  - o the full value of all impacted conservation land recognizing. Significant public dollars go into identifying, purchasing, and stewarding conservation land. Those costs must be identified when considering value
  - o the value of conservation land is greater than the acreage value, both in ecosystem services and in recreation and dollars into local economies
  - o that all of the above be considered when assessing likely extent of eminent domain, as well as percentage of natural gas meant for New Hampshire markets verses for export. Eminent domain is meant only to be used when there is clear public benefit.
- Please require a survey for state-listed rare species be conducted by experts, survey done during the appropriate time of year, when species are most likely to be found
- Please identify conservation and agricultural preservation restrictions, as well as deed restrictions, followed for each affected parcel
- Please extend the scoping period until the proper research can be completed on the sensitive and fragile areas of New Hampshire.
- Please consider the burdens already imposed on rural NH towns which also benefit the greater good. Is this route the "best" location; destroying virgin land of forests, wetlands, conservation areas, State Parks, wildlife and individually owned properties.

- Fitzwilliam is currently burdened with an EverSource (formerly PSNH) substation that creates noise, disrupting abutters, wildlife and view shed.
- And lastly, please consider review of the Connecticut proposed pipeline and NED together as a potential solution to the energy needs of the Northeast, please examine solutions with the least risk to the ratepayer and least impact to the affected property owners and environment.

**20150828-5062**

Debby Williams, W Sismbury, CT.

Dear Secretary Bose,

I am writing in regards to Docket number PF14-22, Kinder Morgan's Northeast Energy Direct (NED) project.

In the environmental impact statement, FERC needs to take into account the increased amount of methane emissions that this large project will pour into our atmosphere. Earlier this month the EPA proposed new standards to reduce methane emissions by 45% over the next 10 years. The EPA recognizes that methane is a potent global greenhouse gas, far worse than carbon dioxide at trapping heat in the atmosphere. The NED project will make those reductions in methane emissions impossible, and will cause irreparable harm to our climate.

Furthermore, these shale gas expansion projects are segmented into two, the Connecticut Expansion and NED. FERC must acknowledge that this is the case, and admit that the environmental harm caused by these two projects is cumulative. They are not separate projects, and FERC has been guilty of illegal segmentation in the recent past.

The potential harm to water has been raised by the Hartford MDC, the municipal corporation responsible for providing clean water to 400,000 people in the Hartford area. In a June 26 letter to FERC, MDC Chief Executive Officer Scott Jellison wrote "to express some concern that the proposed pipeline could potentially impact MDC's public drinking water supplies in West Hartford and Bloomfield, CT." FERC must address the concerns of MDC and the public about the impact of pipeline construction and operation on drinking water.

FERC should take into account the frequency of pipeline leaks and explosions, and factor in the costs to local communities, who bear a burden when environmental harm from pipeline accidents occur. According to the Pipeline Hazardous and Safety Material Administration, leaks and explosions are not uncommon and have increased in frequency in recent years.

Thank you for the opportunity to comment on this issue.

Yours,

Debby Williams

**20150828-5068**

Ronald VanFleet, Averill Park, NY.

RE: Project docket number PF14-22-000

I am a property owner along the proposed route of the NED pipeline delivering gas from Pennsylvania to Massachusetts. I own a campground that abuts the current National Grid Power lines. As I understand the proposed route of the pipeline it will encroach further into the campground in order to maintain a safe distance from the power lines, which I assume must be considerable since a gas explosion combined with the high tension power lines serving down state NY would not only be a local catastrophe, but would likely shut down power in at least parts if not all of the NYC metropolitan area. At this point I have no knowledge of where the proposed pipe will actually be placed. I have to wonder what the impact on my business will be if I no longer have a "Nature Trail" to offer my campers. Also will people want to camp next to a potentially dangerous situation? And lastly what will the impact be on the ability to sell the campground in the future?

Beyond that I have other concerns about the delicate eco system that surrounds our property and feeds the wetlands and the nature ponds in and around our property. Our ponds are home for herons, fish, frogs, turtles, and geese and ducks that return every year to nest. We also have deer that frequent the pond, as well as many other woodland creatures. If this small stream of water from above is changed in any way much of the wildlife could be destroyed forever. Again, I must also wonder, as I mentioned above, what impact this will have on my business without the wildlife that my guests come to enjoy.

While my description of my concerns is brief, the proposed pipeline plans are also brief and not specific enough to make me feel comfortable that a true analysis of the impact on the area in question has been viewed. Just recently a representative of Tennessee Gas and Pipeline came and asked permission to go through my property to go to the National Grid Power Lines saying that they thought there was only one set of poles and lines on the line when in fact after they reviewed aerial photos of the line they discovered there are in fact two sets of poles and lines. This concerns me because it does not seem that they have really put a solid plan together for anything other than accomplishing their goal without regard to the impact on business, environment or quality of life for the property owners near the proposed route of the pipeline.

Lastly, I must question, if the NED pipeline is pushed through, and the environment is destroyed, taking my business with it, will the Federal Government or Tennessee Pipe and Gas pay restitution for the loss of my business, my retirement, my future and my family's future. I have spent 16 years of hard grueling work building this business so that I could provide for my family, and prepare for our future. And if this project is approved by your agency, this can all be taken from me by eminent domain, which would basically destroy my family. How do I prepare my wife and my 16 year old daughter that our future is not what we have been working, saving and planning for, but welfare instead? And how do I tell my daughter that her future plans for college will not happen, as well as many other plans that we have all worked hard for?

Respectfully,

Re: Tennessee Gas Pipeline Company, L.L.C.  
Northeast Energy Direct Project - Docket No. PF 14-22-000

**SCOPING COMMENTS**

Dear Secretary Bose:

The Shelburne Conservation Commission is charged under Massachusetts Conservation Act to protect conservation lands and watershed resources in the Town of Shelburne. We are also responsible for administering and enforcing environmental standards set by the Massachusetts Wetlands Protection and Rivers Protection Acts for projects that affect wetlands and water bodies in the Town.

The Northeast Energy Direct Project (“the Project”) will have significant effects on wetlands and water bodies in Shelburne. Its proposed route will require directional drilling of the pipeline under the Deerfield River, crossing of several streams, and development in wetlands protected under the Wetlands Protection Act. All of these actions should require Tennessee Gasjo file a Notice of Intent with the Shelburne Conservation Commission, and the Conservation Commissions of other towns, to secure its approval of the Project.

The Shelburne Conservation Commission is concerned that the current process for regulation of the Tennessee Gas pipeline will allow approval without the input of local Conservation Commissions through the Wetlands Protection Act, thus bypassing critical local regulation that has proven to be highly effective in protecting wetlands and associated fish and wildlife resources. We therefore request that all parties involved (including Kinder Morgan, FERC, State of Massachusetts) in the approval process act to ensure that the Shelburne Conservation Commission has the opportunity to review any aspect of the construction of all new pipelines that will impinge the wetlands resources of the town of Shelburne, and that similar opportunities be guaranteed for all towns in the Commonwealth that are impacted by the proposed pipeline.

Before getting to scoping comments, we want to make FERC aware that the Shelburne Conservation Commission, like many others in rural areas that will be traversed by the proposed pipeline, is wholly made up of part-time volunteers. We do not have professional staff and generally meet just once a month. We join our state and regional representatives, fellow Conservation Commissions, towns, NGOs and countless individuals in calling for a longer period to comment on the 2n d Draft Environmental Report filed by Tennessee Gas on July 24, 2015. The 60-day comment deadline is unreasonable and should be extended by at least 45 days.

While the Shelburne Conservation Commission has not had time to fully review the 2n d Draft Environmental Report filed by Tennessee Gas, we have identified the following issues and lack of information that we believe must be fully addressed in the Draft Environmental Impact Statement (EIS) to be issued by FERC:

- Impact on water bodies. Provide details of project construction impacts on the Deerfield River, Shingle Brook, and other unnamed water bodies to be crossed by the proposed pipeline. We note that no details on directional drilling under the Deerfield River are included in the 2n d Draft Environmental Report.
- Impact on wetlands. Provide details of project construction and ongoing right-of-way maintenance

impacts on wetlands that will be crossed by the proposed pipeline. Alternate routes to avoid wetlands should be identified and assessed.

- Impact on protected habitats. The Massachusetts Natural Heritage and Endangered Species Program have identified a land corridor with Priority and Endangered Species habitats along the Deerfield River. Provide details of project construction and ongoing right-of-way maintenance impacts on protected habitats that will be crossed or disturbed by the proposed pipeline.
- Invasive species. Soil used to backfill the pipeline trench could introduce invasive plant species. Provide information on procedures that will be required by FERC to insure no invasive species are introduced. A long-term control plan for the right-of-way should be required.
- Blastinfi impacts. If blasting is required for creating an adequate pipeline trench, the FERC should require a geomorphologic study of the pipeline corridor to assess the potential for impacts on private wells and groundwater flow patterns. The Draft EIS should include a discussion of measures that will be taken to insure against or mitigate any adverse groundwater impacts.
- Geology. Massachusetts is regarded by USGS as a region of active geologic faults. The Draft EIS should examine the geology under the Deerfield River and adjoining areas in Shelburne and Conway to determine whether there is a threat to pipeline integrity in both the short and long-term and how to mitigate the risk.
- Fragmentation of farmlands and forests. Development of a cleared pipeline corridor will increase fragmentation of farmlands and forests in Shelburne, resources of natural and economic importance to the Town. To minimize economic and environmental impacts, the final pipeline route should be required to follow existing cleared rights-of-way, e.g., transmission lines, or major highways such as the Mass Pike (1-90). Pipeline development should be accomplished within, not expand, existing rights-of-way.
- Sediment runoff. The majority of roads serving the proposed pipeline route in Shelburne are narrow, rural, two-lane roads; some of which are gravel. Heavy equipment and construction traffic will damage these roads and create the likelihood of sediment runoff into brooks that run along many of the roads. The Draft EIS should identify the roads that will be used and the measures to control erosion and sedimentation. Provide details of plans for post-construction road repair.
- Noise. Shelburne is a quiet, rural area, but residents live throughout the town including the area of the proposed pipeline route. The Draft EIS should include an analysis of ambient noise levels and define an upper noise limit for project operation that meets the state noise regulations (not to exceed the average ambient noise the level by more than five (5) db(A)).
- Air quality. As noted above, many of the roads in Shelburne are unpaved, making them highly susceptible to dust production by heavy trucks and equipment. A plan should be outlined to maintain local air quality to minimize impact on residents living near the construction sites and on roads used for transport.
- Permanently protected open space. While the proposed pipeline route does not cross any permanently protected lands in Shelburne, the Conservation Commission wholly supports Article 97 of the state Constitution that provides this protection, and we oppose any effort to secure legislative approval to void this protection. Permanently protected open space reflects a more than century old public initiative to insure the natural heritage of the Commonwealth.

In closing, the Shelburne Conservation Commission wishes to state its endorsement of the more comprehensive scoping comments submitted by the Franklin Regional Council of Governments. We intend to participate actively in the oversight and monitoring of the construction and maintenance of the Northeast Energy Direct Project, should it be approved by FERC.

Sincerely,

Norman Davenport

John Zimmerman, Hopkinton, NH.

I support the Northeast Energy Direct pipeline. Over the past 30 years, it has bothered me that my friends who had access to natural gas in their street had a less expensive and cleaner burning fuel than the number 2 fuel I was stuck with. What a great combination! This expansion will allow more people to have that advantage.

**20150828-5080**

Peter Engelman, Conway, MA.

We oppose the construction of the Northeast Energy Direct pipeline that is slated to run through Conway and other towns in Western Massachusetts. The pipeline poses a direct threat to our determined community effort over the years to protect open space land in Conway and surrounding towns and to insure that small farms continue to thrive in this region. We have chosen to live here because of the natural beauty of the area, highlighted by open spaces, ample farmland and clean rivers. The drilling and blasting necessary to build the pipeline and its substations will mar this tranquil environment and permanently scar the region, while it offers local residents little in return.

We oppose the pipeline because:

- It has not been shown by objective studies to be necessary to meet the energy needs of the region.
- It has the real potential to have a deleterious effect on protected habitats, wetlands, agricultural lands and the Deerfield River and other water ways.
- It will cross lands protected under Article 97 of the state Constitution.
- It will pass through active geologic fault zones, and Tennessee Gas has not demonstrated that the structure can withstand earthquake damage, which could result in catastrophic disaster.
- Conway and other towns are not equipped to respond to a pipeline emergency.

Kendall Clark  
954 Reeds Bridge Road  
Conway, MA 01341

**20150828-5094**

Maureen Quinn, Temple, NH.

The town of Temple NH is a small rural community that is a pleasant quiet place to live a life of escapes from the everyday noise and confusion which is why I decided to move to Temple and build a new home about twelve years ago. The town is primarily dependent on property taxes to support our school and town needs there are farms and other small businesses located here. As a recent retiree and owner of 2 properties in the town I have many concerns with the proposed pipeline and compressor station that is presented.

My Residence is within 1 mile of the proposed compressor station and 3 Titan Turbines. It is with great concern that I provide you with this list of concerns and comments.

- The danger of being within the burn zone for me and my husband and the potential loss of my home and

belongings is first on my list. I have worked hard and many years to retire here and have planned the value of my home as part of my support later in life. In the event that the pipeline is built the value of my property will be greatly reduced and the opportunities to sell my home will basically be nonexistent. I wonder what Kinder Morgan has to offer the people that will be taking monetary losses of this large nature?

- The Town of Temple and State of New Hampshire have nothing to benefit from this supply of Natural gas. Our town does not have public utilities so there is no form of natural gas available to us and we only have a volunteer Fire Department to respond to any emergencies that might result from the compressor station, turbines or the pipeline making the risk of loss much higher.
- The Town Elementary School is also with 1/2 mile of the compressor station and the safety of the children in town should be considered the ultimate reason for you to reconsider running the pipeline through this area. The school is relatively new and our town cannot afford to relocate the school that also serves as our local disaster shelter. Our property taxes are already high enough and with property values dropping we can't afford to up the taxes or the community will not survive.
- The NOISE POLLUTION that will be created from the compressor and turbines will totally disrupt the local wildlife and human population that reside in this area. The creatures that have elected to live here because of the peaceful nature of this community.
- We don't need this gas in NH
- With no benefit to our community and the only reason this area is being considered for a location is that the resistance in some towns in Massachusetts makes this route seem completely unreasonable. The state of Massachusetts already has existing gas lines that could be improved to handle additional load and provide the towns with gas more access and potentially less cost
- Contamination to our private water system as well as the local reservoir.

Proposed alternates

- If this gas is for use in Massachusetts and not just for export then keep the line in Massachusetts as originally proposed. Improve the services and feed lines in the towns and cities and offer lower rates and provide a solid tax payment to the towns to help support the communities. Do Not just run large pipelines outside of the current systems.
- Keep the pipe lines traveling along route 2 and utilize land that is already a publicly defined area that people have accepted as through way for traffic. These previously defined corridors are not currently inhabited by a lot of people or wildlife.
- When compressor sites and turbines are needed construct them under ground to help minimize impact to local areas.

## 20150828-5123

kaela law, pelham, NH.

In places where the pipeline is scheduled to hop from one side of the powerlines to the other, does the pipeline need to be completely perpendicular to the overhead transmission wires to mitigate corrosive effects? If so, will the pipeline have 90 degree angle bends in certain places? If so will the 'pigs' be able to make full sweeps of the entire pipeline lengths? Will the 90 degree bends be considered weaker points along the pipeline system? If there are not going to be 90 degree bends in the pipeline could we get a set of updated maps delineating longer arcs that are specific and representative of how the pipeline would actually be routed in real life.

We deserve to know, with pinpoint accuracy where the route of this pipeline will be carved through our towns and across our properties so that we can prepare, research and become informed on all aspects of this project. Until such time as we have that level of accuracy there is no reason your agency or the pipeline company should be carrying forward with this project. Please make the answers to my questions available and public through this docket.

**20150828-5145**

Patricia H. Silvestro, Temple, NH.

Dear Secretary Bose:

Blow downs from the New Ipswich compressor station will release (along with millions of cubic feet of methane) other pollutants including Radon 222 and its radioactive decay isotopes of heavy metals and other toxic chemicals used in the fracking process. Once they settle through the air, they can be inhaled and also contacted and absorbed through the skin upon settling to the ground in the many square miles surrounding the station. Our only source of water for our towns and major cities will be poisoned when these toxic chemicals perk down to our aquifers.

I have lived in Temple since 1971 and love the tranquil beauty of this picturesque New Hampshire village. My husband and I are now retired, and our dream is to live out our remaining years here in peace and safety. We're greatly concerned about the very real possibility of pollution to our well water and soil, not to mention the harmful quality of the air we would be breathing due to toxic emissions that would be released by the compressor station. We are currently in the process of having work done on our house after carefully saving funds specifically for that purpose. Now we are faced with the likelihood that if the compressor station is built in New Ipswich, our property will be greatly reduced in value while our property taxes will increase. We can't afford to move, even if we wanted to (which we don't!); neither can we afford to pay higher property taxes or increased energy rates due to gas exportation overseas.

