestyle within our means and not have anyone be able to take it from us for their personal pursuit.

There are solutions.

Permanently halt this pipeline. It's a venture for greed. There has been no justified U.S. public need identified.

Focus on job creation. There is a job for everyone to help clean up the damage done and create new energy solutions. No one has to be without a job from cancelling this pipeline.

Present the alternative: Kinder Morgan should adopt a leadership role to fund task forces with the mission to enhance existing renewable technologies and discover new ones. They have the money and the resources to do this. This is an opportunity to turn the past into a better future.

Present the alternative: Kinder Morgan should adopt a leadership role to repair, replace or decommission all their existing pipelines as most accidents are attributed to deterioration due to a failure to inspect and maintain pipelines.

Present the alternative: Kinder Morgan should implement safer renewable options without tariffs and taxes to the public. We have paid our dues to corporate energy giants for decades. Are any of these companies able

to adopt a “pay ahead” mission and start giving back for all they took so wrongly? Remember Exxon Valdez in Alaska and BP in the Gulf of Mexico, PG&E in Hinkley, California and Love Canal in New York. There are thousands of Superfund sites in the United States. How long will we remain so careless?

Repurpose the FERC into a true regulatory agency that will identify and disallow corruption and irresponsible and reckless entities. Fees imposed by infractions need to be used to install efficiencies, balance our energy consumption and provide safer energy solutions to everyone.

Tighten environmental controls and stop the damage. The U.S. government must take the lead to show commitment to public good as they are currently really, really bad at doing that. The loopholes are more carefully constructed than the topic itself and the time it takes to respond is always too late.

Thank you listening. I hope you act against this pipeline.

Sincerely,

Evelyn Taylor  
213 Old Wilton Road  
New Ipswich, NH 03071

Project docket # PF14-22-000

To: Kimberly D. Bose

We live in Richmond NH and we are tax-paying landowners and have owned land in Richmond for twenty-nine years. In our opinion it is unconscionable to consider the impact that the Kinder Morgan pipeline project will have on our rural town. We are concerned about the shortterm health and safety impacts and the impact on the wild lands. We are especially worried about our well water and the wetlands and wildlife habitats. On a personal level we are also concerned about land rights, loss of property and reduced property values. This is an attempt to solve a problem that doesn't exist. Finally we are concerned on the impact on roads, schools and the local economy.

Please consider the human impact. It doesn't have to happen.

Fred Goldberg  
Roberta Jaffe  
216 Whipple Hill Rd.  
Richmond, NH 03470

### **20150817-0027**

August 10, 2015

Dear Senator Shaheen,

We are writing to oppose the pipeline proposed by Kinder Morgan. The Northeast Energy Direct (NED) pipeline will bring no benefit to New Hampshire.

It feels like the negative effects of this pipeline do not matter to elected officials. Well it matters to all of us who are being asked to live near a compressor station's hub of noise, light pollution, toxic chemicals and frequent “blow downs.”

Not only are homes affected, but the compressor station is proposed to go near Temple School where children are. We can prevent the compressor station going in New Ipswich if we find endangered species of animals living there — well isn't this endangering our children of New Hampshire who will be exposed to the harmful effects of this compression station! What if it blows up? I ask you, are children no longer valuable in the eyes of the American government?

If you want this to go through we highly recommend that in your agreement with Kinder Morgan they must offer to buy out the Temple School and the homes in the “burn zone” for fair market value if the owner

wishes to sell! If you don't do this all homes will become worthless, it won't sell for fair market value and many people will eventually have to walk away with nothing — because home owners in the burn zone will not be able to live in the type of safe, clean environment that everyone in New Hampshire is entitled to!

After doing the research I am convinced the pipeline construction process will pollute our air, contaminate our aquifers, wells and other water resources. Over 800 NH families will lose their homes and it will destroy conservation lands. It will harm the tourist industry and rural character of New Hampshire. Stand up and stop the greed of Kinder Morgan from ruining our way of life!

Thank you for your consideration,

Most sincerely,

*{signature not legible}*

P.O. Box 253

New Ipswich, NH 03071

Kimberly D. Bose

Secretary Federal Energy Regulatory Commission

888 First St. NE, Room 1A

Washington, D. C. 20426

Dear Ms. Bose:

New Ipswich, New Hampshire, is such a beautiful place to live. You ought to visit it sometime. It has been a rural community filled with trees and ponds and lovely properties for two and a half centuries. My husband and I live on a pond and we love our view and our quiet neighbors. This is our dream come true.

Now you and your commission have disregarded the recommendation to turn down the Kinder- Morgan pipeline. Will you profit from this in some way? We won't profit from it in any way. Our taxes will simply go up, our energy rates will go up, and our homes may well go up in flames and us along with them. Our beautiful retirement life will be ruined. The Kinder-Morgan pipeline will pass through our lovely town and destroy its rural character. It won't bring us cheaper fuel.

How is it the state of Massachusetts managed to get rid of this pipeline? Did their government stand up for its people as ours won't? We need you to be firm and stand up for us.

You should visit New Ipswich's religious retreat where people go for peace and the opportunity to meditate. It is right next to the proposed pipeline area and the compression station. The noise alone will ruin their calm environment, let alone the threat of incineration.

My grandchildren went to the elementary school in Temple, NH, which is less than a mile away from the compression station. If the station explodes, it will incinerate those little children as well as my daughter and her family who live nearby. It will also destroy Temple's only emergency shelter.

I have heard that the pipeline will impact the Souhegan River, 22 brooks and streams, 13 aquifers, 11 ponds and lakes, 27 wetlands and vernal pools, 600 private wells, and numerous municipal water sources and watersheds. Would you like to have your water supply poisoned? We have a well for our water. Will it be usable if Kinder-Morgan succeeds?

Will our property be worth anything if Kinder-Morgan wins? Why should a big corporation be allowed to destroy our wonderful rural community just for their profit in fossil fuels. Why isn't anyone thinking about renewable energy sources? Why isn't anyone thinking about us who live here? Why do big corporations who make tons of money win in cases like this while we lose?

I respectfully request that you do not approve this potential disaster to our beautiful New Ipswich, NH. Please consider the "little guy" rather than the "BIG MONEY GUYS" as you make your decision. This pipeline is NOT in the best interests of the citizens of New Ipswich nor the citizens of New Hampshire.

Sincerely,

Judith G. Baldwin

Re: Opposition to the Proposed NED project by Kinder Morgan/Tennessee Gas

Dear Kimberly D. Bose, Secretary, FERC

The proposal by Kinder Morgan and its subsidiary, Tennessee Gas, to build the fracked gas pipeline called NED will be detrimental to the people, infrastructure, and environment of my county.

I am writing to you in the hope that you will listen to those of us who are aware of the dangers this project poses and will take whatever action you can to stop its construction.

My opposition to the NED stems from the following facts:

1. Pipeline safety standards in rural areas are much lower than in urban ones. People who live along the proposed route are being treated as if they are less worthy of protection than their fellow urban citizens because fewer of them may be harmed by the project.
2. The pipeline as proposed, will be 36 inches in diameter and will carry hydro-fracked gas at approximately 1400 psi through pristine woods and under various (currently) unpolluted rivers and streams. This land, which many of us have fought to protect, will be adversely affected by the construction and on-going operation of the NED.
3. In addition to the possibility of rupture, pipelines like this inevitably develop leaks &om welding joints. The process of hydro-fracking gas has been banned in New York State in part because of the known toxins the process produces. Yet this pipeline will transport these same toxins through leaky pipes across our state.
4. According to many reports, the federal and state agencies responsible for pipeline safety are very underfunded and under-manned.
5. Most of the residents along the pipeline route will receive no compensation for bearing the risks the NED poses. In fact, their burden is increased by potentially higher taxes and insurance rates, as well as lower property values. In addition, no New Yorker will get any of the gas or will benefit by lower gas prices, because it is most likely that Kinder Morgan's plan is to market the gas abroad.

I would appreciate your attention to this matter and thank you in advance for your help.

Sandra L. Ryan

Washington, DC 20426

RE: Docket'F14-22-000

Dear Secretary Bose:

I am writing to express my opposition to the proposed Kinder Morgan/Tennessee Gas Pipeline project My concerns regarding this project are many and include the proposed pipeline route ( underneath the Cheshire Reservoir and the Ashuwillticook Rail Trail ), the related construction activity and the damage that will occur to our roads, the natural environment and the possible contamination of our drinking water. The high pressure under which the fracked gas would need to travel through this pipeline increases the likelihood of leaks, spills and in the worst case scenario, an explosion.

The safety record of Kinder Morgan along with their response to spills is also a concern. In a report filed last year with the Canadian Government, Kinder Morgan was quoted as saying that “ Pipeline spills can have both positive and negative effects on local and regional economies, both in the short and long term. Spill response and cleanup creates business and employment opportunities for affected communities, regions and cleanup service providers “. I find this statement to be outrageous and I think it raises some serious questions about the ethics of Kinder Morgan.

I am strongly opposed to any project that would be paid for by new tariffs on our electric bills, particularly when there is ample evidence that our energy needs here in Massachusetts can be met through existing pipeline capacity combined with renewable sources and increased energy efficiency. There are many existing pipelines in Massachusetts that leak and they should be repaired prior to building any new pipelines. I believe that the Kinder Morgan/Tennessee Gas Pipeline project is not in the best interests of the residents of Massachusetts and I ask that you do everything in your power to ensure that this pipeline is not built.

August 8, 2015

Dear legislator,

We have a special opportunity ?? we are living in a time when great change is not only possible it is necessary. We have the opportunity and responsibility to make a great positive impact by doing the right thing right now.

My husband and I strongly oppose the Kinder Morgan Tennessee Gas Pipeline proposal that if constructed would pass through Northfield, MA, the town we love living in. We oppose further money spent on fracking and the exportation of precious gas resource overseas. It is not a NIMBY thing; we oppose all further new construction of pipelines for this use. Period.

We in Massachusetts have the opportunity to set a trend and an expectation for further development in the direction of alternative, sustainable and renewable energies. This may not be easy, but it is the right decision. We have the right and responsibility to stand up to the oil and gas companies and instead do what we know to be right for the planet. You have the power to make this happen.

Our family of four lives on an annual income of about \$100,000/year and this year we decided to invest in

a \$25,000 solar system for our home. It is certainly a struggle figuring out how to pay for this, but we know it is the right choice. We are delighted to have the incentives and rebates in Massachusetts that you all have worked hard to put in place. Thank you for making alternative energies a priority. We are proud to live in Massachusetts where environmental concerns are being addressed every day.

Ask yourself what makes most sense: looking backwards to the way things have been done that have led us to a world of climate change and disastrous rapid environmental changes, or looking forward to new solutions that will allow for our children and grand children to live healthy productive lives generations from now.

Thank you for your consideration of our thoughts and the good hard work you do each and every day for the Commonwealth of Massachusetts. Continue to make us proud with a strong stance opposing Kinder Morgan TGP proposal.

Robin and Terry McKeon

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, h1E, Room A1  
Washington, DC 20426

Dear Madam Secretary:

I am writing to ask the FERC to extend the time period for commenting on Kinder Morgan's North East Direct natural gas pipeline proposal and report. It was submitted on Friday, July 24, is over 6,000 pages long, has four sections that have not been completed including on horizontal drilling under the Connecticut River, and has many TBD (To Be Determined) markings.

At the FERC scoping hearing on Wednesday in Greenfield, Massachusetts, our publically elected officials, from Representative McGovern in the U.S House to local Select Board members, either in person or written statement, asked FERC to extend the time period for comments and to schedule scoping hearings past the current August 31 deadline. After public officials spoke many other citizens echoed this same request.

In addition, our Massachusetts Attorney General's, Maura Healey's, office is conducting a study on options for Massachusetts' electricity needs over the next 15 years, including whether more natural gas capacity is necessary. This evaluation is scheduled to be completed by the end of October.

It is not possible for us, the public, to adequately digest and comment on such a huge and unfinished document under the current schedule. It doesn't make sense to have the scoping process stopped before the Attorney General's report has been completed.

The natural gas pipeline will affect many of our citizens in serious ways, including land taking, property values, quiet enjoyment, environment and health. We need to get this decision right, not rush into it. Please, extend the period for responding to Kinder Morgan's voluminous report.

Sincerely yours,

DeAnne Riddle

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room IA  
Washington, DC 20426

Dear Ms Bose,

I am writing to you to express my opposition to the NED pipeline proposed by Kinder Morgan / Tennessee Gas, to be buried across a 71 mile swath in southern New Hampshire. In addition to agreeing with the general reasons put forth by those opposed to the pipeline, I wish to highlight an issue specific to me and to those who own property in the designated "incineration zone." While Kinder Morgan may be obliged to negotiate with those whose properties will be physically altered by the pipeline, there apparently is no similar expectation for Kinder Morgan to have any contact with abutting property owners. I conclude Kinder Morgan has no interest in - or sympathy for -- us.

My husband and I have enjoyed our twenty-four years in the rural peace and quiet of Richmond, NH. However, our advancing ages (currently 88 and 83) and escalating health concerns mean that we will be unable to maintain our independence more than another two or three years at best, and we will need to sell our home and move to an area with more services. How will the pool of potential buyers be affected when our home carries the label "incineration zone," and how will the selling price of our property compare to a similar property well distant from a pipeline? In addition to our twelve-acre house lot we own an adjacent eleven-acre undeveloped lot. Who would buy that at any price, knowing that a house built there likely could not be sold for as much as its construction costs? It seems incontrovertible to me that the marketability and value of our home and adjacent lot (both located in the incineration zone) will be negatively affected, and significantly so. Is this fair?

Has FERC done, or have you even seen, any study on real estate transactions specific to incineration-zone properties, comparing them to similar properties not so stigmatized? Shouldn't you? A private company is entitled to earn a profit but that should not be achieved by causing a financial loss to individual citizens. I fervently hope that FERC will not approve KM's application, and if it does, that there will be some recognition of --and compensation for -- the decreased value. of our property.

Please consider our plight

Yours truly,

Barbara Woodward

**20150817-0044**

August 8, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room A1  
Washington, DC 20426

Dear Madam Secretary:

My understanding is that FERC can consider Environmental Impact Statements when deciding whether or not to approve natural gas pipeline routes, but that climate change is not considered in these impact statements. If this is true, please change this. The environmental impacts of climate change should be included. Climate change effects, such as sea level rise and warming stream and river temperatures, clearly have environmental impacts. Sea level rise threatens low-lying coastal wet lands and beaches, and the animals and

plants that live there. Warming stream and river temperatures increase eutrophication and decrease oxygen levels, thus affecting fish populations.

FERC needs to take these environmental impacts of climate change into account when considering approval of future gas pipelines, such as the Kinder Morgan North East Direct Pipeline. This pipeline should not be built, in part because the additional carbon and methane, which it enables, will affect the climate and thus have a negative impact on our environment.

Sincerely yours,

DeAnne Riddle  
252 Strong Street  
Amherst, MA 01002-1848

FERC  
888 First Street, NE, Room 1A  
Washington, DC 20426  
Re: Docket 1 PF14-22-000

July 31,2015

My name is Stephanie Wales and I live at 89A Seaverns Bridge Road in Amherst, NH. The town line separating Amherst and Merrimack runs through our property; we own land and pay taxes in both towns.

Our property abuts the power lines, but you would never know it looking off my back deck. That's because my back yard is heavily wooded. There is also a significant brook that runs from the other side of the power lines, across the path of this project, through our back yard and continues under Seaverns Bridge Road until it flows into the Souhegan River. For some reason, this brook is not identified on any maps yet presented by Kinder Morgan. In fact, the most recent project map presented to the Amherst pipe-line task force has a map key with stream and creek identification symbols.....yet this brook is not identified? Why? If you take a walk up the power lines from Seaverns Bridge Road-trust me, you can't miss it, and you will get wet.

The "colocation benefits" that KM continually refers to do not benefit my family at all. The proposed pipe-line route runs \*beside'he power lines ROW. Technically on occasion it may be in the actual ROW, but the fact of the matter is that the pipe will be laid on the very far edge of the currently cut power line path. Not directly under the power lines. Why?

That red line representing the pipe line route is a place that I spend a lot of time. Right on top of it. I sit on it. I walk up and down it daily. It is thick with trees, underbrush, wetlands, and the brook. It also teeming with wildlife, which is why I am able to hunt right out my back door on my own property. There are wild turkeys and deer in abundance. We have had bear on the property multiple times. There are also numerous weasels and turtles that call the unmapped brook home, using it as a path to and from the river.

My backyard is everything-it is the core of my lifestyle and existence. I recreate there, I grow & provide food for my family there. These woods also protect our view and privacy. I don't want to cut down any trees. I would never willingly chose to change the ecosystem of my backyard in this or any other way.

I'm pro-gas and pro-infrastructure. Many other houses on our road already have natural gas. However I don't believe I should be forced to give up such a valuable part of my property-or my lifestyle-for a multi-billion dollar company's convenience.

FERC is supposed to be monitoring the checks and balances of this project; the process for citizens is laid out clearly and distinctly. Yet KM is currently providing inaccurate maps, incomplete information, and showing up to survey private property where permission has been denied. What consequences have they faced? None that I am aware of.

“Live Free or Die” is the state motto here, and some of us really do live by this ideology. For example, I live less than 5 minutes from every major American big named box store, but I rarely even drive on 101A. When I need eggs, I head out to the hen house. For apples, we go to Mr. Currier’s orchard. When I need meat, I head up to Don Miner’s farm just a few houses up the hill, or I head out to my back yard during hunting season and sit in my tree stand -the one located on my own property directly on top of the proposed pipeline route. If you approve this project, you will be in effect, displacing me and my family. This project will affect me at the very core of my lifestyle.

Some may call me a NIMBY er. And they would be correct. I don’t want this project on my property in my backyard. If someone else does, that’s their business.

My Father was a licensed NH Land Surveyor for over 40 years. As my siblings and I worked for him in the family business throughout HS and college, and during this time I learned quite a bit about mapping and easements. When there is a brook on a property, you walk the length of it and map it-both its path, origin, and destination. Another thing I learned is that when a rich bully with bottomless pockets starts ignoring the law and facts (like where something is supposed to be located) and builds it where he wants anyway, the affected victim land owner certainly doesn’t expect “fair market value” for the easement gained in court. They are usually granted much, much more than that.

For a roughly 100 foot permanent easement on our property, plus a 250+/- foot during construction, plus the loss of my hunting and recreation area, plus the destruction of the brook which has not been identified by KM, and the ruined privacy and view from my house, anything less than the total value of our property and home will be unacceptable.

I don’t know how FERC could possibly review or approve an EIS when there are waterbodies not even accounted for on KM maps. Please look into the following:

- 1.) There is a running, flowing brook at the lowest point on the power line path off of Seaverns bridge Road (heading up the hill towards Merrimack). There are wetlands on BOTH sides of the brook, including one that runs across our property. They need to be identified and explored by FERC. Simply by walking in this area and exploring the shoreline, many species can be identified. This brook roars with adequate rainfall.
- 2.) Why isn’t the pipe line path being laid in the middle of the power lines instead of on the edge of the woods where so many trees will need to be cut? The colocation argument and “benefits” is totally moot otherwise.
- 3.) The well in our front yard is approximately 175 from the pipeline route at a road crossing. Will our well need to be replaced?
- 4.) I run a business out of my home; any construction across the roadway will create a 15 mile+ detour for my Client’s access. What types of concessions will FERC insist and support by KM for interrupted business and loss of income that may result?

Thank you for your time and sincere attention to this matter.

Sincerely,

Stephanie Wales  
89A Seaverns Bridge Road  
Amherst, NH 03031

Washington, DC. 20426  
RE: Docket g PF14-22-000  
Kimberly Bose, Secretary

Ms. Bose,

I have attached a copy of a letter sent to the Massachusetts Energy Facilities Siting Board. It was signed by more than a dozen voters in this area of western Mass. through which the proposed Kinder-Morgan pipeline will pass.

We are very concerned and completely opposed to this pipeline in our area.

Any action you take against this will be greatly appreciated

Sincerely

Don & Judy Whitman  
Hancock, Mass.

-----

Commonwealth Of Massachusetts  
Energy Facilities Siting Board  
Re: Kinder-Morgan Pipeline  
Attention: Steven August, Presiding Officer

Mr. August,]

August 1, 2015

As longtime residents of Hancock, we would like to register our opposition to the proposed gas pipeline passing through our town. We live approximately 2 miles from the proposed route.

We are very concerned about:

The large area of construction and destruction of natural habitat.

Deep frost averaging 4-Sft and it's effect on the pipe.

Long term maintenance and integrity of the pipe.

Accidental rupture by a disaster (earthquake .plane crash, terrorism,) and the effect on our area due to leaks, fire or explosion.

The danger to local residents and inability of local emergency services to handle a disaster of that magnitude, especially since shut offs will be miles apart. Large amounts of gas would be released and the fire hazard is very high.

Devaluation of property

The small benefit to the people of Massachusetts and large benefit to large companies.

We are totally against fracking. The need to move away from our use of fossil fuel is greater than the need for a gas pipeline.

Sincerely,

**20150817-0048**

Re: Siting of the Kinder Morgan/Tennessee Gas proposed Northeast Energy Direct Pipeline in  
Berkshire County, MA Docket 1PF14-22-oc c

Dear Ms Bose:

I am writing to express my total opposition to the proposed Tennessee Gas Pipeline Northeast Expansion project.

I am a retired Boston Public School teacher. Just 10 months ago I moved to Dalton, MA (population 6,750) from Beverly MA and Boston (metro Boston population, 4,732,161). I moved here for the noticeably cleaner, fresher air and water that did not have a chemical aftertaste. I lived in Boston for most of my adult life and I thought the water in the MWRA district was good, though we did start filtering it a few years ago. I have friends in Boston who have never smoked but who have asma and shortness of breath worse than mine was at its'orst. I moved here for the walks and hikes, for the forests and for the open spaces. I have seen the maps of methane leaks in Boston and I know that here, I am not breathing in methane everywhere I walk. Pittsfield, with it's population of 44,737, many automobiles and natural gas being provided to many homes, may be worse than Dalton but it is definitely not in the same league as Boston.

I urge you to reiect the sitinit of anv natural eas oioeline throuh Berkshire Countv. and in the case of KinderMorgan/Tennessee Gas the reasons are as follows:

1. KinderMorgan/Tennessee Gas Co has offered, willy-nilly, a number of routes through and over terrain they obviously know nothing about. One of the most recent routes would take the pipeline through the watershed for Dalton, Lanesborough, Cheshire and Pittsfield —some 50,000 people. At least one expert testified at a recent Scoping Hearing that the blasting that would need to be done to lay the pipeline could very well alter the route of the underground streams that feed the wells and reservoirs that provide water for Dalton, Lanesborough, Cheshire and Pittsfield, nearly half the population of Berkshire County.
2. Another proposed route takes the pipeline through a series of other towns, including Lenox and that route would traverse their watersheds as well.
3. The 30" pipeline proposed for Berkshire County is the same diameter as the Spectra Gas pipeline approved for lower Manhattan in 2013. The Spectra pipeline pumps approximately 800 million cubic feet of Marcellus Shale 'natural'as into Manhattan daily. The population of Manhattan is 1.6million but the population of Berkshire County is only 128,715! Where will the rest of the 'natural'as go? Will it be sold to the Canada? To Europe? Who will make the money? The principals and shareholders of a corporation that is being allowed to take (steal) private and state land, livelihoods and personal serenity for private gain. What will they tell their children when there are no more trails to hike, fun rivers to kayak or, like California, when the reservoir runs dry?
4. No one is cold during the long winters in Berkshire County for lack of availability of 'natural'as, oil or propane. Cold homes and apartments happen because energy efficiency measures have not been adequately attended to or funded, because landlords do not care, because the housing stock is older, because homeowners do not have the money to update and because the gas company raises prices during the winter.
5. Apparently, Kinder Morgan/ Tennessee Gas are not concerned with alternative sources of energy. They are multibillion dollar corporations whose job it is to sell 'natural'asapparently at any cost. When there are no trees left to absorb the CO2 produced from the production of 'natural gas', then they will understand.
6. We know that solar, hydro, wind and geothermal energy go on line with virtually no risk to consumers and little environmental impact. Common sense would dictate that we make the switch as soon as possible! The FERC can and should be facilitatina the transition.
7. As you know, residents of low-lying areas, including Manhattan, are and should be worried about big weather events, sea level rise and flooding. Here, in the Berkshires, health concerns are continually raised with reference to the safety of the pipeline due to frost heaves, disruption of watershed ecosystems by blasting, noise, light and chemical pollution from a very large compressor station and the overall degradation of the quality of life and livelihoods of the residents and caretakers of Berkshire County.

8. To save the Berkshires, the FERC must reject any siting of pipelines, including the KinderMorgan/Tennessee Gas Pipeline through Berkshire County. Your support for solar, wind, hydro and weatherization would take up any slack between supply and demand.

Sincerely,

Sandra G. Leonard  
Dalton, MA

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Re: docket Number PF14-22-000

I am sure that you have received extensive dam questioning the actual need for the proposed pipeline from Wright, Ny to Draco. I have enclosed some of the concerns that I have read regarding the need for additional lines and some proposals for alternative energy . I question why the Federal Government would want to allow a private company to financially benefit from a plan to sell fuel overseas while putting the local population at risk. There seems to be a spin put on the information that promotes gas as an environmental fuel source and that more pipe lines are needed.

There have been some documented studies showing that formaldehyde and benzene are being released at Compressor sites. There is no requirement to study and monitor air around these and proposed Compressor sites. Who will be responsible for the health of the surrounding population of up to a mile down wind from the site. I have also read that the Methane released from the Compressor Stations and from leaking pipes is overall more dangerous to global warming than the pollution of oil or coal.

As an affected landowner I am also very concerned about my family's safety. A high pressure gas line explosion would damage everything within 1,000 feet. That would be most of my property including my house. While we have received requests to survey our property from Kinder Morgan, no one has acknowledged that placing a high pressure gas line so close to my home is dangerous. No one has acknowledged the financial damage that we will sustain because of decreased property value. How many other homeowners will have to worry and have sleepless nights because they cannot afford to move.

My home is a passive solar home with solar panels. For thirty years we have been conserving energy and only using renewable resources to heat such as solar and wood. The federal government should not allow Kinder Morgan to build new gas lines. They are not needed and they are not safe. Please put more effort into supporting renewable resources and protect our people and planet for years to come.

Sincerely,

JoAnn Timme

Re: Opposition to the Proposed NED project by Kinder Morgan/Tennessee Gas

Dear Kimberly Bose

The proposal by Kinder Morgan and its subsidiary, Tennessee Gas, to build the fracked gas pipeline called NED will be detrimental to the people, infrastructure, and environment of my county.

I am writing to you in the hope that you will listen to those of us who are aware of the dangers this project poses and will take whatever action you can to stop its construction.

My opposition to the NED stems from the following facts:

1. Pipeline safety standards in rural areas are much lower than in urban ones. People who live along the proposed route are being treated as if they are less worthy of protection than their fellow urban citizens because fewer of them may be harmed by the project.
2. The pipeline as proposed, will be 36 inches in diameter and will carry hydro-fracked gas at approximately 1400 psi through pristine woods and under various (currently) unpolluted rivers and streams. This land, which many of us have fought to protect, will be adversely affected by the construction and on-going operation of the NED.
3. In addition to the possibility of rupture, pipelines like this inevitably develop leaks & welding joints. The process of hydro-fracking gas has been banned in New York State in part because of the known toxins the process produces. Yet this pipeline will transport these same toxins through leaky pipes across our state.
4. According to many reports, the federal and state agencies responsible for pipeline safety are very underfunded and under-manned.
5. Most of the residents along the pipeline route will receive no compensation for bearing the risks the NED poses. In fact, their burden is increased by potentially higher taxes and insurance rates, as well as lower property values. In addition, no New Yorker will get any of the gas or will benefit by lower gas prices, because it is most likely that Kinder Morgan's plan is to market the gas abroad.

I would appreciate your attention to this matter and thank you in advance for your help.

Adeline R. Styno  
8 Parkview Ct  
Troy, NY 12180

*{drawing, not reproduced here}*

FERC Scoping meeting July 29, 2015 NED PROJECT, Kinder Morgan Tenn Gas Project in Massachusetts

Thoughts on...the certificate of public convenience & necessity? And a fossil free future ...

NED does not qualify as public use because it depletes a national resource and contributes to climate change. Only 30% is slated for New England. Isn't this what we did to the Native Americans, took their land and gave them some trinkets I

The NED pipeline is dearly not wanted or needed in Massachusetts.

People want the scoping session restarted as we received the 6500+ pages a few days ago and there were over 10,000 TBD's...clearly we do not have all the material. This renders the scoping period null and void.

Most people spoke articulately and passionately at the July 29th FERC meeting, and talked about the obvious concerns ...the pipeline's potential issues... air, water, earth, vegetation, inhabitants, wildlife, history, safety, fire, police, terrorism, etc. Each of these issues has been clearly documented. Some Springfield labor union people stressed the need for jobs, certainly valid. We can all harp on all the negative issues that are well documented but we all know this pipeline would be a very poor decision for everyone (except the 1%ers), but especially for climate change. We are at a CRITICAL TIPPING POINT!

A better stance would be to move towards the right solution ...

We are transitioning to a fossil free fuel future, and we will need some gas to help with this transition.

1. SHOW DATA ABOUT ENERGY USE! A COMPREHENSIVE REPORT THAT SHOWS ALL THE PLUSES AND MINUSES of the energy we will need through 2030. Thank you Maura Healey!

2. INCENTIVES... CONSERVATION, INSULATION, SOLAR, WIND, and NEW BAmRY RESEARCH.

Conservation is easy and cheap, but people need daily reminders about - how and why to do it. Isn't Massachusetts the leader in tech research? Put our college kids onto a race to create energy storage batteries!

Hilary Clinton just came out with her goal of renewables supplying about 1/3 of our energy using solar by the end of her first term.

Extend generous energy efficiency measures and incentives to businesses and schools.

3. HAVE A TIERED RATE SYSTEM FOR ELECTRICITY...

1st TIER 400KWh @ a certain rate. Second TIER above 400KWh a higher rate, etc. so that people have an incentive to reduce their energy use.

4. FIX LEAKS IN EXISTING GAS PIPES,now!

5. JOB CREATION THROUGH INSULATION, SOLAR,and ENERY EFFICIENCY MEASURES.

6. SOME COUNTRIES AND STATES HAVE BANNED FRACKED GAS, how about ours!

7. Massachusetts needs to be a leader, we need to set the pace for our country, NOW!

8. No NEW PIPELINES •••ONLY, REPAIR OR EXPAND THE EXISTING PIPELINES.

LOOK TO THE FUTURE I OUR SUSTAINABLE FUTURE IS FOR EVERYONE. DO NOT GIVE IN TO THE CORPORTATE BULLIES, AS HAS BEEN DONE FOR TOO MANY YEARS!

Seems like common sense...not so common ...

Virginia Hastings, 30 North lane Northfield, MA 01360

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room IA  
Washington, DC 20426

RE: Northeast Energy Direct (NED) Project  
Federal Energy Regulatory Commission (FERC)  
Scoping Session, Lunenburg, MA

Dear Secretary Bose:

I am Andrew Sheehan, Town Administrator for the Town of Townsend, Massachusetts. I speak to you this evening as one of the co-chairmen of the Northeast Municipal Gas Pipeline Coalition (NMGPC). Our coalition is composed of duly appointed representatives of Ashby, Andover, Dracut, Dunstable, Groton, Littleton, Peabody, Pepperell, North Reading, Tewksbury, Townsend, and Wilmington, Massachusetts, and Brookline, New Hampshire. Coalition members include selectmen, town managers and administrators, and other municipal staff

The Coalition's mission is to gather knowledge and work collaboratively to provide representation and information to relevant government and public bodies concerning the proposed Kinder Morgan Pipeline Project and the Project's effects on our communities.

Over the past 14 months the member communities have become unified in their steadfast opposition to the Northeast Energy Direct Project. The overwhelming majority of member communities have joined the more than 70 towns and counties in Massachusetts, New Hampshire, and New York in passing resolutions in opposition to the Project. In Townsend, the Special Town Meeting on July 31, 2014 voted unanimously to instruct its Board of Selectmen to oppose the Pmject.

The Coalition is concerned that the Project is moving too rapidly. On July 24 Kinder Morgan released updated resource reports that remain woefully incomplete. By one count there are more than 10,000 TBD's —to be determined. Ifthe proponent cannot answer relevant questions then how can the affected communities and FERC fully evaluate the impact of the project.

Coalition members share significant concerns about all aspects of the Project, including the impact of con-

struction activities, impacts of operations on rare and endangered species habitat, protected open space subject to Article 97 of the Massachusetts Constitution, water resources, and forests and farm land. We question the need for the capacity the Project will provide, its impact on air quality and greenhouse gas emissions, and historic and archeological resources. We share with the homeowners of our towns the concern about falling real estate values and the subsequent impact on tax revenues.

With the above noted comments in mind, I hereby respectfully request that FERC delay the completion of the proceedings until October 2015 when the Massachusetts Attorney General will release her independent study on electricity reliability and capacity needs of the pipeline, and determine if the NED Project is the most cost-effective means of meeting the energy requirements of the Commonwealth.

We are keenly aware of the pitfalls and unintended consequences of large projects such as this one. We request that FERC schedule additional scoping meetings to be held after Labor Day, after Kinder Morgan provides complete information on the Project, after all relevant bodies have had a chance to review the Project information, and after the Attorney General has issued her study. We cannot fully comprehend the impacts of the Project until these significant issues have been addressed.

Thank you for the opportunity to speak on behalf of the Northeast Municipal Gas Pipeline Coalition and for coming to Lunenburg this evening.

Very truly yours,

Andrew J. Sheehan

August 10, 2015

Dear Senator Shaheen,

We are writing to oppose the pipeline proposed by Kinder Morgan. The Northeast Energy Direct (NED) pipeline will bring no benefit to New Hampshire.

It feels like the negative effects of this pipeline do not matter to elected officials. Well it matters to all of us who are being asked to live near a compressor station's hub of noise, light pollution, toxic chemicals and frequent "blow downs."

Not only are homes affected, but the compressor station is proposed to go near Temple School where children are. We can prevent the compressor station going in New Ipswich if we find endangered species of animals living there — well isn't this endangering our children of New Hampshire who will be exposed to the harmful effects of this compression station! What if it blows up? I ask you, are children no longer valuable in the eyes of the American government?

If you want this to go through we highly recommend that in your agreement with Kinder Morgan they must offer to buy out the Temple School and the homes in the "burn zone" for fair market value if the owner wishes to sell! If you don't do this all homes will become worthless, it won't sell for fair market value and many people will eventually have to walk away with nothing — because home owners in the burn zone will not be able to live in the type of safe, clean environment that everyone in New Hampshire is entitled to!

After doing the research I am convinced the pipeline construction process will pollute our air, contaminate our aquifers, wells and other water resources. Over 800 NH families will lose their homes and it will destroy conservation lands. It will harm the tourist industry and rural character of New Hampshire. Stand up and stop the greed of Kinder Morgan from ruining our way of life!

Thank you for your consideration,

Most sincerely,

Roger & Joan Crooker

Project Docket Number: PF14-22-000

Dear Secretary Bose,

The Department of Resources and Economic Development requests to participate in the preparation of the Environmental Impact Statement for the proposed Northeast Energy Direct Project. The Department has two interests; first the proposed pipeline crosses state owned lands and/or crosses lands that are encumbered by easements held by the Department. Secondly, the Department's Natural Heritage Bureau was contacted to provide the occurrence of any threatened or endangered species, candidate species and/or their critical habitats within the project area. In addition a data check provided by the Bureau is required for wetlands permitting and the Bureau consults with the NH Fish and Game and the Department of Environmental Services on permit conditions for the avoidance, minimization and mitigation of impact.

Contacts for the project will be:

William Carpenter, Land Agent, Division of Forests and Lands

Sabrina Stanwood, Administrator, Natural Heritage Bureau

Eric Feldbaum, Program Specialist, Community Recreation Office

Sincerely,

Jeffrey J. Rose

Commissioner

Subject: Tennessee Gas Pipeline Company  
Known as Northeast Energy Direct Project  
FERC Docket No. PF14-22-000

Dear Ms. Bose,

The proposed 12 inch "lateral" pipeline planned to cross our property, through our "Hay Field", will have a dramatic long-term negative impact on the entire field as the entire field has been designated for storage of material and heavy equipment during construction by the Pipeline Company. The impact will damage the top soil by the heavy equipment and we will lose revenue over an unknown number of years after completion of the construction.

According to Mr. Chipman, a representative of Tennessee Gas, they plan to "strip the top soil from the entire field so that their equipment will not become bogged down in mud". We have little faith in Kinder-Morgan's promise to restore the property because a similar project in Lunenburg, Massachusetts a few years ago, left farmland covered with so many large stones that farmers could not use their equipment. Kinder-Morgan has not responded to requests from town officials to rectify the situation.

Our major concerns:

1. Our septic leach field is located in this field
2. Loss of income from our hay crop for an unknown number of years
3. Willard Brook runs through our property. To run the pipeline under the brook, mature trees will have to be cut on both sides causing an erosion problem during Spring flooding
4. The negative impact of the pipeline construction and long-term effects on the Town's environment and recreational areas. Other companies have proposals for our area that are more acceptable.
5. Our soil is very rocky and any blasting would produce a problem with Radon Gas

We ask that FERC deny permission for the Kinder-Morgan Pipeline project.

Sincerely,

Edward C. Dow  
Homeowner

888 First Street, N.E.  
Washington, DC 20426

Attention: Kimberly D. Bose, Secretary FERC  
Docket 11 PF14-22  
Northeast Energy Direct Project

Dear Kimberly D. Bose,

I am expressing my concerns with regards to Tenn. Kinder Morgan's proposal to install a 30-36 inch pipeline having a 23,000 HP compression station in our Town of Dracut, which lies 1 mile from my residence. My utmost concern is the great DESTRUCTIVE IMPACT this will have in my town of Dracut Ma, pertaining to the environment, the wetlands, wildlife areas, farmlands, the High Noise pollution that would be very present 24/7 eminent domain issues, air pollution, and yes the "blow downs" producing air-borne chemical particles, potential contaminant water from may it be a leak or complete Blow and this WILL happen as to when, no-one knows, and lastly health issues cancer, cardio-pulmonary, and chronic lung diseases caused by the emitting of gas in the atmosphere, and fracking when and if this project develops. Hopefully your final decision AVOIDS Tenn. Kinder Morgan from proceeding with this project.

I am sure and it's plain to see from all the correspondences, letters electronic emails of grievances from town residences, town selectmen across the Mass, and NH, states the EPA, Lawmakers from those districts, the Natural Resources Conservation Committees, the USDA, Mass. Farm Bureau Federation, Mass. Pipeline Awareness Networks and all those establish Town Pipeline Awareness Organisations within towns of these

states that WE DO NOT WANT THIS PIPELINE PROJECT going through because of the many ramifications behind this pipeline project, need I state these facts its very obviously stated within those grievances you have received from all departments under your jurisdiction.

This project is and seems solely for the sake of "Profit and Greed" and future increase in stocks for those stockholders benefits. Tenn. Kinder Morgan seeks to gain new customers, provide more power to existing Grid facilities, and sell to Canada and foreign markets Europe or Asia.

There is NO benefit to Town of Dracut, from Tenn. Kinder Morgan's project We have adequate amounts of gas to sustain our heat even during the Peak times of winter season.

Building of this compression stations would only be like an Artery station with branches jeffing out to Canada, overseas gas and foreign markets. A major Win Win for Tenn. Kinder Morgan.

Everybody reads, views videos, have socialmedia see TV journalisms of Green- House gas warniugs each and eveiy day from fossil fuel destruction namely Gas, Oil, and Electricity. The continued use of these fossil fuels is devastating to our planet. We continue to have problems of drought in areas within the U.S. and all over the world, we continue to have melt-downs of our glaciers, and high rise coastal waters and devastating uncontiuifiable weather changes It's very very obvious that we need to do something. We have succeeded with Solar and Wind turbines even during trial testings. Gas pipelines are toxic industrial infrastru ctu res.

STOPPING, one of these major sources Gas, and the continued building of compression stations WILL HELP our planet. It's a solution.

The Town of Dracut is a veiy pristine community with an abundance of wildlife, conservation wetlands, growing farmlands who supply residents sources of produce and a town that's cherished by all who reside here. Gas pipelines, and compression stations will expel and destroy our beautiful town immensely.

Finally, your decision to DENY a permit to Tenn. Kindle Morgan would be morally justified.

Thank you respectfully,

Deb Prud'homme

Re: Docket No. PF14-22-000

August 5, 2015

Ms. Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First St NE, Room 1A  
Washington DC 20426

Enclosed is the statement to the Federal Energy Regulatory Commission from the Amherst MA and the Northampton MA League of Women Voters regarding the proposed Tennessee Gas Pipeline Northeast Direct Project, Docket No. PF14-22-000.

We urge the Federal Energy Regulatory Commission to extend the deadline for submitting comments beyond August 31, 2015, in order to allow the affected communities adequate time to respond to the very delayed release of the Kinder Morgan Report issued July 24, 2015. The League believes in an open government that is representative, accountable, and responsive. The League works to protect the citizen's right to know and to facilitate citizen participation in government decision-making.

Amherst League of Women Voters, P.O. Box 2372, Amherst MA 01004  
Northampton Area League of Women Voters, P.O. Box 39, Leeds MA 01053

-----  
Statement to the Federal Energy Regulatory Commission July 29, 2015

**The Amherst and the Northampton League of Women Voters Oppose Construction of the Proposed Kinder Morgan / Tennessee Gas Company (TGP) Pipeline**

## **Environmental Damage Is Severe**

Construction of the proposed TGP pipeline would cut an environmentally destructive path across productive farmland, forests, and conservation land in western Massachusetts, as well as residential communities. It would also lock in dependence on fracked natural gas for many decades, contrary to the long-term environmental goal of reducing greenhouse gases.

## **The Pipeline Is Designed for Export**

The large diameter and high capacity of the proposed pipeline far exceed even the highest projected future demand for natural gas in Massachusetts. The pipeline would link the Marcellus shale gas fields in Pennsylvania with the Maritimes and Northeast Pipeline to Canada. These facts indicate that the main purpose of the proposed pipeline is for exporting Marcellus shale gas, not for serving Massachusetts needs.

Thus, any tax or tariff imposed on Massachusetts ratepayers in order to pay for the pipeline would be subsidizing a private, for-profit enterprise, with only minor benefit to residents of Massachusetts.

## **Need for Pipeline has not been Established**

The Synapse Report projected a potential shortfall in future electricity generation capacity in Massachusetts only for peak demand on certain days of the year. The Report has been criticized for not adequately taking into account future benefits from improved energy efficiencies, as well as the growth of renewable sources. Moreover, ISO-NE has expressed concern about over-reliance on natural gas as the primary means of electricity generation.

The League believes that energy conservation and renewable energy are the first priority for meeting future energy needs — green buildings, energy efficient appliances, flattening peak energy demand, wind generation, etc. and that more can be done to reduce reliance on fossil fuel sources.

## **Future Energy Requirements Must be Analysed**

Before undertaking any new natural gas pipeline construction project, objective analysis of Massachusetts future energy needs must be carried out, taking into account trends in energy conservation and growth of renewable energy sources. Would investment in energy storage for variable energy sources (wind, solar) be more cost effective than the proposed pipeline?

## **Existing Pipeline Infrastructure Must be Reviewed**

An independent analysis of existing gas pipeline infrastructure must be conducted, including capacity of the Northampton Lateral and Berkshire Gas local feedlines in Western Massachusetts. What prompted the sudden moratorium on new customers this year? Why is the upgraded Southwick Compressor Station suddenly inadequate?

Would smaller, less costly upgrades to the pipeline infrastructure in Massachusetts provide the modest additional capacity needed? How much could be gained from an aggressive leak detection campaign?

**We urge the FERC to delay any decision on the proposed TGP pipeline until the key studies have been completed:**

- Comprehensive environmental impact assessment**
- Analysis of future energy requirements in Massachusetts, fully incorporating improved energy efficiencies and projected growth in renewable energy**
- Independent analysis of existing gas pipeline infrastructure**

**The FERC decision must take into account the national goals of preserving the environment, reducing dependence on fossil fuels and protecting the rights of individuals.**

**The benefit of the proposed TGP pipeline to Massachusetts residents is negligible, the environmental and economic price high.**

The League supports environmentally sound policies that reduce energy growth rates emphasize energy conservation, and encourage the use of renewable resources. The League supports practices that preserve the

physical chemical, and biological integrity of the ecosystem, with maximum protection of public health and the environment

The League of Women Voters is a nonpartisan organization that encourages informed and active participation in government. The League comments publicly on issues when these issues are relevant to published local, state, or national positions. League positions are established after League members study issues and there is general consensus among members.

Re: Tennessee Gas Pipeline Company, L.L.C.

Proposed Northeast Energy Direct Project, FERC Docket No. PF14-22-000

Dear Secretary Bose,

The Town of Warwick, MA Conservation Commission (ConCom) hereby notifies FERC of its great concern on Compressor Station (CS) in Franklin County, the erection of which is proposed by Tennessee Gas Pipeline Company, LLC (TGP).

The Warwick ConCom is responsible for the protection of the Town's natural resources as well as administering the Massachusetts Wetland Protection Act. Some of the Conservation Commission's jurisdiction overlaps interests that are subject to review under several federal laws including the Clean Water Act, Clean Air Act, and the Endangered Species Act. The Warwick ConCom also reviews projects which require review by the Massachusetts Natural Heritage and Endangered Species Program under provisions of the Massachusetts Endangered Species Act.

TGP has proposed to locate the CS in Northfield, MA, our neighboring town. Proposed location is adjoining Warwick State Forest (see the document "Compressor station Locations— Aerial Maps", 06/01/2015). Said CS will be powered by several extremely large gas turbine engines 120,000 HP in total (see pages 1-23 and 1-25 of Draft Environmental report/Resource report 1, 11/2014). There are very few, if any, compressor stations of such a scale in the country. More than 97% of the stations, currently working in the USA are less than 60,000 HP.

Negative influences from natural gas CS, including noise, air and water contamination to natural resources, are well documented. Since these structures are a major source of broadband noise pollution and methane emission across the US landscape, their environmental impacts have been specially studied by many scientists. There is stark and well proven evidence that CS functioning removes wildlife habitat, alters connectivity, causes mortality, and introduces ecological pollutants. The format of this letter prevents us from wide citation of special studies performed around tens of CS sites. Just 3 examples:

~ Insects, birds and mammal densities decline in close vicinity and significantly deteriorate within 5 km zones of compressor stations sites (C. Solomon. When Birds Squawk, Other Species Seem to Listen. New York Times, May 18, 2015);

~ Bat species activity level decrease over 70%, even due to considerably low-intensive constant noise of 50-75 dB, produced by small scale compressor stations (J. P. Bunkley et al. Anthropogenic noise alters bat activity levels and echolocation calls, *Global Ecology and Conservation*, 3 (2015), p. 62—71);

~ Floral resources are significantly suffer from methane emission, which rate had been measured as 1.7+ 0.2 SCFM from the lowest emitting site to 880+ 120 SCFM from the highest emitting site (R. Subramanian et al. Methane Emissions from Natural Gas Compressor Stations in the Transmission and Storage Sector: Measurements and Comparisons with the EPA Greenhouse Gas Reporting Program Protocol. *Environmental Science and technology*, 49, 2015, p. 3252—3261).

We would like to stress that such terrifying findings were made during the studies of CS, which are by far less powerful than the scale of 80,000 - 120,000 HP Franklin County compressor station, proposed by TGP.

Over half the land area of the Town of Warwick is comprised of mostly contiguous lands under public and private ownership —including State Forests, Wildlife Management Areas, and land under conservation restrictions held by state agencies, town, and public land trusts —all of which are protected under Article 97 of the Massachusetts Constitution. The majority of this land was conserved in perpetuity using federal and state funds. This large landscape, which stretches into adjacent towns and beyond, provides unbroken habitat for wildlife and delivers a corridor for species migration and diffusion. Warwick State Forest has many wetland resource areas, streams, freshwater wetlands, and groundwater resources used by the public. There are tens of certified vernal pools in Warwick State Forest and, in particular, near proposed CS location. Many wetland resource areas in the Town of Warwick are still not mapped or catalogued in generally available map layers and databases. ConCom continuously finds new vernal pools in Warwick. The latest letter with three vernal pools certification had been received from Massachusetts Natural Heritage and Endangered Species Program just two weeks ago.

Based upon prior experience, ConCom believes that there are populations of species listed under the federal Endangered Species Act and the Massachusetts Endangered Species Act in the Town of Warwick.

The Warwick ConCom is deeply concerned that the establishment of a super powerful natural gas CS in close vicinity of the State Forest will result in unbearable damage to natural recourses of the Town of Warwick. In particular, we are alarmed about the environmental impacts from air/water pollution to water resources and wetlands, as well as from air pollution, noise and odor to vegetation and wildlife. The cumulative impact to the unique non-fragmented protected land can be huge and irreversible.

The Warwick ConCom believes that under any circumstances CS site should not be situatal closer than four miles (5 km) to protected land per the studies.

It is generally known that there are tools available now for avoiding, minimizing and mitigating impacts of this kind. Among them are: extensive implementation of soundproof technologies and materials, use of electric motors instead of turbines, erection of small stations instead of a super large one, etc.

Warwick ConCom is very concerned about proposed pipeline wetland crossings within Warwick. We have several certified vernal pools in the vicinity of the proposed pipeline route. The excavation and other construction activity will very likely destroy these habitats, which are protected under Massachusetts and Federal laws, including the current Massachusetts General Permit of the Federal Clean Water Act (03/09/2015).

In light of the above The Town of Warwick, MA Conservation Commission request to be included in environmental mailing list for this project. Information request for EIS draft is enclosed to this letter. We intend to become an Intervenor to the project and ask to be kept informed about the application process.

Sincerely on the behalf of the Commission,

Gregory Brodski, Co-Chair

Comments to the FERC, August 11, 2015, Dracut, MA

Re the Kinder Morgan/ Tenn. Gas/Northeast Direct Natural

Thank you for the opportunity to give testimony. I am Alix Dricocol of Andover representing the **Andover Conservation Commission**.

#### **Introductory Comments**

We await the Attorney General’s study of Massachusetts energy needs and support her decision to initiate the study.

We have grave concerns about the cumulative environmental effects of the Lynnfield Lateral in Andover and in the entire Menimack Valley, and the entire pipeline.

#### **Constitutional questions about permanently protected open space and the environment**

The pipeline will damage at least five parcels of Chapter 97 permanently protected open space in Andover, and damage tens of thousands of similarly protected acres across the state. They are protected by the Massachusetts Constitution, the oldest functioning constitution in the world.

“The people shall have a right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water and air and other natural resources is hereby declared to be a public purpose.” Art. XCVII.

#### **Endangered Species:**

The entire Merrimack River in Andover is Priority Habitat for Rare Species and Estimated Habitat for Rare

Wildlife.

Parts of the east side of the Shawsheen River including the river's floodplain and upland is Priority Habitat for Rare Species in the Lowell Junction area.

### **Water quality and pollution**

Merrimack River, an interstate river to the Gulf of Maine which is now Class B from Class D after four decades of cleanup. It is in danger of pollution from the churning up of historic contaminants including mercury and other chemicals from 400 years of industry upstream. The drilling medium is hazardous.

### **Economic Justice and Water Quality**

The proposed crossing of the Merrimack is just upstream from the water intake for the City of Lawrence, the poorest municipality in the Commonwealth. The Lawrence Water Department obtains its water from the Merrimack River. "A susceptibility ranking of high was assigned to this system using the information collected by the DEP" because there is already one high threat land use within the water supply protection area. The drinking water for Andover and Methuen and all towns downstream to the ocean are also threatened due to water intakes downstream from the proposed Merrimack River crossing.

### **Noise Pollution, Air Pollution and Blow Downs**

The proposed compressor in Diacut, MA across the Merrimack River will be the largest east of the Mississippi. The monthly or more frequent blow downs will roar with the intensity of a jet plane engine. This noise pollution will disturb tens of thousands of Merrimack Valley residents, including those in Andover. The gases and other matter that are expelled will pollute the air in the Merrimack Valley.

### **Wetlands**

The Andover Conservation Commission and all the Commissions along the proposed route are charged by state and local laws to protect wetlands, a public good. The pipeline will cross and damage substantial wetlands on five town-owned permanently protected reservations in Andover plus extensive wetlands on many private homesites in town. It will cross two major rivers, the Merrimack and Shawsheen and riverfronts protected by local state and federal laws. The damage to the steep slopes at the Merrimack River crossing and deforestation will lead to erosion and water quality damage.

### **Safety**

The velocity radius for 24 inch pipeline is 640 feet for explosions, thus putting the hundreds of citizens, homes and sensitive sites in the danger zone. In addition a plan is required to train first responders and a source of funds to pay for their training. To put in context, the pressure in the proposed 24 inch pipeline through Andover is 1460 psi; a pipeline in the street is 10-20 psi.

"Throughout the U.S. since 2003, Kinder Morgan and its subsidiaries' pipelines have been [28] responsible for at least 180 spills, evacuations, explosions, fires, and fatalities in 24 states. Some notable examples (including spills in Canada)": PHMSA Pipeline Safety State Pages at

<http://primis.phmsa.dot.gov/comm/States.htm?nocache=3971>.

### **Conclusion**

We urge FERC to take the cumulative effects of damage to wetlands, and protected Article 97 reservations, endangered species, river crossings, plus drinking water contamination, noise pollution, air pollution and public safety into account as decide whether to grant a certificate of "need and necessity" to Kinder Morgan/Tenn Gas. The latest Resource Reports have been available for 18 days with not adequate time for the public to study in depth. There are an alarming number of TBDs and constant changes.

PF14-22, Kinder Morgan/Tenn. Gas/Northeast Direct

Alix Driscoll

Town of Andover, MA Conservation Commissioner

**20150817-5007**

Jan A. Griska, Rindge, NH.

Dear Senators Ayotte, Shaheen and Representative Kuster,

The Need For a Third Scoping Session:

I sent an email to Eric Tomasi (FERC's Environmental Project Manager for the NED Pipeline) on 6/2/2015, making a case for a Scoping Session in Rindge. My final statement in the email was that I was beginning to feel the regulatory process under FERC was a farce. I also sent a copy of the same email to FERC's ecomments. I received a confirmation on that ecomment, so I know they got it.

The newly scheduled open houses are a sorry excuse for being transparent. They do however, satisfy the request of all of our legislators that Kinder Morgan listen to us.

Time has moved on, a FERC mailed document and articles in our local papers told us that there would be a Scoping Session in Nashua and Milford and a TBD session in the Winchester area. So, hope springs eternal; the Monadnock Region, felt we were finally going to get a chance to voice our concerns.

Much letter writing to Concord and Washington about the need for more time and a third Scoping Session in the Monadnock Region, prompted Eric Tomasi to tell the assembled people in Nashua that there would definitely be a third session in the Monadnock Region. Hopes soared, our government was going to work for us.

The next day, at the Milford Scoping Session, Eric Tomasi made no announcement about a third Scoping session in the Monadnock Region. This prompted my wife to ask Eric why he did not tell the Milford crowd that a third session was being scheduled, Eric got evasive and wouldn't give her a straight answer. My guess is the bureaucrats in Washington felt the storm had blown over, they had heard quite enough objections to this pipeline and they could move on to business as usual.

I should note at this point, that people were turned away at the Milford Scoping Session because the town hall was full.

I hope this letter, email, ecomment etc. is making people angry, I'm tired of big money politics, petro-dollars, a government managed by lobbyists, and an organization masquerading as a regulatory body telling us we have to live with a project that has a cost, but no benefit...

I've been fighting this project since December of 2014, please help me make this effort worthwhile. Please write to your Representatives and Senators, the Governor, our Executive Council, Representatives and Senators in Washington, FERC, most of all, my and Executive Councilor David Wheeler's favorite bureaucrat Mr. Eric Tomasi. My hope is that everyone will send so many posting, by whatever is your preferred method, that they are still digging out of it next July.

Before I go any further, please note Eric's email address: eric.tomasi@FERC.gov

Please feel free to use the text of this message if it in any way that will help you communicate your concern to our government and the media. Social Media oriented folks, have at it...

Citizens of New Hampshire, let's make General John and Molly Stark proud of what we are doing here in New Hampshire in the 21st century.

Thank you,

Jan A. Griska  
Rindge, NH.

**20150817-5011**

Michael J Barrett, Temple, NH.

August 15, 2015

Norman C. Bay, Chairman

Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE: Docket No. PF14-22-000

Dear Chairman Bay:

I respectfully request that the Federal Energy Regulatory Commission reject Tennessee Gas Pipeline Company's proposed Northeast Energy Direct (NED) Project. I base this request upon the following:

1. The pipeline and compressor station are located too close to Our Lady of Hope, our religious facility. This high-pressure, high-capacity station will bring significant human safety risks to our Sisters living there.
2. The pipeline and compressor station are located too close to a farm containing Newfoundland ponies, an endangered animal. There are only 250 left on earth.
3. The pipeline and compressor station are located too close an annual migration path of thousands of raptors. The high-pressure, high-capacity station's exhaust plumes of heated gases will bring significant safety risks to these birds.
4. The pipeline and compressor station are located too close to a school whose heating system uses outside air to heat the facility. This high-pressure, high-capacity station will bring significant human safety risks to our teachers and children attending the school.
5. The pipeline and compressor station are located too close to our water supplies, parks, and conserved land and will bring significant environmental hazards.
6. FERC has already approved another pipeline to satisfy New England's natural gas-fired electric generation needs on the coldest days. We don't appreciate the need to add more supply.
7. The particular gas that would be carried in the proposed pipeline is likely to be particularly high in toxins and radiation, and the health impact upon our families, animals and plants must be avoided.
8. The proposed pipeline route requires a new right-of-way that would cut through many miles of environmentally sensitive areas and take permanently protected land out of that protection.
9. Some "fracking" compounds and chemicals negatively impact the skin, eyes, sensory organs, the respiratory system, the gastrointestinal system, the liver; the nervous system; and are candidate endocrine disrupting chemicals. Endocrine disrupting chemicals (EDCs) present unique hazards, particularly during fetal and early childhood growth and development. We do not want to be exposed to any of these chemicals.

Respectfully submitted,

Name: Michael Barrett Address: 24 Twillingate Road, Temple, NH 03084

## **20150817-5012**

evelyn taylor, New Ipswich, NH.

Kentucky made great strides and supported human rights by denying eminent domain for projects that do not serve the public good. I am in New Ipswich, NH, in the 1/2 mile radius from the proposed compressor station for NED and have been saying all along that Kinder Morgan has no right to use eminent domain or douse us with toxins or keep us from life-essential sleep and water and the ability to breath the air around our homes without ingesting biological toxins. The FERC has no legal choice other than to reject this pipeline as it includes use of torture to garner private profit. If the FERC fails to reject this pipeline, the FERC is also participating in human rights violations as you have been forwarned over and over again. must say no or you are also exercising proliferation of torture and The only just decision to this pipeline is NO BUILD and no alternative. There is no compromise for torture. This has to be a NO BUILD decision by FERC.

### 20150817-5013

Evelyn Taylor, New Ipswich, NH.

There are millions of miles of gas and oil pipelines in the United States. Those that are buried are left to disintegrate and release biological toxic waste not only along the pipeline itself, but to then travel beyond the borders of the pipeline. The FERC is not standing up to its responsibility to keep pipelines safe. This problem will result in mass destruction of fresh water drinking supplies to millions of people. Where will these violating companies get bottled water for so many? Bottled water is destructive in of itself and where would such large supplies be drawn from and how will so much demand possibly be serviced? I demand FERC take control and regulate as they should as they are responsible for creating these conditions by approving submissions and usurping subsequent responsibility to protect the public.

### 20150817-5015

Margaret Viglione, Greenville, NH.

Re: Tennessee Gas Pipeline Company, L.L.C. (“TGP”)

Docket No. PF14-22-000: Proposed Northeast Energy Direct (“NED”)

I am writing to request that you take any and all measures available to stringently review and honestly evaluate the proposed Tennessee Gas/NED pipeline project. As a resident of Greenville, NH, a town affected by the proposed pipeline, I have grave concerns about this project, including:

- The Public Utilities Commission’s paid consultant, Melissa Whitten, strongly stated that Kinder Morgan could not demonstrate the required need for this project. The only substantial contract in NH is with Liberty Utilities, a conveniently fabricated “customer” and a Kinder Morgan subsidiary. NH is currently a net exporter of electricity so the claimed need for extra natural gas to increase electricity production is spurious. No NEED.
- New Hampshire would not be the recipient of any significant portion of the gas, and in fact, only about 4% of New Hampshire residents use natural gas. No BENEFIT.
- Most of the gas is intended for export overseas or to Canada where gas prices are higher, providing huge financial benefit only to Kinder Morgan. To accomplish this they will illegally use eminent domain to usurp NH homes and land. Then those affected will be asked to pay for this pipeline through higher utility rates.
- Negative impacts would be severe on the safety, health and welfare of NH citizens, the ecosystem as well as the economy of the region. NH communities have a historic commitment to the environment and have actively worked to place significant portions of pristine wilderness into conservation trust. This pipeline would jeopardize many of these fragile watersheds and ecosystems as well as the water supplies of NH towns. Kinder Morgan sees “empty space” ripe for their picking and destruction. We see the natural beauty, wildlife and clean air and water that make NH unique and precious. Pipelines and compressor stations are exempt from Clean Air and Clean Water laws, allowing them to spew hazardous fumes into the air without regard for health consequences to people, farms, gardens, livestock and wildlife. This is unacceptable.
- Existing pipelines owned by Portland Gas or Spectra could easily handle any projected needs for natural gas in the state without additional damage to property and ecosystems.
- Kinder Morgan cannot guarantee the safety of their pipelines or compression stations and has a long history of safety “incidents,” poor honesty and transparency, failure to perform required maintenance procedures and slow response to emergencies. Their remote monitoring facility is capable of detecting pipeline leaks only after a leak of greater than 150,000 gallons. This in no way provides adequate monitoring for public safety. Local emergency services are not prepared for or able to handle a pipeline or compressor station emergency and the requirement to do so would place a severe financial burden on affected towns already struggling to balance budgets.
- Current projections indicate that the Marcellus shale may only produce significant output for somewhere between 10 and 20 years, with some estimates as low as 8 years. Affected communities will then be left

with an abandoned, toxic, obsolete pipeline still requiring tariff payments.

- Investment of taxpayer dollars in non-renewable energy strategies and infrastructure which will be outdated within 20-25 years shows poor vision for future energy solutions for New Hampshire as well as globally.

I respectfully ask that you rise to the charge of seeing that ‘the common good’ means we use restraint against an industry that wants to burn as much fossil fuel as it can, as fast as it can for their own private profit at the total expense of NH citizens. Neither NH nor the US will have time to create sustainable technologies if we continue to permit redundant pipelines like NED. The NED plan goes against the public interest. We ask you to refocus your mission and act as a good steward for the energy environment we face today and into the future by working to stop this pipeline project.

Thank you very much,

Margaret Viglione

### **20150817-5016**

Linda Hastings, Nassau, NY.

Please HELP US! Please do not let Kinder Morgan and Tennessee Gas Company ruin our lives, our health, our community, our forests, our economy, the infrastructure of Rensselaer and our future well being.

Kinder Morgan wants to make money at any costs. We want to live, breathe the fresh air and enjoy the peaceful quiet of trees, flowers, birds and animals in an area that we paid our hard-earned money to buy. None of us would have bought here if we had known that these companies were going to come in with their trucks, explosives, dangerously thin pipelines with explosive gas forced through them right in our back yards. Would you want your loved ones put in the constant danger of being burned alive or have them die from their asthma made worse by the pollution?

The pipeline will leak fracked gas containing toxic chemicals that threaten our health and that of our families, neighbors and communities. Damage to the environment (soil, air and water) will result from pipeline construction and leaking gas. Our forests, streams, rivers, wells, groundwater and aquifers are at risk of being polluted. What about the contamination of our wells, gardens and farms? In addition, the gas is methane which is a damaging greenhouse gas.

Both Kinder Morgan and Tennessee Gas have very bad histories of not maintaining their equipment and there are no protections put in place. In Pennsylvania where they have already been accused of causing earthquakes, their answer was for the people “to just live with it”. THEY JUST DO NOT CARE about anything but money.

Local homeowners may be forced to give the companies a right of way but the homeowners will remain responsible for taxes on the property. Homeowners will not be able to sell the property because no one would buy it. We will have land we cannot live on, pay taxes on it but not be able to sell it because any property value will be gone.

All or most the gas will be for export and sale on the international market which will drive up the price we are paying for gas here. This is definitely not the the common good. It is not for our benefit. It is only for the good of Kinder Morgan. We would not want this pipeline in our backyards for any price. We are being used. My understanding is that they will even be using our tax money to pay for this. HELP!

### **20150817-5018**

James R. Kowalsky, Fitzwilliam, NH.

Will compressors in compressor stations along this pipeline be constructed to be completely enclosed so as to limit the amount of noise emitted beyond the compressor station property? What is the maximum allowed noise level at the edge of the compressor station property? Who will police the allowed noise level and to whom can complaints be made if noise levels are exceeded?

**20150817-5019**

James R. Kowalsky, Fitzwilliam, NH.

Can you assure the people all along the route of this pipeline that once the pipeline is in operation that noise levels at the right of way will be no greater that they are today without the pipeline? If you cannot, then I suggest the cost of construction does not reflect the true cost of this pipeline. What is the maximum allowed noise level at the right of way when the pipeline is in operation?

**20150817-5020**

Lisa Derby Oden, New Ipswich, NH.

Kinder Morgan is not honest in how it portrays this project to the public. View this news clip where their PR person in NH states that they have 70,000 miles of pipeline across NH that they have been operating safely for many years. <http://www.nh1.com/news/new-ipswich-proposed-pipeline-compressor-station-has-one-family-ready-to-pack-up-and-leave/>

Kinder Morgan states that it “owns an interest in or operate approximately 84,000 miles of pipelines” on its website. So the spokesperson, Tiffany Eddy, misled the public to believe that their presence here in NH is much greater than it is, as well as focusing on the safety over those 70,000 miles. Saying that your safety record is good over about 100 miles of pipeline that they own in NH is a much different picture than saying safety over 70,000 miles.

**20150817-5023**

Cynthia Lawton-Singer, Conway, MA.

The NED pipeline project is not a solution to anything. It will CREATE more problems by far than it solves.

“Climate Change is the mother of all battles. If we don’t win this one, all the others may not really matter.”(NRDC –President Rhea Suh)

Like you I want to keep this country strong, keep our economy sound and give our children a future full of promise and opportunity. That is precisely why we need to begin to address climate change now.

The Environment is global. What we do here affects the entire planet. Half of the industrial carbon emissions have been released since 1988. That trend needs to shift and fast. This New England Direct (NED) Gas Pipeline is exactly the type of project we MUST abandon and replace with investments instead in renewable infrastructure.

Lies and doubt are sewed by scientists whose research and speeches are paid for by BP, Chevron, Peabody Energy, Conoco Phillips, Exxon Mobile, Shell, The Koch Brothers, The American Petroleum Institute and probably Kinder -Morgan and others who specialize in fossil fuel infrastructure.

Citizens like myself are not won over by their misleading tidbits meant to keep us from taking action. The actions we clearly need to take IMMEDIATELY as a society in crisis, is to replace our use of fossil fuels with renewable energy, renewable infrastructure and conservative living practices not based on excessive consumption.

The job growth rate in the solar sector is 20x faster than the overall job growth rate (2014). Every 2.8 minutes another rooftop solar home project was completed. The US now has the equivalent of six nuclear power plants worth of solar capacity installed. Solar is an increasingly important part of combatting dependence on fossil fuels, particularly for producing electricity. Electrical production accounts for the major amount of increased use of natural gas in Massachusetts. Install more windmills (Cape wind!) and rooftop solar on homes. People want to take actions like these. Renewables unfortunately do not enjoy the same level of subsidy support from our government as fossil fuels.

Shell oil has permission to drill in the Chukchi Sea of the Arctic; approval has been granted for drilling for oil off the East Coast. The Keystone pipeline is still being constructed despite the controversy over it. These

projects are all AGAINST THE WILL of the majority of people. Only the poorly informed, desperate, or those who will profit from these poorly thought projects are supporting them. They are based on short-term results and consistently IGNORE the long-term problems they create, WITH THE COSTS FOR THESE PROBLEMS ALWAYS PAID BY THE TAXPAYERS WHILE THE PROFITS ARE ENJOYED BY A TINY GROUP OF EXTRAVAGANTLY WEALTHY ELITES!

The insurance industry knows that climate change is real. Their premiums on property have gone up to reflect their assessments of increased risks. Our National Defense Planners know that climate change poses dramatic threats to our way of life, even our very existence in the future. Climate scientists world-wide, including the IPCC of the United Nations publishes reports on their collected data showing trends that become ever more frightening to read.

The extraction, transportation and burning of fossil fuels has numerous collateral damages that have been measured and studied. One result of natural gas is the leakage of methane. Ton for ton, Methane is 87x more potent a climate heating gas than CO2 during the initial 20 year period after release. The Obama Administration has recognized the importance and announced a plan to start cutting rampant methane pollution as much as a 45% cut over the next ten years.

The water cycle is one of the first casualties of human produced climate change. Increased moisture content in the air leading to increasingly heavy down pours during rain events and “Freak storms” are increasingly common. There has been a 71% increase in severe precipitation events in New England. These storms lead to property damage, crop destruction, and loss of life. Simultaneously, increased temperatures lead to droughts and severe fire seasons. Growing of traditional crops that we have come to rely on becomes increasingly difficult as we hit unpredictable extreme weather coupled with new patterns of insects and plant diseases as the climate changes. Ironically, Fossil fuels, including fracking, all rely heavily on water in order to be produced. A large majority of land glaciers are in dramatic retreat. Some of the world’s largest human populations depend on these glacial waters to feed rivers that they depend on for drinking water and agricultural irrigation. When there is no water, this will create refugees of very large populations. Melting glaciers also raise the sea level and cause low lying areas like New Orleans, New York City, London, and the nations of Bangladesh and Holland to see a dead end in their futures as they will be flooded.

Ocean acidification and warming also result from the greenhouse gases we have used. Ocean warming threatens to alter critical ocean circulation patterns that keep temperatures, weather and ecosystems functioning. Also the increased ocean temperature allows the huge volumes of methane trapped in frozen material in the continental shelves and in tundra to be released. Higher ocean temperatures lead to increased storm destructiveness. Acidification leads to ocean death as ecosystems collapse.

Arctic areas have experienced some of the most dramatic warming. The disappearance of sea ice from the Arctic poses threats to the lives of many keystone species such as the Polar Bear and the Walrus. Endangered populations lose their struggle to survive and we know that we have entered the sixth mass extinction on planet earth! If we reach tipping points, it is game over. If FERC says yes to projects like this one, that is exactly where we are headed. Those are scientific facts.

## **20150817-5026**

Denise Greenleaf, Merrimack, NH.

Kinder Morgan is trying to put a 30” fracked gas line through Merrimack, NH. It is going through our only water supply, underground wells. This is unacceptable. They claim this is to lower our gas and electricity rates, this is an outright lie. This dangerous gas is not for New England, it’s for export to China. It will pass through wetlands, protected forests, generations old farms, orchards, bogs, not to mention how many hard working families will lose their land or be forced to live in incineration zones.

Kinder Morgan’s pipelines are blowing up all over this country almost every week! They have a dismal safety record. Your complacency should weigh heavily in your hearts if you OK this atrocity.

Fracked gas is dangerous! It has been banned in some areas of this country, why should anyone be forced to

accept the air pollution as part of their every day life. How can people truly enjoy their homes waiting for what will inevitably happen? Any explosions will be on FERC's shoulders if you let this go through.

Kinder Morgan is just trying to line their own pockets, like they always do. I've read that FERC never goes against Kinder Morgan, no pipeline has ever been stopped by you. It's about time you join the 21st Century and forbid this outrageous farce to go on.

It's time for clean energy to take precedence over fossil fuels. DO THE RIGHT THING!!!  
SAY NO TO KINDER MORGAN !!!

#### **20150817-5027**

James R. Kowalsky, Fitzwilliam, NH.

As a citizen located within a couple of miles of this proposed pipeline I wish to express my opposition to this pipeline based on its potential environmental impact. I feel compelled to speak because I believe FERC and all other government agencies will consider not speaking as acquiesce. This project is one more insult, a raw open path, to an already fragmented and struggling ecosystem. Also, I do not believe that this project is necessary nor is it in the best interest of the region or for the common good. I do believe that it will make already wealthy people richer. Studies show that only 10% of the capacity of this pipeline is intended for regional use, none of it for local use. The majority is for export internationally that in the long run it will result in higher prices for fuel here at home.

#### **20150817-5029**

Joseph and Christine Sangermano, Dublin, NH.

August 15, 2015

Norman C. Bay, Chairman  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE: Docket No. PF14-22-000

Dear Chairman Bay

I respectfully request that the Federal Energy Regulatory Commission reject Tennessee Gas Pipeline Company's proposed Northeast Energy Direct (NED) Project. I base this request upon the following:

1. The Pipeline and compressor station are located too close to Our Lady of Hope, our religious facility. This high-pressure, high-capacity station will bring significant human safety risks to our sisters living there.
2. The pipeline and compressor station are located too close to a farm containing Newfoundland Ponies, an endangered animal. There are only 250 left on earth.
3. The pipeline and compressor station are located too close to an annual migration path of raptors. The high-pressure, high-capacity station's exhaust plumes of heated gases will bring significant safety risks to those birds.
4. The pipeline and compressor station are located too close to a school whose heating system uses outside air to heat the facility. This high-pressure, high-capacity station will bring significant human safety risks to our teachers and children attending the school.
5. The pipeline and compressor station are located too close to our water supplies, parks, and conserved land and will bring significant environmental hazards.
6. FERC has already approved another pipeline to satisfy New England's natural gas-fired electric generation needs on the coldest days. We don't appreciate the need to add more supply.
7. The particular gas that would be carried in the proposed pipeline is likely to be particularly high in toxins and radiation, and the health impact upon our families, animals and plants must be avoided.

8. The proposed pipeline route requires a new right-of-way that would cut through many miles of environmentally sensitive areas and take permanently protected land out of that protection.
9. Some “fracking” compounds and chemicals negatively impact the skin, eyes, sensory organs, the respiratory system, the gastrointestinal system, the liver, the nervous system and are candidate endocrine disrupting chemicals. Endocrine disrupting chemicals (EDCs) present unique hazards, particularly during fetal and early childhood growth and development. We do not want to be exposed to any of these chemicals.

Respectfully submitted,

Joseph and Christine Sangermano

164 Lower Jaffrey Road, Dublin, NH 03444

## **20150817-5031**

Anthony and Carole Giordano, Methuen, MA.

PLEASE NOTE THERE WAS A TYPO IN OUR ORIGNIAL eCOMMENT WHICH CHANGED THE MEANING.

THE CHANGE IS IN POINT 1.

Our names are Anthony and Carole Giordano and we live at 29 Copley Drive, Methuen, MA. We are writing because we are very concerned about the Kinder Morgan (Tennessee Pipeline, Co) Northeast Energy Direct Project.

On the Methuen Massachusetts map, we are located on the (yellow) study corridor (400 ft) and already have two (2) pipelines through our yard. A valve station is about 200 yards away on Maple Street. We believe that we have already been subject to enough stress having the two lines in our backyard.

We believe you need to study the following before allowing the project to go forward.

1. Is there a universal intent and legality of easements? One would assume the original easements were allowed for utilities to provide access to locals AND NOT for the purpose of exporting natural gas overseas. Are these easements enforceable in this situation?
2. At the Methuen meeting, the Kinder Morgan representatives stated that although they are not doing the project to enable potential exporting of gas, they are required by law to allow the gas drillers to use the pipeline to transport gas overseas, if they (drillers) so desire. What is the law and why should we and the Town of Methuen be subject to additional risk, with no benefit to us while allowing them to achieve large profits by exporting overseas?
3. Where is the demand for this additional gas? I questioned the Kinder Morgan representatives at a recent Town Meeting, and they couldn't give me an answer so I concluded verbally that it is “assumed” and they agreed. Is there a demand overseas? Certainly everyone in my town has had access to gas.
4. Please study the fact that my neighborhood (Homestead Acres) has entirely underground utilities: Comcast, Verizon, the city DPU, National Grid etc. All are constantly upgrading cables etc. and digging. They hire independent contractors who may have no experience with gas lines. One mistake and we have an “Incineration Zone,”
5. Please study home valuation effects and the possibility of the pipelines providing yearly compensation to maintain valuations. I recently suggested to Governor Ed Markey's office that homeowners involved should receive some type of substantial Federal Tax Credit for assuming this risk. It can be subsidized by charging the pipelines with a windfall profits tax for this. We are assuming risk for all potential users of natural gas and should be compensated if some way it is allowed...which we hope it isn't.
6. Please explain why Kinder Morgan said it could take 45 minutes to shut the gas off if there were an explosion and how is that acceptable?
7. Please study the fact that there has been a recent substantial drop in valuations of pipeline companies due to a decrease in drilling activity due to excess supply. Why then do we need another pipeline other than to ship overseas? Solar power is coming; appliances are much more efficient; etc.

8. Please determine what the benefit of this pipeline is to the City of Methuen? We assume the risks and additional costs for training personnel for the explosion danger. What is our benefit?
9. Finally, please determine the increased danger of explosions created by natural gas produced from fracking. The Kinder Morgan representatives had no answer as to why there are so many train (gas) explosions even though we all know that fracking gas is much more volatile. Do we want a company with its “head in the sand” and playing “mickey the dunce?” They are building these pipelines through our back yards while putting us all at risk. These are uncharted waters.
10. To build this pipeline through my yard, they must go through many, many acres of wetlands to get it done. Have you studied this?

In summary, do we want companies building these pipelines through our back yards putting us all at risk to enable the exporting of natural gas? There has to be and there is a better way because adding pipelines is not a solution....it is a problem.

Sincerely,

Anthony and Carole Giordano  
29 Copley Drive,  
Methuen, MA 01844

#### **20150817-5034**

SUSAN A DUHAMEL, NEW IPSWICH, NH.

I would like to see this project denied. It will contaminate our drinking water and air. We should not have this forced on us so that Kinder Morgan can make more money. I will continue to protest until you say no.

#### **20150817-5035**

Christine Erb, LANESBORO, MA.

Please issue a new Notice of Intent, so that affected communities can read the study undertaken by the Mass. Attorney General, regarding New England’s energy needs, and in addition, analyse Kinder-Morgan’s very recently released 6571-page Resource Report.

Please determine what chemicals will be released into the air, water and soil, during the venting or filtering processes.

Please determine what additional safety measures will be taken when the pipeline crosses our state-protected lands, both during the construction phase and afterwards.

Please study Kinder-Morgan’s plans in the event of an explosion: how they will assist local volunteer fire departments, compensate landowners, compensate for deaths and injuries, provide clean drinking water, remediate the destruction of wildlife, forests, wetlands, vernal pools, water supply, clean air, and vegetation.

Please require Kinder-Morgan to supply all environmental studies, who performed those studies, and how much they were paid, to the public.

Please identify all vernal pools, private wells, septic systems, wetlands, lakes, ponds, and streams within 500 yards of the pipeline, work area, or staging area, and the ways they will be protected.

Please address the effect the proposed pipeline will have on appraised property values within one mile of the route.

Please identify intended blasting zones, impacts on roads, and temporary construction areas.

Please identify where construction dust and periodic gas venting will flow, in the air, water, and soil.