The families who are living in what would be the "incineration zone" (that term alone is terrifying!) area of the compressor station are in a nightmarish position. The deafening noise, lights, and dangerous emissions from the station are horrendous conditions to subject any person (or other living creature) to.

The NED pipeline would have a severe negative impact on towns in our state. It would certainly NOT benefit the people, only the Kinder Morgan/Tennessee Gas Pipeline Company and contractors who stand to make large profits if it's approved. New Hampshire doesn't need more gas; we already have a surplus!

Even one precious life lost because of a pipeline/compressor station accident is one too many, and the tragic result of unmitigated greed! Are we all considered to be "expendable" along with the children who attend the Temple Elementary School?

Sincerely,

Patricia Silvestro  
215 Colburn Road  
Temple, NH 03084

**20150828-5146**

Peter R Wood, Stephentown, NY.

August 28, 2015

Re: Docket #PF 14-22-000

Peter R. Wood  
153 Fire Tower Road  
Stephentown, NY 12169

Federal Energy Regulatory Commission  
Kimberly D. Bose, Secretary  
Washington, D.C.

Commissioners:

I write to express my strong opposition and serious concern about the proposed Kinder Morgan/Tennessee Gas Northeast Energy Direct Project.

Kinder Morgan has a demonstrated record of skimping on safety and compliance, and an above average incidence of pipeline explosions, fires, and other safety issues.

Our towns, Schodack, Nassau, and Stephentown, and the Rensselaer County legislature, have passed resolutions expressing the people's will against the construction of this pipeline.

The proposed pipeline compressor plant located in Nassau, NY will burn gas contaminated with hydrofracking chemicals. Residents in that area, as well as those living downwind of it, will be exposed to and breathing those contaminants. Gas contaminants released by compressor stations include volatile organic compounds such as methane, benzene, methylbenzenes, ethylbenzene, xylene, pentane, hexane, toluene, 1, 3-butadiene, aliphatic hydrocarbons. These are known human carcinogens. Compressor stations also release formaldehyde, hydrogen sulfide, and radon, which are carcinogens and can cause cancer and other health disorders, and respiratory and nervous system diseases. The compressor plant will operate 24/7 and its noise will reverberate for miles through the Burden Lake basin and the surrounding hills and hollows. The fumes, noise, and light pollution will become a constant presence in the lives of hundreds, if not thousands of residents in the vicinity. This dangerous industrial facility is completely unsuited to what is a bucolic agricultural and residential area.

The proposed pipeline will cut through, destroy, reduce and degrade parts of the Rensselaer Plateau, which is a unique and irreplaceable natural area, and a reservoir of natural diversity.

The proposed pipeline is planned to pass through our property. It will slash through and require bulldozing 200-year old stone walls, a maple sugar bush, a low and high blueberry bush, a rare lag gravel, vernal pools, wetlands, and an aquifer recharge area. As bedrock is close to or even on the surface, I question what effect blasting or other excavation techniques might have on our water well and aquifer.

The pipeline's approval would force us to sell through eminent domain at least several acres and create an unnatural leveled strip separating our house from the main part of our property. The pipeline will pass through what is our backyard. The high-pressure gas pipeline will pass closely around our house on two sides. I would not feel safe or comfortable living fifty or one hundred feet from a 30" high-pressure fracked gas pipeline. It will also leave our c.1800 home and barns isolated on a small rump portion of what is a thirty-five acre parcel, cut off from and inaccessible to the larger portion. This strip, which will be owned by Kinder Morgan, will be a magnet for off-road vehicle mayhem running 24/7. I do not believe that they can ever successfully fence off or otherwise restrict this space.

The pipeline will reduce our property's value and destroy part of what we have worked for, saved, and accumulated. This amounts to an unfair taking of our property, and government overreach.

This pipeline is not about convenience or necessity, but an industry taking profit by forcing risk and cost onto individual private property owners, who will not be fairly compensated. This is wrong, and Un-american.

This project will override local control and opposition, and subject the people of Rensselaer County to potentially devastating health impacts, for a hydrofracked gas pipeline operated by a company with a poor safety record. It would degrade the ecologically unique Rensselaer Plateau.

## **20150828-5169**

Susan F. Conger, Montague, MA.

I'm writing in regard to the Tennessee Gas Pipeline Company's proposed Northeast Energy Direct pipeline. (PF14-22-000) The proposed route of the pipeline would cross through beautiful Franklin County, Massachusetts, where I live, work, and own property. Where it would cross nearest to my property, the pipeline would cut through the Montague Plains — a Wildlife Management Area preserved "in perpetuity" by the Commonwealth of Massachusetts — and underneath the Connecticut River. In 2012, the Connecticut River Watershed was designated as the first ever "National Blueway" by the U.S. Department of the Interior.

Along its proposed route through the Connecticut River Valley, the pipeline would also cut through a fertile landscape dotted with active farms, including many preserved through our state's Agricultural Preservation Restriction (APR). The official website of the Massachusetts EEA states: "The primary purpose of the APR program is to preserve and protect agricultural land, including designated farmland soils, which are a finite natural resource, from being built upon for non-agricultural purposes or used for any activity detrimental to agriculture..." APR land has "a permanent deed restriction which precludes any use of the property that will have a negative impact on its agricultural viability."

As FERC reviews the application for this pipeline, it must thoroughly consider the following critical issues:

-Is the pipeline necessary at all? This crucial question must be the starting point of any consideration of the proposed pipeline. Currently the Massachusetts Attorney General's office is conducting an investigation into how the energy needs of the state can be met, with the goal of answering the question of whether the pipeline is necessary. Please await the results of this study before making any decision. Common sense dictates that before a massive, costly, disruptive, and long-term piece of infrastructure is built, the need for it should be very thoroughly examined. This is even more imperative in the case of new infrastructure related to fossil fuels. To build this project at all is to invest heavily in a technology that is no longer appropriate in a world imperiled by climate change.

-How would construction of the pipeline and its use to transport gas affect all of the following: the rivers under which the pipeline would cross (including the Connecticut), aquifers, farmland, preserved wildlands, endangered species?

-How would a gas leak affect each of the entities listed above?

-How would a gas explosion affect each of the above? What dangers would it pose to residents in the area? Are local emergency responders (in many cases volunteer forces in small towns) prepared to deal with such an emergency? Are there adequate evacuation routes?

-What dangers would be posed by having a gas line run through the Montague Plains, an area somewhat prone to wildfires?

-What will be the effect on Massachusetts' hitherto robust programs of land preservation, if it turns out that land preserved "in perpetuity" can become the property of a for-profit corporation which has goals completely antithetical to preservation?

-How would the pipeline compressor station proposed for the town of Northfield, Mass. affect air quality, noise levels, and night-time dark skies in that rural community?

-Why must the utility rate-payers bear the cost of construction for a project built by a for-profit corporation?  
I ask FERC to urgently and thoroughly consider each of these questions, in addition to the many other thoughtful questions posed by those who live in the communities that would be permanently affected by the construction of this pipeline.

Thank you for your attention to these concerns. It is my sincere hope that FERC will deem the proposed pipeline both unnecessary and unwise, and will deny any permit for its construction.

Sincerely,

Susan F. Conger  
4 Main Street  
Montague, MA 01351

**20150828-5171**

**Trout Unlimited**

August 28, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, D.C. 20426

RE: Trout Unlimited comments on the scope of environmental impact statement for the Northeast Energy Direct Project, Docket No. PF14-22-000

Dear Ms. Bose:

Trout Unlimited hereby submits these comments, in response to the Notice of Intent to Prepare an Environmental Impact Statement for Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, published in the Federal Register on July 8, 2015. 80 FR 39095. These comments are submitted by Trout Unlimited, and its Pennsylvania, New York, Massachusetts, Connecticut and New Hampshire State Councils and our chapters in the affected area, representing more than 30,000 members, including: Lackawanna Valley Chapter, Al Hazzard Chapter, Upper Delaware Chapter, Dave Brandt Chapter, Clearwater Chapter, Homewaters Chapter, Catskill Mtn. Chapter, Deerfield River Watershed Chapter, Taconic Chapter, Millers River Chapter, Nor'East Chapter, Greater Boston Chapter, Farmington Valley Chapter, Great Bay Chapter and Merrimack Chapter (collectively "Trout Unlimited").

Trout Unlimited has reviewed the following documents associated with the proposed Northeast Energy Direct project (Docket No. PF14-22-000): original Resource Reports 1, 2, 3, 7 and 10, revised Resource Report 2, and related correspondence between the Federal Energy Regulatory Commission (Commission) or other agencies and Tennessee Gas Pipeline, LLC (Applicant).

On July 24, 2015, the Applicant filed a letter documenting changes to the project, along with revised Resource Reports 1-13 that reflect project changes and respond to hundreds of comments made by the Commission and other federal and state agencies on the original Resource Reports. Project changes and the revised Resource Reports were made available to the public 27 days into the 60-day scoping period and after six of the thirteen public scoping meetings had been held. Trout Unlimited strongly urges the Commission to re-start the scoping period and to require that additional hearings be held in the communities where hearings were held before the new project information and revised Resource Reports were filed, to allow for meaningful public participation in the required Environmental Impact Statement (EIS) scoping process. By not doing so, the Commission would be frustrating the public participation component of the National Environmental Policy Act process and limiting input on specific issues and concerns that may arise from the project changes and revised Resource Reports.

## General Comments

Trout Unlimited's mission is to conserve, protect, and restore North America's trout and salmon fisheries and their watersheds. To accomplish its mission, Trout Unlimited employs a comprehensive strategy to protect the highest quality trout and salmon habitat, reconnect high quality habitats with restored areas downstream through the augmentation of instream flows and barrier removals, and restore degraded habitats so that they again support healthy trout and salmon populations. Given the significant volume of new information released in the revised Resource Reports and the limited time available in the comment period to review these reports, Trout Unlimited's comments on the scoping document for the draft EIS for the planned Northeast Energy Direct project will focus on identifying the general impacts of the project on coldwater resources and identifying mitigation measures to limit or eliminate those impacts.

The Northeast Energy Direct project would involve the construction and operation of approximately 418 miles of new pipeline, pipeline looping and laterals (ranging from 12" diameter to 36" diameter) in multiple counties in Pennsylvania, New York, Massachusetts, New Hampshire and Connecticut. Construction of the planned facilities would temporarily disturb approximately 6,761 acres of land for the pipeline and above-ground facilities, not including temporary access roads. Approximately 2,602 acres would be maintained for permanent operation of the project's facilities, not including permanent access roads. Approximately 82 percent of the planned pipeline route parallels existing pipeline and utility rights-of-way.

Pursuant to the National Environmental Policy Act (NEPA), the Commission is required to consider the following actions and impacts, in determining the scope of the draft Environmental Impact Statement (EIS): (1) connected actions, cumulative actions and similar actions; (2) the no action alternative, other reasonable alternatives and mitigation measures not proposed in the action; and (3) direct, indirect and cumulative impacts. NEPA §102(2)(C); 40 C.F.R. §1508.25.

Given that the proposed preferred route for the Northeast Energy Direct project will cross, or is located near, more than 220 streams in Pennsylvania, New York, Massachusetts, New Hampshire and Connecticut that are designated as native or wild trout streams or have high trout habitat potential, Trout Unlimited strongly urges the Commission to specifically identify the potential direct, indirect and cumulative impacts to coldwater fisheries and their habitats in the draft EIS, and to propose avoidance measures where possible and mitigation measures where avoidance is not feasible.

## **ALTERNATIVES CONSTRUCTION TECHNIQUES**

Trout Unlimited strongly recommends that the draft EIS contain an analysis of smaller right-of-ways—at a minimum, a 50 foot right of way—for the entire length of the pipeline, based upon the use of alternative techniques for pipeline construction and placement such as stove-piping, dragging or other currently available methods that require less acreage for temporary and permanent workspace. By reducing the amount of land disturbed by the project, the Applicant will be reducing the risk of potential sedimentation events from exposed soil.

## **STREAM CROSSINGS**

### *Stream Designation*

According to revised Resource Report 2, the Applicant has yet to identify the water quality designation/fishery classification for 125 streams that are proposed to be crossed in New York. Stream/fisheries designations must be determined before the EIS is prepared, if the Commission is to identify potential impacts and mitigation needed to ensure that these 125 streams are not adversely impacted.

### *Pipeline Route*

*{map omitted}*

Depending on the size, timing, duration and methods employed, stream crossings can have significant impacts on aquatic ecosystems by altering stream morphology, process and function including instream habitat both upstream and downstream of the crossing location, as well as at the crossing location itself.

Trout Unlimited recommends that the pipeline route avoid alteration of stream hydrology, sediment trans-

port, and morphology by eliminating crossing streams of any size, including ephemeral streams, where possible. Where avoidance is not feasible, measures to reduce impacts should include site specific evaluations of construction activities. Stream crossings should be located downstream from all confluences to reduce the total number of stream crossings and the impacts on stream morphology at these convergent locations. For example, the EIS should evaluate whether the two proposed pipeline stream crossings on Weston Brook and Wahconah Falls Brook in the headwaters of the Housatonic watershed in Berkshire County, MA could be reduced to one stream crossing by moving the pipeline route southwest less than 0.1 mile.

Trout Unlimited strongly recommends that the Commission include in the draft EIS appropriate measures to reduce both short-term and long-term impacts to stream morphology and hydrology. This is particularly important given the importance of small headwater streams that serve as spawning reaches and thermal refuges for coldwater fish, including native and wild trout.

### ***Stream Crossing Methods***

Resource Report 2, section 2.2.11.1, describes the proposed methods that will be used for stream crossings, including: wet open cut, dry crossing methods (which could include flume, dam and pump, cofferdam and dry open cut), conventional bore, horizontal directional drilling (HDD) and Direct Pipe. While each of these methods is explained, the report fails to explain what information has been gathered during surveys and related analysis to inform which stream crossing method should be used, what criteria and type of evaluation process will be used by the Applicant to determine which crossing method is appropriate, and when, during the planning process, a final decision will be made on which method is appropriate for each stream crossing. As additional information is collected by the Applicant through surveys and the pipeline constructability analysis, Trout Unlimited urges the Applicant and Commission to make that information publicly available, in order to provide

interested parties such as Trout Unlimited with a meaningful opportunity to review stream crossing methods and make recommendations for avoiding or minimizing impacts to streams. Additionally, Trout Unlimited recommends that the conventional open cut wet crossing method not be used in any circumstances on any streams within watersheds that support native and wild trout.

Trout Unlimited recommends that the Applicant use HDD, conventional bore or Direct Pipe methods to cross sensitive streams, where feasible. HDD, conventional bore and Direct Pipe methods are preferred for stream crossings because they have the advantages of minimizing land disturbance, avoiding the need for dewatering the stream, leaving the immediate stream bed and banks intact, and reducing erosion, sedimentation and project-induced watercourse instabilities. Further, the Direct Pipe method is favorable for stream crossings over other methods, including HDD and open trench, because it is suitable for unconsolidated sand, gravel, and cobbles (such as river bottoms), virtually eliminates the risk of blowouts associated with HDD, and does not disturb the channel bed as compared to dry crossing methods. Because the Direct Pipe method presents the least amount of risk to stream systems, it should be evaluated for proposed crossings of native and wild trout streams.

The draft EIS should evaluate whether the use of HDD, conventional bore and Direct Pipe methods for each stream crossing is feasible, and where these methods are determined not to be feasible, provide a justification. Where HDD, conventional bore or Direct Pipe methods are proposed, the draft EIS should describe the typical work area required and protective measures that will be used to limit runoff of sediment and other fluids into streams, as well as describe a contingency plan if the HDD, conventional bore or Direct Pipe method fails and results in sediment and/or drilling fluid entering a stream.

If the dry crossing method is proposed, the Applicant should identify which type of dry crossing—whether dam and pump, flume, cofferdam, or dry open cut—will be used. Each type of dry crossing method has unique and individual impacts that must be considered on site-specific basis. In revised Resource Report 2, Attachment 2b, Tables 2.2-4 through 2.2-8, the Applicant describes its “dry crossing method” as dam and pump or flume, but does not distinguish between these two methods for each stream being crossed. Further, the tables do not include the other types of dry crossing methods that the Applicant stated in revised

Resource Report Section 2.2.11.1 that it would use, including cofferdam and dry open cut. In order for the Commission to identify the impacts of each stream crossing on stream hydrology and aquatic habitat and to propose appropriate mitigation measures, the specific type of dry crossing method proposed for each stream crossing must be identified in the draft EIS.

Field reconnaissance by pipeline personnel is necessary for the identification of stream crossings since many ephemeral and some perennial streams are not visible on topographical maps. Information that must be gathered during surveys and included in a draft EIS, in order to determine which type of crossing method should be used for each stream, what impacts may result, and what mitigation measures are needed, includes at a minimum:

- Geotechnical feasibility studies to determine if HDD, Direct Pipe or other conventional bore method is appropriate and feasible for each stream crossing;
- Proximity to the nearest confluence up and downstream;
- Stream discharge, channel gradient, channel sinuosity, stream substrate, cross-sectional surveys, channel debris and sediment storage, and stream order;
- Geomorphological data, including complete fluvial geomorphic characterization of the stream's hydraulic geometry, plan form, and profile, and information about bed and bank stability, scour depth and depth of pools; and
- A scour depth analysis either based upon measured pool depth or calculated scour for observed bed materials and design discharge, to determine the potential for vertical or lateral adjustment of each stream.

This information is necessary for a site-specific review of the proposed method and will provide an opportunity for Trout Unlimited and other interested parties to provide specific recommendations on mitigation measures appropriate for each specific stream crossing.

According to revised Resource Report Section 2.2.11, the Applicant is proposing to provide a minimum depth of cover of five feet over the pipeline across waterbodies, stating that “the proposed cover (of 5 feet) will generally provide adequate scour protection from high flows and flooding.” As part of the stream crossing method assessment, Trout Unlimited recommends that a hydraulic analysis be completed at each crossing to ensure that the pipeline is buried deep enough to remain undisturbed by scour and fill processes typically associated with peak flows that have the potential to negatively impact trout habitat. The appropriate pipe depth will vary for each stream and can only be determined by collecting the necessary information and performing a site-specific analysis at each site as part of the EIS process. Regardless of crossing method, the pipeline should be located at sufficient depth in and distance from the stream bed to accommodate any reasonably anticipated horizontal or vertical channel adjustment during the design life of the pipeline materials.

## **CONSTRUCTION ACTIVITIES, EROSION AND SEDIMENTATION CONTROLS**

As part of the planning process, the draft EIS should evaluate opportunities for sediment reduction at each phase of construction, giving specific attention to locations where the pipeline parallels a stream, and making sure that there is an adequate buffer between the excavation and the stream. The proposed pipeline project has the potential to impact many miles of headwater systems in steep terrain, even if the pipeline itself is not crossing the stream. Trout Unlimited urges the Commission to include in the draft EIS appropriate erosion control mitigation measures for each construction area proposed for slopes in excess of 15%. These should be site-specific plans that include a mechanism for ensuring that the erosion control measures are performing properly, as well as being maintained. Additionally, construction and earth disturbance activities on slopes in excess of 15% in headwater areas should be avoided or, at a minimum, limited.

Stream bank and soil disturbance occurring on or near streams during critical trout spawning and rearing stages can negatively impact coldwater species. At least 15 different direct negative effects from sedimentation have been demonstrated to impact trout, ranging from stress, altered behavior, reductions in growth and direct mortality.<sup>i</sup> The draft EIS should describe each proposed construction activity—in addition to the

stream crossing itself—and identify acceptable time frames for when the proposed construction near trout streams may take place, with the goal of avoiding impacts on critical life stages of coldwater species.

A preliminary stormwater pollution prevention plan (SWPPP) must be included as an appendix to the draft EIS, describing the proposed erosion and sediment control practices and post-construction stormwater management practices that will be used and constructed to reduce the pollutants, including increased water temperatures, in stormwater discharges. The draft EIS should include methods for isolating work areas from flowing waters to ensure that the work is accomplished such that no visible contrast to waters outside and downstream of the work site is apparent. Additionally, the draft EIS should discuss and evaluate how the various erosion control techniques described in the SWPPP will be coordinated within the construction schedule to avoid the potential for catastrophic sedimentation events. Extensive time delays between vegetation clearing/grubbing, initial grading of the right-of-way and actual installation of the pipe must be avoided and only a limited length of the project development area should be opened at any one time. Further, the presence of karst topography along the proposed primary route is of particular concern and warrants additional consideration in preparation of the SWPPP to ensure that by-products from the construction process do not enter karst inlets, including exposed soil, fuel, oil, hydraulic fluids and other construction-related chemicals. Where karst topography cannot be avoided, best management practices must be employed and strict attention to proper installation and maintenance of erosion and sediment controls in areas with karst topography is critical to minimizing impacts to water resources.

#### **SITE SPECIFIC DETERMINATION OF RIPARIAN BUFFERS AND SITE RESTORATION**

Due to the serious potential for erosion and sedimentation from construction activities occurring near streams to impact trout populations, Trout Unlimited recommends that the draft EIS include general minimal buffer setbacks for construction activities occurring on various slope grades, with a site-specific determination for each construction activity occurring near any stream supporting trout or trout reproduction, to determine if the buffer width for each stream should be greater than the general minimal buffer distance.

Regardless of the type of crossing method, the Commission should require the Applicant—with input from appropriate agencies and groups such as Trout Unlimited—to develop a stream restoration plan for each stream crossing as part of the EIS process. At a minimum, the restored stream channel should be comparable in width, depth, slope, and substrate to upstream and downstream reaches, and should be constructed of native materials similar in condition, appearance, type, composition and species to those in the vicinity of the crossing including, but not limited to, wood, rock, and vegetation. Stream restoration activities should resemble pre-construction conditions. Stream restoration plans should also ensure that the resulting re-construction does not impede natural channel processes, such as lateral channel migration, vertical adjustment (bed aggradation/degradation), or the transport of sediment, wood and ice.

Trout Unlimited recommends that the Commission require the Applicant to explain how pre-construction conditions will be restored at each stream crossing location or the methods for documenting existing conditions and how that information will be used to guide stream reconstruction activities, prior to the Commission's preparation of the draft EIS. Without this information, the Commission cannot reasonably identify the potential impacts of this project, nor can

the Commission identify which mitigation measure will limit or eliminate impacts on stream form, process, and function and its dependent aquatic life.

#### **HYDROSTATIC TESTING**

Prior to performing hydrostatic testing, the impacts of such testing on aquatic life (both fish and invertebrates) must be determined for all streams that support native or wild trout populations. If large quantities of water are to be removed from the stream, there may be an adverse impact on stream temperature and water levels, which are critical for fish health and habitat. Bypass flows must be required and strictly adhered to, in order to ensure that adequate stream flows are maintained to support aquatic life. Discharge of hydrostatic testing water must be through barriers that permit filtration of sediments contained in the discharge, and also

to allow the water temperature to cool to its pre-withdrawal temperature. In order to determine the potential impacts from hydrostatic testing, the Commission must include the above-identified information in the draft EIS so that appropriate mitigation measures are thoroughly developed, publicly-vetted and included in the final EIS.

## **MONITORING**

A monitoring plan should be developed for each stream crossing and tailored to evaluate potential biological and morphological impacts to the aquatic system. Pre-construction monitoring will provide baseline data to evaluate potential impacts. During construction, real-time monitoring devices should be installed to capture changes in water quality as a result of construction activities. Post-construction monitoring should consider immediate and long term impacts to the stream system. Trout Unlimited recommends that the Commission require the Applicant to develop a monitoring plan for each phase of development, including pre-construction, during construction and post-construction, and that monitoring be conducted by an independent third-party.

## **CUMULATIVE IMPACTS**

To comply with the NEPA, the Commission must conduct a comprehensive analysis of the incremental impacts of the project when considered in addition to other past, present, and reasonably foreseeable future actions. NEPA requires the Commission to conduct a detailed and useful analysis of cumulative effects, not just describe the anticipated impacts. The analysis must include information about the baseline impacts of other actions and the incremental impact of the current project will have on existing projects and reasonably foreseeable future projects and it must include detailed data and explanation to support the Commission's findings.

Given the significant number of native and wild trout streams that will be crossed by the project, Trout Unlimited strongly urges the Commission to conduct a comprehensive analysis of the cumulative impacts of constructing the pipeline on native and wild trout populations and the water resources they rely upon, including among other aspects: crossing and disturbing significant acreage in watersheds that support native and wild trout populations; constructing the pipeline on steep slopes in excess of 15%; multiple crossings of streams in watersheds that support native and wild trout populations; and water withdrawals from trout streams for hydrostatic testing.

NEPA requires the Commission to take a hard look at the proposed project within the context of past, present and future activities and it requires the Commission to conduct an analysis of the cumulative harm that results from the proposed action's contribution to existing adverse conditions or uses in the area. Therefore, Trout Unlimited urges the Commission to conduct a thorough analysis of the proposed project's impacts in light of other existing and foreseeable natural gas pipeline infrastructure. For example, while co-location of this project with the Constitution Pipeline may have the advantage of reducing forest fragmentation, the Commission must fully evaluate the direct, indirect and cumulative impacts to streams and aquatic life from multiple phases of construction, likely just a year apart, in the same corridor. The project's construction will have additive impacts on the streams where the pipelines will cross, including long-term degradation in water quality from sedimentation, effects on stream stability from multiple stream disturbances, and potential impacts on aquatic life and function.

Declines in water quality directly affect Eastern Brook Trout, the East's only stream-dwelling native trout, and a species whose survival depends on a steady supply of clean, cold water. A recent assessment found that brook trout are either greatly reduced or have vanished from 50 percent of their historic range, and are at risk of disappearing from other areas.<sup>ii</sup> The report found that two of the major impacts to brook trout are instream habitat alteration and sedimentation due to road crossings and construction—two impacts that will result from this proposed project. Significant efforts have been made by Trout Unlimited, federal and state agencies, and other partners to improve water quality and stream habitat in the areas affected by this project, so that streams that have historically supported native Eastern Brook Trout can once again support thriving

populations.

In conclusion, Trout Unlimited strongly urges the Commission to prepare an EIS that fully considers the potential direct, indirect and cumulative impacts of the Northeast Energy Direct project on coldwater streams and avoids water quality degradation and other stream health impacts, so that years of progress to restore native Eastern Brook Trout to its historic range is not undone.

Thank you for your consideration of Trout Unlimited's comments. Please do not hesitate to contact Katy Dunlap, kdunlap@tu.org or 607-703-0256, if you require additional information or clarification.

Sincerely,

Katy Dunlap

Dear FERC Commissioners,

REFERENCE: EIS Pre-filing scoping comments for PF14-22 TGP Northeast Direct Project (NED)

**General:**

Conway is located in Pioneer valley near the foothills of the Berkshires, heavily forested and pastured with little industrial and commercial business. As there are no National Forest Parks located in Massachusetts; the State, various land conservation agencies, and private citizens in western Massachusetts have undertaken a concerted effort to preserve its pristine environments, many of which are protected by conservation restrictions authorized under Article 97 of Massachusetts Law. These lands should be deemed as valuable if not more valuable as lands preserved with Federal dollars. The Kinder Morgan TGP NED project is poised to disrupt or destroy many of the environmentally sensitive areas along and adjacent to its proposed path. To prevent or mitigate the detrimental effects of the proposed pipeline and to minimize the inherent associated safety and environmental risks with pipeline construction and operation the Planning Board of Conway recommends the following for your consideration in the EIS scoping process:

**Pipeline diameter, design strength, operational pressure and LNG storage:**

The potential impact blast radius (PIR) from a pipeline explosion has been shown to be correlated with pipeline diameter and operational pressure. The 30" pipeline as currently proposed for the 1.3 Bcf/day natural gas (NG) flow capacity will operate at pressures that correlate with a predicted blast radius of 800 feet and represent an unnecessarily high risk for our community. FERC should insist that the pipeline be sized to meet the projected natural gas demands of only the Northeast, allowing for little or no growth as new alternate sources of electrical energy, such as hydro, solar, and wind become mainstream sources of energy. Selection of the smallest possible pipeline required to serve the Northeast's energy demands will significantly reduce any associated risks to our community. LNG storage should be investigated as an alternative to increased pipeline capacity to address peak winter NG flow demands to the Northeast.

**PHMSA's Pipeline Safety program:**

The Pipeline and Hazardous Materials Safety Administration (PHMSA) was charged (P.L. 112-90) in 2011 with developing and implementing interstate pipeline law to provide safety and environmental protection in the transportation of natural gas by pipelines. There are 42 Congressional mandates to be included in the reforms, requirements, and programs established under the law. That law is scheduled to expire in September 2015 with potentially unimplemented mandates. The current law requires pipeline operators to implement these mandated requirements within one year of promulgation on new or replacement pipelines. Given the enormity of this proposed NED pipeline project and its associated safety and environmental risks, TGP should be required to comply with all current and future mandated requirements that are promulgated under the law, or alternatively delay construction and/or operation until these important mandated requirements can be included in this project.

**Noise:**

Current Federal standards of 55 dba for allowable noise levels from pipeline operation do not account for the current ambient background conditions that exist in our community. Noise abatement technology exists today to minimize radiated noise from point sources. Given the topography of our town with its rolling hills and valleys that reflect sound we recommend that the allowable noise standard be no net gain in ambient noise at the TGP property borders. We request pre- construction and operational sound level monitoring to establish compliance with these requirements.

**Methane releases:**

TGP has proposed that pipeline valves and safety blow-offs be located on a ridgeline north of the town population center. The town's population center is surrounded by hills and has been commonly known to be colder than the surrounding hill tops. While compressed NG in pipelines is presumed to be warmer than the ambient groundcover, rapidly expanding NG associated with routine or emergency venting is anticipated to be significantly colder than the ambient air. This denser, colder NG containing residual shale fracking chemicals could, with prevailing winds, drift to our town center resulting in potential health and safety issues, and potential contamination of organic farming product operations. We request that air quality sampling be conducted to establish pre-construction background levels of known possible harmful chemicals.

**Potential Aquifer and Groundwater Contamination:**

While Conway's drinking water needs are served by private shallow and deep wells, it also serves as a watershed area for Deerfield's and Northampton's water reservoirs. Any risk assessments involving blasting, channelization of bedrock, horizontal direction drilling, etc. should include the potential impacts to these watershed resources.

**General Support:**

The Conway Planning Board in concert with other town boards and the Franklin Regional Council of Government (FRCOG) has submitted additional topics and concerns for the EIS which are supported by the Planning Board and included by reference thereof.

Respectfully submitted,  
Conway MA Planning Board

**Monadnock Conservancy**

Together; protecting forever the land we love

August 28, 2015

Ms. Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE: Northeast Energy Direct Project, Docket N. PF-14-22-000

Dear Ms. Bose, and To Whom It May Concern;

We at the Monadnock Conservancy are grateful for the opportunity to provide comment on the proposed Northeast Energy Direct Project (NED) and our recommendations of considerations to be made in the associated Environmental Impact Statement (EIS) now in development.

The Monadnock Conservancy recently celebrated its 26th anniversary as the only land trust dedicated exclusively to the protection of natural resources, wild and working lands, rural character and scenic beauty of the Monadnock region of southwestern New Hampshire. We currently protect nearly 17,000 acres of conservation easement lands across 37 towns, and we own and manage more than 1,000 additional acres of conserved lands. Two of our conservation easement properties are located directly within the proposed NED corridor: the Towne Hill Fairmount Farm conservation easement, and the Converse Meadow conservation easement, both in Rindge. We are opposed to new utility infrastructure, including the NED, traversing preexisting conservation areas of any kind. Conservation areas represent significant public investments of resources and are established in the public interest, which is arguably greater than the public interest of the NED.

Substantial public dollars go into identifying, purchasing and stewarding conservation land forever, which in turn provides tangible and valuable public benefit through ecosystem services, recreational opportunities and scenic value. Federal Treasury regulations and the Internal Revenue Code pertaining to conservation transactions and land trusts support this assertion, as does charitable trust law here in the State of New Hampshire. Therefore, New Hampshire's conservation land should only be used for new utility corridors as a last resort, and only when the public need is overwhelming and no other route is feasible. Further, we request that, if conservation areas must be impacted, compensation paid by the project developer to holders of conservation land and conservation easements should account not only for the loss of directly impacted real estate, but also for the ecosystem services and other conservation values compromised by both direct and indirect impacts.

We are aware that the federal Natural Gas Act grants private natural gas companies that have received a FERC certificate of public convenience and necessity the power of condemnation through eminent domain proceedings. This authority is a powerful tool providing significant regulatory advantage over landowners. Therefore, FERC must exercise extreme diligence and restraint before granting such power. Given that staff of the New Hampshire Public Utilities Commission recommended that the Commission deny Liberty Utilities' Petition for Approval of a Firm Transportation Agreement with Tennessee Gas Pipeline Company,

LLCI related to the NED Project, we do not feel that substantial public ‘convenience and necessity’ has been demonstrated to warrant condemnation of conservation lands. Removing permanent restrictions on conservation land for a temporary utility use (30-50 years) is unwise. We encourage the Commission to require conditions in its certification process that totally avoid impacts to conserved lands such as ours.

Regarding our conservation lands specifically, over the last several months we have begun to assess the potential impacts the NED project could have on our Towne Hill and Converse Meadow conservation easements and their natural resources. Our recent assessments of these properties discovered many significant natural resources that warrant avoidance<sup>2</sup> These resources contribute to the high level of ecological integrity found on these two properties and include:

- Intermittent and perennial streams delineated by the NH Department of Environmental Services.
- 20 acres of palustrine wetlands, more than 16 acres of which have a high probability of meeting NH state criteria for prime wetland designation under RSA 482-A:15. These 16 acres comprise more than twice the total wetland acres listed for the entire Town of Rindge in NED Resource Report 2, Water Use and Quality, Table 2.3-8 (page 98), dated July 2015.
- Occurrences of two animal species of special concern according to the NH Natural Heritage Bureau. One of these two species of special concern is the ebony boghaunter (*Williamsonia fletcheri*), which is not listed in NED Resource Report 3, “Fish, Wildlife and Vegetation”, section 3.4.1.5, dated July 2015.
- Potential occurrences of several endangered plant and animal species according to the NH Natural Heritage Bureau.
- Natural community types not included in NED Resource Report 3, “Fish, Wildlife and Vegetation”, dated July 2015 or in NED Resource Report 2, “Water Use and Quality”, section 2.3.1.4, dated July 2015.
- Hydrologic connectivity to portions of a stratified drift aquifer which has the potential to serve as a source for municipal drinking water, as delineated by the NH Department of Environmental Services.
- Documented turtle nesting habitat and rare snake habitat<sup>3</sup>

We are concerned that potential impacts to the above resources resulting from construction and maintenance associated with the NED project ‘would severely degrade the conservation values protected by and for the public of the State of New Hampshire and visitors to these properties. For this reason and those stated previously, we oppose siting the NED project on our conservation lands.