Please identify species affected by continuous light and noise at the compressor stations.

I am opposed to this pipeline and feel it is not necessary to meet New England’s energy needs. We are being asked to pay for a pipeline for a private company’s profit through selling gas abroad, and this project risks

environmental degradation and public safety.

### 20150817-5036

James R. Kowalsky, Fitzwilliam, NH.

Fitzwilliam New Hampshire is one of several communities along the pipeline route that are being forced to host a metering station. I am sure you would have us believe that a metering station is some kind of passive device that once in place will be unnoticeable in the environment. However, a little research shows what our Texas neighbors, who are also hosting a metering station on a 30 inch pipe line are subjected to noise and emissions from the metering station every day. It cannot be that the emissions of sound, fluids and gases shown in the videos posted are legal and considered routine operation. Please review these videos and comment on what is shown. Is this what we can expect from a metering station operation? Would you accept this in your neighborhood? We will not.

### 20150817-5040

Jeff Lacatell, Pittsfield, MA.

I am against the proposed Massachusetts state-wide gas pipeline to pump fracked natural gas from Pennsylvania. It's a big step backwards away from cleaner sources of energy which our whole country should be investing in and transitioning to. Seemingly less expensive natural gas does not factor in the environmental costs.

I am a husband, father of two boys, teacher, hunter, biker, and general outdoor enthusiast. Please make decisions that will leave our environment better for the next generations and do what you can to stop this project.

Thank you for the opportunity to comment.

Jeff Lacatell

NORTHEAST DIRECT PF14-22

Stephanie Scherr

Fitzwilliam, New Hampshire

7/30/2015

Those of us OPPOSING THE KINDER MORGAN NED PIPELINE want you to HALT THE SCOPING HEARINGS and RESTART THE PROCESS giving land owners the FULL 60 days they are allowed. The thousands of "to be determined" labels in Kinder Morgan's latest report is unacceptable. Routes have been changed leaving no time for land owners to understand what is happening to them as Kinder Morgan's people swoop in on them like vultures trying to negotiate deals. These calculating moves on the part of Kinder Morgan do not go unnoticed, nor without response.

When Kinder Morgan uploaded their latest draft of the Environmental Report on Friday afternoon, leaving just days to sort through the enormous document before scoping, land owners called FERC. Their calls were met with incredibly rude, disrespectful, condescending responses. This reinforces that you support pipeline projects at any and all cost with no regard for those that will be impacted and whether they WANT or NEED your services.

The following comments were made by FERC employees **Sarah McKinley & Marcia Lurensky** at the FERC Landowner Helpline:

- Sarah told one caller, “Compressor stations are just big chemical plants. There is no pollution. I don’t know what you’re worried about. I have worked on gas pipelines for FERC for over 30 years and never heard the term blowdown. You have been sold a bill of goods. You need to get off YouTube!” Then she hung up. This was the second person at FERC to tell her blowdowns do not exist.
- Sarah told another caller, ”You and your folks can take as long as you want to process and digest this information. You do not need it for scoping. Your FERC comments sent in to us are the same as testifying at scoping. Kinder Morgan pushed your buttons and there’s no need for your buttons to be pushed.”
- A caller who spoke to Marcia stated, “Not one of my questions have been answered. She’s beating around the bush. She wouldn’t stop talking until I told her that it was my turn to talk now. She tried to tell me that there would be no tariffs on our electric bill, that the noise wouldn’t be THAT interruptive, and that any information that I may get from protest groups is biased.”
- Marcia told another caller that she talks to Kinder Morgan on the phone. They’re wonderful people. They don’t want to hurt anyone. She said that she’d be at working until 7:00 tonight “donating her time to FERC” talking to people to make them feel better. She was told she should not be so upset.

Believe me, this kind of response doesn’t make anyone feel better.

The FERC game is rigged to promote old, outdated, filthy energy technology. Seal the leaks in existing pipelines and send Kinder Morgan back to Texas! We value clean air, clean water, wildlife, scenic vistas, outdoor recreation, state parks, conservation lands, historic homes and small town culture. The injustice of shoving this pipeline through rural communities does not sit well with us. **RURAL LIVES MATTER!**

We have clean energy solutions already in use, exploding in popularity. The energy field labor force already possesses the skills to transition to safer, healthier, clean energy jobs with bright futures. I call upon Governor Hassan and all of our state representatives to have the vision to boldly move New Hampshire forward, promoting choices that will proudly put New Hampshire in the lead.

#### **20150817-5064**

NORTHEAST DIRECT PF14-22

Stephanie Scherr

Fitzwilliam, New Hampshire

8/12/15

I live in Fitzwilliam, New Hampshire and work closely with the towns of Troy, Richmond and Winchester’s residents, Selectmen, Planning Boards, environmental organizations and elected officials.

Those of us **OPPOSING THE KINDER MORGAN NED PIPELINE** want you to **HALT THE SCOPING HEARINGS** and **RESTART THE PROCESS** giving land owners the **FULL 60 days** they are allowed.

Just a few weeks ago, Kinder Morgan added an alternate route in Winchester, New Hampshire. Their people descended upon the rural town like vultures to survey land and negotiate deals with uninformed land owners. When property owners ask them to leave or call the police, they return to harass land owners another day. Between both routes, there are 97 affected and abutting land owners, not including the incineration zone.

Hugh McGovern, who is here tonight, is a Massachusetts resident with 335 acres of farm land in Pleasant Valley, in Winchester, New Hampshire. Regardless of which route is chosen, Mr. McGovern’s property is impacted, and the pipeline will blast through Pulpit Falls conservation land and the large town aquifer that serves Winchester and other towns.

This past Friday, August 7th, the route changed again, this time in Richmond, New Hampshire. Without notification to the town, Kinder Morgan showed up on the front porch of homeowners at dinner time to let

them know that the pipeline route now goes through their homes. In one case, a resident was told that the pipeline route would go past the front of their home and through their driveway and they would no longer have access to their home. This new route suddenly diverted off the property of a large company in town, and understandably, residents suspect an underhanded deal.

Just days ago, Kinder Morgan announced more Open Houses. We played the Kinder Morgan switch & bait game last winter. Kinder Morgan chooses small local venues, distributes information that is not just limited, but is deceptive. They display photos of compressor stations that are buildings the size of a backyard shed while the actual proposed compressor stations are the largest on the East Coast. They offer maps that are dark and lack detail and some venues are intentionally dark. At Hidden Hills in Rindge, KINDER MORGAN'S BLUE MAN GROUP had to use FLASH LIGHTS to show maps to residents attending the open house. It was quite a show.

We are unimpressed by FERC and Kinder Morgan stating that the pipeline has been DOWNSIZED to 30" when they stated 30-36" inch pipe from the beginning. Their M.O. is to threaten large, and decrease the size to let land owners think their concerns have been considered and appeased, and then increase or add pipeline and compressor stations once their pipeline has been approved.

The FERC game is rigged to promote old, outdated, filthy energy technology, promoted by sleazy deals from slimy fossil fuel executives.

I have dedicated my life to environmental education and promoting clean energy alternatives. I want them to experience the sense of awe that comes from appreciating the grandeur of nature. Our youth are hungry for a hopeful world. You are incapable of giving it to them. They look at what you can offer, and the world of renewables, and the answer is clear to them. They eagerly await the day when you go out of business. I will do my best to educate them so that if we aren't able to do it, THEY WILL.

Seal the leaks in existing pipelines, send Kinder Morgan back to Texas, and count your days in a dying industry. RURAL LIVES MATTER.

#### **20150817-5080**

Charles J. Waggoner, Nassau, NY.

I ask FERC — and our federal representatives — to explain to the people of New York, Massachusetts and New Hampshire what federal laws or regulations allow it to facilitate the poisoning of American citizens by letting an utterly corrupt and incompetent corporation like Kinder Morgan shove toxic compression stations, which will sicken our children, down our throats solely for the profit of the corporation.

#### **20150817-5162**

Julia V. Stockwell, Townsend, MA.

FERC Commissioners,

I am sorry I was not able to attend the hearing on August 12th in Lunenburg. I am a 70 year old single woman trying to survive without any financial support from the state or the Federal governments. Of course my income is fixed since I am retired, social security, which I support while working and savings, and I manage by funds and life style according to what I can afford. I do have several acres of land, two parcels of Chapter 61 lands already have an easement by Unitil for power lines. All of the property I own as a caretaker are predominately wetlands and two parcels are classified as Chapter 61. The parcels are either landlocked or not marketable properties. The only way I can manage to retain the properties is through Chapter 61 and recreation classification due increasing yearly taxes. Believe me I would rather not manage this land as it consumes much of my time. It does provide clean oxygen and a habitat for wildlife. I am explaining this to give you an idea of what I accomplish without state or federal aid. I burn wood and supplement it with oil. I would love to convert to solar energy and I may in the future with the new technology and if costs become more reasonable. This is where we should be putting our energy towards developing. It is safe and will take us into the future as long as the sun continues to exist.

I guess caring for the environment comes with age. As Americans we relied too much on oil and now it seems we are heading towards that same path with natural gas regardless of the effects it has on our environment and the people. I am 70 so I do not expect to ever see, at least I hope, the repercussions from transporting gas and its added chemicals across our land, providing damage to our pristine water systems, air, wildlife and fire safety. We do not need to experience forest fires like the west coast. Additionally, We need to take a lesson from Nova Scotia in predicting their gas field would last for twenty years and it ran out in five. It is exactly what they are predicting the Pennsylvania shale fields will supply. Most of the land the pipeline will be built on is wetlands, conservation land, forests and in people's back yards. There is already an existing pipeline in the southern part of Massachusetts that actually extends into Fitchburg. If it is not large enough to transport the volume of gas they say they need, then they need to think about enlarging that line rather than building another separate line impacting more of our environmental resources, From the hearings I have attended I have not received a clear answer from Kinder-Morgan - the catch phrase is the area is too densely populated from the time the pipeline was built in the 1950s. The real problem is the money since the existing pipeline is old and most likely more expensive to rebuild. Besides they already have existing easements and would not have to take anymore land by eminent domain. The other area they have not addressed is once the gas no longer exists, then how do they propose to eliminate the existing vacated pipelines and restore the areas to their original condition, or will it be like the railroad tracks that are left abandoned across our state.

Kinder-Morgan and or the Tennessee Gas Pipeline has diverted their plan for the pipeline to encompass more of New Hampshire than Massachusetts, but as I see the lateral is proposed to go through my land. I can tell you that is probably the result of the impact our local towns people had on making their voices heard loud and clear that we will fight this invasion to the end. The Revolution began in Massachusetts in 1775 to make our country, we still have that same spirit to defend it against unjust invasion of a dangerous element to our lives. I am whole heartedly against this pipeline, it is not needed and it is to dangerous. Our energies need to be put towards renewable energy resources like solar and wind power that does not damage our environment and our lives.

Respectfully,

Julia Stockwell  
203 Lunenburg Road  
Townsend, Massachusetts 01474-1131

#### **20150817-5202**

Steven Truss, Nassau, NY.

The NED project is being sold to the American people under the guise of public convenience and necessity. We are being told that New England has a greater demand for natural gas than the current infrastructure is capable of supplying. Yet, since the EICC meetings started the pipe diameter has been reduced from 36" to 30", and laterals branching off in Mass. have been eliminated. Now we are being told that Kinder Morgan has submitted over 6300 pages worth of changes to the project. I am now, more than ever, convinced that Kinder Morgan's motivation to build this pipeline is to sell natural gas to foreign buyers. FERC's policy on public convenience and necessity should pertain ONLY to the American public. Not foreign buyers, and not Kinder Morgan.

August 17, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission

888 First Street, N.E.  
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000  
Northeast Energy Direct Project  
Monthly Status Report -- July 2015

Dear Ms. Bose:

Tennessee Gas Pipeline Company, L.L.C. (“Tennessee”) is filing with the Federal Energy Regulatory Commission (“Commission”) in Docket No. PF14-22-000 its monthly pre-filing status report for the above-referenced project. The enclosed status report covers the period July 1 through July 31, 2015.

In accordance with the Commission’s filing requirements, Tennessee is submitting this filing with the Commission’s Secretary through the eFiling system. Tennessee is also providing complete copies of this filing to the Office of Energy Projects (“OEP”). Any questions concerning the enclosed filing should be addressed to Ms. Jacquelyne Rocan at (713) 420-4544 or to Ms. Shannon Miller at (713) 420-4038.

Respectfully submitted,  
TENNESSEE GAS PIPELINE COMPANY, L.L.C.  
By: /s/ J. Curtis Moffatt  
J. Curtis Moffatt  
Deputy General Counsel and Vice President  
Gas Group Legal

Enclosure

cc: Mr. Michael McGehee  
Mr. Rich McGuire  
Mr. Eric Tomasi

-----  
**Tennessee Gas Pipeline Company, L.L.C. (“Tennessee”)**  
Northeast Energy Direct (“NED”) Project, Docket No. PF14-22-000  
Pre-Filing Monthly Activity Report  
(Reporting Period: July 1, 2015 through July 31, 2015)

### **Public Outreach**

Tennessee provided the following NED Project notifications:

- On July 1, 2015, Tennessee provided applicable elected officials with the Commission’s public scoping meeting schedule.
- On July 16, 2015, Tennessee provided applicable elected officials and stakeholders with the Tennessee press release announcing that it is proceeding with the Market Path Component of the Project.
- On July 24, 2015, Tennessee provided applicable elected officials with the second draft of the Environmental Report (Resource Reports 1 through 13).
- On July 31, 2015, Tennessee provided applicable elected officials and stakeholders with a link to the new Project website.

### **Environmental**

- Tennessee filed the second draft of the Environmental Report (Resource Reports 1 through 13) with the Commission on July 24, 2015.
- Tennessee continued to work on revising Resource Reports 1 through 13 for the final Environmental Report, to be included with the certificate application filing, scheduled for October 2015.
- Tennessee continued field surveys during the reporting period, including cultural, environmental, and

threatened and endangered species surveys. Threatened and endangered species surveys conducted during the reporting period include bat acoustic surveys across the Project area; bog turtle surveys in Rensselaer County, New York; and plant surveys in Pennsylvania, New York, New Hampshire, and Connecticut. Tennessee continues to prepare for additional threatened and endangered species surveys throughout the Project area once survey protocols are finalized.

As of July 31, 2015, biological surveys have taken place over approximately 86.32 miles, or 52 percent, of the NED Project Supply Path component route, and approximately 64.36 miles, or 26 percent, of the NED Project Market Path component route. In addition, cultural resource surveys have taken place over approximately 94.23 miles, or 57 percent, of the NED Project Supply Path component route, and approximately 36.73 miles, or 15 percent, of the NED Project Market Path component route. Table 1 below summarizes the completion status of environmental and cultural surveys.

**Table 1: Civil, Biological, and Cultural Surveys Performed**

Segment	Survey Area* (miles)	Survey Completed (miles)		
		Civil**	Environmental	Cultural
NED Project (Supply Path)	171	C: 95.3 D: 86.4	86.32	94.23
NED Project (Market Path)	248	C: 56.6 D: 46.3	64.36	36.73
% Complete		C: 36% D: 32%	36%	31%

\*The total survey area in Table 1 does not correlate precisely to proposed total length of pipeline for the NED Project. This number represents the survey area for the proposed pipeline and for evaluation of route alternatives.

\*\* “C” represents center line staking. “D” represents completed civil detail survey.

### Project Meetings

Tennessee met with the New York Department of Environmental Conservation (“NYSDEC”) on July 14, 2015.

Tennessee attended a tribal meeting with Commission staff, Tennessee representatives, and tribal representatives held in Oneonta, New York on July 16, 2015.

Tennessee met with the New York State Parks Recreation & Historic Preservation on July 27, 2015.

Tennessee met with the Massachusetts Natural Heritage & Endangered Species Program on July 28, 2015.

Tennessee met with the New York State Department of Agriculture & Markets on July 28, 2015.

Tennessee met with the New York Department of Transportation on July 28, 2015.

Tennessee met with the Massachusetts Environmental Policy Act Unit on July 29, 2015.

Tennessee met with the NYSDEC on July 29, 2015.

Tennessee met with the New Hampshire Department of Environmental Services Wetlands Bureau on July 29, 2015.

The Commission conducted the following scoping meetings during the reporting period:

- Towanda, Pennsylvania -- July 14, 2015
- Castleton-on-Hudson -- July 14, 2015
- Great Bend, Pennsylvania -- July 15, 2015
- Castleton-on-Hudson -- July 15, 2015

- Oneonta, New York -- July 16, 2015
- Schoharie, New York -- July 16, 2015
- Pittsfield, Massachusetts -- July 28, 2015
- Nashua, New Hampshire -- July 29, 2015
- Greenfield, Massachusetts -- July 29, 2015
- Milford, New Hampshire -- July 30, 2015
- New Britain, Connecticut -- July 30, 2015

### **Right-of-Way**

Tennessee has obtained survey permission for approximately 39% of the NED Project Market Path component area, and approximately 55% of the NED Project Supply Path component area.

Title work is approximately 95% completed for the NED Project Market Path component area and approximately 97% completed for the NED Supply Path component area.

Tennessee has received 225 calls as of the date of this report on the toll-free phone number established for the Project.

Tennessee is continuing with survey permission requests in order to conduct bat surveys and access road surveys throughout the Project area.

Tennessee mailed out its Landowner Newsletter at the end of the reporting period.

### **Engineering**

Tennessee continues to evaluate the proposed route for the Project. Deviations to the proposed route are being reviewed to accommodate construction constraints, and requests from landowners, towns, and applicable regulatory agencies. Some examples include requests for routing deviations submitted by Amherst, New Hampshire and the NYSDEC. Tennessee will continue these evaluations based on information provided during the upcoming scoping meetings.

Tennessee continues to evaluate the proposed major river crossings, including potential Horizontal Directional Drill (“HDD”) locations. Tennessee is conducting environmental surveys where access is available at these potential locations, and will seek appropriate permits, as needed, for geotechnical investigations.

Tennessee contracted for aerial photography of the proposed primary route for the Project and for several alternative routes discussed in the draft Resource Report 10 submitted on March 13, 2015. The primary route was flown to a one-mile corridor and the imagery continues to be processed. LiDAR information as well as high resolution photography has been acquired and is currently being processed, and will be included with the certificate application filing targeted for October 2015. It is anticipated that additional areas where re-routes have occurred, as identified in the July 24, 2015 second draft Environmental Report, will be flown in the fall after the leaves are off the trees.

Tennessee provided preliminary layouts for some of the proposed compressor stations as part of the July 24, 2015 second draft Environmental Report. Surveys of these locations were conducted at most of the proposed sites during the reporting period.

Tennessee field engineers continue to identify available access roads, pipe/construction yards, and other areas proposed for use during construction.

Survey activities identifying and staking the centerline along all routes on accessible land continued during the reporting period. Work being performed includes staking and detail survey along the pipeline route and surveys of supporting sites such as contractor yards and compressor stations. The Project is nearing its total available areas of survey access.

Tennessee continued discussions with the electric utility companies regarding the co-location of proposed Project facilities with existing utility corridors. Eversource provided Tennessee with property

information of their facilities. This information is being utilized to layout the proposed alignment in relation to their easement. When access is granted, Tennessee will then follow up with field survey to finalize the property base.

Tennessee has conducted an initial analysis based on public imagery to review class locations to allow for siting of mainline valves. Mainline valve sites continue to be field-reviewed. Locations will be re-evaluated following the final imagery and class determination.

Structures along the proposed pipeline alignment were located during the aerial flights. This information is being evaluated for final class location determination. Field teams are reviewing the structures where access is available to determine their use.

Preliminary construction spreads have been determined. A hydrostatic test plan is being developed, including depicting potential water supplies and discharge locations.

Residential figures were provided based on public information for residences within 50 feet of the proposed workspace with the July draft Environmental Report. These drawings are being updated for the next filing utilizing the flown imagery for structure locations.

Reviewed the trenchless crossing table with the NYSDEC and discussed a path forward for the Highway I-88 hybrid route. Tennessee agreed to review the I-88 route and provide a follow up report on its conclusions directly to the NYSDEC within the FERC comment period. The next filing of Resource Report 10 will contain a summary of the report findings.

**THE FEDERAL ENERGY REGULATORY COMMISSION**

August 17, 2015

Ms. Chetkowski  
Villi Poni Farm  
Newfoundland Pony Sanctuary  
P.O. Box 371  
New Ipswich, NH 03071

Re: Northeast Energy Direct  
Docket Number PF14-22-000

Dear Ms. Chetkowski:

The White House forwarded correspondence from you regarding the Northeast Energy Direct Project (Docket No. PF14-22-000), whose pre-filing for a natural gas pipeline is currently before the Federal Energy Regulatory Commission.

We acknowledged that you have already filed several comments using the Docket Number listed above and awaiting actions to take place. We would recommend that you consider refile those comments once the company submits the formal application to us and we assign a new docket number to this proceeding. This ensures that your concerns are properly documented and analyzed by FERC's staff through drafting of the Environmental Impact Statement (EIS).

If you would like to be added to the environmental mailing list that allows us to mail a copy of the environmental report directly to you, please reply to [customer@ferc.gov](mailto:customer@ferc.gov). Also, please be assured that I have entered this correspondence into the official record for this proceeding on your behalf.

Sincerely,

Jerry Chiang  
Office of External Affairs

**FEDERAL ENERGY REGULATORY COMMISSION**

WASHINGTON, DC 20426

August 17, 2015

OFFICE OF THE CHAIRMAN

Nancy Carney, Chairman  
Fitzwilliam Board of Selectmen  
P.O. Box 725  
13 Templeton Turnpike  
Fitzwilliam, NH 03447

Dear Chairman Carney:

Thank you for your June 18, 2015, letter regarding Tennessee Gas' proposed Northeast Energy Direct project (Docket No. pF14-22-0001 and requesting that Commission staff hold a public scoping meeting in Fitzwilliam, New Hampshire.

On June 30, 2015, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, which initiated the formal public scoping period and indicated the locations, dates, and times for the public scoping meetings. The meeting locations were selected to be convenient for the greatest number of people who might be interested in the project.

Commission staff does not plan to hold a scoping meeting immediately in Fitzwilliam. However, as mentioned in the Notice of Intent, Commission staff are planning a scoping meeting in Cheshire County, New Hampshire, which should be convenient for residents of Fitzwilliam. The date and location for that meeting will be announced with a future notice, once the details are finalized.

While scoping meetings are a valuable tool for us to receive comments from the public, they are only one of several ways for interested parties to bring their concerns to the attention of the Commission. Stakeholders may also file written comments with the Commission. Those comments will receive the same attention and scrutiny as comments received at the public meetings.

As in any Commission matter, please be assured that we strive to make our review of energy proposals both accessible and transparent to the public. If I can be of further assistance in this or any other Commission matter, I hope you will not hesitate to let me know.

Sincerely,

Norman C. Bay  
Chairman

20150818-0009

**FEDERAL ENERGY REGULATORY COMMISSION**

WASHINGTON, DC 20426

August 17, 2015

OFFICE OF THE CHAIRMAN

The Honorable Chris Gibson  
U.S. House of Representatives  
Washington, DC 20515

Dear Congressman Gibson:

Thank you for your June 29, 2015, letter regarding Tennessee Gas' proposed Northeast Energy Direct project (Docket No. pF 14-22-000).

This planned project is still early in the Commission's environmental review process. Tennessee Gas filed its pre-filing request letter on September 15, 2014, and the Director of the Office of Energy projects approved Tennessee Gas's request to enter into the pre-filing process. The Commission's pre-filing process allows staff to actively participate with landowners, interested parties, other federal and state agencies, elected officials, and the applicant in order to identify environmental or other issues, and discuss potential solutions and route modifications before an application is filed. By engaging the public early in the process, we believe that we can conduct a comprehensive and meaningful review of the project as part of our obligations under the National Environmental Policy Act.

On June 30, 2015, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, which initiated the formal public scoping period and indicated the locations, dates, and times for the public scoping meetings.

I assure you Commission staffs review will fully examine the issues listed in your letter. Once complete, the environmental impact statement (EIS) to be prepared for this planned project will include a review of the design and construction requirements established by the United States Department of Transportation pipeline safety regulations, as well as a socioeconomic analysis addressing any impacts to property values and community financial effects. During the EIS development process, the public will have numerous opportunities to comment on the project and the adequacy of the EIS.

As in any Commission matter, please be assured that we strive to make our review of energy proposals both accessible and transparent to the public. If I can be of further assistance in this or any other Commission matter, I hope you will not hesitate to let me know.

Sincerely,

Norman C. Bay  
Chairman

August 17, 2015

OFFICE OF THE CHAIRMAN

Dawn Magi  
Selectboard Chair  
Town of Warwick  
12 Athol Road  
Warwick, MA 01378

Dear Chair Magi:

Thank you for your June 17, 2015 letter regarding Tennessee Gas's proposed Northeast Energy Direct Project (Docket No. PF14-22-000) and requesting that Commission staff hold a public scoping meeting in the Town of Warwick.

On June 30, 2015, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, which initiated the formal public scoping period and indicated the locations, dates, and times for the public scoping meetings. The meeting locations were selected to be convenient for the greatest number of people who might be interested in the project. While Commission staff does not plan to hold a scoping meeting in the Town of Warwick, we have held and will hold scoping meetings within a 30-40 minute drive. On Wednesday July 29, a public scoping meeting was held in Greenfield, Massachusetts. Commission staff is also currently arranging a meeting in Cheshire County, New Hampshire

which may be more convenient for the citizens of the Town of Warwick. The date and location for that meeting will be announced with a future notice once the details are finalized.

While scoping meetings are a valuable tool for us to receive comments from the public, they are only one of several ways for interested parties to bring their concerns to the attention of the Commission. Stakeholders may also file written comments with the Commission. Those comments will receive the same attention and scrutiny as comments received at the public meetings.

As in any Commission matter, please be assured that we strive to make our review of energy proposals both accessible and transparent to the public. If I can be of further assistance in this or any other Commission matter, I hope you will not hesitate to let me know.

Sincerely,

Norman C. Bay

Andover, MA 01810

Thank you for your June 12, 2015 letter regarding Tennessee Gas Pipeline Company, L.L.C.'s planned Northeast Energy Direct Project (Docket No. PF14-22-000).

The Commission approved Tennessee Gas' request to enter into the pre-filing process for the planned project

on October 2, 2014. The Commission's pre-filing process allows staff to actively participate with landowners, interested parties, other federal and state agencies, elected officials, and the applicant in order to identify environmental issues and discuss potential solutions and route modifications before an application is filed. Commission staff attended Tennessee Gas'pen House Meetings at which residents had the opportunity to learn more about the project and the FERC environmental review process. By engaging the public early in the process, we believe that we can conduct a comprehensive and meaningful review of the project as part of our obligation under the National Environmental Policy Act.

Your letter contained a gas pipeline resolution on behalf of the citizens of Andover, Massachusetts. The town of Andover's resolution will be entered into the record, and the issues raised will be examined in staff's environmental impact statement.

On June 30, 2015, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, which initiated the formal public scoping period and indicated the locations, dates, and times for the public scoping meetings. A public scoping meeting will be held at Dracut Senior High School in Dracut, Massachusetts on Tuesday, August 11. Stakeholders may also file written comments with the Commission. Those comments will receive the same attention and scrutiny as comments received at the public meetings.

As in any Commission matter, please be assured that we strive to make our review of energy proposals both accessible and transparent to the public. If I can be of further assistance in this or any other Commission matter, I hope you will not hesitate to let me know.

Sincerely,

Norman C. Bay  
Chairman

**FEDERAL ENERGY REGULATORY COMMISSION**  
WASHINGTON, DC 20426

August 17, 2015

OFFICE OF THE CHAIRMAN

Susan Silverman  
Fitzwilliam Board of Selectmen  
P.O. Box 725  
13 Templeton Turnpike  
Fitzwilliam, NH 03447

Dear Ms. Silverman:

Thank you for your June 18, 2015, letter regarding Tennessee Gas' proposed Northeast Energy Direct Project (Docket No. PF14-22-000) and requesting that Commission staff hold a public scoping meeting in Fitzwilliam, New Hampshire.

On June 30, 2015, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, which initiated the formal public scoping period and indicated the locations, dates, and times for the public scoping meetings. The meeting locations were selected to be convenient for the greatest number of people who might be interested in the project.

Commission staff does not plan to hold a scoping meeting immediately in Fitzwilliam. However, as mentioned in the Notice of Intent, Commission staff are planning a scoping meeting in Cheshire County, New Hampshire, which should be convenient for residents of Fitzwilliam. The date and location for that meeting will be announced with a future notice, once the details are finalized.

While scoping meetings are a valuable tool for us to receive comments from the public, they are only one of several ways for interested parties to bring their concerns to the attention of the Commission. Stakeholders may also file written comments with the Commission. Those comments will receive the same attention and scrutiny as comments received at the public meetings.

August 12, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

Dear Ms. Bose,

On August 9th I sent a letter to you expressing my opposition to the NED pipeline proposed by Kinder Morgan / Tennessee Gas, specifically addressing the issue of the pipeline's negative effect on the marketability of properties in the "incineration zone." Now I wish to address another issue specific to residents in towns dependent on private wells for their water supply.

The town of Richmond, NH has no public infrastructure to provide water; residents have individual wells and our own well is within 800 feet of the proposed pipeline. Our water is pure and its taste is the envy of our far-flung family. Richmond has an aquifer that lies under the proposed path of the NED pipeline and our property is directly over that aquifer.

New Hampshire as you know is “the Granite State.” Richmond itself has several ridges running north and south, and the proposed pipeline runs from west to east across those ridges. The blasting required to enable KM to bury that pipeline in our rocky terrain has many of us very concerned. What is our recourse if our wells are negatively affected, either by contaminants or by loss of volume or pressure? How can we prove that the samples we have lab-tested and analyzed before the blasting begins are in fact from the wells we claim? I have seen that there is a procedure whereby KM signs off on the pre-blast condition of a home’s foundation but I have not seen a similar protective procedure for well water.

Thank you for any help you can give to those of us at risk.

Yours truly,

Barbara Woodward

Re: Reiteration of denial of access sent on December 14 2014

I’m sending this letter to reiterate my denial of access sent on December 14 2014 for 337 Townsend Rd, Mason, NH 03048 also known as Lot G-48-1 in the Mason tax maps. To be explicit, I’m denying permission to the Tennessee Gas Pipeline Company, LLC (a Kinder Morgan Company), its representatives, contractors, subcontractors, or associates to enter my land or to perform surveys, or for any purpose. As stated in my previous letter (dated Dec 14 2014) any physical entry onto my property will be considered unauthorized, and treated as trespass.

Daein and Sarah-Jean Ballard

337 Townsend Rd

Mason, NH 03048

Member of New Hampshire Federation of Garden Clubs, Inc., District RI, New England Region  
PO Box 427, Fitzwilliam, NH 03447

August 12, 2016

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street, NE, Room 1A

Washington, DC 20426

Dear Secretary Bose:

On behalf of the members of the Fitzwilliam Garden Club, I urge you to oppose the Northeast Energy Direct (NED) Project and the extension of Kinder Morgan’s Tennessee Gas Pipelines. Our Club, organized in 1932 and incorporated in 1956, voted unanimously to oppose this intrusion to the forests, wetlands and most especially our beloved Rhododendron State Park.

Rhododendron State Park is home to a rhododendron grove, which is the largest in northern New England, and was designated a National Natural Landmark in 1982. The Park is also home to the Fitzwilliam Garden Club’s Wildflower Trail as well as many native orchid varieties confirmed by the New England Wildflower

Society. Our Conservation Committee reports throughout the year on matters of special interest in the areas of conservation, ecology and nature education. The proposed pipeline would cause an unimaginable amount of disruption and possible damage to the natural areas it crosses.

Our concerns regarding the pipeline project are not just during the construction which will greatly disturb habitat and wetlands, but also the need to clear forest and convert land to low scrub-shrub cover in State areas around the pipeline right of way, should it be built. In addition, we will live with the on-going concern over potential damages to our aquifers, wetlands and other habitat should the pipeline ever be compromised. We hope you will join us in opposition to the pipeline project.

Sincerely,

Theresa Robbitts  
President

C., R Benson, Amherst, NH.

This planned pipeline has been rejected by the people of Massachusetts, who stand to gain the most from it. The benefits to New Hampshire are minimal. It seems that the company thinks that it can ruin the character of New Hampshire towns with no regard for their residents and property owners.

I strongly urge the Commission to reject siting this pipeline in southern New Hampshire.

**20150818-5001**

Marilyn Learner, Hollis, NH.

Please read the briefs submitted by the NH Office of Consumer Affairs and PLAN-NE to the NHPUC in opposition to the Liberty Utilities Precedent Agreement contract between Kinder Morgan/TGP and Liberty Utilities. The so-called need is unsubstantiated and speculative and has been engineered to create justification for NED according to FERC criteria.

See links below: NHPUC docket 14-380

<https://www.puc.nh.gov/Regulatory/Docketbk/2014/14-380/BRIEFS/14-380%202015-08-07%20OCA%20OST%20HEARING%20BRIEF.PDF>

<https://www.puc.nh.gov/Regulatory/Docketbk/2014/14-380/BRIEFS/14-380%202015-08-10%20PLAN%20>

**20150818-5003**

Leanne yinger, Lanesborough, MA.

I am completely opposed to the Tennessee gas pipeline proposal Kinder Morgan is applying for in my town and state (Lanesborough MA.). Thus far Kinder Morgan has not effectively answered the many questions raised regarding environmental impact, actual need and potential risks.

I attended our town meeting and like so many other communities in Massachusettes there was a unanimous vote to stop this pipeline from entering our community. With this type of strong opposition to the proposed pipeline I would expect that there will be due diligence in researching Kinder Morgan's track record and weighing the long term negative impact this pipeline would have for all those directly effected by its construction.

I am asking that FERC as the regulatory agency stop all progress of this project until the actual need is identified for such a project, environmental studies are thoroughly completed and an investigation of Kinder Morgan's track record in such cases can be clearly outlined and presented to concerned parties.

One only has to look up the list of pipeline explosions in the 21st century to be very concerned about a 30 inch pipeline running through their community. Many of the "accidents" listed in the 21st century had pipelines of only 6-10 inches in diameter and yet the damage was monumental. Why would any community agree to allow such a risk into their neighborhoods willingly?

Please stop Kinder Morgan from using their might to bully another small community into accepting their proposal and empty promises.

**20150818-5024**

August 17, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission (FERC)  
888 First Street, N.E.  
Washington, DC 20426

RE: Environmental Impact Statement under FERC Docket No. PF14-22

Dear Secretary Bose,

The "Purpose and Need" section of Tennessee's Resource Report 1 discusses "the basic market forces of supply and demand" putting "considerable downward pressure on energy prices" and "the expanded natural gas pipeline transportation infrastructure will ensure greater reliability and fuel certainty in the electric generation sector."

The Alternatives section of Tennessee's Resource Report 10 should properly address project alternatives. Rather it discounts all methods of energy efficiency, conservation, and renewable resources in the following statement.

*"While these measures could impact the overall demand for electricity from fossil fuel generation, the energy conservation and renewable alternatives do not meet the purpose and need of the Project, which will provide additional natural gas pipeline transportation capacity to its customers, including LDCs that will ultimately provide additional natural gas supplies to their customers for residential and commercial heating, drying and cooking, and industrial uses. Accordingly, energy conservation and renewable resources will not be an alternative to meet the purpose and needs of the Project."*

Therefore in Resource Report 1 Tennessee suggests flooding New England with extra capacity of home heating fuel would lower electric rates. However in Resource Report 10, they grossly ignore that under this same "supply and demand" scenario, flooding the electricity market with conservation and alternatives would reduce gas demand by power generators therefore releasing gas in existing pipeline capacity for

heating, drying, cooking and industrial uses. Repurposing existing capacity would support the “No Build” alternative by defeating the project need and alleviating short and long term environmental impacts caused by construction and operation of NED.

Please look at Energy Conservation, Energy Efficiency, Wind Power, Solar Power, Geothermal Power, Coal, Fuel Oil, Nuclear, Hydroelectric Power, Electric Generation, Fuel Cells, and Other Energy Sources as methods of reducing the demand on current gas capacity to generate electricity. Specifically please look into the following:

1. The cumulative effect of Energy Conservation reducing the demand on current gas capacity to generate electricity. Further this reduction in demand allowing for repurpose of gas in existing pipelines for heating, drying, cooking and industrial uses.
2. The cumulative effect of Energy Efficiency reducing the demand on current gas capacity to generate electricity. Further this reduction in demand allowing for repurpose of gas in existing pipelines for heating, drying, cooking and industrial uses.
3. The cumulative effect of Renewable Resources reducing the demand on current gas capacity to generate electricity. Further this reduction in demand allowing for repurpose of gas in existing pipelines for heating, drying, cooking and industrial uses.

Please consider all of these alternatives in the environmental impact statement when comparing construction and operation of NED versus the “No Build” alternative.

Insulation is a proven method of Energy Conservation. It reduces the amount of electricity required to cool a home in summer months and reduces the amount of gas required to heat a home in the winter months. Therefore Energy Conservation absolutely has an effect on the “purpose and need of the Project.”

Wood is a Renewable Resource. Burning wood to generate heat in a home reduces the amount of gas required to heat a home. Therefore Renewable Resources absolutely have an effect on the “purpose and need of the Project.”

Please request that Tennessee remove the following statement from Resource Report 10 as it is blatantly false.

“Energy conservation and renewable resources will not be an alternative to meet the purpose and needs of the Project.”

Sincerely,

Rob Chesebrough

RE: PF14-22-000

Dear Secretary Bose,

I am writing to urge that you reject the Kinder Morgan (KM) “Northeast Energy Direct (NED) pipeline.” This project will cause irreparable harm to homeowners, businesses, and the environment, while providing little tangible value to the New Hampshire stakeholders.

The project has been falsely sold as a “bridge” solution. Instead, NED will seriously inhibit the progress of renewable clean energy. Given that both federal and state governments strongly espouse the growth of renewables, and in fact have made same “policy,” the approval of NED would be antithetical to achieving

that goal.

I also ask that FERC allow more time for public comments and analysis of NED, given that KM has provided potentially false information to the public. For example, KM states that the approval of NED will “help alleviate the high costs of electricity and natural gas in New England....” To the contrary, FERC’s own analysis demonstrates that the export of gas via NED could lead to an explosion of the region’s natural gas price as it rises to fungible global levels. Thus, the key premise for NED is fictional and should be rejected by FERC, as seen in your own global pricing data of June 2015.

Another issue that will surely be ripe for litigation is any issuance of a certificate of “public convenience and necessity” for a pipeline that provides little energy for New Hampshire and appears principally geared for the global market. Similarly, did Congress intend that our land be ripped away from American citizens through the widespread use of eminent domain for the benefit of global markets? I doubt that a Federal court would agree, if this issue is forced to litigation by a FERC approval. I suspect that nearly “zero” percent of NH landowners will enter easement agreements for NED, and FERC should weigh that clear sign of rejection in their “sliding scale” analysis and reject the proposal.

If KM or other pipeline companies wish to transport gas to export markets, they should enter into arms-length agreements with landowners and pay full and fair compensation. No citizen should be forced to suffer the economic and potential physical harm of this export-driven project – for private profit – through the taking of their property through eminent domain.

Again, for all of the above reasons, I urge you to reject NED.

Jon Bryan  
Mason, NH 03048-4803

#### **20150818-5052**

Lisa M Senus, Mason, NH.

My comments are regarding the Fitchburg Lateral portion of the NED project.

Firstly, without any subscribed customers, the need for the lateral is questionable at best. The best option for this lateral is “no build”.

Secondly, as currently portrayed on KM/TGP’s route map, the Fitchburg lateral would amount to a “greenfield” project. It would traverse state-funded conservation lands (Fifield Tree Farm), a stratified drift aquifer which provides potable water for a large portion of Mason, wetlands, stream corridors, undeveloped forested areas, and residential lots. I would like to suggest closer examination of one of KM/TGP’s alternate routes for the lateral: following the Route 31 corridor. This corridor is an existing commercial route, and impacts to the environment would be significantly less than the proposed “greenfield” route.

Respectfully,

Lisa Senus  
Intervenor

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE Room 1 A  
Washington, DC 20426

re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Dear Secretary Bose,

Please find attached the information requested by FERC personnel at the Lunenburg Scoping Hearing on August 12th regarding Article 97 of the Amendments to the Massachusetts Constitution (“Article 97”), and public lands under its protection, impacted by the Kinder Morgan Northeast Energy Direct pipeline proposal described in FERC Docket PF14-22.

*“Article XCVII. The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose. ...*

*“Lands and easements taken or acquired for such purposes shall not be used for other purposes or otherwise disposed of except by laws enacted by a two thirds vote, taken by yeas and nays, of each branch of the [state legislature].”*

The attached documents include:

- Text of Article 971
- Massachusetts Executive Office of Energy and Environmental Affairs Article 97 Land Disposition Policy2
- Compiled list of impacted properties

The compiled list of impacted properties is as it was known following the removal of the Worcester lateral on June 5th. A cursory comparison of existing maps with the view-only Google Map published by Kinder Morgan accompanying their July 24th filing shows at best minimal change to the huge impact of their proposal on public lands believed to be protected into perpetuity. There are over 100 conservation parcels impacted, including 85 protected by the Massachusetts Constitution. The parcels on the compiled list are all directly impacted or within Kinder Morgan’s survey corridor. All GIS data for these parcels is freely and publicly available on the Commonwealth’s Office of Geographic Information (MassGIS) website at: <http://mass.gov/mgis>

As Kinder Morgan’s recent filing of all Resource Reports and supporting documents, some 7,000 pages, occurred in the middle of FERC’s scoping meeting schedule, that mountain of data has not yet been completely analyzed. If we determine there has been any change in the number of Article 97 public land properties impacted by this latest Kinder Morgan release, an update comment will be submitted to the docket.

Thank you,

Cathy Kristofferson  
Ashby, MA 01431

COMMONWEALTH OF MASSACHUSETTS  
EXECUTIVE OFFICE OF ENVIRONMENTAL AFFAIRS

### **EOEA ARTICLE 97 LAND DISPOSITION POLICY**

**FEBRUARY 19, 1998**

#### **I. Statement of Policy**

It is the policy of EOEA and its agencies to protect, preserve and enhance all open space areas covered by Article 97 of the Article of Amendment to the Constitution of the Commonwealth of Massachusetts. Accordingly, as a general rule, EOEA and its agencies shall not sell, transfer, lease, relinquish, release, alienate, or change the control or use of any right or interest of the Commonwealth in and to Article 97 land. The goal of this policy is to ensure no net loss of Article 97 lands under the ownership and control of the Commonwealth and its political subdivisions. Exceptions shall be governed by the conditions included in this policy. This policy supersedes all previous EOEA Article 97 land disposition policies.

An Article 97 land disposition is defined as a) any transfer or conveyance of ownership or other interests;

b) any change in physical or legal control; and c) any change in use, in and to Article 97 land or interests in Article 97 land owned or held by the Commonwealth or its political subdivisions, whether by deed, easement, lease or any other instrument effectuating such transfer, conveyance or change. A revocable permit or license is not considered a disposition as long as no interest in real property is transferred to the permittee or licensee, and no change in control or use that is in conflict with the controlling agency's mission, as determined by the controlling agency, occurs thereby.

## **II. Conditions for Disposition Exceptions**

EOEA and its agencies shall not support an Article 97 land disposition unless EOEA and its agencies determine that exceptional circumstances exist. A determination of "exceptional circumstances" is subject to all of the following conditions being met:

1. all other options to avoid the Article 97 disposition have been explored and no feasible and substantially equivalent alternatives exist (monetary considerations notwithstanding). Note: The purpose of evaluating alternatives is to avoid using/affecting Article 97 land to the extent feasible. To that end, the scope of alternatives under consideration shall be commensurate with the type and size of the proposed disposition of Article 97 land, and must be performed by the proponent of the disposition to the satisfaction of EOEA and its agencies. The scope of alternatives extends to any sites that were available at the time the proponent of the Article 97 disposition first notified the controlling agency of the Article 97 land, and which can be reasonably obtained: (a) within the appropriate market area for private proponents, state and/or regional entities; or (b) within the appropriate city/town for municipal proponents.
2. the disposition of the subject parcel and its proposed use do not destroy or threaten a unique or significant resource (e.g., significant habitat, rare or unusual terrain, or areas of significant public recreation), as determined by EOEA and its agencies;
3. as part of the disposition, real estate of equal or greater fair market value or value in use of proposed use, whichever is greater, and significantly greater resource value as determined by EOEA and its agencies, are granted to the disposing agency or its designee, so that the mission and legal mandate of EOEA and its agencies and the constitutional rights of the citizens of Massachusetts are protected and enhanced;
4. the minimum acreage necessary for the proposed use is proposed for disposition and, to the maximum extent possible, the resources of the parcel proposed for disposition continue to be protected;
5. the disposition serves an Article 97 purpose or another public purpose without detracting from the mission, plans, policies and mandates of EOEA and its appropriate department or division; and
6. the disposition of a parcel is not contrary to the express wishes of the person(s) who donated or sold the parcel or interests therein to the Commonwealth.

## **III. Procedures for Disposition**

Although legislation can be enacted to dispose of Article 97 land without the consent of an EOEA agency, it is the policy of EOEA to minimize such occurrences. To that end, and to ensure coordination, EOEA agencies shall:

1. develop an internal review process for any potential Article 97 land disposition to ensure that, at a minimum, the conditions in Section II above are met;
2. develop, through the Interagency Lands Committee, a joint listing of all requests, regardless of their status, for the disposition of Article 97 land;
3. notify the Interagency Lands Committee of any changes to the Article 97 land disposition list;
4. monitor all legislation that disposes of Article 97 land, and communicate with legislative sponsors regarding their intent;
5. recommend to the Secretary that the Governor veto any legislation that disposes of Article 97 land, the purchase, improvement, or maintenance of which involved state funds, on and for which the EOEA

agency has not been consulted and received documentation (including information on title, survey, appraisal, and a MEPA review, all at the proponent's expense);

6. obtain the concurrence of the Secretary of EOA for any proposed Article 97 land disposition decision prior to finalizing said decision;

7. if recommending an Article 97 disposition, attach to all Article 97 legislative recommendations and TR-1 forms a justification of the disposition and an explanation of how it complies with this policy, signed by the EOEA agency head;

8. ensure that any conditions approved by EOEA and its agencies to any Article 97 land disposition are incorporated within the surplus declaration statement submitted to and published by DCPO as required by M.G.L. C. 7, §40F and 40F1/2 and throughout the disposition process, and if such conditions are not incorporated in said statement throughout the disposition process, the EOEA agency head shall recommend to the Secretary that the Governor veto any resulting legislation;

9. recommend to the Secretary that the Governor veto legislation that disposes of Article 97 land of which the agency disapproves; and

10. ensure that any Article 97 land disposition is authorized by enacted legislation and approved by all municipal, state and federal agencies, authorities, or other governmental bodies so required and empowered by law prior to conveyance.

#### **IV. Applicability of the Policy to Municipalities**

To comply with this policy, municipalities that seek to dispose of any Article 97 land must:

1. obtain a unanimous vote of the municipal Conservation Commission that the Article 97 land is surplus to municipal, conservation and open space needs;

2. obtain a unanimous vote of the municipal Park Commission if the land proposed for disposition is parkland;

3. obtain a two-thirds Town Meeting or City Council vote in support of the disposition;

4. obtain two-thirds vote of the legislature in support of the disposition, as required under the state constitution;

5. comply with all requirements of the Self-Help, Urban Self-Help, Land and Water Conservation Fund, and any other applicable funding sources; and

6. comply with EOEA Article 97 Land Disposition Policy [note: the municipality must also file an Environmental Notification Form with EOEA's MEPA office].

After the effective date of this policy, any municipality that proposes, advocates, supports or completes a disposition of Article 97 land without also following the terms of this policy, regardless of whether or not state funds were used in the acquisition of the Article 97 land, shall not be eligible for grants offered by EOEA or its agencies until the municipality has complied with this policy. Compliance with this policy by municipalities shall be determined by the EOEA Secretary, based on recommendations by the EOEA Inter-agency Lands Committee.

**If you care, tell FERC, DPU, Governor Baker, and Attorney General Maura Healey that more reasonable alternatives are available.**

Lands listed are on or within 200' of the NED route. June 9, 2015

### **20150818-5070**

Peter Cottrell, Stephentown, NY.

The proposed North East Direct 36" high-pressure gas pipeline passes through rural areas and is permitted to use lowered safety standards in construction and operation compared to that required in more densely populated areas. Yet the proposed pipeline will pass closely by hundreds of houses which will be located in the so-called incineration zone.

Our towns, and County, have passed resolutions expressing the people's will against the construction of this pipeline.

The proposed pipeline compressor plant located in Nassau, NY will burn gas contaminated with hydrofracking chemicals. Residents in that area, as well as those living downwind of it, will be breathing those contaminants. The compressor plant will operate 24/7 and its noise will reverberate for miles through the Burden Lake basin and the surrounding hills and hollows. The fumes and noise will become a constant presence in the lives of hundreds, if not thousands of residents in the vicinity. This is a highly scenic rural area with multiple recreation areas used by residents and visitors.

The proposed pipeline will reduce and degrade parts of the Rensselaer Plateau, which is a unique and irreplaceable natural area, and a reservoir of natural diversity.

Over thirty years ago we bought a derelict late 18th century farm house and barns on thirty-five acres. Much time, sweat, and money has been spent restoring the home and property. It is home. The proposed pipeline will slash through and bulldoze 200 year old stone walls, a sugar bush, a low and high blueberry bush, a rare lag gravel, vernal pools, and an aquifer recharge area. As bedrock is close to or even on the surface, I question what effect blasting or other excavation techniques might have on our water well.

The pipeline's approval would force us to sell at least several acres and create an unnatural leveled strip separating our house from the main part of our property. This is through what I call our backyard. The 36" high-pressure gas pipeline will pass closely around our house on two sides.

This strip, which will be owned by Kinder Morgan, will be a magnet for off-road vehicles running 24/7. I do not believe that they can ever successfully fence off or otherwise restrict this space.

The pipeline will reduce our property's value and destroy part of what we have worked for, saved, and accumulated. This amounts to an unfair taking of our property. This pipeline is not about convenience or necessity, but an industry taking profit by forcing risk and cost onto individual private property owners. This is wrong and un-American. It amounts to corporate piracy. Who benefits? Not us, Stephentown, Rensselaer County, NYS or anyone but the owners of Kinder Morgan. There is no public good. Public pain for private gain. Do not rubber stamp this deal as it amounts to larceny.

### **20150818-5120**

Dorothy Crawford, Fitzwilliam, NH.

I have many concerns about the NED project but the issue that scares me the most is the potential impact of the pipeline construction and operation on the Troy Mills Superfund site. It took several years and around \$50 million dollars to clean up this site, but more importantly the toxic nature of this event damaged the Troy economy for generations to come. Given all that went into cleaning up and containing of the toxins, why would FERC approve a project that would clearly involve extensive blasting into the bedrock adjoining the Superfund site. We have been told that the pipeline will be 30-36" and that it needs to be buried 30-36" from the top of the pipe. We are known as the granite state for a good reason. Please research all aspects of the pipeline proximity to the superfund site including locations of staging areas, blasting, construction,

maintenance, and possible leaks or explosions. Please coordinate with the EPA and other relevant agencies. Do not rely exclusively on what you are told from Kinder Morgan.

Stephen August, Presiding Officer  
Energy Facilities Siting Board  
One South Station  
Boston, Massachusetts 02110

August 12, 2015

RE: Tennessee Gas Pipeline / Kinder Morgan Northeast Direct (NED) Proposed Pipeline  
Project Docket Number: PF14-22

Dear Presiding Officer August:

It is our understanding that the Energy Facilities Siting Board (EFSB) is charged with “ensuring a reliable energy supply for the Commonwealth with a minimum impact on the environment at the lowest possible cost” I. Further, according to information presented by presiding officer James Buckley at the EFSB Hearing held in Greenfield on August 5, 2015, the EFSB will include comments received on this matter with their comments to the Federal Energy Regulatory Commission (FERC) and also make recommendations as to modifications that should be made to the proposed NED pipeline project in order to meet Massachusetts environmental and safety concerns.

Please accept these preliminary comments from the Town of Conway Ad Hoc Pipeline Taskforce and consider them in your comments to FERC. Initial comments were presented by a member of the Ad Hoc Pipeline Task Force on behalf of the Town of Conway at the August 5th hearing. This written testimony is intended to provide additional details and more specific areas of concern. However, as the EFSB is aware, the project details provided by Kinder Morgan (KM) regarding the proposed NED pipeline are incomplete. It therefore follows that the comments pertaining to the environmental impact of the proposed NED pipeline are incomplete. The Ad Hoc Pipeline Task Force will be submitting additional comments to the FERC and reserve the right to amend and add to our comments as missing and incomplete data are provided by KM. Included as relevant for this project are a copy of a letter from the Conway Conservation Commission to the PERC and a copy of the BioMap 2 report for the Town of Conway. Lastly, The Conway Planning Board in concert with other town boards and the Franklin Regional Council of Government (FRCOG) has submitted additional topics and concerns for the EIS which are supported by the Planning Board and included by reference thereof.

**General**

The Town of Conway is located in the Connecticut River or Pioneer valley, in the foothills of the Berkshires. It is a region rich in agriculture and history. Conway is heavily forested and pastured with little industrial and commercial business. Conway is the first ‘hilltown’ northbound on Route 116, one of seven designated Scenic Byways in Western Massachusetts.

The proposed Tennessee Gas NED pipeline project will specifically and significantly impact the Town of Conway. As it stands, the proposal includes: 3.41 miles of a 30” (or 36”) diameter pipe across the Northern end of town; a mainline and ‘blowoff valve; a cathode protection ground bed, with associated infrastructure; a Horizontal Directional Drilling (HDD) operation; and numerous temporary work areas, temporary access roads, temporary right of ways (ROW), permanent ROW’s, and permanent access roads. The segment of

proposed pipeline through Conway is routed along side of an existing utility corridor of high power lines. The proposed pipeline detailed plans for the Horizontal Directional Drilling portion of the proposed pipeline were not included in the revised reports released by Kinder Morgan at the end of July. This is particularly disturbing as the proposed drilling project that begins in Conway and proceeds eastward under the Deerfield River into the town of Shelburne, is 4,400 feet, the longest in the Commonwealth. Further, site-specific water body crossing plans were not provided. ~ noted by the Conservation Commission the proposed route includes three (3) significant water body crossings that constitute environmentally sensitive areas. Lastly, KM notes in the revised reports that main line valve (MLV) locations are approximate with final locations confirmed prior to “final filing”. It is unclear how any duly appointed or elected board in the Town of Conway, absent detailed and complete plans, can comment on the environmental impact of the proposed drilling, ML V, and water body crossings, much less any aspect of this project without complete information.

### **Alternatives**

The Franklin Regional Council of Governments has or will submit detailed study and information requests as part of the Environmental Impact Statement (EIS). Please note the Task Force support for a detailed alternative route analysis to avoid permanently protected open space, rare and endangered species habitats, water resources, forests, and farmland. We request justification for “greenfield” locations, an assessment of the quality of resources impacted for the ‘preferred route’ as opposed to alternate routes, and full documentation of sources of information used to arrive at the conclusions. Full analysis of the ‘preferred’ and alternate routes should consider need for a new pipeline, and therefore consider the ‘no. action’ alternative.

### **Analysis of Need**

The FERC can only determine that the proposed NED pipeline is in the “Public Convenience and Necessity” where there is a demonstrated need for additional natural gas infrastructure. A full assessment of the need for this project should include a comprehensive analysis of alternative solutions and consideration of the cumulative environmental impact of the NED project in conjunction with ALL other projects purporting to meet the energy needs of the Commonwealth. Additionally your evaluation of the merits of this project results should incorporate the study commissioned by Attorney General Healy on the electric reliability needs, including natural gas capacity demand, for New England.

### **Water use and quality**

The Town of Conway has no public drinking water supply, but rather its residents are served by private shallow and deep wells, of varied age. Additionally, Conway serves as a watershed area for Deerfield’s and Northampton’s water reservoirs. Threats to the integrity of the water in Conway therefore are also threats to the integrity of the water in those communities.

Areas of concern specific to water in Conway include, but are not limited to, the following: impact of blasting on the flow rate and quality of the water in private wells, and on the underlying aquifer; contamination of the water during construction, pressure testing, and operation; the impact of JIDD on private wells, groundwater tables, aquifer, adjacent waterbodies, and watershed resources. Risk assessments regarding blasting, channelization of bedrock, HDD, excavations, waterbody crossings, and water quality necessarily must consider the potential impact to all water resources within the Town of Conway and neighboring communities.

### **Fish, Wildlife, and Vegetation**

Concerns related to fish, wildlife, and vegetation include the impact to environmentally sensitive areas not limited to vernal pools, cold water fisheries, braided stream systems, priority habitat for rare species, and permanently protected open space and farmland.

As previously mentioned, attached is a copy of a letter from the Conservation Commission for the Town of Conway. The Ad Hoc Task Force requests full consideration of the following statement in reference to a preliminary report commissioned on the environmental impact of the proposed NED:

... there are multiple and significant environmental issues effecting critical habitat, the environment, wetland areas, and river areas. There are at least three substantial stream and river crossings. Inthe submitted report we have highlighted four (4) critical areas as examples. This report is not intended to be conclusive as to all critical or impacted areas, but rather is to support that it will be crucial, given the highly sensitive nature of the ecosystems that may be impacted, to, before any work is commenced, carefully study and then condition any work to avoid impacts, minimize impacts, and mitigate impacts both to the aquatic system and supporting terrestrial ecosystems.

The Ad Hoc Task Force notes that the primary responsibility of an applicant to FERC is to avoid impacts to the environment. Additionally, as noted before site-specific detailed plans for water body crossings are not included in the revised resource reports released at the end of July 2015.

### **Noise**

Noise during construction of the pipeline and operation of the mainline and blowoff valves in an area characterized by hills and river valleys, where sound travels and echoes is a concern.

Current Federal standards for allowable noise levels from pipeline operation do not account for current low level ambient background conditions that exist in our community. Noise abatement technology exists today to minimize radiated noise from point sources. Given the topography of our town with its rolling hills and valleys that reflect sound we recommend that the allowable noise standard be no net gain in ambient noise at the TGP property borders. We request preconstruction and post -operational sound level monitoring to ensure compliance with these requirements. Such testing should be sensitive to the unique acoustical topography of the area

### **Air Quality**

The impact of planned, as well as unplanned, gas releases from the MLV and blowdown valve on the air quality, environment, and health of residents is a grave concern. The current NED proposed pipeline project includes MLV and blowoff valves located on a ridgeline north of the town population center. The town's population center is surrounded by hills and has been commonly known to be colder than the surrounding hill tops. While compressed natural gas (NG) in pipelines is presumed to be warmer than the ambient groundcover, rapidly expanding NG associated with routine or emergency venting is anticipated to be significantly colder than the ambient air. This denser, colder NG containing residual shale fracking chemicals could, with prevailing winds, drift to our town center resulting in potential health and safety issues, and potential contamination of organic farming operations. We request that air quality sampling be conducted to establish pre-construction background levels of known possible harmful chemicals.

### **Reliability and Safety**

Concerns related to reliability and safety pertain to all aspects of construction and operation.

#### *PHMSA 's Pipeline Safety program:*

The Pipeline and Hazardous Materials Safety Administration (pHMSA) was charged (p.L. 112- 90) in 2011 with developing and implementing interstate pipeline law to provide safety and environmental protection in the transportation of natural gas by pipelines. There are 42 Congressional mandates to be included in the reforms, requirements, and programs established under the law. That law is scheduled to expire in September 2015 with potentially unimplemented mandates. The current law requires pipeline operators to implement these mandated requirements within one year of promulgation on new or replacement pipelines. Given the enormity of this proposed NED pipeline project and its associated safety and environmental risks, TGP should be required to comply with all current and future mandated requirements that are promulgated under the law, or alternatively delay construction and/or operation until these important mandated requirements can be included in this project.

#### *Proximity of NG pipeline to high tension power lines*

Risks associated with the proximity of a natural gas pipeline to high tension power lines need to be fully explored. A drilling operations expert stated at a public meeting that NG pipelines should be 1000' from high tension power lines. A full and detailed independent risk analysis for the placement of the proposed NED pipeline in or adjacent to an existing ROW for high tension lines should be provided. Such risk analysis should include, but not be limited to, analysis of risk of equipment failure, longevity of sacrificial cathodes in cathode beds, and evidence based maintenance plans. The task force notes that according to a report "Local Government Guide to Pipelines" published by the Pipeline Safety Trust, equipment failure is the leading cause of significant incidents for NG transmission lines. "'Material, weld, and equipment failure' is the leading cause of incidents for transmission lines, whereas 'excavation damage' is the leading cause for gas distribution lines." 2 According to the report material, weld, and equipment failure accounts for 35.2% of transmission line failure. Corrosion accounts for an additional 17.3% of transmission line failure.

*Pipeline diameter, design strength and operational pressure:*

The potential impact blast radius (PIR) from a pipeline explosion has been shown to be correlated with pipeline diameter and operational pressure. The 30" pipeline as currently proposed for the 1.3 Bcfd/day natural gas (NG) flow capacity will operate at pressures that correlate with a predicted blast radius of 800 feet and represent an unnecessarily high risk for our community. PERC should insist that the pipeline be sized to meet the projected natural gas demands of only the Northeast, allowing for little or no growth as alternate sources of electrical energy, such as hydro, solar, and wind become mainstream sources of energy. Selection of the smallest possible pipeline diameter required to serve the Northeast's energy demands could reduce any associated risks to our community.

Given the potential blast radius of the proposed pipeline a detailed emergency response plan is necessary. A full independent risk analysis is requested that includes identification of risk scenarios and response, including equipment, communications, and personnel required to respond appropriately. Such an analysis should include not only the impact related to the thermal burn radius, but should also include the risk related to concussive impact following a blast and related shrapnel risk. Further, an analysis of potential risk related to pipeline failure should include an analysis of risk associated with NG build up and ignition in the valley areas downwind of the proposed pipeline.

*Emergency Response and Access*

The pipeline crosses the main road between the center of Conway and Shelburne Falls, bisecting the town west to east. Approximately 13% of residential structures in Conway are north of the proposed NED pipeline. In the event that Shelburne Falls Road were not passable, due to construction activities, road damage related to construction, or road damage related to a significant event, it is possible that Conway EMS (fire, ambulance, and police) would be unable to provide services to those north of the proposed NED pipeline. It is unlikely that Conway is alone in its concern for access of Emergency Responders in the event that construction or a significant incident impacts the integrity of roadways. Additionally, a full and independent analysis of town communication systems is necessary to ensure integrity in the event of a significant incident, especially given the potential for a multiple site mass casualty scenario.

It is expected that the applicant, KM, would be responsible for all costs associated with training of emergency management personnel, purchase, storage, and maintenance of all necessary equipment, and retain liability for any significant incident related to the proposed NED pipeline.

The impact to roadways, bridges, and related infrastructure.

The impact to the integrity of roadways in Conway is anticipated to be huge. Concerns relate to the impact both the weight of trucks and equipment traversing the roadways and the repetitive use of the roads by heavy equipment. Existing bridges and culverts are not currently rated for loads and use of equipment necessary for a major construction process. A full, detailed independent analysis of site specific road use is necessary. The analysis should include an assessment of load capacity for all roadways, bridges, and related infrastructure that may be used in the construction of the proposed pipeline. Road closures and alternative

plans should be included given that Shelburne Falls road is a major roadway and designated evacuation route in Conway, connecting neighboring communities. Analysis of impact of road closure should consider economic impacts to Conway and neighboring communities as well. Road closure analysis should take into consideration the impact to transportation for local schools as at least three school systems utilize Shelburne Falls road. Lastly, activities should be scheduled to avoid periods of seasonal thaw.

The town requests a detailed description of notification related to the construction of the proposed NED pipeline and a full disclosure of requirements, restrictions, and response time for the operational phase. It is expected that KM will again retain full liability for the project (during construction, operation, and decommissioning), maintain necessary insurance, and that the project will be fully bonded for the lifetime of the pipeline.

### **Concluding statements**

We request the following of the Energy Facilities Siting Board, of Governor Baker, and of FERC:

Restart the scoping process at such time as complete project information is available and can be evaluated appropriately in order comment on the environmental impacts of this project.

A full assessment of the need for this project should include a comprehensive analysis of alternative solutions and consideration of the cumulative environmental impact of the NED project in conjunction with ALL other projects purporting to meet the energy needs of the Commonwealth.

Additionally your evaluation of the merits of this project results should incorporate the study commissioned by Attorney General Healy on the electric reliability needs, including natural gas capacity demand, for New England.

Re: Tennessee Gas Pipeline CO.'s Northeast Energy Direct proposed gas pipeline project  
Kinder Morgan Project  
Project Docket number PF14-22-000

Mailed by United States Postal Service mail and sent electronically ,  
To Whom It May Concern ,

This letter is being submitted by the Conservation Commission for the Town of Conway, Massachusetts. We are requesting you consider the following and the enclosed information as you review the pending Tennessee Gas Pipeline CO.'s Northeast Energy Direct (TGPIKM) project application. Our comments are made as the duly appointed Conservation Commission for the Town of Conway, Massachusetts.

Our statutory and regulatory jurisdiction is pursuant to the provisions of Massachusetts General Laws (MGL) Chapter 131 section 40 (The Massachusetts Wetlands Protection Act), Chapter 258 of the Acts of 1996 (The Massachusetts Rivers Act), The Code of Massachusetts Regulations (CMR) set forth in 310 CMR 10.00 et. seq., and the Massachusetts Stream Crossing Standards. Our Commission is commenting only on issues within these areas of jurisdiction.

The proposed pipeline project in its projected location will cross the entire Town of Conway from west to east.

We have been advised, according to a notice issued by The Federal Energy Regulatory Commission (FERC) on June 30, 2015, that the Federal Energy Regulatory Commission, within its review of the TGPIKM project application, will analyze steps to "avoid, minimize or mitigate the impacts" of the environment. This submission is intended to address these issues. We have attached to this letter a report we have commissioned on these issues. As you can see from the report there are multiple and significant environmental issues affecting critical habitat, the environment, wetland areas, and river areas. There are at least three substantial stream and river crossings. In the submitted report we have highlighted four (4) critical areas as examples. This report is not intended to be a conclusive as to all critical or impacted areas, but rather is to support that it will be crucial, given the highly sensitive nature of the ecosystems that may be impacted, to, before any work is commenced, carefully study and then condition any work to avoid impacts, minimize impacts, and mitigate impacts both to the aquatic system and supporting terrestrial ecosystems.

It is our Commission's conclusion, supported by the report, that these issues must be fully evaluated and addressed in a Notice of Intent (the regulatory process for permitting proposed projects) to be filed by the applicant (we have been advised that the applicant intends to comply with the regulatory authority set forth in 310 CMR 10.00 et. seq.). These issues should be analyzed in detail and scientifically approached, and must be fully completed and submitted to FERC prior to any PERC approval of the project in order to allow FERC to analyze steps to "avoid, minimize or mitigate impacts" of the environment as FERC has indicated needs to be done (see above).

The report, submitted by the Commission as an attachment to this letter, is not intended to be a substitute for a full evaluation of the entire proposed project location; but rather the report submitted by the Commission is intended to support our determination that a complete analysis will be needed with evaluations along the entire proposed project location,

It cannot be stressed enough that the proposed project, whatever the merits are, is planned to go through highly sensitive ecosystems and thus the proposed work must be carefully conditioned to avoid impacts, minimize impacts, and or mitigate impacts to both the aquatic systems and the supporting terrestrial ecosystems.

We thank you for your consideration.

Very truly yours,

Conway Conservation Commission

July 28, 2015

Mr. John Gates, Chair

Conway Conservation Commission

PO Box 240

Conway, MA 01341

Re: Preliminary Wetland Resource Area Review

Tennessee Gas Pipeline Company, LLC.

Northeast Energy Direct Project

Proposed Pipeline Route

Conway, MA

Dear Mr. Gates and Commissioners:

Per your request, Stockman Associates LLC performed a preliminary review of the wetland resource areas located within the proposed Tennessee Gas Pipeline Company, L.L.C. (TGP) Northeast Energy Direct Project pipeline route within the town of Conway. The proposed pipeline location was provided by the Conway Conservation Commission; the majority of the footprint is within and along the existing high-tension line easement. During the review process, a potential modification of the easterly extent of the proposed footprint, veering to the north of the existing easement was indicated by the Commission. The goal of the review was to assist the Conway Conservation Commission with an initial review and inventory of protected inland wetland resource areas.

Based on a desktop review of current MassGIS and USDNRC Soil Survey mapping as well as a field inspection of portions of the route, the proposed pipeline route crosses a number of sensitive wetland resource areas subject to protection under the Massachusetts Wetlands Protection Act (MA WPA) and its regulations, which the Conway Conservation Commission is charged with upholding. Inland wetland resources, which will be impacted by the proposed route include, Bank (310 CMR 10.54), Bordering Vegetated Wetlands (310 CMR 10.55), Land under Water Bodies and Waterways (310 CMR 10.56), Land Subject to Flooding (310 CMR 10.57), Riverfront Area (310 CMR 10.58) and potential vernal pool habitat. In addition, the proposed route will impact Priority Habitat of Rare Species, Estimated Habitat of Rare Wildlife, Core Bio Habitat and Coldwater Fish Resources designated by the Massachusetts Natural Heritage Endangered Species Program (MA NHESP) and the Massachusetts Division of Fisheries and Wildlife. The pipeline route may also contain isolated wetlands subject to federal and state protection under Section 401 and 404 of the Clean Water Act.

As stated in 310 CMR 10.00, any proposed work within protected wetland resource areas is subject to the associated performance standards set forth in the regulations for each specific inland resource area. While certain projects may be permitted as limited projects under 310 CMR 10.53 (i.e., utilities), these limited projects must demonstrate that the proposed activity meets the regulatory definition of a limited project and meets the required performance standards to the maximum extent feasible. Avoiding, minimizing and mitigating for impacts is an essential component of the protection of wetland resource areas at the eight interests

of MA WPA. which they serve.

The attached information summarizes the findings of four (4) specific areas visited along the proposed pipeline route. This information serves to provide an example of some of the unique ecosystems located along the proposed route and should not be considered as a complete inventory. On the contrary, the entire route throughout Conway contains numerous protected ecosystems, both mapped and unmapped, all of which require diligent study, delineation, and review to ensure necessary protection.

Sincerely,

Emily Stockman, M.S., P.W.S  
Senior Scientist/Owner  
Stockman Associates LLC

Stephen August, Presiding Officer  
Massachusetts Energy Facilities Siting Board  
One South Station  
Boston MA 02110

Re: Request for Comment on Northeast Energy Direct Project proposed by Tennessee Gas Pipeline Company (hereafter "TGP")

The Town of Deerfield (hereafter "Town") recognizes that the Energy Facilities Siting Board (hereafter "EFSB") has primary jurisdiction over the siting of intrastate natural gas pipelines in the Commonwealth of Massachusetts, and participates actively in the Federal Energy Resources Regulatory Commission siting process. At the EFSB Siting Board hearing on August 5, 2015 in Greenfield, Massachusetts, the Town stated its position on the Northeast Energy Direct project (hereafter "Project"). However, we would like to take this opportunity to submit the following written comments for your review.

Dear Mr. August:

The Town of Deerfield (hereafter "Town") recognizes that the Energy Facilities Siting Board (hereafter "EFSB") has primary jurisdiction over the siting of intrastate natural gas pipelines in the Commonwealth of Massachusetts, and participates actively in the Federal Energy Resources Regulatory Commission siting process. At the EFSB Siting Board hearing on August 5, 2015 in Greenfield, Massachusetts, the Town stated its position on the Northeast Energy Direct project (hereafter "Project"). However, we would like to take this opportunity to submit the following written comments for your review.

On August 20, 2014, the Board of Selectmen voted a resolution to ban the project from the Town of Deerfield. In addition to that action, on October 22, 2014, the Board of Health issued an order banning construction and operation of the project. Both documents are attached to this letter for reference.

The bottom line, as the Town of Deerfield perceives siting evaluation of the project, is whether this Project benefits the public good. With that in mind and on behalf of the residents, business owners and institutions of the Town of Deerfield, we respectfully request that the following items be considered as part of the siting process by EFSB:

**PUBLIC SAFETY**

The Town of Deerfield considers public safety of vital concern. With terrorism threats rising around the

world the Town is very aware that an attack on the pipeline could be a considerable threat to the residents and visitors in the area. The resources necessary to secure the pipeline, and protect residents and the region at large, both during construction and after the pipeline is operational, will require significant investment, money that the Town does not have.

## CONSTRUCTION

We believe that construction impacts will be a significant detriment to the Town's infrastructure. Additionally, we are concerned that there could be an adverse effect on railroad infrastructure and environmental remediation activities, as well as harm to private property.

## ECONOMIC

The construction and operation of the pipeline could create significant impacts on farming and other agricultural activities, resulting in significant loss of revenue for established farms. Operational projects along the pipeline route are a very real concern. There is a real threat to revenue generated by recreation activities, retail establishments, and historical enterprises. Ultimately, if there is significant loss of income and adverse effects on commerce in Town, companies could relocate away from Deerfield; leading to a loss of tax revenue. That loss of tax revenue will put a substantial burden on home owners in the Town.

Evidence from other areas of the country shows that energy infrastructure projects adversely affect the sale, financing and insuring of private homes. Though Deerfield is not in an active drilling area, there is concern that lenders and insurers will increase rates and premiums, due to the proximity of the pipeline.

The Town is troubled that, in addition to these factors, both personal and private property tax revenue could be decreased. Obviously, this directly affects municipal budgets; the critical funding source of efficient and effective municipal operations. Despite the assurances of proponents of the Project that towns will see tax revenue from the pipeline, there is presently no information available to us that marked revenue may be realized. Directly related to the above, the Massachusetts Department of Revenue (hereinafter "DOR") will have sole control of the tax rates producing that revenue stream to towns. Again, there is no information by which towns can gauge the revenue; the lack of sufficient information is notable and disquieting. However, additional information may be forthcoming as evaluation of the project and its impacts proceeds.

As it is proposed presently, the cost of the construction of the pipeline will fall to the taxpayers of the Commonwealth of Massachusetts. This represents an unfair burden on residents of the state, particularly as many could face a devaluation of their property and hardships associated with that decrease in equity. Residents may not see any corresponding benefits from the increased transmission of natural gas through the state. It is a fact that the Commonwealth of Massachusetts is one of the most expensive states in which to live. Given the possible impact on residents' property valuations, this project represents yet one more hardship faced by taxpayers.

Mindful of the detriment the project will have on residents and property owners from a tax and property value perspective, the Town questions whether that the project will increase jobs beyond construction. However, as evaluation of the project continues, Tennessee Gas pipeline, LLC may be able to further clarify that issue.

## CONSERVED LAND, OPEN AND RECREATIONAL SPACE

Conserved and Preserved Lands, Open Space and Recreational resources are a major concern. Construction and operation activities will have a significant impact on agricultural and recreational resources. Activities along the open space and preserved lands near the Connecticut and Deerfield Rivers, the Pocumtuck Ridge hiking range, and bicycling routes are threatened.

## ENVIRONMENTAL

The environmental effects of the pipeline construction and operation loom large. Notwithstanding any other consideration or concern, we request that this project fully comply with the provisions of the Environmental Protection Act, the National Environmental Policy Act, the Endangered Species Act, the National Historic

Preservation Act, the Magnuson-Stevens Act, and the Massachusetts Environmental Policy Act ( MEPA ). Possible degradation of air quality, geology, and water resources will directly affect residents and visitors to the Town of Deerfield. The Town is concerned about the impact to water resource areas such as wetlands and drainage areas, both private and public water supplies, reduction of capacity in bedrock wells, and groundwater flow patterns. We are also concerned about the potential impacts from blasting during construction. The installation of pipe in the frost zone, and the lack of proper bedding, could reduce pipe integrity.

#### HISTORIC

The possible siting of a metering station on Routes 5 gr 10 could be a significant impact to both the historical and educational institutions nearby. Pocumtuck Valley Memorial Association and Historic Deerfield are world renowned for their preservation of Old Deergeid, and the region; the pipeline represents a very real threat to their conservancy efforts, and could impart Old Deerfield's vital historical presence. Old Deergeld hosts three important educational Institutions; Deerfield Academy, Eaglebrook School, and the gement School. These institutions maintain an educational mission natlonagy and internationally which is a direct benefit to the community. It is very important to the Town that these institutions not suffer any effects from the siting of the pipeline.

#### GOVERNMENTAL OVERSIGHT

If this project is approved by the FERC, the Town respectfully requests that, as with any large project, the Town retains its authority to conduct Site Plan Review and Conservation Commission review in accordance with the gylaws of the Town of Deerfield, and the General Laws of the Commonwealth of Massachusetts. These review processes will allow the Town to implement conditions that, while not prohibiting the installation of the pipeline, will serve to minimize the impact of the project on local resources.

On a related note, we believe that the EFSB should consider possible impacts on the Commonwealth of Massachusetts of allowing TGP any relief from permitting requirements, induding fees and charges associated with said permits. It may be of vital importance to preserve those revenue sources due to the high costs of oversight associated with the project.

Attorney General Maura Healy has proposed to examine options to address electricity reliability needs in the New England Region. The study Is Intended to provide an assessment of costs and benefits, including price impacts, of each option, consistent with the region's energy and climate goals. A key focus of the study will be the question of whether more natural gas is needed in the region, and if so, how much more capacity is needed. Analysis Group, a Bostonbased economic and financial consulting firm, will begin work on the study, which is slated to be completed by October 2015. The Town supports Attorney General Healey's efforts and respectfully asks EFSB to request that FERC suspend their process until the report has been completed.

As you can see, there are many issues facing the residents and officials in the Town of Deerfiejd. We respectfully ask that EFSB consider these concerns as part of their siting process for submission to FERC. We believe it is vital for these issues to be represented to state and federal officials as there will be a detrimental impact on the Town and residents.

On behalf of residents in the Town of Deerfield, we thank you for your time and effort throughout the siting process.

Sincerely,

Carolyn Shores Ness, Chair  
Mark E. Gilmore  
David W. Wolfram

**RESOLUTION TO BAN KINDER MORGAN ENERGY PARTNERS AND ITS  
SUBSIDIARY TENNESSEE GAS PIPELINE CO.'S PROPOSED GAS PIPELINE  
EXPANSION IN DEERFIELD, MASSACHUSETTS**

WHEREAS, Kinder Morgan Energy Partners and its subsidiary Tennessee Gas Pipeline Co. have proposed to build a new 30"-36" high-pressure pipeline, also known as the Northeast Expansion Project, for the transport of "fracked gas" from Richmond to Dracut, Massachusetts; and

WHEREAS, the currently proposed route for this pipeline would cut across Deerfield, passing through or near several private residences, town property, and a number of environmentally sensitive areas, requiring roughly 75' Right of Way that would be denuded of all vegetation except grass and maintained through the use of herbicides; and

WHEREAS, high pressure pipelines of this kind carry inherent risks such as leaks and ruptures, and as conveyors of flammable gas, can and have caused accidents resulting in explosions and major fires that have been occurring across the United States with greater frequency; and

WHEREAS, town taxpayer money would pay for emergency response in the event of explosions, fires or other accidents since Kinder Morgan Energy Partners (as a gas utility) and its subsidiary Tennessee Gas Pipeline Co. is exempt from liability in addition to being exempt from the Clean Air Act, the Clean Water Act, the Safe Drinking Water Act, and the Superfund Act; and

WHEREAS, the pipeline, while being owned and operated by a private "for profit" company, would be paid for by Massachusetts ratepayers through an electric utility bill tariff; and

WHEREAS, the pipeline, with its environmental impact on scenic vistas, open space, farmland, and recreation, will adversely affect community appeal and quality of life in Deerfield; and

WHEREAS, landowners would be detrimentally affected through devaluation of property and difficulty procuring homeowners insurance; and

WHEREAS, this pipeline is inconsistent with what we treasure in Deerfield and would provide no benefit to the town or its residents; this gas is not intended for use in Deerfield and any monies paid to the Town by Kinder Morgan Energy Partners and its subsidiary Tennessee Gas Pipeline Co. would not compensate the Town for the environmental losses and liabilities caused by the pipeline;

NOW, THEREFORE BE IT RESOLVED that the Board of Selectmen of the Town of Deerfield, at a duly posted and called meeting, hereby stand in opposition to Kinder Morgan Energy Partners and its subsidiary Tennessee Gas Pipeline Co.'s pipeline expansion or any similar projects that may be proposed later within our Town borders; rescinds any permission that has been granted to Kinder Morgan and its subsidiary Tennessee Gas Pipeline Co. or its agents to survey Town of Deerfield property; and convey this resolution to the State and Federal Legislative Representatives of the Town of Deerfield and the Governor of the Commonwealth of Massachusetts, asking them to take action to prevent the construction of the pipeline within the borders of the Commonwealth of Massachusetts.

Given this Twentieth day of August in the year Two Thousand and Fourteen.

Carolyn Shores Ness, Chair  
Mark E. Gilmore, Selectman  
David W. Wolfram, Selectman

-----

TOWN OF DEERFIELD  
Board of Health

## BOARD OF HEALTH'S DECISION ON THE KINDER MORGAN PROPOSED PIPELINE

This matter has come before the Deerfield, Massachusetts Board of Health at the request of citizens of Deerfield that the Board hold hearings in order to determine whether the “fracked” gas pipeline Kinder Morgan Corporation proposes to build in Deerfield presents unreasonable risk to the health and lives of the citizens of Deerfield. For the reasons set forth below, the Board of Health of Deerfield does indeed find that the proposed pipeline presents an unreasonable risk to the health and lives of the residents of Deerfield and ORDERS Kinder Morgan or any of its subsidiaries or affiliated companies to immediately cease from carrying on activities in Deerfield associated with said pipeline.

### **I. Background**

Kinder Morgan is a Texas Corporation with headquarters in Houston, Texas and offices in Holyoke, Massachusetts. On or about February of 2014 Kinder Morgan announced that it planned to build a pipeline carrying natural gas produced by hydraulic fracturing–fracking–to transit the Town of Deerfield, Massachusetts.

On August 20, 2014 the Deerfield Board of Selectmen held a public hearing, at the request of Deerfield residents, to hear testimony about the concern many residents had over anticipated impacts of the proposed pipeline. In response, the Board of Selectmen issued a non-binding resolution in opposition to the installation of the pipeline on Deerfield's land.

Residents of the Town of Deerfield requested the Board of Health of Deerfield (“BaH”) on the same date, August 20, 2014, to hold hearings and determine, under the provisions of M.G.L. Ch. 111 §§s. 31 and 143, whether or not construction and operation of the proposed pipeline presents an unreasonable risk to the health and lives of residents of the Town of Deerfield. The Board of Health agreed to conduct the requested hearings and set a hearing date for September 9, 2014.

That same evening of August 20, 2014 BaH send an e-mail to the local representative of Kinder Morgan, notifying Kinder Morgan of the forthcoming hearing. (Ex.-1 at pg. 6). This e-mail communication was followed by a Certified Letter addressed to the General Counsel of Kinder Morgan on August 26, 2014 giving notice of the scheduled hearing. (Ex.-1 at pgs. 1-3). Joseph Listengart, General Counsel of Kinder Morgan, received the Certified Letter communication on September 3, 2014 (Ex.-1 at pg. 5). Kinder Morgan notified the BaH via telephone at approximately 12:30 PM on the day scheduled for the hearing, September 9, 2014, that Kinder Morgan would not be attending the hearing (Certified Transcript [“CT”] at pg.4).

The BaH went forward with the scheduled public hearing on September 9, 2014 as planned, at the auditorium of the Frontier Regional School in Deerfield. At this hearing the BaH introduced twelve exhibits into the hearing record (CT at pgs. 9-25). Exhibits 1-12 were introduced by the BaH for the truth of the matters asserted therein and without objection from Kinder Morgan.

Kinder Morgan was notified that the hearing had taken place in spite of their default absence and that BaH had granted Kinder Morgan fifteen days, ending on September 24, 2014, to comment on all matters and Exhibits presented at the hearing (CT at pg.5 and Ex.-13). Kinder Morgan defaulted failing to respond to the BaH request by the deadline set of September 24, 2014 at 4:00 PM (CT at pg. 24).

On September 24, 2014 Kinder Morgan wrote to the BaH, in a letter delivered on September 26, 2014, two days past the deadline, in response to BaH communications of August 26, 2014 (Ex.-1) and September 12, 2014 (Ex.-13).

In this defaulted letter, filed past the deadline set by the BOH, Kinder Morgan alleged that the Federal Energy Regulatory Commission (“FERC”) “will be the government agency responsible for reviewing”

the projected pipeline (Ex.-14). Kinder Morgan chose to ignore all facts introduced into the record of the BOH hearing of September 9, 2014.

## **II. Facts.**

### **a. Kinder Morgan’s subsidiary was convicted in California of six felony counts regarding the deaths of Javier Ramos, Israel Hernandez, Tae Chin, Victor Rodriguez and Miguel Reyes. (Ex.- 2)**

The Supreme Court of the United States has

... rejected the argument that political speech of corporations or other associations should be treated differently under the First Amendment simply because such associations are not “natural persons.” *Citizens United v. Federal Election Commission* Supreme Court of the United States 558 Us. 310at 343; 130 S. Ct. 876 at 900; 175 L. Ed. 2d 753 at 784 (2010)( citations omitted)

The order of the Supreme Court establishing that corporations cannot be treated differently from “natural persons”, albeit in the context of the First Amendment, gives clear indication to the BOH that a corporation cannot be treated differently from “natural persons” in the context of felonies committed.

Felons have limited rights in Massachusetts, i.e., cannot participate in elections as they cannot vote while incarcerated, cannot be members of the Gaming Commission, etc.

The Deerfield BOH hereby finds that a corporation convicted of felonies resulting in the tragic deaths of five people presents an unreasonable risk to the health and lives of residents of Deerfield if such felon were to be allowed to build a massive, high pressure fracked-gas pipeline, the dangers of which will be enumerated in the sections which follow.

### **b. Kinder Morgan’s Safety Violations and Accidents (Ex.2)**

Kinder Morgan was cited by the Hazardous Materials Safety Administration for violating its regulations five times in 2011 (Ex.-2 at pg.-4).

In Texas, alone, from 2003 to 2014 Kinder Morgan experienced 36 “significant incidents” resulting in fatalities or hospitalization, fires, explosions or spills (Ex-2 pgs. 4 and 5, describing the incidents in detail with adequate references).

The Deerfield BOH hereby finds that allowing a corporation known to have acted with such willful disregard for regulations enacted to prevent injury to or death of residents and citizens to build and operate a massive high pressure “fracked” gas transportation pipeline through the town would present unreasonable risk to the health and lives of residents of Deerfield.

### **c. Kinder Morgan Has a Record of Bribery, Pollution, Fraud, Scams, Thefts, Deaths, Felonies, Environmental Disasters, Labor Violations, Unsafe Working Conditions, and Influence Buying. (Ex.-4 at pgs. 7-11).**

Kinder Morgan’s operations in Portland, Oregon, have been home to pollution, lawbreaking, and even bribery. (Ex.-4 at pg. 7).

The Federal Bureau of Investigations determined that between 1997 and 2001 “Kinder Morgan systematically scammed some of its customers, including the Tennessee Valley Authority (‘TVA’), a publicly owned provider of electricity in the mid-South” (Ex.-4 at pg.-7).

The same federal investigation found that at its Grand River Terminal in Kentucky, Kinder Morgan officials took coal from a customer’s stockpiles and resold nearly 259,000 tons (Ex.-4 at pg.-7).

In another case the US Environmental Protection Agency (“EPA”) fined Kinder Morgan \$613,000 for violations of the Clean Air Act after “regulators discovered that the company had been illegally mixing an industrial solvent described as a ‘cyclohexane mixture’ into unleaded gasoline and diesel” (Ex.-4 at pg-7).

In 2010 the federal government fined Kinder Morgan \$1 million for repeatedly violating the Clean Air Act. The US Department of Justice found that “among other crimes” Kinder Morgan managers lied in permit applications, stating that the company would control its pollution when all the while they knew the control equipment was not being operated or even maintained properly (Ex-4 at pg.-7).

Currently, Kinder Morgan is under investigation by the EPA for violating the federal Renewable Fuels Standard. Officials believe that Kinder Morgan purchased conventional fossil fuels while filing falsified documents certifying that the fuels came from renewable sources (Ex.-4 at pg-8).

The Deerfield BOH hereby finds that if allowed to build and operate a massive fracked gas transportation pipeline through the town, a corporation on the record as having acted with such willful disregard for regulations enacted to prevent injury to or death of residents and citizens would present unreasonable risk to the health and lives of residents of Deerfield.

**d. Kinder Morgan's Pipelines Have Endangered Lives in Many Communities across the United States and Canada.**

In 2007 a Kinder Morgan pipeline ruptured in Burnaby, British Columbia, forcing 50 families to evacuate their homes as oil rained down on a residential neighborhood (Ex.-4 at pg. 8).

In January of 2012 a Kinder Morgan storage facility in British Columbia spilled roughly 29,000 gallons of crude oil into the community of Abbotsford (Ex.4 at pg. 90).

In April of 2004 a long stretch of a Kinder Morgan corroded pipeline ruptured, spilling 123,000 gallons of diesel fuel into a sensitive saltwater wetland on San Francisco Bay. Kinder Morgan pled guilty on four counts relating to that spill as well as an unrelated spill in Los Angeles Harbor (Ex.-4 at pg. 9).

In November of 2004 an oil pipeline of a Kinder Morgan subsidiary burst in the Mojave Desert, sending a jet of fuel 80 feet into the air. The break closed the nearby interstate highway and contaminated more than 10,000 tons of soil in the habitat of the federally endangered California Desert Tortoise (Ex.-4 at pg. 10).

In 2005 Kinder Morgan spilled 70,000 gallons of fuel into Oakland's inner harbor, and then 300 gallons into the Donner Lake watershed in Sierra Nevada. And in 2007 the City of San Diego sued Kinder Morgan for falsifying records of the clean-up of a fuel leak that contaminated the aquifer (Ex.-4 at pg. 10).

In May of 2011 the US Pipeline and Hazardous Materials Safety Administration announced a proposed \$425,000 fine against Kinder Morgan for safety violations following a federal investigation into Kinder Morgan's having spilled 8,600 gallons of hazardous liquids in New Jersey (Ex.-4 at pg. 10).

In December of 2011 a two-year-old Kinder Morgan natural gas pipeline leaked in Ohio, spewing 127,000 cubic feet of natural gas and forcing residents to evacuate their homes (Ex.-4 at pg. 10).

The Deerfield BOH hereby finds that allowing a corporation with a known record of endangering the lives of residents across North America to build and operate a massive fracked gas transportation pipeline through the town would present unreasonable risk to the health and lives of residents of Deerfield.

**e. Pipeline Transportation of Fuels is a Dangerous Operation in the United States and Worldwide.**

From 2000 to 2009 there were 460 accidents on record related to pipeline discharges of fuels, whether gas or liquids, in the United States (Ex.-5 at pgs. 1 to 23). Pipelinelated incidents have brought pipeline safety to national -and presidential - attention (Ex.-6 at pgs. 1-5).

From 1994 through 2013 the United States had 745 serious incidents with gas distribution, causing 728 fatalities, 1059 injuries, and \$110 million in property damage (Ex.-7 at pg.-2).

National Public Radio reported in January of 2014 that more than 6,000 leaks of gas had occurred in the District of Columbia alone (Ex.-8 at pgs. 1-4). In Massachusetts in the last ten years it has cost consumers more than \$1.5 billion for fuel leaked from pipelines (Ex.-9 at pgs. 1-4).

The Deerfield BOH hereby finds that there is a danger to the health and lives of residents of Deerfield if the BOH were to permit construction and operation of natural gas pipeline within the town of Deerfield, particularly when the company constructing and operating the pipeline is Kinder Morgan, as per sections a to d above.

**f. Kinder Morgan's Official, Mark Hamrich, Reported at a Public Meeting Held at Greenfield Community College on July 14, 2014 that Kinder Morgan Does Not Know the Composition of the Gas Resulting from Fracking to be Transported in the Proposed Pipeline.**

Fracking is a process designed to extract gas from shale buried in the soil. Fracking fluid is a toxic brew consisting of multiple chemicals which may include toxic materials such as petroleum distillates, ethylene glycol, methanol, polyacrylamide and many others (Ex.-11 and Ex-12 at pgs. 1-3).

Kinder Morgan has not denied that some of these fracking chemicals might be present in the fracked gas to be transported through the pipeline.

The Deerfield BOH finds the statement by Mark Hamrich of Kinder Morgan at an open meeting disingenuous as the actual composition of the gas in the pipeline can be established at any time by simple gas and/or liquid chromatography analysis.

The Deerfield BOH hereby finds that the unknown composition of the gas in the pipeline does indeed present a danger to the health and lives of residents of Deerfield if the BOH were to permit construction and operation of natural gas pipeline within the town of Deerfield, particularly when the company constructing and operating the pipeline, Kinder Morgan, does not know the composition of the gas to be transported through the pipeline.

**g. Many Residents of Deerfield Have Shallow Wells Which Might Be Contaminated by Leaks from the Proposed Pipeline, and There is No Evidence that the Proposed Pipeline Will Not Disturb the Aquifer and thus Endanger Residents of Deerfield (CT at pages 21-22).**

The Deerfield BOH hereby finds that given possible contamination of the fracked gas with fracking chemicals from possible corrosion and leaks from the pipeline that installation of the massive pipeline through Deerfield will indeed endanger the health and lives of the residents of Deerfield by contaminating drinking water drawn from the shallow wells of many Deerfield residents.

**III. The Board of Health of Deerfield Has Authority to Prevent the Construction and Operation of the Proposed Pipeline Within the Confines of the Town of Deerfield.**

**a. The Board of Health of Deerfield Has Authority under M.G.L. Ch. 111 §§. 31 and 143 to Conduct Hearings and Determine Whether or Not the Proposed Kinder Morgan Pipeline Presents an Unreasonable Danger to the Health and Lives of the Residents of Deerfield.**

Kinder Morgan, in a belated letter arriving at the offices two days after the close of comments on the subject matter of the hearings (Ex.-14), implies that any resolution by the BOH in this matter is inconsistent with the Federal Constitution and Federal statutes, and thus that it is invalid under the supremacy clause of the United States Constitution, Art. VI, cl. 2.

This argument has been dealt adequately by the Supreme Court of Massachusetts in *Arthur D. Little v. Commissioner of Health of Cambridge* 395 Mass. 535; 481 NE.2d 441; 1985 Mass. LEXIS 1720(1985).

The Supreme Court considered the argument in light of two principles which are traditionally the basis of preemption analysis.

First, “[p]reemption ... is not favored, and State laws should be upheld unless a conflict with Federal law is clear.” *Attorney Gen. v. Travelers Ins. Co.*, 385 Mass. 598,602 (1982) (*Travelers 1*), vacated, 463 U.S. 1221 (1983), reaffirmed, 391 Mass. 730 (1984), *aff’d sub nom. Metropolitan Life Ins. Co. v. Massachusetts*, 471 U.S. 724 (1985). See *Commonwealth v. McHugh*, 326 Mass. 249, 265-266 (1950); *Exxon Corp. v. Governor of Md.*, 437 U.S. 117, 132 (1978). State law is not preempted merely by reference to some vaguely defined Federal policy, or on the ground that Congress has enacted a statute which is tangentially relevant to the subject at issue. Instead, the plaintiff here is obligated to show preemption “with hard evidence of conflict ... on the basis of the record evidence in this case.” *Grocery Mfrs. of Am., Inc. v. Department of Pub. Health*, 379 Mass. 70, 81-82 (1979), quoting *Kargman v. Sullivan*, 552 F.2d 2, 6 (1st Cir. 1977). Generally speaking, “a finding of no preemption is regarded as preferable because Congress can overrule it by appropriate legislation, while a finding of preemption cannot be changed by the states.” *Agency Rent-A-Car, Inc. v. Connolly*, 686 F.2d 1029, 1038 (1st Cir. 1982). See *Pacific Gas & Elec. Co. v. State Energy Resources Conservation & Dev. Comm’n*, 461 U.S. 190, 216 (1983).

Secondly, the Court argued that the Supreme Judicial Court of the Commonwealth and the United States

Supreme Court have been particularly reluctant to overturn State laws which are “deeply rooted in local feeling and responsibility.” *Travelers L supra* at 611, quoting *San Diego Bldg. Trades Council v. Garmon*, 359 U.S. 236, 243-244 (1959). *Massachusetts Elec. Co. v. Massachusetts Comm’n Against Discrimination*, 375 Mass. 160, 174 (1978). This principle applies with special force to laws designed to protect the public health and welfare, a subject of “particular, immediate, and perpetual concern” to any municipality 6 E. McQuillin, *Municipal Corporations* §24.01 (3d ed. rev. 1980). In fact, according to an early decision of the Massachusetts Supreme Judicial Court, *Vandine, petitioner*, 6 Pick. 187, 191 (1828), “[t]he great object of the city is to preserve the health of the inhabitants.” Accordingly, municipal health and safety regulations, such as that at issue here, carry a heavy presumption of validity and are only rarely preempted by Federal law. *Travelers L supra* at 612. See *Malone v. White Motor Corp.*, 435 U.S. 497, 513 n.13 (1978). “The States traditionally have had great latitude under their police powers to legislate as ‘to the protection of the lives, limbs, health, comfort, and quiet of all persons.’” *Metropolitan Life Ins. Co. v. Massachusetts*, 471 U.S. 724, 756 (1985), quoting *Slaughter-House Cases*, 16 Wall. (83 U.S.) 36, 62 (1873). *Huron Portland Cement Co. v. Detroit*, 362 U.S. 440, 442-443 (1960).

**b. The Federal Energy Regulatory Commission Cannot Prevent the BOH of Deerfield from Issuing Regulations Safeguarding the Health and Lives of the Residents of Deerfield.**

The law created by Congress designed to regulate pipeline transportation of natural gas in the United States is the Natural Gas Act, 15 USCS §§ 717 et seq. The Federal Energy Regulatory Commission is the agency created by Congress to enforce the Natural Gas Act.

The purpose of The Natural Gas Act is to protect consumers against exploitation .... The Natural Gas Act was intended to provide, through exercise of national power over interstate commerce, agency for regulating wholesale distribution to public service companies of natural gas moving interstate, which United States Supreme Court has declared to be interstate commerce not subject to certain types of state regulation .... Congress, in drafting Natural Gas Act, was not only expressing its conviction that public interest requires protection of consumers from excessive prices for natural gas, but was also manifesting its concern for legitimate interests of natural gas companies in whose financial stability gas-consuming public has vital stake .... Purpose of Congress in enacting Natural Gas Act was to create comprehensive and effective regulatory scheme, and to underwrite just and reasonable rates to consumers of natural gas .... Primary aim of Natural Gas Act is to protect consumers against exploitation at hands of natural gas companies; to that end, Congress created comprehensive and effective regulatory scheme .... Purposes of Natural Gas Act are to protect consumers against exploitation at hands of natural gas companies, to underwrite just and reasonable rates to consumers of natural gas, and to afford consumers complete, permanent, and effective bond of protection from excessive rates and charges .... Primary aim of Natural Gas Act is protection of consumers against exploitation at hands of natural gas companies, and congressional intent is to give Federal Power Commission [now FERC] jurisdiction over rates of all wholesale sales of natural gas in interstate commerce .... Natural Gas Act is intended to create, through exercise of national power over interstate commerce, agency for regulating wholesale distribution to public service companies of natural gas moving interstate, and is, for this purpose, expected to balance investor and consumer interests; Federal Power Commission’s [now FERC’s] responsibilities include protection of future, as well as present, consumer interests .... Fundamental purpose of Natural Gas Act is to assure adequate and reliable supply of gas at reasonable prices .... Basic purpose of Natural Gas Act is protection of public interest .... Purpose of Natural Gas Act is to underwrite just and reasonable rates to consumers of natural gas .... Protection of interest of consumers in adequate supply of gas at reasonable rates is overall purpose of Natural Gas Act. ... Purposes of Natural Gas Act, including that of protecting consumers from prices which are forced above just and reasonable level by market power of natural gas suppliers, impose limits on Federal Power Commission’s [now FERC’s] broad discretion to devise methods of natural gas regulation capable of equitably reconciling diverse and conflicting interests .... Purpose of regulation under Natural Gas Act is to provide reliable and adequate supply of gas for interstate market at

lowest reasonable cost; Federal Power Commission [now FERC] must regulate, through application of Act, in such manner as to encourage exploration, development, and dedication of natural gas to interstate market. ... It is not purpose or intent of Natural Gas Act to interfere with intrastate transportation, sale, or use of natural gas, and Act was not designed to limit state authority to prevent waste in its natural gas resources. [(Natural Gas Act 15 USCS §717 Section III (A) (2)] (Citations Omitted).

**c. Safeguarding the Health and Lives of Residents of Towns in Massachusetts by Boards of Health Is Not a Preempted Activity by The Natural Gas Act.**

These are the State Activities preempted by the Natural Gas Act according to the Statute and Court decisions, (Court Citations Omitted):

Natural Gas Act preempts regulatory powers over transportation and sale of natural gas in interstate commerce. . . . Congress meant by Natural Gas Act to create comprehensive and effective regulatory scheme, complementary in its operation to those of states and in no manner usurping their authority .... Natural Gas Act does not envisage federal regulation of entire natural gas field to limit of constitutional power, but contemplates exercise of federal power as specified in Act, particularly in that interstate segment which states are powerless to regulate because of commerce clause of Federal Constitution .... Congress, in enacting Natural Gas Act, did not intend to cut down state regulatory power, but rather to supplement it by closing gap between federal and state powers created by prior decisions of United States Supreme Court .... Congress, in enacting Natural Gas Act did not give Federal Power Commission [now FERC] comprehensive powers over every incident of gas production, transportation, and sale; rather, Congress invested Commission with authority over certain aspects of this field, leaving residue for state regulation; however, from fact that Congress intended to impose comprehensive regulatory system on transportation, production, and sale of gas, it follows that as to problem which is not, by its very nature, one with which state regulatory commissions can be expected to deal, Congress desired regulation by federal authority rather than no regulation. . . . Interstate sales of gas are not to be determined by case-by-case analysis of impact of state regulation upon national interest. ... Congress meant by Natural Gas Act to create comprehensive and effective regulatory scheme of dual state and federal authority, and, from this fact, it follows that as to problem which is not, by its very nature, one with which state regulatory commissions can be expected to deal, Congress desired regulation by federal authority rather than no regulation; when dispute arises over whether given transaction is within scope of federal or state regulatory authority, problem should not be approached negatively, thus raising possibility that “no man’s land” will be created; in borderline case where congressional authority is not explicit, crucial question is whether state authority can practicably regulate given area, and, if it cannot, federal authority governs .... Congressionally designed interplay between state and federal regulation under Natural Gas Act does not permit states to attempt to regulate purchasing decisions of interstate pipelines in mere guise of regulating natural gas production .... Congress, in enacting Natural Gas Act (15 USCS §§ 717 et seq.), did not envisage federal regulation of entire natural gas field to limit of federal constitutional power; rather, Act is designed to supplement state power and to produce harmonious and comprehensive regulation of industry, and neither state nor federal regulatory body is to encroach upon jurisdiction of other. ... In passing Natural Gas Act, Congress took care not to intrude unnecessarily upon state prerogatives; Congress did not intend Federal Power Commission [now FERC] to act as local forum on matters over which it had no regulatory jurisdiction .... Federal regulatory control is proper during period from time that Federal Power Commission [now FERC] has made determination that federal jurisdiction exists until conclusive upholding of such finding by last available court, and state authorities have no right to regulate unfettered merely because courts have not conclusively reviewed Commission’s finding of jurisdiction .... In borderline cases under Natural Gas Act (15 USCS §§717 et seq.) involving respective ambits of state and federal regulatory authority, courts ask whether it is within capability of states to regulate in accordance with purposes of Act, and if it is not, courts can preserve efficacy of Act only by determining that federal authority prevails .... Under Natural Gas

Act, regulation of interstate transportation and sale for resale of natural gas is committed exclusively to jurisdiction of Federal Power Commission [now FERC], and jurisdiction over such transactions cannot be asserted by state agency. Courts have subject matter jurisdiction under 28 USCS § 1331 in action in which companies sought declaration that zoning amendment providing for absolute prohibitions and limitations on siting of liquefied natural gas facilities was preempted by Natural Gas Act, and also sought injunction barring enforcement of amendment because complaint sought both declaratory and injunctive relief on grounds of preemption .... If Natural Gas Act, 15 USCS §§ 717 et seq., grants jurisdiction to Federal Energy Regulatory Commission over matter, its jurisdiction is exclusive .... Gas producers do not have “natural” monopoly power; that is, the industry does not possess the inherent technical characteristics that prevent its efficient and economical operation unless operated as a monopoly. Therefore, the theory that a regulatory agency is necessary to represent consumers when they bargain on rates with a natural monopolist like a utility no longer applies to gas production; FERC has a fundamentally different regulatory obligation, a narrower authority to administer the NGPA and to prescribe higher price ceilings only in certain circumstances .... Regulation of natural gas companies engaged solely in interstate commerce and sale for resale has been preempted by federal government. ... Natural Gas Act was so framed and enacted as to complement and in no manner usurp state regulatory authority .... Where natural gas company was not engaged in exclusively interstate operations, state control was not precluded by Natural Gas Act. Natural Gas Act 15 USCS §717Section III (B)(6) (Citations Omitted).

The Natural Gas Act is primarily concerned with safeguarding consumer financial protection from predatory practices of corporations involved in natural gas transportation. Thus it specifically pre-empts certain activities .... Order of state regulatory agency requiring interstate natural gas pipeline company to take gas ratably, in proportion to shares of various well owners and operators, from common gas pool and to purchase gas under nondiscriminatory conditions is pre-empted by comprehensive scheme of federal regulation .... When applied to “natural gas companies” within meaning of Natural Gas Act (NGA) (15 USCS §§ 717 et seq.), state statute under which state’s public service commission regulates issuance of securities by public utilities transporting natural gas in interstate commerce is preempted by NGA as regulation of natural gas companies’ rates and facilities .... Interstate natural gas pipelines operate within field--reserved under Natural Gas Act (15 USCS §§ 717 et seq.) for federal regulation--ofbuying gas in one state and transporting it for resale in another, so inevitably states are preempted from directly regulating such pipelines in such way as to affect pipelines’ cost structures . ... Needs of metropolitan area for adequate and efficient supply of natural gas outweighed state’s plan for community development, and therefore regional development commission’s action in refusing to issue permit for construction of natural gas plant was arbitrary and unwarranted imposition on interstate commerce in conflict with Natural Gas Act. ... Oklahoma statute providing that pipeline company, on request, shall furnish gas to one whose premises are crossed by its pipeline frustrates full effectiveness of Natural Gas Act because it frustrates exercise of power which Congress has delegated to Federal Power Commission [now FERC]; state statute violates supremacy clause and is without effect. ... Natural Gas Act (15 USCS §§ 717-717w) pre-empts state public utilities securities regulation law which requires public utilities, including natural gas companies as defined under 15 USCS §717a(6), operating in state to obtain approval of state’s public service commission before issuing long-term securities .... District Court properly determined that Oklahoma’s ratable take statute and implementing regulation, requiring interstate pipeline company to purchase natural gas from all producers of natural gas reservoir or field, was pre-empted by federal regulatory scheme established by Natural Gas Act (15 USCS §§ 717 et seq.) and Natural Gas Policy Act (15 USCS §§ 3301 et seq .... Under Natural Gas Act (15 USCS §§ 717 et seq.) Congress had implicitly preempted state regulation of interstate pipeline company’s direct transportation of natural gas from wellhead in Oklahoma to ultimate consumer in Michigan .... As applied to interstate pipeline construction, New York State regulatory scheme governing construction of natural gas transmission lines was preempted by Natural Gas Act (15 USCS §§ 717 et seq.), since Congress

intended to vest exclusive jurisdiction to regulate pipelines in FERC, and Congress had occupied field of regulation regarding interstate gas transmission facilities .... Oklahoma statute directly regulating interstate pipeline companies in their purchase of natural gas by rendering them liable to all royalty owners in entire drilling and spacing unit regardless of whether they had complied with their obligations to parties with whom they had contracted was preempted by Natural Gas Act (15 USCS §§ 717 et seq.) as amended by Natural Gas Policy Act (15 USCS §§ 3301 et seq.) insofar as state statute applied to interstate pipelines engaged in purchase of natural gas .... In case involving natural gas pipeline regulation, Iowa provisions regulated in federally occupied field because (1) Federal Energy Regulatory Commission (FERC) considered environmental concerns and specifically addressed issues of soil preservation and land restoration, which were very areas that board members wished to regulate, (2) there was substantial potential for collision between Iowa provisions and FERC plan in that Iowa regulations imposed additional requirements in number of areas, (3) imminent possibility of collision between Iowa provisions and federal regulatory scheme affected ability of FERC to achieve uniformity of regulation, which was objective of NGA, (4) it was undeniable that Congress delegated authority to FERC to regulate wide range of environmental issues relating to pipeline facilities, and (5) because FERC had authority to consider environmental issues, states could not engage in concurrent site-specific environmental review; thus, Iowa's regulations were preempted by Natural Gas Act (NGA), 15 USCS §§ 717 et seq., and trial court did not err in granting summary judgment to gas companies granting permanent injunction in companies' favor. ... Rhode Island's Coastal Resource Management Program's Category B Assent (licensing) process required by 04-000-010 R.I. Code R. § § 100.1(A), (D), 300.1, clearly conflicted with exclusive authority of Federal Energy Regulatory Commission (FERC), which it had exercised in instant case, to license siting, construction, expansion, or operation of liquefied terminals under 15 USCS § 717b(e)(I); by finding dredging activities were part of construction and operation of terminal facility, FERC interpreted dredging at issue to be within its jurisdiction, and thus, assent process utilized by Rhode Island clearly collided with FERC's delegated authority and was preempted .... Where natural gas company could have raised question whether Natural Gas Act (15 USCS §§ 717 et seq.) preempted state franchise law before FERC at same time that company was raising question in state court, Court of Appeals would not require FERC to reopen proceedings at late date in order to permit introduction of preemption question .... On review--under §§ 1 and 5 of Natural Gas Act (15 USCS §§ 717, 717d)--of FERC Order No. 636, which comprehensively restructured natural gas industry through mandatory unbundling of sales and transportation services, court would uphold (1) FERC's jurisdiction to regulate re-sale of interstate-transportation rights in general, as well as specifically its jurisdiction over local distribution companies (LDCs) who broker capacity to local end-users and over municipal LDCs, (2) uphold FERC's decision that state authorized "buy/sell arrangements" are pre-empted by FERC's capacity-release program, and (3) uphold FERC's decision to exclude Part 157 shippers .... Where established course of business of gas distributing company is predominantly interstate, mere fact that some gas is sold and delivered in state of its origin affords that state no superior power to regulate or control transaction .... State constitutional provision and statute which gives state users first priority at obtaining new natural gas that may be found in state is invalid as being violation of Supremacy Clause of United States Constitution since these state provisions clearly frustrate Congressional intent to provide adequate and reasonably priced supply of natural gas for entire nation with equal access to both intrastate and interstate markets . ... Oklahoma ratable take provision in natural gas statute and regulation is unconstitutional where state attempted to prevent discrimination in favor of anyone common source of supply as against another by allowing state to skew free market for gas, because federal law and policy to allow price to be determined by free flow of commerce among states preempts state regulation .... Federal Energy Regulatory Commission's granting of certificate of public convenience and necessity for bypass transportation of natural gas preempts regulatory power of state public service commission, where bypass will allow direct transportation of gas from Oklahoma facilities to Michigan steel plant, because 15

USCS § 717(b) applies to this approved interstate transportation of gas, which is neither “other sale” nor “local distribution” within meaning of residual regulatory authority of states .... In interstate natural gas pipeline companies’ suit against state utilities board members, state laws relating to pipelines and land restoration, Iowa Code ch. 479A and 199 Iowa Admin. Code chs. 9 and 12, were preempted .... Amendment to county zoning regulation, which provided for absolute prohibitions and limitations on siting of liquefied natural gas (LNG) facilities, was preempted under Supremacy Clause of U.S. Const. art. VI by Natural Gas Act (NGA) because 15 USCS § 717b(e)(1) provided Federal Energy Regulatory Commission (FERC) with exclusive authority over siting of LNG terminals; NGA governed virtually every step of LNG facility’s siting, construction, and operation; zoning amendment conflicted with NGA by impeding upon FERC’s jurisdiction; and, although 15 USCS §717b-1 (b) required FERC to consult with state agencies on matters of local concern and 15 USCS §717b(d) reserved to states their delegated authority under certain environmental statutes, Congress intentionally structured NGA to give states no decision-making authority .... Requiring plaintiff natural gas company to obtain permit under Connecticut’s Structures, Dredging and Fill Act, Conn. Gen. Stat. §22a-359 et seq., for pre-construction, construction, and operation of its federally authorized gas pipeline conflicted with Federal Energy Regulatory Commission’s certifying project, and permit requirement was therefore preempted by Natural Gas Act. ... Because Natural Gas Act, 15 USCS §§717 et seq., and Federal Energy regulatory Commission’s regulations promulgated thereunder govern virtually every facet of liquefied natural gas facility’s siting, construction, and operation, Congress has occupied entire field of natural gas regulation and thereby preempted state assent processes .... Natural Gas Act (NGA), 15 USCS §§ 717 et seq., delineates specific areas of federal regulatory authority; section 1(b) of Natural Gas Act (NGA), 15 USCS §§ 717 et seq., gives Federal Energy Regulatory Commission plenary jurisdiction over three areas, and three areas only: (1) transportation of natural gas in interstate commerce, (2) sale in interstate commerce of natural gas for resale, and (3) natural-gas companies engaged in such transportation or sale .... State commerce commission is without authority to regulate issuance of securities issued by natural gas pipeline companies to finance construction and acquisition of facilities subject to jurisdiction of Federal Power Commission [now FERC]. Natural Gas Act 15 USCS §717Section III (B)(7). (Citations Omitted).

#### **IV. Conclusion**

The Deerfield BOH finds that the proposed hydraulic fracturing-fracking-pipeline will endanger the health and lives of the residents of Deerfield, and hereby bans the construction and operation of such pipeline within the boundaries of the Town of Deerfield. The Board of Health of Deerfield has the authority to ban construction and operation of the proposed pipeline and the Federal Energy Regulatory Commission does not have the legal authority to preempt the decision of the Board of Health.

#### **ORDER.**

For all the reasons stated in this opinion the Board of Health of Deerfield orders Kinder Morgan or any of its subsidiaries or affiliated companies to cease immediately all its activities in Deerfield related to construction of the proposed hydraulic fracturing pipeline within the boundaries of the town of Deerfield, Massachusetts.

So ORDERED.

Carolyn Shores Ness  
Chair, Deerfield Board of Health

Mark E. Gilmore  
Member, Deerfield Board of Health

David W. Wolfram  
Member, Deerfield Board of Health

To Whom It May Concern:

In regard to the NED Pipeline project, I would like to assert that there is no site in Massachusetts where a new 30 or 36 inch gas pipeline would be acceptable.

This project has arisen in conjunction with the work of ISO-NE. ISO-NE wears three hats: overseeing day-to-day operations; developing and administering regional wholesale electricity markets; and managing comprehensive regional power system planning. I am wondering if ISO-NE is wearing too many hats, and has not had sufficient consultation and dialogue with the community about their recommendations.

In the "2013 Regional Electricity Outlook" report of ISO-NE, I see the genesis of the NED Pipeline developing. It is not entirely clear how ISO-NE arrived at the plan. They expressed concern with over-reliance on a single source of energy before then going on to enlist in more reliance on natural gas as a good thing. I am not sure it is a good thing that they have moved from concern to piling on the bandwagon for natural gas. Some thoughts could be offered.

~ "Cheap" gas from shale formations is not being offered at its true cost. The extraction of this resource is destroying potable water supplies and, where the developers are not liable for this harm, it is on the taxpayer's dime. A true assessment of shale gas expense involves including the cost of replacing what is irreplaceable and essential to life.

~ In light of these as yet untallied costs of shale gas, gas that can be obtained by way of an existing pipeline from Canada may be relatively inexpensive.

~ I have learned from the report mentioned above that ISO-NE has concerns over the reliability of energy from wind and solar. The wind may not blow as hard in summer and winter, and the sun is low on the horizon in winter. In another report, I have seen that ISO-NE forecasts declining development of energy efficiency measures. I have no consciousness of what is going on commercially, but have a strong belief that, at a residential level, energy efficiency is a largely untapped resource.

~ The Acadia Center has proposed hydroelectricity from Canada as a reliable back-up source of electricity. If that does not seem sufficient as a back-up source of power, I would offer that perhaps some of the oil-burning power plants that may be going offline can be retooled and upgraded at less cost to the environment and community good will than would result from development of the NED pipeline. If there could be creative financing to pay for a pipeline, I propose that such creativity could be applied in this different direction. While I am not knowledgeable, I would think it would be easier to use oil-burning plants as a supplemental source of energy than it would be to use gasfired plants in this way.

~ Finally, I see that the Massachusetts DPU has a lengthy report on your website about gas that is being lost in pipeline leaks. I am not sufficiently skilled to calculate how much energy could be generated from this resource that is being wasted, but I gather the amount is meaningful. I do not want there to be cheating by gas companies, but would think it might be fair to price recovered gas essentially as a new resource in order to give companies an incentive to fix leaks that is commensurate with the true value of the resource that is being squandered under present conditions.

Yours Sincerely,

Mary H. Hall

August 5<sup>th</sup>, 2015

To The FERC

Re: Docket No. PF14-22-000

I am a landowner at 190Bixby Rd, Schoharie, NY 12157 in the town of Middleburgh, Schoharie County. I am opposed to the Tennessee Gas Pipeline that is proposed to be co-located with the Constitution Pipeline that has an eminent domain easement on our property waiting for water permits from the Department of Environmental Conservation.

This pipeline will divide the land running through hay fields, forests, and government designated "wetlands" that include 2 streams feeding our nearly 19 acre lake that has many Canadian geese, wood ducks, mergansers, mallards, and other ducks and herons. Also, American eagles and osprey feed from this lake. There are beaver, muskrats, and mink that use these two streams. Construction and maintenance will certainly discourage these waterfowl and disrupt seasonal migrations.

I am very concerned about the loss of value in the property of the whole 300- acre farm and the increased cost of insurance due to leaks or explosions as well as emissions from venting that will be done.

Another concern is what will happen to our excellent drinking water. They are avoiding largely populated areas because the hazards would involve fewer residents in case of tragedy. This tells me that there are dangers in these pipelines, a very big concern.

American Medical Association has passed a resolution to have serious, all-inclusive health impact studies done on pipelines and compressor stations. Surely the health of our residents is important

I apologize to Eric Mossey and his staff at scoping meetings. Very few residents of our Schoharie County are as discourteous as several speakers were at the meeting I attended in Schoharie.

The Honorable Norman Bay Chairman FERC  
888 First Street, NE Washington, DC 20426

Subject NED pipeline

Dear Mr. Bay:

Neither you nor I know whether the proposed pipeline will have seriously damaging effects upon our Richmond environment. We both do know, however, that there will be no positive, to be desired, impacts. I am a layman environmentalist. That means,for one thimng, that I treasure the wonderfully cold pure water we enjoy at my house near the pipeline. We are above an aquifer. No ons knows how the blasting and heavy machinery employed to bury the pipeline may affect that aquifer. It would be a day by day real blow to our quality of life were that aquifer to be damaged to the point where sediments or less pure water were to find a way into it.

That risk and the fact that my house and lot and another lot I own right next to the lot abutting the pipeline path are in what you folks call the "Incineration " zone should the pipe rupture where it crosses my road. I am 88. My wife is 83. The inevitables of life point to the necessity of a move to an elder care facility probably within the next months or very few years. Who will buy my house? Will anyone? Is not a realtor required to state full disclosures about a property?

I have yet to meet any of my fellow townsmen who are in favor of the pipeline. We read much and have yet to see justifying demand for the NED project. Without that demand and with the widespread objections in towns all along the 71 mile New H~mpshire leg on what basis Gould fERC rationally approve NED?

Sincerely,

Norman E. Woodward

August 11, 2015

My name is DeVeda Brokenshire Prochilo. Summer and fall I live at 119 Sandy Pond Road, Richmond, New Hampshire.

My grandfather, John J. Brokenshire was a minister in Rhode Island and wanted a summer place in the country for his five sons to be able to run and explore. He bought our place with a house and 12 acres in 1910. The house was already 100 years old, 1810. Over a period of years, as the sons grew to men, they bought additional acreage, woodland and lakefront on Sandy Pond, 179 acres total. Our property borders the power line north and south. The proposed pipeline will be very close to our family gravesite and our backyard. My dad and mom, sister, uncle and cousin are all buried in this woodland graveyard behind our house. The proposed pipeline is a threat to all of this.

My father, a former minister, and my mother were both teachers, as well as I. We spent our summers at Hillside, our property, named by my grandfather. I am 76 years old and have missed only one summer since I was 6 months old. My daughter was always with me. My father was a woodsman and spent every day working in the woods and hiking. A very spiritual man, this was the way he rejuvenated after a year of teaching. The rest of the family came here to de-stress and find peace and quiet, to enjoy the great outdoors. It is and always has been my favorite place to be. I am like my dad. I love waking up to the sound of birds and to sit on the bottom porch and watch the hummingbirds and bees work the garden while I have my morning cup of coffee. The dog sits with me waiting to take our morning walk down the road.

One can not climb behind our house over the historic old carriage road past the power line to the 100 foot ledges, sit on the rock and look at Mount Monadnock and the beautiful landscape, viewing the miracle of it all, or sit on the shore of Sandy Pond and not believe in God. Sandy Pond is approximately 6 and half miles long and is fed solely by the brook that runs thru our property. Possible leakage of the pipeline not to mention the changes to the underground aquifers due to blasting is a threat to our water and the wells of Camp Wiyaka and all those living in this area and the pond, which is inhabited by beavers muskrats, turtles, salamanders frogs and a variety of fish. It is soft water pristine and free from contamination. I have been swimming in it all my life. Swimming to the end and back for exercise and enjoyment. It is my favorite thing to do, my dog too. Leaking into the pond will cause contamination and end Sandy Pond as we know it.

**IF THE PROPOSED PIPE LINE GOES THROUGH IT WILL THREATEN ALL WE HOLD DEAR. AS WELL AS THE ANIMALS AND THEIR HABITAT AND OUR WELL WATER AND THE BROOK THAT FEEDS SANDY POND.**

There are 6 property owners surrounding Sandy Pond including us, 3 that have cabins on the lake and Camp Wiyaka, which is affiliated with the Athol, MA YMCA. The rest is woodlands. Camp Wiyaka was created from a swamp and has existed since 1921. Many boys and girls have had life changing experiences there, turning into productive individuals. The Wiyaka Spirit is repeated every night in the mess hall before dinner. It was written by Alexander (Johnny) Johnston and is as follows: "We have tented with nature and as her children have learned the ways of woods and winds: she has ministered to us with rain and sunshine and made us sturdy: the spirit of forest and lake is ours and we yearn to be upright as the trees and pure as the waters. May we keep our Wiyaka Spirit and hold fast that which is good: and know that "every perfect gift is from above" and that the spirit of God dwells in us, may we live as men who are sons of God"

It is still that kind of camp today. The children sleep 8 in a tent on canvas bunks. There is swimming lessons, boating, kayaking sailing, hiking, and campfires every night, plus nature activities. Although I only went to camp 1 year, our family was always welcome to participate in their activities: swimming lessons all the way through to senior life saving, playing ball on our field, which they still do, hiking and campfires. Many great childhood memories. Some of the best times of my life,

I was sitting at our cabin the other morning and saw a mother deer and her fawn come down to the water to drink. Beautiful sight.

The proposed pipeline is a threat to the lake surrounding its surroundings. **DON'T ALLOW THIS CONTAMINATION!**

The pipeline will affect property values. Access roads will destroy the landscape.

Noise pollution will be horrendous due to blasting through some very big granite rocks. There will be debris from the blasting creating dust affecting our family allergies and for those of us prone to bronchitis (me being one) it could cause lung problems. Also the debris will spread into yards and surrounding areas possibly causing injuries to those of us who are near the blasting area.

If there should be an explosion, and it cannot be guaranteed that this or a leakage couldn't happen, our whole area would be wiped out. We are within the incineration area. There are not adequate personnel or equipment or medical facilities since everything depends on a few volunteers who work elsewhere during the day.

The pipeline will be of no benefit to us as NH already produces more energy than they need and will raise the surcharge on our utility bills. Why should we pay for private outside the state companies to make a profit? No compensation (or this pipeline would ever be enough. Peace, quiet, and love of nature have no price.

I see pictures of spectacular places around the world. I can't imagine more beautiful place than what we have here. I have always referred to it as "my little bit of heaven on earth". If the pipeline goes through it could turn it into "my hell on earth". Please do not let this pipeline go through.

The fifth generations of Broken shires are coming here now. Please do not allow it to be destroyed for further generations.

Please do not allow our environment to be destroyed.

Enclosed are pictures of our property, Sandy Pond, Camp Wiyaka and surrounding areas.

HOW CAN YOU JUSTIFY DESTRUCTION OF THIS BEAUTIFUL LAND?

Sincerely,

DeVeda Brokenshire Prochilo

Re: DOCKET NO. PF14-22-000

Tennessee Gas Pipeline Company, LLC, Proposed Northeast Direct Project

Dear Secretary Bose:

On behalf of Northeast Energy Solutions, Inc. ("NEES"), kindly accept these further comments concerning the Tennessee Gas Pipeline Company's ("TGP") proposed Northeast Energy Direct Project (the "Project").

On October 29, 2014, NEES filed with the Federal Energy Regulatory Commission ("FERC") comments (enclosed) that included the following statement:

"During the pre-filing stage of the FERC proceeding, NEES looks forward to thoughtful input from

other stakeholders and the public at-large. NEES will also work with relevant state agencies and regulatory bodies throughout the Northeast.

**Further, NEES will pursue the Company's promise of being open to adjusting its proposal during the pre-filing process. In fact, NEES has already reached out to the Company. Should NEES directly or indirectly learn the Company's promise to be a vaporous one, NEES will duly inform the FERC and all relevant agencies for appropriate action" [emphasis added].**

Unfortunately, NEES is compelled inform that, despite NEES' good faith efforts, TGP has not made an attempt to facilitate a meeting with NEES. Initially, TGP's responses to NEES were sporadic but promissory of such a meeting. However, during the last five (5) months, TGP has completely ignored NEES' request and left all communications unreturned.

NEES has a stated desire to meet with TGP during the pre-application phase to address concerns including, but not limited to:

- Increasing demand for natural gas in the region versus peak demand during certain weather events;
- The current ability of distribution companies' to meet non-peak load demands;
- Pipeline capacity and pricing for end-users;
- Developer guarantees of lower energy costs as a condition precedent;
- Optimal pipeline-to-port routes for exporting natural gas to new and expanding markets;
- States entering the pipeline capacity market;
- Energy efficiency and leak remediation, versus new infrastructure;
- Requirement of "de-bottlenecking" before pipeline expansion;
- Federal protection of conservation lands and watersheds;
- Natural gas for thermal use versus generation needs;
- Increasing storage capacity for natural gas and liquefied natural gas;
- Pipelines safety; and,
- Segmentation and cumulative impacts analysis, including industry activities related to natural gas production and processing.

The last communication NEES received from Jacquelyne M. Rocan, Assistant General Counsel of TGP, was on March, 18, 2015 (enclosed). As such, should TGP attempt to file an application concerning the Project, FERC should determine that TGP has failed to make progress during the pre-filing process towards resolving issues and that any such application is not ready for processing. Specifically, NEES respectfully requests the FERC to duly reject any attempt by TGP to formally file an application until they have kept their promise of openness and cooperative actions and have met, in good faith, with NEES.

Very truly yours,

Vincent DeVito

Re: Tennessee Gas Pipeline Company, L.L.c., Docket No. PF14-22-000

Dear Ms. Bose:

I am writing on behalf of Northeast Energy Solutions (“NEES”) to recognize that Northeast Direct, a natural gas pipeline project proposed by Tennessee Gas Pipeline, LLC, (“the Company”), is under pre-file review by the Federal Energy Regulatory Commission (“FERC”).

NEES is an organization comprised of economic stakeholders, including conservation land owners, and is committed to investigating and providing sound and thorough energy infrastructure analysis and advocacy regarding the economics and routing of energy transportation projects in the Northeast. NEES is concerned about the effect of energy infrastructure development as it relates to economic vitality and environmental impacts. The mission of NEES is to thoroughly analyze and advocate for responsible energy infrastructure development by means of public education and formal advocacy. The participants of NEES include former DOE senior management and non-partisan professionals who hold sophisticated expertise regarding industry, market, municipal, and grassroots concerns. NEES intends to use its assets to eruditely inform FERC throughout this matter.

During the pre-filing stage of the FERC proceeding, NEES looks forward to thoughtful input from other stakeholders and the public at-large. NEES will also work with relevant state agencies and regulatory bodies throughout the Northeast. Further, NEES will pursue the Company’s promise of being open to adjusting its proposal during the pre-filing process. In fact, NEES has already reached out to the Company. Should NEES directly or indirectly learn the Company’s promise to be a vaporous one, NEES will duly inform the FERC and all relevant agencies for appropriate action.

Independently, by way of its members, NEES has immediate and direct interests that will be impacted by the proposed project and, as such, NEES will be an aggressive participant in the pre-filing -----’pml’GGess-ane---subs~pr-esoodings,i:f..a~el~BS-as-a-regiooal-eeatitif)-fi-Wi.l+\_ptlfStle’-flreacl,P’,t’-. ---- concerns, in a detailed fashion, that are potentially impacted by the proposed project. Such concerns include, but are not limited to:

- Increasing demand for natural gas in the region versus peak demand during certain weather events;
- The current ability of distribution companies’ to meet non-peak load demands;
- Pipeline capacity and pricing for end-users;
- Developer guarantees of lower energy costs as a condition precedent;

- Optimal pipeline-to-port routes for exporting natural gas to new and expanding markets;
- States entering the pipeline capacity market;
- Energy efficiency and leak remediation, versus new infrastructure;
- Requirement of “de-bottlenecking” before pipeline expansion;
- Federal protection of conservation lands and watersheds;
- Natural gas for thermal use versus generation needs;
- Increasing storage capacity for natural gas and liquefied natural gas;
- Pipelines safety;
- Segmentation and cumulative impacts analysis, including industry activities related to natural gas production and processing; and,
- Archeological protection.

Analysis of these concerns will help address the uncertainty and confusion surrounding the need for the Company’s proposed project in a regional context. Therefore, at this stage, NEES welcomes any available-analysis the Company can provide-regarding regional’ demand-Also; the Company-should---- - provide initial information about how their project will meet end-user needs. Further, the Company needs to answer this question: Will the proposed project meet only thermal energy requirements? In addition, the Company should thoroughly and soon respond to the broad belief that the proposed project, including any embedded future expansion, is intended for customers outside of the Northeast.

While NEES anticipates industrious, direct discussions with the Company about the questions and concerns raised herein, we also look forward to being fully engaged in the FERC’s process. Thank you for the opportunity to provide this correspondence.

Sincerely,

Vincent DeVito

Just checking on your schedule for a potential meeting in BOS, NYC, or WAS; or, kindly advise on how best to schedule. Thank you.

Best,

Vincent

## 20150819-5012

suzanne cashman, Fitzwilliam, NH.

There is no need for the gas that would be transported through this pipeline. Not only is there no need, but if leaks in the existing pipeline were to be fixed, as energy leaders are suggesting, if we were to want to increase natural gas supply, it could be done without the disruption that building a new pipeline will pose. The route is near a super fund site and is sited through an area of quiet natural beauty with ubiquitous wetlands and plentiful vernal pools. Our well water will be in jeopardy--do not believe all the assurances that KM gives. Further, I urge FERC NOT to accept KM's filing until the Resource Reports are complete and its EIS reports have specified the many open areas where "to be determined" appears in the text.

thank you.

Suzanne

August 19, 2015

Eric Tomasi, Project Manager for PF14-22

cc: Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street NE, Room 1A

Washington, DC 20426

Re: Tennessee Gas Pipeline, Northeast Energy Direct, PF14-22-000

**Topic: "Open House" meetings - perverted from "obligation to inform" into "opportunity to sell".**

Dear Mr. Tomasi,

At the August 12, 2015, Scoping Meeting in Lunenburg, MA, several complaints were voiced about the conduct of the "Open House" meetings hosted by Kinder Morgan ("KM"). These complaints alleged that misinformation had been disseminated by KM staff, in some cases appearing to include willful deception.

Your response was that FERC needed to be informed about such problems and would take them seriously. While some in the audience pointed out that such reports were already part of the Docket, it did seem possible that you might not have been aware of the extent of the problem.

In an effort to help clarify this issue I have performed a search in the PF14-22 Docket looking for the phrase "open house". Several dozen reports were found in this way - I have included below the accession numbers

for these submissions along with partial quotations from their contents.

There may be other relevant reports in the docket which did not happen to include the literal phrase “open house” - these will not have been located by my search, hence will not have been included below.

I also must point out that, from what I have heard and read, these reports represent only “the tip of the iceberg”. Emails, social media, discussions in meetings of Town officials and Boards and private discussions are rife with reports of KM providing incorrect, incomplete, or misleading information.

At every opportunity I have tried to persuade people of the importance of filing reports of such problems with FERC for inclusion in the official docket. More often than not I encounter some variant of the “FERC has been completely captured by the industry they are supposed to regulate, so there is no purpose in filing reports which will simply be ignored...”. I find such wide-spread assumptions of pervasive corruption in a Federal commission very disturbing; I hope they are incorrect. They certainly result in a significant under-reporting of the problems witnessed by citizens who attended the “Open House” meetings.

Some, but not all, “Open House” meetings were attended by FERC staff or contractors - who received plaudits in several of the submissions listed below. I know that they were greatly outnumbered by KM staff and were kept extremely busy during the “Open House” meetings, and often long after KM staff had disassembled their displays and left. Nonetheless they certainly would have received clear impressions from the questions of the people they spoke with, as well as from conversations they overheard.

I recommend that you “debrief” these individuals concerning these issues. What they have to tell you should cause you considerable concern.

The potential for this sort of abuse seems fully foreseeable. KM is a for-profit enterprise which normally operates by “selling” its products or services. “Selling” speech is an energetic effort to manipulate the listener for the benefit of the speaker. In the hurly burly of commerce it frequently includes appeals to biases, efforts to prejudice, propagation of mis-information, disparagement of competitors, and deceit in all its various forms. The bottom line is to “sell” the recipient. As one FERC staffer said, commercial companies do tend to “spin”; a euphemism for deception, and surely an understatement when billions are at stake.

“Adult supervision” was needed, desperately, but FERC was sleeping soundly... Time to wake up!

Cordially,

Garth Fletcher  
Mason, NH 03048

### **List of complaints in FERC docket PF14-22 about the conduct of “Open House” meetings**

20150120-5085 Maryann Harper, Rindge, NH

“Open Houses” that utilized sales techniques have been scheduled quickly

20150122-5184 David Moloney Hollis NH

...excerpts from the following PDF on the Kinder Morgan website ([http://www.kindermorgan.com/content/docs/NED\\_Competition.pdf](http://www.kindermorgan.com/content/docs/NED_Competition.pdf)) to help explain why there is such confusion and consternation over Tennessee’s current posture toward affected populations. In the following discussion where Tennessee contrasts the NED proposal with that of a competing Algonquin pipeline system, they expound upon the importance and efficacy of public outreach in defining project scope:

*“Ultimately, until the competing company proposes specific pipeline facilities, shows where these facilities will be installed, what land will be required, what resources will be impacted and starts to conduct public outreach, it is impossible to provide a meaningful comparison”*

20150223-5005 Kaela Law, Pelham, NH

At the Open Houses, many of my town’s and neighboring town’s residents noticed the maps KM are working from seemed to be around 25 years old.

Over the last two nights I have attended two separate Kinder Morgan Open Houses regarding the transmission pipeline they intend to bring through Pelham, NH. The level of real information that KM reps were able to provide to affected landowners was sub-par. The pictures on their poster boards were gross misrepresentations of this proposed 36" pipeline and its components.

How a KM representative at an informational session could utter the words "I don't know" in response to a simple and pointed question is beyond my comprehension, and I heard it frequently.

Also, different representatives were giving different answers to the same questions

At the Open House, in answer to my question about how they keep the easement corridors clear I was told by a Kinder Morgan rep, "We don't use herbicides on our pipeline easements, despite what the opposition wants you to think, we use mowing."

...meeting minutes where one of our Selectmen read a letter to the town about "Tennessee Gas Pipeline Notice of Routine Maintenance of Pipeline with Herbicide 56 Applications Notices sent out to affected areas"

20150223-5032 William D. and Lucy S. Jackson. Stephentown, NY

NOT ONE of the questions we posed to various members of the KM team at this event was answered to our satisfaction.

20150223-5069 Frank Gullotto, Wilmington, MA

Residents had hoped to get many of the project details at the February 17 Kinder Morgan open house in Andover, Massachusetts, but unfortunately, most of the answers were vague

I spent some time speaking with a Kinder Morgan rep about the risk of running gas pipelines through a town's drinking water supply and he said it is safe to drink water that has been contaminated with gas. This was a stunning answer

20150224-5031 Hiel Lindquist, Fitzwilliam, NH. What I learned at the Rindge, NH KM open house.

When I asked a specific question to Kinder Morgan as to whether or not my residence was within the danger zone of the pipeline in the event of a rupture I did not receive any answer, other than the statement "there will not be a rupture"

I had heard about how some areas might be designated as High Consequence Areas (HCA's), so I asked some of the Kinder Morgan reps what HCA's were all about. They didn't know the answer and so I talked to the Kinder Morgan engineer again. He gave me some nebulous answer and said that FERC establishes HCA's and Kinder Morgan is responsible for meeting the requirements in an HCA.

Next, I went over to one of the easels where a Kinder Morgan rep was "explaining" why New England needs the NED pipeline. The Kinder Morgan rep claimed, "most of the coal based electric power generating facilities in New England will be closing soon". Among the nebulous "many power plants statements" was a specific statement that the "Seabrook, NH nuclear station would be closing soon", so New England needed the pipeline and new natural gas generation facilities to replace the Seabrook electric output.

Every answer I received from Kinder Morgan didn't sound correct to me. When I verified and fact checked the answers I found that, in fact, most of the answers were incomplete or at worst, outright lies.

20150224-5036 Hiel Lindquist, Fitzwilliam, NH

The amount of misinformation provided by Kinder Morgan is getting ridiculous. I would have included the following on my last comment, but I just received more information.

At the Rindge, NH Open House last night (Feb 23, 2015) I told a Kinder Morgan rep that I had seen many statements as to how big a right-of-way Kinder Morgan would require for the NED. I said I had heard numbers such as 400 feet, 150 feet, 125 feet and 100 feet. It was confusing and I wanted to hear from Kinder Morgan exactly what they would require. He told me quite specifically that they would need a 50-foot right

of way. He said that the 400 feet was probably referring to the “scooping” requirements of the project. He didn’t know where those other numbers I referred to came from.

OK, fair enough, finally some factual information. However, I was just speaking with a property owner impacted by the pipeline. He told me the Kinder Morgan letter he received is asking for a 100 foot right-of-way for construction and 50 foot for the pipeline.

I went away from the meeting believing there would be a 50 foot clear-cut for the pipeline. Now I find out it will be 100 feet. I wonder how many other people went away from the meeting with the same impression?

Why is it that I never get a straight answer from Kinder Morgan? Why didn’t the rep say it was 100 feet?

20150224-5169 Nick Miller, Groton, MA

It has been stated that Kinder Morgan did not inform FERC of this week’s rescheduled Open Houses. If this is so, it seems an intolerable situation. First FERC’s “strong recommendation” to Kinder Morgan that it reschedule Open Houses planned for the week of February 16th is ignored by the company hoping to gain approval for this huge and disruptive project. And then Kinder Morgan does not inform FERC of another set of Open Houses rescheduled for this week?

The proper question to FERC at this point seems to be “Who is in charge of this process?”. I thought it was FERC, but the answer seems to be coming back more and more as “Kinder Morgan”

20150225-5057 David Yachnin, Andover, MA

I am writing to notify FERC of the misinformation provided by Kinder Morgan at the “open” house held in Andover on February 17th.

When Kinder Morgan representatives were asked direct questions about the pipeline they knowingly and consciously lied. As the Kinder Morgan representatives were all well briefed and trained for this meeting, their lies and misinformation were conscious and deliberate acts.

For example, when asked about the safety record of Kinder Morgan the response was it was “impeccable”. When the same representative was asked to clarify and comment on the documented accident rate, he remained silent and would not comment further

Another example is when a representative was asked about the co-location of the pipeline with existing utility corridors; the response was that the pipeline would be “within the existing corridor”. When pressed by the fact the survey teams are surveying 150 from the corridor the same representative stated that “Kinder Morgan” was doing their best efforts where it was feasible”. When pressed about the actual facts, and that Kinder Morgan was not making best efforts the representative again remained silent

20150225-5148 Maryann Harper, Rindge, NH, Dear FERC: Where were you on February 23, 2015

I, along with many other residents of Rindge, NH and nearby communities, braved sub-zero temperatures for a chance to talk with FERC about our concerns regarding the Tennessee Gas proposed NED pipeline project. ( PF-14-22-000)

While we were subjected during the evening to a variety of vague statements from TGP and given no real answers to our questions, many of us attended and waded through this mire of sleazy sales tactics by TGP for a chance to talk with FERC.

We were told that representatives from FERC attend the Open Houses and are available to answer questions.

The Open House was scheduled during the week of school vacation, perhaps you had a similar scheduling conflict.

20150225-5292 David S Beach, Amherst, NH

I attended the open house in Milford, NH on February 24th, 2015. At that meeting I had the opportunity to pose several questions to Kinder Morgan employees and company representatives. Some of the answers

were informative, others were clearly evasive. Some answers conflicted with prior information from KM, and some responses seemed to be intentionally misleading.

The primary purpose of this note however, is to show my appreciation for FERC's attendance at the meeting and John Peconom's performance in particular

20150226-5008 Joseph Cigna, Wilmington, MA

I had hoped to get many of the project details at the February 17 Kinder Morgan/Tennessee Gas Pipeline Company open house in Andover, Massachusetts. Unfortunately, most of the answers were vague or Kinder Morgan representatives told us the route might be changed but could provide no details or guarantees.

20150302-5004 Liz Fletcher, Mason, NH

At the February 24th Open House in Milford, NH, I found responses by some Kinder Morgan staff were vague, confusing, and conflicting

Since about half of the powerline ROW in Mason crosses shallow to bedrock soils, I was concerned about blasting that would be involved in construction. When I asked KM staff Frank McSloy about blasting to lay the pipeline, he told me there would be no blasting

Rather incredulous, I asked him how KM proposed to bury the pipeline in the solid granite that's clearly visible along the powerline. He told me they use a chisel. I asked for some information about this chisel – maybe it would work for soft rock but granite??? Frank dismissed me by telling me to go look at the poster that showed how they install the pipeline. I did, and all it showed was an ideal image of pipe being laid in a soft soil trench.

I was appalled. Not only did Frank lie about blasting, he disrespected my inquiry by pushing a KM propaganda poster that did not show realistic conditions of installing pipeline in New Hampshire soils

Another KM "land" staff responded very misleadingly to my question about co-location. I asked, does KM actually plan to put the pipeline entirely within the powerline ROW?

Oh yes, he said, they can bury it right between the legs of the pylons. What??!! I told him in Mason and most of the rural towns along the powerline, the wooden pylons don't have anything close to the 100 foot width that's needed for pipeline construction between their legs.

He admitted his statement only applied to areas where there are large steel pylons. I'd be surprised if many of the 70+ miles of NH powerline ROW have large steel pylons. But if I hadn't questioned his answer, he would have succeeded in creating the illusion that very little land outside the powerline will be disturbed. This appears to be KM's goal in its use of the misleading term co-location.

KM engineer James Lucas gave me a clear answer on this: the gas pipeline will be offset 100 feet from the powerlines. So the swathe of disturbed land for the pipeline will be at least 100 feet wide along the 70+ miles adjacent to the powerline

When I asked if compressor stations were staffed, Mr. Lucas was somewhat vague, saying that a station could have staff sometime on a weekday, a staff would be assigned to a region and would travel about. When I asked how large a region a staff member would have to cover, he couldn't tell me.

KM staff Doug Carey was able to answer my concerns about blasting realistically. He described how they use a blanket over the blasting area so that it's possible to blast for a new pipeline close to an existing pipeline. I was concerned about the subsurface effects of blasting on groundwater. Doug told me that KM tests wells pre- and post-blasting for quality and quantity, and set seismic sensors up to 200 feet from the site. This is somewhat re-assuring, although it's known that blasting can affect wells much farther than 200 feet away. Pelham's blasting ordinance requires testing up to 500 feet away for small projects and up to 1,000 feet for the largest blasting projects such as road building. FERC should require testing well beyond the 200 foot radius in all blasting areas.

In contrast to the sometimes difficult to believe responses of some KM staff, I would like to commend

the FERC staff who was there at the Milford Open House. Environmental Biologist John Peconom gave straightforward, thoughtful answers to a wide range of questions

In conclusion, I am concerned that many Open House visitors who spoke with KM staff may not have received clear answers to their questions. These events can be more murky than transparent, depending on which staff member a visitor happened to speak with. FERC cannot assume that because these Open Houses have been held that the public has now been fully informed about this pipeline

20150302-5046 Marilyn S. Griska, Rindge, NH: Inconsistent answers from Kinder Morgan

The Open House in Rindge at Hidden Hills with Kinder Morgan regarding the proposed natural gas pipeline was a real eye opener

They were all very friendly and polite. However I found their answers to vague, generalized, superficial, contradictory and, at times, totally misleading

I approached at least three representatives with the same questions and astonishingly received different answers from each!

The answer I received as to how much land they might need/ take was different with each responder

I had read that they used herbicides to keep growth along the corridor down. One representative said they only employed mechanical means, the next told me the chemicals were used sparingly, and yet a third said they would meet with the homeowner to make the well safe!

20150302-5061 Nick Miller, Groton, MA:

The Damage Caused By Kinder Morgan's Deliberate Misinformation

One egregious example occurred when Kinder Morgan displayed a slide of a portion of a 6,130 HP compressor station in Pelham, NH while Allen Fore, a Kinder Morgan Vice President, stated:

*"We expect there will be a compressor station similar in size and scope to other compressor stations we have on our system. Not exactly what we have in Pelham, but you can get an idea of what compressor stations look like."*

The problem of course being that the actual compressor stations planned are large industrial complexes with capacities of 80,000 or 90,000 HP - up to 15 times that of the displayed unit. This was a deliberate attempt by Kinder Morgan to misinform and mislead the public about their plans and to lessen the public's resistance to those plans ***{Author's note: it gets worse, see 20150323-5074 for further details}***

This bad behavior continues even as the MA and NH Open Houses were concluded this past week. For example, members of the public approaching Kinder Morgan employees staffing the Open Houses were recently given wildly different answers to questions about the extent of new easements required for pipeline collocation with power lines – a critical issue for the updated pipeline route.

20150302-5172 Pamela Shuel-Sargent, Rindge, NH

I attended the local Kinder Morgan Open House. They gave us very, very few answers to our questions and the answers that they did give us doesn't seem to be accurate information

20150303-5005 Christina Miller, Pelham, NH

After attending a local Kinder Morgan Open House in Hudson, NH on 2/19/15, I found I was left with more questions than answers.

I very quickly noticed the maps that were being used were not current. There were many properties that were not even shown on the map even though the maps were dated 1/2015. This would make me wonder if all direct abutters have been notified to date

I also received many different answers to questions regarding loss of personal use of property, compensation for reduction in property value, impact on Homeowners Insurance for an "At Risk" property, the standard distribution of the "pigging" units on the transmission lines, addressing of noise and vibrations around

and nearby Compressor stations, impact on private drinking water wells, structural damage due to blasting during construction, degradation of local conservation land as well as habitat for local flora and fauna. There appeared to be no “experts” in these specific categories and many of the answers received were merely conjecture (“I think”, “I believe”, “In the vast majority of instances” on how a particular topic would/could be addressed.

20150306-5125 Alison Jaskiewicz, Mason, NH

I attended the Feb 24 KM Open House in Milford NH and was astounded by the overbearing and condescending attitudes of the KM representatives. I was told I had a ‘chip on my shoulder’ by Steve Martin

I was astounded by the outright lies being told to my face. I was told that all my current electricity is generated by natural gas, when more than 50% of New Hampshire’s electricity is nuclear generated from Seabrook and he could have no idea whether I have solar panels on my roof. I was told that the main pipeline would be situated only 5 feet from the electric power line right of way. The FERC rep told many of us that the minimum would be 25 feet and likely much more.

One KM rep bragged that FERC never denies KM projects.

KM reps ignored or avoided the tough questions. The Open House format is designed to divide and misinform.

The only sincere, straightforward and helpful information I heard at that Open House was from FERC representative John Peconom who spent three full hours answering questions from concerned citizens, the last hour while the entire Open House infrastructure was dismantled around us and we ultimately left a completely empty room. Kudos to John!

20150312-5038 Carolyn Sellars, West Townsend, MA

I attended the Hudson, NH Open House to gather information about the pipeline and in particular the newly proposed Fitchburg lateral which bisects Townsend, MA. There were maps that people could take home for NH affected communities but none for Townsend. Kinder Morgan representatives assured me that they would have copies of the the Townsend maps available at the Rindge, NH and Milford, NH Open Houses. They did not.

Many Townsend residents attended the Rindge and Milford Open Houses looking for these map. Townsend maps were not available until the very last Open House in Fitchburg.

20150312-5121 Townsend, MA, Conservation Commission

We would like to file a complaint in that the Open House held by Tennessee Gas for the lateral was held in Fitchburg, MA. There is no proposed pipeline construction in Fitchburg. Our municipal offices were not contacted about holding the initial Open House and when the Open House was postponed, we reserved sufficient space with parking at no cost for the Open House. We then contacted Kinder Morgan to ask that it be moved to Townsend, to no avail. Traveling in Massachusetts this February was difficult, particularly at night with high snow banks and narrow roadways where pedestrians were forced to walk because the sidewalks were buried. It was even more difficult for older citizens for a number of reasons

20150318-5089 Kathleen Padden, Warwick, MA

At open houses, they refuse to give clear, concise SPECIFIC answers about the proposed compressor stations, which would be 80,000-90,000 monsters.

20150320-5210 Nick Miller, Groton, MA: Chapter 3: FERC Allows The Public To Be Misled

But what if an energy company doesn’t keep its end of the bargain? What if it delays informing the public and then supplies vague, misleading and simply false information – so that the public is robbed of some of its opportunity to provide timely feedback to FERC?

During the snowiest New England winter weather in 81 years, FERC staff “strongly recommended” that

Kinder Morgan reschedule the public Open Houses planned for a week in February in order to insure that those planning to attend the meetings were not deterred by the record amount of snow and the two significant storms predicted for the upcoming week. Kinder Morgan thought it over and simply refused FERC's strong recommendation to reschedule.

Told the public that the pipeline would be constructed mostly within an existing power line right-of-way (ROW) when the truth is that it will be built parallel to but almost completely outside of the existing ROW. This is a huge difference to those along the pipeline's path.

Misleading ("There are no current plans to export any of this gas" and "Natural gas pipelines do not affect property values")

Misdirected (Mr. Fore loves to answer a question that has not been asked rather than the one that has been. When asked about his company's pipeline safety record, he talks about the many safety regulations that apply to pipeline companies. When asked about the environmental damage caused by pipelines, he talks about the licensing procedures.)

So it seems that Kinder Morgan is at best misbehaving and at worst deliberately lying to the public about their plans through omission and commission, while ticking off the "public information" check boxes that FERC requires of them. And what is FERC's response to the missing and blatantly false information being used by Kinder Morgan to "inform" the public? Nothing. Nada. Zilch.

From my vantage point, Kinder Morgan is pretending to accurately inform the public and FERC is satisfied to let that pretense stand. There appears to be no attempt at all by FERC to monitor the (lack of) quality of the information being supplied to the public by Kinder Morgan, much less to try to control it or to remediate the damage done when the public is deliberately misled. And FERC does not seem to be prepared to react to this situation at all, even when the public does report the misdeeds and misinformation to them. Here is a question for FERC to consider: Is the public interest served by informational meetings where the public is deliberately misled by those presenting the information?

With no sanctions being applied by FERC, why would Kinder Morgan ever be expected to mend their ways? Simply stated, Kinder Morgan does not want there to be an informed public. An informed public does its homework, asks pointed questions and does not passively accept vague and inaccurate answers. It is to Kinder Morgan's advantage to release as little information as possible, to delay its release as long as possible, to keep the information as vague as possible and to simply misinform when they can. An informed public will inevitably begin to question the need for a new pipeline as they realize what the actual short term and longer term costs of this massive new fossil fuel infrastructure would be.

#### Summary

So here we are. Kinder Morgan is pretending to properly inform and notify the public of their plans in a timely manner. And FERC is pretending that the public is being properly informed and notified. Check boxes are being checked and the plans for this pipeline are moving through the system. Apparently this is all simply business as usual for FERC. But this bogus "information" is misleading the public and it causes people to underestimate the true impact of the proposed pipeline. Shame on Kinder Morgan for perpetrating this sham and shame on FERC for standing idly by as it happens.

20150323-0057 John J. Serio, Stephentown, New York: Failed Public Participation Plan

A review of some of the eComments at FERC.gov reveals the following words and phrases used to describe Kinder Morgan and their tactics: lies; threatening; deliberate misinformation; not being transparent; need a flashlight to read their open house maps; maps not . current and missing properties; open house scheduled on 'school vacation and when bad weather is forecast; FERC not notified of an open house; different answers to the same question; answers didn't seem accurate; deceptive; discourage public feedback; property owners not informed there is a new route, etc., etc. You will see in numerous comments many more specific examples of deceit. How many more have not been reported?

20150323-5012 Ann Moser, Mason, NH

While attending KM recent open house that was billed as an informational meeting to inform the public of plans to install a pipeline through New England I found this not to be the case. I was struck by the amount of false information and outright lies that were promoted at the meeting.

All presenters avoided all direct answers to questions asked by people who attended the meeting. They also told complete lies stating that they always do their best to avoid sensitive areas and always mitigate if they do have to destroy a sensitive area!!!

20150402-5007 John Belliveau, New Ipswich, NH

Kinder Morgan representatives repeatedly lied outright about their companies safety record and denied knowledge of publicly available information during their open house, and again at the town meeting

20150512-5003 Linda Underwood, Castleton, NY

I am appalled at the outright lying by KM representatives to citizens at the KM open house on April 13, 2015 at Green Meadow School in Schodack. I didn't receive a single straight answer from anyone about any topic. From how many people would be employed to the route of the pipeline to the location of the compressor station, not one KM rep knew anything. Really? A project this big and not ONE detail is known at this point? I find that hard to believe. It begs the question - what are they hiding from the people?

20150513-5042 Debbie A McCarthy, Andover, MA

Kinder Morgan held an Open House in our area on February 17, 2015. This date fell within the Andover school vacation week and many interested families were not able to attend. A letter was written to Kinder Morgan requesting an alternate date by the Town of Andover as well as well as a letter signed by our local State Representatives and Congressman. Kinder Morgan ignored both letters and held their Open House on February 17

I attended the Kinder Morgan Open House in our area on February 17, 2015 with my neighbor. I found their representatives totally apathetic towards our local concerns.

20150518-0133 James P. McGovern, Member of Congress

It is my understanding that Tennessee's plans show a four-mile swath where it intends to locate a compressor station, but it has not provided notice of the pre-filing or of the open houses to any of the landowners within half a mile of the swath (except when co-located within the 400-foot-wide pipeline survey corridor).

I understand that open houses are sponsored by the applicant and that scoping meetings are sponsored by FERC. To say that these affected landowners will be notified of the scoping meeting is simply not enough. The stated goal of open houses is to "share information about [the Company's] project with the public." To exclude affected landowners from the very beginning of this pre-filing process because Tennessee has not yet identified a specific site for a compressor station is not acceptable, nor does it ensure an open and transparent process.

20150522-5133 co-signed by a large group of NGOs

During our exceptionally bitter and long winter, and in spite FERC's strongly worded letter to Kinder Morgan to postpone their open houses until conditions improved, they held them anyway along the newly proposed alternate routes through Massachusetts, New York and New Hampshire. It is significant, that regardless of subzero temperatures and accumulating snow, these open houses generated strong interest and those who attended raised important concerns regarding health, safety, environmental impacts and infringements on property rights, among other legitimate issues. Kinder Morgan provided few substantive answers to these concerns; it is now imperative that the impacted communities receive the benefit of a full disclosure of information with which to critically evaluate the far reaching impacts of this project.

20150522-5146 michelle scott, Mason, NH

Finally, Kinder Morgan has been doing Open House/Town Meeting events around our region. They promise to address questions, are polite and reassuring, but fail to follow through on answering our questions

20150615-5051 Alison Jaskiewicz, Mason NH

One KM rep at the Milford NH Open House stated, “All our projects are approved.” They believe they are ‘too big to be denied’. That being said they see no reason to expend effort in communicating honestly and fairly with potentially impacted landowners

20150617-5138 Carolyn Sellars, Townsend, MA

At the Open House, Curtis Cole from Kinder Morgan told us the lateral was to serve National Grid. I reviewed and commented on the National Grid Capacity Agreement MA DPU Docket (15-34). No where did it mention this lateral. National Grid’s request was all about an “Everett Lateral” and getting gas into the Greater Boston area

20150617-5200 deborah pomerleau, Londonderry, NH

Last night, I attended Hudson Open House Meeting with selectmen and Kinder Morgan. They are still showing small and old compressor stations, instead of one close to the size of the proposed New Ipswich

20150619-5123 deborah pomerleau, Londonderry, NH

I went to the Londonderry Open House with Kinder Morgan last night. Strangely, this had not been advertised much and many said that only found out about it shortly before 7pm

deceptive presentation of smaller compressor stations during these open houses, instead of a realistic drawing of what the large 80,000 hp compressor station will look like

20150714-5061 Polly Ryan, Plainfield, MA.

In addition, many questions were not addressed at Kinder Morgan Open Houses or their informational meetings. I, as well as many in my community, attended KM presentations and several open houses. Our consensus was that they intentionally avoided questions that would shed light on the cons of this project while only addressing questions that promoted the pros.

20150715-5072 Nick Miller, Groton, MA: “Open”, “Transparent”, “Accessible” – Seriously?

Kinder Morgan, at FERC’s urging, has held a number of open houses. These are public meetings ostensibly set up to educate the public about their NED pipeline proposal. At these sessions, various Kinder Morgan personnel have openly and repeatedly lied to the public. They lied in one-on-one sessions, they lied in small groups and they lied in presentations to hundreds of local residents. They lied with words and they lied with pictures. They lied by omission and they lied by commission.