Finally, in the interest of greater natural resource conservation, we expect that the draft Environmental Impact Statement (eEIS) for this project will include inventory and consideration of the following natural resources on all potentially impacted lands: wetland and vernal pool complexes, floodplains and riparian corridors, seeps, bogs and fens, unfragmented forest blocks, rare plant and animal occurrences, rare natural communities, important agricultural soils, highranking wildlife habitat and migratory bird habitats.

Sincerely

Ryan Owens  
Executive Director

**20150828-5219**

To: Federal Energy Regulatory Commission (FERC)  
Filing Party: Troy Conservation Commission, Troy, NH  
Docket: PF 14-22-000 (Applicant - Tennessee Gas Pipeline Company, L.L.c.) Date: August 2015

The Troy Conservation Commission (Troy NH) requests that FERC address the following comments when preparing an Environmental Impact Statement regarding the Northeast Energy Direct Project proposed by Tennessee Gas Pipeline Company and / or Kinder Morgan (Docket PF:14-22-000).

**Subject: Construction (National Park Service) - Comment Number TCC146**

Please determine all properties acquired and/or developed with LWCF (Land & Water Conservation Fund) assistance. There are parcels of land in the NED project path that were acquired or developed with LWCF assistance.

**Subject: Construction (National Park Service) - Comment Number TCC147**

Please determine the process to ensure the NED project complies with all the conversion provisions of Section 6(f)(3) of the LWCF Act, 36 CFR Part 59. These rules are applicable to each and every area or facility for which LWCF assistance was obtained.

**Subject: Construction (Conservation) - Comment Number TCC148**

Please determine how the towns will be compensated for the lost tax dollars surrendered (in some cases for decades) for conservation lands currently threatened by the NED project in South Western NH.

**Subject: Construction (Conservation) - Comment Number TCC149**

Please determine how the violation of lifetime gifts by donors who deeded lands to be conserved “in perpetuity” will be fairly discharged due to the NED project in South Western NH.

**20150828-5229**

Re: Docket No; CP14-529 (copied to PF14-22)  
Ms. Kimberly Bose, Secretary  
Federal Energy Regulatory Commission (FERC)  
888 First Street NE, Room 1A  
Washington, DC 20426

Dear Ms. Bose,

I recently discussed the realities of pipeline repair with the Pipeline and Hazardous Materials Safety Administration (PHMSA). Regular pipeline maintenance is not something that is regulated with respect to the protection of resources (environmental) by PHMSA. This makes sense because protection of the “non-human” environment is not part of PHMSA jurisdiction. That being said:

In the long term, a pipeline will have repairs. Some of the repairs may be necessary in places where other

entities do have jurisdiction. For example:

In 2014, maintenance was necessary along the pipelines located in Sandisfield, MA. The repairs/maintenance were discovered by a pigging operation done in 2012. TGP had the information at some point in time, about the necessary repair/maintenance, and they planned this repair, in part, based on their maintenance budget. The local Conservation Commission was informed about the planned work, in 2014, only days before the work was to be done, but many months after the work was planned. The work was presented to the Commission as an “emergency”.

Needless to say, the Sandisfield Conservation Commission did not dispute the “need” for the repairs/maintenance, and the wetlands in the areas of “maintenance” were not protected.

In the future, (CP14-529) what procedures will be required by the various jurisdictional agencies who do have authority over protection of the environment (non-human) about this issue?

Since the Sandisfield Conservation Commission has already been lied to about an “emergency” situation, should they assume that any further “emergency” is without basis? Which authority can over rule the Sandisfield Conservation Commission in the possibility of future “emergencies” claimed by TGP, and will they (the authority) be held accountable for the damage to the environment in Sandisfield if there is no “emergency”?

Obviously, TGP filing a NOI in Sandisfield, MA, for work in wetlands, prior to doing work would, in a maintenance situation, be responsible, and allow for protection of the environment.

I would think the FERC would agree, and would ask, in addition to clarifying what procedures for routine maintenance of the pipe line (not ROW) should be followed for CP14-529, that some consideration be given to how the environment already disrupted by the previously installed lines can be protected in the future.

I believe that the Director of the Office of Energy Projects might have delegation authority to take whatever steps are necessary to ensure the protection of all environmental resources during construction and, more importantly, operation of the previous projects. Who should be contacted at OEP or has the authority been delegated, and if so, to whom?

Sincerely,

Susan Baxter

Subject: Docket Number PF14-22-000 Northeast Energy Direct Pipeline Project

Dear Secretary Bose:

In evaluating the environmental and related social and economic effects of the proposed NED pipeline, please consider the impacts on all of the natural and human resources identified at the scoping hearing in Greenfield and at all of the scoping hearings, as well as in all of the written comments submitted to you, in respect to:

- local habitats, both animal and human. Please look at the prospective fragmentation of habitats including forests, wetlands, and waterways. Please consider the effects of this project on agricultural lands and soils, noting for example the fact that organic farmers may have invested decades of labor in establishing soils, and may not have capacity to start over in other locations. Please examine the consequences for local geological formations, including karst and seismic areas. Please examine the likely incalculable damage to parks, conservation land and nature reserves, and recreational areas. Please investigate the predictable harm to state and federally listed endangered and sensitive species. Please assess carefully the prospective harm to ground and surface water, including wells, aquifers, reservoirs, rivers, lakes, ponds, and wetlands.
- the societal contexts, involving local and regional interests, and the wider society. Please look into prospective harms to historic places, and to the quality and character of the region. Please inquire into the effects of the project on first responders' safety and evacuation plans, on their ability to enforce property use rights on rights of way (including illegal snowmobile use), and their ability to meet an increased threat of terrorism. Please look into environmental justice concerns involving low income, minority and tribal communities who would be affected by this project.
- the impact of the project on local economies that are dependent on aesthetics and on natural and wild settings, or are dependent on certified organic status of farming practices, and that would suffer declines in local property values as well as insurmountable insurance issues.
- the cumulative effects of the project, by itself and in conjunction with existing and other proposed pipelines, on all of these values stated above over time, together with the cumulative effects of drilling fields, LNG and shipping facilities that would also fall inside the network of this project.
- the consequences for climate change, remembering both the guidelines issued in December 2014 by the Council on Environmental Quality for NEPA reviews to include potential greenhouse gas emissions and climate change impacts of projects, and the stipulations of the Massachusetts Global Warming Solutions Act.

Please require that Kinder Morgan pay for air quality testing and tests of all potentially affected wells and septic systems both before and after execution of the pipeline project.

Please study the very toxic coating used for lining the pipelines, in relation to all natural and human contexts in which the coating substances could be expressed, both in regular operations and in the event of any rupture or other accidents.

In regard to public health and safety impacts, please investigate the likely harm at blowdown sites, such as compressor, metering and valve stations. Please study the zones that are within a blast radius of the project, including neighborhoods, schools, hospitals, and senior facilities. Please study the likely impacts to air and water quality during construction and operation of the project.

In regard to local infrastructure, please analyze the effects of construction and operation of this project on all affected roads, water sources, and utilities. Please study and assess the effects of blasting on water wells and septic systems. Please evaluate the effects of heavy equipment on local roads during construction as well as maintenance of the proposed pipeline. Please examine the feasibility of forming emergency plans for infrastructure within the blast radius of the project, including roads, bridges, water, sewer, and power resources. Please consider questions of what training and compensation responders to such emergencies would receive, and at what societal cost they would receive it.

In regard to the impacts of construction and maintenance of the project, please include in your evaluation a consideration of the pipeline right of way, temporary work zones and staging areas. Please assess the impact of heavy equipment on roadways and temporary access roads. Please look into the environmental and agricultural effects of maintaining the right of way, including the consequences of chemical defoliation and the spread of invasive species. Please evaluate the question of where temporary crews would be housed, and how that would impact local towns in terms of law enforcement, public health, and rescue costs. I request that you require detailed plans for each town along the pipeline route and in neighboring towns that have only voluntary responders. Please remember that Massachusetts has an open trench law requiring that any dug trench measuring 3 feet or more that is left open overnight must be guarded or fenced, as a part of

the requirements in safeguarding the project if it were to go forward.

Please require the public release of a potential impact radius disclosure for every affected property and for the entire pipeline project, including for private homes, schools, hospitals, historic sites, places of archaeological or artifact concern, conservation and open space easements, preserved farmland, organically certified farmland, and all farmland, scenic and recreational sites, wetlands and stream crossings, and forests.

In regard to impacts on endangered species, I call upon FERC to go out and canvas the populations to be adversely affected, since we do not know where they are.

In regard to social harms of the project, I ask you to recognize that the affected region enjoys a tourism economy, and to consider how the project would impact that economy and the likelihood that people would stay in the region. I ask you to be thorough and fair in assessing how many people would be affected by this project, and what would be the economic loss, especially to communities that are already vulnerable. Please consider, also, that within the impact area of the compressor stations, people would receive no compensation, and that, along the path of the pipeline itself, compensation would be inadequate.

Please note in your considerations that the New England Scenic Trail has the same protected status as the Appalachian Trail.

In regard to the harms of this project for climate change, please count the huge and deliberate venting that is planned to take place at compressor stations.

I request that you provide data throughout your consideration of harms, and that your gathering of data be direct, and independent of the developer that has a financial incentive to minimize the environmental, social, and economic damage that would result from this project. I ask you to use established, reproducible scientific methods (including defining a question and gathering information and resources), supply the appropriate scientific controls, have your research peer reviewed, and publish the data so that the public will have access to it.

In regard to each subject of study, please include an analysis of the severity of all impacts, and the direct and indirect effects of pipeline construction and operation in each category. Please evaluate how Kinder Morgan would try to avoid impacting existing assets and, if they are not able to avoid impact, how would they minimize impact, and if they could minimize harm to a high standard of protection. Please state how you would monitor mitigation areas, and provide a detailed description of how problem areas would be resolved when all other mitigation attempts had failed.

Please examine the main subject areas of the thirteen Resource Reports, and Considerations during Construction and Operation. Please evaluate Kinder Morgan's claim of a need for the pipeline, and ask yourselves the questions that you have been asking Kinder Morgan.

Please consider Energy Efficiency as an alternative to this project, recognizing that, under Section 1502.16(e), NEPA specifically requires consideration of this resource. In evaluating the potential for Energy Efficiency as an alternative to this project, please consider what would be possible with a full societal commitment to the recovery of this resource. Please include in your assessment what would be a reasonable benefit of repairing leaks in existing gas pipelines in Massachusetts.

Where NEPA mandates that agencies discuss "energy requirements and conservation potential of various alternatives and mitigation measures", please consider as well the potential resources of wind and solar electricity production in Massachusetts. Also, please evaluate the possibility that some existing oil burning plants could be retooled for use in the event of an emergency. Please consider that there exist pipelines to bring natural gas from Canada, and facilities to bring LNG in to Massachusetts by ship. Please consider the potential for bringing more hydro power down to Massachusetts from Canada, and wind power from Maine.

I request that you faithfully execute your duty to analyze all of the areas of study listed here and in all of the other comments on the harms that would follow from the pipeline project, and on reasonable alternatives to the project. Finally, I ask you to consider what would be the impacts of not building the pipeline.

Yours Sincerely,  
Mary H. Hall

**for the North East, Inc.**

August 28, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20216

Re: Docket No. PF14-22, TGP Northeast Energy Direct – Scoping: Air Quality & Noise

Dear Secretary Bose:

The Pipe Line Awareness Network for the Northeast, Inc. (PLAN) submits these comments to inform the scope of the Commission's environmental impact statement for the proposed Northeast Energy Direct project with respect to air quality and noise issues. PLAN reserves our rights to file additional scoping comments in September, as we have been informed that the comment period will be extended. We note that a minimum two-week extension of the comment period was mentioned in the August 20th interagency call notes, but such extension has not been formally noticed as of the filing of this comment.

**Scope of the Proposed Action and Alternatives**

PLAN respectfully requests the Commission, in its assessment of the project:

- (1) Rigorously explore and objectively evaluate all reasonable clean energy alternatives to natural gas in the region, including alternatives involving energy efficiency and energy storage;
- (2) Rigorously explore and objectively evaluate all reasonable siting alternatives including, but not limited to, areas not adjacent to or upwind of the Ozone Transport Region, and areas not adjacent to or upwind of nonattainment or maintenance areas for the 8-hour Ozone National Ambient Air Quality Standards (NAAQS); and
- (3) Insofar as the examination of clean energy alternatives, emission controls, and additional siting alternatives may meet any public purpose of or need for the proposed project, such alternatives and controls cannot be removed in good conscience from detailed study; therefore, please ensure that substantial treatment is devoted to each alternative throughout the evaluation process so that reviewers may evaluate their comparative merits. Systematic exclusion of viable alternatives may not meet the letter, nor the spirit, of your primary mandate.

**Criteria Pollutants and Hazardous Air Pollutants**

We understand that the currently proposed project is within areas that are considered nonattainment for the 8-hour Ozone the NAAQS. In addition, there are nonattainment and/or maintenance areas in all upwind (and downwind) directions (i.e. north, south, east, and west) of the proposed pipeline and its components. The nine compressor stations combined account for power generation comparable to a new mid-sized power plant in the area. However, because the project is spread throughout several regions and states, the project systematically divides the siting and regulatory process into smaller more navigable components. This segmenting may allow for the incremental approval of the entire project, while eastern New York and the New

England states will shoulder the majority of the downwind effects

<b>Compressor Station</b>	<b>County, State</b>	<b>Air Quality Control Region</b>	<b>Attainment Status</b>
Station 319 Upgrades	Bradford, PA	Northeast Pennsylvania-Upper Delaware Valley Interstate AQCR	Unclassifiable
Supply Path Head Station	Susquehanna, PA	Northeast Pennsylvania-Upper Delaware Valley Interstate AQCR	Attainment
Supply Path Mid Station	Delaware, NY	Southern Tier East Intrastate AQCR	Attainment
Supply Path Tail Station	Schoharie, NY	Hudson Valley Intrastate AQCR	1997 O3 Marginal
Market Path Head Station	Schoharie, NY	Hudson Valley Intrastate AQCR	1997 O3 Marginal
Market Path Mid Station 1	Rensselaer, NY	Hudson Valley Intrastate AQCR	1997 O3 Marginal
Market Path Mid Station 2	Berkshire, MA	Berkshire Intrastate AQCR	1997 O3 Moderate
Market Path Mid Station 3	Franklin, MA	Hartford-New Haven-Springfield Interstate AQCR	1997 O3 Moderate
Market Path Mid Station 4	Hillsborough, NH	Merrimack Valley-Southern New Hampshire Interstate AQCR	Attainment
Market Path Tail Station	Middlesex, MA	Merrimack Valley-Southern New Hampshire Interstate AQCR	1997 O3 Moderate

The proposed facility locations are effectively spread over several states and nonattainment areas within the Ozone Transport Region (OTR). This allows the project systematically avoid the strictest requirements and controls outlined in individual states' State Implementation Plan (SIP) of the Clean Air Act (CAA); while at the same time, the proposed activity will generate air pollutants and their precursors that are known to have the ability to be transported regionally from one airshed to another.

In short, we have concerns about the potential for pollutants of interest to form within and/or migrate downwind from Pennsylvania and New York and have adverse effects on the health and welfare in areas downwind, and to potentially interfere with adjacent areas' ability to attain and/or maintain the NAAQS. Therefore, we respectfully request the Commission, in its assessment of the project:

- (1) Include all associated areas spanned by project and all downwind areas including the Metropolitan Boston Intrastate AQCR, the Merrimack Valley-Southern New Hampshire Interstate AQCR, the Berkshire Intrastate AQCR, and the Central Massachusetts Intrastate AQCRs within the in the Region of Interest (ROI);
- (2) Include a discussion about the new 8-hour Ozone NAAQS and the PM2.5 nonattainment status of areas and counties adjacent to the project;
- (3) Include a discussion about the potential for health effects associated with 8-hour ozone levels in the range of 0.060-0.070 parts per million (ppm) as outlined by the US Environmental Protection Agency's (USEPA) Clean Air Scientific Advisory Committee.