Numerous attendees have filed comments with FERC documenting where, when and how these lies were told to the public by Kinder Morgan

Just what was an unwary citizen to think if they attended such a meeting, saw the FERC information booth and then heard Allen Fore, the main Kinder Morgan spokesman, telling them that “Natural gas pipelines don’t affect property values” or that “All of the gas that enters a pipeline makes it to the other end”? \*I have personally heard Mr. Fore say both of these things+

During the snowiest New England winter weather in 81 years, FERC staff “strongly recommended” that Kinder Morgan reschedule the NED public Open Houses planned for a week in February in order to insure that those planning to attend the meetings were not deterred by the record amount of snow already on the ground and the two significant storms predicted for the upcoming week. Kinder Morgan thought it over and simply refused FERC’s strong recommendation to reschedule. The open houses went ahead as planned, in very snowy conditions.

Rather than “Open”, “Transparent” and “Accessible”, I might suggest that FERC find itself a new set of

favorite words. Perhaps “Rushed”, “Rigged” and “Rubberstamped”? For many of those tracking the progress of the NED pipeline proposal through the FERC process, these latter terms would seem to provide a much truer picture of the FERC that we find ourselves dealing with. During the past year, I have witnessed firsthand the deception and the misdirection that Kinder Morgan uses in parceling out information to the towns and individuals impacted by their proposed pipeline. But as the FERC pre-filing process progressed, I also came to see that Kinder Morgan was in effect being given cover by FERC. Kinder Morgan would tell the public that FERC was in charge of the process, but in the meantime FERC would simply be looking the other way. As the months went by, FERC seemed to be acting more as a silent partner to Kinder Morgan than as the watchdog agency that I had (naively) assumed it to be. FERC exerted little or no control over the orgy of misinformation that Kinder Morgan provided to the public about their pipeline plans

**20150819-5090**

### **Kinder Morgan’s End Game - EXPORT**

To Everyone Concerned With and Concerned About the NED Pipeline Proposal,

Please understand that if additional natural gas pipelines are approved for New England, gas from here will then be exported to Canada to be compressed into LNG and shipped abroad. In the case of the NED pipeline, hundreds of New Englanders will face the threat of eminent domain takings from a private company in order that US gas can then be piped across their property to be exported as LNG. And if you think our local natural gas prices will be sure to drop and become more stable with additional gas pipelines, just wait until we start competing with export market natural gas pricing.

Maybe you’re not convinced that gas export is really being planned – after all, there are continued denials being issued by many here in the US. This is a recent article from Canada’s largest national newspaper detailing plans for two LNG facilities in the Canadian Maritimes. The first paragraph reads (emphasis is mine): “Two proposed liquefied natural gas projects have received approval from the National Energy Board to export LNG, but they are counting on the United States to build pipeline capacity into New England in order for them to obtain the supply needed to underpin their ambitious plans.”

Also please be aware of renewed attempts to implement a “pipeline tariff” in some New England states. Such a tariff is a new tax that would force all electric customers to subsidize the construction of one or more natural gas pipelines in our region. We would then be treated to the spectacle of a for-profit company taking private property from members of the public while being paid to do so by that same public.

Kinder Morgan spokesman Allen Fore has said on multiple occasions that any reports of plans to export gas from the NED pipeline are “purely speculative”. Allen, Allen, Allen. Such blanket denials in the face of news articles such as that referenced above do nothing to enhance your reputation for truthfulness. In fact, a thoughtful listener might consider them to be just one more reason to question your other blanket reassurances to the people of New England that Kinder Morgan gas pipelines don’t leak, that all of the gas put in one end of the pipe comes out the other end and that Kinder Morgan will be a good neighbor. You KM guys really need to get a better handle on that pesky Canadian media if you want your continued export denials to look anything but increasingly ridiculous here in New England.

Export is the end game for the NED pipeline. One that Kinder Morgan is desperately hoping that they can continue to publicly deny until after FERC has approved their NED pipeline plans. They well understand the public outrage that would accompany any admission from them that gas from the NED pipeline is indeed headed overseas.

Nick Miller Groton, MA

**Testimony concerning Northeast Energy Direct Project Scoping Meeting Towanda PA 7/14/2015**

Diane V. Ward  
902 Grove School Rd  
Wysox PA 18854  
pekin\_2@yahoo.com

I am a PA resident and property owner in Bradford and Wyoming Counties, in the Marcellus Shale region, and I oppose the entire scope of the Northeast Energy Direct project from its origin in the gasfields of my home turf to its endpoint in Dracut MA. My opposition is based on the fact that the NE Energy Direct project is not driven by documented US customer or consumer need. To the contrary, the need for this project is a direct outcome of American Greed on the part of gas industry, both at the corporate and individual levels. Any customers or consumers who may be served as a result of this project are tangential to the real economic purpose of this project.

The people who oppose this project along the supply and market paths in NY, MA, and NH are clear that although they may pay some of the highest gas and electric prices in the country, this project is not in their best interest, or in the public interest. I support and applaud their efforts to insure that this project is not approved by FERC, and I think you should understand why.

Here in the Northern Tier of PA, the gas corporations were besides themselves in the rush to drill drill drill without regard to the short term need for additional gas supply. They drilled irresponsibly, cutting corners, polluting land and water, defiling our culture and ruining many lives. They rushed to insure long term lowest cost to themselves. The oversupply situation and the current low gas price problem are of their own doing. Gas industry economic health is the need behind this project, not customer need. The gas industry desires that this project come to fruition so that it can reap the rewards that it envisioned when it decided to drill with gusto, with reckless abandon. They know that the corrupt American systems which support the American economy can be counted on to assist them in counteracting any undesirable results of their rush to drill. They count on FERC itself to look the other way when omissions, contradictions, and unsound data fill their application.

This project does not end in Dracut MA as stated. The chief method by which the gas industry achieves its nefarious results is by phasing. They plan the first phase to be as acceptable as possible, obtain approval, and construct. When phase one results are unacceptable, they bring in phase two, now a dire emergency and necessity, a phase which carries with it the additional negatives that fuel the public's ire.

In this case, phase 2 goes beyond Dracut to Canada, and further beyond by means of LNG exports from Canada. Phase 2 cannot be stated, because it would eliminate the possibility of a positive outcome from the basic decision that FERC needs to make, that of public convenience and necessity. Phase 2 work has already begun, but this work is being ignored by FERC. Pieridae Energy has filed a federal application to send domestic natural gas from Massachusetts to Nova Scotia, where it would be converted to liquefied natural gas (LNG) and exported. Agreements are in place for a sale to Germany. The natural gas would travel through the Maritimes & Northeast Pipeline from Dracut, MA. Spectra Energy, who owns the pipeline, has already applied to reverse the direction of the pipeline flow to reach the Maritime Provinces.

The gas industry leaves off the unpalatable details and FERC swallows the story whole. Somehow FERC is able to believe that MA will be able to use all this gas, regardless of how unreasonable that may seem.

FERC itself is not an objective decisionmaking agency relative to its role as nay-sayer. FERC jobs and funding are linked directly to energy projects. The more projects, the more money and jobs. However objective FERC may be on other matters, such as choosing between various siting alternatives, FERC is beholden to the interstate energy industry. No project, no job. No nice cars, fine homes, college educations for the kids. No benefits, no retirement. It is the common human low level of American Greed, it resides in the psyche, and it is disguised by generally calling it ambition. And the culture rewards ambition.

While I oppose the entire project and request that it not be approved as a public convenience and necessity, I do also feel that several specific areas that need additional FERC attention in the current filing.

- Moving the pipeline from MA to NH but adding the Fitchburg lateral extension since that is really where

some gas is needed is an abomination. If you're going to build the pipeline, put it in MA where the service is needed.

- Do not use, or allow others to use, statements such as "82 percent of the planned pipeline route parallels existing pipeline and utility rights-of-way" as justification for a specific line placement. Once the pipeline is outside of the right of way, it impacts on the property owner just the same. Do not allow the valuation of the land adjoining the right of way to be lower than valuation of other land not adjoining utilities. To the property owner, it is all one and the same - his or her land - paid for and taxed the same. Whenever land never dug before is dug for the first time, it is a greenfield project. This project is still a greenfield project and don't try to get around it with omissions of data. What percentage of the 6,761 acres disturbed has never been disturbed before under the current plan? And please include estimates of the access roads, they are just as burdensome to the environment and the landowners.

- It is wrong to build 9 new compressor stations to support this unnecessary project. They will deliver pollutants to our environment so that the gas industry can achieve their envisioned profits by selling gas overseas (long term).

- It is wrong to build the "loops" since they are normally used for gas storage and not capacity.

Here in the gaslands of PA, some people may envision personal profits for themselves based on additional royalties that they will receive through larger volumes produced or higher prices at the wellhead. Their support for personal profit should not be construed as evidence to support that the project meets the measure of public convenience and necessity.

Many in PA have been taken for a ride, over and over again, by the greedy gas corporations who came to drill. Some of these corporations, such as Chesapeake Energy, are currently under investigation by the state Attorney General for cheating landowners out of their just due royalties. CHK is also being sued pertaining to this same issue. FERC should refuse to allow Chesapeake Energy's gas to move into the Northeast Energy Direct pipeline until all investigations concerning this fraud have been completed. An alternative would be to establish a fund where proceeds to Chesapeake Energy are withheld, pending the completion of said investigation. Otherwise, I would support the view that FERC could be guilty of negligence at a minimum, and of being a co-conspirator, at worst, relative to this royalty theft.

In the Bradford County area, FERC has already shown its true colors relative to treatment of landowners under threat of eminent domain. FERC allowed pre-filing of eminent domain to occur with the Marc 1 project before all negotiations were complete for reasons of schedule. Schedule should not be allowed to shorten the negotiation time for landowners to work in good faith with Tennessee Gas.

FERC has shown its willingness to look away and ignore the issues, such as the issue of the Marc 1 project being installed near the Wyalusing School, even when the project plans failed to show the school's existence despite its physical on the ground presence.

FERC has shown that it sides with the gas companies and we can expect nothing more. So supposing that FERC knows (but doesn't know on paper) that the gas will be exported to Canada and further east via LNG export. FERC may ignore this issue, and this cuts to the heart of the very decision that you are to make, that of public convenience and necessity. This project meets neither and that is how FERC must rule, if each individual within the FERC chain of decision-making uses the truth in his or her heart.

My challenge to FERC: if FERC goes ahead and issues an approval of this ill-advised project, state in the approval in no-nonsense wording that the gas carried by this pipeline, regardless of future situations, will never, ever leave the USA. Period. If this is made an irreversible condition of FERC's approval this will go a long way toward mitigating people's concerns.

Let the gas stay here in the ground in PA to support future uses and actual dire needs for energy. I stand shoulder to shoulder with those along the supply and market paths who also oppose the project. The construction of this pipeline would not fulfill an American need. It would only serve to condone and reward American Greed. I hereby request that FERC withhold approval of this project based on lack of demonstrat-

ed need and irregularities in gas usage projections.

Thank you,  
Diane Ward

P.S. I have a really simple request also. If you go ahead with this or any other pipeline project in the future, please classify waste thrown as roadside litter by pipeline contractors, subcontractors, suppliers, etc. while on or off the job as solid waste associated with the pipeline project. This would mean that the company in charge of the project would have to have a portion of their solid waste plan dealing with these behaviors and with remediating any issues that these workers create. Since this particular pipeline is so extensive, there will be thousands upon thousands of miles of local, mostly rural roadways littered upon by the workers, as they have been littering in and around all of the other projects. There need to be clear expectations, enablers, and incentives for workers who eat and drink on the run to dispose of their fast food containers, drinks containers and other waste in a proper manner. Our environment depends on FERC doing something about this. It has been a real eye opener in the rural areas, seeing so much litter where before there was so little. If you can't do anything else, please do this!

### **20150819-5117**

Crystal Giggi, MERRIMACK, NH.

Please take the time to review the NED pipeline and determine if it is really needed in NH. "New England needs more gas" is what they want us to believe, however the shortfall has only been in a couple states, where with proper planning the shortfall could be reduced or completely eliminated. To build a pipeline that is more than 5X the size that New England is expected to have for shortfall in 2029 is overkill, unless the real destination is for export. We will not save on our energy cost, we will pay for the pipeline to be built, and at some point those of us who use domestic gas will be completing with export prices which will be significantly higher. Only frackers and pipeline builders will benefit.

Late last year due to opposition in Massachusetts, the NED route moved from Massachusetts north into southern New Hampshire, would cross the state, and then drop back down into Massachusetts.

Year after year, more than half of the energy New Hampshire generates is supplied to our neighboring states. To run the pipeline through a state that does not need the gas is unreasonable and unfair. Why should New Hampshire have to shoulder the burden, share the cost of the pipeline construction, and disrupt water supplies, conservation land, property values, and our way of life in this beautiful state for the potential need in other states? Shouldn't the states that have a proven need actually bear that burden?

### **20150819-5118**

Dorothy Crawford, Fitzwilliam, NH.

Having reviewed recent maps on the NH Southwest Regional Planning Commission website, it is clear that Kinder Morgan proposes using Rockwood Pond Rd as an access point to the construction that crosses the Cheshire Rail Trail. The vast majority of the residents of Rockwood Pond Rd have sought out this area for its quiet natural beauty. Our's is a dirt road – totally unsuited to carrying these kind of trucks and earth moving devices which this project would require. The noise, the dust, the traffic – all of these issues are of grave concern. Please research the proposed timeline, time of year, extent of traffic, impact to our road and surrounding properties, and mitigation if damage is done. Will Kinder Morgan be responsible for repairing or even re-building the road once construction is complete? Will maintenance and repair vehicles use this same route? How will Kinder Morgan compensate us for our loss of peace and quiet, impact on our property values etc?

### **20150819-5162**

**TOWN OF SHELBURNE**  
**Conservation Commission**

51 Bridge Street  
Shelburne Falls, MA 01370

Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C.  
Northeast Energy Direct Project - Docket No. PF14-22-00

## SCOPING COMMENTS

Dear Secretary Bose:

The Shelburne Conservation Commission is charged under Massachusetts Conservation Act to protect conservation lands and watershed resources in the Town of Shelburne. We are also responsible for administering and enforcing environmental standards set by the Massachusetts Wetlands Protection and Rivers Protection Acts for projects that affect wetlands and water bodies in the Town.

The Northeast Energy Direct Project (“the Project”) will have significant effects on wetlands and water bodies in Shelburne. Its proposed route will require directional drilling of the pipeline under the Deerfield River, crossing of several streams, and development in wetlands protected under the Wetlands Protection Act. All of these actions should require Tennessee Gas to file a Notice of Intent with the Shelburne Conservation Commission and the Conservation Commissions of other towns to secure its approval of the Project.

The Shelburne Conservation Commission is concerned that the current process for regulation of the Kinder-Morgan pipeline will allow approval without the input of local Conservation Commissions through the Wetlands Protection Act, thus bypassing critical local regulation that has proven to be highly effective in protecting wetlands and associated fish and wildlife resources. We therefore request that all parties involved (including Kinder Morgan, FERC, State of Massachusetts) in the approval process act to ensure that the Shelburne Conservation Commission has the opportunity to review any aspect of the construction of all new pipelines that will impinge the wetlands resources of the town of Shelburne, and that similar opportunities be guaranteed for all towns in the Commonwealth that are impacted by the proposed pipeline.

Before getting to scoping comments, we want to make FERC aware that the Shelburne Conservation Commission, like many others in rural areas that will be traversed by the proposed pipeline, is wholly made up of part-time volunteers. We do not have professional staff and generally meet just once a month. We join our state and regional representatives, fellow Conservation Commissions, towns, NGOs and countless individuals in calling for a longer period to comment on the 2nd Draft Environmental Report filed by Tennessee Gas on July 24, 2015. The 60-day comment deadline is unreasonable and should be extended by at least 45 days.

While the Shelburne Conservation Commission has not had time to fully review the 2nd Draft Environmental Report filed by Tennessee Gas, we have identified the following issues and lack of information that we believe must be fully addressed in the Draft Environmental Impact Statement (EIS) to be issued by FERC:

- Impact on water bodies. Provide details of project construction impacts on the Deerfield River, Shingle Brook, and other unnamed water bodies to be crossed by the proposed pipeline. We note that no details on directional drilling under the Deerfield River are included in the 2nd Draft Environmental Report.
- Impact on wetlands. Provide details of project construction and ongoing right-of-way maintenance impacts on wetlands that will be crossed by the proposed pipeline. Alternate routes to avoid wetlands should be identified and assessed.
- Impact on protected habitats. The Massachusetts Natural Heritage and Endangered Species Program have identified a land corridor with Priority and Endangered Species habitats along the Deerfield River. Provide details of project construction and ongoing right-of-way maintenance impacts on protected habi-

tats that will be crossed or disturbed by the proposed pipeline.

- Invasive species. Soil used to backfill the pipeline trench could introduce invasive plant species. Provide information on procedures that will be required by FERC to insure no invasive species are introduced. A long-term control plan for the right-of-way should be required.
- Blasting impacts. If blasting is required for creating an adequate pipeline trench, the FERC should require a geomorphologic study of the pipeline corridor to assess the potential for impacts on private wells and groundwater flow patterns. The Draft EIS should include a discussion of measures that will be taken to insure against or mitigate any adverse groundwater impacts.
- Geology. Massachusetts is regarded by USGS as a region of active geologic faults. Plans in the 1950s for a proposed hydroelectric dam on the Deerfield River above where the South River comes in from Conway were abandoned when it was determined that it would sit on an active fault. The proposed pipeline river crossing is in the same area. The Draft EIS should examine the geology under the river and adjoining areas in Shelburne and Conway to determine whether there is a threat to pipeline integrity in both the short and long-term and how to mitigate the risk.
- Fragmentation of farmlands and forests. Development of a cleared pipeline corridor will increase fragmentation of farmlands and forests in Shelburne, resources of natural and economic importance to the Town. To minimize economic and environmental impacts, the final pipeline route should be required to follow existing cleared rights-of-way, e.g., transmission lines, or major highways such as the Mass Pike (1-90). Pipeline development should be accomplished within, not expand, existing rights-of-way.
- Sediment runoff. The majority of roads serving the proposed pipeline route in Shelburne are narrow, rural, two-lane roads; some of which are gravel. Heavy equipment and construction traffic will damage these roads and create the likelihood of sediment runoff into brooks that run along many of the roads. The Draft EIS should identify the roads that will be used and the measures to control erosion and sedimentation. Provide details of plans for post-construction road repair.
- Noise. Shelburne is a quiet, rural area, but residents live throughout the town including the area of the proposed pipeline route. The Draft EIS should include an analysis of ambient noise levels and define an upper noise limit for project operation that meets the state noise regulations (not to exceed the average ambient noise the level by more than five (5) db(A)).
- Air quality. As noted above, many of the roads in Shelburne are unpaved, making them highly susceptible to dust production by heavy trucks and equipment. A plan should be outlined to maintain local air quality to minimize impact on residents living near the construction sites and on roads used for transport.
- Permanently protected open space. While the proposed pipeline route does not cross any permanently protected lands in Shelburne, the Conservation Commission wholly supports Article 97 of the state Constitution that provides this protection, and we oppose any effort to secure legislative approval to void this protection. Permanently protected open space reflects a more than century old public initiative to insure the natural heritage of the Commonwealth.

In closing, the Shelburne Conservation Commission wishes to state its endorsement of the more comprehensive scoping comments submitted by the Franklin Regional Council of Governments. We intend to participate actively in the oversight and monitoring of the construction and maintenance of the Northeast Energy Direct Project, should it be approved by FERC

Sincerely,

Norman Davenport

To The FERC

Re: Docket No. PF14-22-000

Our farm is located in Schoharie County, town of Middleburgh in Ecker Hollow. A community of 60 homes, which includes a horse boarding business and a large campground.

I have lived here for 87 years and have made my living off this land, raised 4 children and hope to spend the rest of my life here. I am facing eminent domain easement on our land for the Constitution pipeline. The Tennessee Gas Line is looking to go alongside the Constitution Pipeline.

I am concerned with what this will do to my property value and our drinking water. It will disrupt the many waterfowl that use and raise young on our large pond. We have many deer, turkey, beaver, muskrats, eagles and osprey that call this valley home. This line will also cross 2 sections of large wetlands and 2 feeding streams.

The pipelines could be kept at the top of the hill and travel a little farther south through more woods and acres of abandoned land, affecting no crop fields and not close to any homes. You really need to visit this area to see what will destroy a quiet neighborhood and our 300 acres that has been in the Bixby family for over 150 years.

I am very much opposed to these lines and ask for you to not give your approval.

James E. Bixby

Re: Kinder-Morgan Proposed Pipeline.

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street N.E., Room 1A  
Washington, DC 20426

Re: Tennessee Pipeline LLC

Docket 8 422400 Proposed Northeast Energy Direct -NED

Dear Ms. Bose

The people of Sharon overwhelmingly oppose the construction of the Kinder-Morgan Pipeline, reflected by their response to a town wide survey. Of the 120 or so households, those responding voted 100 to 15 against the Kinder-Morgan project. The Sharon Board of Selectmen is unanimously and unequivocally opposed to this pipeline. As their elected representatives, we urge you to reject the Kinder-Morgan application out of hand on the following grounds:

1. Any purported economic benefit will be utterly eclipsed by higher costs to all of the state's residents. New Hampshire is a net exporter of energy. But under the NESCOE plan, the ratepayers will face a hike in their electricity bills to cover the costs of construction.
2. The pipeline is designed simply to provide a highway for fracked gas to reach Dracut, Massachusetts from which it will be piped north to the Maritimes for export to the European markets. This will effectively raise costs on the domestic market, including New Hampshire.
3. The pipeline will blast its way through 71 miles of granite in a thirty-yard corridor of destruction, crossing thousand of acres of conservation land, rivers, streams, aquifers, and woods to the degradation of the entire Monadnock Mountain Region.
4. While Sharon, like neighboring Temple is not among the 17 communities facing direct devastation from this project, like Temple we will get the fallout. We have no town water. Blasting and cutting into the aquifer within a few miles of Sharon has the potential to destroy the safe use of many of our drinking water wells.
5. The planned 40,000HP compressor station or neighboring New Ipswich will dramatically damage the quality of life for Temple and, to a lesser extent, Sharon with forty blow downs a year and the consequent release of dangerous chemicals into the air we breathe.
6. Finally, the Mount Monadnock Region is an iconic resource for the entire eastern seaboard. The pipeline

has the potential to impact or destroy tourism in this region.

It is the largest area of unspoiled woods, waters, and mountains within easy reach of millions of city dwellers. Its uniqueness is preserved by the thousand of acres of conservation land from bequests over many years intended to keep it a living habitat forever.

But should FERC approve this project Kinder-Morgan may by law disregard all that, ignore EPA standards, misuse eminent domain for private profit, and despoil a semi-wilderness intended for those who come after Us.

Again, we urge you to reject the Kinder-Morgan application

The Sharon Board of Selectmen

Linda Paris, Chairperson

Carl Newton

Ted O'Brien

To: Federal Energy Regulatory Commission

From: David Barnard, 115 Elm Ave, Delmar, NY12054

6/15/2015

1 Your charge is to oversee the progress of energy development and energy projects in our nation.

These times require a much deeper analysis of energy solutions. Is the technology up to date? What are the serious impacts, of greenhouse gas emissions? How much gas, coal, nuclear, solar, or wind? How does it effect our communities?

2 Your charge is to assure that appropriate technology is applied to the nationwide energy transmission systems. It appears that the impact of this pipeline on populations near compressor sights is very serious. Serious enough to require independent design and planning. There is a basic conflict of interest with profit and impact on populations and environmental issues. This mandates that this nationwide design plan be independent of business or gas companies. All the public stakeholders should have a say before the plans are firmed up by pipeline industries. It would appear that the present plans shown to the public are much too late in the design process. This public hearing process is done in such a way as to limit the effectiveness of public input into the planning process. That is to say, that the industry has already set the technical design and routing priorities and the public must accept the plan without much ability to change. It would seem that large energy hungry compressor stations that produce tremendous noise pollution and leak gas are outdated technology. It would seem that, as we plan for the future we need to require a noise free and pollution free technology. Natural gas leakage is a serious greenhouse gas, many times more serious than carbon dioxide. In this day and age this is unacceptable.

Why can't a nation that could send people to the moon and send a perfect mission to Pluto also produce a quieter gas infrastructure? Why can't a nation that could produce safe underground urban roads also produce a non polluting gas infrastructure? Why can't our nation find ways to prevent massive disruption to rural communities all across the country as we progress in building our new energy infra structures?

The answer is we can. We can if the agencies of government, like FERC and all stake holders prevent short sighted profit motives from taking technology shortcuts. Industry must not be in charge of national infra structure design. National and community welfare requires the charge be given to independent energy planning agencies responsive to public concerns and environmental science. Lets get the smart young engineers with vision and knowledge to design our energy future not the gas companies. (fthe cost is more then this IS the cost of THIS energy. Let the cost be on the end-consumers not the home owners along the way.

We pay the taxes to support responsive agencies like FERC and we, the concerned citizens of these communities and of this nation require you to take a more proactive role in the design of our future. Thankyou,

Russell Bennett

July 14,2015

Re: Scoping Notice; Tennessee Gas Pipeline Company, I.L.C., Docket No. PF14-22-000  
Northeast Energy Direct Project

I am submitting these comments for purposes of seoping in relation to the proposed Northeast Direct Pipeline.

Hudson River crossing. The Hudson River is a Superfund site for two hundred miles from Fort Edward south to NYC. The crossing at Coeyman's Landing and Schodack is just 20 miles south of the Troy dam, where General Electric has performed an expensive dredging and cleanup operation of PCB deposits in the sediments to prevent their further downstream migration. The river is over 1400 feet wide at the proposed crossing point. This is much wider than can be crossed with horizontal drilling, suggesting that the applicant will use open blasting. It should be determined whether and how Kinder- Morgan's river crossing method will disturb and re-suspend PCB deposits at the crossing site. FERC should study the effect on downstream communities such as Rhinebeck and Poughkeepsie which use the Hudson River for drinking water. Additionally, the Town of Bethlehem uses wells adjacent to the Hudson at its Clapper Road treatment facility, in very close proximity to the proposed pipeline crossing. The Hudson is an estuary river which changes its direction of flow four times per day. The danger to the public water supply requires a hard look.

Nassau compressor station (Market Path Mid Station 1). The proposed 90,000hpcompressor station is just 2800 feet from the southern tip of Burden Lake in an area that is otherwise extremely quiet. Portions of the lake are within the half-mile buffer from the compressor. Once sound reaches the lake, there is no topographical barrier to attenuate the noise or prevent its travel over the water. The extremely loud sounds produced by blow downs will be carried far further than in other locations, particularly since the prevailing winds are from the south and running directly to the lake. As pointed out in NYSDEC's SGEIS on the Oil, Gas and Solution Mining Regulatory Program in New York State, even a six decibel increase in sound pressure can be annoying against existing rural background levels of only thirty decibels. (See Final SGEIS, May 2015, Vol. I, page 6-301.) FERC should study the effect on the sound impact of the topography, prevailing winds and quiet background.

Burden Lake hosts a children's summer camp and Wounded Warriors events for recreation and recovery of severely disabled veterans. It is inconceivable that we would subject these veterans, many of whom may be suffering from post-traumatic stress syndrome or traumatic brain injury, to constant, sudden and extreme noises or to force them to find another host site after forging a strong community connection for so many years here in an ideal site.

Aside from hosting a nesting population of bald eagles and numerous osprey, Burden Lake is a regular stopover for migratory waterfowl in the spring and fall. These include large numbers of Canada geese, bufflehead ducks, mergansers, loons, wild swans, and mallards, etc. FERC should study the impact of the compressor station on resident and migratory birds.

The sound from the compressor station could be mitigated by employing a number of smaller stations with electric motors instead of natural gas engines, installing silencers and mufflers, erecting sound containment structures, moving the facility to a less sensitive location, or, preferably eliminating it altogether.

Pipeline compressor stations typically employ stadium type lighting for security purposes, despite the fact that these stations are generally hidden from view by the topography and are unattended. Lighting of the sort contemplated would pollute the night sky, preventing any view of the stars from Burden Lake and unneces-

sarily interfering with activities of night animals such as bats and owls. FERC should study these impacts and whether there is a reason why night vision security cameras could not be employed as a mitigation measure. There is no reason why the facility cannot meet Dark Sky guidelines for shielding of glare.

The proposed compressor station is 9,000 feet from Eastfield Village, a collection of colonial buildings in an historically authentic setting, used for educational and study purposes at 104 Mud Pond Road in East Nassau. The constant sound would be incongruous with the site's mission and purpose.

The pipeline would run just north of the former Dewey Loeffel landfill, a Superfund site. FERC should study the compound effect on the affected lands and the waters of Nassau Lake of a potential leak from the pipeline flowing through the landfill area.

Rensselaer Plateau. The pipeline would bisect the 105,000 acre Rensselaer Plateau, one of the largest and most ecologically intact native habitats in New York State. The pipeline would isolate and fragment wildlife on either side of the line, defeating the goals of the Rensselaer Plateau Alliance's conservation plan, recently ranked #5 nationally by the U.S. Forest Service Legacy Program. Running the pipeline adjacent to existing electric power easements exacerbates the problem by widening the gap separating contiguous habitats. The impact on the Plateau's animal and plant life should be closely studied. Consideration should be given to burying the pipeline deep enough to permit reforestation.

The Plateau is characterized by steep topography. Construction across such areas creates a potential for flash flooding, affecting lakes and streams at lower elevations. Glass Lake and Crooked Lake are particularly vulnerable to flows from higher elevations in high volume storm events. The dams along Wynantskill Creek are not capable of withstanding additional loads. Catastrophic collapse would threaten communities as far away as the City of Troy.

Thank you for the opportunity to comment.

Sincerely,

Russell Bennett

### **20150820-4003**

I would like to address the very real health consequences to residents in close proximity to these compressor stations. I am referencing a 2014 scientific health study of air quality around natural gas drilling wells and compressor stations in 5 states. This study was co-authored by Dr. David Carpenter, Director of The Institute for Health & The Environment at the University at Albany.

The Institute was created with the primary purpose of promoting and supporting research in the area of environment and public health. In June 2015, the Institute was redesignated as a World Health Collaborating Center in Environmental Health.

The study found:

Air samples taken near existing compressor stations in Pennsylvania revealed unsafe concentrations of benzene and formaldehyde in levels that EXCEEDED Environmental Protection Agency (EPA) levels.

Benzene is a known human carcinogen. Chronic exposure to benzene increases the risk of leukemia. Benzene exposure also increases risk of birth defects, respiratory effects including pulmonary edema, laryngitis and bronchitis. The study specifically includes benzene as a fugitive emission along numerous points of production such as compressors and pipelines.

Formaldehyde is a suspected human carcinogen. It can effect nearly every tissue in the human body leading to acute dermal (skin), allergies, asthma, and chronic health effects including neuroreproductive, genetic and pulmonary toxicity, and cellular damage. It was another volatile compound that exceeded health-based risk levels near compressor stations in Pennsylvania, Wyoming and Arkansas. As with benzene, formaldehyde emits along the production chain and is "a product of incomplete combustion emitted by natural gas-fired reciprocating engines at compressor stations".

Other toxins, specifically hexane and hydrogen sulfide can affect the central nervous and respiratory systems. The study states that where high concentrations of hexane were found in samples taken around compressor stations in Wyoming suggests a combination of leaks, spills and fugitive emissions as potential causes.

In a radio interview yesterday, on Capitol Pressroom, WCNY, Dr. Carpenter stated that in his 5 state study, compressor stations were the greatest source of pollution and adverse effects to human health. He stated that breathing in carcinogens and toxic chemicals are agents that cause cancer and would have long term effects. He named hydrogen sulfide as an emission which would, in the short term, cause degradation to the central nervous system, and disrupt the quality of life with symptoms of headaches, "brain fog", and fatigue.

When asked specifically if fracking and transporting of natural gas could be done safely he responded, it could, if the industry's feet were held to the fire. The problem, Dr. Carpenter expressed is "that whole industry has been exempted from all the regulation other industries have to apply" by the federal government. When asked again if he thought it was safe under these existing, current political parameters Dr. Carpenter concluded "Absolutely not. The industry is not held to the same standard as every other industry is held".

In every interview, whether print or media Dr. Carpenter has concluded the lack of federal regulations a contributing factor to the risk to human health caused by the fracked gas industry. The multi-billion dollar oil and gas development industry enjoys special status and are exempt from complying with environmental protective laws like the Clean Air Act and Clean Water Act. They are only required to self monitor and report incidents.

This scientific health study is not supposition, conjecture, or a hypothetical. It's fact. It's evidence. Whereas a fracked gas pipeline carries potential danger, compressor stations are a definite hazard to human health.

That being said, I don't know why this, alone, isn't enough to deny a license to Kinder Morgan/Tennessee Gas.

No company or government agency should have the right to impose suffering, illness and death on a human being. When did human lives become so expendable? This is contrary to everything our country stands for. The ability of a government to force law abiding tax payer to give up their land, the peace and security of their homes and the safety of their families so a few can profit is imperialism at it's worst.

Our forefathers, members of my family, members of my husband's family and I'm sure your family, too, served this country and were prepared to give their lives to protect our way of life, and the ideals and freedoms we hold so sacredly. Hundreds of thousands of our young men and women died to save us from exactly this: unjust taxation, seizure of land and property, exploitation of our forest lands and natural resources, and most important of all, the callous disregard for human life. This nation has fought wars with countries who treat their people like this.

Our health and safety should be every government agency's primary concern. To allow a 90,000 horsepower compressor station to be inserted into a populated rural residential zone and threaten the health and lives of citizens is unjust, Un-American, inhumane and inhuman.

Granting this application would be giving Kinder Morgan a license to kill.

Thank you,

Shelley Bennett

O Carpenter6\*

## Abstract

**Background:** Horizontal drilling, hydraulic fracturing, and other drilling and well stimulation technologies are now used widely in the United States and increasingly in other countries. They enable increases in oil and gas production, but there has been inadequate attention to human health impacts. Air quality near oil and gas operations is an underexplored human health concern for five reasons: (1) prior focus on threats to water quality; (2) an evolving understanding of contributions of certain oil and gas production processes to air quality; (3) limited state air quality monitoring networks; (4) significant variability in air emissions and concentrations; and (5) air quality research that misses impacts important to residents. Preliminary research suggests that volatile compounds, including hazardous air pollutants, are of potential concern. This study differs from prior research in its use of a community-based process to identify sampling locations. Through this approach, we determine concentrations of volatile compounds in air near operations that reflect community concerns and point to the need for more fine-grained and frequent monitoring at points along the production life cycle.

**Methods:** Grab and passive air samples were collected by trained volunteers at locations identified through systematic observation of industrial operations and air impacts over the course of resident daily routines. A total of 75 volatile organics were measured using EPA Method TO-15 or TO-3 by gas chromatography/mass spectrometry. Formaldehyde levels were determined using UMEx 100 Passive Samplers.

**Results:** Levels of eight volatile chemicals exceeded federal guidelines under several operational circumstances. Benzene, formaldehyde, and hydrogen sulfide were the most common compounds to exceed acute and other health-based risk levels.

**Conclusions:** Air concentrations of potentially dangerous compounds and chemical mixtures are frequently present near oil and gas production sites. Community-based research can provide an important supplement to state air quality monitoring programs.

**Keywords:** Benzene, Community monitoring, Formaldehyde, Grab and passive samples, Hydraulic fracturing, Hydrogen sulfide, Oil and gas

## 20150820-4005

Testimony by Bob Cohen, Esq.

Scoping Hearing, NED Pipeline Project

July 15, 2015

Good evening. My name is Bob Cohen. Thank for the opportunity to testify tonight. I am a resident of Schodack in Rensselaer County. I am also the **Policy Director of Citizen Action of New York**, an organiza-

tion with thousands of members in New York State, including here in Rensselaer County. I share the views of so many speakers tonight and last night in regard to the safety and environmental issues presented by this massive project. I will expand the argument I'm presenting tonight in comments I will shortly file with the Commission.

My focus tonight is the bogus job claims made by Kinder Morgan as to the positive jobs impacts of a pipeline. I share the concerns of our union brothers and sisters here that we create jobs locally, but this pipeline is not the way to do it. Quite simply, a June 2015 study funded of the Massachusetts impacts by the Beacon Hill Institute at Suffolk University found that only 1,713 temporary jobs will be created in that state. The study concedes that much of the jobs and other income generated by the pipeline will go out of state, for example, in the form of skilled workers brought into Massachusetts to work to build it.

Long term, the study only projected 9,420 jobs by 2020. And these jobs will only materialize if we accept the study's projections, which are not certain, that decreased energy prices will result from the increased supply of gas, which will in turn expand the state's business climate. New York is not currently slated to get the fracked gas, so we won't even get anything close to this number of jobs in New York, even assuming the BHI is right about Massachusetts.

More importantly, the BHI study-funded by Kinder Morgan and performed by an Institute that has received large amounts of Koch brothers funding - does not even consider the alternatives: the positive employment effects that would come (rom investing in alternative fuels like wind. water and solar and increased energy conservation.

Estimates are spending on green investments creates roughly three times as many jobs as spending the same amount of money on maintaining our existing fossil fuel sector. This is primarily because clean energy jobs are more labor intensive and a greater proportion of spending would stay in our country. And a study done by several Stanford professors has projected that conversion to 100% clean, renewable energy by 2050 would create 104,000 permanent construction and operations jobs in Massachusetts - tar more than the 9,420 jobs created by the pipeline. In New York, the figure would be 277,200 jobs.

In short, neither the Commission nor the public should rely on this highly questionable study. In light of the environmental and safety concerns highlighted by other local residents, this dangerous white elephant should be rejected. Thank you.

Bob Cohen, Esq.

## **20150820-4006**

FERCseeping hearing 7/14/15 at Birch Hill Catering Castleton- on - Hudson, NY 12033  
In regards to the proposed Northeast Energy direct pipeline Docket # PF 14-22-000

Comments presented by:

Dr. Lisa Dietrich Zimmerman DVM  
80 Rice Road  
Nassau, NY 12123

I have multiple concerns of Kinder Morgan/ Tennessee Gas' proposed NED pipeline.

Environmental, Air, Water and Soil Quality concerns:

1. The effects of the construction process: On the compaction of soils on our farm, the aquifer, the quality of life of the residents, and the presence of wild life including bald eagles sighted on Clark's chapel and Rice Roads.

2. The potential for contamination of the ground water through streams supplying the aquifer. It is an unconsolidated aquifer which flow east to west to the Hudson River.
3. Continual noise levels from the proposed compressor station exceeding SS deb at the nearest house especially during blow downs.
4. Toxic chemicals emitted by compressor station blow downs including formaldehyde, benzene and toluene and radon with serious health effects according to MSDS sheets.
5. Significant light at the compressor station affecting wildlife, migrating birds, bats and the quality of life of surrounding residents.

#### Public Safety

1. There will be co-location of the NED with two other pipelines that will parallel the NED from Wright to Iape Road in Schodack. A crack in aged pipelines from frost heaves or corrosion and leakage could lead to a catastrophic explosion in populated areas like Glenmont, Bethlehem or Castleton especially if all 3 pipelines are affected.
2. Potential for terrorism especially if the compressor station is left unmanned and not fenced with a significant structure.

#### Socioeconomic Concerns

1. It is well known that the production of Marcellus shale fracked natural gas far exceeds the capacity for use in the northeast. There is enormous pressure from both the natural gas industry and Wall Street investment firms who financed them to export this gas out of the United States. Excessive gas exportation could raise US domestic gas prices, use a finite resource, and allow excessive construction of infrastructure that does not directly benefit US citizens.
2. Gas transported in the proposed NED will not benefit Rensselaer County and most of the natural gas will not benefit NYS or New England.

#### Solutions to stop or mitigate the effects of the proposed NED pipeline:

- a. Stop the NED pipeline application process thereby denying construction of the NED.
- b. Move the proposed pipeline out of Albany and Rensselaer counties
- c. Require Kinder Morgan and Tennessee gas pipeline companies to replace the existing pipelines with new pipes from Wright to Iape Road.
- d. Decrease the pressure of the NeD from 1460 psi to 740 psi and the diameter from 36" to 30" to make an explosion less dangerous.
- e. There must be continual monthly monitoring by KM/TGP before and after construction of areas within a mile around the compressor station to detect dangerous chemicals in the air, soil and water of surrounding landowners.
- f. Move the compressor station to another less populated area
- g. Size down the compressor station with a total cap of no more than 10,000 HP gas turbines
- h. Require a large sound proof 50 foot high barrier around the compressor station,
- i. Require all Jighting to be no more than 10 feet off the ground and on motion sensors as to not allow continual lighting
- j. Providing 24 hour armed guards to a locked facility around the compressor station.
- k. Require the pipeline to be buried at least 4 feet below the ground not 3 feet like it is proposed
- i. Study the Bald eagle population sighted on Rice and Clark's chapel road for nesting sites.

I ask you to deny the Certificate of Public Convenience and Necessity. If the project moves forward then please do not close the scoping comment period until 60 days after Kinder Morgan files new complete resource reports since there is still too much to be determined.

Submission for Federal Energy Regulatory Commission Scoping Hearing

1 Celebration Way, Castleton-on-Hudson, NY

July 14, 2015

Thank you for giving me the chance to speak. When I first moved to Malden Bridge 27 years ago from Albany I figured I could hang my laundry out to dry in the country air. I didn't reckon on Kinder Morgan's compressor station two miles up the road which spewed ash out of its stacks onto my sheets from pipelines they drove under the formerly pristine Kinderhook.

97 percent of scientists agree that global warming is caused by co2 emissions from carbon fuels. Every significant study of our environment for the past twenty years has shown we must switch from carbon fuels to green energy, or else the earth as we know it will be doomed: our seas warmed until their fish are gone, our lands raked by monster storms and heat waves, our shores invaded by rising salt water, our glaciers gone, and droughts world-wide. However a switch is being made to solar, wind and geothermal energy at such a tremendous pace, providing a greater abundance of jobs involving installation and maintenance of new systems than in the natural gas industry, that by 2020 the energy requirements for New York and New England will be increasingly met without resorting to fossil fuels. Indeed a recent article in Scientific American documents that this switch is outpacing prior predictions due to the rapidly dropping cost of solar panels.

Kinder Morgan's plan to drive a pipeline underneath our homes, woods, streams and pastures is a rape of our land, pure and simple. It is a short sighted, selfish, last ditch attempt by a corporation too cheap and greedy to invest in or convert to green energy, to wring yet more profits from a flawed and dangerous technology, whose compressors vent polluting gases and whose pipelines rust and explode. No more pipelines. Not in my backyard, not in anyone's backyard. Isay Kinderhook, not Kinder Morgan .

Comments Of David & Patricia Flint For FERC Public Scoping Meeting

Castletown-On-Hudson, Tuesday, July 14,2015

We are Rensselaer County landowners with property abutting the proposed Kinder-Morgan NED pipeline route. We estimate that the construction area for the project will come within 100 feet of our house and well.

The amount of gas proposed to be delivered at high pressure through this 36-inch pipe is far more than needed in Massachusetts and New Hampshire. The stated need has been reported as 0.7 billion cubic feet per day for regional electrical generation - and that's only on some 10 to 27 peak demand days per year. The

proposed pipeline is supposed to deliver 2.2 billion cubic feet per day. So most of the gas is intended for export up to Nova Scotia and overseas - export to benefit Kinder-Morgan and the natural gas industry. No gas for New York State or Rensselaer County is intended from this pipeline.

But we shoulder the risks, the economic costs, the legal costs, the irreparable damage to our wells, the plummeting property values. We even pay tax on any minimal compensation we get for easements - as if it were some kind of windfall.

Congressman Chris Gibson does not support this proposal. "Our community should not bear the burden of the project, take on all the risk, and not benefit from the construction and placement of the pipeline," he said. U(And)with several other projects recently approved or close to approval, it is important that we not over-develop, which could increase risk and significantly decrease any offsetting economic benefits to local communities,"

Please investigate the abysmal status of pipeline safety oversight. Recently the National Transportation Safety Board has spoken of systemic weaknesses in how natural gas providers maintain their pipelines. and the top official at the Pipeline and Hazardous Material Administration has admitted that he has "lively few tools to work with" in enforcing safety rules. At the State level, the New York State Department of Environmental Conservation says that they conduct no air monitoring at compressor stations and rely on self-reporting by pipeline companies for any incidents. If suspicious they simply ask the company to conduct a study.

Please note too that frost in our area this past winter was reported to be as much as six feet below ground. Kinder-Morgan proposes to lay the pipeline only three feet down.

We are not qualified to suggest any alternate route for this pipeline. We believe this pipeline is not needed and is convenient only for Kinder-Morgan. Please deny the Certificate of Convenience and Necessity.

FERC

re: Docket Number PF14-22

ENVIRONMENTAL IMPACT

I represent a non-profit religious organization incorporated in California. In 2008 we relocated from Napa, California to Nassau, NY at great cost and sacrifice. I donated nearly 40 acres of land that has been in my family for almost 100 years to build a center for our organization. The headquarters are located at 202 China Hill Road, Nassau, NY. The center is used by local, national and international members and non-members to come for retreats in a peaceful rural setting. It has been an ideal location with its contemplative environment offering a place for silence, serenity to meditate and pray. It has been a safe place. The air is pristine, the spring water is clean and pure, and the atmosphere is peaceful and quiet. We have an organic garden and we raise honeybees.

If a 90,000 horsepower compression station were to be built on Clarks Chapel Road, within walking distance of our property, all this would change. We would be bombarded by noise pollution 24 hours a day as the fracked gas aided by three Titan 250 gas turbines would be pushed along the pipeline, which is proposed to be on our property. The light and noise and off-gases periodically to regulate pressure will disrupt our peaceful environment 24 hours a day, a Public Nuisance. The compression station would pollute the air and the water. We would no longer be in a safe environment. The noise alone would inhibit our ability to practice our faith. The dangers that a pipeline in our backyard and a compression station very close to our property would make it an unsafe place to hold retreats, let alone to live.

We also protest the robbery of the community's wealth by Kinder Morgan through their proposed compression station and pipelines. As soon as they would be established all the property values will go down to nothing. After all who wants to live next to a pipeline and a compression station?

Would any of you members of FERC, members of our government, anyone from Kinder Morgan live in a place where there is a fracked gas pipeline and a compression station of 90,000 horse power in your backyard? I think not Well, we don't want it in our backyard either. We want the same right to peaceful quietude as the decision makers. Please find another place that is not populated to put your fracked gas pipeline and your compression stations.

FERC, we know that you have never denied a pipeline application. But now you should for the first time deny Kinder Morgan's pipeline and compressor stations application. There is no place for them in our populated area. We know that the truth is hard to accept. But look at the truth, the scientific evidence, and the track record of safety of Kinder Morgan and other pipelines and compressor stations. You know that the pipeline and compressor stations will be devastating to our communities and it will destroy us. If we are to survive, then we must not be consumed by corporate greed, money, and power. You must make a decision that will be for the good of the people, for humanity, for the environment, for our government, which is of the people, for the people, by the people. After all as the Declaration of Independence says, "...we are endowed by the Creator with certain inalienable rights, that among these rights are life, liberty, and the pursuit of happiness." Do not take away our life, liberty or our ability to pursue happiness. Deny the application for the pipeline and compressor stations in our communities.

Humbly submitted by a peaceful homeowner and board member of our non-profit religious organization  
Sheila OSForaker

#### **20150820-4013**

Katie Garrity, 1224 Averill Park Rd, Nassau, NY 12123

When my husband and I were looking for a home 11 years ago, one of the main characteristics we wanted was a rural setting. Being an asthmatic, as well as being prone to migraine headaches, the quiet setting, and clean fresh air of country living was important to my health. I love where I live, it is rural, but not desolate. I have many neighbors, and often hear the sounds of their children and pets playing outside. I love my neighborhood. Now however Kinder Morgan wishes to move a monster into my neighborhood. This 90,000 hp death machine threatens our neighborhood in so many ways. Having done some research on pipelines and compressor stations, I am concerned about my environment. Compressor stations are known polluters, releasing tons of hazardous chemicals each year. In research by the Southwest Pennsylvania Environmental Health Project, it has been found that high levels of toxic chemicals have been found at compressor stations, as well as in the surrounding air, land, and groundwater. These chemicals include benzene, toluene, formaldehyde, methane, and methylene chloride to name a few. These are dangerous chemicals that are known carcinogens, and nervous system attackers. There are concerns about radon, and radioactivity in the vicinity of compressor stations. Anecdotal records show high percentages of breathing issues, skin problems, and

cancer in people living within a 2 mile radius of these polluting stations. Then there is the light and sound pollution of this station. My migraines are triggered by sounds and smells. The constant low frequency drone of a compressor station has been shown to cause vibra-acoustic disease in a five to eight mile radius surrounding the station. This disease can cause migraine headaches, ruptured eardrums, loss of hearing, depression, anxiety, and even brain damage.

In looking at the documents that were sent to me by Kinder Morgan, I find that my home is approximately 300 feet from the proposed compressor station property. I will likely suffer with illnesses caused by compressor station pollution. I worry that being so close will put me in the incineration zone. How is it possible in our free democratic SOCIETY that homeowners can be involuntarily forced into living in fear of everything they love being incinerated in the case of a gas disaster. You might think that this rarely happens, but in looking into Kinder Morgan's safety record, I found that since 2003, there have been 36 major disasters in this groups pipelines. Property damages in the millions, fines in the millions, loss of property, loss of wild-life habitats, pollution of bodies of water, groundwater, and surrounding land, and the most costly damage of all, death of several humans. In most cases, improper pipeline maintenance was found to be the main contributing factor. This is just the cases in which Kinder Morgan was involved. In the same amount of time, there have been 180 significant disasters based on pipelines. I do not wish to be a part of one of these disasters. The probability of there being an accident with the compressor station, or the pipeline in my area is high. I feel that it is necessary to do more research into Kinder Morgan's safety record before even considering issuing approval for this project.

This pipeline is not needed. Studies in New England show that there is not a need for this extra natural gas. The plan for this gas to be sold as an export shows that the citizens of this country do not have a need for this gas pipeline. This gas is not meant for me, and will not benefit my family or neighborhood in any way. It is imperative that this proposal be denied, and that the pipeline be canceled, or at least find vacant land in which the daily lives of American citizens will not be negatively effected.

#### **20150820-4014**

- Tennessee Gas is now scheduled to file its formal application in October. The public comment period needs to be changed as well. The new deadline should be September 30th, not August 31st.
- Recent studies have been conducted by such organizations as the AMA and the Medical Society of the State of New York which state that they "support legislation that would require a comprehensive health impact assessment regarding the health risks that may be associated with natural gas pipelines." Time is needed for such an assessment.
- Another in a series of ongoing resolutions issued by town and COUNTY governing bodies was just released by Rensselaer County in support of the AMA's resolution that I just alluded to and asking, "the NYS Department of Environmental Conservation to implement an immediate freeze on new air and water quality permits for Kinder Morgan." Time is needed to examine the implications of the AMA's resolution.
- ...Kinder Morgan filed and was issued a docket number for this project almost a year ago. Since then, the ( market has changed. By the time the company files formally, the original application will be based on old data. It is common practice in many industries to re-evaluate such a massive project's viability on at arly if not an ongoing basis. .s p~t should be no ~xcq,tion~ FE;C n~ to stop, take a \ breath, step back from the pell-mell rush to grow the fossil fuel infrastructure and evaluate whether we really need, right now, more capacity.
- New laterals, loops, and route directions have been added, subtracted, and altered and we still don't precisely know where the thing is going to be. Until Tennessee Gas issues a concise plan with maps clearly identifying all the land, roads, and rivers it intends to bury its pipe under, there ought to be a delay in the permitting process to give the public a chance to examine the project as it really is, not as it might be.
- FERC should require Kinder Morgan to resolve all things that have a "To Be Determined" status. Once all the TBDs have been resolved, then and only then should the permitting process be continued. How can

you approve or disapprove of what isn't? You can issue contingency orders in the hopes that a \ company will either comply or be penalized by a regulatory party. But we all know that the regulatory \ enforcement agencies, like PHMSA, is hard pressed to enforce anything. Of course, that's not FERC's concern, but it is OUR's!

- Why don't we admit the truth - that nobody has the time or resources to adequately reflect on what our future energy needs and policies should be when we're rushing ahead, knee-jerking our way to a possibly disastrous future. Let's slow the process down and do the necessary research into cause and effect and determine what the real trade-offs should or should not be.

Wall Street Worries About Kinder Morgan's

Safety Record

8C pipeline operator slashes and defers maintenance spending.

Eric de Place @Eric\_deP

This post is part of the research project; Northwest Coal li OJ! EM2[ll

Kinder Mol'!an is a titan In the North American enel'!)' sector and a major player in Northwest fC15S11 fuel shipments. The flnn was the author of a failed scheme to ell POrt hUll!! volumes of Coal on the Columbia River In Oregon, and It Is lobbyIns heavily to tdAle Its all AIOT:llne throufJh\_ British Cplumbia In a bid to move more tar sands 011 to Washington refineries and AsIan mar1<ets.

It is also, as Slightllne has documented, a dangerous and irresponSible company with a clear history of law breaking. deceit, and DOIllytloo.

Last week, a financial research finn t ~, released a scathln! report on Kinder Morgan that supports many of Sightlfne's conclusions. Aptly titled Is Kinder Momn Maintaining Its Stock Prices Instead of its Assets? (no longer available online), the report is mainly concerned with Kinder Mol'!an's books, but it Includes a few bombshells that should worry the public.

Consider just this sampling fnxn the summary section:

We believe that Kinder Morsan's high- level business strategy Is to starve Its plpeltoes and related Infra-structure of routine maintenance spending in order to maximize OIstnbutable Cash Row ...

In our view, Kinder Morgan cuts, defers, and eventually fmances the [Limited Partnership'sJ maintenance spending ...

A broader, and more Important concern Is the reliability and safety of Kinder Morsan's pipeline's. In 2012, Kinder Mol'Ban acquired EI Paso, then the largest natural gas pipeline company In the US, in a +\$306 deal; Kinder MOf!!an has already cut maintenance expenses by 70-99% and maintenance [capital expenditures] by -60% on most of those assets. In our view, it is alarming that Kinder Morsan supporters believe that this is a sound business practice.

The report goes on to detail specific maintenance spending deferrals, and It enumerates a few of the mis-haps-some of them deadly-that Kinder Morgan's pipelines have syffered in recent years.

The Hedgeye analysts made waves In the Investment community. It also came 10 for a bit of a .ll.wbbins

from company boosters ( ~ some of the ~ and Wlb) and I'm certainly In no position to weigh In on the accuracy of the report's assertions about finance. Yet we do know that the report Is consistent with Kinder Mors10's well-documented track record of law· bl:I:JIsIng pollution, and cover-ups.

Update 9126113: CfO Rlchord KInder tJeffU!dcd the firm's practlces On Q conference call, and Hedge"e hjt bad with Q rebuttal.

Sightline Institute » Research & Maps.. R p

The Facts about Kinder Morgan

Energy giant Kinder Morgan has big ambitions. Best known for its empire of oil and natural gas pipelines, the firm aspires to enlarge its role in coal transport too. Expanding its export terminals in Louisiana and Texas would increase Kinder Morgan's coal export capacity in the Gulf Coast region from roughly 5 million tons annually in recent years to nearly 29 million tons.

These coal terminal expansions could boost Kinder Morgan's profits, but they also raise questions about what the projects might cost neighboring communities. The company's existing coal export operations are well known for blighting neighborhoods and fouling rivers. In fact the company's track record is one of pollution, law-breaking, and cover-ups.-

Kinder Morgan has been found guilty of num r u violations:

Kinder Morgan has been fined numerous times by the USgovernment for stealing coal from customers' stockpiles, lying to air pollution regulators, illegally mixing hazardous waste into gasoline, and many other crimes.

Kinder Morgan's pipelines are plagued by leaks and explosions, including two large and dangerous spills in residential neighborhoods in Canada. One hedge fund analyst has accused the firm of "starving" its pipelines of maintenance spending.

Kinder Morgan was convicted on six felony counts after one of its pipelines in California exploded, killing five workers.

In Louisiana, Kinder Morgan's terminal spills coal directly into the Mississippi River and nearby wetlands. The pollution is so heavy that satellite photos show coal-polluted water spreading from the facility in black plumes. The same site generates so much wind-blown coal dust that nearby residents won a class action lawsuit because their homes and belongings are so often covered in coal dust.

In South Carolina, coal dust from Kinder Morgan's terminal contaminates the bay's oysters, pilings, and boats. Locals have videotaped the company washing coal directly into sensitive waterways.

In Houston, Kinder Morgan's terminal operators leave coal and petcoke, a highly toxic byproduct of oil refining, piled several stories high on its properties. The company's petcoke operations are so dirty that even the firm's promotional literature shows plumes of black dust blowing off its equipment.

In Virginia, Kinder Morgan's coal export terminal is an open sore on the neighborhood, coating nearby

homes in dust so frequently that the mayor has spoken out about the problem.

In Oregon, Kinder Morgan officials bribed a ship captain to illegally dump contaminated material at sea, and the firm's operations have repeatedly polluted the Willamette River.

Care to comment? The report is also featured on our blog.

Read the press release and listen to audio from a press call on this report.

Fracking pipeline company's safety questioned

James Bruggers, eJbruggers

C-J WATCHDOG JOURNALISM

2:46p.m. EDT May 4. 2015

east one measure, the Tennessee Gas Pipeline Co. has the worst safety record for its type of business, according to self-reported filings of significant incidents with a regulatory agency.

Among pipeline transmission companies, Tennessee Gas reported more significant incidents to the Pipeline and Hazardous Materials Safety Administration than any other operator over the last decade, The Courier-Journal has found.

Tennessee Gas operates in 16 states including neighboring Ohio, West Virginia and Tennessee, and the Gulf of Mexico. And most of the reported incidents during the past decade occurred before the company was acquired in 2012 by Kinder Morgan as part of its purchase of the El Paso Corp.

Kinder Morgan's purchase of Tennessee Gas brought improvements in safety procedures, spokeswoman Melissa Ruiz said.

"Safety is Kinder Morgan's number one priority," she said.

RELATED: New plan for old pipeline, carrying toxic fracked liquids

Going back to 2004, an analysis of the records through May 2014 by USA TODAY and the C-J shows that of the 142 companies reporting incidents involving transmission lines, Tennessee Gas' 119 were more than twice the number of the second-highest company, Transcontinental Gas Pipeline Co., at 56. Twelve incidents were reported after Kinder Morgan announced its May 2012 purchase of Tennessee Gas.

The 119 incidents caused at least \$206 million in damage. The highest total, and at \$17,391 in damages per mile of pipe, the costliest damage rate per mile among the 10 companies with the most pipeline.

Natural Gas Pipeline of America, at \$10,268 per mile, the records show.

Tennessee Gas' incident rate per mile also was the highest among the 10 companies.

The newspapers' findings are consistent with a study covering 2006-2013 published last year by the Pipeline Safety Trust, an advocacy group. It found that Tennessee Gas had about double the rate of incidents per mile than the industry average.

"There seems to be a lot of evidence that they don't pay enough attention to safety," said Frankfort resident Bob Penky, a volunteer with Kentuckians for the Commonwealth. The group opposes a plan by Kinder Morgan to convert one of Tennessee Gas' pipelines to natural gas liquids.

Tennessee Gas' incidents over the past decade resulted in two injuries and no deaths.

Six incidents were in Kentucky, causing \$2.4 million in damage. One was a fiery July 22, 2006, blast in Clark County that propelled piping 200 feet and burned for more than an hour near Winchester, causing \$888,000 in damage. Others were in Allen, Greenup and Green counties.

The figures come from incident reports that pipeline companies file themselves with the Pipeline and Hazardous Materials Safety Administration for any incident that involves an injury, death or at least \$50,000 in

damage to its or others' property.

USA TODAY collected the data for a special report last year: "Look out below: Danger lurks underground from aging gas pipes." It focused on distribution lines operated by utilities, rather than transmission lines like those of Tennessee Gas.

Reach reporter James Bruggers at (502) 582-4645 or on Twitter @jbruggers. USA

TODAY's John Kelly contributed to this report.

## 20150820-4021

William Hasting, 32 Pine Dr S, Nassay, NY 12123

Federal Energy Regulatory Commission Safety Standards

The U.S. Federal Energy Regulatory Commission (FERC) allows high-pressure 30-42" diameter interstate natural gas pipelines to be built less than fifty feet away from occupied dwellings\_[22]

Thus a FERC-approved pipeline could be well within the blast radius of roughly 800-1100 feet for pipelines of those diameters\_[23]

Kinder Morgan Safety Violations [edit]

In 2009, the Pipeline and Hazardous Materials Safety Administration (PHMSA) cited Kinder Morgan for violating safety standards regarding the distance between a natural gas pipeline and a "high consequence area" such as a school or hospital; the pipeline was too close for safe operation in case of a leak.[24]

In 2011, PHMSA cited Kinder Morgan for these safety violations:

- failing to maintain update maps showing pipeline locations,
- failing to test pipeline safety devices,
- failing to maintain proper firefighting equipment,
- failing to inspect its pipelines as required, and
- failing to adequately monitor pipes' corrosion levels\_[25]

In 2013, the headline "Wali Street Worries About Kinder Morgan's Safety Record: BC pipeline operator slashes and defers maintenance spending" was a concern to anyone who lived or worked near a Kinder Morgan pipeline\_[26]

The Wall Street Journal asked, "Is Kinder Morgan Scrimping on its Pipelines?" after an investment analyst charged the company with starving its pipelines of routine maintenance spending in order to return more cash to investors\_[27] Deferred maintenance may account for the high number of Kinder Morgan pipeline accidents in the last decade.

Close examination of PHMSA's incident reports for Kinder Morgan's onshore gas transmission pipelines shows that faulty infrastructure causes 45% of onshore gas transmission pipeline significant leaks. Failure of the pipe, a cracked weld, and faulty pipeline equipment together account for 28.3% of pipeline leaks, and corrosion of the pipe causes 16.8%\_[28]

Accidents {edit}

In Texas from 2003 to 2014, Kinder Morgan experienced 36 "significant incidents", resulting in fatalities or hospitalization, fires, explosions, or spills,[29]

Throughout the U.S. since 2003, Kinder Morgan and its subsidiaries' pipelines have been responsible for at least 180 spills, evacuations, explosions, fires, and fatalities in 24 states.[30] Some notable examples (including spills in Canada):

- 2003

In August 2003, in Caddo County, Oklahoma, a Kinder Morgan Natural Gas Pipeline of America failed in a rural farming area about just east of the town of Stecker. A 2611 diameter pipe exploded, throwing a 54-foot long section of pipe 30 feet from the ditch. The cause was environmental cracking along the length of the

failed section parallel to the longitudinal weld seam.[131]

.. 2004

On April 27, 2004, an underground Kinder Morgan 14” pipeline ruptured at Suisun Marsh in Solano County, California, spilling over 120,000 gallons of diesel fuel directly into the marsh. The cause was pipe corrosion. The company failed to notify authorities about the spill for 18 hours, another safety violation for which it was later cited. Kinder Morgan was fined \$5.3 million for the spill, and agreed to enhance spill prevention, response and reporting practices. The company had 44 spills in 31 months, indicating “widespread failure to adequately detect and address the effects of outside force damage and corrosion.” according to an order issued in August 2005 by the U.S. Department of Transportation’s Pipeline and Hazardous Materials Safety Administration (PHMSA). [32][33]

On November 9, 2004, a Kinder Morgan pipeline in Walnut Creek, California was struck by a backhoe, causing a gasoline spill that ignited in an explosive fireball that incinerated five workers and severely injured four others. CalOSHA (California Occupational Safety and Health Administration) cited Kinder Morgan for failure to accurately mark or map the pipeline location.[134] In 2005, the California Fire Marshal fined Kinder Morgan \$500,000 for its role in the “completely preventable” tragedy. Kinder Morgan agreed to upgrade pipeline inspection methods and improve corrosion control.[35]

· 2005

A Kinder Morgan Energy Partners petroleum products pipeline was found to be leaking gasoline into Summit Creek, near Truckee, California, on April 1. About 300 gallons were spilled.[36][37]

In May 2005, a Kinder Morgan Natural Gas Pipeline of America 30” diameter pipe exploded near Marshall, Texas, sending a giant fireball into the sky and hurling a 160-foot section of pipe onto the grounds of an electric power generating plant. Two people were hurt, 40 evacuated. The cause was stress corrosion cracking.[138]

· 2006

On July 22, 2006, near Campbellsville, Kentucky, a Kinder Morgan Tennessee Gas Pipeline exploded. A 25-foot chunk of pipe blew out of the ground and landed 200 feet away, the pipe twisted and mangled, its external coating burned off. The 24” pipeline ruptured due to external corrosion more than two feet long at the bottom of a valley in an area of wet shale, known to cause corrosion on buried pipelines in this part of Kentucky.[139]

On November 11, 2006, a subcontractor on Kinder Morgan’s Rockies Express (REX) pipeline outside Cheyenne, Wyoming struck an existing pipeline, causing a rupture and explosion. Two months after this explosion, the Federal Energy Regulatory Commission threatened to shut the project down if REX didn’t improve its “poor compliance record” involving construction activity outside the approved work area.[40]

On November 27, 2006, the Kinder Morgan Plantation Pipeline at Charlotte, North Carolina released about 4,000 gallons of gasoline from a Plantation Pipe Line Company block valve on a delivery line into a terminal owned by a third party company.[141]

· 2007

On July 24, 2007, the Trans Mountain Pipeline, operated by Kinder Morgan Canada, released over 250,000 litres of crude oil (70,000 of which flowed into Burrard Inlet, requiring a C\$15-million cleanup) after a backhoe broke the improperly-marked line in Burnaby.[42][43]

• 2008

On September 23, 2008, a Kinder Morgan pipeline exploded and burned for more than ten hours at Pasadena, Texas. One person died; another was injured.[44] The cause of this significant event was corrosion. The Pasadena pipeline experienced at least 18 “significant incidents” 2004 to 2013.[45]

• 2009

In May 2009, near Palm City, Florida, a Kinder Morgan Florida Gas Transmission Company 18” diameter

natural gas pipeline ruptured in a sparsely populated rural area of Martin Co. and “displaced” about 106 feet of buried pipe onto the right-of-way between Interstate 95 and the Florida Turnpike (SR-91). About 106 feet of pipe weighing about 5,000 pounds was blown out of the ground. The rupture was near a high school that was within the 366-foot potential impact radius (PIR). Injuries included two people in a car that ran off the road and a Sheriff’s deputy treated for inhaling gas.[46] .

On July 15,2009, a pipeline accident at Sylvarena, Mississippi involved Boardwalk Pipeline Partners, Southern Natural Gas and Kinder Morgan in an explosion that killed one person and injured three.[47]

• 2010

On November 30, 2010, a 30” diameter Kinder Morgan Tennessee Gas Pipeline failed in a semi-rural area between Highway 1 and State Road 3191, two miles NW of Natchitoches, Louisiana, 1/4 mile NE of a country club, and 200’ south of a residential subdivision. Louisiana state police evacuated 100 homes. Pipe cracked: 52.5 inches long & about 0.5 inches in maximum width. The failure site is near where TGP had a previous failure in 1965, with multiple fatalities. That failure was attributed to stress corrosion cracking.[48]

• 2011

The Carteret, New Jersey, KMLT had a leak and fire during maintenance work on March 14, 2011. On April 4, 2013, the PHMSA Office of Pipeline Safety issued a Notice of Probable Violation, Proposed Civil Penalty and Proposed Compliance Order (NOPV) after an inspection. In 2013, KMLT paid a penalty of \$63,100 and was required to complete pipeline integrity testing and other corrective measures by May 2015.[49]

On August 17,2011, Kinder Morgan’s Natural Gas Pipeline Company of America had a flash fire and explosion south of Herscher, Illinois. Five employees went to the hospital. Kinder Morgan was cited for pipeline and workplace safety violations.[50]

On November 16, 2011, near Glouster, Ohio, a weld failed on a Kinder Morgan Tennessee Gas Pipeline 36” diameter pipe; the leak exploded, leaving a blast crater 30 feet across and 15 feet deep. Three homes were destroyed by the fire.[51] The leak was caused by “displacement produced by a landslide and an inadequate understanding by (TGP) of the influence of the geotechnical threats on the pipeline in this location. “[52]A girth weld failed due to earth movement, inadequate design, materials or workmanship, exceeding operational limits & gaps in integrity management.[53]

• 2012

In May .2012, at Arvin, California, a Kinder Morgan EI Paso Natural Gas pipeline’s relief valves and pipe supports failed, causing an explosion that damaged the Mojave facility and a surrounding cherry orchard, causing “the complete structural failure of the overpressure protection support system...,[54]

In June 2012, in Gray County, Texas, a Kinder Morgan Natural Gas Pipeline of America 2611 diameter pipe failed at Compressor Station 154, Mile Post 52,4 mi. east of Laketon. The gas ignited, blowing a crater 30 feet in diameter and burning 2 acres of agricultural land as well as two 500-gallon plastic tanks used to store liquid fertilizer plus two telephone poles and transformers. State Highway 152 was closed for several hours. The cause was a 50-foot-long longitudinal rupture in the pipe.[55]

On December 26, 2012, in West Melbourne, Florida, a Kinder Morgan Florida Gas Transmission Company pipeline exploded in a pasture.[56] The blast ejected a 20-foot section of 20” diameter pipe which landed about 15 feet from the rupture.[57]

• 2013

On May 8, 2013, a Kinder Morgan Tejas pipeline compressor station near Crockett, Texas, had a fire that caused \$7,502,188 in property damage. [58]

On June 18, 2013, in Louisiana, a Kinder Morgan Florida Gas Transmission Company 3011 diameter pipeline ruptured and exploded before dawn, jolting residents out of their beds in a rural, wooded area of Washington Parish. No one was seriously hurt but 55 homes were evacuated. The blast knocked down trees in an area about 200 yards across and the fire burned those within another 300 yards. “The ground around the

crater is completely bare. The dirt around it is just like it had been cooked in a kiln,” and an 80-foot section of pipe was destroyed.1591

•• 2014

On June 26, 2014 near East Bernard, Texas, a gas pipeline next to the Kinder Morgan compressor plant blew out, destroying the road and setting a truck on fire at FM 1164 just south of Highway 59. Flames shot as high as 150 feet.160]

### 4 REASONS TO OPPOSE THE NEW KINDER MORGAN TRANS MOUNTAIN TAR SANDS PIPELINE

Developing Canada’s tar sands is not our vision for a clean energy future-it’s one of the dirtiest fossil fuel projects on the planet. Let alone the destruction to the environment caused by Alberta’s open mining tar sands pits, we won’t stand for transporting the highly corrosive stuff to be refined into oil any which way the industry tries to paint it: by rail, by pipeline or by tanker.

American energy company Kinder Morgan is proposing to nearly triple the capacity of its Trans Mountain pipeline, we’re standing together and saying ‘no’ with concerned citizens in North America and beyond. Their existing Trans Mountain pipeline already spans 1,150 kilometres (714 miles) from Alberta’s tar sands to British Columbia’s stunning, fragile coast.

Northern Gateway, or Trans Canada’s Keystone XL. Here’s why:

news:

1. It would increase the barrels per day it ships from 300,000 to 890,000 in 2017 (1). By nearly tripling the capacity of Trans Mountain, the demand to keep the pipelines full would mean that more tar sands would be mined, and more carbon dioxide would be spewed into our climate.
2. It would increase oil tanker traffic on North America’s West Coast to more than 400 giant vessels per year. Exxon Valdez? BP’s gulf spill? You don’t have to do a whole lot of research to see that oil tanker spills are expensive, if not impossible, to clean up. And tar sands is the worst on both accounts. Our economy, our tourism, our marine life, our wild and beautiful coast. ..there’s simply too much at stake. Learn more and track those tankers at [nup:lltarsanassos.org](http://nup:lltarsanassos.org)
3. Its pipelines and tankers won’t be carrying conventional oil. Tar sands isn’t oil. It’s a corrosive, thick substance injected with chemicals to make it just-liquid-enough to pump through a pipeline. This makes spills especially costly and damaging. Just think of the community of Kalamazoo, Michigan, the site of the US’s costliest onshore pipeline disaster, to remember the lasting devastation that tar sands can have.
4. Kinder Morgan doesn’t have a good track record (2):
  - July 15, 2005: About 210,000 litres (55,500 gallons) of crude leaked into the area surrounding the company’s Sumas Mountain storage facility in Abbotsford, BC, polluting Kilgard Creek.
  - July 24,2007: An oil spill occurred along the Kinder Morgan pipeline in Burnaby, BC, when a construction crew accidentally ran into the unmarked pipe. Almost 250,000 litres (66,000 gallons) of oil sprung from the pipeline, soaking a residential neighbourhood and seeping into the Burrard Inlet. 50 homes were evacuated.
  - May 6, 2009: A spill was discovered at the company’s Burnaby Mountain, BC, tank farm with had nearly 200,000 litres (52,800 gallons) of leaking oil
  - January 24,2012: A pipeline rupture at the Sumas Mountain tank farm in British Columbia spilled an estimated 110,000 litres (29,300 gallons) of oil. Communities nearby reported nausea, headaches and fatigue, and schoolchildren were kept indoors for fear of airborne toxins.
  - April 3, 2012: Another spill in at Sumas Mountain facility caused strong odors and air quality concerns

in surrounding neighbourhoods.

Federal Court Rules FERC Violated Federal Law When Issued Approvals for NEUP Pipeline Project

Washington, DC: In a decision issued June 6, 2014, the United States Court of Appeals for the District of Columbia ruled that the Delaware Riverkeeper Network, the NJ Sierra Club and New Jersey Highlands Coalition were correct in their legal challenge to the Tennessee Gas Pipeline Company's Northeast Upgrade Project and ordered additional analysis and review.

The Court stated, 'On the record before us, we hold that in conducting its environmental review of the Northeast Project without considering the other connected, closely related, and interdependent projects on the Eastern Leg, FERC impermissibly segmented the environmental review in violation of NEPA. We also find that FERC's EIS deficient in its failure to include any meaningful analysis of the cumulative impacts of the upgrade projects, We therefore grant the petition for review and remand the case to the Commission for further consideration of segmentation and cumulative impacts.'

'On the record before us we find that FERC acted arbitrarily in deciding to evaluate the environment effects of the Northeast Project independent of the other connected action on the Eastern Leg.'

In May 2012 the Federal Energy Regulatory Commission (FERC) issued a certificate of public convenience and necessity to Tennessee Gas Pipeline Company authorizing construction and operation of its Northeast Upgrade Project. Delaware Riverkeeper Network, the NJ Sierra Club and New Jersey Highlands Coalition argued that the approval was inappropriate because FERC had illegally segmented its environmental review of the Northeast Project by failing to consider three other connected and interdependent projects--the 300 Line Project, the Northeast Supply Diversification Project, the MPP Project--and by failing to provide a meaningful analysis of the cumulative impacts of the projects.

Maya van Rossum, the Delaware Riverkeeper said about the decision "This is an important vindication of the rights of our communities and environment to be honestly considered and protected by our federal agencies. FERC has been allowing illegal segmentation by pipeline companies for years, it has ignored the pleas of the public for equity and for honest review of impacts, and as such FERC has been complicit with the pipeline companies in their ongoing efforts to avoid the rule of law and to ignore the devastating impacts they are having on our environment, impacts that will harm not just present, but also future generations. It is rewarding that a federal court has finally held FERC to account"

The case was argued before the Court of Appeals by Delaware Riverkeeper Network attorney Aaron Stemplewicz. Said Stemplewicz of the decision, 'The DC Circuit's decision today should put other pipeline companies on notice that the practice of segmenting pipeline projects before the Federal Energy Regulatory Commission will no longer be tolerated, and that the cumulative environmental impacts resulting from these projects must be fully considered before a project is approved.'

'This is a victory for clean water and environmental regulation over a fossil fuel pipeline. This is the first time the Court sided with the environment over a gas company but more importantly it sends a clear message to FERC that they cannot ignore the environment. We see this as a critically important precedent that will now require FERC to look at the real environmental issues of the projects they review,' said Jeff Tittel, Director, New Jersey Sierra Club,

Added Delaware Riverkeeper Maya van Rossum 'This decision is important and powerful for every pipeline, related infrastructure and LNG project to come, but sadly for the communities, forests, streams, wetlands and critters impacted by the four projects at issue here, the decision comes too late to ensure their full consideration and protection. We will be able to press for important mitigation and efforts to undo the harms

already inflicted, but as for avoiding the full array of harms, that is now impossible. FERC needed to do its job when it had the opportunity-but they were too busy servicing the gas pipeline companies to care”

Of particular note-all three justices ruling on this case concurred on the final judgment rendered. Case is titled Delaware Riverkeeper Network, et. al, v Federal Energy Regulatory Commission, Tennessee Gas Pipeline Company, United States Court of Appeals for the District of Columbia, Decided June 6, 2014.

Tennessee Gas Pipeline Company’s Northeast Upgrade Project (NEUP) Is an interstate transmission line upgrade project The project included pipeline drilling activities under the Susquehanna and Delaware Rivers, significant new grading and clearing of previously undisturbed forested land and steep slopes, 90 stream crossings 136 wetland crossings and 450 acres of land development within the Delaware River watershed alone Highpoint Slate Park and Delaware State Forest are among the public

Rensselaer County Biodiversity Greenprint Project  
July 12, 2015

Federal Energy Regulatory Commission

RE: Scoping Hearing for Proposed Kinder-Morgan Pipeline, Rensselaer County.  
(Northeast Energy Direct Pipeline Project)

Important Biodiversity Features, Presence & Mitigation.

Dear Federal Energy Regulatory Commission,

Attached, please find written comments on 9 biodiversity features that I suggest be addressed in any environmental impact statement (EIS) for the proposed Kinder-Morgan Pipeline throughout Rensselaer County. These features relate to NEPA sections on fisheries, wildlife, vegetation, water quality, geology, and soils. The focus of my comments is on ecological features of regional importance for their rarity and/or outstanding biodiversity value. I suggest that their presence, importance, and mitigation of impacts all be addressed in the EIS. Associated with each feature are cited documents that detail the nature and relevant composition of important sites of that feature plus an estimate of how many sites of that feature are to be crossed or potentially impacted by the pipeline.

As someone who has studied and helped identify important biodiversity sites throughout the NE U.S. and New York for The Nature Conservancy and New York Natural Heritage Program and most intensively during the past 25 years throughout Rensselaer County, New York in a project entitled the Rensselaer County Biodiversity Greenprint Project, I hope that the numerous regionally important biodiversity features of various scales that are known along the proposed pipeline are addressed in the EIS. Features of importance include relatively large and intact forest landscapes, large roadless areas, large forest interiors, intact stream systems/aquatic networks, large examples of restricted ecosystem types, significant natural communities, rare animal/plant species populations, and special animal concentration areas. In addition to documentation of some of these features by federal and state agencies such as the US Forest Service and NY State Department of Environmental Conservation, and regional agencies such as the Rensselaer Plateau Alliance (the regional conservation plan), three site-specific reports that I recently wrote (see below) summarize important biodiversity sites throughout different sections of the pipeline route and probably contain the most detailed information on the regional importance of these various biodiversity features. I suggest that these documents be reviewed for the EIS and addressed there, plus ideally supplemented with more careful field surveys during the growing season for a sufficient evaluation of impacts at all important biodiversity sites along the Rensselaer County route.

Sincerely in conservation,

David M. Hunt, Ph.D., Conservation Ecologist  
Rensselaer County Biodiversity Greenprint Project.

FERC Scoping Assessment

Proposed Kinder-Morgan Pipeline, Rensselaer County.

**Important Biodiversity Features, Presence & Mitigation.**

David M. Hunt, Ecological Intuition & Medicine

Rensselaer County Biodiversity Greenprint Project. July 12, 2015.

Several biodiversity features with global to local importance amounting to numerous individual sites have been identified to date by the Rensselaer County Biodiversity Greenprint Project (RCBGP), as summarized in 3 reports specific to portions of the pipeline in Rensselaer County, one for the new pipeline route across most of the county (Hunt, David. 2015. Proposed Kinder-Morgan Pipeline, Potential Biodiversity Impacts. Rensselaer County Segments, Towns of Stephentown, Nassau, , Schodack New York. Ecological Intuition' Medicine. Draft 2: March 12. 2 pp with 8 maps), one for the segment across the Rensselaer Plateau (Hunt, David. 2015. Proposed Kinder-Morgan Pipeline, Potential Biodiversity Impacts. Rensselaer Plateau Segment, Towns of Stephentown & Nassau, New York. Ecological Intuition' Medicine. Initial Compilation: January 25-30. 4 pp with 6 maps), and one for the Town of Nassau (Hunt, David. 2015. Town of Nassau, New York. Important Biodiversity Sites Along the Proposed Kinder-Morgan Pipeline. Ecological Intuition & Medicine. May 31. 25 pages with 11 tables and 9 maps). Additional information is also available in the Rensselaer Plateau Regional Conservation Plan and associated on-line DataBasins datalayers of the Rensselaer Plateau Alliance (RPA), and from ongoing field surveys starting April 2015 by the Rensselaer County Biodiversity Greenprint Project and the Capital District Friday Field Group (CDFFG). Many features associated with the Rensselaer Plateau are identified as important landscape components necessary for the ecological integrity of the Rensselaer Plateau, one of few remaining large relatively intact forested landscapes of New York and the Northeastern U.S. . Although most or all of those regionally-important landscape features are not well captured within legal regulations, they are no less important for biodiversity conservation than smaller-scale features that might have some legal protection.

1. Regionally- Intact Forest Landscapes. (numerous NEPA sections, especially vegetation) The Rensselaer Plateau has been identified as the single landscape most effective for the conservation of forest species for Rensselaer County by RCBGP. It has also been identified in various regional reports as a regionally-important forest landscape for the Hudson River Valley (Hudson River Estuary Program/HREP), New York (The Nature Conservancy), and the Northeastern U.S. (The Nature Conservancy, Wildlands & Woodlands). It has been identified as a Forest Legacy Area by the U.S. Forest Service. The EIS should generally address how the presence of the pipeline will impact this intact landscape. The Taconic Mountains, another regionally-important forest landscape, will also be crossed by the pipeline (near Rounds Mountain) and should also be addressed in the EIS.

2. Aquatic Networks. (numerous NEPA sections, especially water quality/fisheries definition, stream systems and associated lands and waters needed to maintain high water quality and intact sets of native aquatic plants and animals in those streams including natural riparian corridors and intact headwater sub-catchments). Five regionally-important aquatic network sites along the pipeline route have been identified as among those most effective for aquatic species conservation in Rensselaer County (RCBGP) and the Hudson River Valley (HREP). Details can be found in the 3 RCBGP pipeline reports and the Rensselaer Plateau

Regional Conservation Plan (RPA). All of these networks have been designated as trout streams by the New York State Department of Environmental Conservation (NYS DEC) and most have known native brook trout populations. These networks include ones for Tsatsawassa Creek, Black River, Roaring Brook, Pikes Pond, Valatie Kill, and West Brook. Two other networks of potential importance along the existing pipeline in Schodack that have neither been evaluated by RCBGP nor documented for pipeline impacts but should be evaluated include ones potentially associated with the Moordener Kill and Vierda Kill. The Hudson River, a Tidal River community, is regionally unique and important (see the NY Natural Heritage Program community database) and should also be evaluated for impacts as a network.

3. Regionally-Restricted Ecosystems (numerous NEPA sections) (definition: assemblages of similar natural community types in a shared physical setting). Three regionally-important sites along the pipeline route have been identified as among those most effective for habitat-specific species assemblage conservation for regionally-restricted habitat types, especially relatively large and intact rocky summits, lake complexes, peatlands, and tidal habitats, in Rensselaer County (RCBGP) and the Hudson River Valley (HREP). Details can be found in the 3 RCBGP pipeline reports and the Rensselaer Plateau Regional Conservation Plan (RPA). Details on tidal habitats can be found in Hunt 2000 (Hunt, David M. 2000. Conservation Sites of Statewide and Global Importance and Component Important Community Occurrences and Biota. Rensselaer County, New York. Draft 3: January. 19 pp plus map). These important ecosystems are Pikes Hill Complex (a rocky summit), Pikes Pond (a lake complex), and Schodack Marshes (tidal wetlands). Important peatland sites addressed in the RCBGP reports are Stump Pond Outlet Wetlands and Crum Pond Fen, both in Stephentown.

4. Forest Interiors. (numerous NEPA sections, especially Wildlife/Vegetation) Three regionally-important sites along the pipeline route have been identified on the Rensselaer Plateau as among those most effective for intact forest species conservation in Rensselaer County (RCBGP) and the Hudson River Valley (HREP) due to a relatively low degree of landscape fragmentation to forest cover. Details can be found in the Nassau RCBGP pipeline report and the Rensselaer Plateau Regional Conservation Plan (RPA) for several large areas over 300 acres including forest interiors associated with the Cherry Plain/Moore Hill, Pikes Hill, and Alps Mountain Blocks. Details on another large forest interior along the pipeline route associated with the Taconic Mountains (Taconic Mountains Berlin) can be found in Hunt 2000.

5. Matrix Blocks/Roadless Areas. (numerous NEPA sections, especially Wildlife) Several regionally-important sites along the pipeline route have been identified on the Rensselaer Plateau as among those most effective for terrestrial species conservation in Rensselaer County (RCBGP) and the Hudson River Valley (HREP) due to a relatively low degree of landscape fragmentation by roads. Details can be found in the Nassau RCBGP pipeline report and the Rensselaer Plateau Regional Conservation Plan (RPA) for several large areas over 800 acres including the Cherry Plain, Moore Hill, Moore Hill East, Pikes Hill, and Alps Mountain Blocks. Details on another large roadless areas along the pipeline route associated with the Taconic Mountains (Taconic Mountains Berlin) can be found in Hunt 2000. Three additional roadless areas over 400 acres were identified in the Nassau RCBGP pipeline report as regionally important within the Taconic Foothills region of the county, especially the Slivko Road Block, where a pipeline compressor station is planned.

6. Significant Natural Communities. (numerous NEPA sections) Over 21 regionally-important/significant sites have been identified as among those most effective for conservation of species characteristic of individual natural community types within Rensselaer County, as designated by the NY Natural Heritage Program (NYNHP) ecological community classification. Details for many of these sites can be found in the 3 RCBGP pipeline reports and the Rensselaer Plateau Regional Conservation Plan (RPA). Some information for state-important community sites may be in the state databases of NYNHP, but only those analyzed to date by that program (especially in or near the Hudson River tidal areas and the Taconic Mountain forest landscape). Details on several regionally-significant communities associated with the latter two areas likely to be along the pipeline route can also be found in Hunt 2000. A total of 11 regionally-significant natural community examples, mostly state significant, are documented from the Rensselaer Plateau route (streams, wetlands, lakes, plus lag gravel-a globally unusual geologically

6. Significant Natural Communities (continued). feature). An additional 3 examples are documented from the Taconic Foothills route of Nassau. An additional 10 examples associated with Pikes Pond and Pikes Hill are near the pipeline. Multiple significant tidal communities are expected at the Papscahee Creek crossing.

7. Vulnerable Natural Communities. (numerous NEPA sections) All community types identified as most vulnerable to impacts from pipeline leaks and explosions, especially stream communities, wetland communities, and lake communities, should be addressed in the EIS. Over 232 examples of vulnerable community types were identified by RCBGP in 3 pipeline reports including many from a comprehensive community map made for the Rensselaer Plateau (see the RPA Rensselaer Plateau Regional Conservation Plan) plus others mapped in the federal National Wetlands Inventory and National Hydrography Database and state databases for wetlands and streams (NYS DEC). A total of 154 such sites were identified from the Rensselaer Plateau and 78 more were identified from the Taconic Foothill region of Nassau. Many more unlisted examples are suspected from the pipeline route in the Town of Schodack and the part of the Town of Stephentown east of the Rensselaer Plateau. At least 2 large reservoirs on the Rensselaer Plateau were also identified as vulnerable to pipeline impacts.

8. Rare Species. (Wildlife/Fisheries/Vegetation) Known important populations of animals and plants identified as rare at various levels should be addressed in the EIS. These include global- and state-rare species designated by NYNHP and NYS DEC and county-rare species designated by RCBGP. Populations addressed should especially include those identified by RCBGP in the 3 pipeline reports, those mapped in the Rensselaer Plateau Regional Conservation Plan (RPA), and any mapped by NYNHP (especially in or near the Hudson River tidal areas). Additional findings are known from 2015 field surveys of RCBGP and CDFWG. Additional on-site searches of rare species are suggested in the most likely habitats along the pipeline route. The rarest species documented in RCBGP pipeline reports are one globally-rare plant, Angerman's Peat Moss (*Sphagnum angermanicum*), at Crum Pond Fen and one state-rare animal (timber rattlesnake) at Pikes Hill. A total of 8 county-rare species are known or possible from the Nassau pipeline route including reports of nesting and hunting territory for several rare birds. Many more county-rare species are known near the pipeline at Pikes Hill and Pikes Pond. Numerous rare species are expected in the tidal habitats of Papscahee Creek. Numerous rare species are known from sandy flats along the powerline in East Schodack. Field surveys in 2015 revealed several county-rare plants associated with 3 pipeline sites in the Town of Stephentown: Cemetery Hill Road Hill, Rounds Mountain South, and Stump Pond Outlet Wetlands, all pending more standard documentation by RCBGP.

9. Special Animal Concentration Sites. (Wildlife/Fisheries) Numerous examples of 8 types of important animal concentration areas of potential importance for common species were identified by RCBGP in the pipeline report for the Town of Nassau. These habitat types include trout spawning habitat, amphibian breeding concentration area, and beaver habitat. All should be addressed in the EIS.

FERC Scoping Session  
Northeast Energy Direct Pipeline  
14 July 2015

Andrew Kahnle  
8 Phillips St.  
Nassau, NY 12123

My name is Andrew Kahnle. I am a retired fisheries scientist with over 30 years' experience with management of fishes of the Hudson River. This evening, I would like to talk about impacts of the proposed NED pipeline to the Hudson River. I will focus on location and construction.

The proposed pipeline appears to cross the Hudson at an existing pipeline right of way just north or upriver of the village of Castleton. It will cross the mainstem Hudson as well as a tidal stream and marsh complex just east of the river.

- The reach of river containing the pipeline crossing is used as a spawning and nursery area for short-nose sturgeon, American shad, and striped bass and as a foraging area for juvenile Atlantic sturgeon. Shortnose sturgeon is a federal and state listed endangered species. American shad was a popular food and sport fish that is now at such low abundance that all fishing for the species is banned in NY State. The striped bass is an important food and game fish in NY and the Atlantic sturgeon is a federally listed endangered species.

- The marsh and stream complex to the east of the river is an important spawning and nursery area for many Hudson River fish species including the alewife. Alewife are at low abundance and harvest is severely restricted. The tidal complex has been designated as a "Significant Coastal Fish and Wildlife Habitat" by the NY State Department of State. This formal designation means that activities that might lead to habitat impairment such as pipeline construction require special scrutiny.

The environment reports prepared by the applicant are silent on construction techniques. The following are issues associated with two possible methods: an open trench and directional drilling.

- Construction and filling of an open trench is disruptive and should not occur when the area is used for fish migration, spawning, rearing of young, or feeding.
- If the trench is constructed in water, turbidity must be controlled with turbidity curtains. If the trench is constructed within coffer dams, the discharge of turbid water must be restricted.
- The bottom of the Hudson and tidal marshes contain a variety of contaminants. Prior to any excavation, the applicant must test bottom sediments for contaminants across the entire width of the proposed trench. If contaminants are detected, then plans must be made to contain any contaminated materials disturbed during construction.
- The river and marsh bottom is home to a rich variety of macroinvertebrates which serve as important food for fishes. Construction of a trench will disturb or eliminate this community of organisms and this loss should be considered among impacts to fishes, especially the endangered shortnose sturgeon. Experience with pipeline and cable construction elsewhere in the river suggests that bottom biota recover very slowly, if at all.
- If directional drilling is used, then drilling muds should be disposed of elsewhere, especially if sediments are contaminated.

Finally, the Kinder Morgan pipeline crossing is one of several pipelines and power cables being proposed for the Hudson River corridor and it will only add to impacts from the other projects. Given the importance of the Hudson River to the endangered shortnose and Atlantic sturgeon, I suggest that FERC should ask the National Marine Fisheries Service to prepare a "Biological Opinion" concerning the cumulative impacts of all of the proposed projects to these endangered fish species.

## **20150820-4028**

### **Input regarding Kinder Morgan pipeline thru Rensselaer County**

Terence Klein  
345 Totem lodge road  
Averill Park NY 12018

I am a graduate engineer from RPI (MSEE) and I have given considerable thought to the pipeline.

My thoughts break down into several areas:

1. Why is it needed at all ?
2. Why is it being implemented in this fashion?

3. Impact on local industry
4. Impact on rare land forms
5. Summary

**On the first subject: “Why at all ?”**

I have to question why the government is granting Kinder Morgan eminent domain.

The principles of eminent domain are that a few must suffer for the greater gain for society as a whole. The only entity that benefits from this pipeline is Kinder Morgan, who wishes to sell its gas internationally. There is NO benefit to the public at large. In fact once the gas is traded on the international market the price of domestic gas will rise to the levels of the international market. This will increase the price of energy to all Americans placing a burden on people in the form of higher heating and electricity costs. It will also diminish the ability of American industry to compete in the world market. This will kill jobs for Americans.

We should keep American gas for Americans; we need it to compete against the Chinese.

I find it despicable that the way that eminent domain was granted to Kinder Morgan at a federal level deprives me of my right to challenge how the eminent domain was granted.

I have attached a copy of an article in the Economist that indicates that the fracking industry is in deep financial trouble. It is entirely possible that this pipeline is an optimistic pipe dream. That seemed like a great idea while the industry was booming. Maybe it's not such a great idea if the industry is crashing because of low oil prices.

Unless, of course, the entire exercise is to raise prices on energy for American citizens.

The purpose of government is to protect the citizens, not the oil companies

**On the second subject, “why in this fashion ?”:**

Wherever the pipeline is sited, it will create a corridor of potential danger and depressed property values. This represents safety and personal property that has been basically stolen from American citizens.

There is a well established right of way in Columbia County used by multiple pipelines. There is also an existing pumping station.

It seems to me that the best location for this pipeline is right next to the existing pipelines. And the best place for the pumping station is right next to the existing one.

Since the property values around the existing right of way in Columbia County are already reduced there would be no further reduction of people's assets by the addition of the new pipeline. In addition the emergency services along this existing right of way are already trained in responses to pipeline incidents.

I know that the people of Mass have been very effective in saying no pipeline thru the Lenox area. If this is an issue the pipeline could be routed along the existing Columbia County right of way to the NY I Mass border and then north along the border. There is virtually no housing on that line that would be impacted.

I think this would provide a solution that would have a minimum impact on people, property values, and quality of life.

PLEASE don't create 2 Corridor's of Danger in our state.

It makes NO sense to route the pipeline and compressor station thru pristine residential areas

As an engineer, the size and pressure of the pipe is an issue. It is MUCH larger than the existing pipes in Columbia County and the pressure is MUCH higher, 1460 PSI vs. 900. When the question was asked, at an information meeting, if this had ever been done before the answer was a bit of mumbling and references to competent people knowing what they were doing ..... that's what they said about the Hindenburg.

The shut off valves are something like 10 miles apart. That means that if there is an “incident” it will vent 36” times 10 miles of explosive gas at 1460 PSI. I use welding equipment and am aware of the OSHA requirements on a gas welding cylinder which is only roughly 6” x 4 feet of explosive gas. These cylinders are

extremely dangerous if they explode (as could happen if they are in a structure fire). It is hard to imagine the scale of how much more dangerous is the pipeline. Kinder Morgan proposes putting it thru a pristine residential area, when there are logical and viable alternatives.

There are better solutions if we have to do this Put it Next to the Existing Pipeline. Why create two Corridors of Danger

**On the third subject, “Impact on local industry”:**

There are many local sawmills in Hoags Corners, Averill park, Stephentown and elsewhere. They depend on local independent loggers to provide them with raw material. As I understand it a loaded logging truck or skidder cannot cross the pipeline except on town roads. This severely limits the ability of local loggers to move trees or access properties. Case in point, my property would have an area that could no longer be logged. My property would be forever landlocked and I would be effectively denied access to it.

There are also many small gravel operations whose operation would be impacted by the pipeline

**On the fourth subject, “Impact on rare land forms”:**

The pipeline goes thru the Rensselaer Plateau. There are floating bogs adjacent to the right of way. The pipeline would significantly impact the rare vegetation found in the floating bogs. One such bog area is located north of the power line right of way, west of Calvin Cole road

**Summary:**

If we have to have this pipeline: there are other ways of implementing it that have significantly lower impact.

This pipeline is bad for the people of Rensselaer County. It is bad for Americans in general.

It will put people in Rensselaer County in danger and basically steal their property.

It will raise energy costs for all Americans.

It will result in loss of American jobs due to higher energy costs to American industry.

It will have significant negative impact on local jobs.

It will have negative impact on sensitive and rare environments.

It is being proposed in a non optimal fashion that puts additional American citizens at risk relative to other completely viable alternatives.

It is not obvious that the original reasons for implementing the pipeline are still valid due to changing economic conditions

“The purpose of any government is to provide for the safety of the citizens”

“We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights that among these are Life, Liberty and the pursuit of Happiness. - That to secure these rights, Governments are instituted among Men”

..... I seem to have missed the part in there where it said that oil companies have the right to take my land (with no benefit to the public).

Respectfully submitted

Terence Klein

Subject: Rensselaer County Is With You!

Dear Supervisor Lape:

A few moments ago the County voted unanimously in support of a resolution very similar to yours. However prior to the unanimous vote it was amended to read only freezing of all new Kinder Morgan permits (as opposed to just all).

We urged them to contact other Counties to seek additional support. Thanks for your inspiration.

ResolUtion # P337-15

### **Negative Impacts of the NED Pipeline Project and Specifically the Compressor Station Proposed for the Town of Nassau**

Prepared by Eric J. LaPier of 1218 Nassau Averill Park Rd, Nassau, NY 12123

It is important to note that the proposed NED pipeline project, if approved, will have significant negative impact to the quality of life of residents along the pipeline corridor and particularly those in close proximity to the compressor stations required to maintain functionality of that pipeline. I am one of those residents and will describe the concerns that I have:

#### The Pipeline

My primary concern with the proposed pipeline is with regards to eminent domain. The lands required to provide a corridor for the new project will force residents to turn over portions of land which are owned and have had taxes paid by citizens who, for the most part, will not receive any benefit from the project whose delivery destination is in Dracut, Massachusetts. On the contrary these people will be exposed to potential harm in the event of a malfunction or failure. There will be no "opt-out" available to these people. In fact I have already received a statement from Kinder-Morgan stating: "... if the commission approves the Project, that approval conveys with it the right to eminent domain. Therefore, if easement negotiations fail to produce an agreement, the pipeline company could initiate condemnation proceedings ...", Is this the reason I have paid taxes for 10 years on my land? To lose say with the way I develop and use it? If eminent domain is to be allowed on this project, my feeling is the need must be clear. Delivery of inexpensive fossil fuel (more than half of which is expected to be exported) is not a necessity. If the corridor were used to deliver high efficiency renewable energy, I would be more willing to accept this as a need. At this point there is no definite route for the pipeline (only proposals which may change after the approval) and so the number of effected residents and the potential for property loss is unknown.

Additional concerns that I have with the pipeline itself are:

- Safety:

- o In the event of a failure, those within the "incineration zone" are at a high potential for harm. Ac-

According to the Pipeline and Hazardous Materials Safety Administration there have been 360 fatalities and over \$7 billion in property damages in the past 20 years. This does not include incidents in which there was an outside force or nearby fire that caused the incident. Failures happen.

o In the event of a failure there is a significant risk to the environment by both water and air pollution. The NYSDEC has produced a “Final Supplemental Generic Environmental Impact Statement on the Oil, Gas and Solution Mining Regulatory Program” with regards to the impact of hydrofracking wells and many of these same hazards exist along the pipeline if an accidental release occurs. I therefore wish to make the statement a part of the scoping project review in terms of accidental release via incident or maintenance to the pipeline or compressor station.

- Construction:

- o Considerable disruption of wildlife habitat. In the area where I live I have observed the following:

- Bald Eagle
- Golden Eagle
- Snowy Owl
- Pileated Woodpecker
- Wild Turkey
- Blue Heron
- Red Tailed Hawk
- Peregrine Falcon
- Black Bear
- Fisher
- Red Fox
- Gray Fox
- Thriving Colonies of Brown Bats
- Many song birds
- Monarch Butterfly (and Viceroy)
- Karner Blue Butterfly
- Along with many other small and large common mammals, amphibians; reptiles and insects.

*{possibly a page missing?}*

raised here). There are locations less than 10 miles from this proposed site that have 0 residences within a 0.5 mile. Why were these locations not chosen? Did Kinder-Morgan decide that 63 families health weren't worth investigating other options?

There are other forms of pollution given off by the compressor station as well. It will be lit all night long - 7 days per week, 365 days per year. So much for star gazing. All those compressor units give off sound too. The noise pollution allowed at my house will be an average of 55db. I guess I won't be listening to the owls anymore either. I wonder if the owls will even want to stick around if they can't hear each other. Maybe the bald eagles will like it - on the other hand probably not. I wonder if any of the animals I listed earlier will appreciate all the light and noise? I doubt it - I suspect they will just move on to some other neighborhood.

I digress - this is a serious matter. I have to come back to the poor choice of location for a known health hazard which is the compressor station in the Town of Nassau. The data is mounting that the contaminants that will be released from the facility are harmful (particularly to children and pregnant women). I have a list of publications and reports that detail the harm caused by hydraulic fracture wells, and by association, the infrastructure that transports the raw natural gas (which I would like to submit for the record and for review). You will see many of them are dated within the past year. The amount of information out there is enormous. The PSE Health Energy is a repository for peer reviewed publications relating to shale gas development. Of the over 550 publications currently in the literature, 194 were published in 2014 and 103 more were published in the last 6 months. It is important to make the right decision - not a fast decision. I urge you to weigh the need of a natural gas pipeline with a goal of over 50% exports against the harm that it will cause

to our families, communities and property.

## 20150820-4031

From:

Lucie Murray  
110 Clarks Chapel Rd.  
Nassau, NY

To: FERC,

Washington, DC

6/14/2015

My name is Lucie Murray. I live on Clark's Chapel Rd. in Nassau County, NY and live within the 1/2 mile "buffer zone" of the proposed '90 ton compressor station.

When I first bought my property almost 40 years ago it was designated then, and still is, as a rural zone. Our land consists of pastureland and forest land. We grow our own vegetables. We have a small apple orchard and have sold Christmas trees for many years. We built our own home and have invested all we have into this dwelling.

One week after I retired in June I received a letter from Kinder Morgan informing me they have rezoned my property into a "buffer zone".

- My home, my property, nor my neighbor's home and property, cannot "buffer" anything.
- We are totally helpless to defend ourselves from anything the proposed compressor station will inevitably throw at us; such as their toxic wastes, constant noises (24/7), and the fear of possible bodily harm or incineration and property damage in the case of an accident or leak in the pipes.
- We believe it will inevitably reduce the quality of our lives and our environment and the value of our property.
- Our local fire department is not equipped to rescue us or our property from any accidents that may occur at this compressor station and Kinder Morgan has not made any provision to deal with accidents which are likely to be catastrophic because of the volume of gas transmitted and the huge pressure generated.
- From our understanding "the proposed "buffer zone" is in reality a "dumping zone" for the compressor's wastes.
- Our town has not yet completely recovered from the waste products dumped in our area by other companies, which contaminated our drinking water and killed the animals/fish in our lakes.

- The people in my neighborhood have waited 50 years for the bald eagle to return to our area. He was designated as an endangered species until only a few years ago. My husband and I recently witnessed the bald eagle's return to our neighborhood. We saw him perched on a dead tree on the very property targeted for the compressor station. He was a majestic sight and we want to keep him in our neighborhood. I took the liberty to represent him here today as he cannot talk for himself.
- My parents immigrated to this country when I was young to get away from the devastation in Europe, which resulted from one man wanting to rule the world.
- And now towards the end of my life a company, that I never even heard of until a month and a half ago, is proposing to invade my private space and take away my right to peace and quiet and tranquility and my right to clean air and clean water, and my right to live without fear of bodily harm and possible incineration.
- We the people here in Nassau all pay taxes, both state and federal taxes. In return we want you to protect our fundamental rights to clean air, clean water, unwanted noise intrusions. We want you to protect us from unnecessary fear of possible death by incineration, bodily harm from toxic waste and possible property damage and devaluation imposed on us by large companies that are primarily profit driven. We do not begrudge their profits but not at our expense and against our will.

## 20150820-4032

To the Representatives of the Federal Energy Regulatory Commission (FERC)

My name is Barbara Nuffer and I'm here this evening to speak in opposition to the proposed Kinder-Morgan Northeast Energy Direct (NED) pipeline project and specifically the proposed route across the northern portion of the Town of Nassau.

A brief statement on my background, for the record. My education was in the field of Biological Sciences. I studied at the University at Albany and Cornell University, earning both a Bachelors and a Masters Degree. I worked for the NYSDEC for 32 years as an Environmental Program Specialist 2. My speciality was Air Toxicology and I helped write regulations to ban Open Burning of Trash and limiting mercury emissions from Municipal Waste Combustors. I served on several Binational committees with Canada to limit mercury pollution emitted into the air and deposited in our waterways. Currently I serve on Town of Nassau's Natural Resources Committee and the Zoning Board of Appeals.

I have lived on Radley Road in the Town of Nassau for 41 years, with my husband Fred, and raised our 2 children in the bucolic rural setting of this dirt road. One of our boundary lines is a stream with waterfalls and brook trout, emanating from Pikes Pond on Rt 66. About 600 feet above our house is a National Grid powerline and this is the site of the proposed NED pipeline. We will be well within the Incineration Zone.

Back to our life on Radley Rd. Living in the upland forest of the Rensselaer Plateau has provided many opportunities to view wildlife. We have been visited by black bears including a Mom with 2 cubs. The latest visitor 3 weeks ago was a beautiful yearling cub. Other visitors include turkeys, ravens, a large variety of nesting songbirds and birds of prey including eagles and osprey, and fisher cats. Many vulnerable native wildflowers are found on our property. I write wildflower profiles for The Conservationist magazine and do the macrophotography of the flowers for these articles. The construction and operation of the pipeline will severely disrupt the native birds and animals' habitats and destroy many native plants.

The NED pipeline, if constructed across the northern most proposed route, will cut across the Rensselaer Plateau, one of the most unique geologic and biodiverse areas in Rensselaer County and the New York State. The ecological distinctiveness of the Rensselaer Plateau has led it to be given priority project status in New York State's 1998 and all subsequent Open Space Conservation Plans and includes the fifth largest unfragmented forest in New York.

New York State has identified the Rensselaer Plateau as an important area for protection due to its diversity and bird breeding features and the Audubon Society has designated the Rensselaer Forest Tract as an important bird breeding area. The Audubon Society specifically cites the high diversity and abundance of forest

breeders on the Plateau, including many at-risk species. Many birds are experiencing declining population numbers in the Northeast due in part to loss of large blocks of forest. The Plateau has also been the focus of conservation efforts by the Rensselaer Land Trust and The Nature Conservancy.

Protection of the Rensselaer Plateau as an un-fragmented upland forested habitat is an important goal both for the State of New York as well as the Town of Nassau. Currently, both State Route 43 and the National Grid transmission line corridor present significant barriers for wildlife movement between the northern and southern portion of the Plateau within the Town of Nassau and Stephentown. The clear cutting of an additional 100 to 200 feet during initial construction of the NED and the permanent maintenance of a 30 to 50 foot corridor stretching for the entire width of the Plateau will almost certainly completely isolate the southern most section of the Plateau.

The Rensselaer Plateau has been identified in NYSDEC's Hudson River Estuary Program as a Significant Biodiversity Area. These upland forest tend to be cooler and more densely wooded than adjacent lowlands. The soils are often shallow and poorly drained, but support an Adirondack-like coniferous forest with wetlands, including unique bogs and fen habitats. Many properties on our road fit this classification of an upland forest habitat.

This is an unnecessary project that people are fighting for many reasons. This is not strictly a NIMBY fight, although our health and safety, property values and quality of life will be threatened by this pipeline. Many New Yorkers, including our Governor, support a future freeing ourselves of fossil fuels. Continuing construction of fossil fuel infrastructures like pipelines will seal the fate of our children and grandchildren as they face the alarming effects of climate change on our delicate planet. Dramatic shifts in weather patterns with severe storms and shifts in temperature extremes and rising sea levels have affected millions of people across the world.

I appeal to FERC, NYSDEC, our Federal, State and Local elected government representatives to stop the NED pipeline NOW and promote initiatives to encourage the growth of renewable energy sources. This is a moral decision affecting not just us but the entire future of our planet and future generations.

Thank you

Respectfully submitted by

Barbara Nuffer

### **Summary on Compressor Stations and Health Impacts**

February 24, 2015

Quoted from this document:

Compressor construction and operational phases are generally projected to produce emissions below the NAAQS standards. They are presented in tons per year. This measure of emissions is used for NAAQS purposes and determines the air quality designation over a region and over long periods of time. The problem posed by estimating tons of contaminants emitted per year is that over the course of a year emissions will vary, often greatly. As phases of construction and operation change so will emissions content and concentrations. For a resident living near a compressor station, the concern is not simply PM2.5 emissions over the course of a year, but is PM2.5 emissions during the peak construction time when it's at its most intense. Even during normal operations compressor stations have been shown not to emit uniformly (lowdown and accident events will be discussed separately).<sup>1</sup> The measurement tons per year, while common in the industry and common in the environmental field where regional air quality is at issue, is not an appropriate measure to determine individuals' health risks which increase during episodes of high exposures.

Health risks from relevant air contaminants: Averages, peaks and health events As stated previously, one of our primary concerns is the poor fit of a tons per year measurement to the assessment of risk to the public's health near a compressor station. Furthermore, the National Ambient Air Quality Standards (NAAQS) used as a benchmark for air quality were not created to assess the air quality and safety in a small geographic area with fluctuating emissions. NAAQS effectively address regional air quality concerns. But these standards do not adequately assess risk to human health for residents living in close proximity to polluting sources such as unconventional natural gas development (UNGD) sites, where emissions can be highly variable.

Generally, it has been shown that:

1. Current protocols used for assessing compliance with ambient air standards do not adequately determine the intensity, frequency or durations of the actual human exposures to the mixtures of toxic materials released regularly at UNGD Sites, including compressor stations.
2. The typically used periodic 24-hour average measures can underestimate actual exposures by an order of magnitude.
3. Reference standards are set in a form that inaccurately determines health risk because they do not fully consider the potential synergistic combinations of toxic air emissions.

Thus estimates of yearly totals of contaminants released by a compressor station do not allow for an assessment of the physiological impact of those emissions on individuals.

NAAQS reflects what, over a region, over time, is deemed safe population-wide. This is very different than what is safe within for instance 1200 feet of this compressor station. As already stated, averaging over a year can wash out important higher spikes in emissions (thus exposures) that may occur at various points throughout the year. These high spikes can put residents at risk for illnesses caused by air toxics.

#### Toxicity and characterization of exposures

Toxicity of a chemical to the human body is determined by the concentration of the agent at the receptor where it acts. This concentration is determined by the intensity and duration of the exposure. All other physiological sequelae follow from the interaction between agent and receptor. Once a receptor is activated, a health event might be produced immediately or in as little as one to two hours. In some instances, where there is a high concentration of an agent, a single significant exposure can cause injury or illness. This is the case in the instance of an air contaminant induced asthma event. On the other hand, after an initial exposure, future exposures might compound the impact of the first one, in time, producing a health effect. Repeated exposures will increase, for instance, the risk for ischemic heart disease.

#### Peak exposures

Researchers have demonstrated the wisdom of looking at peak exposures as compared to averages over longer periods of time. Darrow et al (2011) write that sometimes peak exposures better capture relevant biological processes. This is the case for health effects that are triggered by, short-term, high doses. They write, "Temporal metrics that reflect peak pollution levels (e.g., 1-hour maximum) may be the most biologically relevant if the health effect is triggered by a high, short-term dose rather than a steady dose throughout the day. Peak concentrations ... are frequently associated with episodic, local emission events, resulting in spatially heterogeneous concentrations ...."

Delfino et al (2002) posited that maxima of hourly data, not 24-hour averages, better captured the risks to asthmatic children, stating, "It is expected that biologic responses may intensify with high peak excursions that overwhelm lung defense mechanisms." Additionally, they suggest that "[o]ne-hour peaks may be more influenced by local point sources near the monitoring station that are not representative of regional exposures ...."

Because episodic high exposures are not typically documented and analyzed by researchers and public agencies, natural gas compressor stations emissions are rarely correlated with health effects in nearby residents. However, examination of published air emission measurements shows the very real potential for harm from industry emissions.<sup>31</sup> Reports of acute onset of respiratory, neurologic, dermal, vascular, abdominal, and

gastrointestinal sequelae near natural gas facilities contrast with research that suggests there is limited risk posed by unconventional natural gas development

Burden Lake is in extremely close proximity and directly north of the planned Compression Station.

Burden Lake flows North.

Prevailing wind direction is from the South. There are also low lands between the Compression Station and Burden Lake. Every time that there is any form of exhaust from the Compression Station, the prevailing winds will flow directly to the lake.

Burden Lake is Spring fed. The coolness of the water acts as a magnet for any affluent particles being exhausted from the Compression station.

There are Bald Eagle nesting areas within close proximity of the lake. The bald eagles use the lake as a feeding ground. This is in addition to the Blue Herring and other native spiecies.

Burden Lake has hosted the Wounded Warrior Water Sports program for the past decade. It is a permanent part of the Wounded Warrior! Adaptive Sports Program. For one weekend each summer the wounded warriors and their family members are welcomed to the lake to enjoy a variety of water sports in special adaptive water sports equipment.

Burden Lake is also the home of the Rensselaer County Boys and Girls Club, Camp Adventure. For the summer months, the last week in June, the months of July and August approximately 80 inner city children are bused out on a daily basis to Camp Adventure to enjoy the lake.

To reduce the affluent matter going into the lake, a sewer system with a cost in excess of 3,000,000 was just installed. The entire bill is being paid for by the residents in an effort to improve and maintain the water quclity,

Yesterday, Phase 2 of the planned Lake Treatment for evasive weed infestation was done. Phase 1 was done in the beginning of June. The combined cost for both phases is 64,000. This is also paid for by the Lake Residents to maintain and improve water quality.

## **20150820-4033**

To the Representatives of the Federal Energy Regulatory Commission (FERC)

My name is Fred Nuffer and I'm hear this evening to speak in opposition to the proposed Kinder-Morgan Northeast Energy Direct (NED) pipeline project and specifically the proposed route across the northern portion of the Town of Nassau.

A brief statement on my background, for the record. I've worked for the NYSDEC for 35 years and was the Assistant Director for the Division of Water in charge of groundwater, water supply management and flood protection issues for NYS. I served as a Commissioner on both the Delaware River Basin Commission and the New England Water Pollution Control Commission. I was on the Board of Directors and Vice- President of the National Association of Flood and Stormwater Management Agencies. I currently work with the NYS Department of Homeland Security and Emergency Services advising them on climate change issues as it relates to hazard mitigation and community resiliency. I currently also serve as Chair of the Town of Nassau's Natural Resources Committee.

The NED pipeline, if constructed across the northern most proposed route, will cut across the Rensselaer

Plateau, one of the most unique geologic and bio-diverse areas in Rensselaer County and the New York State. The ecological distinctiveness of the Rensselaer Plateau has led it to be given priority project status in New York State's 1998 and all subsequent Open Space Conservation Plans and includes the fifth largest unfragmented forest in New York. The boundaries of the Rensselaer Plateau can be viewed on the website <http://www.rensselaerplateau.org> . FERC should consult with and seek input from both the NYSDEC Division of Lands and Forests as well as the NYS Office of Parks, Recreation and Historic Preservation on the impact the proposed NED project would have on the Plateau as it relates to the goals and objectives of the Open Space Conservation Plan.

New York State has identified the Rensselaer Plateau as an important area for protection due to its diversity and bird breeding features and the Audubon Society has designated the Rensselaer Forest Tract as an important bird breeding area. The Audubon Society specifically sites the high diversity and abundance of forest breeders on the Plateau, including many at-risk species. Many birds are experiencing declining population numbers in the Northeast due in part to loss of large blocks of forest. The Plateau has also been the focus of conservation efforts by the Rensselaer Land Trust and The Nature Conservancy. FERC should consult with and seek input from the NYS Chapter of the Audubon Society, the Rensselaer Land Trust and the NY Chapter of the Nature Conservancy on the impact the proposed NED project would have on the Plateau.

Protection of the Rensselaer Plateau as an un-fragmented forested habitat is an important goal both for the State of New York as well as the Town of Nassau. Currently, both State Route 43 and the National Grid transmission line corridor present significant barriers for wildlife movement between the northern and southern portion of the Plateau within the Town of Nassau and Stephentown. The clear cutting of an additional 100 to 200 feet during initial construction of the NED and the permanent maintenance of a 30 to 50 foot corridor stretching for the entire width of the Plateau will almost certainly completely isolate the southern most section of the Plateau.

The U.S. Department of Agriculture's (USDA) Forest Service has designated the Rensselaer Plateau as a Forest Legacy Area. The USDA has awarded a \$5.5 million grant to the NYSDEC to work with the Rensselaer Plateau Alliance to create a program designed to protect forest lands from conversion to non-forest uses. The federal Forest Legacy Program recognizes that most forested lands in the United States are held in private ownership. Many forest landowners are facing growing financial pressure to convert their lands to uses that would remove them from the forested land base, such as residential and commercial development. The Rensselaer Plateau meets the goals of the FLP, including maintaining and enhancing water quality, preventing lands from being converted to non-forest uses and protecting important wildlife habitat. This program will provide DEC with the ability to assist landowners within the Plateau through financial incentives designed to ensure that property remains dedicated to traditional forest uses, including logging, hunting, trapping, snowmobiling and open space. FERC should consult with and seek input from the USDA, Forest Service on the impacts of the proposed route of the NED on the Rensselaer Plateau.

The plateau also includes a portion of the Tomhannock Reservoir Watershed as well as other important groundwater aquifers and provides drinking water to more than 100,000 residents, including many within the Town of Nassau. The proposed northern route of the NED through the Town of Nassau will impact many headwater streams and wetland areas of the Valatiekill and the Tsatsawassa Creek. Both of these streams are protected C(t) streams. In the most recent rule changes to the Clean Water Act the EPA and the US Army COE have indicated that they intend to extend protection to the headwater segments of protected streams. The proposed northern route of the NED will also cross over a major unconsolidated aquifer in the Town of Nassau and Stephentown. The aquifer roughly follows the Tsatsawassa Creek as it meanders through Dunham Hollow, both above and below State Route 43. This aquifer and its re-charge zones provides the water supply for many homes in the Town of Nassau and the Village of East Nassau. Protection of this aquifer is critical to the Town and is afforded such protection in Town law. FERC should consult with and seek input from the Town of Nassau and the Town of Stephentown on the proposed route of the NED on the Rensselaer Plateau as it relates to impacts on streams, wetlands and groundwater quality and quantity. FERC should address this issue in the EIS they are preparing and delineate how these headwater streams, wetlands and

groundwater aquifers will be afforded protection both during the initial construction and post construction phase.

The Plateau supports several unique wetland communities (including sedge meadow, dwarf shrub bog, spruce-fir swamp, and kettle hole bog), an impressive mammal diversity not typical of the greater Capital District (including black bear, fisher, otter, bobcat, and moose), and is included on National Audubon Society's list of Important Bird Areas in New York, which specifically mentions a high diversity and abundance of forest breeders, including many State listed species. Protecting this area would not only serve to secure these significant features, but would also contribute to a long-term vision shared by a number of organizations to establish an open space corridor and trail system across the Plateau, connecting Dyken Pond Center to Grafton Lakes State Park, Pittstown State Forest, Capital District Wildlife Management Area, Dickinson Hill Fire Tower, and other recreation and environmental education facilities. FERC should consult with and seek input from the managers of Dyken Pond Center, Grafton Lakes State Park, Pittstown State Forest, Capital District Wildlife Management Area, and Dickinson Hill Fire Tower on the impacts of the proposed route or the NED on the Rensselaer Plateau.

The Nassau Town Board recently requested that the Town's Natural Resources Committee (NRC) prepare a report of the potential natural resource impacts that a proposed natural gas pipeline would have. The report was completed and submitted to the Town Board in May, 2015. It compares and contrasts the air, water, noise, cultural, archeological, historic preservation, visual, aesthetic impacts of two proposed routes for the NED within the Town. This report can be viewed at the Town of Nassau web site: [townofnassau.org/contents/Boards/Niew/6](http://townofnassau.org/contents/Boards/Niew/6). Included in this report is a detailed habitat and bio-diversity report that was conducted by Dr. David Hunt, one of the State's preeminent authorities on bio-diversity. The report enumerates the likely impacts on the ecosystem of the Plateau from the NED, even with various mitigation efforts. The area of the Plateau that the NED proposes to cross is referred to as the Pikes Hill Block. This area has been identified as one of the 14 highest priority ecosystem sites within the Rensselaer Plateau due to the block's rocky summit/slope complex. It has associated high quality examples of State and county-rare natural communities including cliff, talus and rocky summit, and several county-rare plant species characteristic of these communities. Pikes Hill has 7 county-rare plant species, 3 of which are "actively tracked". Pikes Hill Block is one of 35 relatively large and important areas within the plateau without roads bisecting it. It is about 1,500 acres in size, with about 1,200 acres of contiguous forest centrally located within it. This unfragmented forest provides habitat for forest interior species and large mammals, as well as state significant plant communities and concentrations of rare plants. FERC should review the Town or Nassau NRC May, 2015 report and the accompanying report by Dr. David Hunt entitled "Important Biodiversity Sites Along the Proposed Kinder-Morgan Pipeline".

Excerpts from the report are attached below:

### **POTENTIAL IMPACTS ON OUR NATURAL RESOURCES**

Along the Northern route, the NRC has listed the specific natural resource sites of concern, using the map/mile notations on the KMC Pipeline Segment Maps. The areas of potential impact were identified based on reports filed by KMC with the Federal Energy Regulating Commission (FERC), USGS quad maps, aerial photography and field survey work. While the NRC has tried to be complete and thorough in its listing of sites and potential impacts, there may be additional concerns and sites that will be identified at a later date.

Along the Southern route, the NRC has also listed the locations of the natural resource sites that may potentially be impacted by the construction of a pipeline based on reports from KMC filed with the Federal Energy Regulating Commission, as well as USGS Quad maps and aerial photography. No detailed field survey work was performed for this existing route. The natural resources along this route have already been impacted and disturbed when the pipelines were previously laid.

The following is a list of general information that will be presented to the Town Board as well as the natural resources that will be reviewed for potential impacts:

- General information distances of proposed routes, number and size of potential property "takings" and cur-

rent land uses

- Surface Water Resources - streams, ponds and lakes crossings.
- Wetlands State and federally regulated wetland areas as well as other wetlands areas with habitat or species of special concern.
- Groundwater Resources known bedrock and surficial groundwater aquifers or where existing springs are located.
- Fish, Wildlife and Vegetation - fish and wildlife species and plant communities that are protected, endangered, or of special concern or unique to this area.
- Soils, Geology, and Topography - soils of special concern for their value to agriculture or unique geologic formations of aesthetic value.
- Cultural/Archeological Resources - sites of known or suspected cultural or archeological value.
- Air and Noise The exact location of any potential compressor station in the Town of Nassau, if any, has not been identified. Therefore it will not be possible to specify which or how the other resources listed above may be impacted. The NRC did evaluate the potential air and noise impacts that locating a compressor station with three 30,000 horsepower generators would have on a potential site within the Town of Nassau. These impacts are listed in a separate section in the Report

**COMPARISON OF NATURAL RESOURCES IMPACTS**

	Northern Route	Southern Route
Length	6.65 miles	2.95 miles
Permanent Easement (land taking)	24 to 40 acres (ROW 30' to 50')	up to 10 acres (additional ROW 25")
Property Parcels Directly Impacted	50 Parcels	20 to 22 Parcels
Land Use	Electric Power Transmission Wooded Rural Residential	Natural Gas Pipeline Agricultural (Hay & Com) Rural Residential
Clearing Required	90% forested 22 to 36 acres (up to 15 acres within the Rensselaer Plateau)	10% forested 1 acre or less
Streams & Wetlands	19 sites of concern 4 classified stream crossings 6 unclassified stream crossings 2 small unnamed ponds  8 wetland areas	7 sites of concern 1 classified stream crossing 5 unclassified stream crossings 5 wetland areas
Archeological Sensitive Areas	Subsurface areas undisturbed (over 5mi. of this route are within Archeological Sensitive Areas)	Subsurface areas previously disturbed

Groundwater Northern Route

Insufficient geo-technical data exists along the Northern route to make a thorough analysis of potential groundwater impacts. USDA soils maps identify soil type and depth only down as

far as 5 feet, however the depth of the pipeline trench will need to be at least 7 feet. A trench at that depth, along with the blasting that may be necessary, has the potential to impact artesian influenced wells and springs along the proposed route. (Approximately 2.0 miles of the Northern route is located on steep side hills, above some 20 private wells.) Approximately 1.5 miles of the Northern route does pass thru a major groundwater aquifer along the upper Tackaswasick Creek. This aquifer has been recommended for special protection by the NRC in previous reports to the Town Board because it serves as the principle water supply for the numerous homes along Taborton and Dunham Hollow Roads.

Groundwater Southern Route

The Southern route passes through approximately .7 miles of the groundwater aquifer shared by Town of Schodack and Nassau just south of the Village of Nassau. The Village water supply well is located 1.1 miles north of the Southern route and not subject to impact from this pipeline route. The NRC is not aware of any private water supply issues that occurred from placement of previous pipelines along the Southern route.

Fish, Wildlife and Vegetation Northern Route

Please refer to Dr. David Hunt’s report entitled “Important Biodiversity Sites Along the Proposed Kinder-Morgan Pipeline”, dated May3, 2015. Table 1 in this report lists numerous sites along the Northern route where significant and important aquatic networks, ecosystem complexes, natural communities areas, probable presence of rare species, and fish and herptiles areas have been identified. Many of these have significance at both the County and State level.

Fish, Wildlife and Vegetation Southern Route

No detailed field work was performed to analyze the potential impacts to the natural resources along the Southern route. Since previous pipelines have already disturbed this area it is assumed that this route will have fewer and mainly short term impacts on the Town’s natural resources.

	Northern Route	Southern Route
Type II & III Soils (prime agricultural soils)	4600’ = 0.87 mi	1300’ = 0.25 mi

Geology Northern Route

An extremely uncommon geologic formation called Lag Gravel is present along the Northern route in at least two known areas.

Geology Southern Route

No know unique geologic features have been identified along the Southern route.

Topography Northern Route

There are significant and frequent elevation changes along this proposed route. The pipeline will enter Nassau at an elevation of approximately 500 above sea level and eventually climb to an elevation of 1100 feet in the Alps before crossing into Stephentown. In some cases, the pipeline descends and ascends over 300 feet of elevation change within a 2/10th of a mile or a 30% up hill and down hill grade. Most of these steep valleys have streams and wetland areas at the bottom of the grades. This type of topography will require extensive movement of earth to enable the pipe to be laid without sharp bends. While the spoils will be put back into place and the finished project profiles will closely resemble the original topography, even with extensive mitigation measures the history of pipeline projects has shown that there are often extensive natural resources impacts. The bio-diversity and productivity of the streams and wetlands will be negatively impacted by the widened corridor, eventual sedimentation, and invasive species that are more easily introduced on the disturbed lands.

On the steep side hill sections of the Northern route, in order to lay the pipe, significant cut and fill areas will have to be created in order to allow trenching machines to properly operate. Again this means more disturbed land and potentially wider temporary construction and permanent ROW corridors.

#### Topography Southern Route

This route has a much gentler topography with far fewer significant slope changes. The proposed pipeline would enter Nassau at an elevation of approximately 450 feet. Over the next 1.6 miles, the pipeline would climb to a high point of approximately 640 feet (mile marker 37.8), and then over the next 1.35 miles would leave Nassau at an elevation of 510 feet. Construction along this route will impact fewer streams and wetlands and the amount of earth needed to be moved near these streams and wetlands will be far less.

#### **20150820-4034**

Hand written FERC comment form, Fred Nuffa, 171 Radlog Rd, Averill Park, NY 12018, should look at alternative route.

#### **20150820-4035**

FROM:

RICHARD E. OGSBURY

119 OGSBURY WAY

DELANSON, NEW YORK

12053-5619

MY RESIDENCE IS ON ROUTE 146, 2 MILES EAST OF GALLUPVILLE, NEW YORK. WE PURCHASED TIDS PROPERTY IN 1973.

IN 1950, TENNESSEE PIPELINE INSTALLED THE #1 LINE: SINCE THEN THEY HAVE INSTALLED TWO MORE LINES. IN THE 1990'S IROQUOIS INSTALLED ONE LINE ACROSS OUR PROPERTY. THE RIGHT-OF-WAYS FOR THESE LINES IS 85 FEET FROM MY HUMBLE RESIDENCE.

THERE IS MORE THAN A Y1MILE OF RIGHT-OF-WAY VISmLE FROM OUR PROPERTY;- TO THE BEST OF MY KNOWLEDGE, THERE NEVER HAS BEEN A PROBLEM FROM SHARON SPRINGS TO ALBANY.

WE FIND IT ENJOY ABLE TO SEE THE VARIED WILDLIFE USING THE CLEARED AREAS FOR GRAZING AND TO RAISE THEIR YOUNG.

IT IS REALLY DISGUSTING TO SEE OUR ELECTED OFFICIALS PUBLISH FALSE HOODS AND HALF TRUTHS. THE PIPELINE COMPANIES HAVE ONLY A RIGHT-OF-WAY; THEY DO NOT OWN THAT REAL ESTATE. THE ONLY RESTRICTIONS ARE NO PERMANENT STRUCTURES OR TREES PLANTED ON THE RIGHT-OF-WAY.

OUR ASSESSOR INFORMED ME THAT THE PIPELINE HAS NOTHING TO DO WITH OUR ASSESSMENT; ALSO MY BANKER INFORMED ME THAT THE LOAN VALUE IS NOT AFFECTED. NO PROPERTY IS WORTH MORE THAN WHAT SOMEONE IS WILLING TO PAY FOR IT.

OUR FAMILY TAKES GREAT PRIDE IN BEING A SMALL PART IN HELPING TO SUPPLY AN ENERGY SOURCE FOR THE MULTITUDES. ONE HAS TO REMEMBER THAT NEARLY 50% OF OUR ELECTRICITY IS GENERATED BY NATURAL GAS, AND THIS POWER GOES INTO THE POWER GRID AND THIS POWER IS SENT TO WHERE IT IS NEEDED.

WE FIND THAT TENNESSEE AND IROQUOIS ARE VERY GOOD NEIGHBORS.

10 July, 2015

To: FERC Scoping for NED Pipeline proposal

From: Stephen Pentak, and Frank Cuttone (Chapter President) for  
The Homewaters Chapter of Trout Unlimited

Re: Northeast Energy Direct Docket #PF14-22

The Mission of Trout Unlimited is: To conserve, protect and restore North America's cold water fisheries and their watersheds.

By our count the NED pipeline would cross or come tangent to no fewer than six Brook Trout spawning streams in Stephentown and adjacent Dunham Hollow in Rensselaer County. Our question/comment for the purposes of the FERC scoping period and EIS is this:

What assurances can be made to protect the viability of these cold-water streams? And specifically: what guarantee is there that the methods for crossing such streams won't cause harm?

The potential harm of erosion and sedimentation and the possibility of the stream flow being diverted underground and cutting off trout migration are risks. These are freestone streams (not spring creeks) and they have periods of low flow in the summer. Any stream collapse would damage the stream viability and trout migration.

Here are the concerns expressed in an assessment done by the Nature Conservancy in 2011 with funding from the Heinz Foundation, The R.K. Mellon Foundation, and The Wm. Penn Foundation. It gives some credence to our concern about the sub-stream boring (aka "horizontal directional drilling") and the risk of "stream collapse." "Stream and wetland crossings may create erosion and sedimentation problems, as well, especially with an "open cut" process, and there is a risk of stream bed collapse with t'bore crossing" techniques if poorly designed or executed. The "open cut" process uses a trench dug across the stream channel with water temporarily diverted around the trench, while the "bore crossing" technique uses a drill or hydraulic ram to create a bore for the pipeline under the stream. "

The streams that we have identified as Brook Trout spawning streams are as follows (these are listed by NY DEC as spawning streams, and confirmed by our own experiences of catch-and-release fly fishing.) Much of this is confirmed in The Environmental Report: NED Project Resource Report:

Waters with classifications A, B, and C also may have a standard of (T), indicating that they may support trout populations; or (TS), indicating that they may support trout spawning (TS). Special requirements apply to sustain those waters that support these valuable and sensitive fisheries resources. Streams and small waterbodies located in the course of a stream that are designated as CrT) or higher (i.e., C(TS), B, or A) are referred to collectively as "protected streams," and are regulated by NYSDEC under its Protection of Waters Program regulations(6 NYCRR Part 608) (NYSDEC 20 15c).

Tackawisick Creek

Roaring Brook\* (this is listed as TBD on the NED report. A NY DEC shocking survey in 2008 confirmed Brook Trout spawning) Randall Brook (listed as an unnamed tributary on the NED report 42° 34' 13,784" N 73° 24' 43.68211W)

Black River

West Brook

East Brook\*

\*also unnamed tributaries

The Environmental Report: NED Project Resource Report lists these all as a 3 foot crossing which underestimates most if not all of these.

The proposed pipeline would also cross the headwaters of the Kinderhook in Hancock Massachusetts which

carries Brook Trout.

The most recent issue of Trout Unlimited "Trout" magazine (September 2015) is focused on preservation of native spawning streams across the country. A map of this region (see attached) shows that the areas described above is just within the current range for Brook Trout and near what is considered "the historic range." The boundary roughly conforms to the southern edge of the Rensselaer Plateau and the Kinderhook Creek. Brook Trout are the canary in the mine for cold water streams. Their presence indicates a clean, cold, oxygenated stream.

We urge FERC to fully consider the impacts to native and wild trout and their watersheds during the EIS process, including how stream crossings will impact trout habitat in the short- and long-term and what the cumulative impacts of building this pipeline will be on native and wild trout habitat and populations.

Respectfully submitted,

#### **20150820-4037**

June 17, 2015

16 Clarks Chapel Rd.  
Nassau, NY 12123

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE  
RmlA  
Washington, DC 20426

Re: Federal Energy Regulatory Commission Docket No. PF 14-22

Dear Secretary Bose.

Pending before FERC is a pipeline project referred to as the Northeast Energy Direct (NED). This proposed pipeline is being built by Kinder Morgan Energy Partners, Inc. I believe that you may be aware of the scope of this project and have received communications from residents affected by this. The details of the specific construction aspects of the project need not repeat. However, there are personal concerns neighboring residents and I of the Town of Nassau living on Clarks Chapel Rd. and Rensselaer County Rte. 15 have concerning this project:

1. The overall daily safety and health of the residents concerning every aspect of physical construction and on going daily 24/7 operation of these facilities in the proximity to each of us. We are aware of facility operations and failures of these facilities in the past
2. The 24/7 constant decibel level from the 90,000 horsepower gas fired turbines and the number of unknown instances of purging cycles. I am aware of this from working as an employee at Niagara Mohawk Power Corporation generating facilities. I am also aware of the current Tenneco Compressor station on Rte 66, Malden Bridge, Columbia Co. at 10,000 horsepower and its noise level.
3. The loss of natural quiet rural character in this area we have lived with for many years.
4. The loss of home and property values for us. The raising of taxes for others in town.
5. If you review a NYS utility company power bill such as National Grid, NYSEG, etc., there is a particular item of concern we should notice. Under terms and definitions is listed SBC, System Benefits Charge. The

SBC is a state-mandated charge for all electricity and natural gas customers. The electricity sse is used to fund energy efficiency programs to meet [state energy use reduction targets], provide assistance for low-income customers and conduct energy research. The natural gas SBC is used to fund initiatives focused on [reducing natural gas use in the state] as part of the Energy Efficiency Portfolio Standard. These charges were required by the Public Service Commission of the State of NY. Here is my point. The State of New York is mandating that we as utility customers pay this SBC for the above mentioned programs, particularly energy use reduction and reducing natural gas use. Now we have a proposed project going to transport a product through the State of NY that the State is making us pay a charge to reduce the use of this product here. FERe may approve this project and will be able to enact eminent domain rights against people who are paying to reduce the use of this product here and are not going to benefit from the product going through NY. This is a double slap in the face!

Therefore, it would be greatly appreciated if you would oppose this project because there is not one single benefit to almost all of the residents of New York State, Rensselaer County and the Town of Nassau. The health, safety and lifestyle we enjoy and value now and hopefully in the future, outweighs any economic value of this project. Thank you for your time and I look forward to your response to my concerns.

Sincerely,

Wesley D. Petrone

Hand written 4-page letter, Susan Phelps, Nassau, NY, opposing.

#### **20150820-4039**

volume hydraulic fracturing] to all New Yorkers and whether the risks can be adequately managed ... HVHF should not proceed in New York State."

#### **J. Pipelines**

The Public Service Commission (PSC) would be the principal regulatory entity in overseeing the construction of intrastate pipelines. Gas pipeline and compressor station siting actions undertaken pursuant to Public Service Law (PSL) Article VII are designated Type 11SEQRA actions. IS In addition, Section 130 of the PSL overrides the Department's State permitting authority, so that the Public Service Commission is the single State authority empowered to grant or deny applications to these site pipelines. However, in considering site-specific impacts of pipelines, PSC and the Department have historically coordinated and would continue to coordinate their reviews within the PSC proceedings. The PSC's Article VII proceedings are an analogue of the SEQRA process. The Department is a statutory party to such proceedings and additionally retains Federally delegated or authorized separate jurisdiction over any required air pollution control permits and registrations (usually for associated compressor stations and dehydrators) as well as under the State Pollution Discharge Elimination System (SPDES) for stormwater runoff. Consequently, significant site-specific adverse impacts would be addressed through the Article VII proceeding. However, on a generic level authorization of high-volume hydraulic fracturing would result in the construction and operation of pipelines and associated infrastructure and equipment that have the potential to result in significant adverse impacts.

The construction of natural gas pipelines, compressor stations and other associated infrastructure has the potential to create adverse impacts to state-owned lands, freshwater wetlands, forests and other habitat due to fragmentation, streams where pipelines cross, air resources (from compressor stations), visual resources, agricultural lands, and threatened and endangered species, and to contribute to the spread of invasive species.

Additionally, there is the potential for cumulative adverse impacts from gathering lines necessary to support

high-volume hydraulic fracturing operations and these cumulative impacts could affect community character and wildlife habitat from the network of pipelines needed to facilitate high-volume hydraulic fracturing activities. Consequently, because the SGEIS is a generic SEQRA review of an activity that would be widespread across certain regions and would induce the construction of gathering lines, pipelines and compressor stations, the Department considered the general potential impacts associated with these ancillary activities. The Department recognizes that these considerations are limited where the Department is preempted by federal law (e.g., Surface Transportation Act, Natural Gas Act).

#### K. Cumulative Impacts

A generic environmental impact analysis is intended to consider the common impacts of an activity that will be performed using a standard process in various locations. 16 With respect to high-volume hydraulic fracturing, regardless of where a well is drilled, there would be impacts common to all well pads and wells. In many sections of Chapter 6, the SGEIS analyzes the combined, or cumulative, impacts of drilling more than one high-volume hydraulically fractured well or multi-well pad because the Department had sufficient information to conduct such analysis on a generic basis (e.g., air impacts). In certain instances there is insufficient information regarding the actual number of wells to be drilled in a town or county, the distribution of such wells statewide, and the timing of drilling, to conduct a cumulative analysis of the impacts of several wells or well pads. However, even with the significant uncertainty surrounding the scope and siting of high-volume hydraulic fracturing, the Department anticipates that high-volume hydraulic fracturing would impact many areas, including some that previously have not been widely exposed to oil and gas development. Moreover, beyond directly impacting those areas where the activity would be allowed, the ancillary activities associated with high-volume hydraulic fracturing and their corresponding significant adverse impacts would likely spread to those areas of the State where high-volume hydraulic fracturing is prohibited and would lead to significant adverse cumulative impacts.

Indeed, as NYSDOH stated in its Public Health Review, “[t]he number of well pads and associated high-volume hydraulic fracturing activities could be vast and spread out over wide geographic areas where environmental conditions and populations vary. The dispersed nature of

FRACTIVIST - Assist, Reform and Protect!: PROXIMITY OF COMPRESSOR STATIO ... Page 1 of 12

Libby Reilly  
149 Clarks Chapel  
Nassau, NY 12123

TUESDAY, JULY 7, 2015

PROXIMITY OF COMPRESSOR STATION DEVALUES HOMES BY AS MUCH..

50%

FOR IMMEDIATE RELEASE

Fremont Center, NY - Homeowners living near the Millennium Pipeline Company's 15,000 horser compressor station on Hungry Hill Road in Hancock, New York have seen the value of their horm decline by as much as 50 percent since the industrial facility was constructed in the midst of whal be a quiet, rural community.

In May 2014 several Hungry Hill residents sought real estate tax relief citing the adverse impact c compressor station on their property values. The Town of Hancock, denied the tax grievances, b Catskill Citizens for Safe Energy subsequently offered to fund homeowner appeals. On August 2! small claims hearings were held in the Hancock Town Hall. Two homeowners, a certified Real Es Appraiser, and a representative of

Catskill Citizens testified that the compressor station was resp for heavy truck traffic, noxious odors, persistent low-level vibrations, and air contamination. The ‘J also asserted that the facility presented a safety threat and recounted how a Millennium employe. suddenly knocked on the door of a house late one evening and urged the family to quickly evacui home. Finally, it was alleged that blasting during the construction of the compressor station had c the foundation of one house, which in turn led to an unsafe spike of radon levels. (Pre and postconstruction radon tests conducted by Professional Home Inspection Service of Binghamton, Ne, showed that radon levels in the home jumped from 3 pCi/l to 6.1 pCill, which is above the EPA recommended action guideline of 4.0 pCiL.)

In light of the evidence proffered, the Town of Hancock tax assessors agreed to decrease the ass valuation and real estate taxes on two homes by 25 percent. The assessed valuation and taxes c home, the one that had been physically damaged, were cut by 50 percent. Hearing Officer John ( who presided over the settlement, was familiar with the compressor station and remarked, “I wou want to live next to it.” After the tax assessors agreed to the 50 percent tax cut he told the owners have a good lawsuit here.”

## 20150820-4041

7/14/2015

Dear FERC,

My Name is Libby Reilly, my husband Scott and my two children, Tyler 6 and Andrew 2 own a 100 acre organic farm across the street from the proposed 90,ODDhpcompressor station in the Town of Nassau, Rensselaer County, NY. In a 1 Mile radius we have 11 other households of family members along the proposed pipeline and compressor station route, that consists of sisters, nieces ,nephews, cousins, aunts, uncles and my parents. My Children along with their cousins are the s” generation to inhabit this road. My 6 year old son Tyler has been crying almost nightly since he now knows of the industrial structure that may potentially invade his neighborhood. If this structure were to go in, we would have no choice but to sell our farm that is currently valued at \$355,000. He knows moving means leaving his 7 cousins, grandparents from both sides, the only neighborhood he has ever known, and all of his animals he loves dearly. I would like to let FERC- know this neighborhood is more than just a neighborhood, it’s a family that will be torn apart.

My farm homestead was built in 1777; it is a beautiful and spectacular piece of history that is currently under review by NYShistoric parks and recreation to be on the national register. Please explain to me how this industrial infrastructure will hinder my farms historical status, specifically with the visual effect and the noise that will be generated 24/7. It is also proven home values can drop by 50% when located next to these stations. I will lose over \$160,000 of my farms worth, who will compensate me?

- We are a starter farm looking to seek organic certification. We purchased the farm two years ago and have been focusing on brining the farm back to working condition. In order to be certified organic one criteria is pesticide free for 3 years, since we have only owned the farm for two years we cannot certify the third years history. Prove to me that the emissions and documented toxins produced from a compressor station will not hinder my farms ability to receive an organic certification.

- When the “blow Downs” occur, a 36” 1460 psi pipeline will generate noise equal to a jet engine taking off. My cows pasture is extremely close, this will spook the cows and they potentially will jump or run through there fencing. Who will be responsible if this were to occur? Getting back a herd of cattle when they are spooked is not an easy task if at all possible. This could be a threat to anyone in the cow’s path. If someone were to be injured or if I sustain an economic loss who will pay?

- There is also research that proves crop land near compressor station sites suffer up to a 30% reduction

in crop growth. We rely on a full crop production to sustain our herd of cattle. A reduced crop yield year after year will cut into my farms business. Prove to me the acid rain produced by the turbines, evaporators, coolant system and “blow downs” will not hinder the growth of my crops.

- There is 20 acres of crop land that will be lost in the transfer of the compressor station property from agriculture to industrial, this map I have here is from the county outlining the crop lands on the parc-;i]-MY family would have purchase this land to expand ~ttle farm had it been placed at fair market value.

- I also have bee hives that are sensitive to Chemicals! Prove to me the emissions,toxins and constant vibration ana noise will not hinder the bee colonies.

- Cornell University has done research on how acid rain is causing loss of valuable northeast sugar maples. How will having this 90,000hp industrial compressor station effect my sugar maples as well as Wells Maple Farm, who is in direct line of the stations emissions as well. Prove to me?

- We operate a Christmas tree farm in the winter months, I have thousands of customers who come to the farm for the quiet rural historic country setting, the compressor station location would create an industrial feel rather than a classic historic feel once again cutting into my business profits.

- Looking at this map, you can see a stream forms on the property of 149 Clarks Chapel Road, it flows south through the compressor stations site and links u~~ Valatie Kill, flows into Nassau Laketo Kinderhood lake and out to the Hudson River. The Valatie Kill is part of the cleanup efforts of the EPA superfund site known as the Dewey Loeffel Dump” This site sits 1.2 miles from the proposed compressor station site and the Valatie Kill is tested on a regular basis for toxins.

- Three miles east of the compressor station site, the pipeline is slated to passthrough property that is currently pursuing a mining permit, how is this a safe practice to allow blasting and a pipeline to be collocated?

- I also have included a picture of the bald eagle that inhabits the area; he is seen here on the actual property for the compressor station.

- There are 01 residential household and 50 small children who live within the marked “1/2 buffer zone” with many more in close proximity. Prove to me that the compressor stations emissions are safe and that these children of the future will not be hindered with short and long term health effects due to toxins like benzene, toluene, formaldehyde and methane. I have come across studies such as this one from the Southwestern Pennsylvania Environmental Health Project, states they have detected from 16-18 chemicals in the air surrounding these compressor station sites. Benzene is now being linked to child hood leukemia and most of the other chemicals hinder the nervous system. Ultimately the children will be the ones who will suffer since there little bodies are still growing and trying to develop. Prove to me through government studies, that these compressor stations are “good neighbors” since they can supersede town zoning to be allowed in rural residential hamlets.

- My son and I suffer from a MTHFRgene mutation. He is heterozygous to the 677/1298 combination which is the worst to have. 98% of autistic children have this MTHFR~gCfA’iv<!1 This condition can lead to a variety of medical problems when people with MTHFRare exposed to more toxins than their bodies can handle. According to research laughing gas/nitrous oxide can cause severe problems or death in people with MTHF gene mutations. Compressor stations are documented to release nitrous oxide into the atmosphere on a daily basis, How willi protect my son from this? I want you to prove to me this will not harm my six year old son. I have included the studies and medical records to prove this case.

When Kinder Morgan was conducting there 24 hour sound level testing on May 21-22, Box # 5 by HF-PAcoustical Consultants based out of Houston Texas was placed around a telephone pole on the side of the road. During that 24 hour period Tom Hanson who is selling the 142 acre parcel for the compressor station was on his land hauling gravel with dump trucks and equipment to load on this particular day and for a majority of the whole week. His water truck used for his commercial well drilling business was also driving up and down the road all day. I was in my field running a tractor drilling holes for our once a year

Christmas tree planting. I request that the results from this testing be rejected and a new 24 hour test be performed by FERC.

Ultimately this is my home, my neighbor's homes. We reside in a rural residential neighborhood to protect the way of life we want for our families. If this project truly was of public necessity, Kinder Morgan should not be having issues gaining customers to sign on. As of a few weeks ago in a conversation I had with Jim Hartman, Kinder Morgan does not have enough customers to fill the 2.2 cubic billion feet of gas that can flow through this pipe a day. Kinder Morgan is abusing our constitutional rights and this pipeline should not be approved, until all valid points and alternative routes are investigated. It is FERCS responsibility according to their strategic Plan dated March of 2014 to promote safe, reliable, secure, and efficient infrastructure. Running High pressure pipelines within feet of residential households and placing Massive compressor stations in heavily populated rural residential zones is not promoting a safe environment.

Thank You for your time.

Washington, DC 20426

Docket # PF14-22

FROM: Jeannette Rice  
31 Rice Road  
Rensselaerville, NY 12147

RE: Proposed NED Pipeline/Kinder Morgan Scoping Hearing

DATE: July 16, 2015 Schoharie, NY

I am providing the following comments as a repeated public service:

1) First I would like to acknowledge the many good people here who are seeking jobs. I support you in your search. We need more jobs in NYS, but not through expanding an aging pipeline grid that will cause harm to our family's health and well being. I encourage you to be open to jobs in renewable/sustainable energy resources for the healthy future of our NYS communities.

The land and life, liberty and happiness of those NYS citizens who just want to live quietly, peacefully, and healthfully is being raped by the threat of land takings for gas export. Please do not disregard this destruction in favor of corporate greed.

2) Secondly, to the five appointed commissioners of FERC:

Commissioner Tony Clark:

You've been active in North Dakota energy development and exportation, expanding oil and gas infrastructure.

Four representatives from FERC and five from PSC had a meeting in NYC on Nov 5, 2014 and determined that NYS did not need any more gas pipelines or electric transmission lines. The proposed NED, which will parallel the proposed Constitution pipeline through NYS doesn't demonstrate public convenience and necessity. It is clearly a method to export natural gas for corporate profit.

It seems quite apparent that the purpose of the pipeline( s) is to transport natural gas to St. Jolm, Nova Scotia, Dracut, MA, Quonset Point, RI, the proposed Ambrose Shallow (about 100' depth between the inbound

Barnegat Channel and outbound Ambrose Channel).

Please pack Kinder Morgan up and send them back to Texas. I see no benefit to the citizens of NYS.

There needs to be a cumulative impact assessment of two pipelines running together - the proposed Constitution and NED. What about the impact of the blast radius. <http://nogaspipeline.org/2010-08-19/the-blast-radius>

As I read this report noted above, I imagined what my life would be like lived in one of the many housing developments next to an additional 36" natural gas pipeline that will transport about 2 billion cubic feet of natural gas per day. I am also concerned about the negative impact this pipeline will impose on my friend's organic garden and family's health.

I recall the increase in pipeline incidents in an aging system with many miles approaching 50 years old. I think of the thousands of gas line leaks found in the city of Boston last winter and remember explosions and loss of life in NYC.

I've attached a list of pipeline accidents in the US in the 21st century. The list was too long to be downloaded completely on my server:

<http://www.dontfractureillinois.net/list-of-pipeline-accidents-in-the-united-states-in-the-21st-century/>

[http://en.wikipedia.org/wiki/List\\_of\\_pipeline\\_accidents\\_in\\_the\\_United\\_States\\_in\\_the\\_21st\\_century](http://en.wikipedia.org/wiki/List_of_pipeline_accidents_in_the_United_States_in_the_21st_century)

Surely you ("you" in my comment paper means all FERC members) are aware that Pipeline and Hazardous Materials Safety Administration (PHMSA) cited Kinder Morgan for these safety violations:

- failing to maintain update maps showing pipeline locations
- failing to test pipeline safety devices
- failing to maintain proper firefighting equipment
- failing to inspect its pipelines as required, and
- failing to adequately monitor pipes' corrosion levels.

<http://nhpipelineawareness.org/wp-content/uploads/2014/05/Kinder-Morgan-Accidents.pdf>

I wonder if you own a house within a mile of a compressor station and/or a 36" pipeline. Would you care if your property values went down ... Would you care and appreciate the noise and toxic odors. Would you care.

Cheryl A. LaFleur:

You are a known leader in the natural gas industry.

As a grandmother, I wonder if you have children or nieces and nephews. I wonder what kind of world you want to leave tomorrow's generations.

I wonder if you have read NYS' s Findings Statement to the FSGEIS released on June 29,2015:

[http://www.dec.ny.gov/docs/materials\\_minerals\\_pdf/findingstatevhf62015.pdf](http://www.dec.ny.gov/docs/materials_minerals_pdf/findingstatevhf62015.pdf)

The proposed NED causes proliferation of the dangerous and destructive practice of fracking process not wanted in NYS. I wonder if you are able to hear the citizens of NYS who have taken great joy that fracking has been banned. More pipelines mean more fracking and negative impacts on human health and the Earth's clean air, water, and soil resources.

I wonder if you are a climate change denier. Do you accept that 99% of the world's scientists recognize that global warming is caused by an increase in carbon produced by fossil fuels ... Natural gas production is a major contributor to carbon pollution and global warming.

Natural is not an energy "bridge" to anywhere safe. It's only a bridge on the road to the bank for corporate investors.

Norman C. Bay:

You are known as "one of the 10 most influential people in energy."

If you really want to protect consumers, this grandmother advises you to reject the plan for the Constitution Pipeline and the North East Direct and recommend that the United States transition from fossil fuels to sustainable/renewable energy, just as there was a transition from “sea oil” to “land oil” in the 1850s, it is beyond time to transition to renewable/sustainable energy resources. You will become the #1 most influential people in energy, distinguishing yourself in history by taking our country in a new direction to provide for our energy resources from solar, wind, tidal, geothermal, waves, hydro.

[www.stanford.edu/group/efmh/jacobson/Articles/UNewYorkWWSEnPolicy.pdf](http://www.stanford.edu/group/efmh/jacobson/Articles/UNewYorkWWSEnPolicy.pdf)

Phillip D. Moeller:

You’ve worked on conservation, energy and waste. Please REJECT this proposal to build the NED. Natural gas development and exportation via increased pipeline infrastructure does not support water, air, and soil conservation and produces toxic waste that the industry still has not found a way to safely dispose.

According to an article in Bloomberg, T. Boone Pickens owns 850/0of the water rights in the Texas Panhandle, owns more water than any other individual in the USA and he wants to control more. He has been known to say that after natural gas, water will be the next commodity, he doesn’t care who buys the water, probably Dallas, but it will be to the highest bidder.

<http://www.bloomberg.com/lbw/stories/2008-06-11there-will-be-water>

It’s absolutely unacceptable to think that the basic right of clean water will be sold off to the highest bidder as a result of fossil fuel pollution. This is not a plan that can be supported.

Please reject the proposed NED pipeline.

Colette D. Honorable:

You worked as a consumer protection attorney.

Please hear the like voices of consumers in NYS. We do not want more natural gas, we do not want more pipelines, or more compressors fouling our resources and making our children and families ill. Protect us.

You also have experience working on pipeline safety and reliability. If you really want to ensure NYS citizens safe, reliable, and affordable electric service, please stop this NED proposal. Surely you know that very little of the system (about 7%) is inspected. Surely you know that adding more on the pipe pile isn’t going to make it safer, or more reliable.

You’ve worked on diversity of the energy supply. The NYS PCS released a sweeping reform in February, 2015 to decentralize power resources. The approval of any further pipelines for NYS is contrary to this sweeping policy framework. The directive envisions many small renewable/sustainable power sources joining together to replace baseload power. The proposed NED is contrary to this new policy.

3) Finally:

You already have all the information about the toxic effects of compressor stations (Mines ink, NY) and pipelines. You already know that an increase in infrastructure supports the continued destructive process of fracking our Earth. You already know the harmful effects to human health, clean soil, air, and water resources. You already know that children, doctors and citizens who have had health and water problems in PA have been gagged.

Please do not turn these hearings into a farce by favoring corporate greed. Do not ignore the will of the people who back their views with science. As a community elder and grandmother, I want all future generations of have an opportunity to have clean soil, air, water resources and the best chance at a healthy life. ‘

Please think out of your corporate gas and oil controlled box and REJECT this proposed pipeline. (Constitution and NED)

Allow us to protect our clean air, water, and soil resources and protect public health. Allow us to aggressively transition to renewable/sustainable energy resources.

cc. President Obama

PF14-22

Patricia Sahr  
98 Coldwater Tavern Rd.  
East Nassau, NY 12062  
518-766-3419  
psahr47@yahoo.com

Nassau is a town that values its history. I'm speaking tonight on behalf of the dedicated people who do the preservation work, and in this statement I will address the impact the pipeline might have on historic structures located on Clarks Chapel Rd., County Route 15, China Hill Rd. and Mud Pond Rd., all of which are close to the proposed pipeline route.

Existing buildings date from the late 18th century to the mid-19th century and include farm houses, barns and out buildings. The owners have striven to preserve them and increase their value so that they have a viable future. Two examples of this restoration work are the farm house owned by John Keegan, where he lives and operates a perennial landscaping business, and the 1850 home of John Marsch.

Another extremely important part of Nassau's Historic District is located on Mud Pond Rd. Eastfield Village is a fully functional colonial village and repository of 18th and 19th century Nassau buildings and artifacts. The site has 25 structures, including an 1860s Greek Revival church and a large tavern with many rooms, each having its own fireplace and woodstove. Individuals come from all over the world to study and reside at Historic Eastfield Village during its workshops. They escape their busy, noisy city life to journey to an authentic 19th century early American village in upstate New York.

Classes are ongoing and well attended. Eastfield Village is open during the spring, summer and fall to educate individuals in the early crafts of colonial America. The areas of study are timber framing, masonry, fireplace building, plaster and lathe treatments, slate roofing, tin smithing, woodworking, blacksmithing, open hearth cooking, fabric dating, weaving, restoration of early structures, early ceramic study, glass dating, and many others.

Eastfield Village is the creation of the late Donald Carpentier, who was one of the foremost preservation experts in the world. He acquired, through purchase or donation, many of the parts for the Eastfield buildings from local Nassau residents. He used all of these items for the purpose of the reconstruction and maintenance of the village. If someone was removing old windows, old doors, clapboard siding, hinges, hand hewn beams etc., Don would pick them up and reuse them at Eastfield. Some of Nassau's lost history survives at Eastfield Village in the buildings.