- (4) Quantify the proposed facilities potential to emit all criteria pollutants and hazardous air pollutants;
- (5) Discuss in detail the expected permit status of the facility including but not limited to Prevention of Significant Deterioration (PSD), New Source Review, and Title V. Due to the “no backsliding” provisions of the Clean Air Act, these assessments should be made as if the areas (where appropriate) were still nonattainment areas for the 1-hour NAAQS;
- (6) Discuss the plan for the proposed facilities to comply with the National Emissions Standards for Hazardous Air Pollutants (NESHAPs) and the New Source Performance Standards (NSPS); and
- (7) Rigorously explore and objectively evaluate all emission control alternatives for the proposed compressors stations including, but not limited to, the Lowest Achievable Emission Rate (LAER) for NO<sub>x</sub> and carbon sequestration for CO<sub>2</sub>.

The CAA is not all-inclusive. The CAA does not specifically address direct effects of the proposed action and alternatives on human health and the environment. In addition, the CAA focus is on evaluating and limiting air emissions within the confines of a specific region, although it is well understood that such emissions are transported inter-regionally. Therefore, to help ensure the protection of human health and welfare for individuals, we respectfully request the Commission, in its assessment of the project:

- (8) Include specific health-based and epidemiological criteria to determine the significance to air quality under NEPA, for example, 0.060-0.070 parts per million (ppm) as outlined by the USEPA’s Clean Air Scientific Advisory Committee;
- (9) Quantify all actual direct and indirect emissions of the criteria pollutants from the proposed action and alternatives;
- (10) Include in the analysis all emissions from the construction and operation of the project components as well as all the natural gas that will be transported to and burned within the areas in the ROI;
- (11) Quantify the expected change in ground-level ozone concentrations in the AQCRs in the ROI from the proposed action, including the maximum-modeled change;
- (12) Quantify the effects to human health and welfare in terms of number of people exposed to the criteria pollutants, and the number of people that would develop adverse health effects from the exposure. Please break the analysis down to the county level;
- (13) Quantify the number of individuals in the AQCRs in the ROI that would develop and or have additional heart trouble, lung disease, and asthma-associated health effects due to elevated ozone levels. Please break the analysis down to the county level, and differentiate for adults, children, and the elderly;
- (14) Quantify the effects to human health and welfare to children; people with lung disease, such as asthma, emphysema, or chronic bronchitis; and older adults. Please break the analysis down to the county level, and differentiate for the different sensitive groups; and
- (15) Quantify the indirect cost of all indirect costs associated with effects to human health and welfare, including health care cost, insurance cost, loss of wages, unemployment insurance, and reduction in productivity.

In addition, to help ensure the timely attainment and continued maintenance of the NAAQS in adjacent regions, we respectfully request the Commission, in its assessment of the project:

- (16) Quantify the expected change in ground level ozone concentrations at the regional monitoring stations within AQCRs in the ROI;
- (17) Discuss the effects the proposed action will have on the ability of these regions to obtain and maintain the NAAQS, and what additional controls if any these regions would need to implement to achieve attainment; and
- (18) Discuss reductions-by-design, emission controls, emission offsets, and other mitigation that would be implemented to reduce air quality impacts of criteria pollutants and HAPs below the significance level.

## **Greenhouse Gases**

The CAA specifically states that USEPA “shall” (i.e. must, not may) regulate dangerous pollutants once they are found to endanger public health or welfare. Based on an April 2007 Supreme Court decision, USEPA is currently preparing rules regulating global warming pollution from all major sources. These rules are expected to be implemented during the timeframe of the proposed action, and are expected take the form of a cap-and-trade system inherent to all Federal air regulations. The timing of the proposed action seems suspect and specifically designed to take advantage of the gap in final regulations regarding Green House Gas (GHG) emissions. Therefore, we respectfully request the Commission, in its assessment of the project:

- (19) Include a discussion of the existing global environment with respect to greenhouse gas emissions;
- (20) Include a discussion of existing GHG control technologies;
- (21) Include an analysis pertaining to any final, draft, or reasonably foreseeable federal or state regulations or guidances regarding GHG emissions; and
- (22) Include in the analysis all emissions from the construction and operation of the project components as well as all the natural gas that will be transported by the proposed pipeline and burned.

Cumulative impacts are the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time. Keeping this in mind, we respectfully request the Commission, in its assessment of the project:

- (23) Quantify all direct and indirect GHG emissions from the proposed action and alternatives;
- (24) Quantify all cumulative GHG emissions including those from the proposed action plus all other past, present, and reasonably foreseeable actions;
- (25) Discuss the potential for the cumulative GHG emissions to affect the global environment;
- (26) Discuss the ability of the proposed facilities to comply with the pending/reasonably foreseeable regulations for GHG emissions;
- (27) Discuss reductions-by-design, emission controls, emission offsets, and other mitigation that would be implemented to reduce air quality impacts of GHG emission below the significance level;
- (28) Include in the analysis all emissions from the construction and operation of the project components;
- (29) Include in the analysis all the natural gas that will be transported by the proposed pipeline and burned; and
- (30) Include in the analysis all emissions from the future leaking of the system, and intentional and unintentional venting of natural gas into the environment.

## **Noise**

FERC regulations require the noise associated with project components not exceed 55 dBA Day- Night-Level (DNL) at any nearby residence. Several states have more stringent regulations; for example, Massachusetts regulations require the noise associated with project components not increase the ambient noise levels at the edge of the right-of-way or property boundary by greater than 10 dBA.

The Commonwealth of Massachusetts defines “ambient” as the background A-weighted sound level that is exceeded 90% of the time, measured during equipment operating hours (i.e. L90). The proposed compressor stations and numerous other components of the project would generate significant noise. We respectfully request the Commission require the applicant to comply with all state and local noise regulations and specifically as that the Commission, in its assessment of the project:

- (1) Compel the applicant to conduct before-construction noise surveys to accurately identify baseline noise as outlined in the state noise regulations. These surveys should be conducted over the period of days or weeks, and during the winter months, so as not to systematically introduce seasonal vegetation

and insect noise into the background readings;

(2) Background noise survey should be conducted at all project components that would have permanent or semi-permanent noise sources, including but not limited to proposed compressor stations, blow-down valve locations, and HDD sites;

(3) Include all nearby residences as well as any area within audible distance to the facilities that is zoned residential or has the ability to be developed residential in the future;

(4) Compel the applicant to prepare and provide a detailed noise assessment outlining how both the FERC and state noise regulations will be met for all project components that would have permanent or semi-permanent noise sources, including but not limited to proposed compressor stations, blow-down valve locations, and HDD sites. This assessment should use the data collected during the winter months as outlined above as a comparative baseline when determining the level of adverse effects;

(5) Compel the applicant to conduct after-construction noise surveys within one month of the in service dates to assure compliance with all federal, state and local noise regulations; and

(6) Compel the applicant to install additional engineering controls and/or noise mitigation as needed after construction to insure noise levels at the edge of the right-of-way or property boundary comply with all federal, state and local noise regulations on an ongoing basis, including during winter months; and

(7) Include in the cost analysis the reduction in property value adjacent to the project components due to noise.

Respectfully submitted,

Kathryn R. Eiseman, President

Pipe Line Awareness Network for the Northeast, Inc.

17 Packard Road

Cummington, MA 01026

## **20150828-5236**

Sheila OBrien, Dracut, MA.

I would like to speak out against this proposed pipeline. I live on Blueberry Hill Rd in Dracut, MA. Blueberry Hill is an established residential neighborhood with mature landscaping. My home is within 500 feet of the proposed pipeline and compression station. I have lived here for 21 years. I have raised my family here. I plan on staying here for at least another 21 years - watching my future grandchildren enjoy the nature here. This pipeline/compression station will bring noise, light, and air pollution to my neighborhood, to my home. There are wetlands and wildlife that will be negatively impacted. Members of my family have asthma - and toxins put into the air from the compression stations will compound their breathing issues. I have concerns regarding my family's and local children's safety during construction. My homeowner's insurance will increase as an 'incineration' zone would cost far more than a flood zone (which we are not in). My home is in the 'incineration' zone - that will get up to 800 degrees within seconds if there is an explosion at this compression station - my family and home would no longer exist. This pipeline/ compression station will lower my property value. If I do chose to move away no one in their right mind would want to buy my house. Also, given the increase in solar and alternate power I see in my town, in my neighborhood, there is no need for additional natural gas here in New England.

In summary: the proposed pipeline/compression station will diminish the quality of life for my family, neighbors, the plants, the animals...nature. The issues I raise are irresolvable. I request that you do NOT approve this proposed pipeline - docket PF14-22-000. Thank you. Sheila OBrien

20150828-5239

Sheila OBrien, Dracut, MA.  
{duplicate of 20150828-5236 above}

Pertaining to Tennessee Gas Pipeline (TGP)  
Docket No. PF14-22-000  
Proposed Northeast Energy Direct (NED) pipeline

Ms. Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Dear Secretary Bose:

New Hampshire is, in fact, a forest, which becomes obvious when flying over the state. In this forest are a few cities, a more numerous number of small towns, and many private homes. So, what do you suppose would happen if a pipeline fire, or worse yet a compressor station fire occurred in this forest. These fires have been known to cause spontaneous combustion of wood as far away as 300 ft. just from the radiant heat. If NED is approved and a fire exploded, that would be ignition of a forest fire some 600ft. in diameter before anyone could even start to respond. Obviously, citizens are considered expendable when it comes to acquisition of more money.

Thorstein Veblen, one of the foremost economists of the last century, wrote a description of corporate business methods. To condense the book to its conclusion, he stated that the only goal of a corporation is to make money. If a corporation does something for the good of the people, the community, or even the country, it will only be because it expects that it will thereby increase its profits. Given the hazards of this unnecessary gas pipeline and compressor station and the hardships it would inflict on the residents of Massachusetts, New Hampshire and New York, KM is most certainly adhering as closely as possible to the dark side of this method. Please do not allow them to continue in this travesty.

Sincerely,

Richard Silvestro

Re: Site Evaluation & Analysis [LEC File MoC/15-224.04]

**Monadnock Conservancy – Towne Hill Farm**

**Robbins Road**

**Rindge, New Hampshire**

Dear Ms. Hague:

LEC Environmental Consultants, Inc., (LEC) is pleased to submit this baseline information of upland and wetland resource areas located within and adjacent to the existing utility Right-of-Way (ROW) extending through the Towne Hill Farm property of which the Monadnock Conservancy holds a conservation easement. LEC personnel proficient in ecology, botany, soil science, and wildlife biology conducted multiple site evaluations on July 24th, August 6th and 7th, 2015, in order to: 1) identify, classify and evaluate wetlands using the “Cowardin System”<sup>i</sup> and NH Natural Communities<sup>ii</sup>; 2) evaluate wetlands using the “NH Method”<sup>iii</sup>; 3) characterize upland habitat cover types; 4) document important wildlife and plant habitat features, including potential rare species habitat, and actual wildlife habitat utilization/evidence of the presence of wildlife or rare plants.

**General Site Description**

The 302.1± acre Towne Hill Farm property is located west of Route 202 and south of Route 119 within Rindge. Residential development is scattered along Robbins Road (becoming Thomas Road) and off Sundridge Road to the southwest. Undeveloped land primarily dominates the landscape to the west and north and minimally to the east before commercial development along Route 202.

Robbins Road extends through the southeastern portion of the property. Two separate utility ROW’s and corresponding overhead electric lines occur within the southeastern portion of the property, merging immediately west of Robbins Road and continuing in a northwesterly direction through the property within a ±350-foot wide corridor. A narrow band of trees and saplings bisects the ROW, separating the two overhead electric lines.

Remaining portions of the property are primarily comprised of forested upland, forested wetland, and active agricultural (hay) fields. A perennial stream flows in a southerly/southwesterly direction through the western portion of the property, eventually extending through the utility ROW just west of the property boundary. Fringing emergent marsh/wet meadow and scrub shrub habitat conditions abut the meandering stream channel.

An unnamed Pond occurs immediately east of Robbins Road. Several intermittent stream channels (hillside seeps) discharge into the Pond. The northwestern portion of the Pond abuts Robbins Road and an 18” wide culvert extends under Robbins Road, draining the Pond. West of Robbins Road, the stream meanders downhill within forested wetland habitat and continuing through a scrub shrub/emergent marsh wetland that is also fed by two separate intermittent stream channels extending through the utility ROW corridor. Following stream convergence, the stream flows through the utility ROW, eventually discharging to the emergent

marsh associated with the aforementioned westerly perennial stream.

### **Wetland Resource Areas**

In accordance with the NH Method Section 2D. Guidelines to Determine Wetland Evaluation Units, the primary connected wetland system present within the utility ROW has been divided into two separate wetland evaluation areas with Robbins Road functioning as the dividing line. Furthermore, four (4) isolated wetlands occur within the utility ROW east of Robbins Road and have been grouped together for discussion purposes. Wetland areas (map units) are depicted on the Aerial Orthophoto—Wetlands Overlay, prepared by LEC, dated August 14, 2015 (Attachment A) and are described in more detail below.

### **Wetlands East of Robbins Road**

#### **Map Unit W-TH-1**

This map unit is a Palustrine (nontidal), Persistent Emergent wetland (PEM1Eb) associated with the westerly unnamed perennial stream that is seasonally flooded or saturated, at least in-part, due to beaver activity (such as dam building). The plant community is characterized by erect, rooted, herbaceous hydrophytes that are present for most of the growing season in most years. The plants are mostly perennial, dominated by species that normally remain standing at least until the beginning of the next growing season.

Surface water is present for extended periods especially early in the growing season. When surface water is absent, the soils remain saturated near the surface for most of the growing season.

The New Hampshire Natural Community that best describes this map unit is Tall Graminoid Meadow Marsh (S4)-Tussock Sedge Variant. This plant community is dominated by Tussock Sedge (*Carex stricta*), in addition to tall, clonal grasses or sedges such as Bluejoint (*Calamagrostis canadensis*), Woolly Bulrush (*Scirpus cyperinus*), Mannagrasses (*Glyceria* spp.) Lurid Sedge (*Carex lurida*), Three-way Sedge (*Dulichium arundinaceum*), and various spike-rushes (*Eleocharis* spp.). These plants often form dense root mats, and may dominate individually or in combinations depending on hydrologic regime. The community often resembles a meadow and only sustains water at the ground surface for short periods of time (seasonally flooded). A broad diversity of other herbs is often present, but much of the cover and biomass is contributed by only a few species.

The soils are mapped as Borohemists, ponded (197) by the USDA-NRCS. They are very poorly drained organic material (dominantly sapric) that is 16 to 51 inches thick. These areas may also include silty alluvium enriched with organic matter (mucky silt loam). The underlying mineral material (2C) is typically gleyed and ranges in texture from silt loam to coarse sand fluvial material or loamy sand to fine sandy loam glacial till. These soils typically serve as aquifer recharge areas because of their coarse substratum. A soil profile taken from this site is shown to the left. This soil would be classified as a Chocurua mucky peat (395).

Off-site to the west, portions of the wetland within the ROW and abutting the perennial stream can be characterized as Short Graminoid-Forb Meadow Marsh/Mudflat (S4). As a result of beaver activity, extensive mud flats occur along the perennial stream.

#### **Map Unit W-TH-2**

This map unit is primarily a Scrub-Shrub, Broad-leaved Deciduous wetland upgradient of the Tall Graminoid Meadow Marsh within the ROW. The wetland is seasonally saturated and sometimes (partially) ponded as a result of beaver activity (PSS1Eb). The vegetative community consists of shrubs, saplings, emergents, and mosses, but is primarily dominated by woody vegetation less than 6 m (20 feet) tall. Broad-Leaved Deciduous species are woody angiosperms with relatively wide, flat leaves that are shed during the cold or dry season. Surface water is present for extended periods especially early in the growing season. When surface water is absent, the soil is saturated near the surface for much of the growing season.

Transitioning from the Tall Graminoid Meadow Marsh, this map unit can be best characterized as Mixed Tall Graminoid-Scrub Shrub Marsh (S4S5). The clonal grasses and sedges present within the Tall Graminoid Meadow Marsh are also interspersed throughout the Mixed Tall Graminoid-Scrub Shrub Marsh in addition

to Cinnamon Fern (*Osmunda cinnamomea*), Royal Fern (*Onoclea regalis*), Swamp Dewberry (*Rubus hispidus*), areas of Sphagnum spp., and pockets of Narrowleaf Cattail (*Typha angustifolia*). The shrub community is somewhat artificially maintained by periodic vegetative maintenance in the utility ROW and is largely comprised of Meadowsweet (*Spiraea alba*), Steeplebush (*Spiraea tomentosa*), Highbush Blueberry (*Vaccinium corymbosum*), Winterberry (*Ilex verticillata*), and European Buckthorn (*Frangula alnus*) along with scattered Sweet Gale (*Myrica gale*), Speckled Alder (*Alnus incana*), Maleberry (*Lyonia ligustrina*), Witherod (*Viburnum nudum*), and Red Chokeberry (*Aronia arbutifolia*). Distinct patches of Leatherleaf (*Chamaedaphne calyculata*) also abut portions of the Tall Graminoid Meadow Marsh.