The NED pipeline as planned will go right through this area of the town that is of great historic and cultural importance to Nassau. I ask that a study be made of the damage that will result from pipeline construction near historic structures and of the detrimental effects the nearby compressor station (to be installed just 3/4 mile to the west) will have on the operation of Eastfield Village. Surely it will disrupt the learning atmosphere with its frequent, intense blowdowns. It might also discourage students from attending Eastfield because of the environmental hazards caused by blowdowns.

rsahr23@yahoo.com

July 14, 2015

My name is Richard Sahr. My wife and I live at 98 Coldwater Tavern Road in East Nassau. We originally moved into the Town of Nassau in 1979 because it was a rural residential community. We valued our home and land for a number of reasons including, its quiet setting, the opportunity to view and enjoy wildlife, the ability to grow our own food organically, and the ability to raise our two children in such a setting. During that time I studied and became a Healing Touch Certified Practitioner. Healing Touch (HT) is an alternative therapy that can complement traditional medicine or it can stand alone. HT can work on physical, mental, emotional, and spiritual issues by facilitating the ability of patients to heal themselves. I regularly worked on patients at Albany Medical Center (AMC) and the Albany VA Hospital. At AMC I worked in all departments including ICU and periodically accompanied patients into Pre-op, OR, and Post-op. After becoming certified, I also established a private practice out of my home. Our home and my private practice are now in jeopardy.

If the pipeline and compressor station are approved in the proposed location, it will detrimentally affect my ability to conduct my home occupation. Quiet is one the essential ingredients in this kind of work because my clients have to be able to focus inwardly without being shocked by loud noises. I am concerned that the periodic "blow downs" and the constant anticipation of them will interfere with their and my ability to focus on the healing process.

#### **20150820-4044**

The American Medical Association adopted a policy this June in support of legislation requiring comprehensive health impact assessments for gas pipeline proposals.

The AMA adopted this position because it felt existing regulatory approaches to health impact consideration, including FERC's, do not adequately protect public health and safety.

The National Environmental Protection Act requires FERC to adequately protect public health and safety.

Your scope should include studying the AMA Resolution and the rationale for it, and reacting appropriately by consulting with and including prominent, independent public health professionals in all phases of your health impact assessment.

The second topic for inclusion in your scope is a complete assessment of the alternatives to this pipeline represented by solar and wind energy.

This assessment should include a determination of all direct and indirect costs and impacts, particularly health impacts, of gas vs. renewable energy as they would be used to satisfy the public convenience and necessity. The particulars of the optimal renewable systems should be determined through consultation with major corporate providers of these systems.

FERC's approach to renewable alternatives in its review of the Constitution Pipeline proposal was a cynical and brazen betrayal of its responsibilities under NEPA. Two examples of the egregious inadequacy of its approach are: 1) the solar alternative was dismissed from further consideration in part because of its excessive cost. But the cost figure was derived solely from a 5-year old report, which overstated the current cost of solar energy by a factor of three; 2) the cost comparison between solar and gas did not include the contribution of gas infrastructure to climate change, and subsequent environmental and health impacts.

When these inadequacies were pointed out during Public Comment, FERC ignored the issues.

When the Pace Environmental Litigation Clinic asked for a rehearing to consider these issues, FERC stalled and used shameful tricks to prevent the issue from being reviewed in court.

I have talked with staffers of Senators Schumer and Gillibrand and with Congressman Gibson about FERC's outrageous skirting of serious questions concerning health impacts and alternative energy systems. They

have written FERC asking for a meaningful response. They were stonewalled. They are very angry. You might include that anger in the scope of your review.

NORTHEAST ENERGY DIRECT PROJECT

DOCKET NO. PF14-22"()()

COMMENTS PROVIDED BY:

KENNETH C. SCAILLON, 369 MALDEN BRIDGE ROAD, NASSAU, NY 12123

JULY 14, 2015

My remarks from my written statement will be brief in the interest of the time limitations at these Scoping Meetings. I reside about one mile south of the village of Nassau which is south of the proposed new pipeline and about one mile north of the two older existing lines which cross Malden Bridge Road on their way to the Malden Bridge Compressor Station.

It is clear to me and to others who have worked diligently on this issue of the proposed pipeline carrying fracked gas from Pennsylvania, that we now have a situation best described as a Negative Synergy issue, which Kinder Morgan will have to address.

Synergy is by dictionary definition, a combined action or operation. When we add the term , Negative, to that, we are now faced with a situation that dearly implies multiple effects, none of which are positive nor predictable.

The proposed NED pipeline passes through an area which has two other very distinct environmental issues:

1. The Dewey Loeffel landfill Site. This site containing toxic waste deposited years ago by General Electric and Bendix corporation among others ,and was originally thought to be encapsulated, has long been known to be leaching into the soils and the waters around and south of it. For years the Town of Nassau and the citizens group, UNCAGED, have fought to mitigate and resolve this. Currently the Valatie Kill, the major water source from that area is monitored by the Environmental Protection Agency since the pollution has entered that stream as well as Nassau lake. The NVS Department of Conservation in its guide to the safety of bodies of water in NYS, cites both these water sources as polluted and warns that fish taken from them cannot be consumed

This landfill Site is just over one mile south of the pipeline and the proposed Compressor Station site.

2. There is an active proposal by Troy Sand and Gravel Co for a quarry to be situated off Route 66 approximately 1500 feet south of the intersection of Radley road and Route 66. The total area is approximately 88 acres and the material to be mined is Rensselaer Graywacke, (sandstone), one of NVS's hardest and most durable stones used for blacktop and concrete, while the bedrock is used for commercial products. The mining operation will be worked for a number of years in phases, using established drilling and blasting methods. This blasting work will be done 10am to 5 pm Mondays through Fridays. According to their land use plan of March 17, 2006, Revery effort will be made to ensure that vibrations are kept to a minimum to mitigate the effect of blasting". Processing of the sandstone will take place at the quarry site and then will be trucked out.

Most Importantly, this site is approximately 6,000 feet from the proposed Compressor Station site BUT it also appears, in the maps, to border on the actual pipeline route.

The critical factor here is that aUof these sites exist within a two mile radius as measured on the Kinder

Morgan maps. And, NONE of this, to date, has been addressed by the company.

This brings me to my last point which is a direct result of the above Negative Synergy description.

It is the psychological/social aspect. This point often gets ignored when a new and disturbing situation is introduced into a community. • This is becoming much more apparent over the past two months as more residents have found out about the pipeline. Southern Rensselaer County is still largely rural with some suburban sectors. People, like myself, moved here to establish a way of life as a buffer against the Increasing demands of our society. We joined many already here, some for decades, their families having roots far back In time \_

We now find ourselves targeted by an increasing number of threatening and disturbing commercial events which threaten our environment and our bucolic way of life. These events are represented as needs of our society, but in actuality, most have a large element of greed built in. Some would have us believe this is progress. But we have increasingly found that it comes at a high cost for us , our families, friends and neighbors and we end up paying for it physically and psychologically\_

A landfill site that has and continues to leach toxic material, a quarry that will entail blasting even beyond many of our lifetime's, a pipeline with a compressor station that will be the largest in the northeast - all in an area that ALREADY HAS TWO PIPELINES THROUGH IT.

Last week at a public meeting in Nassau to explain the role of FERCCand how the public can participate, the disbelief and even anger that this can happen here was evident. Many said ,how can it be possible that a for profit company can even take our land against our will in certain cases, to dig a pipeline, with most of the fracked gas in that line quietly slated for export? •

What has become increasingly clear is the absolute mistrust of this corporation and our own government as now represented by the Federal Energy Regulatory Commission. These types of situations are happening dally across America and many Americans are saying we have had enough - enough being ignored and not listened to , enough of the arrogance of big business. Even if we as citizens have to oppose these on our own time with little professional help, while Kinder Morgan and FERCCdo this fulltime as part of their job and get paid for it •

When we the people don't trust the actions of our own government, and believe that we are being bought and sold for private profit and political gain ,then we are forced into a corner and have no recourse but to stand up for our beliefs and our way of life here in southern Rensselaer County.

As this process goes forward towards the preparation of the Environmental Impact Statement, we must demand that the well being of Southern Rensselaer County residents be placed first on the list of impacts cited on p.5 in the FERCCnotice of intent. It is an integral part of our environment that we here in the county live in everyday.

I, with my neighbors, friends and community look forward to FERCC's Findings.

**20150820-4046**

July 16, 2015

To: Kimberly D. Bose, Secretary  
FERC  
888 First Street, NE  
Washington, DC 20426

From: Dianne Sefcik  
194 Clickman Rd  
Westerlo, NY 12193

Re: Docket # PF14-22 Kinder Morgan Northeast Direct Pipeline

I'm going to speak to you person to person. FERCC, after all, isn't staffed by robots or automatons, but by people.

I believe we are all accountable. Individually and collectively. I am accountable and you are accountable. Consider the people who lined up to follow Hitler. Some certainly thought they were patriots. Many were charmed or mesmerized, although it's hard to imagine how. I guess you had to be there. Others went along, excusing themselves by saying they were following orders, or even following the law. Many were afraid. Afraid to be different. Afraid to say NO. Afraid to be tortured and punished, or that their families would be tortured and punished, or that they would be disappeared.

Lets imagine Hitler got a marketing makeover. What would he look like? How would he behave?

Still a tyrant. Still a bully. Still greedy. Still a psychopath. Still surrounded by yes-men and opportunists, and other psychopaths. Still intent on getting what he wanted no matter what the cost in lives, in destruction of the earth and property. Still recruiting brainwashed twelveyear- aids, all too willing to die for him, to snipe for him, to spy for him.

You can't appease a bully. Prime Minister Chamberlain, to his dying day, regretted the deal he made with Hitler, thinking it would avoid war.

You may be sitting there thinking, "Ho-hum, just another protest. I won't take it personally. Just another sap of a taxpayer, a peon, not one of the New Aryans."

Well, you're just like me. A taxpayer. A peon. An ordinary American, although some of you may venture ever deeper into the propaganda pit and on to industry jobs like a lot of your peers and predecessors.

FERC serves the oil and gas industry. Even though I pay your salary, you don't serve me.

FERC EIS's are a joke. You might as well use toilet paper.

FERC is a colonizer, using eminent domain for the emperor's of industry.

NED serves the oil and gas industry.

NED would transport fracked gas - at great cost to humans, animals and the environment - to foreign markets to benefit the rich.

NED is not "needed" by Americans. It is of no benefit to Americans. It would not serve Americans, in this, or any other region.

NED would contribute mightily to global warming and climate change.

Use this opportunity to be a human being, using aUyour resources and gifts, not just the goalong brain.

Consider the impacts to the people whose health, safety and welfare is at stake, whose property is at stake. Consider the impacts to the innocent life of the land.

Stand up to the bullies and to the land grabbing tyrants.

Say YES only to renewable energy projects, which would provide long-term employment for many Americans, not just transient jobs for a few.

Say NO to NED.

Best to you,

Dianne Sefcik

## **20150820-4047**

Re: Docket No. PF14-22-000

We are John and Sally Sober from 173 Shufelt Road in the Town of Schodack. We are here to speak against the pipeline which would run adjacent to and through our property as it is currently proposed to cross Shufelt Road.

We purchased our property with the two existing natural gas pipes currently running through it. We were not then particularly concerned about the safety of those pipes. They exude no odor so we don't know if they are leaking. We have, however, a serious concern about their integrity if the proposed new line goes through.

Heavy equipment, possible blasting and shifting earth could compromise them in many ways. There have already been reported explosions of the old Tennessee Gas pipes from broken welds in 2006 and 2011, this last with 3 homes destroyed.

The portion of our property affected by the pipeline also includes a designated water collection area with which we aren't allowed to interfere. This area supplies water for birds and animals and frequently spills into our back lawn. We are concerned about the contamination caused by leaking fracked gas, and the chemicals that could potentially find their way into our well.

Kinder-Morgan's plan to bury this pipe at the minimum depth required for a rural area is simply unacceptable for our area. Studies show a pipeline leaks continually. That means we and our children and grandchildren who visit daily, and also own homes close to the pipeline, will be constantly exposed to fracked gas containing known carcinogens. Several of our family members suffer from asthma. We are seriously concerned about air quality for them.

Kinder-Morgan doesn't have an exemplary track record for pipeline safety. We know they have had at least 21 reported explosions of natural gas pipelines, including some with personal injuries and homes destroyed. They were lucky in April during the one in Texas: no trees, only 1 home to evacuate, no injuries.

We will not be that fortunate here. We live on 9 acres of forested land and there are literally hundreds more surrounding us. If we aren't killed in an explosion, we and all of our neighbors will likely lose everything in the firestorm. A cloud of fracked gas, and the chemicals it contains, including methane and benzene, will blanket our area and endanger people and wildlife. If a temperature inversion occurs at the same time, it will be an unprecedented health disaster.

In 2013 the investment research firm Hedgeye Risk Management concluded that Kinder-Morgan's business strategy is to starve their pipelines and related infrastructure of routine maintenance to maximize profits. Also the NTSB has determined that the Pipeline Hazardous Materials Safety Administration's inspections are inadequate. How can we believe that Kinder-Morgan holds our safety and the safety of the environment above its own interests?

To recap ~concerns: (1) integrity of the existing natural gas pipelines, (2) continual leaking of gas and known carcinogens into our air and groundwater, (3) danger of rupture and explosion of this high density, high pressure pipe, and (4) lack of maintenance and procedural oversight by a qualified and dedicated outside agency.

New York State has banned fracking, why should we be endangered by its product for the profits of those who take no risk themselves? We implore you to put the safety of our family and the environment we are trying to protect, over Kinder Morgan's profit margin.

Thank You!

## **20150820-4048**

Jack Spillman's FERC Scoping Hearing Testimony

The Black River Pond Dam

I live next to the Black River in Stephentown Center. Three miles upriver is the Black River Pond dam, a 560-foot earthen dam which measures twenty feet wide at its top. It was built in the 1930s and holds back a 35-acre lake which is twenty-five feet deep.

In 2007 and again in 2014, two extensive Engineering Assessments by Civil Dynamics Engineering, PC and the ABCOM engineering company were conducted for the New York State Office of Parks, Recreation and Historic Preservation. Both reports are in agreement and state that anything over ten inches of rainfall within a twenty-four hour period would overtop the dam and in all probability, cause it to collapse. Depending on the extent of that collapse, a 300-foot wide flood of water between five and eleven feet deep would devastate my house.

Kinder Morgan has proposed locating its NED pipeline downstream from my property. The proposed loca-

tion is eight hundred feet away from and ten feet lower than my house. If the dam fails, it would unleash a huge flood of water down the river's length, potentially destroying everything in its path, including the proposed pipeline. A catastrophic event would be unleashed and made drastically worse by the presence of a hydro-fracked gas pipeline buried a few feet under the river bed.

-----  
Black River Pond Dam  
Hazard Classification Study  
January 2008

1.0

## INTRODUCTION

This report presents the results of a Hazard Classification Study for Black River Pond Dam located in Cherry Plain State Park in the Town of Stephentown, Rensselaer County, New York. Specifically, this report presents the results of the hydrologic and hydraulic studies conducted to determine the appropriate hazard classification and spillway design flood for Black River Pond Dam. Also, the report details the preparation of downstream flood inundation mapping.

The studies performed by Civil Dynamics Engineering, P.C. for the New York State Office of Parks, Recreation and Historic Preservation (OPRHP) are in accordance with Work Order SAR-OOI dated July 25, 2005, which was authorized on September 7, 2005, and Work Order SAR-002 dated February 23, 2007, which was authorized on March 30, 2007.

The results presented in this report were reviewed with the OPRHP at a meeting on January 29, 2007 and then with the NYSDEC Bureau of Dam Safety at a meeting on October 25, 2007.

This report has been divided into seven sections. Section 2.0 presents a general project description. Section 3.0 discusses data collected for this study. Section 4.0 presents the details of the completed hydrologic and hydraulic analysis. Section 5.0 presents conceptual alternatives to increase the spillway capacity of the dam. Section 6.0 discusses details of the inundation mapping and includes an inundation chart summarizing the potential flooding impacts at critical downstream locations. Section 7.0 discusses limitations of the study. The appendices provide copies of the input and output data of the hydrologic and hydraulic analysis.

2.0

## PROJECT DESCRIPTION

The Black River Pond Dam is located across the Black River within Cherry Plain State Park in the Town of Stephentown, Rensselaer County, New York [See Appendix A, Location Map]. The dam is currently used for recreational purposes including swimming, nonpowered boating and fishing and is owned and operated by the OPRHP. The dam was originally constructed by the Civil Conservation Corps between 1934 and 1937.

The Black River Pond Dam is currently classified as a Class B - Significant Hazard potential dam structure by the New York State Department of Environmental Conservation (NYSDEC).

The Black River Pond Dam is an earthen embankment dam with a concrete corewall. The embankment is approximately 560 feet long with a maximum height of 40 feet, and a crest width of about 20 feet.

The spillway structure, located along the left (east) side of the embankment consists of a concrete chute spillway. The chute varies in width from about 100 feet at the crest to 20 feet along the downstream end of the slope and is followed by a stilling basin.

In the center of the embankment crest is a concrete outlet structure with an above-grade valve stand and operator which controls the low level outlet. This valve was replaced in 1999. According to an As-Built Drawing, the operator controls a 24-inch diameter gate valve attached to a 24-inch diameter inlet pipe open to the reservoir. The valve discharges into the outlet structure and then into the 8-inch diameter downstream outlet pipe.

Black River Pond receives storm water inflows from an approximately 6.2 square mile drainage basin watershed area and has a normal pool surface area of about 35 acres. Based on an estimate of the lake areas and their corresponding elevations, the lake is a maximum of approximately 25 feet deep and has a reported normal pool storage volume of approximately 410 acre-feet of water.

#### J. Pipelines

The Public Service Commission (PSC) would be the principal regulatory entity in overseeing the construction of intrastate pipelines. Gas pipeline and compressor station siting actions undertaken pursuant to Public Service Law (PSL) Article VII are designated Type II SEQRA actions. In addition, Section 130 of the PSL overrides the Department's State permitting authority, so that the Public Service Commission is the single State authority empowered to grant or deny applications to these site pipelines. However, in considering site-specific impacts of pipelines, PSC and the Department have historically coordinated and would continue to coordinate their reviews within the PSC proceedings. The PSC's Article VII proceedings are an analogue of the SEQRA process. The Department is a statutory party to such proceedings and additionally retains Federally delegated or authorized separate jurisdiction over any required air pollution control permits and registrations (usually for associated compressor stations and dehydrators) as well as under the State Pollution Discharge Elimination System (SPDES) for stormwater runoff. Consequently, significant site-specific adverse impacts would be addressed through the Article VII proceeding. However, on a generic level authorization of high-volume hydraulic fracturing would result in the construction and operation of pipelines and associated infrastructure and equipment that have the potential to result in significant adverse impacts.

The construction of natural gas pipelines, compressor stations and other associated infrastructure has the potential to create adverse impacts to state-owned lands, freshwater wetlands, forests and other habitat due to fragmentation, streams where pipelines cross, air resources (from compressor stations), visual resources, agricultural lands, and threatened and endangered species, and to contribute to the spread of invasive species.

Additionally, there is the potential for cumulative adverse impacts from gathering lines necessary to support high-volume hydraulic fracturing operations and these cumulative impacts could affect community character and wildlife habitat from the network of pipelines needed to facilitate high-volume hydraulic fracturing activities. Consequently, because the SGEIS is a generic SEQRA review of an activity that would be widespread across certain regions and would induce the construction of gathering lines, pipelines and compressor stations, the Department considered the general potential impacts associated with these ancillary activities. The Department recognizes that these considerations are limited where the Department is preempted by federal law (e.g., Surface Transportation Act, Natural Gas Act).

#### K. Cumulative Impacts

A generic environmental impact analysis is intended to consider the common impacts of an activity that

will be performed using a standard process in various locations. 16 With respect to high-volume hydraulic fracturing, regardless of where a well is drilled, there would be impacts common to all well pads and wells. In many sections of Chapter 6, the SGEIS analyzes the combined, or cumulative, impacts of drilling more than one high-volume hydraulically fractured well or multi-well pad because the Department had sufficient information to conduct such analysis on a generic basis (e.g., air impacts). In certain instances there is insufficient information regarding the actual number of wells to be drilled in a town or county, the distribution of such wells statewide, and the timing of drilling, to conduct a cumulative analysis of the impacts of several wells or well pads. However, even with the significant uncertainty surrounding the scope and siting of high-volume hydraulic fracturing, the Department anticipates that high-volume hydraulic fracturing would impact many areas, including some that previously have not been widely exposed to oil and gas development. Moreover, beyond directly impacting those areas where the activity would be allowed, the ancillary activities associated with high-volume hydraulic fracturing and their corresponding significant adverse impacts would likely spread to those areas of the State where high-volume hydraulic fracturing is prohibited and would lead to significant adverse cumulative impacts.

Indeed, as NYSDOH stated in its Public Health Review, “[t]he number of well pads and associated high-volume hydraulic fracturing activities could be vast and spread out over wide geographic areas where environmental conditions and populations vary. The dispersed nature of

Findings Statement, Page 28

#### **20150820-4050**

My name is Janet Tobia and I live in the town of Schodack on Nassau Lake. My husband and I moved up-state 29 years ago. We swapped the sounds of the elevated trains and sirens for the honking of geese, and the chirping of birds and the croak of bullfrogs. We have raised our family here and now live with two young adult children, two rescue dogs and five rescue cats. I love our home and our town and don’t want it ruined by this monstrosity threatening our very lives.

We are under attack. A large and rich corporation is planning to disrupt our river, our lakes, our streams, our roads and our homes and our quality of our lives.

Please don’t allow Kinder Morgan and Tennessee Pipeline and Gas to slowly poison our air, and our water. Unknown toxic chemicals and methane can leak out of these pipes. The 90,000 horse power compressor station planned for Clarks chapel road will belch toxins into our air for miles. If there is an explosion, our fire fighters will be helpless to protect us because they cannot know what exactly is burning because of Kinder Morgan’s proprietary rights. What about our rights?

We are trying to recover from the effects of the nearby Dewey Loeffel dump site which is now a Superfund site. We don’t need this attack. This project will not benefit us, only hurt us.

Please help us move out of the dinosaur age and our dependence on fossil fuels and into the twenty first century where we belong with emphasis on renewable resources. We as Americans could be the progressive leader of the rest of the world instead of the slave to a filthy and greedy industry. Please don’t help Kinder Morgan slowly poison us.

#### **20150820-4051**

Tom Tobia - Schodack resident.

This proposed pipeline will be 1 mile away from my home and the compressor station is 3 miles away.

Air quality in Rensselaer County, NY, on a scale of 1 to 100, (100 is the best), as reported by the EPA, is 95 (the United States as a whole is 93). This is based on ozone alert days and number of pollutants in the air.

Last year, David Carpenter, director of the Institute for Public Health and the Environment at the University of Albany, conducted a study of such compressor stations in five states and found unsafe amounts of human

carcinogens that were released into the air.

In 1964, Governor Rockefeller first outlined the Pure Waters Program with a bold proposal that the people of state of New York spend \$1 billion, to clean lakes, rivers, and coastal waters. This approval launched the largest and most comprehensive water pollution control program in the world. New York's Pure Waters Program laid the groundwork for the federal Clean Water Act that was adopted in 1972.

For the past 50 years, the residents of Rensselaer county and the state of NY, have worked hard to preserve and protect the quality of our air and water resources.

As stated during this comment period by many of the residents and our town and county officials, none of us are convinced this project will serve any value to our community or county that we have fought to protect.

On January 1, 1970, The National Environmental Policy Act (NEPA) is a United States environmental law that established a U.S. national policy promoting the enhancement of the environment. NEPA is one of the most emulated statutes in the world and it is often referred to as the modern-day "environmental Magna Carta".ill

Based on the current state and federal environmental laws in place today, the Federal Energy Regulatory Commission, FERC, the governing body of oil pipelines, must deny the placement of this pipeline and compressor station.

## 20150820-4052

Hand written FERC comment form, Mark Ciofri, 37 Clim?er Circle, West Sand Lake, NY 12146, with attached resolution passed by Sand Lake Town Board:

### TOWN OF SAND LAKE TOWN BOARD MEETING

JUNE 10,2015

Introduction #2015-06-06

RESOLUTION# -15

#### **Supporting Neighboring Towns in Opposition to the Kinder Morgan Natural Gas Pipeline Proposed to be Routed through Rensselaer County**

Moved:

By: Flora Fasoldi	Glasser YES
Seconded	Turner YES
By: Mark Cioffi	Cioffi YES
	Kronau YES
	Fasoldt YES

Whereas, a large natural gas pipeline called the Northeast Energy Direct (NED) pipeline project, has been proposed by Kinder Morgan and its subsidiary Tennessee Gas Pipeline, LLC, to be routed through Rensselaer County, including the neighboring Towns of Schodack, Nassau and Stephentown; and

Whereas, the proposed NED pipeline would operate at much higher pressures, than currently operating natural gas pipelines in Rensselaer County; and

Whereas, the pipeline proposed for routing through neighboring towns will be approximately 36 inches in diameter, and routed on existing rights of way, along with nearby private properties and include a large gas compressor station or stations that will encompass extensive acreage and possibly located near residential areas; and,

Whereas, the proposed NED pipeline would transport natural gas from other parts of the country for intended export out of New York State and possibly overseas, with no natural gas benefits to the residents of Rensselaer County; and

Whereas, neighboring Towns directly impacted by the proposed NED pipeline have endeavored to be fully informed of this project and have documented and reported the potential detrimental impacts of this project, to include, but are not limited to:

1. As proposed, this pipeline will run across private property, directly adjacent to homes and through waterways; and,
2. As proposed, this project will impact residential wells, natural groundwater recharge areas and aquifers; and,
3. This proposal is expected to blast through the Rensselaer Plateau which is one of New York's largest intact forested areas that has brought economic opportunity through tourism and responsible business to many areas of Rensselaer County; and,
4. This proposal would impact designated areas of archeological sensitivity across communities; and.
5. As currently proposed, this pipeline has significant potential impact in the areas of public health and safety, home values, businesses, sensitive habitat fragmentation and the further stalling of economic development; and.
6. The project applicant, Kinder Morgan, is seeking federal eminent domain status to allow for property to be secured for the routing of the pipeline which will not benefit the residents of our neighboring communities and give the company and its affiliates an unfair advantage over property owners in these communities; and
7. The proposed NED pipeline would closely follow the high voltage right-of-way raising reasonable concern for the detrimental interaction between the pipeline and the electromagnetic fields established by the high voltage wires; and
8. The thickness/strength of the proposed NED pipeline, the depth at which it would be buried in the ground and the inspection methods for the necessary welds are proposed to be significantly less for rural areas than those required by urban areas; and
9. The proposed NED pipeline carries an inherent risk of leaks, ruptures, fires, explosions, and accidents, which may cause disruption and undue burden for emergency services and would significantly increase the potential for catastrophic damage to lives, property, roadways, streams, wells, aquifers and wetlands in our neighboring rural communities; and
10. Neighboring towns believe the level of compensation and mitigation would not outweigh the long term fiscal, health, safety, business, environmental and quality of life impacts to those neighboring towns; and
11. The proposed pipeline is contrary to the rural residential character of these communities and fails to follow the already existing pipeline corridor; and,
12. The proposed use of land for an industrial compressor station necessary to operate this pipeline, would have dramatic and long term, environmental, social and economic impacts on the rural residential character of our neighboring towns; and
13. The proposed use of land for this project is in direct contradiction to town law as well as the comprehensive plans of these communities; now therefore,

Be it Resolved, that due to the widespread serious concerns and questions raised by residents and the potentially significant negative impacts of the proposed project, the Town of Sand Lake stands in solidarity with the neighboring Towns of Rensselaer County in opposition to the construction of the proposed NED pipeline; and,

Be it Further Resolved, that the Town Clerk of the Town of Sand Lake is hereby directed to transmit certified copies of this resolution to United States Senator Charles Schumer, United States Senator Kirsten Gillibrand, Congressman Chis Gibson, Congressman Paul Tonko, Governor Andrew Cuomo, New York State Senator Marchione, State Assemblyman Steve McLaughlin and Rensselaer County Executive Kathy Jimino.

### 20150820-4053

Hand written FERC comment form, Steven Truss, 44 Slirko Rd, Nassau, NY 12123, questioning “need” and why EPA is not tasked with EIS. Followed by 1 page typed with photo:

Alternate compressor station location

It seems that in the 6 months that Kinder Morgan has allotted to propose the” northern route” through the town of Nassau, they have not fully evaluated the potential sites for the 90,000 HP compressor station.

The area where Rice road intersects the proposed northern route and west towards Poyneer road presents an open area which abuts fewer residences and being flatter would involve less disruption to the environment during both construction and operation.

Maps suggests room for a 1/2 mile buffer zone that would affect fewer properties than the Clarks Chapel Rd location

looking west from Rice rd-

*{photo}*

The Southern Route as supported by the Nassau Town government would be far less damaging than the proposed route, but in any circumstance Kinder Morgan needs to explore all potential Compressor Station sites to minimize environmental impacts and reduction in property values whatever route if any is allowed.

### 20150820-4054

Before giving my testimony, I would like to state for the record: Given the incomplete nature of the information in Kinder Morgan’s Resource Reports, these scoping meetings are being conducted prematurely and are failing to provide information that would benefit the NEPA process.

It is also clearly unfair that almost no Scoping Meetings are being conducted in the communities most impacted - those who will bear the brunt of impacts from compressor stations, several of which are among the largest ever built in the U.S.

My name is Chelsea Zantay, and I live on Burden Lake in Averill Park, New York. I am concerned about the effects of the 90,000 horsepower compressor station slated to be built on Clark’s Chapel Road in Nassau, New York, less than 3,000 feet away from Burden Lake. Living on the lake my entire life, I have seen the appearance of American bald eagles, our national bird. They have built two nests on our lake. In addition, the lake is host to a plethora of wildlife including painted turtles and blue herons. These species could all be at risk due to the changing ecosystem that a compressor station would cause.

Perhaps of most concern is the fact that sections of pipeline could be laid on Logan’s Fault Line. Disturbance of this fault line could trigger potential earthquakes (U.S. Geological Survey). Furthermore, if leaks occur along the pipeline, it could affect Kinderhook Creek, which flows southwest, and has a drainage area of over 329 square miles. If this creek or any other creek in the vicinity is contaminated, we could be looking at water contamination into Albany, Rensselaer, Columbia, and Greene counties. The Environmental Impact Statement should include how these habitats, creeks, and fault lines will be avoided by the pipeline and compressor stations.

“Director of the Institute for Health and the Environment at the University at Albany David Carpenter, who participated as a researcher in the DEC’s fracking study, called compressor stations among the worst of all the fracking infrastructure, and I quote: “Previous studies showed that some of the most serious air pollution came from the compressor stations. There needs to be a statewide analysis of the health of the population of New York from these compressor stations ••.” end quote. I ask: why have we banned hydraulic fracturing in New York State but allow compressor stations, if said stations are worse for the environment? This compressor station would lie extremely close to the Dewey Loeffel Landfill Site, which is a superfund site. Also, due to a strong southern wind in this area, the station would blow methane and other toxins onto a highly populated recreational site. The Environmental Impact Statement should specify how the habitat that lives in and surrounds the lake will be avoided.

Members of the Federal Energy Regulatory Commission, please do not close the scoping comment period until 60 days after Kinder Morgan files new, complete Resource Reports. I implore you to reconsider this site as a potential location for a compressor station and pipeline and to consider a “no action” alternative.

No Thank you.

Chelsea Zantay

**TOWN OF NASSAU, N.Y.**

OFFICE OF THE TOWN SUPERVISOR

David F. Fleming, Jr

August 12,2015

Hon. Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

Re: Matter of Tennessee Gas Pipeline Co., Northeast Direct Project  
FERC Docket PF14-22  
Filing by TGPL dated July 24,2015

Dear Secretary Bose:

On July 24, 2015, Tennessee Gas Pipeline (TGPL)filed a massive update to the earlier draft Resource Reports and mapping files for the NED project, constituting thousands of pages of information and map sheets providing seemingly significant updates to previous submittals. The submitted files amount to over one gigabyte of electronic files that are publicly accessible, as well as hundreds of pages of text and maps that are not accessible due to TGPL claims of their containing “Critical Energy Infrastructure Information” not to be disclosed for public review. This information is of vital interest to and may have a dramatic impact on the community that I represent.

**INFORMATION PROVIDED IN THE TGPL JULY 24, 2015 SUBMITTAL TO FERC IS AN UPDATE TO PREVIOUS SUBMITTALS, BUT IS INCOMPLETE PENDING FURTHER UPDATES**

While the July 24, 2015 publicly accessible filing includes a large amount of new information, there are significant amounts of additional information either not yet provided, or inaccessible for public review, which include information essential for understanding the TGPL proposal for a major compressor station at Clarks Chapel Road in the Town of Nassau, New York. Information such as: a compressor station site layout plan; an indication of the location of the 3D-inch pipeline to and from the station site from the mainline route; an indication of the proposed vehicular access route to the compressor station from public roadways; location, external dimensions and finish materials of compressor station enclosure building, fence-line, emergency blow-down vent facility; location and extent of buffer areas around proposed compressor station facilities; and the location and extent of non-jurisdictional infrastructure that may be subject to siting and site plan review by the Town of Nassau. Without access to much of this information, some of which is indicated on the 73 pages of “Responses to Comments” and “Responses to Letters” on Draft Resource Reports, dated May 15, 2015, the Town of Nassau cannot fully comment on the appropriate scope of studies appropriate for studying the proposed project, its impacts, alternatives and potential mitigation measures that should be

evaluated in the Environmental Impact Statement.

Furthermore, the matrix of “Responses” is replete with indications of information that will be “provided in the October, 2015 filing” or “TBP in Final ER.” Examples of this information include: locations of HD-D installations; specification of communication system and whether communication towers will be proposed to be sited and proposed locations of these towers; sensitive groundwater resources in relation to compressor station sites; fisheries resource protections and mitigation proposals; wetland delineations; groundwater aquifer information and details; sites of contaminated sediments; project operational effects on surface waters; interior forest ecological impacts; environmental justice information for aboveground facilities locations; seismic fault information; NYS § 480-a forest lands affected by the proposed facilities; visual resources information (including regarding any as-of-yet unidentified communications towers); emissions data from compressor stations, including methane and exhaust from compressor facility operations; and acoustical analysis of compressor station operations, including sound emissions and mitigation measures necessary.

#### REQUEST FOR EXTENSION OF THE SCOPING PHASE COMMENT PERIOD

**The deadline for submitting comments on the Scope of Studies for preparation of an Environmental Impact Statement should be extended until after the CEII information is made available to Town of Nassau officials, and information to be provided by TGPL in the forecasted October environmental report is available for consideration.**

Town officials and committee members are making great efforts to review the Resource Reports and associated information submitted at a late date in July, only a few weeks prior to the close of the Scoping Period. This is a huge undertaking for these officials, given the large amount of information that was provided. However, the large amounts of information not yet provided or only provided under protected status, make it infeasible for the Town of Nassau to provide a full evaluation of the information necessary to develop relevant Scoping Comments by the August 31 deadline. The listed incomplete or “to be provided” information includes many topics of specific concern to the Town of Nassau, given the proposal to site the large, 41,000 horsepower compressor station in a Rural Residential area, far from any similar industrial or major utility station use; and the pipeline traversing the rural landscape of northern Nassau. Additional time should be added to the Scoping Period schedule to provide a realistic opportunity for review of the Resource Reports, including information submitted by TGPL as Critical Energy Infrastructure Information, and for development of reasoned comments on the Scope of Studies appropriate to evaluate the proposed major transmission facility project.

Additional time will not represent a burden to the applicant, given that the Resource Reports as filed do not fully provide the requested baseline information as spelled out in many sections of the FERC GUIDANCE MANUAL FOR ENVIRONMENTAL REPORT PREPARATION, dated August 2002.

#### REQUEST FOR IMMEDIATE ACCESS TO CRITICAL ENERGY INFRASTRUCTURE INFORMATION

Pursuant to FERC’s Critical Energy Infrastructure Information (CEII) regulations at 18 CFR § 388.113(d)(4) the Town of Nassau, New York, requests access to certain information submitted by TGPL on July 24, 2015, regarding the Northeast Direct Market Path Pipeline and Market Mid-station 1 Compressor Station proposed to be located within the Town of Nassau, Rensselaer County, New York. Town of Nassau officials should be provided access to the confidential files submitted by TGPL on July 24, 2015, without reservation and on an expedited basis.

CEII submittals regarding details proposed for the Compressor Station site should be provided on a confidential basis for review and development of Scoping Comments by the Town and its representatives. The requested information includes:

- the Compressor Station site plan;
- compressor station facilities arrangement plans;
- ‘non-jurisdictional facilities’ to be located at the Compressor Station property.

The individuals to be granted access to this information would include the following:

David Fleming, Nassau Town Supervisor

Fred Nuffer, Chairman, Town of Nassau Natural Resources Committee

Lani Rafferty, Councilperson, Nassau Town Board

As identified above, the details of the proposed facilities currently hidden from public view are critical to the Town understanding the TGPL proposal within the Town of Nassau, and in developing reasoned comments and consideration of potential impacts on natural and cultural resources, land uses and most importantly on the health, safety and lives of residents within the impact zone around the proposed compressor station site. The Town asserts that this request is a legitimate request for access to information essential to the Town's review of the NED Project proposal and development of Scoping Comments for FERC's pending development of a final Scope of Studies for the Environmental Impact Statement. The Town willingly will assent to execution of a non-disclosure agreement and take reasonable precautions to maintain security and integrity of any CEil information provided pursuant to this request.

In closing, the Town respectfully requests that the FERC immediately grant the relief requested herein.

Thank you in advance for your assistance in this matter.

Very truly yours,

David F. Fleming, Jr.

Town Supervisor

**20150820-4059**

UNITED STATES OF AMERICA  
FEDERAL ENERGY REGULATORY COMMISSION  
INTERAGENCY PRE-FILING CONFERENCE CALL

Tennessee Gas Pipeline Company, LLC

Docket No: PF14-22-000

NORTHEAST ENERGY DIRECT PROJECT

**August 6, 2015**

**Agencies in Attendance (list of attendees is attached):**

- Federal Energy Regulatory Commission (FERC)
- o Cardno (FERC 3rd Party Contractor)
- U.S. Environmental Protection Agency (USEPA)
- PA Department of Environmental Protection (PA DEP)
- PA Department of Conservation and Natural Resources (PA DCNR)

- NY State Historic Preservation Office (NY SHPO)
- NY State Department of Environmental Conservation (NYSDEC)
- NY Department of Transportation (NYDOT)
- NY State Department of Public Health
- MA Attorney General's Office
- MA Department of Public Utilities (MA DPU)
- MA Division of Fish and Game (MA DFG)
- MA Department of Fisheries and Wildlife (MA DFW)
- NH Fish and Game Department (NH FGD)
- NH Department of Transportation (NH DOT)
- NH Division of Historical Resources (NH SHPO)
- NH Office of Energy Planning (NH EP)
- Nashua Regional Planning Commission
- Berkshire Regional Planning Commission
- Delaware River Basin Commission
- Franklin Regional Council of Governments
- Tennessee Gas Pipeline (Tennessee Gas)
  - o Hatch Mott (Contractor for Tennessee Gas)
  - o AECOM (Contractor for Tennessee Gas)

### Meeting Summary

The conference call was conducted to review the general status of the Northeast Energy Direct (NED) Project, including the Project's schedule, field surveys, landowner coordination, and the National Environmental Policy Act (NEPA) process. Topics discussed included:

- Project Reporting and Scoping

- o Tennessee Gas filed a revised set of draft Resource Reports on July 24, 2015. Agencies can submit their questions/comments to Eric Tomasi (FERC) until September 4, 2015 for inclusion in an upcoming Environmental Information Request to Tennessee Gas to address in its next round of Resource Reports/application.

- o FERC continues to conduct scoping meetings and is in the process of collating and reviewing public comments.

The formal scoping period currently closes at the end of August. However, a potential upcoming scoping meeting in Cheshire County, New Hampshire would require the extension of this scoping period for at least couple of weeks. FERC is trying to schedule the additional scoping meeting in late August/early September depending on availability.

- o The currently proposed pipeline loop in Pennsylvania is about 6 miles longer than was previously proposed. FERC is currently determining how to notify affected landowners to ensure they have the opportunity to comment.

- o Upcoming meetings:

- Two scoping meetings in Massachusetts next week in Dracut and Lunenburg.
- FERC has additional meetings with the Massachusetts state agencies and the Dracut Pipeline Awareness group next week.
- Tennessee Gas has scheduled an open house in Connecticut on August 13.

- o The currently proposed Project would reduce the diameter of the pipeline from Wright to Dracut and reduce the amount of compression at the largest compressor stations relative to the previous proposal:

- Tennessee Gas indicated that these modifications could alter the horsepower of the turbines but

would not alter the number of compressor stations or the size of the parcels of land they would occupy.

- FERC confirmed that they consider land use of compressor station locations as part of the environmental review.

- Tennessee Gas status update:

- o Surveys

- Wetlands and Threatened and Endangered species
      - NED East (Wright to Dracut) - about 69 miles surveyed.
      - NED West (Pennsylvania to Wright) – approximately 91 miles surveyed.
    - Cultural Resources
      - ≠ About 37 miles along surveyed NED East.
      - ≠ About 96 miles surveyed along NED West.
    - Bat surveys are ongoing. The window for acoustical bat surveys closes next week. About 83% of the surveys are done.
    - Mussel surveys are scheduled from mid-August to late September.
    - Bald eagle nesting surveys are being completed.
    - Bog turtle surveys may not take place until 2016.
    - Tennessee Gas currently has landowner access to about 32% of parcels crossed.

- o Tennessee Gas intends to file its application in October 2015.

- o There was a tribal consultation meeting last month in Oneonta, New York. It is expected the next tribal consultation meeting will be scheduled in August or September.

- Comments on Specific Resources:

- o Rensselaer Plateau – This potentially sensitive area in New York has been mentioned by several commenters. Steve Tomasik (NYSDEC) will provide FERC with more information about the area.
  - o Stratified Drift Aquifers – Various commentators, especially in New Hampshire, have expressed concern about potential impacts to water quality, water quantity, and associated biological resources.
  - o NH Conservation Lands – In addition to government-owned conservation lands, some private lands have some state-level conservation status. Meredith Hatfield (NH EP) agreed to follow up with FERC on the topic.

- Miscellaneous:

- o Transcripts of the scoping meeting will be posted online.
  - o Tennessee Gas will file state-level permit applications after it files its federal permit applications.
  - o Site visits for alternative routes will be conducted during the next couple of months including a visit to the Dracut area with the Dracut Pipeline Awareness group next week.

Next Call

- Agency call will be held every 2 weeks.
- Next call scheduled for August 20, 2015.

**List of Attendees**

**20150820-4060**

UNITED STATES OF AMERICA  
 FEDERAL ENERGY REGULATORY COMMISSION  
 INTERAGENCY PRE-FILING CONFERENCE CALL

Tennessee Gas Pipeline Company, LLC

Docket No: PF14-22-000

NORTHEAST ENERGY DIRECT PROJECT

**July 23, 2015**

**Agencies in Attendance (list of attendees is attached):**

- Federal Energy Regulatory Commission (FERC)
- Cardno (FERC 3rd Party Contractor)
- U.S. Environmental Protection Agency (USEPA)
- U.S. Fish and Wildlife Service (USFWS)
- PA Department of Department of Conservation and Natural Resources - Forestry (PADCNR)
- NY State Department of Environmental Conservation (NYSDEC)
- NY Department of Transportation (NYDOT)
- NY State Parks and Recreation

- NY State Department of Public Health
- MA Attorney General's Office
- MA Department of Environmental Protection (MA DEP)
- MA Department of Public Utilities (MA DPU)
- NH Department of Transportation (NH DOT)
- NH Department of Energy and Planning
- Berkshire Regional Planning Commission
- Delaware River Basin Commission
- Southwest Region Planning Commission
- Franklin Regional Council of Governments
- Tennessee Gas Pipeline (Tennessee Gas)
- Hatch Mott (Contractor for Tennessee Gas)
- AECOM (Contractor for Tennessee Gas)

### **Meeting Summary**

The conference call was conducted to provide an overview of the Northeast Energy Direct (NED) Project as well as to review the general status of the schedule, field surveys, landowner coordination, and the National Environmental Policy Act (NEPA) process. Topics discussed included:

- Scoping Status and Meetings
  - o PA and NY meetings last week
    - Six scoping meetings, NY State Agency meetings
    - Northeast Tribes meeting
  - o MA / NH / CT meetings next week
    - Pittsfield, Greenfield, Hartford, Nashua, Milford
    - Nashua Regional Planning Commission (RPC) meeting
    - NH Municipal Pipeline Coalition meeting
    - NH Agency meetings in Concord, NH
  - o MA and Cheshire County, NH still being planned
  - o Agency meetings for MA and possibly PA being planned. None for CT at this time.
  - o Scoping period closes August 31, 2015
    - Tennessee Gas must respond to comments filed during this time.
  - o Tennessee Gas plans to tentatively file its application in October
  - o Tennessee Gas filing draft Resource Reports tomorrow
  - o FERC sending Data Request to Tennessee Gas by end of August/early Sept.
- Tennessee Gas Status update
  - o Planning to file all 13 resource reports electronically on July 24th.
  - o Surveys
    - Wetlands
      - ≠ NED East from Wright to Dracut about 138 miles surveyed. Some of this is Threatened and Endangered (T&E) species.
      - ≠ NED West approximately 62 miles surveyed.
    - Cultural Resources
      - ≠ About 35 miles on NED East surveyed
      - ≠ About 92 miles on NED West surveyed.

- T&E species surveys continuing
- Agency / Technical meetings continuing. More next week
- o Survey Access
  - 39% Survey access from Wright to Dracut
  - 54% Survey access from Troy to Wright
- o Press Release
  - Kinder Morgan / Tennessee Gas – modified size of the project
    - ≠ Diameter reduction east of Wright to Dracut (36” down to 30”)
    - ≠ HP reduction for Compressor Stations east of
    - ≠ Delivery reduction from 2.2 Bcf/day down to 1.3 Bcf/day
    - ≠ Ramification of changes
      - o FERC planning site visits to check Alternatives

### Next Call

- Agency call will be held every 2 weeks
- Next call scheduled for August 6, 2015.

**20150820-5001**

Jeffrey Fitzgerald, Lunenburg, MA.

This proposed gas line will may go through our property.

What are the minimum clearances to a large 12” diameter or greater underground gas pipeline for the following:

- Potable well drilling (percussion or rotary)
- Geothermal drilling (horizontal or vertical)
- Septic System (tanks, leach lines and pump stations)
- Foundations (residential or out building)
- Underground electrical main service 200A
- Above ground PV solar electric service
- Hydrofracking an existing well to improve flow characteristics

**20150820-5002**

Jeffrey Fitzgerald, Lunenburg, MA.

This proposed gas line will may go through our property.

What are the minimum clearances to a large 12” diameter or greater underground gas pipeline for the following:

- Potable well drilling (percussion or rotary)
  - Geothermal drilling (horizontal or vertical)
  - Septic System (tanks, leach lines and pump stations)
  - Foundations (residential or out building)
  - Underground electrical main service 200A
  - Above ground PV solar electric service
  - Hydrofracking an existing well to improve flow characteristics
- These minimum clearances may prohibit us as landowners to develop our land as needed.

**20150820-5003**

These minimum clearances may prohibit us as landowners to develop our land as needed.

**20150820-5028**

Madelyn S Collins, Averill Park, NY.

Because of our need to address climate change now, I am opposed to the NED project. Additionally, and as detailed below, I also ask that FERC extend the comment period for a significant period, and that FERC consider the items below.

It is hypocritical to allow fracked gas pipelines to be built while our leaders plan to reduce the threat of climate change. Although natural gas may add less greenhouse gases to the atmosphere than coal, they still add too many. Other countries are well on their way to converting their energy systems to wind and solar. If they can do it, so can we.

I understand that FERC, "s mission is to approve projects such as this, but that mission should be rewritten. "s FERC should have the authority to approve plans to reduce energy use, projects to repair existing leaky pipelines, as well as renewable energy infrastructure.

In addition to my opposition for the reasons state above, I also submit that FERC should extend the comment period for a significant period because Kinder Morgan released new Resource Reports with thousands of items still "s to be determined, "s after Scoping hearings were held in many places, and were about to be held in still others.

That said, and in the spirit of working within your framework, I am a resident of the Town of Nassau, NY. I live less than a mile and a half from the proposed compressor station on Clark, "s Chapel Road.

I request that you research the following:

- The effects that building and running the compressor station will have on the health of the people living in close proximity to it as well as those of us who are within a two-mile radius of the compressor station. Included in this study, please include research into the toxins that will be released during blow-downs and their health effects.
- The effect of the compressor station on Burden Lake which is less than a half mile from the proposed Nassau compressor station and which is a destination for our town and the surrounding areas.
- The effects the toxins released, including those potentially released from compressor station mishap and/or pipeline leaks will have on wells, waterways, the land, and non-human animals.
- The noise level of the compressor station up to a two-mile radius around it and how this will affect the humans and non-human animals in the area.
- The light pollution of the compressor station and how it will affect the humans and non-human animals in the area.
- How property values will be affected for those living in the area, up to two miles from the compressor station and along the pipeline route.
- The effects the building of the compressor station and the operation of the compressor station itself will have on the farms, including organic farms, on Clark, "s Chapel Road, as well as the effects it will have on my own organic garden.
- The interaction of the pipeline and compressor station with the Dewey Loeffel Superfund Site, which it would be in close proximity to.
- The interaction of the pipeline and the crude oil trains in Albany, which it would be in close proximity to. Additionally, I note that the area of the City of Albany where the pipeline is proposed to go is in the vicinity of low income housing. The residents of this area, being mostly renters, would not have been informed of the proposed pipeline. Nor was there a Scoping Hearing in Albany, and many city residents rely on public transportation. "s had they even heard about the closest Scoping Hearings, they would have had no way to attend and participate.
- The effects the pipeline will have on the Hudson River.
- How much of the gas transported by this pipeline will stay in the United States and how much of it will be shipped overseas.

These are the issues I know about because of where I live. However, we, "s not a unique area. "s there are people living all along the pipeline route who will be affected much as my neighbors and I will be and there are waterways, non-human animals all along the route that will be effected.

What I, "s sure you cannot research but hope you will consider is that many, if not most, of us that live

here do so because of the rural nature of the area. Please put yourselves in our shoes. We live here because it is a quiet, clean, and beautiful area. If we wanted industry, noise, and pollution, we would live in cities. We have zoning laws, yet, apparently, if you can allow a huge industrial compressor station and pipeline in a rural area, those laws are meaningless.

Apparently, the American dream of owning one's own home and land is also meaningless. Eminent domain is supposed to allow the government to use private land for public good. The proposed NED pipeline is not for the public good, quite the contrary, the only entity that will benefit from it is Kinder Morgan.

## 20150820-5030

Hiel Lindquist, Fitzwilliam, NH.

Dear FERC.

I read through the resource reports for the NED pipeline. It is very difficult to determine exactly what the environmental impacts of the NED will be since there are so many TBD (to be decided) items in the reports. Also, the resource reports submitted by Kinder Morgan appear to be "boiler plate" statements which are not specific to the NED pipeline. Much more detail is needed.

Kinder Morgan certainly could have presented more complete and accurate information in these resource reports. As I stated in an earlier comment to FERC, I had met specifically with Kinder Morgan back in April, 2015 and voiced my concerns about specific areas of the project. Specifically I met with Lucas Meyer.

These concerns seem to have been completely ignored by Kinder Morgan.

In any event, as far as scoping of the areas that need to be evaluated, I present the following.

1. The proposed route of the NED pipeline crosses and in many instances passes in the same line of travel of several hiking trails. The Appalachian Trail, Metecoment Trail, and Wapack Trail for certain, but there are many other local trails in the conservation lands that will be crossed by the NED pipeline. These trails must be identified and impacts specified in detail. Also, every trail impacted must have plans for the trails during and after construction. For example, how will users of these trails be accommodated during the construction period?
2. The proposed route of the NED pipeline crosses at least 2 active ATV (All Terrain Vehicle) "parks" that I am aware of. There are already problems with ATV use on the existing powerline corridor that will be utilized by the NED. ATV's and other off road vehicles are prohibited from the powerline corridor outside the ATV parks, yet these vehicles continue to use the powerline corridor. There are areas of heavy environmental degradation from this use. The NED environmental impact report must include specifics as to the ATV and off road vehicle impacts on the entire route of the pipeline. It must also provided specifics as to how this use is going to be mitigated. Note that there are existing problems with ATV use in the existing powerline right of way and the NED pipeline, by providing a much wider and smoother avenue, will drastically increase the problem. Just putting up "no access" signs will not be sufficient, nor will assigning the monitoring to existing police and fish and game resources, since they cannot handle the existing problem. Who is going to control this problem. How will the problem be minimized? What is the potential impact?
3. The NED will initially increase the width of the existing powerline corridor by at least 150 feet. By clear cutting all the timber the NED pipeline will increase the "islands" of forest in the area, especially in the proposed corridor where there is no existing infrastructure. For example, several groups have been working on the Monadnock – Sunapee corridor to conserve what remains of the continuous forests in the area. How will the NED pipeline impact these efforts? This is just one small area of the proposed route and the environmental report must address this issue along the entire proposed NED route.
4. The proposed NED pipeline route passes through areas that contain several invasive species such as Glossy Buckthorn, Purple Loosestrife, and Garlic Mustard to name a few. Construction and operation of the NED pipeline will further enhance the optimal environment for the spread of these invasives. The impacts must be evaluated along the entire proposed NED route and mitigation plans both during and after construction must be included in the environmental report.
5. Kinder Morgan, by selecting a route through the natural forests of Massachusetts and New Hampshire, will significantly impact the production of timber in the area in perpetuity. The economic impact must be

evaluated along the entire proposed NED Route. What will be the lost value of this timber, on an annual basis? What tax revenue will be lost? Once the NED pipeline is built, what will be the reduced value of the timberland, since the land will no longer be in timber production? How will the existence of the NED pipeline impact timber harvesting? Are there areas that will be impossible to harvest due to the NED pipeline? How will existing timber harvesting laws and regulations be enforced? Specific to New Hampshire, how will the timber tax be assessed on the NED pipeline clear-cut? Who will be responsible for paying the tax? These and many, many other questions need to be addressed for each specific landowner along the NED pipeline route.

Hiel Lindquist

Fitzwilliam, New Hampshire

## 20150820-5032

Steven McGettigan, Temple, NH.

Steven and Niki McGettigan

PO Box 101

Temple, NH 03084

August 19, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street NE, Room 1A

Washington, DC 20426

Re: Project Docket Number PF14-22-000

Dear Ms. Bose:

We are writing to voice our opposition to the Northeast Energy Direct (NED) pipeline and specifically the compressor station that would be constructed in New Ipswich, New Hampshire by Kinder Morgan/Tennessee Gas Pipeline.

This morning I was installing several frames to display student art flags outside the Temple Elementary School where my wife is the principal and I am a volunteer. The school is located within shouting distance of this proposed compressor station, one of the largest ever to be built in this country. As is typical here, a steady breeze was blowing over the mountain ridge toward the school. As a matter of fact, ten to twelve wind turbines have been proposed for this ridge to take advantage of the great wind resource there.

I thought immediately of the roaring noise, light pollution, and well-documented toxic chemicals that we know are emitted from compressor stations during their daily operations and scheduled blow-downs, not to mention during potential accidents. All of these emissions would be carried directly by the prevailing winds directly toward the elementary school as well as to the open water reservoir next door that provides the only water supply for the town of Greenville.

We cannot knowingly allow the health of children and adults, and our clean drinking water to be destroyed by carcinogens and toxic emissions resulting from Kinder Morgan/Tennessee Gas Pipeline's quest for profits. Because they do not live here, they themselves will never have to worry about the long-term health and environmental damage they will create for us.

We respectfully ask that you read through the well-documented health issues of compressor stations in the Southwest Pennsylvania Environmental Health Project's "Summary of Compressor Stations and Health Impacts" from February 2015 available at:

<http://www.environmentalhealthproject.org/wp-content/uploads/2012/03/Compressor-station-emissions-and-health-impacts-02.24.2015.pdf>

We also respectfully ask FERC to deny approval for this pipeline that would provide huge corporate profits for Kinder Morgan and Tennessee Gas Pipeline at the expense of New Hampshire's citizens and environ-

ment.

Sincerely,

Steven and Niki McGettigan

**20150820-5033**

Charles J. Waggoner, Nassau, NY.

If the president wants to reduce methane emissions, why is FERC on an orgy of fracked-gas pipeline approvals?

**20150820-5046**

**Comments to FERC regarding impacts to the Wapack Trail by the NED gas pipeline. Submitted by Friends of the Wapack, Inc.**

The Wapack Trail, created in 1923, is a very popular 21 mile hiking trail that follows the Wapack Mountain Range from Ashburnham, Massachusetts to Greenfield, New Hampshire, passing through 7 towns. The proposed Kinder-Morgan NED gas pipeline would intersect the Wapack Trail at two locations in New Ipswich, New Hampshire. The first where the trail passes under and parallel to the Eversource power lines at the Windblown Cross Country Ski Area. The second, at a location to the east of Turnpike Road where the trail crosses under the transmission line. Pipeline construction will impact approximately 800 feet of the Wapack Trail at Windblown. Double that distance for ongoing visual impacts resulting from the additional clearing of the transmission line right-of-way, making the existing power lines more visible where the trail runs parallel to them. At the second location the pipeline will directly impact 112 feet of the trail on the east side of Turnpike Road.

The NED pipeline will also impact 350 feet of the Kidder Mountain Trail – a popular Wapack side trail in New Ipswich. This side trail starts at the second location noted above, and runs under the transmission line for 750 feet before entering the woods. The pipeline will be located directly under the trail for approximately 350 feet.

In keeping with our organization's charter to protect and maintain the trails, our concerns are about the impact to these trails during and after construction. Pipeline construction will result in trail surface changes. Those changes may include new erosion issues, newly exposed rocks and boulders, mud, debris left from the clearing and pipeline construction (branches, roots, downed trees, stumps), visual impact of a much wider power line clearing and the large staging area clearings.

Another major concern are the visual and sound impacts of the 41,000 hp compressor station which is planned to be built in New Ipswich. The compressor station may be visible from Kidder Mountain and from the Wapack Trail along the Temple Mountain ridge. The sound from the compressor station will likely be heard on Kidder Mountain which is only two miles from the proposed compressor station and along some locations of the Temple Mountain ridge.

The Friends of the Wapack is an all-volunteer organization founded in 1980 for the purpose of maintaining and protecting the Wapack Trail and certain side trails, including the Kidder Mountain Trail. We have over 1000 supporters / members. We publish a trail guide and trail map, and a newsletter that goes out to all of our supporters. You can find more information about our organization and the trails we maintain and protect at our website [wapack.org](http://wapack.org).

**20150820-5047**

Eileen Myers, Harvard, MA.

I heard that there are plans to use industrial-scale site lighting at the 10-acre 80,000 HP natural gas compressor plant planned for Northfield, MA. I visit that area to do night sky observing with telescopes, and overly bright lighting would ruin the opportunity for myself and my family to use this beautiful dark sky

area. Please ensure that our dark skies are not ruined with light pollution. I am trying to encourage young students to become interested in astronomy and science in general. It is very difficult when solutions for good, non-glaring, full-cutoff lighting is available, but young people see that our government and legislators do not care, and bright overwhelming lighting that shines up in the sky instead on down on the ground, and too much light even on the ground, is used instead. If other states and countries can solve lighting issues to prevent harm to the environment, why can't the United States?

**20150820-5078**

Hiel Lindquist, Fitzwilliam, NH.  
Dear FERC,

The following is an additional requirement to be included in the environmental scoping process for the proposed Kinder Morgan, NED Pipeline.

Recent studies have shown that the fragmentation of forests in the Northeast result in higher incidents of Lyme Disease. A quote from the study is included below.

Please note the conclusion of the study, specifically "that efforts to reduce the risk of Lyme disease should be directed toward decreasing fragmentation of deciduous forests".

The entire route of the proposed NED Pipeline must be evaluated to determine the impact of further forest fragmentation and on the spread of not only Lyme diseases but any of the other 16 pathogens that are spread by ticks in the area. In addition, extensive environmental studies must be conducted to determine how the new environment created by the NED Pipeline will impact the incidents of these diseases in the Northeast and the economic impact of these increased disease incidents.

Thank you

Hiel Lindquist

Fitzwilliam, New Hampshire

Study quote follows:

Keesing, scientist Richard Ostfeld of the Cary Institute in New York and other researchers found that smaller forest fragments had more infected ticks, which could translate to more Lyme disease. Forest patches that were smaller than three acres had an average of three times as many ticks as did larger fragments, and seven times more infected ticks. As many as 80 percent of the ticks in the smallest patches were infected, the highest rate the scientists have seen. These ticks may also be infected with other emerging diseases--Babesiosis, Anaplasmosis and Powassan encephalitis--therefore, forest fragmentation might also be contributing to other serious illnesses, Ostfeld says.

"Our results suggest that efforts to reduce the risk of Lyme disease should be directed toward decreasing fragmentation of deciduous forests of the northeastern United States, particularly in areas with a high incidence of Lyme disease," says Keesing. "The creation of forest fragments smaller than five acres should especially be avoided."

August 11, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission

888 First Street NE, Room 1A  
Washington, DC 20426

Subject: Northeast Energy Direct  
FERC Docket #: PF14-22-000

Proponent: Tennessee Gas Pipeline Company, L.L.C.

### **Tennessee Gas Line Pipeline Concerns**

The Dalton Fire District (DFD) owns land in Dalton, Windsor, Hinsdale and Peru that is being affected by the Tennessee Gas Pipeline (TGP). To this date, the DFD is not aware of any surveys for environmental, biological, sensitive habitat or cultural resources completed or even begun. We would request that the Federal Energy Regulatory Commission (FERC) require a full "Environmental Impact Study" be performed for:

- What will this do to our land quality?
- Wildlife and vegetation?
- Water quality? **We are the only Zone A watershed impacted.**
- Flow of water to rivers and reservoirs in the entire Dalton water shed?
- Timber sales and future timber sales?

The pipeline runs through our watershed and next to a public water supply well. There are three watersheds: the Egypt and Anthony in Dalton and the Windsor/Cleveland which starts in Hinsdale, running through Peru and Windsor. The Cleveland, Windsor, and Egypt reservoirs along with the Anthony Brook and Cady Brook Headwalls are the primary and emergency backup drinking water supplies, respectively, for Dalton. The Cleveland Reservoir and Cady Brook Headwall also serve the City of Pittsfield and the towns of Lanesboro, Lenox and Richmond. This affects tens of thousands of people and industries in our area. All of the reservoirs and filter plant are fed by streams and underground springs. Some of these streams cross the corridor in which the pipeline will be installed and the construction of the pipeline will directly impact these water sources.

We ask that you clearly identify the probable impact radius for potential explosions for the entire pipeline infrastructure, based on the proposed size and pressure of the pipeline. Document the High Consequence Areas (HCA) and the method used to determine them, including quantification used as the basis for each HCA. Identify all structures, public facilities, and areas commonly used by the public (trails, playfields, camping and picnic areas, etc.) within the potential impact radius. Clearly identify the proposed distance between and which valves will be manually, remotely, or automatically operated in the case of a pipeline system failure.

We have compiled a list of questions and stated our concerns in this letter regarding the potential for unreasonable risk posed to human and environmental health. We respectfully ask FERC to have the TGP provide us with answers to our questions and our concerns. We need to feel comfortable with the unknown to protect the water supply for our town, the towns of Lanesboro, Lenox, Richmond and the City of Pittsfield, and our water shed wildlife and vegetation.

#### **In General:**

1. After the original pipeline is installed, can TGP tap into it at any point?
2. If there is a slow gas leak, how many cubic feet of gas will escape before a leak is detected?
3. What are the long term effects to the soil in the event of a spill or major break?
4. Would the precipitate from a break contain chemicals that could migrate into the reservoirs polluting the water?
5. How much fuel would be released given the type of valve and resulting time required to shut the valve off and the distance between valves in the case of a failure?
6. How will the pipeline on DFD land affect the property values?
7. If there is added value, how will the DFD be reimbursed for this?
8. How will the pipeline be marked so that snowmobilers and 4 wheelers will be made aware?

9. What is the maximum weight and speed that is safe to drive over the TGP pipeline?
10. What are the means to maintain access and function during severe winters, heavy winter snows, deep frost and spring mud seasons on our land?
11. The cost of any emergency response related to the construction, maintenance, or failure of the pipeline cannot be borne by the DFD. How will TGP ensure these costs are paid for?
12. We ask that FERC direct TGP to mitigate the adverse impacts on public health and safety by:
  - a. Require TGP to apply for and receive local permits for construction on local roads.
  - b. Minimize the use of open cut construction across public roadways.
  - c. Clearly identify any proposed locations where construction activities will potentially negatively impact emergency responses. Develop and implement a plan agreeable with the DFD.
  - d. Meet with the DFD fire and water personnel at least 2 weeks prior to commencement of any construction activity on our land to review plans and the construction schedule in order to coordinate responses and continue to meet every 2 weeks during the construction period.
13. Require TGP to enter into binding hold harmless agreements with the DFD which protects the DFD from damages resulting from pipeline construction activities.

**Compressor Station:**

Our reading materials provided suggest that water is removed at the compressor stations.

1. What are the disposal methods with the liquid waste extricated from the pipe?
2. What are the procedures used for the extrication?
3. How often does this procedure take place?
4. Do you notify the town, district or land owner when you perform the pigging operations?

**Water bodies construction crossings, drinking water impacts:**

The DFD needs reassurance that our drinking water will be protected. We specifically need diligent environmental protection at the following locations in Dalton, Hinsdale, Peru and Windsor.

<b>Mile post #</b>	<b>Area Affected</b>
9.7 - 11.3	Anthony and Egypt Watershed, Surface Water Protection Areas, Zone C
9.8 - 10.4	Anthony Brook headwaters, Water Supply for Dalton
10.9 - 11.1	Egypt Brook Headwaters, Water Supply for Dalton
11.0 - 11.3	Close proximity to Egypt Reservoir
12.3	Wahconah Falls Well Head
13.0	Close proximity to Windsor Reservoir Watershed
13.5 - 13.6	Aqueduct that feeds water to Cleveland Reservoir from Cady Brook & the East Branch of the Housatonic River
13.5 - 14.2	Cleveland Reservoir Watershed within 1/4 mile of the Buffer Zone
15.0 - 15.1	Cady Brook Zone A Protection Area, Water Supply for Dalton & Pittsfield
14.3 - 16.7	Windsor Reservoir Watershed Protection Area, Zone C

1. What are the specific procedures you will use on DFD land, watershed, and water crossings? (i.e. reservoirs, streams)
2. How would you prevent contamination to our watershed and streams from trench dewatering?
3. How would you handle an oil or fuel spill from a construction vehicle?
4. What herbicides, if any, will be used and how will that directly affect the drinking water supplies?

Before the gas pipeline is placed into service, it is pressure tested with water. The migration of water along the pipeline in this testing phase may contain invasive or foreign water borne flora and fauna.

1. What prevention measures will be put into place to prevent drinking watersheds contamination from this?
2. Where does the water come from to perform the testing?
3. What chemical contaminants will be in the water to be discharged?
4. How is that water discharged?
5. Where is that water discharged?
6. How would you prevent contamination from ROW runoff before vegetation is established?
5. How would you remediate in the event of water supply contamination?
6. What are your restoration measures?
7. What is your post construction monitoring of re-vegetated areas?

The DFD would request that a truck washing station be implemented to prevent the introduction or spreading of invasive species and vegetation between work sites. We request that no blow off, compressor, meter or pig stations be allowed on District lands. Provide the DFD with funding to hire on-site Environmental Engineer and Construction Inspector, with DFDs approval of choice, to be on all work sites on DFD lands to ensure proper procedures are followed. The DFD would ask that testing is completed to establish baselines for water quality and existing flow rate in the Windsor, Egypt and Cleveland Reservoirs, the headwalls on Anthony Brook and Cady Brook and the Wahconah Falls Well. The DFD would require that continued water quality monitoring be established to assess contaminants associated with the pipeline construction and operation every 6 months. Clearly lay out the ongoing inspection protocols for the pipeline once in operation. Define the frequency of internal inspection for corrosion or the damage to the pipeline.

**Blasting:**

Before blasting begins a permit must be issued by our fire chief to ensure Massachusetts General Laws are being followed. We prohibit the use of explosives containing per chlorate. The DFD will also prohibit storage of explosives on DFD lands. We also require that we be notified of the blasting days and times. During construction, analyze the impact of blasting necessary to remove rock. Determine the area of potential concern regarding rock throw and seismic impacts due to blasting activities. Determine the impact of construction activities, particularly on reservoir dams and the condition of the infrastructure given the age and condition of the water mains and aqueduct.

1. What are the specific blasting techniques used on district land?
2. What chemicals will TGP be using in the blasting on our land?
3. What land and water contamination prevention measures will be put into place?
4. How will TGP guarantee that blasting won't impact wells, the dam, streams and springs that feed the reservoirs - structurally or via underground movement? It is important to be aware that we have substantial frost here which moves the ground/ damage may not be immediately evident.
5. What are the safety and security measures for transporting and storage of construction explosives in Dalton?
6. Will security be provided during construction for the explosives and construction?

**Fire Department:**

Initially, there are concerns for safety during the construction phase. The DFD needs access for all emergency vehicles on the construction sites. We would ask the TGP conduct a full assessment of the training, equipment and supplies needed for emergency response to incidents involving the Northeast Energy Direct (NED) Project, during construction or continued operations, as part of the NEPA process and that all impacted emergency responders have the capacity to respond appropriately to pipeline related incidents. The DFD is a volunteer fire department with both fire fighters and EMS personnel. Our average response times

are 3 - 8 minutes depending on the location to the call from the fire station and the location of our volunteers when the call comes in. Our equipment inventory includes: 3 pumpers, 1 ambulance, and 2 old military vehicles converted for use on brush fires. The DFD respectfully requests no blow off, meter, compressor or pig stations are allowed on DFD lands.

1. The DFD does not have a safety vehicle to handle emergencies in this kind of project. We will need to acquire a safety vehicle to perform medical and fire rescues. Are there funds available from TGP for this?
2. All construction roads need to be properly maintained at all times. Is there security for this?
3. Where will the pipeline shutoff valves in and nearest to Dalton be located?
4. How will the shut off valves be marked?
5. Who can shut off the gas once a leak is found?
6. How long will it take for TGP operators to access and shut off these valves in our area?
7. What is the "Standard Operating Procedure" to shut off the gas in an emergency?
8. What response measures are to be taken?
9. What is the wildfire impacts from the clearing associated with the construction?
10. Provide the fire department with a list of hazardous materials which will be present during construction. Provide training to them on appropriate responses to incidents involving those hazardous materials; provide additional material or equipment necessary for the fire department to safely respond.

#### **DFD Timber stands:**

The DFD would like one rotation of timber for regeneration and growth. We need access to our forest lands. We want an access road running parallel with the pipeline with marked crossing points every 1/4 mile. At the crossing points, the pipeline needs to be buried deeper or protected for heavy equipment.

1. How would the pipeline address access for forest cutting equipment on DFD lands?
2. How will the access points be marked?
3. Can the DFD limit the amount of land to be cleared?
4. How would the loss of future income be addressed?
5. What is the weight that the crossing will handle without damage to the pipe?

Due to the substantial concerns we have for the safety of our drinking water and surrounding watersheds, as well as for issues related to the pipeline crossing in the vicinity of Route 9 and populated areas of town, we have recommended an alternate route through Dalton, which will negate a majority of the concerns we have with the current pipeline route, and connect back to the route proposed for Windsor. It is as follows:

At coordinates 42 degrees 30' 45.94"N, 73 degrees 09' 14.61"W the pipeline will turn Northeast for 3.1 miles to coordinates 42 degrees 32' 19.48"N, 73 degrees 06' 17.93"W. At this point the pipeline will turn East for 3.1 miles to coordinates 42 degrees 32' 16.00"N, 73 degrees 02' 36.36"W and turn again heading Southeast for 3.32 miles to coordinates 42 degrees 29' 52.17"N, 73 degrees 00' 24.04"W. This will bring the alternate route back to the proposed pipeline in Windsor without the need to cross the watershed or Route 9, Wahconah Falls Brook and the headwaters of the Westfield River.

Again, this alternate route avoids our watershed, populated areas of town, 2 major road crossings, an Interim Wellhead Protection Area, Massachusetts Biomap 2 Critical Natural Landscape, Natural Heritage & Endangered Species Program Priority and Estimated Habitats, the Wahconah Falls Brook, farm land and privately owned timber lots. Furthermore, out of the 7.2 miles of proposed for Dalton's pipeline layout, at least 4.2 miles will have a direct impact on our watershed - all of which will be avoided with the alternate route, which is also entirely within State (and possible Federal) owned property with some privately owned land. Respectfully,

Transmission Water Main to Town of Dalton. Vintage 1930's, Egypt Brook Culvert on Reservoir Road, Sewer Mains / Culverts, Size and Numbers Unknown. Town Roadways to Power lines
5. Old abandoned 4" C.I. water main from Duncan Brook Headwall, into Dicken Crane's field, Mile Marker 12.1. This line may still be holding water. Vintage 1890's.
6. Chalet Rd / Duncan Brook Road, 1 1/2" plastic water main, Vintage 1988. Mile Maker 12.14.
7. Route 9 crossing Mile Maker 12.22. Two water mains 1) 4" D.I. water main, part of Wahconah Falls Distribution System, Vintage 1988. 2) 10" C.I. water main, part of the Windsor Dam Reservoir Raw Water Transmission Main to Filter Plant, Vintage 1890's to 1900's.
8. Wahconah Falls Brook crossing. Mile Maker 12.4.
9. Adams Road crossing. No Water Mains. Mile Maker 13.01.
10. Old Windsor Rd crossing. No Water Mains. There is a sewer Line, Size Unknown. Mile Marker 13.5.
11. East Branch Housatonic / Cady Brook 6' ft Cement Aqueduct Transmission Main to the Cleveland Reservoir. Mile Marker 13.66.
12. Hinsdale Road into Eversource Electric Sub Station. Mile Maker 14.7.
13. Dirt Road off August Smith Road to Nobody's Road into Power Lines. Mile Maker 15.6.
14. Peru Road into Power Lines. Unknown Utilities. This entrance leads to the top side of the Windsor Reservoir Water Shed. Mile Make 17.2.
15. Side Note there are two side roadways into the Power Lines coming from Old Windsor Road. Roadways are Hinsdale Road. Mile Maker 14.8. The other is Crane Road. Mile Maker 15.6. Both these roadways transverse thru the Windsor Reservoir Water Shed.
16. Side Note: There may be numerous Culverts that are Unknown on the entire Pipeline Route from Mile Maker 9.5 - 17.

### 20150820-5092

Michael DeMarco, Troy, NH.

Dear FERC

I'm sending this note to PLEASE do not allow the pipeline in Troy.

Where I live I would not have access to water, we do not have hydrants near us.

Looking at Kinder Morgan's past records is a good reason to prevent them here.

They have so many violations, accidents, even deaths on record. We moved here to be away from city dwelling and to relax in nature. Our politicians will do any

thing for bigger money, and KM must know it, since KM has already started some

work at the end of my driveway. What reason for this if they don't already have your permission. Did you tell them to go ahead already.

Please think of what you are going to let happen to our Town, accidents we don't have aid for , eco damage, value damages, loss of nature, landscapes, wildlife, peace.

ALL SO KINDER MORGAN CAN MAKE A TON OF MONEY, AT OUR EXPENSE.

PLEASE VOTE NO TO THE PROPOSED PIPELINE,

SINCERELY

Mike DeMarco

**20150820-5119**

David F Fleming, JR, Nassau, NY.

The information presented for the PF14-22 includes statements that the pipeline project would include the Tsatsawassa/Tackawasick Creek and the Valatie Kill as sources for hydrostatic test water. These statements are outrageous.

The Tsatsawassa/Tackawasick is a protected aquifer and trout stream serving hundreds of households. Additionally, the Valatie Kill is a trout stream that is also contaminated from discharge by the Dewey Loeffel Toxic Landfill Federal Superfund site. The use of water from the Valatie Kill has the significant potential of contaminating even larger areas of surrounding towns.

Additionally, please note both of these creeks are impacted by the seasons and at this time are barely moving due to summer rainfall. Removing water from these watersheds would dramatically impact wildlife, aquatic habitat and human health.

David Fleming, Jr., Supervisor  
Town of Nassau

Washington, DC20426

RE: TOWN OF DALTON, MASSACHUSETTS - PIPELINE CONCERNS

Dear Ms. Bose,

Due to the pending Tennessee Gas Pipeline proposal for our area in western Massachusetts, we have tried to put together a list of our concerns, questions & requests for you - based on the very limited & vague information that has been provided by Kinder Morgan. We sincerely hope that FERC will review this document with the utmost consideration for the situations we face regarding the proposed pipeline here.

-----  
TENNESSEE GAS PIPELINE CONCERNS:

\* It should be noted that several of the concerns and comments listed below fall within more than one cat-

egory; however for the purposes of brevity, we have not repeated them.

**A. POSSIBLE DRINKING WATER IMPACTS:**The majority of the pipeline runs through our watershed, and next to a 'Public Water Supply Well' (AKA:Interim Wellhead Protection Area), which serves approximately 50,000 people, including businesses and industry. We have two watersheds: the Egypt and Anthony is in Dalton and the Windsor/Cleveland, extends from Dalton into Hinsdale, Windsor and Peru. The Cleveland, Windsor and Egypt reservoirs, along with the Anthony Brook Headwall and Cady Brook Headwall, are the primary and the emergency backup drinking water supplies for Dalton. The Cleveland reservoir and Cady Brook Headwall also serves the City of Pittsfield, Town of Richmond, Town of Lanesborough and Town of Lenox. All of the reservoirs and filter plant are fed by streams and underground springs. Some of these streams cross the corridor in which the pipeline will be installed and the construction of the pipeline will directly impact these water sources. We have significant concerns regarding the potential for unreasonable risk posed to human and environmental health.

We are the only location in the State where the pipeline is proposed to run within Zone A of a Municipal Well. As previously stated, our water supply serves easily 50,000 people, which includes a Federal government contracted facility that makes the paper our currency is printed on. That business depends upon our water to make the paper, and that is only one large business which our water service is an integral part.

Based on the need to protect our drinking water supply, and the unknown chemicals used during construction & contained within the pipeline during its lifetime, construction variables and long term potential for pipeline leaks associated with the pipeline, we feel that the following need to be addressed:

1. What will be the chemical compounds coming into Dalton related to the pipeline & what is their chemical makeup?
2. Pipeline construction and maintenance effects on the surface and underground. Post-construction water runoff characteristics will inevitably be different from preconstruction conditions. Land contours will be different. Vegetation, water retention capacity and the concentration of precipitation runoff will all change to some extent. While some changes may be benign, others may pose problems. There will be increased runoff during storm events due to the creation and maintenance of more cleared land closely associated the reservoir
  - i. What will be the effects of the flow of water into these reservoirs (introduction of new & unknown water into our drinking water)?
  - ii. What will be the effect of construction-related soil compaction to the flow of water into these reservoirs (including the underground springs that feed the reservoirs ).
  - iii. How will Kinder Morgan, or their relevant subsidiaries, determine the likely impact of runoff changes on our drinking water supply (including those that are not immediately evident)?
  - iv. What Measures will be taken to insure that there will be no contamination due to erosion or possible petroleum leaks from construction equipment?
  - v. How will adverse changes be mitigated?
  - vi. There are significant concerns related to a potential use of herbicides in any location where they would negatively affect our drinking water.
3. The presence of a buried 30-36/1 diameter pipeline could divert water flowing into the reservoirs. This impact should be assessed.
4. We understand that a tremendous amount of pigmented water is used to test the pipe for leaks, prior to use.
  - i. What is the chemical composition of the pigment?
  - ii. Where will they get all of that water?
  - iii. How is it discharged?

- iv. Where will it be discharged?
- v. What chemicals might it have accumulated from inside of the pipe (solder, ..)?
- vi. Will it be re-used?

5. **Leaks:** Chemicals contained in the pipeline and leaks from construction equipment, such as hydraulic fluid, could potentially migrate into drinking water.

- i. What are the effects of the chemical compounds to humans, fish and correlated organisms?
- ii. How often will they monitor the water to ensure there are no leaks?
- iii. How will they remediate in the event of water supply contamination?

6. **Blasting:** the flow and quality of water entering the reservoirs and wells could be compromised by cracks and fissures created by explosive blasting needed for pipeline construction.

- i. Blasting combustion by-products, including perchlorate, must be prevented from entering ground and surface waters that feed these two drinking water reservoirs and the water table that serves private wells.
- ii. How will Kinder Morgan guarantee that blasting won't impact wells, the dam, streams and springs that feed the reservoirs - structurally or via underground movement? It is important to be aware that we have substantial frost here which moves the ground; damage may not be immediately evident.

### 7. Current Requirements:

- i. Independent 3rd party supervision for erosion control assurance.
- ii. Test and establish baselines for existing flow rate and water quality in these two reservoirs and municipal wells.
- iii. Continued water quality monitoring to assess contaminants associated with the pipeline construction and operation.
- iv. Our local Stormwater Commission regulates discharges per EPA regulations (see Addendum A), so any fluid based discharges will require their review prior to being released.
- v. Said fluid discharges may require treatment prior to contact with the ground if we find threat of environmental or drinking water contamination.
- vi. The list of concerns from our Board of Health (Addendum D).

**Recommendation:** Due to the substantial concerns we have for the safety of our drinking water and surrounding watersheds, as well as for issues related to the pipeline crossing in the vicinity of Route 9 and populated areas of town, we have recommended an alternate route through Dalton, which will lessen the many concerns we have with the current pipeline route, and connect back to the route proposed for Windsor. It is as follows:

At coordinates 42Q 30' 4S.94/1N, 73Q 09' 14.61"W the pipeline will turn Northeast for 3.1 Miles to coordinates 42Q 32' 19.48" N, 73Q 06' 17.93"W. at this point the pipeline will turn East for 3.1 Miles to coordinates 42Q 32' 16.00"N, 73Q 02' 36.36" Wand turn again heading Southeast for 3.32 Miles to coordinates 42Q 29' S2.17"N, 73Q 00' 24.04" W. This will bring the alternate route back to the proposed pipeline in Windsor without the need to cross the watershed or Route 9

Again, this alternate route avoids our watershed, populated areas of town, road crossings, an Interim Well-head Protection Area, Massachusetts Biomap2 Critical Natural Landscape, Natural Heritage & Endangered Species Program Priority and Estimated Habitats. the Housatonic River. farmland & privately owned timber lots. Furthermore, out of 34 Pipeline Mileposts proposed for the Dalton Pipeline layout, at least 14 will have a direct impact on our watershed - all of which will be avoided with the alternate route, which is also entirely within State (and possibly Federal) owned property; there will be no private landowners involved.

**B. ECOLOGICAL AND AGRICULTURAL IMPACTS:** Construction and operational impacts on environmentally sensitive lands including the Housatonic River, farms and forests is of substantial concern.

**ECOLOGICAL:** Virtually all of the project area is within Massachusetts Biomap2 Core Habitat which is “designed to guide strategic biodiversity conservation in Massachusetts over the next decade by focusing land protection and stewardship on the areas that are most critical for ensuring the long-term persistence of rare and other native species and their habitats, exemplary natural communities, and a diversity of ecosystems. BioMap2 is also designed to include the habitats and species of conservation concern identified in the State Wildlife Action Plan.” It is land that is “key to conserving our state’s biodiversity.” Core Habitat includes:

- \* Habitats for rare, vulnerable, or uncommon mammal, bird, reptile, amphibian, fish, invertebrate, and plant species
- \* Priority Natural Communities
- \* High quality wetland, vernal pool and aquatic habitats
- \* Intact forest ecosystems

./ A substantial portion of the project area is located within Biomap2 Critical Natural Landscape. Critical Natural Landscape includes:

- \* The largest Landscape Blocks in each of 8 ecoregions
- \* Adjacent uplands that buffer wetland, aquatic, and coastal habitats

./ The project area runs through Natural Heritage & Endangered Species Program Priority and Estimated Habitats.

\* Priority Habitat is based on “the known geographical extent of habitat for all state-listed rare species, both plants and animals, and is codified under the Massachusetts Endangered Species Act (MESA). Habitat alteration within Priority Habitats may result in a take of a state-listed species, and is subject to regulatory review by the Natural Heritage & Endangered Species Program.”

\* Estimated Habitats are “a sub-set of the Priority Habitats, and are based on the geographical extent of habitat of state-listed rare wetlands wildlife and is codified under the Wetlands Protection Act (WPA) .../1. State-listed wetland wildlife species are protected under the Massachusetts Endangered Species Act as well as the Wetlands Protection Act.

./ A portion of the project area also runs through The Upper Housatonic Valley National Heritage Area (a Federal designation), which exists in partnership with the National Park Service to illuminate the diverse, rich identity of the Upper Housatonic River Valley region and to preserve and promote its historical, cultural and natural resources.”

### **Current Requirements:**

1. A complete Environmental Impact Study must be done by a third party in order to assess the existing environmental species and habitats, and document the impact of the pipeline installment on those ecological areas, including its long term presence.

### **HOUSATONIC RIVER:**

1. The proposed route crosses streams that flow into the Housatonic River. Soil in these areas may contain hazardous chemicals from mill operations dating back as many as 200 years.

- i. Kinder Morgan should determine whether contaminants in the soil will be disturbed during pipeline construction and migrate into the streams.
- ii. Testing for baseline should be done beforehand.

2. The EPA has already determined we have a high level of phosphorus in the river. Will this project in any way this exacerbate that? If so, how will that be remediated?

### **General:**

1. Explosive combustion by-products must be prevented from entering creeks and streams down-

stream of the reservoirs, as well as the Housatonic River.

2. If there is a slow gas leak, how many cubic feet of gas will escape before a leak is detected?
3. What safeguards will be used to ID leaks and how will they be capped?
4. What are the long term effects to the soil in the event of a spill?
5. What will be the pipeline construction and maintenance effects on the multiple streams, wetlands and important wildlife habitats in our town? Remember: Postconstruction water runoff characteristics will inevitably be different from preconstruction conditions. Land contours will be different. Vegetation, water retention capacity and the concentration of precipitation runoff will all change to some extent. There will be increased runoff during storm events due to the creation and maintenance of more cleared land closely associated with these environmentally fragile areas.
6. Will herbicides be used at all during any phase of the construction or maintenance?
  - If so, what types and what are their short and long term effects to the environment?
7. What are the wildfire impacts from the clearing associated with the construction?

#### **FARM & FOREST:**

1. How will this project affect people's timber rights (= income)? This includes the clearing of trees within the ROW for the pipeline and the loss of income from the perpetual clearing of that land.
2. Farmland and timber producing forestland will be bisected by the pipeline and will require the ability to drive over the pipeline for access. What is the maximum equipment weight, speed and angle that is safe to drive over the pipeline?
3. We have been informed that the pipeline will be buried deeper in areas requiring access by heavy equipment; however how would a farmer or logger know today what locations they will need access to in the future?

**C. AIR QUALITY IMPACTS:** We are concerned about air quality impacts associated with the construction and operation of the pipeline.

1. Where are all of the locations along the pipeline within 10 miles of Dalton where gas will be released under normal operation?
2. Identify the locations where the compressor and pigging station are to be sited around Dalton.
3. Identify the metering sites.
4. Given that gasses are released during compressor station blow-off and may settle into low-lying areas, especially during certain climate conditions, and that Dalton lies downhill from Windsor along the Route 9 corridor, what plans exist to mitigate the migrations of these blow-off gasses?
5. During normal operation, what is the total volume and composition of gas (in cubic feet when measured at 70 F and 1 atmosphere) that is expected to be released in Dalton in one year?
6. What is the product & its chemical makeup of the additive that is scented so as to be able to smell if the pipe leaks?
  - i. What is the effect of that additive on people & animals?
7. The list of concerns from our Board of Health (Addendum D).
8. Will there be any other valves in Dalton other than the one Main Line Ball Valve to be located at milepost 12.02 (approximately 200 yards north of Route 9 on Chalet Rd.), which we learned about from the KIM, TGP July Resource Report?
9. We understand that the one valve we are aware of will be manually and remotely operated, which is good. What is the process for Kinder Morgan operators to shut off these valves?
10. As this valve is supposedly a Remote Blowoff. what exactly will occur in such an event, and what will be the public safety & environmental impacts of it remotely blowing off if access cannot be gained

(i.e.- during heavy winter snows or ice)?

**D. PUBLIC SAFETY IMPACTS:** In the event of a major pipeline failure (major leak, explosion, fire):

1. What are the means to maintain access & function during severe winters, heavy winter snows, deep frost & spring mud seasons?
2. There is one major route through town - if Route 9, (which you plan on crossing with the pipeline) gets cut off for ANY reason, we have no way to get through.
3. What are the contingency plans for alternate routes and detours in case of an emergency?
4. The pipeline runs near the electrical power lines for Dalton, and may run directly underneath the power lines.  
- What are the plans to protect against loss of power and to see that Dalton retains electrical power during construction, and in the event of an accident?
5. What are the safety and security measures for transporting and storage of construction explosives in Dalton?
6. Security during construction - who provides & what is provided?
7. Should portions of the pipeline be fenced in at certain areas?
8. How will our small-town fire department be assisted by Kinder Morgan personnel?
9. The cost of any emergency response related to the construction, maintenance, or failure of the pipeline cannot be borne by the Town.
10. Our Emergency Responders will need a means to access the route, which is mostly located in forests & on steep slopes near high tension lines. Access will be needed during construction & into the neighboring town of Windsor as well, since we will likely be the responding party.
11. We are lacking in forestry equipment for Emergency Responses.
12. The list of concerns from our Board of Health (Addendum D).

**E. ROAD AND TRAFFIC IMPACTS:** We are concerned about damage to roads, overpasses, bridges, and associated “staging areas” due to heavy equipment use during pipeline construction and operation (\* See attached Comments from our Highway Superintendent, in Addendum B).

1. Will Kinder Morgan post bonds against damage caused by the heavy loads of pipe, earth moving equipment, and associated construction material and equipment?
2. How will Kinder Morgan determine the likely impact of runoff changes on public roads (including those that are not immediately evident) and how will adverse changes be mitigated? (Remember: Post-construction water runoff characteristics will inevitably be different from pre-construction conditions. Land contours will be different. Vegetation, water retention capacity and the concentration of precipitation runoff will all change to some extent. While some changes may be benign, others may pose problems).
3. Third party excavation activity is the most common cause of pipeline failures. Roads that cross the pipeline are areas where excavation activities are more likely to occur and cause damage to the pipeline. What steps will Kinder Morgan take to lessen the chance of third party activity damaging the pipeline? Particularly and including decades from now.

**Current Requirements:**

1. The roads affected by the construction shall be rebuilt at the expense of Kinder Morgan.

**F. RECREATIONAL AND AESTHETIC IMPACTS:** One of Dalton’s greatest assets is its character-its “look and feel/-as a historic, beautiful, small New England town with rich natural, recreational, and agricultural resources within its borders and in the surrounding towns. We are concerned that the construction, operation and maintenance of a major high-pressure gas pipeline through the Town and neighboring towns,

will adversely impact these characteristics. Roughly half of the route through Dalton will be within the area we have protected through a by-law as a Scenic Mountain region.

1. The clear-cutting required by the construction and maintenance of this pipeline violates the Scenic Mountain Bylaw. (See Addendum C).
2. Please show us the visual impact that the construction and maintenance of the pipeline will have throughout Dalton, including the following areas:
  - The East Branch of the Housatonic River
  - Wahconah State Park
  - Holiday Brook Farm
  - The Wahconah Country Club
  - Forested areas and trails around the Cleveland and Egypt Reservoirs
  - Mountain views
3. What is the risk of a safety issue for ATV's & 4-wheeler's that create deep mud bogs in the woods.

#### **G. HISTORICAL STRUCTURE IMPACTS**

1. Milepost 12.2 is very close to our historic North Street Pump house. How will this structure be protected during construction of the pipeline?
2. There are many historic stone walls in the location of the proposed pipeline through Dalton. How will they be protected during the construction of the pipeline? They are a part of the historic fabric of our community & New England history.

#### **H. ECONOMIC IMPACTS:** How will Kinder Morgan address the following issues?

1. Decreased property values, in a town whose largest employer is divesting and has significantly downsized.
2. Loss of forestry income (residents, local businesses such as Holiday Farm, Town Forest, Fire District lands in Dalton, Hinsdale, Windsor & Peru).
3. Loss of business due to traffic congestion during pipeline construction.
4. Public safety cost during construction due to known protesting, or other related issues.
5. Dalton is the home of Crane & Company. They have a Federal contract to make the paper that our currency is printed on & they depend on our water to do so. ANY disruption or contamination of our water would have serious consequences for their production.
6. Please explain the legality of a public company (Kinder Morgan) to use Eminent Domain for their personal benefit?

#### **SUMMARY:**

What are the plans for the end of the pipeline's lifetime? Will the pipeline be replaced, updated or removed?

**Please remember: the alternate route** we have recommended would be the best Kinder- Morgan Tennessee Gas Pipeline option for Dalton. However, an even better solution for not only our town, but for the state of Massachusetts as a whole, is the Algonquin Incremental Market Project (AIM). If Massachusetts truly needs an additional natural gas supply, this alternate to Kinder Morgan's Tennessee Gas Pipeline is preferred. AIM would not even pass through the many of the towns that the Kinder Morgan Pipeline proposes to. Furthermore, the AIM pipeline would only be 10 inches in diameter (versus the 30-36 inch Tennessee Gas Pipeline which allows for the underground storage of large volumes of gas; the equivalent of several million cubic feet of gas under Dalton, at 1 atmosphere and 70F).

Sincerely

John W. Bartels, Jr., Chairman

Robert W. Bishop, Jr.

-----  
**Addendum A**  
**Chapter 280 of the Dalton General Code:**  
**Stormwater Management and Erosion Control**

**1.0 PURPOSE**

Regulation of discharges to the municipal separate storm sewer system (MS4) is necessary for the protection of Dalton's water bodies and groundwater, and to safeguard the public health, safety, welfare and the environment. Increased and contaminated stormwater runoff associated with developed land uses and the accompanying increase in impervious surface are major causes of impairment of water quality and flow in lakes, ponds, streams, rivers, wetlands and groundwater.

Increased volumes of stormwater, contaminated stormwater runoff from impervious surfaces, and soil erosion and sedimentation are major causes of:

- 1) impairment of water quality and decreased flow in lakes, ponds, streams, rivers, wetlands and groundwater;
- 2) contamination of drinking water supplies;
- 3) erosion of stream channels;
- 4) alteration or destruction of aquatic and wildlife habitat;
- 5) flooding; and,
- 6) overloading or clogging of municipal catch basins and storm drainage systems.

The United States Environmental Protection Agency has identified sedimentation from land disturbance activities and polluted stormwater runoff from land development and redevelopment as major sources of water pollution, impacting drinking water supplies, natural habitats, and recreational resources. Regulation of activities that result in the disturbance of land and the creation of stormwater runoff is necessary for the protection of the Town of Dalton's water bodies and groundwater resources, to safeguard the health, safety, and welfare of the general public and protect the natural resources of the Town. Therefore, this bylaw establishes stormwater management standards for the temporary and final conditions that result from development and redevelopment projects to minimize adverse impacts offsite and downstream which would be born by abutters, townspeople and the general public.

The objectives of this Bylaw are to:

- 1) Protect ground water and surface water to prevent degradation of drinking water supply
- 2) Require practices that eliminate soil erosion and sedimentation and control the volume and rate of stormwater runoff resulting from land disturbing activities;
- 3) Promote infiltration and the recharge of groundwater;
- 4) Ensure that soil erosion and sedimentation control measures and stormwater runoff control practices are incorporated into the site planning and design process and are implemented and maintained;
- 5) Require practices to control waste such as discarded building materials, concrete truck washout, chemicals, litter, and sanitary waste at a construction site that may cause adverse impacts to water quality;
- 6) To prevent pollutants from entering the Dalton municipal separate storm sewer system (MS4) and to minimize discharge of pollutants from the MS4;
- 7) To ensure adequate long-term operation and maintenance of structural stormwater best management practices so that storm water structures work as designed;

- 8) Comply with state and federal statutes and regulations relating to stormwater discharges; and
- 9) Establish Dalton's legal authority to ensure compliance with the provisions of this by-law through inspection, monitoring, and enforcement.

## **2.0 DEFINITIONS**

The following definitions shall apply in the interpretation and implementation of this bylaw.

**ABUTTER:** The owner(s) of land abutting the activity.

**APPLICANT:** Any person, individual, partnership, association, firm, company, corporation, trust, authority, agency, department, or political subdivision, of the Commonwealth or the Federal government to the extent permitted by law requesting a soil erosion and sediment control permit for proposed land-disturbance activity.

**AUTHORITY:** The Dalton Stormwater Management Commission or its authorized agent(s) are responsible for coordinating the review, approval and permit process as defined in this Regulation. Other Boards and/or departments of the Town of Dalton, including (but not limited to) the Conservation Commission, Board of Health, and Highway Department, may participate in the review process as defined herein.

**BEST MANAGEMENT PRACTICES:** Structural, non-structural, and managerial techniques that are recognized to be the most effective and practical means to prevent and reduce nonpoint sources of pollution.

**CLEARING:** Removal or causing to be removed, through either direct or indirect actions, trees, shrubs, or topsoil from a site, or any material change in the use or appearance of the land. Actions considered to be clearing include, but are not limited to: causing irreversible damage to roots or trunks; destroying the structural integrity of vegetation; or any filling, excavation, grading, or trenching in the root area of a tree which causes irreversible damage.

**DETERMINATION:** A written finding by the Stormwater Management Commission as to whether a site or the work proposed thereon is subject to the jurisdiction of the Stormwater Management and Erosion Control Bylaw of the Town of Dalton.

**DETERMINATION OF SIGNIFICANCE:** A written finding by the Stormwater Management Commission that the area on which the proposed work is to be done, or which the proposed work will alter, is significant to one or more of the interests identified in the Stormwater Management and Erosion Control Bylaw of the Town of Dalton.

**DEVELOPMENT:** The modification of land to accommodate a new use, revised use, or expansion of use, usually involving construction.

**DISTURBANCE OF LAND:** Any action that causes a change in the position, location, or arrangement of soil, sand, rock, gravel or similar earth material.

**EROSION:** The wearing away of the land surface by natural or artificial forces such as wind, water, ice, gravity, or vehicle traffic and the subsequent detachment and transportation of soil particles.

**EROSION AND SEDIMENTATION CONTROL PLAN:** A document containing narrative, drawings and details developed by a qualified professional engineer (PE) or a Certified Professional in Erosion and Sedimentation Control (CPESC), which includes best management practices, or equivalent measures designed to control surface runoff, erosion and sedimentation during pre-construction and construction related land disturbing activity activities.

**GRADING:** Changing the level or shape of the ground surface.

**IMPERVIOUS SURFACE:** Land covering, such as concrete or asphalt, that does not allow water to pass through it into the ground.

**LAND-DISTURBING ACTIVITY:** Any activity that causes a change in the position or location of soil, sand, rock, gravel, or similar earth material and meets or exceeds 43,560 square feet, or 200 square feet of land disturbance on existing or proposed slopes greater than or equal to 15 percent.

**LAND DISTURBANCE PERMIT:** A permit issued by the Stormwater Management Commission, after review of an application, plans, calculations, and other supporting documents, which is designed to protect the environment of the Town from the deleterious affects of increased volumes of stormwater, contaminated stormwater runoff from impervious surfaces, and soil erosion and sedimentation.

**MASSACHUSETTS STORMWATER MANAGEMENT POLICY:** The Policy issued by the Department of Environmental Protection, and as amended, that coordinates the requirements prescribed by state regulations promulgated under the authority of the Massachusetts Wetlands Protection Act G.L. c. 131 § 40 and Massachusetts Clean Waters Act G.L. c. 21, §. 23-56. The Policy addresses stormwater impacts through implementation of performance standards to reduce or prevent pollutants from reaching water bodies and control the quantity of runoff from a site.

**MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4):** Any pipe, ditch or gully, or system of pipes, ditches, or gullies, that is owned or operated by a governmental entity and used for collecting and conveying storm water.

**NOTIFICATION OF NON-SIGNIFICANCE:** A written finding by the Stormwater Management Commission that the area on which the proposed work is to be done, or which the proposed work will alter, is not significant to any of the interests of the Stormwater Management and Erosion Control Bylaw of the Town of Dalton.

**ONE HUNDRED YEARFLOODPLAIN:** An area delineated under the Federal Emergency Management Act (FEMA) indicating the extent of flooding as a result of a 100 year flood.

**OPERATION AND MAINTENANCE PLAN:** A plan setting up the functional, financial and organizational mechanisms for the ongoing operation and maintenance of a stormwater management system to insure that it continues to function as designed.

**OWNER:** A person with a legal or equitable interest in property.

**PERMEABILITY:** The property or condition of being permeable; especially having pores or openings that permit liquids or gases to pass through.

**PERSON:** An individual, partnership, aSSOCIatION, firm, company, trust, corporation, agency, authority, department or political subdivision of the Commonwealth or the federal government, to the extent permitted by law, and any officer, employee, or agent of such person.

**PRE-CONSTRUCTION:** All activity in preparation for construction.

**REDEVELOPMENT:** Any development, construction, alteration, rehabilitation, improvement expansion, demolition or phased projects that meets or exceeds 200 square feet of land disturbance on existing or proposed slopes equal to or greater than 15 % and where the existing land has been subject to previous development or that meets or exceeds 43,560 square feet and where the existing land has been subject to previous development.

**RUNOFF:** Rainfall, snowmelt, or irrigation water flowing over the ground surface.

**SEDIMENT:** Mineral or organic soil material that is transported by wind or water, from its origin to another location; the product of erosion processes.

**SEDIMENTATION:** The process or act of deposition of sediment.

**SITE:** Any lot or parcel of land or area of property where land-disturbing activities are, were, or will be performed.

**SLOPE:** The incline of a ground surface expressed as a ratio of horizontal distance to vertical distance e.g. twenty (20) percent.

**SOIL:** Any earth, sand, rock, gravel, clay or similar material.

**STORMWATER:** Storm water runoff, snow melt runoff, and surface water runoff and drainage.

**STORMWATER MANAGEMENT PLAN:** A plan showing existing and proposed features on a site. This is

required as part of the application for a Land Disturbance Permit.

**WETLANDS:** Areas characterized by saturated or nearly saturated soils most of the year that are located between terrestrial (land-based) and aquatic (water-based) environments. including freshwater marshes around ponds and channels (rivers and streams), common names include marshes, swamps and bogs.

### **3.0 AUTHORITY**

This bylaw is adopted under authority granted by the Home Rule Amendment of the Massachusetts Constitution, the Home Rule statutes, and pursuant to the regulations of the Federal Clean Water Act found at 40 CFR 122.34

### **4.0 APPLICABILITY**

This Bylaw shall apply to all land-disturbing activities within the jurisdiction of the Town of Dalton. Except as permitted by the Stormwater Management Commission in a Land Disturbance Permit or as otherwise provided in this Bylaw, no person shall perform any activity that results in land disturbance as detailed in Section 4A.

#### **A. Regulated Activities**

Regulated activities shall include, but not be limited to:

- 1) Land disturbance equal to or greater than 43,560 square feet, associated with construction or reconstruction of structures;
- 2) Development or redevelopment involving multiple separate activities in discontinuous locations or on different schedules if the activities are part of a larger common plan of development that all together disturbs 43,560 square feet or more of land;
- 3) Paving or other change in surface material over an area of 43,560 square feet or more causing a significant reduction of permeability or increase in runoff;
- 4) Construction of a new drainage system or alteration of an existing drainage system or conveyance serving a drainage area of more than 43,560 square feet;
- 5) Any other activity altering the surface of an area equal to or greater than 43,560 square feet that will, or may, result in increased stormwater runoff flowing from the property into a public way or the municipal storm drain system; OR
- 6) Land disturbance where there is a 15% or greater slope and where the land disturbance is greater than or equal to 200 square feet within the sloped area.

#### **B. Exempt Activities**

The following activities are exempt from the requirements of this Bylaw:

- 1) Normal maintenance and improvement of land in agricultural use as defined by the Wetlands Protection Act regulation 310 CMR 10.04;
- 2) Maintenance of existing landscaping, gardens or lawn areas associated with a single family dwelling;
- 3) The construction of fencing that will not substantially alter existing terrain or drainage patterns;
- 4) Land disturbance activities that are wholly subject to jurisdiction under the Wetlands Protection Act and demonstrate compliance with the Massachusetts Storm water Management Policy as reflected in an Order of Conditions issued by the Conservation Commission;
- 5) Construction of utilities (gas, water, electric, telephone, etc.) other than drainage, which will not alter terrain, ground cover, or drainage patterns, the reconstruction of or resurfacing of any public way; the construction and associated grading of a street that has been approved by the Planning Board;
- 6) For the removal of earth products undertaken in connection with a sand, gravel or similar enterprise where such activity is allowed by zoning;
- 7) Any logging operation with a cutting plan approved by the state forester;

8) Emergency repairs to any utilities (gas, water, electric, telephone, etc.), stormwater management facility or practice that poses a threat to public health or safety, or as deemed necessary by the Planning Board;

9) Any work or projects for which all necessary approvals and permits have been issued before the effective date of this Bylaw.

## **5.0 RESPONSIBILITIES FOR ADMINISTRATION**

### **A. Responsibility**

A Stormwater Management Commission shall be established to administer and enforce this bylaw. The Stormwater Management Commission shall consist of nine members. The Building Inspector and the Highway Department Superintendent shall serve ex-officio during the term of their appointment. Seven additional members shall be recommended for appointment by the Town Manager and subject to the Select Board's ratification: a member of the Conservation Commission, a member of the Planning Board, and a member of the Board of Health, whose terms shall be co-terminus with their appointments to said boards and four other members for a term of three years except upon enactment of this amendment one member shall be reappointed for one year, one member shall be reappointed for two years and two members shall be reappointed for three years. The Commission shall annually vote for a Chair, who shall preside at meetings, a Vice-Chair who shall preside at meetings in the absence of the Chair and Clerk or Recording Secretary who shall record minutes of the of the Commission meetings. The Clerk need not be a member of the Commission. Any powers granted to or duties imposed upon the Stormwater Management Commission may be delegated to its employees and/or agents.

### **B. Rules and Regulations**

The Stormwater Management Commission may adopt, and periodically amend rules and regulations relating to receipt and content of Land Disturbance permit applications; review time periods, permit terms, conditions, additional definitions, enforcement, fees, procedures and administration of this Bylaw, after conducting a public hearing to receive comments on any proposed revisions. Such hearing dates shall be advertised in a newspaper of general local circulation, at least fourteen (14) days prior to the hearing date. After public notice and hearing, the Storm water Management Commission may adopt by majority vote rules and regulations. Failure by the Commission to promulgate such rules and regulations shall not have the effect of suspending or invalidating this Bylaw.

## **6.0 PERMITS & PROCEDURES**

Permit Procedures and Requirements shall be defined and included as part of any rules and regulations promulgated as permitted under Section 5B of this Bylaw.

A. The Stormwater Management Commission and its agents shall review all applications for a land disturbance permit, conduct inspections, issue a final permit and conduct any necessary enforcement action.

B. The Stormwater Management Commission will refer to the policy, criteria and information including specifications and standards of the latest edition of the Massachusetts Stormwater Management Policy.

C. Any applicant may submit a request for a determination of non-significance. Such a request shall be accompanied by an explanation or documentation supporting a request for a determination of non-significance and demonstrating that the proposed work is not significant to any of the interests of the Stormwater Management and Erosion Control Bylaw of the Town of Dalton and that strict application of the by-law does not further the purposes or objectives of this bylaw.

1) All requests for determination of non-significance shall be discussed and a decision will be made by the Stormwater Management Commission within 14 days of receiving the request in writing.

2) If in the Stormwater Management Commission's opinion, additional time or information is required for review of request for determination of non-significance, the Stormwater Management Commission may continue a consideration of the request by an additional 7 days. In the event the applicant objects to

a continuance, or fails to provide requested information, the request shall be denied.

3) The Stormwater Management Commission will prepare a written finding that the area on which the proposed work is to be done, or which the proposed work will alter, is either significant or not significant to one or more of the interests identified in the Stormwater Management and Erosion Control Bylaw of the Town of Dalton. If a project is deemed significant by the Storm water Management Commission the applicant must file for a full land disturbance permit.

D. A completed application for a Land Disturbance Permit shall be filed with the Stormwater Management Commission. A permit must be obtained prior to the commencement of land disturbing activity as described under Section 4A of this Bylaw. The Land Disturbance Permit Application shall include:

- 1) A completed Application Form with original signatures of all owners;
- 2) A list of abutters, certified by the Assessors Office;
- 3) Payment of the application and review fees; and
- 4) One (1) copy each of the Application Form and the list of abutters filed with the Town Clerk.

E. A public hearing shall be held by the Stormwater Management Commission within 21 days of the receipt of the minimal submission requirements as established under Section 6D of this bylaw.

F. The Storm water Management Commission shall publish a notice of the time and place of said hearing at the expense of the applicant, not less than five days prior to the public hearing, by publication in a newspaper of general circulation in the Town of Dalton.

G. The Land Disturbance Permit application shall be available for inspection by the public during normal business hours at the Town Hall for a minimum of 5 business days from the notice. The public may submit their comments within the time that the Land Disturbance Permit is available for inspection. Comments may be submitted to the Town Hall during regular business hours. .

H. The Stormwater Management Commission shall take final action on an Application within 21 days of the close of the public hearing if review from Conservation Commission or Planning Board is not required. Failure to take action shall be deemed to be constructive approval of said Application. Upon certification by the Town Clerk that the allowed time has passed without the Stormwater Management Commission's action, the Land Disturbance Permit shall be issued by the Stormwater Management Commission.

I. No permit shall be issued by the Stormwater Management Commission for projects that are actively under review or pending decisions from the Conservation Commission or the Planning Board until those decisions have been concluded.

J. The Stormwater Management Commission shall take final action on an Application within 21 days of receiving final written decision(s) from Conservation Commission and/or Planning Board if the project was under review by the Conservation Commission and/or the Planning Board. Failure to take action shall be deemed to be constructive approval of said Application. Upon certification by the Town Clerk that the allowed time has passed without the Stormwater Management Commission's action, the Land Disturbance Permit shall be issued by the Stormwater Management Commission.

K. Filing an application for a land disturbance permit grants the Stormwater Management Commission or its agents, permission to enter the site to verify the information in the application and to inspect for compliance with permit conditions.

L. The Storm water Management Commission may:

- 1) Approve the Application and issue a permit if it finds that the proposed plan will protect water resources and meets the objectives and requirements of this Bylaw;
- 2) Approve the Application and issue a permit with conditions, modifications, requirements for operation and maintenance requirements of permanent structural BMPs, designation of responsible party, or restrictions that the Stormwater Management Commission determines are required to ensure that the project will protect water resources and will meet the objectives and requirements of this Bylaw; or

3) Disapprove the application and deny a permit if it finds that the proposed plan will not protect water resources or fails to meet the objectives and requirements of this Bylaw. If the Stormwater Management Commission finds that the applicant has submitted insufficient information to describe the site, the work, or the effect of the work on water quality and runoff volume, the Stormwater Management Commission may disapprove the application, denying a permit.

M. Appeals of Action by the Stormwater Management Commission. A decision of the Stormwater Management Commission shall be final. Further relief shall be to a court of competent jurisdiction. The remedies listed in this Bylaw are not exclusive of any other remedies available under any applicable federal, state or local law.

## **7.0 FEES**

The Stormwater Management Commission shall establish fees to cover expenses connected with application review and monitoring permit compliance. The fees shall be sufficient to cover professional staff.

## **8.0 Waivers**

A. The Storm water Management Commission will determine applicability and grant a waiver to compliance with this bylaw. The Stormwater Management Commission may waive strict compliance with any requirement of this by-law or the rules and regulations promulgated hereunder, where:

- 1) such action is allowed by federal, state and local statutes and/or regulations, and
- 2) is in the public interest, and
- 3) is not inconsistent with the purpose and intent of this by-law.

## **9.0 ENFORCEMENT**

A. The Stormwater Management Commission, or its authorized agent shall enforce this Bylaw, its regulations, orders, violation notices, and enforcement orders, and may pursue all civil and criminal remedies for such violations.

B. The Stormwater Management Commission, or its authorized agent may issue a written order to enforce the provisions of this Bylaw or the regulations thereunder, which may include:

- 1) a requirement to cease and desist from the land-disturbing activity until there is compliance with the Bylaw or provisions of the land-disturbance permit;
- 2) maintenance, installation or performance of additional erosion and sediment control measures;
- 3) monitoring, analyses, and reporting;
- 4) remediation of erosion and sedimentation resulting directly or indirectly from the land-disturbing activity;
- 5) compliance with the Operation and Maintenance Plan.

C. Any person who violates any provision of this Bylaw, regulation, order or permit issued there under, shall be punished by a fine of not more than \$300.00. Each day or part thereunder that such violation occurs or continues shall constitute a separate offense.

D. As an alternative to criminal prosecution or civil action, the Town of Dalton may elect to utilize the non-criminal disposition procedure set forth in G.L. Ch. 40, §21D, which has been adopted by the Town in Sec. 15.8.2 of the general bylaws, in which case the Stormwater Management Commission or authorized agent shall be the enforcing person. The penalty for each violation shall be \$300.00. Each day or part thereof that such violation occurs or continues shall constitute a separate offense.

## **10.0 SEVERABILITY**

If any provision, paragraph, sentence, or clause of this Bylaw shall be held invalid for any reason, all other provisions shall continue in full force and effect.

**Addendum B**  
**Town of Dalton**  
**Impact on Town Roads**

**Pipeline Construction Impact on Town Roads**

John Roughley, Highway Superintendent 7/20/2015

After reviewing the maps of the proposed pipeline site, I am assuming there will be at least four town roads directly impacted by the construction vehicle traffic. This does not include additional roads that may be used as staging areas for construction equipment and materials. Some of the more rural town roads in the proposed section of town started out as logging roads or cow paths. These roads have very little gravel base and were not constructed to handle a heavy truck load, the heavy truck traffic displaces gravel from the surface to the shoulder area leaving large wheel ruts. The blacktop roads in the proposed area also have a limited gravel base and were not constructed to handle heavy truck loads.

Some of the roads included are Chalet Road and Johnson Road. Both are gravel roads that are maintained and graded throughout the year by the Highway Department. Wahconah Falls Road and Cleveland Road are black top roads in good condition also maintained by the Highway Department. These town roads along with many others will be directly affected by the pipeline construction.

Without adequate support, a pavement or gravel surface deflects under trucks carrying heavy loads, developing cracks and ruts. These cracks and ruts then let moisture penetrate, worsening the cycle until the road fails completely. The amount of damage a road sustains is directly related to the weight of the load and how it is applied, passenger cars and light duty vehicles are not a problem. It is trucks carrying legal weight loads of up to 80,000 pounds over weakened surfaces which do the damage. As the Highway Superintendent for the Town of Dalton I am recommending that if the proposed pipeline is constructed, the roads affected by the construction be rebuilt at the expense of the pipeline company.

-----  
**Addendum C**  
**Town of Dalton**

**Berkshire Scenic Mountains Act Regulations**

Regulations under Massachusetts General Laws, Chapter 131, Section 39A, the Berkshire Scenic Mountains Act (the Act).

**PREAMBLE**

Activities that alter the natural characteristics of mountaintops and steep slopes may irreversibly change these environmentally sensitive areas. Excavation, construction, clearing, and fill may be visible for many miles. Destruction of the natural ground cover can result in severe erosion. Alteration of mountainsides increases the likelihood of uncontrolled runoff. Steep, rocky slopes impede adequate sewage disposal. Aquifer recharge areas are usually located at elevations higher than the valley floors, and can be polluted by mountainside alteration.

The intent of these regulations is to guide the review owner applications to conduct activities with the goal of avoiding, minimizing or mitigating the impact of proposed activities. The intent of these regulations is not to prohibit construction, nor to hinder farmers or gardeners in their normal pursuits, or landowners in the normal maintenance of their properties.

If a mountain, a steep slope, or a ridgeline is to be altered, the regulations that follow provide both protection for the regulated scenic areas and due process for those who propose changes. The Conservation Commission carries responsibility for these regulations.

**1.0 GENERALPROVISIONS**

## 1.1 Authority

The Conservation Commission of the Town of Dalton, having been designated as hearing authority under General Laws Chapter 131, Section 39A in a vote at Special Town Meeting on 26 June 2006, promulgates these regulations pursuant to the authority granted to it.

## 1.2 Purpose of the Regulations

The purposes of the regulations are:

- a. to protect watershed resources;
- b. to preserve the natural scenic qualities of the mountain region.

These regulations create a consistent process and clarify the provisions of the Act by establishing standard definitions and procedures.

## 1.3 Implementation of the Regulations

The Act and these regulations shall take effect when the following events have occurred:

- a. The text and map describing boundaries for the mountain regions have been approved by a two-thirds vote of the Selectboard;
- b. The Commissioner of the Department of Conservation and Recreation has approved the text and the map; and
- c. The text and map delineating the boundaries of the mountain regions subject to regulation have been filed with the Town Clerk, recorded in the Registry of Deeds, and sent to the Commissioner as specified in the Act.

## 1.4 Statement of Jurisdiction

These regulations apply to the areas delineated in the Town of Dalton and shown on the approved map entitled "Town of Dalton, Scenic Mountain Region";

The areas in the map include all the areas above 457.2 meters (1,500 feet) in elevation.

## 2.0 DEFINITIONS

TOWN OF DALTON

Town Hall

462 Main Street

Dalton, Massachusetts 01226

(413) 684-6111

To: FERC

From: **Dalton Board of Health**

Date: 6/5/15

Re: Concerns about the proposed KinderMorgan/Tennessee Gas Pipeline (TGP), Northeast Direct Project (NED Pipeline)

While the pipe will contain mostly methane gas, many other chemicals will be present. These other chemicals include known carcinogens and endocrine disruptors. The amounts of these contaminants may be sufficient to pose health hazards to the residents of Dalton.

**A. DRINKING WATER IMPACTS:** The Cleveland and Egypt reservoirs are the primary and backup drinking water supplies for Dalton. The Cleveland reservoir also serves Pittsfield. They are fed by streams

and underground springs. The Dalton Board of Health would like to know:

1. What is TGP's plan to test and establish baselines for existing water quality in these two reservoirs, and for continued water quality monitoring to assess contaminants associated with the pipeline construction and operation?
2. How will blasting combustion by-products and hazardous fluids from construction vehicle and machinery be prevented from entering ground and surface waters that feed these two drinking water reservoirs, and the water table that serves private wells?
3. Please list all the chemicals, by Chemical Abstract Number (CAS) Registry number, that will be contained in the gas in the pipeline that could potentially migrate into drinking water in the event of leaks.
4. What will be TGP's responsibility and course of action in the event either of these water supplies is contaminated?
5. Where will the water associated with pressure/leak testing be discharged? What contaminants will be in the discharged water?

**B. AIR QUALITY IMPACTS:** We are concerned about air quality impacts associated with the operation of the pipeline and nearby compressor and pigging station planned for Windsor.

1. During normal operation, what is the total volume of gas (in cubic feet when measured at 70 F and 1 atmosphere) that is expected to be released at the compressor and pigging station in Windsor in one year?
2. What ongoing air quality monitoring is planned for the compressor and pigging station?
3. Given that gases are released during compressor station blow-off and may settle into lowlying areas, especially during certain climate conditions, and that Dalton lies downhill from Windsor along the Route 9 corridor, what plans exist to mitigate the migrations of these blow-off gasses?
4. Where are all of the locations along the pipeline within 10 miles of Dalton where gas will be released under normal operation?
5. In the event of a major rupture of the pipe in Dalton, what is the maximum volume (in cubic feet when measured at 70 F and 1 atmosphere) that would escape?

**C. PUBLIC SAFETY IMPACTS:** In the event of a major pipeline failure (major leak, explosion, fire):

1. What is the blast zone of the pipeline?
2. How many occupied structures are within the blast zone of the pipeline in Dalton?

*{end of 20150820-5169}*

## **20150821-4001**

NE Energy Direct Pipeline

We are gathered here, again, to hear views about the upcoming plans to deal with natural gas. Tonight it is about allowing natural gas to be piped through NY state to New England.

Our neighboring state, Pennsylvania, has been smart enough to allow drilling and fracking. In Bradford county, among others, where the farms were once as sad as ours, there are now new fences, rooves, buildings, vehicles and affordable taxes.

We, on the other hand, continue to loose jobs, see our taxes increase and watch our neighbors move away. Now we are to consider a pipeline. So what will that be?

A long ditch will be dug, a sturdy well-made pipe line will be placed in it and the ditch backfilled.

The animals who moved away from the ditch digging will move back.

Plants will regrow as anyone who mows understands. There will be minimal long term impact on the areas. I do suppose building construction will be restricted from the pipeline right of way. But Bambi and his

mother won't care. They will graze over the finished pipeline.

The birds will still hunt worms, overfly and nest in the trees. And new bridle paths will be available for horse and human walking.

Why go through all the trouble to make the pipeline?

Civilization requires energy of some type to function. At bare minimum we require heat, lights and transportation no matter where we live. For those who believe that the world as we know it will end if we continue to produce carbon dioxide.- leaving aside the fact that humans can not prevent CO2 production by Mother Nature ..Natural gas should be the desired fuel. It is the cleanest fuel available. It is available in abundant quantities right under our feet. It works regardless of time of day, condition of the atmosphere, amount of sun or wind present. It requires no bird- roasting or bird -killing hardware to be gathered. It can be relied on at all times. If wells are dug and fracked carefully, there is no damage to land or water.

But the product, natural gas, must be made available to it's users. And a pipeline is the surest way to move that gas.

Pipelines have been in this area for over 60 years. There are countless miles throughout the country, over 2,500 trouble-free miles in the state.

The royalties and ad-valorem taxes enrich the areas where the wells are productive.

#### **20150821-4003**

To: FERC

From: Mary Ellen Collier  
927 Henry Edwards Road  
Franklin NY 13775

I am here tonight because you invited me to address this hearing. Nearly half of my 21 acre home in Franklin is within the 'buffer zone' of the siting of the NED compressor station. I am here to express my anger. This compressor station endangers the value of my property, my only significant asset, and it endangers my health and the tranquility of my chosen home. I am a citizen of the United States, and I look to this commission to respect my concerns and protect my well being.

According to your website, one of your functions is to “ ..oversee(s) environmental matters related to natural gas... “ projects. A fact sheet assembled by the group, Compressor Free Franklin, states that “Pipeline construction will put at risk the Village of Franklin's (water) supply, as well as private wells and springs along the Ouleout aquifer.” My water is provided by our spring, which lies close to the buffer zone. We have had that spring dry up in the late fall frequently in the years we have lived here. All my neighbors will attest that the waterfall at the head of Henry Edwards Road reduces to a dripping trickle most years. Some years we have been without water for over a month before sufficient rain fell. I don't believe that an industrial site like a compressor station won't have a negative impact on the reduction of the water table at my elevation in dry seasons. This station should be sited in an area of less residential densltv, or at a lower elevation nearer the river.

Other environmental concerns I have include noise and light pollution, and toxic emissions. The Compressor Free Franklin fact sheet also states that” Recent monitoring of compressor stations throughout the coun-

try has documented, in addition to methane, emissions of carbon dioxide, carbon monoxide, volatile organic compounds, benzene, toluene, and formaldehyde, a known carcinogen.” Further, “ Compressor stations’ turbine power plant and compressor produce continuous noise and low frequency vibration while in operation. “ ..equipment breakdowns, routine maintenance and testing require rapid venting of up 15,000 cubic feet of methane from a segment of the pipe, causing a sound equivalent of a rocket blasting off.” I have followed news stories about gas pipeline infrastructure for more than five years, since our area was first targeted for these pipelines, and I know that news comes out daily that corroborate these claims, and report station fires and accidents, often with photo and video documentation. Who will want to buy my property, with these conditions evident within a fraction of a mile? No one! I don’t even want to live that close to a compressor station! It’s evident that the value of my property will fall, and I will have difficulty selling it when the time comes. The recent report of a 500/0 devaluation of homes near the Hancock compressor stations supports my concerns as well. If my property devalues to that extent I will be upside down on my mortgage.

Your website also states that FERC” ...regulates transmission and sale of natural gas for resale in interstate commerce.” I am angry that you are approving new infrastructure in this time of instability in the commerce of fossil fuels. I believe that Kinder Morgan does not have contracts for all of the gas it proposes to transmit, and may likely export a large percent of it. It does not seem like ‘meeting the public good’, to enrich KM-stockholders and executives at the direct expense of hundreds of landowners- individual citizens who bear the financial and health risks. A recent Carbon Tracker report suggests that many of the proposed pipeline projects may not be feasible if” ...emissions are cut to keep global temperatures rise below the internationally agreed target ...” They state that “ ..many LNG projects being considered will not be needed.”, including up to \$71 Billion dollars worth of projects in the U.S. This report concludes that increasing action to cut carbon emissions, combined with falling renewable energy prices, will put some fossil fuel investments at risk. Last Tuesday’s report from the Brookings Institute draws the same conclusion. This conclusion highlights that new infrastructure and investment should be directed to renewables.

I am here because I am angry. My assets and my quality of life are being threatened by a hazardous project that mayor may not enrich a corporation. My time and energy have been co-opted by combating this project and the previous pipeline for years now. As the world moves away from fossil fuel towards investments in renewable energy, my town is being torn apart by conflict brought by a dirty industry, hoping for a last stand profit from a changing energy industry. Stand up for me! Stand up for an ordinary citizen, trying to live a quiet life! Say NO to this project and YES to the environment.

## **20150821-4004**

More than half the homes in the US are heated with gas. That’s over 100 million homes. Some of them are in new England. 54% of New England buildings are heated with gas.

Electric plants are switching from coal to gas. In fact, gas surpassed coal earlier this year. Gas generation was 21% in 2008. It’s 31% today ... and growing. In New England, 52% of electricity comes from gas. Expect that to increase as nuclear plants age out.

Because of the switch from coal to gas, C02 has been reduced in the US to the lowest levels in 20 years. We’re down to 1994 levels. All this with a growing population and a growing GDP.

CNG cars and truck fleets are on the rise. This option cuts automotive mileage in half and emits 30% less C02 than gasoline. Manufacturing is moving back to the USA. Costs of production and costs of feedstock are lower here.

24 LNG terminals are in the planning or construction phase. Once built, gas from the United States will offset Putin’s chokehold on Europe. Gas will reduce the use of coal in the Far East.

The New England pays a premium for natural gas Last year -- over \$5 a MCF. Currently, New England gas comes from Canada and the Gulf Coast. Marcellus gas sells at less than half that price and comes from a field only a few hundred miles away.

The cost and the convenience of natural gas creates the demand. Meeting that demand depends on a delivery

system. Kinder Morgan's Northeast Energy Direct pipeline is part of that delivery system.

Let's build it -- the sooner the better. Better for our homes, businesses, factories, and quality of life. Better for our local, state, and national governments. And better for the world.

Let's get this pipeline built -- NOW!

Thank you.

Re: Constitution Pipeline Company, LLC, FERC No. PF12-9, New York State Department of Environmental Conservation Comments on Environmental Construction Plan.

Dear Secretary Bose,

The New York State Department of Environmental Conservation (NYSDEC) respectively submits the following preliminary comments for the Constitution Pipeline Company, LLC (Constitution) Environmental Construction Plan (plan) submitted on March 15, 2013.

### IN-STREAM WORK

The proposed pipeline would cross seventy-three (73) known protected class streams; at least seven (7) additional protected class streams containing trout, may be affected. Accordingly, the following comments relate to in-stream construction.

- 1) NYSDEC maintains strict adherence to in-stream work windows, therefore, all stream crossings, including temporary or permanent installation bridges and pipelines, must comply with appropriate warm and cold-water fishery windows. The allowable fishery construction window for (f) & (TS) designated waters is June 15 through September 30.
- 2) All crossings of streams and wetlands must be confirmed with NYSDEC for determinations of regulatory jurisdiction. Although it is useful for informational purposes, the Environmental Resource Mapper does not show or establish all resources regulated by NYSDEC.
- 3) NYSDEC's preferred methodology for all stream crossings is Horizontal Directional <- x1- Drill (HDD). )
- 4) Equipment access roads may also be subject to jurisdictional requirements and NYSDEC staff estimates that the proposed pipeline will include at least 11 such crossings over protected trout streams. Culverts installed at these crossings must be designed to protect and/or restore stream continuity (see <http://www.dec.ny.gov/permits/49060.htm>) using DEC Guidelines and Best Management Practices found at <http://www.dec.ny.gov/permits/49066.html>.
- 5) NYSDEC does not support the use of open-trenching, regardless of method, as an installation technique for pipelines; wet-trenching in particular is strongly opposed. )
- 6) Within stream crossings, pipelines should be buried at least 6' below a stream bottom. If minimum cover depth is not subject to variance based upon field conditions. . J

7) NYSDEC maintains jurisdiction of up to fifty feet (50') of stream bank width along protected streams, including any activity which would disturb the stream bank. Stream crossings, right-of-ways or any other road or disturbance are also included within NYSDEC's jurisdiction.

### **INVASIVE SPECIES**

Although the Plan includes a discussion of invasive species, recently, a new site for the Emerald Ash Borer (EAB) was confirmed in the proximity of the proposed pipeline route in northern Delaware County-about two miles south of the village of Unadilla. Constitution should consult with the DEC Foresters in Regions 4 and 7 to develop wood disposal management plans that incorporate active monitoring of EAB during clearing and limitations on movement of wood/slash products to minimize the spread of EAB from project development

### **NYSDEC BEST MANAGEMENT PRACTICES**

Finally, NYSDEC's Best Management Practices (BMPs) for Gas Transmission Line Construction Projects is attached for your reference. The BMPs include, among other things, recommended construction procedures relating to: erosion and sediment controls; operational stormwater management; clearing and slash disposal; stream and wetland protection; horizontal drilling; general clean-up and restoration; access roads; invasive species control; and the protection of rare, threatened and endangered flora and fauna species and significant natural communities. Please feel free to contact me with any questions or comments you may have.

Very truly yours,

Patricia J. Desroyers

RE: Case No. PF 12-91 New York State Department of Environmental Conservation (NYSDEC) Comments on the Scope of Environmental Impact Statement for the Constitution Pipeline Project.

Dear Secretary Bose,

The New York State Department of Environmental Conservation (NYSDEC) respectfully submits the following comments in response to the Federal Energy Regulatory Commission (FERC) Notice of Intent to Prepare an Environmental Impact Statement (EIS) for the Planned Constitution Pipeline Project, (project)

Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, dated September 7, 2012. Since the majority of the Project is proposed to be located in New York, a thorough evaluation of all impacts, including cumulative impacts to New York's resources, is warranted.

### Project Description

As proposed, the Project would include new construction of approximately 120.6 miles of a 30-inch-diameter pipeline and associated pipeline facilities, providing about 650,000 dekatherms per day (Dth/d) of natural gas from two receipt points in Susquehanna County, Pennsylvania to two new delivery points in Schoharie County, New York. The majority of the Project would be located in New York and is proposed to be approximately 97.9 miles in length routed through Broome, Chenango, Delaware and Schoharie Counties. Constitution Pipeline Company, LLC (Project Sponsor) provided a number of routing segments and recently developed an alternative route at the request of the FERC which generally parallels New York Interstate 88 for a substantial portion of the route.

### NYSDEC Review and Approvals

In accordance with Section 401 of the Clean Water Act, applicants seeking a Federal license or permit for activities that may result in a discharge to navigable waters must obtain a Water Quality Certification (WQC) from NYSDEC indicating that the proposed activity will comply with State water quality standards. Federally-delegated or authorized permits, such as a Title V permit for the proposed compressor station, and a State Pollution Discharge Elimination System (SPDES) Stormwater Permit for Construction Activities, must also be approved and granted by NYSDEC. The Project Sponsor will also be expected to apply for applicable State law permits as relevant to the resources impacted by the project proposal. Along with the permit applications, the NYSDEC also intends to rely upon the federal environmental review prepared pursuant to the National Environmental Protection Act to determine if the Project will comply with the applicable New York State standards.

### Water Resources, Fisheries, and Wetlands

Stormwater Runoff and Erosion: The EIS must provide detail sufficient for NYSOEC to make a determination regarding the applicability of the SPDES Stormwater General Permit for Construction Activities (GP-O.10-001) (General Permit) to the proposed Project, or whether an individual SPDES Permit would be required. A linear utility construction project of this nature may be granted authorization under the SPDES General Permit. However, Part I, Section 0.7, of the General Permit does not authorize discharges from construction activities for linear utility projects that: a) are tributary to waters of the state classified as AA or AA-s; and b) disturb two or more acres of land with no existing impervious cover and where the Soil Slope Phase is identified as an E or F on the USDA Soil Survey for the County in which the disturbance will occur.

Additionally, Section D.4 of the General Permit does not authorize discharges from construction activities that adversely affect listed, or proposed to be listed, endangered or threatened species or its critical habitat. Furthermore, Section D.8 does not authorize construction activities that adversely affect property that is listed or is eligible for listing on the State or National Register of Historic Places (including Archeological sites), unless a written agreement is in place with the NYS Office of Parks, Recreation and Historic Preservation or other governmental agencies to mitigate the effects, or if local land use approvals evidencing the same are obtained. If the Project will include any of the activities described above, an individual SPDES Permit must be granted by NYSOEC for the entire length of the Project within New York State.

A preliminary Stormwater Pollution Prevention Plan (SWPPP) must be included as an appendix to the draft EIS, describing the proposed erosion and sediment control practices and, where required, post-construction stormwater management practices, that will be used and constructed to reduce the pollutants in stormwater discharges. Of particular concern in certain areas along the proposed Project route is the existence of karst topography, which warrants additional considerations in preparation of the SWPPP to ensure that by-products of the construction process do not enter karst inlets, including exposed soil, fuel, oil, hydrologic fluids and other construction-related chemicals. Work in and around streams, wetlands and karst inlets (including discharge of water withdrawn from surface water or groundwater for hydrostatic testing) must employ

Best Management Practices (BMPs) to ensure that water quality standards are maintained. Strict attention to proper installation and maintenance of sediment and erosion controls in these areas is critical. Methods for maintaining water quality should include isolating work areas (e.g. piping, coffer dam, pumping around) from the flowing waters to ensure that work is accomplished in the dry such that no visible contrast to waters outside and downstream of the work site is apparent

The draft EIS should discuss and evaluate how the various erosion control techniques described in the SWPPP will be coordinated within the construction schedule to avoid the potential for catastrophic erosion events witnessed by NYSOEC staff in previous pipeline installations. For example, extensive time delays between vegetation clearing/grubbing, initial grading of the right-of-way (ROW) and actual installation of the pipe must be avoided and temporary mulching or the use of wood chips for ROWs should be evaluated. It is recommended that only a limited length of the Project development area be opened up at anyone time. Where forest cover will be removed, it is also recommended that stwnp. removal and grubbing not be conducted until installation crews are ready to work in that area

Water Withdrawals: The draft EIS must evaluate water withdrawals that would exceed 100,000 gallons per day (gpd), either from surface or groundwater, and procedures to ensure that water withdrawals less than 100,000 gpd do not compromise the required bypass flow (the minimum stream flow at any particular stream point necessary to protect fisheries resources). If proposed NYSDEC regulations pertaining to water withdrawals that exceed 100,000 per day become effective prior to the start of project construction, withdrawal reporting or permit application obligations or updated withdrawal reporting may be required.

Wetlands: The draft EIS should evaluate wetland impacts that would result from construction of the proposed and alternate routes, including avoidance and minimization measures that would be employed. If proposed construction in wetlands could result in a significant change in the type of wetland community (such as conversion of forested to nonforested wetland) or in a significant loss to the functions and benefits of the wetland, mitigation in the form of created wetlands or other acceptable measures would be required and should also be evaluated.

Stream Crossings: The draft EIS must describe the classification of all stream segments proposed to be crossed, including alternative segments, and discuss the proposed method for crossing for each segment All waters of the State are provided a class and standard designation based on existing or expected best usage; these classifications include AA, A, a, C(t) and (Cts) which are classified as “protected. If NYSDEC is currently reviewing stream classifications in NYSDEC Regions 4 and 7. An initial review of the preferred Project route shows that seven stream sections currently classified as “unprotected” would meet criteria for protected status, either as C(t) and (Cts). It is recommended that the Project Sponsor consult with the NYSDEC Division of Fish, Wildlife and Marine Resources in the preparation of the EIS related to this issue.

For streams and wetlands the preferred method for crossing is Horizontal Directional \ Drilling (HOD) because it has the advantages of minimizing land disturbance, avoiding the need for dewatering of the stream, leaving the immediate stream bed and banks intact, and reducing erosion, sedimentation and Project-induced watercourse instabilities. The draft EIS should also evaluate cases where other methods are proposed, for instance the Project Sponsor should explain why HDD will not work or is not practical for that specific crossing. Where HDD will be utilized, the Project Sponsor should: ensure that HDD staging areas remain outside of regulated boundaries (e.g., state-wetland 100 foot adjacent area and 50 feet from protected streams); describe the typical work area required and protective measures that will be used to limit runoff of sediment and HOD fluids into streams and wetlands; and develop contingency plans for any HDD failure that results in sediment and/or drilling fluid entering a wetland or stream. I

The draft EIS should evaluate instances where the bed or bank:of a stream is disturbed and discuss the use of “Natural Stream Design” techniques and structures for restoration of the area instead of extensive use of rip-rap. Many of the structures utilized to stabilize stream banks can also serve to enhance in-stream habitat for fish. Where the pipeline crosses under a stream, “2 ~ there should be an extended Jength on each side of the bank: where the pipe is buried deeper.3 ) ~

## Air Quality

The draft EIS should evaluate the Project facility description and source information used to calculate the anticipated air emission levels from operation of the facility, including the Best Available Control Technology (BACT) analysis for NO<sub>x</sub> and CO<sub>2</sub> equivalents and the modeling protocol for SO<sub>2</sub> and formaldehyde. Further, methane emissions from both emissions/leaks from compressor stations and from pipeline leaks should be evaluated, and the Project Sponsor should identify measures that it will employ to ensure minimization of any such methane emissions.

As proposed, the compressor station would require a Title V permit and is subject to Prevention of Significant Deterioration requirements due to anticipated CO<sub>2</sub> equivalents emissions levels. The Title V permit would require BACT for CO<sub>2</sub>. All other criteria air pollutants emission levels are anticipated to be below Attainment and Nonattainment Major New Source Review thresholds; however SO<sub>2</sub> emissions are expected to be greater than the 40 TPY significant project thresholds. Accordingly, air modeling must be conducted to demonstrate that NO<sub>2</sub> emissions from this facility will not cause or contribute to a violation of the NO<sub>2</sub> National Ambient Air Quality Standard; modeling for projected formaldehyde emissions should also be conducted.

## Land Use

State Land: NYSDEC is opposed to any disturbance to State Forest lands and the draft EIS should include maps, at an appropriate scale, that show the proposed routing alternatives and their proximity to State land. Although the proposed route was reportedly chosen to avoid crossing State land, alternative route segments under consideration would in fact cross land owned by the State.

Forest Tax Law Program: The draft EIS should evaluate the adverse implications of timber removal along the preferred or alternate routes on land enrolled in the Forest Tax Law Program (Real Property Tax Law 480-a), and outline procedures that should be followed to ensure that affected landowners are not inadvertently penalized. Private landowners who are enrolled in the Forest Tax Law Program will be impacted if the Project crosses private lands. Specifically, construction resulting in the removal of timber resources on property enrolled in this program may subject the landowner to violations and penalties if not addressed correctly. As such, landowners must be fully aware of the impacts and process for withdrawing land from the program to avoid any serious tax implications.

ROW Clearing and Disposal Methods: The methods and rationale for cutting and disposition of timber and vegetation, and any use of open burning, should be evaluated in the draft EIS. As a first priority, merchantable timber should be harvested for lumber, secondarily, timber should be harvested for firewood in accordance with NYSDEC's regulations pertaining to the movement of firewood and quarantine areas related to the Emerald Ash Borer infestation. Clearing crews should be trained to identify and report the Asian Longhorned Beetle, the Emerald Ash Borer, and any other insect that NYSDEC identifies as a potential problem along the proposed route. Further, any use of open burning for disposal of wood waste should be evaluated relative to requirements in 6 New York Codes, Rules and Regulations (NYCRR) Part 215 including seasonal prohibitions on all open burning between March 15 and May 15 to limit the risk of wildfires.

## Vegetation and Wildlife

Invasive Species: An invasive species control plan should be included within the Project construction/work plan section of the draft EIS. In order to address the potential impacts from invasive species, the plan should document BMPs that will be utilized to prevent the spread of invasive species between work sites, including the potential transport from withdrawal water sources to the receiving water body during hydrostatic testing. The plan should incorporate conducting preconstruction wetland and stream corridor habitat surveys to document population/percentage of invasive species present within the Project ROW so that post construction monitoring and an evaluation of increased populations resulting from Project construction can be accomplished.

## Rare, Threatened, and Endangered Species

The draft EIS should provide and evaluate general information regarding the presence of any federal or State-listed rare, threatened or endangered (RTE) species or critical habitat areas, taking into consideration that detailed information about the location of known occurrences of RTE species may be confidential. Before including any sensitive RTE information in the draft EIS, the Project Sponsor should consult with NYSDEC staff and the United States Fish and Wildlife Service (USFWS). A description of proposed field surveys for RTE species and/or habitat, measures to avoid impacts to RTE species such as re-routing work: areas, a discussion of the use of physical barriers such as fencing and warning signs, and seasonal timing of construction work should be included in the draft EIS. If RTE species are present and would be permanently impacted, proposed habitat mitigation for these impacts should also be described in the draft EIS.

The draft EIS should also describe proposed contingency plans that will be put in place if an unanticipated encounter with an RTE species occurs during construction activities, including: training for workers; providing stop-work authority for the environmental monitor; ensuring proper handling of the RTE species; and reporting to the appropriate resource agency. Further, the draft EIS should include records of State or federal agency consultation, including any requests to the New York Natural Heritage Program for RTE information along the proposed and alternate routes, if these do not contain confidential information.

#### Cumulative Impacts

Finally, the draft EIS must evaluate whether the pipeline would be reasonably available for supply and distribution for communities along the pipeline route and whether the pipeline could reasonably serve as a collector line for additional supply from New York Marcellus and Utica Shale formations. Since the location of the proposed Project route has a high potential for development of natural gas extraction from Marcellus and Utica Shale formations, as indicated in the revised NYSDEC draft Supplemental Generic Environmental Impact Statement on the Oil, Gas and Solution Mining Regulatory Program, September 7, 2011 the draft EIS must evaluate the cumulative environmental impacts associated with these potential activities.

The draft EIS discussion should include the applicable procedures and requirements for the potential aforementioned activities and their associated Project upgrades and modifications. At a minimum, the draft EIS should describe and evaluate the following: 1) if the pipeline supply is available to additional customers along the route, describe what additional facilities or upgrades would be needed (i.e., additional compressor stations, metering stations) and their associated environmental impacts; 2) discuss whether additional suppliers could be accommodated by this pipeline with and without a need for pipeline upgrades should drilling and production occur in areas serviceable by the pipeline and describe their associated environmental impacts; and 3) discuss the FERC approval process relating to system upgrades or modification such as additional compressor stations, lateral collection and distribution lines.

Thank you for your consideration of these important issues and please contact me if you have any questions or comments.

Very truly yours,

Patricia J. Desroyers, Esq.

-----

1 It is important to note that where HOD cannot be utilized, in-stream work for streams with a standard of Tor TS is permitted by NYSDEC only between the dates of June 1st to September 30th.

2 See <http://www.dec.ny.gov/permits/149Q6Q.html>. ~

3 NYSDEC has witnessed pipeline installations where pipeline became clogged because stream water flowed behind the installed rip-rap and exposed the shallow section of pipe adjacent to stream. Extending the section of the deep bury would provide a significant buffer against this scenario.

4 See 6 NYCRR Section 192.5. s

Eugene Marnier, 1245 Oak Hill Road, Franklin, NY 13775

Comments to FERC scoping hearing, Oneonta, NY July 16, 2015

FERC is required by law under the National Environmental Policy Act-to consider cumulative impacts of projects reviewed by you. During the scoping hearings for the “. . my misnamed Constitution Environmental Impact Statement for that same pipeline, you were repeatedly called upon to consider such cumulative impacts. Many commenters observed that the construction of an open-access pipeline through the Marcellus and Utica Shales region of New York could lead to hydrofracking in New York State. That threat has been temporarily blocked by the Cuomo administration. But a future administration could easily alter that decision. Your final EIS did not examine the potential impact of the fracking build-out that could accompany the Constitution Pipeline.

Furthermore, you were warned that permitting one massive industrial project like the Constitution Pipeline would change the rural, agricultural region traversed by the pipeline from a i “greenfields” area to an already industrialized one. No sooner have you approved the first pipeline than Tennessee Gas Pipeline has come along to propose another to run parallel to the first. Tennessee Gas Pipeline has proposed compressor station for the Town of Franklin, a compressor station that will spew carcinogenic pollutants into the air breathed by citizens of Franklin, Otego, Oneonta and wherever else the winds carry them.

Just yesterday, Medical Daily reported a 27 percent increase in hospitalizations for cardiac and neurological conditions in Pennsylvania counties with large numbers of fracked wells, as well as increases in urological conditions, cancer, and skin ailments.

FERC must revisit the conditional permit given to Constitution Pipeline and study the potential for health and environmental impacts of the expansion of gas extraction activities that will inevitably result from infrastructure expansion. The evidence for that expansion is here before us today as you consider yet another application for another pipeline.

The companies that want to build these pipelines boast on their websites that the gas will be sent to Canada for export. How does that serve the public convenience and necessity of the citizens of New York and the United States? Will making a few more Texans and their shareholders rich compensate for the loss of our clean air, water, and soil, along with the agriculture and tourism that comprise our economy? I don't think so. Reject Tennessee Gas Company's proposal and revisit your ill-considered approval of Constitution Pipeline.

**DELAWARE-OTSEGO AUDUBON SOCIETY, INC.**

P.O. Box 544, ONEONTA, NY 13820

**Comments at Federal Energy Regulatory Commission scoping  
hearing on the Northeast Energy Direct Pipeline**

July 16, 2015

My name is Eleanor Moriarty and I am representing the Delaware-Otsego Audubon Society, Inc., the local Chapter of the National Audubon Society. Our organization and its members have serious concerns about the practice of hydrofracking and the proposed Constitution Pipeline. There is strong evidence against any public need or benefit from this pipeline. FERC should insist on incontrovertible proof that this project is necessary, lacks alternatives, and will provide benefits to the public before giving a privately-owned, for-profit corporation the authority to take citizens' private property against their will.

As for the issues that should be addressed in the environmental review of the project, we have a major concern about the pipeline's impact on bird habitat. Many of the forest-dwelling birds in our region are in significant decline, due in large part to fragmentation of woodlands. Species such as Wood Thrush, Scarlet Tanager, Blackthroated Blue Warbler, and numerous others, require large tracts of contiguous forest for successful breeding. As these areas are broken into smaller pieces by development, agriculture and other activities, predators and nest parasites can negatively impact nests, lowering breeding success.

It is well-documented that corridors as small as a logging road can threaten these at-risk species. Certainly a pipeline right-of-way will significantly damage these forested lands with resulting loss of habitat. The path of the preferred route along the higher elevations of our region will take it through some of the largest and most important unbroken woodlands for birds. Continued maintenance of the right-of-way to keep it clear will mean a perpetual corridor threat to forest birds.

It has been suggested that pipeline rights-of-way could benefit bird species that use brush habitat and edge habitat. However, there is an abundance of these areas in the region and beyond, and as a result, these birds have relatively healthy populations, in contrast to the steadily declining forest species.

These issues were raised during the Constitution Pipeline proceedings, not just by us, but by the US Fish & Wildlife Service and the NY State Department of Environmental Conservation, among others. However, FERC essentially disregarded them, as they did all environment concerns from that project. This is a stunning abdication of the responsibilities and duties of a public agency. There is little to suggest that FERC's approach to this project will be any different. However, we and others do care about the environment and wildlife, so we continue to participate in the process, knowing full well that this agency will again rubber-stamp this company's plans-the public be damned.

In addition to our concerns over loss of important bird habitat, the pipeline poses significant threats to wetlands, streams, vernal pools, vegetation, and other wildlife, among other issues. These should all receive full studies and impacts given prime consideration in assessing this project.

On balance, we do not believe there is any overriding need for this pipeline, and certainly that the environmental damage is unacceptable for such a questionable project.

## **20150821-4012**

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

Dear Secretary Bose,

The NED pipeline and compressor station proposed for Franklin present profound social, environmental, and health challenges to our community. As is evidenced in Hancock and Minisink, such a station will produce emissions which include neurotoxins, carcinogens, and mutagens which are enormous hazards for area residents and animal species. Children are particularly affected.

Please protect our community's health and represent the interests of citizens. I urge FERC to undertake a serious environmental review of cumulative effects and to move toward no action on the construction of this pipeline and associated infrastructure.

The gas is not needed, not wanted, not for the public good, and is not meant to supply domestic energy

needs but is intended for international export for the profit of a private corporation.

Sincerely,

Dr. Katherine O'Donnell  
Professor, Sociology  
Hartwick College  
Oneonta, NY 13820

Washington, DC 20426

Docket # PFI4-22

Dear Ms. Bose;

Through the years I have testified several times at FERC scoping hearings. I spoke passionately on the serious environmental problems that would be created by the Constitution Pipeline, on the important issues that were not addressed in the draft EIS, or even in the Final EIS, and on the lethal threat of highly pressurizing a 50 year old segment of the Dominion pipeline for the New Market Project. My numerous spoken and submitted written comments have always been respectful and painstakingly researched by me on a broad spectrum of environmental concerns - as if you really cared.

The stated purpose of the NED pipeline is to bring gas to New England, but MA residents have already shown there is no true demand for this gas. The real reason Kinder Morgan wants it built is to send the gas North, to a proposed LNG export terminal in Nova Scotia. Their goal is to sell this fracked gas overseas, at a higher price than they can get in the states and thus make a higher profit. It has nothing at all to do with providing cheap gas for us here in the Northeast, and eventually it will actually raise the price of gas here in America. We will get the polluted air, ground and water - and they will get the money.

Most of us have told FERC many times about the catastrophic effects on New York's ecosystems that Constitution's path would cause by clear-cutting steep slopes. Placing Kinder Morgan's Northeast Energy Direct Pipeline alongside Constitution will only compound and magnify these disasters. Why bother going through the effort of listing them all over again?

The fact that you scheduled both local hearings on the same date and time say to me, not only do you not care what we have to say - you don't even care that we know you don't care. The masks are off and the truth is known. After you have your obligatory public hearing, the Commissioners will do their obligatory job and approve the pipeline.

These hearings are a waste of my time and yours. You are not interested in what I have to say. When all is said and done, FERC will approve the NED pipeline, the same as it has approved Constitution. Then you will take our land again through Eminent Domain, for another corporation's bottom line, and say it is for public convenience and necessity ...

I am through playing your game. It is time the Federal Energy Regulatory Commission was replaced by an entity more accountable to the people - not BIG energy.

Allegra Schechter

## **20150821-4015**

July 16, 2015 oral comments by Keith Schue to FERC on the Northeast Energy Direct (NED) Pipeline

My name is Keith Schue. I live in Otsego County, New York and am very concerned about the future of energy in our state and our country. I am an engineer. I also have a background in conservation, having been employed with The Nature Conservancy for five years before moving here to beautiful upstate NY.

There is no way to talk about the NED pipeline without also talking about the Constitution Pipeline. One is right next to the other one and the impacts are cumulative. They cannot be reviewed independently.

The Constitution Pipeline is not only a bad project that if built will shackle us to climate-killing fossil fuels for decades to come. It was also authorized to be built in the worst possible way, in the worst possible location and using the worst construction techniques. Constitution's alignment rips through, blasts through pristine forest, fields, streams, and wetlands of the Northern Catskill region. It will fragment wildlife corridors and permanently diminish the ecological integrity of this beautiful state in which we live - as Yoko Ono boldly said in the New York Times last week "A scar upon the land, a wound that never heals."

The construction methods supported in FERC's EIS on Constitution directly defy responsible, prudent, and well-articulated comments by the NYS-DEC. (DEC comments enclosed.) DEC specifically said that trenching through these waters and wetlands is NOT acceptable, and that if the project is built, Horizontal Direction Drilling (HOD) should occur instead, with a 6 foot minimum depth below water channels to minimize

surface Impacts and to avoid eventual washout, scouring, and exposure due to channel migration. FERCIgnored those recommendations with an EIS that supports trenching nearly all 277 water crossings.

But FERCIgnored FEDERAL recommendations too. For the record, I am submitting an advisory from the Federal Pipeline and Hazardous Materials Safety Administration titled Pipeline Safety: Potential/or Damage to Pipeline Facilities Caused by Flooding, River Scour, and River Channel Migration. Basically this says the same thing that DECHas told you-which is don't do it like this.

So here we are with NED-a pipeline proposed right next door. If you approve NED, all of these terrible Impacts will multiplied by TWO. Each of those 277 waterways and wetlands will be cut through, blasted through AGAIN. And let's be clear, NED's not even proposing to share the same ROW. It proposes to expand it by another 50ft, which means that environmental fragmentation will be even worse, more forest blocks will fall below the threshold for viable internal bird habitat, and many of the same landowners who were victimized by eminent domain for Constitution will be victimized all over again.

I understand that this is a scoping meeting, so as far as ~hat goes FERCneeds to consider the cumulative impact of Constitution when reviewing NED. You also need to back up and perform a supplemental analysis of Constitution that takes NED-and Its compressor stations-into account.

Finally, I would like to say something about compressor stations. I think we all know that the idea of the 124 mile long Constitution pipeline being built without any compressor stations along its length was an imaginary proposltion. Whether Constitution, NED, or both pipelines are built, the compressor station in Franklin and others along the Constitution corridor were probably part of the gas industry's plans from the beginning. FERC needs to put a stop to this piecemeal, segmented consideration of gas infrastructure.

Pipelines and Penn its  
It begins as a lump in my throat;  
a home sickness or a love sickness  
says the poet, Frost, of his verse being born.  
This pipeline begins as a lump in my throat  
A lump bigger than boulders blasted out of gentle hills;  
The tree that was here when my grandfather was born  
And a thousand more, no longer touching the sky;  
The sound of old bones breaking as they fall.  
It begins as a lump in my throat, becoming tears  
Like a flash flood racing off a bald hill-  
Land washed away; the domain taken.  
I should have traveled there and breathed pure air;  
soon to be sour; flared and compressed.  
But who knew?  
Not the peepers searching for wetlands  
Or the fish, once unlimited.  
It begins as a rumble in the heart of the mountain  
Approval given in exchange for mitigated silence.  
And you knew.  
If you grant permission, do not expect forgiveness  
from your children's children.

FERC NED SCOPING 07 16 2015, Oneonta, NY

ATTN: Kimberly D. Bose, Secretary  
FERC, 888 First Street, NE, Washington, DC 20426

Docket # PF14-22-000

Testimony of Joan Tubridy and Stuart Anderson:

My name is Stuart Anderson, AND I'M JOAN TUBRIDY, THE NEXT SPEAKER ON THE LIST. WE'D LIKE TO COMBINE AND SHARE OUR SPEAKING TIMES.

We want to talk about the proposed compressor station in Franklin.

WE'VE HEARD LOTS OF DISCUSSION IN OUR COMMUNITIES, SOME OF IT VERY HEATED, ABOUT WHAT THE COMPRESSOR STATION WILL MEAN FOR OUR AREA, AND WE'D LIKE TO SUM IT UP FOR YOU.

As we have just 6 minutes, we'll be quick about it. Joan will repeat the pro-pipeline arguments we've heard ...AND STU WILL OFFER THE REBUTTALS. HERE WE GO:

1. THE FRANKLIN COMPRESSOR WILL BE OVER A MILE AND A HALF FROM THE OTEGO ELEMENTARY SCHOOL; THE TRAIN IS MUCH CLOSER AND MUCH DIRTIER-the train goes through in just a couple of minutes, but the compressor station will foul the air around the clock; a mile and a half is not far enough to be safe from air pollution when the predominant winds, according to NYSERDA, blow right from the compressor site to the village of Otego and the school. (NYSERDA map attached)
2. THE EPA SETS POLLUTION LIMITS-the Halliburton loophole exempt gas facilities from the Clean Air Act; where there are limits, the operators ignore them with the excuse that venting is an emergency procedure; the most imminent danger may be in short term (3-4 hour) spikes as venting occurs. (We have attached a copy of the SouthWest PA Environmental Health Project compressor station emissions report.)
3. COMPRESSOR STATIONS USE FILTERS; THE AIR LEAVING IS CLEANER THAN THE AIR GOING IN-the tobacco industry told us that smoking was safe. How many millions of people died while the long term studies were being done to prove that they were lying? Now the gas companies would have you believe that air pollution from compressor stations is safe-will your kids be a statistic?
4. NOISE ABATEMENT MEASURES ARE EFFECTIVE-true, but the problem is not about noise, it's about air pollution.
5. THE COMPRESSOR STATION IS IN FRANKLIN, SO THIS IS FRANKLIN'S PROBLEM-the whole region will get the air pollution, so it is a problem for Otego and Oneonta and Meredith residents as well.
6. THE PIPELINE AND COMPRESSOR STATION WILL BRING JOBS- Kinder Morgan says the compressor station will employ 2 people; other than temporary construction jobs, the pipeline will bring no jobs to our area; if you want long term jobs, support the development of wind and solar and geothermal renewable resources.
7. WE ALREADY HAVE PIPELINES IN OUR AREA-yes, little 8 inch lines that do not have compressor stations in our vicinity; the small pipeline blast in 1990 in Blenheim killed two, injured 5 more, and left 40 residents homeless.
8. IT'S JUST ONE COMPRESSOR STATION IN THE MIDDLE OF NOWHERE-The NED is piggybacking on Constitution, which does not yet have a compressor station in its 124 mile run; when they decide to install one, the easiest place will be right alongside the Kinder Morgan facility in Franklin. This project segmentation scam was used on the Millennium pipeline, laying the pipe first, and then siting the compressors later.
9. THE COMPRESSOR STATION WILL NOT RUN ALL THE TIME-the pipeline companies are not

spending hundreds of millions of dollars on things to just sit there; especially after the export terminals get up and pumping, these things will only shut down for maintenance (which is when they vent raw gas, which is worse).

10.OUR CHILDREN ARE MOVING AWAY BECAUSE THERE AREN O JOBS HERE-the pipeline will bring no permanent jobs to the region, and the compressor station will scare away young families and our region's most financially desirable immigrants, retiring downstate professionals who love our safe rural environment.