Portions of the wetland abutting upland areas are more akin to a Highbush Blueberry-Sweet Gale- Meadow-sweet Shrub Thicket (S4) with taller, dense thickets of Highbush Blueberry and Winterberry with scattered Red Maple (*Acer rubrum*) saplings. Herbs are generally scarce, but include Cinnamon and Royal Ferns.

This map unit lacks deep peat soils, abundant peat mosses, and prominent medium-height heath shrub layers and other peatland indicators. Soils are mostly mineral, and vary in organic content. In some settings, leaf litter covers the soil surface and bryophytes and herbs are in low abundance. In other settings this community can grade into tall shrub fens with organic soils.

Searsport mucky peat (15) dominates this area. It is a very poorly drained soil formed in muck and mucky peat overlying sandy glacial-fluvial and ice-contact stratified drift. They occur in depressions, glacial outwash plains and stream terraces. Depth to the water table ranges from 12 inches above the surface to 12 inches below the surface most of the year. The Soil profile (right) was taken from this map unit.

### **Map Unit W-TH-3**

This map unit is a Palustrine (nontidal) Forested wetland (PFO1) located north of the utility ROW and east of the Map Unit: W-TH-1.

This Hemlock - cinnamon fern forest (S4) occurs within the transition zone from the wetlands to the uplands and maintains a seasonally-high water table. The moderately dense canopy is dominated by Eastern Hemlock (*Tsuga canadensis*) with scattered Red Maple trees. Patches of Cinnamon Fern occur sporadically throughout the wetland. Similar habitat conditions exist on-site south of the utility ROW (Mixed Tall Graminoid-Scrub Shrub Marsh).

### **Map Unit W-TH-4**

This is a Palustrine, Persistent Emergent wetland (PEM1E) abutting an intermittent stream that flows in a westerly direction within the utility ROW, including through an old stone culvert. Surface water within the wetland is present for extended periods especially early in the growing season and when surface water is absent, substrate remains saturated near the surface for much of the growing season.

Within the northern portion of the ROW and north of the stream channel, habitat conditions are largely occupied by a Tall Graminoid Meadow Marsh (S4)-Bulrush Variant. Remaining portions of the wetland can be primarily characterized as a Mixed Tall Graminoid-Scrub Shrub Marsh (S4S5).

The soils in this area are dominated by Chocurua mucky peat (395). The soil has 16 to 51 inches consists of organic material (hemic and sapric), overlying sandy glacial outwash or till. On this site there is evidence of regular ponding for most of the year. These areas serve as aquifer recharge sites because of the underlying sandy soils. A soil profile taken from this map unit is shown on the left. The 2C horizon is loamy coarse sand.

### **Map Unit W-TH-5**

This map unit is a Palustrine, Persistent Emergent wetland (PEM1B) associated with two separate seeps/intermittent stream channels extending northerly through the utility ROW and ultimately discharging to Map Unit W-TH-4. Both seeps originate immediately south of the ROW within a hemlock forest.

The New Hampshire Natural Community that best describes these wetland areas within the utility ROW is an Herbaceous Seepage Marsh. These wetlands occur in a variety of settings where minerotrophic ground-

water discharge is prominent. This area found near upland borders, at the toe slope of the adjacent till ridge. The easterly intermittent stream continues through forested wetland (PFO and Map Unit WTH- 6) north of the ROW, joining the aforementioned intermittent stream within Map Unit W-TH-4.

Herbaceous Seepage Marshes generally tend to be larger than forest seeps and usually have little tree canopy (except along their borders). While technically a marsh, these communities are intermediate between fens and marshes, both floristically and environmentally. They contain a mixture of graminoids, forbs, and ferns including indicators of seepage and minerotrophic conditions.

The plant community is primarily dominated by Cotton Grass (*Eriophorum virginicum*), Reed Canary Grass (*Phalaris arundinacea*), Sensitive Fern, Cinnamon Fern, Narrowleaf Cattail, Woolly Bulrush, Lake Sedge (*Carex lacustris*), Spotted Joe-pye-weed (*Eupatorium maculatum*), Goldenrods (*Solidago* spp.), Marsh Fern (*Thelypteris palustris* var. *pubescens*) and Rough Sedge (*Carex scabrata*). Patches of European buckthorn occur along the upper limits of the wetlands. The wetlands occurs directly below the high tension lines and is subject to regular vegetation control, which helps to maintain its open condition.

The soils in this area are dominantly Pillsbury fine sandy loam, very stony (647). These are poorly drained soils with fine sandy loam textures in the solum, underlain by dense loamy glacial till. The dense substratum supports a perched, seasonal water table 0-1.5 feet below the surface from November to May. Soil textures are fine sandy loam or sandy loam with gravelly analogs throughout the profile. A soil profile from this map unit is shown on the left.

### **Map Unit W-TH-6**

This map unit is a Palustrine (nontidal) Forested wetland (PFO1) located north of the utility ROW and west of the Robbins Road. As noted above, the easterly intermittent stream from Map Unit W-TH-6 extends through this forested wetland. A secondary intermittent stream channel meanders through this wetland, originating from the Pond located east of Robbins Road (via an 18" wide culvert extending under the roadway). The New Hampshire Natural Community that best describes this area may be a Hemlock - cinnamon fern forest (S4). Hemlock dominates the canopy with moderate Red Maple. Cinnamon and Sensitive Fern primarily occur at lower reaches of the system upgradient of the Mixed Tall Graminoid-Scrub Shrub Marsh (Map Unit W-TH-2).

### **Wetlands East of Robbins Road**

### **Map Unit W-TH-7**

This map unit consists of a shallow Pond classified as a Palustrine Unconsolidated Bottom wetland that is permanently flooded (PUBHh). This includes all wetlands and deepwater habitats with at least 25% cover of particles smaller than stones (less than 6-7 cm), and a vegetative cover less than 30%. The bottom material is dominated by mud and organic material. Water covers the land surface throughout the year and is partially impounded by Robbins Road and periodically elevated by beaver activity near the outlet at the roadway. A beaver dam was recently removed by the Rindge Highway Department, but likely to be rebuilt. The southern portion of the Pond occupies the entirety of the utility ROW. Four separate stream systems feed into the Pond; three from the south and one from the northeast that drains ponded areas on either side of Thomas Road.

The New Hampshire Natural Community that best describes this area is Aquatic beds. These are wetlands that occur in permanently inundated areas at the transition between emergent marshes and deeper environments of many rivers, streams, and ponds (ones that lack rooted vegetation). This is a very broadly defined Natural Community dominated by floating-leaved and submersed herbaceous species.

The dominant floating vegetation at this site includes variegated yellow Pondlily (*Nuphar variegata*), White Waterlily (*Nymphaea odorata*) and Water Shield (*Brasenia schreberi*) along with pondweeds (*Potamogeton* spp.) and milfoils (*Myriophyllum* spp.).

### **Map Unit W-TH-8**

This is a Palustrine, Persistent Emergent wetland (PEM1F) that is semipermanently Flooded, occurring at the outlet end of the Pond off Robbins Road (Map Unit W-TH-8 or PUDHh) and includes the remnants of a beaver dam described above. The wetland contains Cattails adjacent to standing water accompanied by by Steeplebush, a variety of sedges and ferns, and European Buckthorn. Due to the beaver activity and small nature of the wetland pocket adjacent to the outlet, the map unit doesn't fit neatly in a New Hampshire Natural Community.

### **Map Unit W-TH-8**

This map unit is a Palustrine (nontidal), Persistent Emergent wetland (PEM1Eb) concurrent to and southwest of the Pond (south of ROW). An intermittent stream from the upgradient hemlock forest discharges into this Tall Graminoid Meadow Marsh (S4). The plant community is primarily comprised of various sedges, cattails, and Red Canary Grass. The area resembles a wet meadow and sustains water at the ground surface for short periods of time (seasonally flooded). Highbush Blueberry shrubs populate the outer fringes.

### **Map Unit W-TH-9**

This map unit is a Palustrine (nontidal) Forested wetland (PFO1) located south of the utility ROW and Pond. Three separate intermittent stream channels flow through this wetland. The two westerly streams originate within the separate, southern utility ROW (Herbaceous Seepage Marsh, similar to Map Unit W-TH-4) and extends through forested areas somewhat resembling a Red Maple- Red Oak-Cinnamon Fern Forest (S3S4). The easterly intermittent stream originates from a (hemlock) forested seep (Hemlock - cinnamon fern forest). . Speckled Alder, Highbush Blueberry, Red Maple, and Cinnamon fern primarily occur at lower elevations within the map unit.

### **Map Unit W-TH-10**

This is a Palustrine, Persistent Emergent wetland (PEM1B) located east of the Pond within the utility ROW. The wetland is located within low-lying troughs where the substrate likely remains saturated near the surface for much of the growing season. The New Hampshire Natural Community that best describes these wetland areas within the utility ROW is an Herbaceous Seepage Marsh primarily dominated by Cinnamon Fern and Sensitive Fern with sporadic cattails and sedges.

### **Isolated Wetlands (east of Robbins Road)**

#### **Map Unit W-TH-11, W-TH-12, W-TH-13, & W-TH-14**

These map units are Palustrine, Persistent Emergent wetlands (PEM1B). They occur in small isolated depressions and benches of slopes in the glacial till uplands. Water is perched above a dense substratum creating saturated conditions within 12 inches of the surface, for a significant period of the growing season in most years but surface water is seldom present.

The plant community is not well developed with small patches of bare ground. The plants are dominated by erect, rooted, herbaceous hydrophytes that are present for most of the growing season in most years. The plants normally remain standing at least until the beginning of the next growing season.

These areas have mostly been created by vehicular traffic or former excavations. There is no New Hampshire Natural Community that applies to these areas. In time, if left undisturbed, they have potential to develop into a Mixed Tall Graminoid-Scrub Shrub Marsh. The plant community is currently primarily occupied by various sedges, rushes, and ferns, in addition to encroaching European buckthorn.

The soils are disturbed areas of the Marlow (77) and Skerry (559) series. A profile of the Marlow soils is shown below:

### **Upland Habitat Cover Types**

#### **Within the Right-of-Way**

Considering the on-going vegetative maintenance practices, upland habitat cover types within the utility ROW cannot be classified within a distinct Natural Community. Upland areas within the ROW can be broadly characterized as Early Successional Upland Habitat defined by rolling topography.

Soils present within the upland ROW are mostly concurrent with those present within the abutting forested upland (described below). Exposed ledge is present within the easternmost portion of the on-site ROW.

Dominant vegetation includes patches of Sheep Laurel (*Kalmia angustifolia*) and European buckthorn with Bracken Fern (*Pteridium aquillinum*), Teaberry (*Gaultheria procumbens*), Dewberry (*Rubus flagellaris*), and scattered Eastern White Pine (*Pinus strobus*) seedlings. Gray Birch (*Betula populifolia*) saplings are prominent within the ROW abutting Robbins Road. Open exposed sandy conditions occur underneath the transmission towers. Prominent open sandy conditions are also present immediately east of the Pond. Off-road vehicular use has likely maintained these conditions abutting the Pond within the ROW.

Between LEC's July 24th and August 6th site evaluation, a gravel road had been installed to the west off Robbins Road, terminating at the wetland boundary. Timber (swamp) mats were delivered to the site both on August 6th and 7th, presumably in association with work activities associated with the overhead electric lines.

### **Abutting Forested Uplands**

The power line ROW bisects a large area of Hemlock - White pine Forest (S4). These forests occur on dry-mesic and infertile till and are characterized by the co-dominance of Eastern Hemlock and Eastern White Pine. The community is narrowly distinguished from hemlock - beech - oak - pine forests, but classified as its own community due to strong conifer dominance, its correspondingly poorly developed herbaceous understory, and the apparent longevity of the association (200+ year old pine and hemlock occur at several sites). It is also distinguished from hemlock - spruce - northern hardwood forests by the rarity or lack of Red Spruce (*Picea rubens*), Balsam Fir (*Abies balsamea*), and Sugar Maple (*Acer saccharum*).

Besides pine and hemlock, the plan community includes Witch Hazel (*Hamamelis virginiana*), Mapleleaved Viburnum (*Viburnum acerifolium*), Indian Cucumber (*Medeola virginiana*), New York Fern (*Thelypteris noveboracensis*), Wild Sarsaparilla (*Aralia nudicaulis*), Partridgeberry (*Mitchella repens*), Starflower (*Trientalis borealis*), Clubmosses (*Lycopodium* spp.), Indian Pipes (*Monotropa uniflora*), Canada Mayflower (*Maianthemum canadense*) and Teaberry.

Soils are acidic and well drained to moderately well drained, dry-mesic to mesic sandy loams of varying degrees of stoniness. The upland soils on this site are mostly derived from glacial till. Upland soils on the north part of the study area are mapped as Monadnock fine sandy loam, very stony (143) by the USDA-NRCS. These are well drained soils formed in coarse glacial till and ice-contact stratified drift on moderately steep side-slopes of ground moraine. Soil textures in the solum range from loamy fine sand to loamy sand, and fine sandy loam to loamy sand with gravelly and cobbly analogs in the substratum. In the southern portion of the study area, the upland soils are mapped as Marlow fine sandy loam, very stony (77) and Skerry fine sandy loam, very stony (559). The marlow and Skerry soils have dense till substrata that perches seasonally high water tables. The Marlow soils are well drained and the Skerry soils are moderately well drained. They both occur on broad, gently sloping crests and lower side-slopes of smooth-sided (drumoidal) hills in glaciated uplands, and formed in loamy material overlying sandy and loamy, dense glacial till. The Skerry soils have a perched, seasonal high water table 1.5 to 2.5 feet below the surface. Soil textures in the solum are fine sandy loam and sandy loam with gravelly analogs, and sandy loam to loamy fine sand with gravelly analogs in the dense substratum. A profile (below) of the Monadnock soils was taken in the Hemlock-White Pine Forest north of the ROW.

### **Wildlife and Plant Habitat**

#### **Rare Species**

According to the New Hampshire Natural Heritage Bureau's (NHB) Rare Plants, Rare Animals, and Ex-

emplary Natural Communities in New Hampshire Towns (July 2013), the following rare species have been documented within Rindge:

Plants:

- Pale Duckweed (*Lemna valdiviana*)—Endangered
- Wild Lupine (*Lupinus perennis*)—Threatened

Vertebrates—Birds:

- Common Loon (*Gavia immer*)—Threatened

Vertebrates—Reptiles:

- Blanding’s Turtle (*Emydoidea blandingii*)—Endangered (under review for federal protection)
- Smooth Green Snake (*Opheodrys vernalis*)—Special Concern
- Wood Turtle (*Glyptemys insculpta*)—Special Concern

Vertebrates—Amphibians:

- Slimy Salamander (*Plethodon glutinosus*)—biologically rare

Vertebrates—Fish:

- Banded Sunfish (*Enneacanthus obesus*)—Special Concern

Invertebrates—Dragonflies & Damselflies:

- Ebony Boghunter (*Williamsonia fletcheri*)—Special Concern
- Martha’s Pennant (*Celithemis martha*)—biologically rare

LEC consulted with the Natural Heritage Bureau (NHB) to review their database for records of rare species and exemplary natural communities on or within 1 mile of the Towne Hill Farm property. NHB’s database includes known records for species officially listed as Threatened or Endangered either federally or by the state, as well as species and Natural Communities judged by experts to be at risk in New Hampshire but not yet formally listed. Following review, NHB reported that Wild Lupine and Blanding’s Turtle have been documented within 1 mile of the property (Attachment C). As NHB notes, a negative result (no database record) does not mean that no rare species are present. Records are of known occurrences based on information gathered by qualified biologists and reported to NHB. Many areas have never been surveyed or have been only surveyed for specific species. The following reviews potential habitat for both the Wild Lupine and Blanding’s Turtle.

*Wild Lupine*

Wild lupine, listed as Threatened species in New Hampshire, is primarily found within open to partially shaded habitats containing dry, sandy soils, including utility ROW corridors and/or other open areas that are maintained as early successional habitat.

Wild lupine functions as the host plant for the Endangered Karner Blue Butterfly (*Lycaeides melissa samuelis*) larvae. While the Karner Blue Butterfly hasn’t been historically documented within Rindge, a reintroduction program has been initiated at the Concord pine barrens/Concord Municipal Airport following extirpation in 2000 (Amaral 2000).

LEC did not observe any Wild Lupine within the utility ROW, but a comprehensive survey was not conducted. Suitable habitat for the species is present within upland portions of the utility ROW corridor.

*Blanding’s Turtle*

Blanding’s Turtles are listed as Endangered in New Hampshire and Maine and Threatened in Massachusetts and New York. Blanding’s Turtle are also identified within the NH Wildlife Action Plan as a “Species in Greatest Need of Conservation”. As noted within the species profile, Blanding’s Turtles require large mosaics of wetland and upland habitats with relatively limited development. The species is characterized by a late age of sexual maturity (14-20 years for female Blanding’s turtles; Congdon and van Loben Sels 1993),

relatively low fecundity (average 13 eggs per year, DePari et al. 1987, Congdon et al. 1983), and high rates of adult survival. Small increases in annual adult mortality (as little as 2-3%, Congdon et al. 1993, Gibbs and Shriver 2002), especially among females, can have catastrophic effects on populations. Within New Hampshire, Blanding's turtle habitat overlaps with the highest human population densities. Therefore, turtles are extremely vulnerable to rapid development, especially where road density and traffic volume is high. Blanding's Turtle require Because Blanding's turtles require large mosaics of wetland and upland habitats with relatively limited development,

During the Blanding's Turtle annual life cycle, adult individuals will utilize a wide variety of wetland and upland habitat cover types and will regularly travel long distances between areas. Blanding's Turtles overwinter in the organic substrate in the deepest parts of marshes, ponds, and occasionally vernal pools. Some individuals overwinter under hummocks in red maple or shrub swamps.

Blanding's Turtles will typically emerge from brumation between mid-March and mid-April, however weather dependent. Following emergence, individuals may exhibit long-distance movements associated with migration between permanent wetlands to ephemeral wetlands, which serve as areas for feeding, mating opportunities, and staging habitat for nesting females (Grgurovic and Sievert, 2005). Adult Blanding's Turtle individuals are omnivorous, feeding on a variety of crustaceans, insects, snails, fish, aquatic/emergent plants, berries, and carrion (DeGraaf and Yamasaki 2000). While nesting sites may occur within close proximity to ephemeral wetlands, females have been observed to travel over 1 km (3280 feet) to find appropriate Nesting Habitat (Grgurovic and Sievert, 2005). Nesting activity primarily occurs in June within well-drained loamy or sandy soils (NHESP Fact Sheet). Blanding's Turtle females will also utilize anthropogenic habitats, such as lawns, gardens, mulch piles, and power line right-of-ways to nest (Grgurovic and Sievert, 2005).

During the summer months, Blanding's Turtle are known to aestivate within both upland and wetland habitats; often intermittently from late July to late August (Ross and Anderson, 1990; Joyal, 1996). Additionally, Blanding's Turtle movement activity during the summer months and into early fall is also typically tied into the return to permanent wetlands for overwintering.

Portions of the perennial stream within the western portion of the Towne Hill Farm property and the Pond east of Robbins Road may provide suitable Blanding's Turtle Overwintering Habitat. The Pond and Emergent Marsh/Wet Meadow and Scrub-Shrub Wetlands associated with the westerly perennial stream may consequently provide viable Feeding (Foraging)/Breeding Habitat. Blanding's Turtle may aestivate within the open wetland areas during the summer months, in addition to the surrounding Forested Upland and Early Successional Habitat conditions within the ROW. Viable Nesting Habitat may be limited to the open sandy conditions found under some of the transmission towers or the larger area located east of the Pond.

Additional significant wetland complexes occur within the migratory distance of the property and along the utility ROW, including those associated with Tarbell Brook to the northwest, thus contributing to the overall potential habitat mosaic for the species.

### **Direct Wildlife Signs and Observations**

The following reviews LEC's documented wildlife observations during the August 6th and 7th site evaluations. However, it is important to note the limited evaluations by no means documents all species utilizing the property.

#### *Avian*

Direct avian observations (both visual and auditory) on-site documented during LEC's site evaluations include eastern towhee (*Pipilo erythrophthalmus*), blue jay (*Cyanocitta cristata*), mourning dove (*Zenaidura macroura*), eastern phoebe (*Sayornis phoebe*), downy woodpecker (*Picoides pubescens*), blackcapped chickadee (*Poecile atricapillus*), American robin (*Turdus migratorius*), American crow (*Corvus brachyrhynchos*), great crested flycatcher (*Myiarchus crinitus*), tree swallow (*Tachycineta bicolor*), great horned owl (*Bubo virginianus*), and a broad-winged hawk (*Buteo platypterus*).

Spotted sandpipers (*Actitis macularia*) were extensively utilizing the mud flats abutting the perennial stream within the utility ROW west of the property.

A possibly abandoned osprey (*Pandion haliaetus*) nest was also observed on a transmission tower immediately west of the property.

#### *Mammals*

As noted above, current and recent beaver (*Castor canadensis*) activity is documented within the westerly perennial stream and the Pond located east of Robbins Road.

Additional observed mammalian species include gray squirrel (*Sciurus carolinensis*), chipmunk (*Tamias striatus*), white-tailed deer (*Odocoileus virginianus*), raccoon (*Procyon lotor*), and eastern coyote (*Canis latrans*).

#### *Reptiles and Amphibians*

LEC observed American toad (*Anaxyrus americanus*) and pickerel frogs (*Rana palustris*) within the onsite utility ROW.

Eastern / Red-spotted Newts (*Notophthalmus viridescens*) were documented within the Pond located east of Robbins Road and the perennial stream within the western portion of the Towne Hill Farm property.

Eastern painted turtles (*Chrysemys picta*) were observed basking within the Pond located east of Robbins Road and the perennial stream west of the property. An eastern painted turtle was also observed swimming in a pocket of standing water within the scrub shrub wetland (on-site utility ROW). Additionally, a predated snapping turtle (*Chelydra serpentina*) nest and other unknown turtle egg shell fragments were found within the open sandy conditions abutting the Pond.

#### *Fish*

A fish population was observed within the Pond located east of Robbins Road. While LEC did not taxonomically identify the species, they appeared to be shiners (*Notropis* spp.).

#### *Invertebrates*

Various dragonflies and damselflies were observed foraging within the Pond and the Emergent Marsh/ Wet Meadow and Scrub-Shrub Wetlands associated with the westerly perennial stream.

### **Wetlands Evaluation**

The 14 individual wetland units, ranging in size from 700± sf to greater than 9 acres within the utility ROW, are associated with a larger wetland complex connecting off-site with Tarbell Brook at the north end of Damon Reservoir in Rindge, continuing to Millers River and ultimately to the Connecticut River at Millers Falls in Massachusetts. The wetland's watershed is approximately 1,700± acres and is largely forested with sporadic rural residential development.

Emergent Marsh/Wet Meadow and Scrub Shrub Habitat conditions are the dominant wetland type within the ROW due to the on-going vegetative maintenance. Open water is associated with the unnamed Pond system located east of Robbins Road, while Forested Uplands and Wetlands occupy significant portions of the landscape surrounding the ROW.

### **Prime Wetlands**

In New Hampshire wetlands of particularly high value can be recognized by individual municipalities, under RSA 482-A:15 and administrative rules Env-Wt 700 as "Prime Wetlands". A wetland receives this designation because of its size, unspoiled character and ability to sustain populations of rare or threatened plant and animal species. To date, the Town of Rindge has not chosen to engage in the formal or statutory process of designating Prime Wetlands. Regardless of the regulatory status, the qualities that make a wetland "Prime" may be evaluated anywhere.

In the course of our evaluation of the wetlands on this property, we observed and examined wetlands that have a high probability of meeting the requirements of a Prime Wetland. The statute requires that a Prime

Wetland: “shall be at least 2 acres in size, shall not consist of a water body only, shall have at least 4 primary wetland functions, one of which shall be wildlife habitat, and shall have a width of at least 50 feet at its narrowest point.” (RSA 482-A:15, I-a.). In addition, the regulations specify that: “wetlands designated as prime shall meet the following minimum criteria: (1) The wetlands shall have the presence of hydric soils, hydrophytic vegetation, and wetlands hydrology; and (2) At least 50% of the prime wetland shall have very poorly drained soils and the remaining soils shall be poorly drained soils” (Env- Wt 701.04).

It is our opinion that the wetlands on this site, listed in the following table, would meet the criteria for Prime Wetlands in New Hampshire:

LEC Map Unit	USFWS Class	Approximate Total Area of Wetland	Area of Wetland Within the ROW
W-TH-1	PEM1Eb	33 acres	9 acres
W-TH-2	PSS1Eb	7 acres	6 acres
W-TH-4	PEM1Eb	3 acres	1 acre

Wetland Evaluation forms for the wetland systems located west and east of Robbins Road (separately) are included as Attachment B. They provide the basis for our evaluation using the “New Hampshire Method”. The following provides a cumulative summary of ecological integrity, wetland-dependent wildlife habitat, fish & aquatic life habitat, scenic quality, education potential, wetland-based recreation, floodwater storage, groundwater, sediment trapping, nutrient trapping/retention/transformation, shoreline anchoring, and noteworthiness

### **Ecological Integrity**

The ecological integrity of the Towne Hill Farm wetlands is moderate based on the presence of Robbins Road, one observed stream crossing within the ROW, and surrounding rural residential and agricultural development off Robbins/Thomas Road and Sunridge Road. Beaver activity has also previously influenced hydrology within the Pond and Emergent Marsh within the western portion of the site. Unnatural sources of sediments, nutrients, and other pollutants from Robbins Road may impact adjacent water quality at the culvert crossing located at the topographic low point of the road. Moving away from Robbins Road, ecological integrity increases.

During LEC’s site evaluations, prior ROW maintenance activities did not appear to significantly disrupt wetland hydrology (e.g., ruts) or overall compact surface soils, thus decreasing soil permeability. However, timber (swamp) mats were being delivered to the site on August 6th and 7th, presumably to be used within the ROW. Furthermore, ATV/ORV use was noted to be somewhat minimal on-site.

### **Wetland-Dependent Wildlife Habitat**

The Towne Hill Farm wetlands have significant wildlife habitat value. The Pond located east of Robbins Road provides habitat for various avian, including waterfowl and wading birds, mammalian, reptilian, amphibian, and fish species, in addition to dragonflies and damselflies. The westerly perennial stream and abutting wetlands also provide habitat for similar wetland-dependent wildlife species. The mud flat areas within the ROW provide significant avian foraging habitat.

Several intermittent streams flow through or into the ROW associated with three primary dominant vegetative classes (PEM, PSS, & PFO). The adjacent wetlands increase the value of those present within the ROW. Vegetative maintenance within the utility ROW has further enhanced the available wildlife habitat communities, especially by providing valuable “edge” habitat along the corridor.

Furthermore, the Endangered Blanding’s Turtle has been documented within 1 mile of the Towne Hill Farm property and viable habitat for the species is present within the ROW. Additional significant wetland complexes occur within the Blanding’s Turtle migratory distance of the property and along the utility ROW to increase the overall potential habitat mosaic for the species.

### **Fish and Aquatic Habitat**

As observed, the 3± acre Pond located east of Robbins Road provides habitat for fish and aquatic life buffered by the abutting PEM and PFO wetlands. Abundant cover (woody debris and rocks) is present within the Pond along with floating, submerged, and emergent vegetation. Prior beaver activity (prior to dam removal) within the northwestern portion of the Pond has likely increased water levels and available fish and aquatic habitat.

The westerly perennial stream also provides habitat for fish and aquatic life. Significant swaths of undeveloped forested areas abut the PEM/PSS wetlands occurring along the length of the meandering channel.

As noted above, the Blanding's Turtle has been documented within the vicinity of the site

### **Scenic Quality**

Public access is not currently granted by the property owner under existing conditions. Thus, view areas are limited to locations along Robbins Road. The Pond and surrounding wetlands are readily visible from two separate locations along the road, providing a moderate landscape contrast with the undulating topography and diversity of vegetation in and around Pond. Scenic value increases to the west moving away from Robbins Road with broad vistas of the variable wetland system associated with the perennial stream.

### **Educational Potential**

Under existing conditions, the on-site wetlands have minimal educational potential as public access is not currently granted and parking is significantly limited. If access were granted, the majority of the wetlands are accessible via the utility ROW corridor for educational opportunities.

### **Wetlands-Based Recreation**

The Towne Hill Farm wetlands have opportunities for wildlife observation from the ROW and (canoe/kayak) access to the Pond, if access is granted. Parking is another limiting factor.

### **Floodwater Storage**

Foss Meadow's floodwater capacity is moderate to high. The wetland is relatively large in relation to its watershed (about 7.5%) enabling it to hold a large amount of water produced by the watershed during times of high flow.

### **Groundwater**

This function scored low for Towne Hill Farm. There is no stratified drift aquifer near the wetlands and to LEC's knowledge, no potential public water supply area nearby. There is limited groundwater recharge potential considering the dominant soil types within 500 ft of the wetlands.

### **Sediment Trapping**

The sediment trapping function of Foss Meadow is moderate, due to a moderate to high Wetland Flood Storage capability, an outlet that is not constricted or blocked, a relatively straight stream channel and some ponded open water with limited sediment removal capacity. Contributing to the sediment trapping function are the moderate gradient of the wetland's watershed, dense emergent wetland vegetation and relatively shallow water depth.

### **Nutrient Removal / Retention / Transformation**

The wetland has a moderate ability to attenuate nutrients. Contributing to this function are the Wetland Flood Storage, dense emergent wetland vegetation and sediment trapping capacity. Other factors are a the seasonally saturated or flooded and semi-permanently flooded hydrology, and soils developed in thick organic material that support year-round nutrient attenuation. The relatively shallow water depth adds to the wetland's capacity for this function.

### **Shoreline Anchoring**

The Towne Hill Farm wetlands have a moderate shoreline anchoring capacity, a function of multiple wetland vegetation types along the shoreline (emergent, shrub, and forested), high vegetative density, and wider wetland areas bordering the westerly perennial stream and Pond, respectively.

### **Noteworthiness**

As noted above, the mapped wetland units at Towne Hill Farm are associated with a larger wetland complex connecting off-site with Tarbell Brook at the north end of Damon Reservoir in Rindge, continuing to Millers River and ultimately to the Connecticut River at Millers Falls in Massachusetts.

The “Marsh & Shrub Wetlands” that occur on-site are listed on the New Hampshire Wildlife Action Plan focal habitat list, 2015.

Additionally, NHB has confirmed that the Blanding’s Turtle, state-listed as Endangered and identified within the NH Wildlife Action Plan as a “Species in Greatest Need of Conservation”, occur within 1 mile of the property. Potential habitat for the species exist on-site.

### **Conclusion**

The wetland and upland cover types present within and surrounding the Towne Hill Farm utility ROW form a mosaic of habitats functioning for wildlife habitat, floodwater storage, groundwater protection, sediment trapping, and nutrient removal/retention/transformation. While residential development and roadways fragment the landscape to varying degrees both on and/or surrounding the property, significant portions of the wetlands within the ROW are buffered by forested areas. The wetland systems are comprised of a diversity of Natural Communities providing a myriad of unique functions and values.

While these wetland systems perform important functions, the ecological integrity of the wetlands and uplands matrix is susceptible to disturbance or degradation due to their location within an active utility ROW. Any major disturbance such as soil excavation, vehicular traffic or excessive disturbance of plant cover in the wetlands, or immediately adjacent uplands, will significantly affect their ability to perform the functions identified. It is our opinion that any additional impacts be prevented especially in highvalue areas such as the pond at Robbins Road and its contributing wetland system and the large marsh system to the northwest.

LEC is pleased to provide this baseline information. Should you have any questions or require additional information, please do not hesitate to contact Tom Peragallo at 603-899-6726 or tperagallo@lecenvironmental.com.

Sincerely,

LEC Environmental Consultants, Inc.

Re: Site Evaluation & Analysis [LEC File #: MoC\15-224.04]  
McGregor Pond/Marsh  
Converse Meadow Conservation Area

Converseville Road  
Rindge, New Hampshire

Dear Ms. Hague:

LEC Environmental Consultants, Inc., (LEC) is pleased to submit this baseline information of upland and wetland resource areas located within and adjacent to the existing utility Right-of-Way (ROW) extending through the northern portion of the Converse Meadow Conservation Area (CONVERSE MEADOW CONSERVATION AREA) property of which the Monadnock Conservancy holds a conservation easement. LEC personnel proficient in ecology, botany, soil science, and wildlife biology conducted multiple site evaluations on July 24th and August 6th and 7th, 2015, in order to: 1) identify, classify and evaluate wetlands using the “Cowardin System”<sup>i</sup> and NH Natural Communities<sup>ii</sup>; 2) evaluate wetlands using the “NH Method”<sup>iii</sup>; 3) characterize upland habitat cover types; 4) document important wildlife and plant habitat features, including potential rare species habitat, and actual wildlife habitat utilization/evidence of the presence of wildlife or rare plants.

### **General Site Description**

The 240.8± acre CONVERSE MEADOW CONSERVATION AREA is located immediately north of Route 119 and east of Route 202 in Rindge. Undeveloped forested uplands and wetlands primarily abut the property, while residential development off Old New Ipswich Road (west), Perry Road (north), and North Street (east), and Converseville Road (south) occurs slightly further out. Minimal agricultural lands also occur within the immediate vicinity of the property, primarily to the southeast.

The Converse Meadow Pond/Marsh and McGregor Pond/Marsh systems occupy the eastern and western portions of the 240.8± acre property, respectively. Forested upland and wetland habitats, including three (3) vernal pools occur between the wetland systems. A 170± foot wide utility ROW extends through the northwestern portion of the property. Additional forested uplands exist northwest of the ROW.

Three major wetland classes form the McGregor Pond/Marsh wetland system that lie along the eastern boundary of the utility ROW. On-site, a narrow band of forested upland (avg. 75± feet wide) separates the ROW from the wetland system. Immediately north and south of the CONVERSE MEADOW CONSERVATION AREA property boundaries, the ROW abuts the ROW for lengths of 180± feet and 430± feet, respectively.