11.THERE ARE MANY VOCAL CITIZENS IN FAVOR OF GAS DEVELOPMENT IN OUR AREA many well-intentioned people have been fooled by promises of jobs and an economic boom; go visit Dimock-it's the same depressed region it was ten years ago-but remember to take a water bottle with you.

12.THE PIPELINE COMPANIES HAVE BEEN VERY SUPPORTIVE OF OUR SCHOOLS AND FIRE DEPARTMENTS AND EMS SERVICES--the gas companies have come through our region trying to buy people's loyalty by throwing around gifts but they don't add up to anything like the costs of the damages they will bring; property values around the Hancock compressor station are down 50 percent.

13.GAS FIRED TURBINES BURN VERY CLEANLY- but they still emit formaldehyde, benzene, toluene, and many other volatile organic compounds, plus radioactive radon, and lead and polonium particulates that are common in Pennsylvania Marcellus gas. Many of these disastrous chemicals are linked to childhood leukemia -remember the Halliburton loophole-gas facilities are unregulated air pollution sources.

14.WE HAVE VISITED COMPRESSOR STATIONS AND FOUND NOTHING TO FEAR-you can't see the air pollution, it is invisible; you can't smell the raw gas-it has not been scented yet; the workers on the site are all paid by the gas companies ....do you think they would risk their jobs by telling the whole truth?

15.THIS ISA FERC ISSUE/A FRANKLIN ISSUE/A STATE ISSUE, SO WE CAN DO NOTHING-if you believe you are powerless, then you are powerless; you can urge FERCTo deny the Kinder Morgan NEDaplication. If you have no faith in FERC,urge your local officials to send a letter to the DECand the Governor supporting a gas infrastructure moratorium.

THANK YOU FOR YOUR ATTENTION.

Docket # PF14-22

Re: NED project

My name is Kristina Turechek. I live in Otsego County, Laurens Township, very close to Otego. The proposed NED compressor station in Franklin may well affect me and my family where we live, and also where we work here in Oneonta, both of which are around 10 miles away as the crow flies.

Thank you for taking my comments.

Here we are again. Many of us do not trust you, for myriad reasons, but it is our legal duty to tell you what we expect you will include in the scope of your research for this project, almost all of which research, we were surprised to learn the last time around with the Constitution pipeline, won't be done by you but is provided to you by the company whose project you will be ruling on. Furthermore, that company, among others, provides the money for your commission to exist and to operate. [From your FY 2015, Congressional Performance Budget Request}:

***“FERC recovers the full cost of its operations through annual charges and filing fees assessed on the industries it regulates.”*** II And” ***Federal Statutes require the Commission to recover its operating costs from the entities it regulates.”*** Does that sound like the fox in the henhouse? It does to me.

Many times FERCCuses the word “**stakeholders**”. For example (p.28) you describe your training seminars as being attended by stakeholders such as

***“state, local and federal agency officials, natural gas company representatives, construction contractors, and consulting firm staff”*** When it's convenient for you, like tonight, you might be pressed to say that we, the people, are stakeholders. Do you mean people like those in Delaware and Schoharie counties who recently have had their land taken by Eminent Domain, their property values lowered, life savings destroyed, their retirement or country home dreams shattered, not to mention new fears of explosion and leaks created? (Yes, we remember that fatal explosion of a small pipeline in Blenheim.) All of this was done with NO benefit to them just so that a private company can build the Constitution pipeline to take gas north for export. This is private profit made by shipping American resources out of America at the expense of American people - and of the climate. Who are the stakeholders here?

In your scope of work, I ask that you assess the cumulative damage to the people and to the environment along the right of way that will accrue because of this second pipeline. The first one, Constitution, will cut through prime forests, wetlands and farms, risking erosion and damage from the inevitable floodwaters that care not where they go - just down. The second can only make the damage worse. Please bear in mind that there is no such thing as mitigation. If you are bull-dozed, clear-cut and killed, can you be mitigated?

In your scope of work, we ask that you honestly consider the public interest, determine whether this NED pipeline is actually needed, will provide “**sustainable energy for consumers**” [Mission Statement], and will benefit the American people, indeed, could possibly benefit all those living on the planet.

Thank you,

Kristina Turechek

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A

Washington, DC 20216

RE: Tennessee Gas Pipeline Company, Docket No. PF14-22-000, Northeast Energy Direct Project

The following comments are submitted in response to the FERC scheduled Public Scoping Sessions for the Northeast Energy Direct Project (NED) Docket No. PF14-22-000, and are focused primarily on “reasonable alternatives” that when in full consideration of impact now and certainly in near-term future years, will render the need for a greenfield pipeline unnecessary.

The New England region is host to a wide variety of viable alternative renewable energy resources including, but not limited to, on-shore and off-shore wind, solar, domestic hydro and imported hydro, hydro-kinetic and others.

Energy Efficiency - as stated in the July 2015 Resource Report 10 Alternatives, Section 10.1.1 Energy Conservation - “they (energy efficient technologies) are not expected to eliminate the steadily increasing demand for energy or natural gas”.

1. ISO-New England has recently stated that the 2014 energy consumption numbers are 2% lower than 2013 and the winter peak for those years is also lower (4.2%), and further indicate that EE and Solar are having an impact. “When the EE savings are factored into the region’s load forecast, energy usage is expected to remain flat, with an average annual growth rate of 0.0% , rather than the 1.0 “ projected in the baseline load forecast 1”.
2. Why are these two entities on absolute opposite sides of the spectrum?
  - a. This warrants a comprehensive analysis as Massachusetts has been ranked #1 in Energy Efficiency 2 for the last four years in a row - adding major fossil fuel infrastructure is clearly NOT the answer if Massachusetts intends to continue this trend toward a clean and renewable future.
3. According to the US Environmental Protection Agency 3, “improving energy efficiency is one of the most constructive and cost-effective ways to address the challenges of high energy prices, energy security and independence, air pollution, and global climate change.”

Wind Power - as stated in the July 2015 Resource Report 10 Alternatives, Section 10.1.2.1 - “Wind power is not an option ....” And then closes by stating that “Should these projects be developed, the 2,800 MW proposed by GLIA could reduce pressure from the New England gas supply and reduce greenhouse gas emissions.”

1. Why has Tennessee Gas Pipeline Company, LLC (TGP) upfront dismissed this ‘free’ (zero fuel cost) source of energy? ISO-New England references of 4,000 MW of wind power 4&5 in the 2015 queue.
  - a. The above discrepancies must be accurately assessed and also combined with energy storage viability as addressed within the next section - Solar Power.

Solar Power - as stated in the July 2015 Resource Report 10 Alternatives, Section 10.1.2.2 Solar Power “These systems generally are not well-suited for use as large-scale generation in the proposed Project area .....

1. Why is solar power so promptly dismissed? When in fact, worldwide, nationally, and regionally solar is increasing exponentially (reference ISO NE for regional increases), yet TGP has chosen to state that it is not a viable energy source despite the fact that the cost of this energy source (a.k.a fuel) is zero?
  - a. from the Solar Energy Industries Association “Solar provided roughly one third of aU new electric generating capacity in the U.S. in 2014,,6.
  - b. Battery technology is not addressed at all, yet is currently available by a number of companies, one which “offers its clients a 20-year insured warranty7” for grid-scale batteries.
  - c. Both solar and energy storage (battery) capabilities require accurate and full consideration.

Other Systems - contrary to the statement listed in the July 2015 Resource Report 10 Alternatives, Section 10.2.2 Other Systems, Portland Natural Gas Transmission System (PNGTS) has offered an existing alternative to supply the amount requested by the LDC’s in their statement to the MA DPU.

1. “PNGTS is working with interested parties and is participating in regional initiatives to potentially expand its total system capacity up to 600,000 Dth/day by the addition of compression, in 100,000 Dth/day increments. This service could start as early as November 2018,,8.

#### Existing Alternatives

New England, particularly Massachusetts is already host to underutilized and unused infrastructure, namely three LNG terminals:

1. Distrigas in Everett, MA (oldest functioning LNG import terminal in the country) and is currently underutilized.
2. Northeast Gateway deepwater port (off the coast of Gloucester, received its first shipment in 4 years this past winter.
3. Neptune deepwater port (off coast of Gloucester) unused since its commissioning in 2010
  - a. “The U.S. Maritime Administration announced it was issuing the temporary license suspension at the request of the company, a subsidiary of France’s GDF Suez. In its notice of the suspension, the Maritime Administration said the company requested the action because “the Neptune Port has remained inactive since its commissioning and will likely remain inactive for the foreseeable future”

In closing, why would New England as a region need additional underutilized fossil-fuel infrastructure, which its residents will ultimately pay for over the next twenty years, while directly conflicting with compliance to the Massachusetts Global Warming Solutions Act?

Respectfully Submitted,

Kenneth W. Berthiaume  
52 Fryeville Road  
Orange MA 01364

#### 20150821-4021

Comments prepared for FERC Scoping Hearing July 29, 2015 by Meg Burch on behalf of the **Town of Conway**.

My name is Meg Burch. I am **Chair of the Conway Ad Hoc Pipeline Task Force and a member of the Board of Health**.

I would like to state that the this testimony is incomplete, as is the Draft Environmental Report and Project Scope Update released by the Tennessee Gas Pipeline company and Kinder Morgan late last week. The Conway Selectboard and Board of Health have both submitted letters to the Federal Energy Regulatory Com-

mission requesting that the deadline for written comments be extended given the less than timely release of these revised reports, the new information contained in the reports, including the location of a Mainline and remote blowoff valve in Conway, a 2.6 acre temporary workspace not identified previously, and the lack of complete information related to the Horizontal Directional Drilling portion of the project that will begin in Conway and go under the Deerfield River. Given the pending Energy Need analysis being conducted by the State Attorney General, the quantity of new information, and the level of detailed data still "To Be Determined" these Scoping Hearings are premature and need to be extended.

The Town of Conway lies in the foothills of the Berkshires just west of the Connecticut River Valley, a region rich in agriculture and history. Conway shares boundaries with seven other towns, three of which are also directly impacted by the proposed North East Direct pipeline project. Conway is the first hilltown northbound on Route 116, one of seven designated Scenic Byways in Western Massachusetts.

The proposed NED pipeline project will specifically and significantly impact the Town of Conway, its citizens, and our region. 3.41 miles of the proposed Tennessee Gas Pipeline North East Direct project is routed across the Northern end of the Town of Conway.

Specific comments will follow in written format, but a few areas of concern are as follows:

- We are concerned about the impact of this project on the quality of water in our wells, streams, and aquifer.
- We are concerned about the impact to environmentally sensitive areas including: vernal pools, cold water fisheries, braided streams, core habitat, priority habitat for rare species, prime farmland, and permanently protected open space.
- Noise is a concern. Noise during construction. Noise during operation given the main line valve and remote blowoff in an area characterized by hills and river valleys, where sound travels and echoes.
- The impact of planned, as well as unplanned, gas releases on the air quality, environment, and health of residents is a concern.
- The impact to roadways, bridges, and related infrastructure given the enormity of this project is a concern.
- The proximity of a natural gas pipeline to high tension power lines is a concern.
- Emergency access and response is a concern as residences could be cut off from our fire and EMS as the route bisects a major roadway in town.

As I have prepared this brief statement and considered the impact of this project on my town and our region, the word that comes to mind is unconscionable. Defined by Merriam- Webster as unscrupulous, excessive, and unreasonable. This process must be delayed to allow for a fair and just assessment of the need as well as a thorough exploration of how best to avoid, minimize, or mitigate the impact of this project. Thank you.

**20150821-4022**

Kinder Morgan NEDProject  
FERC Environmental Impact Scoping Hearing  
**Testimony of Mark Burton, Greater Boston Chapter of Trout Unlimited**

July 29, 2015

My name is Mark Burton and I live in Ashfield, Massachusetts. I am a fly fisherman and I speak on behalf of the Greater Boston Chapter of Trout Unlimited, of which I am a member. The chapter has over 1,100 members, many of whom spend days and vacations fly fishing the great trout streams we have to offer in this part of the state.

My concern tonight is the certain adverse impact the NED project will have on our local ecology, specifically the impact on our cold water resources and the habitat of the Eastern Brook Trout.

One hundred years ago, much of New England, and certainly all of the Berkshire region and Pioneer Valley, had healthy brook trout streams. Today, after decades of land development, brook trout have entirely disappeared from 7% of their historical habitat, have been greatly reduced in another 28%, and reproducing

populations are unknown in another 42%.

(<http://www.mass.gov/eea/agencies/dfg/dfw/fish-wildlife-plants/fish/trout-information.html>)

According to the Eastern Brook Trout Joint Venture Report on the status and threats to the species, analysis reveals that in only 5% of historical habitat does a fully sustaining brook trout population exist, and a reduced but sustaining level in 9% of historical habitat. (<http://easternbrooktrout.org>) Virtually all of these populations reside in the western part of the state where the NED project will be located

Clearly there is much at stake here for the habitat ~ brook trout, and what we ask of FERC tonight is that you include in the scope of the EIS a full review of the impact on trout habitat and the necessary mitigation and remediation measures that undoubtedly will be required to be taken in order to minimize it, and hopefully negate adverse impact to the project

We respectfully request FERC to include the following in the scope of the EIS

- A full evaluation of the direct, indirect and cumulative impacts of the proposed pipeline on native and wild trout populations and their watersheds. This would include the impact which deforestation of thousands of acres will have on water temperature in the affected watersheds (i.e., Hoosic, Housatonic, Westfield, Deerfield, Millers, and Connecticut Watersheds) at the level of first order tributaries through to the large rivers.
- A comprehensive analysis of alternative pipeline routes and construction methods that avoid or minimize impacts to native and wild trout populations and their watersheds, including smaller rights-of ways (e.g. 50 foot rather than 75 foot and 150 foot rights of way which is possible using alternative construction methods) must be conducted as part of the EIS process.
- At least 15 different direct negative effects from sedimentation have been demonstrated to impact trout and salmon, ranging from stress, altered behavior, reductions in growth and direct mortality. There must be an assessment of quality turbidity impact and efforts to mitigate the potential for erosion and sedimentation impacts from construction of the proposed pipeline on trout streams, water quality and aquatic life.
- Stream restoration/mitigation plans must be prepared for each stream crossing and use the best available science to ensure that streams are restored to their original condition and long-term impacts avoided.
- Type of crossing method for each proposed stream crossing should be determined on a site-by-site basis, based upon field conditions rather than just a desktop analysis. The wet crossing method should not be used for any crossings on native and wild trout streams. If dry crossing method is specified, then the type of dry crossing method should be identified as each type of dry crossing has unique impacts that must be identified in the EIS so that appropriate mitigation measures can be included in the EIS.
- Sufficient information about stream characteristics should be collected at each proposed stream crossing. Such analysis should include, at a minimum: proximity to the nearest confluence up and downstream; stream discharge, channel gradient, channel sinuosity, stream substrate, cross-sectional surveys, channel debris; sediment storage, and stream order; information about bed and bank stability, scour depth and depth of pools; and a scour depth analysis to determine the potential for vertical or lateral adjustment of each stream.
- Stream crossing installations must be able to handle certain percentage of the 10-year, 50-year or 100-year base flow, based upon site specific conditions at each stream crossing. This is the only way to limit potential flooding impacts. A critical shear stress analysis for all sites with any definable risk of bed scour, to ensure that the stream bed remains stable under flow conditions associated with 100-year storm events and that the pipeline company is using the best engineering practices to assure that stability.
- Geotechnical feasibility studies to determine if horizontal directional drilling, Direct Pipe™ or other conventional bore methods are appropriate and feasible must be conducted for each stream crossing.
- The depth that the pipe is buried beneath the stream must be determined on a site-by-site basis, based upon the potential for vertical or lateral adjustment of the stream.

While this construction project is clearly adverse to trout habitat and will contribute to its long term degradation and potential extirpation of wild and native trout populations, your diligence in ensuring that its

effects are mitigated, remediated, or eliminated is of critical importance.

Thank you for hearing my testimony

**Franklin Regional Council of Governments**

STATEMENT FOR FERC NOI SCOPING SESSION (PF14-22)

KINDER MORGAN TENNESSEE GAS PIPELINE NORTHEAST ENERGY DIRECT PROJECT

July 29, 2015

The Franklin Regional Council of Governments (FRCOG) submits the following initial comments on the proposed Kinder Morgan Tennessee Gas Pipeline (TGP) Northeast Energy Direct (NED) pipeline project (PF14-22). The FRCOG is the Regional Planning Agency for the 26 communities of Franklin County. The FRCOG serves eight communities along the proposed route, as well as abutting communities, that will be impacted by the 34 miles of pipeline and large-scale compressor station proposed for our region. We have actively participated in the FERC process and have also formed a Regional Pipeline Advisory Committee, with representatives from the eight communities along the proposed pipeline route, to provide technical assistance on the FERC process. This is the largest proposed project in Franklin County since the I-91 interstate highway was built.

The FRCOG has significant concerns about the natural and cultural resource impacts of the NED pipeline project. The resources in Franklin County that would be directly impacted by the proposed pipeline include: public and private drinking water supplies, permanently protected open space, farmland, rare and endangered species habitats, public infrastructure, and historic resources. The short and long-term impacts that the proposed project would have on our communities and region are profound.

We request that the FERC thoroughly evaluate the need for this pipeline, which has only 500,000 dekatherms per day under agreement with gas companies. Even with the recently proposed reduction in pipeline size to 30 inches and 1.3 Bcf/day, this pipeline project still has only 38% of its capacity committed. If the larger 36-inch pipeline with a capacity of 2.2 Bcf/day were permitted, only approximately 23% is committed. In the absence of a demonstration of need, FERC lacks authority to approve the project.

We also request that other alternatives to meet electricity generation and natural gas demand in New England be fully explored, including energy conservation, renewable energy production, LNG storage, expansion of existing gas pipelines and improved operational efficiencies by other pipelines that can result in recapture of leaked gas. We also ask that alternative routes be analyzed that could have less impacts on environmental resources. We trust that FERC will include a detailed analysis of these alternatives in the Draft Environmental Impact Statement to be developed and published for public comment.

The FRCOG intends to submit additional, more detailed Study and Information Requests in coordination with other Regional Planning Agencies in Massachusetts and New Hampshire for inclusion in the Environmental Impact Statement before the deadline established by FERC for the Notice of Intent (NOI) Scoping Session comment period. In addition to the alternatives analysis requested above, our Study and Information Requests will focus on the following areas:

- Protection of Water Resources (public & private drinking water supplies, rivers, lakes, ponds & wet-

lands)

- Protection of Air Quality
- Protection of Public Safety
- Protection of Critical Habitat Areas for Rare & Endangered Species
- Minimizing Noise Impacts
- Mitigating Impacts on Infrastructure including Roads, Bridges, Culverts and Electric Transmission Lines
- Addressing Impacts on Private & Public Property
- Avoiding Impacts on Permanently Protected Open Space
- Avoiding Impacts on Historic and Archeological Resources
- Addressing Economic Development Impacts on Heritage & Recreational Tourism and Natural Resource Based Businesses including Agriculture and Forestry
- Addressing Fiscal Impacts on Towns

The Study and Information Requests that will be submitted are directly related to the general headings listed in the FERC Notice of Intent dated June 30, 2015 (Pages 5-6) for the TGP NED project and will provide the level of information needed for FERC to fully evaluate the environmental, land use and socioeconomic impacts of the proposed project and make an informed decision. Thus far, the information submitted by the company as part of the pre-filing stage has not been sufficiently detailed to allow for meaningful public comment. Thus, it is our hope that by asking for specific studies, FERC will develop a record of decision that includes adequate detail on the proposed pipeline project so that the public can fully understand and comment on the potential impacts.

We respectfully request that after the Scoping Session NOI comment period is closed, that FERC advise us as soon as possible about what information will be included in the Draft Environmental Impact Statement (DEIS). We also request an extension of the NOI comment period from August 31, 2015 to September 30, 2015 to provide additional time for public review of the recently filed Resource Reports by TGP on July 24, 2015 which contain a vast amount of information on the project.

Thank you for this opportunity to provide comments on the development of the Environmental Impact Statement for the proposed Kinder Morgan Tennessee Gas Pipeline NED Project.

**20150821-4026**

**THE GENERAL COURT OF MASSACHUSETTS**

STATE HOUSE, BOSTON 02133-1053

LEGISLATORS' STATEMENT TO THE FEDERAL ENERGY REGULATORY  
COMMISSION SCOPING SESSION ON NORTHEAST ENERGY DIRECT  
PROJECT Docket No. PF14-22-000

July 28, 2015-Jittsfield, Massachusetts & July 29, 2015-Greenfield, Massachusetts

We are unable to attend this hearing tonight due to legislative sessions in Boston, but we wish to comment on the matter before FERC due to the critical importance of this regulatory process in evaluating the environmental impact of this proposed project on the communities that we represent.

First and foremost, we believe that FERC should suspend the current environmental scoping process and withdraw the Notice of Intent that was issued on June 30, 2015. It was only days ago, on Friday July 24, 2015, that the latest Resource Reports for the Northeast Energy Direct project were filed for public comment and review as part of this process. These documents are massive, with thousands of pages of highly technical and important environmental information about this project.

Despite the lateness of the filing of these reports, they are incomplete, and omit critical information that is

necessary for a thorough and accurate review of the impacts of this proposed project in our communities. In this short amount of time, it is simply impossible for citizens, organizations, and experts to properly analyze and comment on the environmental and economic impacts of this project.

In order to have a credible and respected regulatory process, we believe that it is incumbent upon FERC to postpone this seeping process. We believe that it should be restarted with the issuance of a new Notice of Intent, extending the public comment period for at least 60 days in light of the July 24th Resource Reports. A new schedule of seeping hearings should be issued to allow for meaningful public comment during this period.

Without re-starting of this process, we believe that our constituents who would be affected by this project will be unable to offer full and meaningful testimony and comments on a project which threatens the environmental health and quality of life in our region. We respectfully ask that you approve this request before proceeding further.

Senate President Stan Rosenberg

Sen. Benjamin Downing-Berkshire, Franklin, Hampshire, Hampden District

Rep. Gailanne Cariddi-1st Berkshire District Rep. Stephen Kulik-1st Franklin District

Rep. Paul Mark-2nd Berkshire District Rep. Susannah Whipps Lee\_2nd Franklin District

### **20150821-4027**

Pixie Holbrook, Conway, MA

local Council of Governors held a public informational meeting that included a gas industry engineer, whose specialty was pipeline installation. When asked how far away a pipeline should be from high-tension wires, he quickly responded with "400, 500 feet away". Then with a lowered voice, "1000 feet. ..II We would like Kinder Morgan to justify the placement of this pipeline that runs

last Friday KM ~rovided us with an extr~engthy Resource Report delineating the details of the installation and operation of this pipeline. They gave it to us only 6 days before this hearing. Clearly intentional, this is unethical behavior. I am here with many others~,,"}and a new schedule with a full 60 days for us to review the information

Thirdly, you should be questioning the ethics of this company, Kinder Morgan, in general. They lie about hiring 1000's of people to install this pipeline, while in fact we know historically that they bring in their own crews. They lie about building a pipeline to benefit New England, yet there are countless indications that this gas is for export. They display a photograph of a quaint barn like building, a very small compressor station. In fact, the one planned for our neighbors in Northfield, is the largest compressor station in the nation. They say they will reduce the size, but we all know full-well that once given your approval, that that station will return to one large enough to provide ample gas to Europe

want to add that in u~i:I(ReSource Report, we discovered that my rural, Conway is the location for a Main-line Valve and a Remote Blowoff Valve. It will serve to periodically release the pressure in the pipe, sending pressured fracked gas into our air. We know that fracked gas carries countless particles of chemicals used in the tracking process. Those particles are heavier than air, and once released, will shoot up into the air, then travel and drop to the ground ... on our rivers, streams, wetlands, farms, livestock, flower gardens and swings. For years and years and years ...

We don't need this pipeline and it is of no benefit to us here. Pipeline leaks can be fixed, other pipelines can be run at capacity. Gas can be stored in the warm months for cold days in winter. We can further pledge, as a state, to conservation and renewables. We ask you to tell Kinder Morgan tq., pack up and leave. They're not wanted or needed here. Thank you.

### **20150821-4028**

Pamela Kelly

32 Spruce Street  
Greenfield, MA 01301

July 29, 2015 Scoping Hearing, Greenfield, MA

The Kinder-Morgan Pipeline is not needed.

(1) It is clear from the Independent Research of professional David Keith, Deerfield, that the Kinder-Morgan Pipeline is not needed, illustrated by the very minimal amount of fracked gas requested in contract by Berkshire Gas. We have ALREADY BUILT infrastructure to hold sufficient Liquefied Natural Gas to make up the minimal unmet needs for particularly cold winter weather. Add to that repair of the leaks, and we clearly do not need this extra gas.

(2) It is also clear that the main reason the Pipeline would be needed is for Tennessee Gas to EXPORT gas to Europe, which will put those of us in New England in competition with Europe for that gas, thus raising the cost of gas for New England, so the Pipeline is actually 'is DIRECTLY AGAINST OUR INTERESTS' which FERC is sworn to uphold.

(3) My own experience: I am a person who REPLACED the home gas heat of my residence with one mini-split, cold climate electric heat pump, and the electricity is generated by 24 solar collectors, ending my reliance on gas and on Eversource Electricity---and lowering my UTILITY BILLS to nearly zero. I am NOT a wealthy person, but a person who lives on social security. So how did I capitalize and pay for the solar collectors? I used my Traditional IRA which was invested in Wall Street. BUT I have eliminated my heating and electric bills, so I am free from a serious disease of the elderly "Wall Street Meltdown Fear and Anxiety!"

(4) The MA legislature is now considering House Bill 3532, to create a GREEN BANK that would initiate a LOAN FUND (same way I used an IRA) to build infrastructure to transition from fossil fuel to sustainable energy like solar. Green Banks in other states are finding that \$1.00 invested from the state will garner 5-10 times the capital from private investment. Connecticut's Green Bank has used a 4 year \$100 million investment to raise \$500 to \$600 million used to upgrade commercial and industrial properties to lower their utility costs down to zero or nearly zero ••• just like my house, except on steroids! What if MA invested the billions proposed for a Pipeline and used it to build a Green Bank LOAN FUND for commercial and industrial energy efficiency, all dedicated to lowering carbon ••• and COSTS!

FERC, if you are doing your job, should reject the Kinder Morgan Pipeline application because the Pipeline and the gas is NOT NEEDED and will actually be detrimental to our well-being. ~&

## 20150821-4030

Barbara Ann Lemoine  
498 Millers Falls Road  
Northfield, MA 01360

Kinder Morgan is slow at providing information and scheduling requested meetings. There are repeated changes to the proposed project. There is an air of secrecy rather than transparency in their actions. Rather than trying to project the image of being a good neighbor, the opposite image is emerging. Because of their self-serving stance, it is imperative that third party geologists, archeologists, wildlife experts and other subject matter experts be hired to protect and safeguard local interests. Towns should have the right to approve these experts, which will be hired at Kinder Morgan's expense.

How will residents within a specified radius of no less than two miles from the perimeters of the pipeline corridor be made whole if experiencing a decrease in property values, increase in insurance, , and any health issues caused by the proposed pipeline? Will adverse impact to property include wells, structures, livestock, driveways, septic systems, soil erosion and invasive plants? Will arbitration be the decision of local agencies, to be identified or created during the preliminary phase? Documentation should be done prior to the commencement of any work by a disinterested third party hired at Kinder Morgan's expense and approved by the Northfield Selectboard. What are the impacts on recreational use? Protected lands should remain

unblemished and accessible to the public.

Historic, Native American, and important geological sites are in the vicinity of this proposed project. The pipeline corridor should bypass these important sites. Archeologists and other experts should identify sites prior to construction, mitigate adverse consequences to these sites, and continue supervision during construction. The finding of artifacts, including human remains, should cause the immediate halt of construction until the site can be thoroughly examined and properly addressed, including the redirection of the pipeline at the direction of Native American and I or Northfield authorities.

The noise and the lighting along the pipeline corridor should not exceed the levels that currently exist. Security measures should be agreed upon by Kinder Morgan and Northfield officials. Security of the pipeline should not be under the sole jurisdiction of the Northfield Police. The Northfield Fire Department and Northfield Police Department should receive specialized training deemed necessary by these departments at the expense of Kinder Morgan, including any additional apparatus and staffing.

The significantly increased truck and vehicle traffic will adversely affect town roads and residents. How will the Town and residents be compensated for this disruption and road degradation? Please set yearly minimums for Payment in Lieu of Taxes in addition to compensation for correcting any damages.

Please have Kinder Morgan disclose the amount and percentage of the gas which will be traveling through and used in the Northeast, State by State. and the amount that will be exported. A fee should be assessed for a 10% variance in the numbers cited. If the need in the Northeast is artificially inflated, then the adverse impact on Western Massachusetts will far exceed any benefit. I use gas for cooking only. I also am assessed a \$50.00 fee each year if I do not meet the minimum usage imposed. Rather than encourage users to waste a resource to avoid fees, emphasis should focus on encouraging green energy, conservation of resources, and implementation of non-fossil fuels.

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, D.C. 20426

July 29, 2015

Re: Tennessee Gas Pipeline Company, LLC  
Docket No. PF14-22-000, Northeast Energy Direct Project

Dear Secretary Bose:

I am a landowner with interests well within the proposed NED pipeline route's impacts.

1) Please reschedule or add additional seeping meetings. We are effectively being denied the right to have input/comment because a) We have only been given a few days to review over 6000 pages of KM's very overdue, draft EIS, b) There is a LOT of missing information, over 10,000 "TBD's."

In addition, Massachusetts' Attorney General Maura Healey is leading a regional energy and gas capacity study, which will be complete in October, 2015, and will address the question of whether more natural gas is needed in the region, and if so, how much more capacity is necessary. --There is much evidence that the 'need' for more gas is being grossly overstated by those with undue financial and/or political interests in gas infrastructure and sales.

Thus, FERC EIS hearings should occur only after the AG's report is available, KM has been required to fill in the major blanks --in a second draft-- and citizens and policy-makers have been given adequate time to review the new information.

2) Please ensure FERC and the EIS study the entire route, especially Montague and the Montague Plains

pine barren, for impacts on:

- wetlands, waterways, aquifers, public and private wells and septic systems
- any pollution to air, soil and water from natural gas and/or fracking chemicals, and their proximity and effects to human, animal and plant populations
- any rare or endangered species such as the northeastern bulrush, which is listed as being present in Montague, as well as other “listed,” or exemplary flora, fauna or natural communities,
- streams and other waterways that support human uses, whether recreational or as drinking water
- certified and certifiable vernal pools and analysis of the means by which damage would be avoided or mitigated
- all temporary work zones and staging areas used during construction, the pre-construction condition of these areas and plans for restoration and mitigation of damages incurred during construction
- sources of water to be used for hydrostatic testing during the construction process and how such water sources would be replenished or restored;
- clean-up of water used in testing, and potential impacts of run-off from the testing process.

Thank you, respectfully

Paul Lipke

#### **20150821-4034**

My name is Jonathan Mark, I am publisher for Flyby News (FlybyNews.com) since 1999.

I also produced three documentary films called, Moss Brook and TGP - No Fracking Way!, Beyond Moss Brook - No Fracking Way! and Beyond Moss Brook - Save Pulpit Falls.

I received a letter from the Tennessee Gas Pipeline company about their demands to survey my land for their interstate pipeline expansion project. IfT did not cooperate with them they claimed they would petition FERC and the MA Department of Public Utilities for eminent domain. After considering their proposal, I realized that this project was fraudulent, and not in the public interest and especially harmful to our Commonwealth in Massachusetts and for New Hampshire.

The proposed \$5 billion project ‘to cross eight PI MIIfTiR Csttnty t6YfflS @! its- ~ from Wright, N.Y., to Dracut, MA, is proposed to deliver Uf’-i8 1:. willion etrbtc ~et a ‘day of fracked gas from Pennsylvania shale fields. The goal for cheaper energy in the short term is misleading. Will they account for the carbon greenhouse gases emitted into our atmosphere, now confirmed as contributing to climate change? Will they account for falling real estate values, can they thoroughly clean up polluted waterways, and accidents? The short term reductions on cost is manufactured or made up, but will not be realized in the long-run since the harm created by such a project is almost unimaginable. It would end up destroying communities and lead toward extreme climate change. This would especially be harmful to cities like Boston, NYC, Miami, areas in Louisiana at risk for rising ocean levels and extreme storms.

In 2012 the International Energy Agency (IEA) released its annual flagship publication, the World Energy Outlook. The TEA made an historic statement in the executive summary.

It said, “No more than one-third of proven reserves of fossil fuels can be consumed prior to 2050 if the

world is to achieve the 2 °C goal, “ which is the internationally recognized limit to average global warming in order to prevent catastrophic climate change.

I will me rephrase that. Over two-thirds of today’ s proven reserves of fossil fuels need to still be in the ground in 2050 in order to prevent catastrophic levels of climate change.

The \$5 Billion investment for such infrastructure if used for solar, could attain a 3,000 megawatt facility, like what was proposed for a project in Nigeria. Tn New England the Kinder Morgan proposed \$5 Billion investment would create pollution, lower property values, create noise and harm our water that is more valuable than fracked gas. Billions for infrastructure for such a finite dirty fuel makes no sense. It pollutes when extracted, transported, and burned. It would leads us toward not keeping 2/3’ s of fuel reserves left in the ground.

I implore the Federal Energy Resources Coalition to not approve such a project. There are better alternatives, and even if the short term has higher energy prices, in the long run, we all will benefit by making our decisions for an environment healthy for people and nature.

As nations grapple with the best strategy for decreasing carbon emissions ahead of the upcoming United Nations Framework Convention on Climate Change negotiations in Paris, a report, published in the journal Nature Communications, underscores the need for communities to transition away from an economy based on endless growth and towards a more renewable energy system to stem the growing climate crisis. The time is late to respond to a responsible energy and climate policy. Will FERC support our humanity or follow the money trail directives from those wanting to control, but are actually destroying our world?

## 20150821-4035

Scoping Questions-NED Pipeline  
Project Docket number PF14-22

Name: Jim Markham  
Street Address: 183 Summit Street, Plainfield, MA  
Phone: 413-634-8877  
Email Address:emandjim3@verizon.net

Draft Environmental report submitted 3 business days before scoping meeting

Location/size of compressor stations subject to change

Location/size of metering stations subject to change

Location/size of pipeline itself subject to change

According to FERC, ”Public benefits must exceed costs to society”

Alternatives: renewables, efficiency, storage and market reform, upgrades to existing infrastucture, fixing leaks in existing gas piping.

In the Environmental Impact Statement please address:

### **Cultural and historic impacts**

- Please explore the degree to which the project will impact Historic and archaeological sites.
- Please determine the impact on farms. Especially explore the affect of pipeline construction and operation on organic farms, and any risks to the organic certification of such farms.
- Please explore the degree to which the project will affect the beauty and rural character of the region.
- Please quantify the impact to the region’s tourist economy.
- Given that rural roads contribute significantly to the region’s beauty, character and ease of transportation, determine the affect of construction and ongoing maintenance on these roads.
- Please determine the means by which damage to roadways will be repaired. Public health and safety impacts

- Please research response time of first responders/firefighters in event of a problem, especially in remote rural areas on difficult terrain.
- Please evaluate the susceptibility of the region's forests and grasslands to catastrophic fire in the event of a pipeline explosion or fire (especially during dry times of year when the region has high fire danger).
- Please address issues related to aging of the pipeline and infrastructure; explore the means by which safety will be maintained as the pipeline ages.
- Please explore the means by which gas/chemical leaks will be identified and remediated.
- Please determine the human impact resulting from short term and long term exposure to gases and chemicals emitted by the pipeline and infrastructure.
- Please explore the potential safety impact of routine cleaning/maintenance operations throughout the lifetime of the system. How will toxic chemicals be contained, and what systems will be needed to rapidly and effectively address accidental releases?
- Please evaluate the human impact of noise caused by the construction and operation of the pipeline. Please evaluate the health impact of high, mid and low (subaudible) frequencies, as well as so-called "pure tones."
- Please determine the emergency evacuation plans that will be required in the event of a pipeline accident or emergency. By what means will the public be notified and, if necessary, evacuated?
- Please address the means by which first responders and firefighters would respond to an emergency during spring mud season, when many roads are impassible.
- Please evaluate the impact of long construction hours on human health and welfare. What means will be used to minimize sound/light/vibrational impact on people in the area during construction?
- Please determine the means by which the contaminated water from pipeline pressure-testing will be safely disposed of.
- Please evaluate the impact of damage to roadways from pipeline construction on emergency responder/ ambulance response times in the region.
- Please evaluate the susceptibility of the pipeline and its infrastructure to terrorist attack. By what means would remote stretches of pipeline and infrastructure be protected?

### **Environmental impacts**

- Please examine the degree to which the construction of this pipeline conforms to the requirements of the Mass Global Warming Solutions Act.
- Please determine the impact of pipeline construction and operation on any endangered plant and animal species found along the pipeline route.
- Please determine the impact of pipeline construction and operation to any wetlands or vernal pools found along the pipeline route.
- Please determine the impact of pipeline construction and operation on ponds, lakes, brooks, and rivers along the pipeline route.
- Please determine the impact of pipeline construction and operation on subsurface water such as ground water, aquifers, wells etc. What effect would the project have upon drinking water quality for the residents of Massachusetts, especially those living near the pipeline and compressor stations?
- Please determine the environmental impact of disposal of water from the pipeline pressure-testing process.
- Air quality. Please determine the level of pollutants expected to be released into the air from compressor stations, and how would these toxic emissions affect the people living downwind from the compressor sites?
- Please evaluate the potential of environmental damage resulting from a pipeline explosion or fire during windy, red flag conditions.
- Please determine the means by which a large pipeline-related fire would be controlled during red-flag con-

ditions in remote, rugged sections of pipeline.

--Please research the potential impact of naturally caused forest fire on the pipeline and infrastructure, particularly on compressor stations. How would firefighters effectively respond to such a fire scenario?

-- Please determine the impact of pipeline construction and operation on wildlife migration corridors; how would the pipeline effect the movement of animals in the region?

--Please evaluate the effect of gas fracking, transport and use on the creation of heat-trapping greenhouse gasses. Please include the entire gas production cycle, from extraction to end-point use, and including all fuels consumed in construction and maintenance, in this evaluation.

--Please compare the greenhouse gas affects of gas production and use compared to current coal-based systems. Take into account the entire scope of gas use, from extraction to construction and maintenance of pipeline, to endpoint use. Evaluate whether sufficient reductions in greenhouse gases would occur to justify a project of this magnitude.

--Please evaluate the Global Warming impact of pipeline construction and gas use, compared to the construction and use of renewable energy sources such as solar and geothermal.

--Please examine the environmental affects of ongoing pipeline and right-ofway maintenance, throughout the lifespan of the pipeline.

--Please explore the means by which pipeline piping and infrastructure will be removed after the lifespan of the system has been reached.

--Please look into the likely frequency of accidental spills from pipeline and associated infrastructure and mainenance equipment. Explore the means by which such accidents will be remediated. Determine also how the public will be informed of such accidents, and protected from harm.

--Please determine the potential increase of 4-wheeler and RVincursion into sensitive areas due to changes to the existing power-line right-of-way.

--Please determine the degree to which pipeline construction and operation will impact plant and animal conservation/protection areas such as Audubon sanctuaries.

### **Economic impacts**

--Please explore the economic impact of pipeline construction and operation on farms, both organic and conventional.

--Please quantify the impact to the tourist economy of the region from pipeline construction and operation.

--Please assess the economic impact on the region resulting from Climate change resulting from gas extraction, transportation and use. Please include in this assessment affects on the spread of invasive species due to a warming climate.

--Please examine the effect of pipeline construction and operation on the spread of invasive species. How will construction and maintenance vehicles avoid spreading invasive plants throughout the region?

--Please evaluate the impact on property values in areas through which the pipeline passes.

--Please determine the degree to which utility customers will be required to pay for this project. Please justify such billing practices when the outcome is tremendous financial gain for a private corporation.

--Please evaluate the degree to which future fluctuations in gas price and supply will impact the financial viability of this project.

### **Concerns of environmental social justice**

--Please explore the rationale by which Kinder Morgan justifies using a lower grade of piping in lower-income, rural areas.

--Please evaluate any differential impacts of the pipeline construction and operation on lower vs. upper income residents in the state.

--Given that the effects of climate change disproportionately affect the poor, evaluate the degree to which this project will impact climate change compared to the use of sustainable energies such as solar energy and biofuels.

--Please determine the degree to which roadway damage from pipeline construction and operation will have a disproportionate effect on the rural poor.

--Please evaluate the disproportionate impact of pipeline construction and operation on the life, welfare, historical sites, and cultural integrity of native Americans in the area.

### **Viable alternatives to the pipeline**

--Please explore all viable alternatives to pipeline construction, including increases in energy efficiency, conservation and renewable energy sources.

--Please determine the degree to which temporary periods of insufficient gas supply could be remedied by repairing leaks in the existing system.

--Please examine the environmental impacts of constructing and operating a pipeline vs. not doing so.

--Please evaluate the possibility of improvements to existing infrastructure vs. this planned massive expansion.

Please do not close the scoping comment period until 60 days after Kinder Morgan files new complete and accurate Resource reports.

Joanne McGee  
9 Main St.  
Northfield MA 01360  
413-498-5022

July 29, 2015

To: Federal Energy Regulatory Commission  
888 First Street NE, Room IA  
Washington DC 20216

Re: Tennessee Gas Pipeline Company, LLC. Docket No. PFI4-22-000, Northeast Energy Direct Project

The proposed location for the compressor and pipeline route in Northfield will adversely impact abutting conservation lands and a network of hiking trails. Others will testify about the environmental problems created by a compressor sited on a high bedrock ridge that drains to our water protection zones and to the Ct. River.

I want to tell you about the damage that this siting will cause to Northfield's Brush Mt. Conservation Area, Town Forest, and to the New England National Scenic Trail, recently designated by Congress in 2009, and one of twelve in the USA.

Ten years ago at Town Meeting I asked the residents to support our first conservation project, Brush Mt. Conservation Area, a 46-acre woodland parcel that protects

The trail head for the historic Metacomet-Monadnock Trail, a 220 mile long distance path from Long Island to New Hampshire, now the New England National Scenic Trail.

The original homestead of Calvin Swan, a free black man, well-respected member of the community, a carpenter and saw mill owner, and a founder of two anti-slavery societies in Franklin County.

Continuous wildlife habitat that runs into the New Hampshire forests. An "imperiled" forest community designated by MA Fish and Wildlife.

At that town meeting residents pledged the money to purchase this property with the help of Mount Grace Land Conservation Trust. Donations and grants originated not only from private people and foundations

but also from the Commonwealth of Massachusetts and the United States government and are specifically for land preservation and cannot be used for anything else. Removing any permanently protected land from conservation not only breaks the trust of these donors, it presents legal issues about reimbursement

Self-Help Grant	\$70,400
Appalachian Mt. Club	5,000
Girl Scout hikathon	315
Basket Raftle	450
North Quabbin Regional Landscape Partnership	4,000
Private donation (Anonymous)	5,000
Recreational Trails Grant	36,000
Fields Pond Foundation	6,000
Private donations	6,010

Brush Mt. Conservation Area is the keystone project for an evolving economy for the town based on recreational activities.

1995 Town voted to acquire Brush Mt. parcel for Conservation Area

1996 Town received SELF HELP Grant from Commonwealth of Massachusetts

1997 Town paid off all loans for Brush Mt.

2003 Calvin Swan paper Slavery/Antislavery in New England published by Dublin Seminar for New England Folklife, Written by Northfield historian Betty Congdon

2007 Congressman John Olver introduced New England Scenic Trail Designation Act in House of Representative

2008 Trust for Public Land greenprint process designated valued conservation areas

2009 Metacomet-Mondadnock Trail now designated New England National Scenic Trail (NENST)

2011 Richardson property protected to provide an additional trailhead to NENST

2010 Federal Forest Legacy funds secured to protect Northfield Town Forest

2013 Northfield Open Space Plan calls for promoting and improving trail systems.

2014 - 2015 Northfield Open Space Committee develops trail maps and builds kiosk

Brush Mt and the Town Forest are now the hub for recreational trails in Northfield. More than 10,000 hikers now travel the New England National Scenic Trail. Who would want to hike next to a noisy compressor station? Would you approve a compressor station on the Appalachian Trail or route the pipeline to weave back and forth across the Appalachian Trail?

Respectfully submitted,

Joanne McGee

[jbmcgee2@verizon.net](mailto:jbmcgee2@verizon.net)

Member, Northfield Open Space Committee

Fonner member, Board of Selectmen

Conservation Committee, Mount Grace Land Conservation Trust

## 20150821-4037

FERC Public Scoping Meeting 712912015

I am commenting on the supposed demand for more natural gas. I have not read anything that conclusively states this is necessary in order for us to meet our energy needs here in Western MA where this pipeline and compressor station are being forced on communities that have expressed many valid concerns and have voted on ordinances opposing it.

In fact I have read that studies commissioned by the New England States Committee on Electricity (NES-

COE) determined that if the current levels of our MA state energy efficiency programs continue, then there is no need for additional natural gas infrastructure even taking into account economic growth factors. And yet ISO New England and NESCOE are both calling for more pipeline capacity.

We are told there is a need for increased capacity when peak demand during cold weather creates a situation where gas for heating and gas for electric generation compete for existing pipeline capacity. However these conditions actually only happen for a few hours a day, for a few days a year, and it has never affected our capacity to generate extra electricity

It has also been determined that ISO New England has been issuing “Minimum Generation Emergency Warnings.” This relates to those times when consumers are using so little electricity that the grid operator has to ask power plants NOT to generate electricity, and that this occurs far more frequently than those few times ISO-NE comes close to dipping into the reserves for electric generation during the few peak usage days per year that occur in winter.

So what is happening here? We are being asked to accept a pipeline that will carry huge amounts of fracked gas through our local communities: amounts that are way beyond what is needed here just for our own usage. Clearly, our environment, watersheds, diverse eco-systems, and health are being sacrificed so that this gas can ultimately be shipped overseas for large profits. We are being lied to.

Natural gas is not clean energy. In fact the fracked gas now being transmitted is much more polluting and dangerous than the natural gas previously in use before it became less plentiful, and hydraulic fracturing became the norm for extraction. Furthermore this process has impacted the quality of life in the communities where it is extracted, polluting drinking water and causing health problems.

Natural gas is primarily methane, a greenhouse gas over 86 times more powerful than CO2. When a full accounting of methane’s impact is taken into consideration, studies show that it has no benefit over coal or oil in reducing greenhouse gas effects. We are at a critical point with climate change and every attempt should be focused on clean renewable energy sources. Adding more natural gas is the wrong approach for achieving Massachusetts’s greenhouse gas emission goals-based on CO2 input alone. It is not a “bridge fuel” as it has been promoted. Does anyone think that once this pipeline is built it will then be abandoned down the line given the huge profits that will be generated overseas? And the latest news that the size of the pipeline and the compressor being considered for Northfield are being reduced in size is not a reason to rejoice; especially in light that both can be increased in the future if Tennessee Gas Pipeline Company decides they want to import even more gas. And the impacts on our local communities are still just as valid.

Re: Docket No. PF14-22-000

Northeast Energy Direct Project

Dear Secretary Bose:

The MetroHartford Alliance serves as the region's economic development leader and the City of Hartford's Chamber of Commerce. Our investors include businesses of all sizes, health care providers, arts and higher education institutions as well as the municipalities of North Central Connecticut. Our mission is to ensure that the region competes aggressively and successfully for jobs, capital, and talent so that it thrives as one of the country's premier places for all people to live, play, work, and raise a family.

The Alliance is also an aggressive advocate for smart investment in our state's infrastructure. Job retention and creation is dependent upon strong infrastructure that supports the efficient movement of freight, information, people, and energy throughout Connecticut.

For too long, Connecticut has faced the unfortunate distinction of having the highest energy prices in the continental United States, while simultaneously facing insufficient access to energy sources. Inadequate natural gas pipeline infrastructure in Connecticut contributes to volatile, increased electricity prices, which in turn stifle our state's economic recovery and the private sector's ability to retain and grow jobs. The Alliance is pleased that through their Northeast Energy Direct Project, Kinder Morgan is working to be part of a solution that will enhance system reliability and lower energy costs in the state.

Reliable access to affordable energy is key to making Connecticut a place in which the private sector can thrive, grow and create jobs. By increasing our state's natural gas pipeline capacity, we can move closer to reaching Connecticut's energy goal of providing cheaper, cleaner and more reliable energy resources to the citizens and businesses of our state. Without strengthened infrastructure, residents and business in Connecticut will continue to face high electric prices and, even worse, could experience power outages.

Connecticut is at a critical point. We can no longer continue to travel down the road of higher energy costs which make our companies unable to compete on a national and global level. We appreciate Kinder Morgan's efforts to help bring reliable, lower cost energy to Connecticut's businesses and residents.

Sincerely,

Patrick McGloin

Vice President for Government Relations and Public Policy

Re: Tennessee Gas Pipeline Company, LLC  
Docket No. PF14-22-000  
Northeast Energy Direct Project

My name is Don Ogden, I am the producer and co-host of The Enviro Show, broadcasting from Florence, MA and aired here in Greenfield.

Your former chairperson, Cheryl LaFleur has been quoted as saying: "We don't do warming" [as in global warming]. You guys just don't get it. You are on the wrong page. There's a Climate Crisis out there. Massive methane leaks from the entire fracked gas infrastructure is making it worse (1). You can't address the environment without addressing the climate and methane leaks, OK? Your job is to determine how much worse new gas infrastructure will affect the climate. You are supposed to be regulators, not enablers for the fossil fuel industry. History will remember what you do with this project: help protect the climate that supports us all or help industry destroy it.

PF14-22

Hannah Perkins  
8 Todd Pond Rd  
Lincoln, MA 01773  
781-277-1780  
hannahperkins4@gmail.com

My name is Hannah Perkins; I'm a student at Hampshire College and a resident of Massachusetts. I am 22 years old. I have my entire future ahead of me. I would like to live out that future in a world that is not constantly dealing with floods, droughts, record-breaking heat, crop failures, and rising sea levels. I would like to live in a world where the already marginalized and vulnerable, in this country and all across the world, do not have to suffer even more because of something they did not cause. I would like to have my own garden that is productive and healthy, not torn apart by floods and pests. I would like to continue drinking water that is clean and breathing air that is pure, not infused with toxic chemicals. These are the effects that climate change will have on our world if we build this pipeline and others.

Natural gas is not natural in any way, and it is not a bridge fuel. Due to the high amounts of methane that are released when natural gas is burned, natural gas, and the pipelines that carry it, exacerbate climate change immensely. According to the newest IPCC report, methane is 34 times more potent than carbon dioxide. Please look into the climate change impacts of methane from this pipeline.

Climate change is the biggest and most urgent issue of our time. The longer we wait to take action, and the longer we keep relying on fossil fuels like natural gas, the more perilous our world will become. The planet is already warming, and temperatures will continue to rise to unlivable conditions if we keep extracting and transporting natural gas. As a college student, it feels almost pointless to be preparing for a future that, right now, is unstable at best. We need to use the legislation already in place from the Global Warming Solutions Act to end all new fossil fuel infrastructure. There are many alternatives to this pipeline, including renewable energy and energy efficiency, which would have much less of an impact on the environment and on climate change, as well as create more jobs. I'm tired of waiting for this transition to happen. I want a future that is healthy, sustainable, and just- for myself, for my peers, and for all those across the globe who don't have a voice in this fight.

Praxair, Inc.  
39 Old Ridgebury Rd.  
Danbury, CT 06810-5113  
Omar A. Vargas  
Executive Director, Government Relations

July 30, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE  
Room 1A  
Washington, DC 20426

RE: Docket No. PF14-22-000

Dear Secretary Bose:

Praxair appreciates the opportunity to comment on the Federal Energy Regulatory Commission's (FERC) notice of intent to prepare an Environmental Impact Statement for the planned Northeast Energy Direct Project.

Headquartered in Danbury, Praxair is one of Connecticut's largest companies and one of the largest industrial and medical gases producers in the world. Praxair's commitment to our employees, customers, and the communities in which we operate is to Making Our Planet More Productive. This commitment means offering products and technologies that support a strong, growing economy and minimize environmental impacts. We have been globally recognized for this commitment and have been referred to as one of the greenest companies in the world.

As a result of our continuous investment in demand side energy efficiency, our operations are highly energy efficient. Nevertheless, we are an energy intensive manufacturer. In many areas of the country, including Connecticut, the cost of electricity, one of our main raw materials, can account for up to 70% of our total production cost. As a result, the cost of electricity is a significant determining factor of where we choose to either build new facilities or expand existing facilities. This is why Praxair strongly supports the Northeast Energy Direct and Connecticut Expansion projects.

As a direct result of limited natural gas pipeline capacity in the region, Connecticut's industrial electricity prices are the highest in the continental U.S. and significantly above the national average. The state's rates are not only high, they are highly volatile-especially in the winter freeze and summer heat. This is true throughout New England. This current reality makes it incredibly costly to be a manufacturer in the region. By way of specific example, our facility just north of here in Suffield competes against a variety of our other facilities in the region. As a result of energy prices, we can, at times of high prices, more affordably serve Connecticut customers from our facilities in New York and Pennsylvania than we can from Suffield.

Praxair strongly supports policies and projects that encourage the robust development of affordable, reliable, and cleaner energy. The Northeast Energy Direct and Connecticut Expansion are these types of projects. Combined, these projects will result significant economic impact in the immediate forms of hundreds of construction jobs and in-state capital spend but, perhaps more importantly, long-term in the form of lower and more stable electricity prices. These projects also make environmental sense in that natural gas fired generation, on a per unit of energy delivered basis, emits 32% less green house gasses than oil-fired generation furthering not only federal policy priorities, but also Connecticut's own Comprehensive Energy Strategy and the region's Six State Energy Action Plan.

Thank you.

Very truly yours,

Omar A. Vargas

PRELIMINARY STATEMENT FOR FERC NOI SCOPING SESSION (PF14-22)  
KINDER MORGAN TENNESSEE GAS PIPELINE  
NORTHEAST ENERGY DIRECT PROJECT

By Whit Sanford, July 29, 2015

Good evening,

My name is Whit Sanford. I am a resident of Shelburne Falls MA. I am a retired, fulltime volunteer. I lived and worked in the Catskill region for 25 years where I directed two nonprofit cultural organizations and served on the Boards of the Catskill Center for Conservation and Development and Catskill Forestry Association. Until 2005, I codirected the Connecticut River Watershed Council in Greenfield working on issues of region concern. I have a BS in Business and a MA in Regional Planning. As such, I am very knowledgeable about environmental and economic issues and well-versed in the communities, counties and regions through

which the NED pipeline is proposed.

My concerns focus on the impact that the pipeline will have on the economy of rural areas like the Berkshires (and Catskills) where tourism, farming, forestry and outdoor recreation are a significant and growing part of our economy. These business sectors and industries are based in and dependent upon the capacity of residents, businesses and towns to protect, restore and sustain the quality of our lands and waters, the scenic beauty of mountain landscapes, the rural character, culture and heritage of our communities, and the health and integrity of our natural and historic resources.

The Kinder Morgan pipeline and TG&E natural gas industry run counter the growth of our rural economy, compromising our farms, forests, water, scenic beauty, and rural heritage. After all, the natural gas industry has heretofore not existed in our region.

As such, in addition to analyzing the need for the pipeline and assessing alternatives to electric generation, as many have suggested be done, it is imperative that FERC evaluate the impact of the pipeline on the economy of the Berkshires and in particular Franklin County one of the poorest in Massachusetts.

FERC should study the impact on farming, forestry, tourism and recreation, where lands are taken via a one-time eminent domain payment, but the land owner loses the productivity of the land in perpetuity. If anything, land owners should be compensated on an annual basis equal to what crop, field, trail and/or timber loss they suffer annually as a consequent of the taking.

Here are some initial questions I have drafted that FERC should look into and understand before it makes its decision about the pipeline.

#### Tourism

- How will the pipeline conflict with scenic values and rural quality of Western MA?
- How will the pipeline make the region less appealing for second-home and tourism development?
- Why should a new pipeline, costing billions of dollar, be routed through pristine wild and rural lands when existing rights-of-ways could be used to support a new or expanded pipeline?

#### Outdoor Recreation, Agriculture and Forestry

- What is the value/cost of losing working lands to property owners individually and collectively?
- What is the value of timber taken?
- What are the tax implications for towns and property owners with lost property values?
- Will the pipeline compete with the region's potential designation as a new type of National Forest and/or National Recreational Trail?

#### Cost to Towns over the Long-Haul

- Impact to and cost of road repair/maintenance and other infrastructure?
- Impact on Emergency Services.
- Impact on village and town center businesses if the pipeline causes farmers that are already struggling to go out of business or tourism a growing industry to falter.

#### Rural Economic Equity

- How will Kinder Morgan and Tennessee Gas & Electric compensate landowners and towns overtime for the use of the lands and natural resources taken for the pipeline in perpetuity?
- How can there be economic parity for urban and rural residents and businesses. Just because there are fewer people in rural areas does not mean that our economy is of less value than in urban areas and that rural landowners and businesses should not be compensated properly for providing a natural gas supply through their towns that is primarily destined for urban cities to bolster urban economies.

Whit Sanford lives in Shelburne Falls, MA and can be reached at 413-458-3160.

**The Commonwealth of Massachusetts**  
**House of Representatives**  
State House, Boston 02133-1054

REP. ELLEN STORY  
3RD HAMPSHIRE DISTRICT  
FLOOR DIVISION LEADER  
HOUSE COMMITTEE ON RULES

July 29, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE  
Room A1  
Washington, D.C. 20426

Dear Madame Secretary:

I regret that I cannot attend tonight's scoping meeting on the prospective Northeast Energy Direct Project. The state House of Representatives is in session, so I must be in Boston to attend to legislative business. Please accept this letter as testimony. .

I have strong reservations about the environmental impacts of the proposed gas pipeline. The materials that Kinder Morgan has provided to my office and to the public do not address these concerns adequately. I have heard many objections about environmental effects from my constituents, and even more from people who live in the vicinity of the prospective pipeline. In particular, I have heard a very persuasive case from a hydrogeologist who lives in a town adjacent to my district that we must study thoroughly the consequences of creating new manmade preferential pathways along this route. Because it alters the geomorphic structures of several unconnected watersheds, this project cannot move forward until the consequences on trophic interactions, nutrient dynamics and contaminant pathways are fully vetted.

Environmental review of this project should be a question for scientists, cartographers and land stewards, not corporate spokesmen, bureaucrats and lawyers. Please enforce a thorough review of this under-vetted project.

Yours sincerely,

Ellen Story  
State Representative  
3rd Hampshire District

**20150821-4045**

**PIPELINE CONCERNS FOR DEERFIELD**

**Economic**

1. Pipeline's presence could cause destruction of home values
2. Pipeline's presence could cause difficulties in financing or refinancing
3. Pipeline's presence could cause difficulties obtaining homeowners insurance

**Water Resources**

1. Pipeline's construction could cause damage to wetlands
2. Placement could cause alteration of surface water drainage patterns
3. Pipeline could be a source of contamination of water supplies
4. Construction could cause a reduction of well capacities for bedrock wells

5. Placement could result in alteration of groundwater flow patterns

#### Geology ~

1. Blasting during construction ~mpact geology and groundwater flow
2. Installation of pipe in frost zone can pose threat to pipe integrity
3. Lack of proper bedding will impact pipe integrity
4. Depth of pipeline could prohibit farming or recreational use damage

#### Public Safety

1. Deerfield does not have resources to protect against terror or vandalism threats
2. Deerfield does not have manpower or equipment to address pipeline accidents
3. Concern withRegional response preparedness
4. Pipeline's proximity to Deerfield Rail Yard could affect or alter remediation efforts at that site.
5. Look at Reverse 911 funding

#### Open Space, Recreation, and Conserved Lands

1. Pipeline will cross bodies of water and recreational areas (Deerfield River, Connecticut River)
2. Pipeline will affect recreation and retreat areas (i.e., Woolman Hill)
3. Pipeline will cross a significant portion of Deerfield farmland, causing loss of arable land, and potential long-term repercussions to farming in Deerfield.
4. Pipeline installation could affect further conservation efforts in Deerfield
5. Pipeline will pass through private and public conserved and preserved land

#### Historical

1. Pipeline will pass adjacent to Historic Deerfield and could affect tourist potential
2. Pipeline could cause disturbance to several historic homes, and potentially disturb one historic cemetery.
3. No provisions related to planning for, or conservation of potential Neolithic or other archeological sites

#### Construction

1. Heavy equipment during construction w~ damage town roads
2. Blasting adjacent to power lines wiIII~~~aten transmission line integrity
3. Construction could have a detrimental effect on farms and businesses along the construction route
4. Critical nature of construction should mandate an independent 3rd party construction monitor and certification

**20150821-4046**

**TOWN OF LEVERETT**  
Massachusetts 01054

**Statement from the Selectboard of Leverett Massachusetts to**  
The Federal Energy Regulatory Commission

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, D.C. 20426

Rc: Tennessee Gas Pipeline Company, LLC  
Docket No. 1'1" 14-22-000  
Northeast Direct Energy Project

Dear Secretary Bose:

The Select Board of the Town of Leverett, Massachusetts has, by resolution, approved this letter and the requests contained therein.

Wherefore, this Select Board requests that you, and the Federal Energy Regulatory Commission ("FERC"), not accept the Tennessee Gas Pipeline Company, Inc.'s ("TGP") formal filing until its Resource Reports are made complete. Currently TGP's Resource Reports as filed with this commission have approximately 10,215 instances of information or condition "to be determined." Where the health and safety of our communities is concerned these omissions create an unacceptable level of uncertainty, ambiguity, and risk. Therefore this Commission should forthwith serve notice on TGP that its Resource Reports, as filed, are rejected as incomplete and further that said reports may be refiled, when complete, i.e. with no "to be determined" evasions, within a reasonable period of time. In light of the foregoing, we hold it imperative that FERC not close the scoping period until 60 days after TGP files new, complete Resource reports and we therefore request FERC not do so.

In addition, we concur with Massachusetts Senate President Stann Rosenberg's proposal to postpone FERC's scoping hearings in this matter until at least September. That would both give the public more time to review the environmental issues involved and give TGP more time to complete its Resource Reports.

Moreover, as state leaders have made clear, there is no urgent need to rush this matter forward. To dispassionately, and disinterestedly, determine the New England regional natural gas energy needs, the office of the Massachusetts Attorney General, under Attorney General Mauro T. Healey, is currently conducting a regional gas capacity study. Attorney General Healey has stated, "As the state makes long-term decisions about additional gas-capacity investments, we should understand the facts: what the future demand is, and which cost-effective energy and efficiency resources can be deployed to meet that demand" and she has asked the Massachusetts Department of Public Utilities to "rigorously study" natural gas capacity and future needs prior to making any decisions relating to TGP's proposed pipeline.

Under The National Environmental Act ("NEPA"), consideration of energy efficiency is specifically required and under section 1502.16(e) FERC is required to discuss "Energy requirements and conservation potential of various alternatives and mitigation measures." Therefore, we request that, in addition to not accepting TGP's formal filing, that FERC conduct a comprehensive study on the potential impact on public health, on public safety, on the scope and consequences of leaks, including methane leaks, from the pipeline, and on the likely costs of mitigation in regard to the foregoing.

With regard to public health, all residents of the Town of Leverett rely on water from private wells. The aquifer upon which these wells draw is largely recharged by sources derived from the Connecticut River, the Deerfield River, and other sources—all areas where TGP's pipeline is proposed to run. Continued access to clean and safe drinking water from this aquifer is vital to our town. Therefore, we request that FERC conduct a separate study on the impact of the proposed pipeline on the aquifer and general water table, as relevant to our town and our neighboring towns along and near the proposed route. Additionally, since gas derived from hydro-fracturing processes ("fracked gas") is the principle or only gas that the pipeline will carry and since fracked gas is associated with elevated levels of internal pipeline corrosion and with the failure of welded pipeline joints, the requested study must address this issue and the consequences of the inevitable pipeline leaks resulting from corrosion and the resulting release of toxic chemicals in sensitive aquifer areas. Again, the study should identify and estimate the likely costs of mitigation, and the methods of mitigation, in regard to all of the foregoing including who will bear the financial costs to mitigate and clean up after pipeline leaks and failures.

Additionally, we request that FERC conduct a study as to the consequences, mitigation, cost allocation, and evacuation plans regarding pipeline and/or compressor station explosions. As you well know, this is a serio

us issue. According to data from the US DOT Pipeline and Hazardous Materials Safety Administration, over the past three years the averages for “serious incidents” was 631 pCI/year, for fatalities was 14 per year, for injuries was 67 per year, and for property damage was \$293,901~379,000 per year.

Leverett is justly proud of its history, traditions, environmental initiatives, and its officially recognized status as a “Green Community.” In May of 2014, consistent with this tradition, Town Meeting passed a resolution opposing the Tennessee Gas Pipeline citing reasons of public health, commitment to our protecting our environment, as well as the town’s support of renewable energy and energy efficiency. Therefore, we request that FERC use all means necessary to determine the cumulative effects over time of the impact of the proposed pipeline on our environment, including how these effects will be monitored: for drinking water, forests, wetlands, lakes, ponds, farmland, homes, and air,

Voted by the Leverett Selectboard on July 28, 2015

Peter d’errico      Julia Shively      Thomas Hankinson

Northeast Energy Direct Project

Dear Ms. Bose:

The Town of Northfield submits its observations and concerns regarding the above entitled project as enclosed.

This community is uniquely impacted by 8.5 miles of pipeline traversing four of the six public water supply protection districts and the placement of a 41,000-80,000 hp compressor station, both on or near environmentally sensitive areas.

We urge careful consideration of our concerns.

Respectfully submitted,

DEP: Department of Environmental Protection

## 1.0 INTRODUCTION

### A. General

Northfield, Massachusetts (population 3,000) is a small rural community located on both sides of the Connecticut River. The route of the proposed Kinder Morgan natural gas pipeline extends for more than 8 miles, from the southeastern edge of town to the northeastern border with neighboring Warwick. The proposed route crosses environmentally sensitive areas, areas designated for preservation by the Town, lands that are currently designated as conserved the Town and the Commonwealth, and water supply protection zones for four public water supplies. Installation of the pipeline will require extensive blasting in areas where shallow depth to bedrock has been mapped.

The proposed pipeline and accompanying compressor station comprise the largest construction project ever planned for Northfield. Because of the conditions noted in the preceding paragraph, it is also the most complex project the Town has been confronted with. To assure a complete and comprehensive review of the project, we ask that the Federal Energy Regulatory Commission (FERC) mandate that potential implementation of the project adhere to Massachusetts Drinking Water Regulations, Massachusetts Environmental Policy Act (MEPA) procedures and Massachusetts Wetlands Protection Act regulations, all mandatory reviews for construction projects undertaken in Massachusetts.

The Town is concerned that Kinder Morgan either has not responded to, or has given incomplete responses to, questions and concerns that the Town has raised. In so doing, Kinder Morgan has created an adversarial relationship from the earliest stages of this project.

In view of Kinder Morgan's disregard for our concerns, the Town maintains that it is essential for independent, third party monitoring and certification of construction should this project proceed. The strongest protection against accidents along the route of the proposed pipeline or at the compressor station in the future is careful attention proper construction in the present. The Town believes that self-monitoring of construction by Kinder Morgan constitutes a clear conflict of interest.

The Town has prepared the following list of concerns and requests that FERC address all of these issues in the scope for the Environmental Impact Statement (EIS). In each of the areas of impact we have outlined our concerns and the requirements we think necessary to address these concerns.

### B. No Action Alternative

There have been numerous conflicting analyses regarding the need for development of this project. The Town requests that FERC include an analysis of impacts of a No Action Alternative in the EIS scope.

If FERC refuses to perform a No Action Alternative analysis, the Town requests that the EIS process be delayed to allow the Massachusetts Attorney General's Office (AGO) time to finalize their study evaluating the need for the proposed pipeline capacity. The July 6, 2015 AGO comments to the Massachusetts Department of Public Utilities (DPU) detailing the AGO concerns are appended to this document. The projected completion date for the AGO's study is October 2015. A small delay waiting for that report may have a significant impact on the results of the FERC determinations.

### C. Request to Delay Scoping Process

In light of the Massachusetts AGO request, the Town requests that the FERC EIS scoping process be delayed pending completion of the AGO report.

We also request a delay to allow affected towns along the route of the proposed pipeline sufficient time to review Kinder Morgan's Draft Environmental Report that was filed just days ago. Information provided to Northfield has been delivered in a piecemeal and ever-changing manner. As a result, it has been difficult to determine which among numerous documents is the most recent and accurate project pro-

posal.

It is essential that the Town have sufficient time to review the newly-filed, detailed project proposal and associated maps of the route so that the true impact of this project can be assessed. The Kinder Morgan proposal prepared for our review must include all plans for current and future pipelines in Northfield over the next 15 years. Without this information, it is difficult to identify all the issues related to the proposed pipeline and compressor station and to fully represent our concerns.

#### **D. Economic Impact**

The desire of the United States to move to green energy is well documented. Unfortunately, adoption of green energy alternatives has been slow to take hold due to the high cost of ownership of small scale green energy production. Because green energy has had to compete in the market place, only in recent years have costs dropped to the point where wide-scale adoption is economically feasible.

The proposed Kinder Morgan pipeline will be granted what amounts to de facto economic subsidies if taking of land for construction and installation is permitted without the pressure having to buy that land at market prices. Fossil fuel infrastructure projects thus receive an unfair market advantage by effectively removing them from the competitive constraints imposed by selling energy at the true cost of development and production. The marketplace provides an economic boost to the sale of fossil fuels at the expense of green energy facilities that are not granted these associated development costs. This unfair advantage negatively impacts green energy efforts across the country and perpetuates our reliance on fossil fuels.

If Kinder Morgan had to compete to buy land at fair market rates, the costs of the delivery of fuel would be reflected in a higher rates to endusers and lower profit margins to suppliers, and would increase the economic feasibility of green energy alternatives that, in the long run, provide a more sustainable solution to perceived energy supply shortfalls in Massachusetts and New England.

By forcing Kinder Morgan to purchase land directly without allowing them the right of eminent domain and the ability to take land they will have to pay for the true value of the land along their route and adjust their route as needed to acquire land. By causing the construction costs to reflect actual value Kinder Morgan will have to evaluate their project and its profitability accordingly and that will be reflected in the cost of gas. Should that cost be high enough it will serve to incentivize alternative energy solutions that may in the long run be better for the Northeast's economy and energy self-sufficiency.

## **2.0 GEOLOGY AND SOILS**

### **A. Depth to Bedrock**

#### **The Concern:**

The route of most of the proposed pipeline lies within areas of very shallow depth to bedrock. Extensive blasting will be necessary to achieve the required depth of cover.

#### **The Requirement:**

That there be advanced public notification regarding proposed blasting, approval of blasting guidelines and a schedule that limits the impact to residents and their livestock.

Blasting will be subject to extensive monitoring to assure the integrity of adjacent electric transmission lines.

#### **The Concern:**

All of the residences in the vicinity of the proposed pipeline rely on bedrock wells. Blasting can have a deleterious effect on these residences' water quality and quantity by opening new rock fissures or closing existing ones.

#### **The Requirement:**

That pre- and post-construction monitoring must be implemented to assure continued safe and reliable

water supply to residences that lie within a one-mile radius of the pipeline and compressor station. The Town's assumption is that any loss of water will be the responsibility of Kinder Morgan unless Kinder Morgan can absolutely prove that it is not at fault.

## **B. Pipeline Backfill and Frost Issues**

### **The Concern:**

The proposed pipe will lie in the frost zone. Northfield is concerned that the pipeline, as currently proposed, will not be buried below the frost line and therefore will be subject to damage from freezing and thawing of the pipe and its environs.

### **The Requirement:**

The Town believes it is necessary to bury the pipe a minimum of four feet below the ground, as that is the depth of the frost line in our region.

That to prevent abrasions and heaving, glacial till and blasted rock shall not be used as backfill. Only screened sand should be used to backfill around the pipe.

That stable bedding for the pipe should be required to assure adequate support.

That blasted rock or glacial till should not be used as pipe bedding.

### **The Concern:**

The proposed pipeline route is characterized by shallow depth of soil over bedrock. Consequently, any contaminants running off the site during construction or ongoing operations represent a threat to public and private water supplies at some distance from the facility.

### **The Requirement:**

That any runoff containing contaminants will be controlled.

That there will be no contaminants leaking into public or private wells.

That should there be contamination after the construction work there will be a presumption of responsibility on the part of Kinder Morgan unless they can otherwise prove absolutely that they are not at fault. (This requirement includes Laurel Lake, a Massachusetts Department of Conservation recreation facility in the neighboring town of Erving.)

## **C. Steep Slopes**

### **The concern:**

The bedrock profile along the route of the proposed pipeline path will require installation of the pipe along very steep slopes. Kinder Morgan has estimated that over one mile of pipe will be installed on slopes in excess of 40%. Installation along steep slopes will present significant challenges in controlling erosion and maintaining slope stability both during construction and during ongoing operations.

### **The Requirement:**

That there be a plan to control the impact of erosion and to guarantee stability during and after construction.

## **D. Excavations of Impervious Deposits**

### **The Concern:**

Excavation and removal of bedrock and glacial till may result in alteration of perched groundwater tables. These alterations of groundwater patterns may impact recharge to bedrock wells and water quantity available to nearby residences.

### **The Requirement:**

That there is no impact to groundwater patterns. That Kinder Morgan will be responsible for providing alternate water supplies to any entity that experiences loss of water after construction.

That the presumption of responsibility lies with Kinder Morgan unless they can absolutely prove other-

wise. That there be appropriate disposal of any unusable backfill.

## **E. Blasting near the Northfield Mountain Hydroelectric Project**

### **The concern:**

The Northfield Mountain Hydroelectric Project maintains a reservoir that was created by construction of a large earthen dam. The Town is concerned that seismic activity caused by blasting could endanger the structural integrity of the dam. Damage to this dam would result in disastrous flooding of residences and farmland located below the pumped storage reservoir.

### **The Requirement:**

That studies be undertaken and protections guaranteed that blasting will in no way affect the integrity of the dam, the turbines or water pipelines that connect these two.

That because of the potential for disaster we require that a third party review and approve any plan developed for blasting in this zone.

## **3.0 WATER RESOURCES AND WETLANDS**

### **A. Public Water Supplies**

#### **The concern:**

Northfield has eight (8) Department of Environmental Protection (DEP) designated public water supplies. The proposed pipeline route will impact four (4) of those supplies.

#### 1. Northfield Water District

The pipeline will pass through the watershed for the Northfield Water District well. (1217000-01G)

#### 2. East Northfield Water Company

The pipeline will pass through a large area of the watershed for the East Northfield Water Company Reservoir (0217001-01S)

#### 3. Northfield Mountain Hydroelectric Project

The proposed pipeline will pass through the Interim Wellhead Protection Area (IWPA) for two (2) public water supplies (1217003- 01G and 1217003-02G) serving the Northfield Mountain Recreation Area.

A significant threat to the water quality of these public water supplies is posed by the construction and operation of the proposed pipeline.

#### **The Requirement:**

That DEP be contacted regarding these water supplies and the threats represented by the proposed pipeline, and their recommendations adhered to.

#### **The Requirement:**

That the route of the proposed pipeline be relocated away from public water supplies so that it no longer impacts watersheds critical to the protection of Northfield's drinking supply.

That there will be no contamination now or in the future of Northfield's drinking water. The Town believes that rerouting the proposed pipeline is the only guaranteed way to ensure that our drinking water supplies will not be contaminated.

#### **The concern:**

A recent study conducted by Duke University found increased levels of radioactivity in the mining areas of the Marcellus Shale.

#### **The Requirement:**

That no radioactivity will be carried in the gas to prevent contamination of Northfield's water, air or lands.

## **B. Private Water Supplies**

### **The concern:**

As stated earlier, private bedrock wells may be adversely affected by construction and operation. Pre- and post-construction testing and monitoring will be essential to ensure continued safe water supplies to nearby residences.

### **The Requirement:**

These water supplies must be preserved and protected from both diversion of flow and from contamination from the construction and/or the pipeline.

That baseline studies at Kinder Morgan's expense will be done prior to any construction work. And that periodic studies be done post construction and compared to the original study to identify any change in water quality. Should changes be identified it will be the responsibility of Kinder Morgan to remediate.

## **C. Ground Water Flow Patterns**

### **The concern:**

The proposed pipeline installation and compressor station construction and operation could significantly affect ground water flow patterns, particularly those related to perched groundwater deposits. Blasting can have a significant effect on the water flow.

### **The Requirement:**

That there be hydrological testing and monitoring to guarantee a continuous water flow. The proposed pipeline route passes through multiple water recharge areas for both private and public water sources.

That baseline studies at Kinder Morgan's expense will be done prior to any construction work. And that periodic studies be done post construction and compared to the original study to identify any change in water to remediate.

## **D. Wetlands Impacts**

### **The concern:**

The proposed pipeline will pass through numerous jurisdictional wetland resource areas subject to the provisions of the Massachusetts Wetland Protection Act.

### **The Requirement:**

That a full survey of all land near the proposed pipeline, along with a complete inventory of rare and endangered species, vernal pools and other wetlands be completed. These inventories must be done by an independent third party to ensure that they are unbiased. As with all other projects in Massachusetts, the project must comply with the Wetlands Protection Act, file a Notice of Intent and obtain an Order of Conditions for construction and operation of the pipeline.

### **The Requirement:**

That long-term impacts from the proposed pipeline project on our wetlands and protected species must be considered a primary concern and measures must be guaranteed to ensure their long term viability.

## **E. Four Mile Brook**

### **The concern:**

Four Mile Brook has been identified as a stream with potential for salmon spawning. The proposed pipeline closely parallels the brook for nearly three (3) miles and crosses it and one of its tributaries. There is a significant threat to the water quality of this pristine stream and the habitat for salmon, a protected species.

### **The Requirement:**

That the proposed pipeline must take measures to guarantee the protection of this brook. Because the flow of this brook goes into the Connecticut River the impact on the Connecticut River must also be

considered.

#### **F. Millers Brook**

##### **The concern:**

The route of the proposed pipeline will cross Millers Brook, which has been identified as a cold water fishery with the same concerns as Four Mile Brook.

##### **The Requirement:**

That installation of the proposed pipeline must take all necessary measures to guarantee the protection of this brook. Because the flow of this brook goes into the Connecticut River the impact on the Connecticut River must also be considered.

#### **G. Erosion**

##### **The concern:**

Construction of the proposed pipeline presents the likelihood of significant erosion for all of Northfield's water resources, both during construction and ongoing operations.

##### **The Requirement:**

That the Massachusetts Wetland Protection Act be followed, and an Order of Conditions be obtained to prevent this erosion threat.

#### **H. Flood Plain**

##### **The concern:**

A portion of the proposed pipeline may be located in the Federal Emergency Management Agency (FEMA)-identified flood plain along the lower reaches of Four Mile Brook.

##### **The Requirement:**

That any FEMA issues be identified as soon as possible and relevant protections put in place.

#### **I. Flood Flows**

##### **The concern:**

The project will result in clear-cutting of 100 – 300 acres of forested land in Northfield. The loss of tree cover will have the potential to significantly increase runoff.

##### **The Requirement:**

That there a plan must be in place to ensure that pre- and postconstruction water flows are monitored and any potential damage mitigated to guarantee protection of all lands downhill from the clear-cut areas.

##### **The Requirement:**

That flood flows not be increased to levels in excess of pre-construction runoff flows.

### **4.0 VEGETATION AND WILDLIFE**

#### **A. Massachusetts Division of Fisheries and Wildlife**

##### **The concern:**