The wetlands occur within a confined basin that is approximately 500± feet (avg) wide and about 3000± long with a north/south axis. They form part of the head waters to the Millers River North Branch. Water enters the system as runoff and subsurface flow from the hill slopes immediately to the west and north of the basin. Water trapped in the basin is confined by steep till ridges that most likely reflect the underlying bedrock surface. Water leaves the basin at the north end of the open water (Aquatic bed) known as McGregor Pond at an elevation of approximately 1120 feet. A partially breached beaver dam is present at the outlet, but beaver activity has reinforced it, keeping the water level approximately 6 feet higher than the lowest elevation of the outlet stream. McGregor Brook, a 1st order perennial stream, drains the Pond in a northerly direction, then turns south to enter Converse Meadow Pond/Marsh System. The southern outlet the Converse Meadow Pond/Marsh System via the North Branch is also partially impounded by beaver activity. Flow extends under a pedestrian culvert crossing on the CONVERSE MEADOW CONSERVATION AREA before extending under Converseville Road and Route 119, ultimately draining into Lake Monomonac. The North Branch continues to extend southerly from Lake Monomonac through Whitney Pond and Tannery/Hunts Pond, before connecting to Millers River which ultimately connects to Connecticut River at Millers Falls Massachusetts.

### **Wetland Resource Areas**

Wetland areas (map units) are depicted on the Aerial Orthophoto—Wetlands Overlay, prepared by LEC, (Attachment A) and are described in more detail below.

## Map Unit W-CM-1

This map unit is classified as a Palustrine, Scrub-Shrub wetland, dominated by broad-leaved evergreen shrubs with relatively wide, flat leaves that generally remain green and are usually persistent for a year or more (PSS-3-Eb). The area is seasonally flooded or saturated to the surface. Surface water is present for extended periods, especially early in the growing season. When surface water is absent, the soil remains saturated near the surface for most of the growing season. The ponded surface water on this site results mostly from continuous beaver activity, such as dam building.

The New Hampshire natural community that best describes this map unit is Leatherleaf - Sheep laurel Shrub Bog (S2S3). These wetlands contain an abundance of dwarf- to medium-height heath shrubs. Overall species richness is generally quite low. Scattered saplings occur within the southern portion of the system, while snags occur throughout the bog.

Mossy hummock and hollow topography is well developed, with occasional sedges on the hummocks. Average and average-maximum hummock heights measure 0.24 m and 0.40 m, respectively. Average pH is 3.8. Shrubs average 0.52 m in height and form a relatively dense cover (35-50%) compared to other peatland communities. Shrub height averages 0.60 m, but occasionally ranges to nearly 1 m. Average pH is 3.8

Leatherleaf (*Chamaedaphne calyculata*) is the dominant shrub, with lesser quantities of sheep laurel (*Kalmia angustifolia*) and rhodora (*Rhododendron canadense*). Sphagnum capillifolium is diagnostic and typically occupies hummocks. Other abundant Sphagna include *S. magellanicum* and *S. rubellum*, while *S. angustifolium* is occasional. Polytrichum strictum is common on hummocks and Billing's sedge (*Carex trisperma* var. *billingsii*) is occasional.

Portions of the Leatherleaf - Sheep laurel Shrub Bog are separated from abutting upland areas by a Marshy Moat (S4), described further below. Sphagnum species, present in some areas of the map unit, are unconsolidated and often characterized by *S. cuspidatum* and other Sphagna found in "soupy" conditions. Moss species that may be found on woody stem bases and elsewhere in the moat include *Callicladium haldanianum*, *Hypnum pallescens*, and *Aulacomnium palustre*.

The soil is mapped as Borohemists, ponded (197) by the USDA-NRCS. These soils are comprised of very poorly drained organic material (dominantly sapric), 16 to 51 inches thick (Web Soil Survey 2015). The underlying mineral material (2C horizon) is typically gleyed and ranges in texture from silt loam to coarse sand glacial-fluvial material, or loamy sand to fine sandy loam glacial till. Wetlands established on these soils typically serve as ground water recharge areas.

## Map Unit W-CM-2

This map unit is classified as a Palustrine (nontidal), Persistent Emergent wetland that is permanently flooded, primarily as a result of beaver activity (PEM-1-Hb). The plant community is perennial and characterized by erect, rooted, herbaceous hydrophytes that are present for most of the growing season in most years. The plants remain standing at least until the beginning of the next growing season. Water covers the surface throughout the year in all years. There are a few small areas where floating plants dominate the surface of ponded water.

The New Hampshire natural community that best describes this area is Floating Marshy Peat Mat (S3S4) with a perimeter Marshy Moat (S4). Floating Marshy Peat Mats generally consist of thin, flat, loosely consolidated skins of peat and vegetation along calm margins of lakes, ponds, and slow-moving streams. They are transitional between aquatic bed or emergent marsh communities in deeper water and open peatlands on thicker, more consolidated peat landward.

The depth of the floating peat mat ranges from a few to more than 50 cm, and measured pH ranges from 4.4 - 5.7. The pH values are influenced by proximity to open water. The mat surface is flat with occasional, very low micro-relief. Width ranges from less than a meter to several meters wide.

Characteristic species composition is variable, but often includes water-lilies (*Nymphaea* spp.), pond-lilies (*Nuphar* spp.), spike rushes (*Eleocharis* spp.), white beak-rush (*Rhynchospora alba*), spatulate-leaved sun-

dew (*Drosera intermedia*), bladderworts (*Utricularia* spp.), cotton-grass (*Eriophorum* spp.), St. John's-wort (*Hypericum boreale*), northern blue flag (*Iris versicolor*), and other forbs and graminoids. Small patches of leatherleaf occur sporadically.

Marshy Moats are wet zones that occur between interior peatland communities and adjacent upland habitats. On this site it lies between McGregor Pond (an Aquatic Bed) to the north and a Leatherleaf- Sheep laurel shrub bog to the south. Moat development is likely related to increased peat decomposition along the edges of these communities. Vegetation is sparse and open water patches are common, but emergent marsh and aquatic bed species are prominent, such as pond-lilies (*Nuphar* spp.), reflecting both relatively higher nutrient availability and pH. A number of minerotrophic indicator species may be present.

Soils include some recent pond deposits and moderately to highly decomposed organic material. The area is mapped as Borohemists, ponded (197) by the USDA-NRCS. These soils are very poorly drained organic material (dominantly sapric), 16 to 51 inches thick (Web soil Survey 2015). The underlying mineral material (2C horizon) is typically gleyed and ranges in texture from silt loam to coarse sand glacial-fluvial material, or loamy sand to fine sandy loam glacial till. Wetlands established on these soils typically serve as ground water recharge areas.

Left is a soil profile from this map unit. The upper peat (fibric soil material) was floating on about 12 inches of water overlying the lower muck (sapric soil material).

### **Map Unit W-CM-3**

This map unit is classified as a Palustrine, Unconsolidated Bottom, Permanently Flooded wetland (PUB-4-Hb). The area has shallow standing water throughout the year in all years that is mainly impounded by beaver activity. This entire wetland system is affected by a beaver dam at the north end of the map unit that was built in conjunction with portions of a historic mill dam. It is known locally as McGregor Pond.

The New Hampshire natural community that best describes this area is Aquatic beds (S5). These are wetlands that occur in permanently inundated areas at the transition between emergent marshes and deeper environments of many rivers, streams, and ponds (ones that lack rooted vegetation). This is a very broadly defined natural community dominated by floating-leaved and submersed herbaceous species. We would describe this unit as a "quiet water variant", where shallow pond water and free-floating and emergent species are common.

Floating-leaved and submersed plants are the dominant life forms. Water depths are usually 2-3 feet at low-water in most years, and may be as deep as about 10 feet, the approximate depth limit for the growth of rooted plants.

The dominant vegetation at this site includes variegated yellow pondlily (*Nuphar variegata*), water shield (*Brasenia schreberi*), white waterlily (*Nymphaea odorata*), common bladderwort (*Utricularia macrorhiza*), lesser duckweed (*Lemna minor*), (*Wolffia columbiana*), pickerel weed (*Pontederia cordata*) and tapegrass (*Vallisneria Americana*). Some rare floating-leaved or submersed aquatic species found in quiet, relatively deep water or along shallow shores of rivers or ponds include several pondweeds (*Potamogeton* spp.), common mare's tail (*Hippuris vulgaris*), water marigold (*Megalodonta beckii*), wapato (*Sagittaria cuneata*), pale duckweed (*Lemna valdiviana*), star duckweed (*Lemna trisulca*), Engelmann's quillwort (*Isoetes engelmannii*), large-spored quillwort (*Isoetes lacustris*), and stiff water crowfoot (*Ranunculus subrigidus*).

Soils at the bottom of the pond include an accumulation of fine textured sediment and moderately to highly decomposed organic material. The area is mapped as Borohemists, ponded (197) by the US DANRCS. These soils are very poorly drained organic material (dominantly sapric), 16 to 51 inches thick (Web soil Survey 2015). Areas of this soil may also include silty alluvium and pond deposits enriched with organic matter (mucky silt loam). The underlying mineral material (2C horizon) is typically gleyed and ranges in texture from silt loam to coarse sand glacial-fluvial material, or loamy sand to fine sandy loam glacial till. Wetlands established on these soils typically serve as ground water recharge areas.

## **Upland Habitat Cover Types**

### **Within the Right-of-Way**

Considering the on-going vegetative maintenance practices, upland habitat cover types within the utility ROW cannot be classified within a distinct Natural Community. Upland areas within the ROW can be broadly characterized as Early Successional Upland Habitat. As noted above, topography slopes down-gradient to the east/southeast towards the McGregor Pond/Marsh system.

The upland areas within and abutting the utility ROW are dominated by one soil type: Monadnock fine sandy loam, 15-25% slopes, very stony (143D). These are well drained soils formed in coarse glacial till and ice-contact stratified drift on moderately steep side-slopes of ground moraine. Soil textures in the solum range from loamy fine sand to loamy sand, and fine sandy loam to loamy sand with gravelly and cobbly analogs in the substratum. The soils express spodic profile development (Typic Haplorthods) and are relatively permeable.

LEC observed an intermittent stream channel extending through the ROW; however, no hydric soils were found. While no protectable wetlands are associated with the intermittent stream it empties directly into the McGregor Pond and wetland system where it is immediately adjacent to the ROW. This channel carries run-off during peak storms and could provide a path of direct discharge of sediment and other pollutants during construction or aggressive maintenance.

Dominant vegetation within the ROW includes gray birch (*Betula populifolia*) saplings and patches of blackberry (*Rubus* spp.) along with bracken fern (*Pteridium aquilinum*), teaberry (*Gaultheria procumbens*), dewberry (*Rubus flagellaris*), lowbush blueberry (*Vaccinium corymbosum*), and sheep laurel. Cinquefoil (*Potentilla* spp.), path rush (*Juncus tenuis*), and panicgrass (*Panicum* spp.) were also observed within the earthen walking trail extending through the ROW.

### **Abutting Forested Uplands**

The fringing band of forested upland between the ROW and McGregor Pond/Marsh system can be characterized as Hemlock - White pine Forest (S4) primarily dominated by a moderately dense stand of eastern white pine (*Pinus strobus*) trees. Eastern hemlock (*Tsuga canadensis*) and red maple trees are present along the edge of the Marshy Moat. Eastern serviceberry (*Amelanchier canadensis*) occur sporadically, while low-bush blueberry patches primarily dominate the groundcover with interspersions of bracken fern.

A Dry Red Oak-White Pine Forest (S3S4) occurs to the west of the utility ROW.

### **Rare Wildlife and Plant Habitat**

According to the New Hampshire Natural Heritage Bureau's (NHB) Rare Plants, Rare Animals, and Exemplary Natural Communities in New Hampshire Towns (July 2013), the following rare species have been documented within Rindge:

Plants:

- Pale Duckweed (*Lemna valdiviana*)—Endangered
- Wild Lupine (*Lupinus perennis*)—Threatened

Vertebrates—Birds:

- Common Loon (*Gavia immer*)—Threatened

Vertebrates—Reptiles:

- Blanding's Turtle (*Emydoidea blandingii*)—Endangered (under review for federal protection)
- Smooth Green Snake (*Opheodrys vernalis*)—Special Concern
- Wood Turtle (*Glyptemys insculpta*)—Special Concern

Vertebrates—Amphibians:

- Slimy Salamander (*Plethodon glutinosus*)—biologically rare

## Vertebrates—Fish:

- Banded Sunfish (*Enneacanthus obesus*)—Special Concern

## Invertebrates—Dragonflies & Damselflies:

- Ebony Boghunter (*Williamsonia fletcheri*)—Special Concern
- Martha's Pennant (*Celithemis martha*)—biologically rare

LEC consulted with the Natural Heritage Bureau (NHB) to review their database for records of rare species and exemplary natural communities on or within 1 mile of the CONVERSE MEADOW CONSERVATION AREA. NHB's database includes known records for species officially listed as Threatened or Endangered either federally or by the state, as well as species and Natural Communities judged by experts to be at risk in New Hampshire but not yet formally listed. Following review, NHB reported that the Ebony Boghunter and Banded Sunfish have been documented on the property and the Slimy Salamander, Blanding's Turtle, Smooth Green Snake, Martha's Pennant, and Wild Lupine have been documented within 1 mile of the property (Attachment C). As NHB notes, a negative result (no database record) does not mean that no rare species are present. Records are of known occurrences based on information gathered by qualified biologists and reported to NHB. Many areas have never been surveyed or have been only surveyed for specific species.

The Slimy Salamander (not formally listed) is reported historically from Rindge and it is unclear whether the report represented a native population and if so, whether the population exists. Additionally, Martha's Pennant (not formally listed) is an uncommon species that inhabits vegetated ponds and lakes. Adults forage within open fields and along shorelines. The McGregor Pond/Marsh system could provide habitat for this species.

The following reviews potential habitat for both the state-listed rare species.

### *Ebony Boghunter*

The Ebony Boghunter, listed as a species of Special Concern in New Hampshire, has been documented within the Converse Meadow Pond/Marsh system. While the life cycle of the species is not well known, the Ebony Boghunter inhabits wet sphagnum bogs and swampy northern wetlands, often with soupy sphagnum pools, typically adjacent to coniferous or mixed coniferous/deciduous woodlands where adults hunt and roost. Adults are often observed along dirt roads and trails, or in small woodland clearings near breeding sites.

The McGregor Pond/Marsh system provides similar habitat characteristics to Converse Meadow Pond/Marsh system and may offer suitable for the Ebony Boghunter. Consequently, the surrounding forested uplands and abutting areas within the utility ROW may provide upland foraging habitat for the species.

### *Banded Sunfish*

Banded Sunfish (Special Concern) have been documented within the Converse Meadow Pond. According to the NH Wildlife Action Plan's Species Profiles, the Banded Sunfish prefers vegetated areas of ponds, lakes, and the backwaters of lowland streams (Scarola 1987). Banded sunfish are highly tolerant of acidic water and can withstand pH levels as low as 4.0 (Gonzales and Dunson 1989). Tolerance for acidic water may be an adaptation that provides banded sunfish with access to habitats unavailable to other fish species (Graham and Hastings 1984, Gonzales and Dunson 1991) and may provide the banded sunfish with refuge from both native and introduced species of predaceous fish (Graham 1993). In New Hampshire, banded sunfish are found in a variety of habitats from lakes and ponds to low gradient headwater streams with beaver activity. The species is highly dependent on an intact, vegetated shoreline habitat.

This (upper Millers River system) population is the only known population of Banded Sunfish within the Connecticut River Watershed in New Hampshire. To LEC's knowledge, Banded Sunfish have not been documented within McGregor Pond, but given the hydrologic connection to Converse Meadow Pond, McGregor Pond may be able to sustain a population.

### *Blanding's Turtle*

Blanding's Turtles are listed as Endangered in New Hampshire and Maine and Threatened in Massachusetts and New York. Blanding's Turtle are also identified within the NH Wildlife Action Plan as a "Species in Greatest Need of Conservation". As noted within the species profile, Blanding's Turtles require large mosaics of wetland and upland habitats with relatively limited development. The species is characterized by a late age of sexual maturity (14-20 years for female Blanding's turtles; Congdon and van Loben Sels 1993), relatively low fecundity (average 13 eggs per year, DePari et al. 1987, Congdon et al. 1983), and high rates of adult survival. Small increases in annual adult mortality (as little as 2-3%, Congdon et al. 1993, Gibbs and Shriver 2002), especially among females, can have catastrophic effects on populations. Within New Hampshire, Blanding's turtle habitat overlaps with the highest human population densities. Therefore, turtles are extremely vulnerable to rapid development, especially where road density and traffic volume is high. Blanding's Turtles require a large mosaic of wetland and upland habitats with relatively limited residential development.

During the Blanding's Turtle annual life cycle, adult individuals will utilize a wide variety of wetland and upland habitat cover types and will regularly travel long distances between areas. Blanding's Turtles overwinter in the organic substrate in the deepest parts of marshes, ponds, and occasionally vernal pools. Some individuals overwinter under hummocks in red maple or shrub swamps.

Blanding's Turtles will typically emerge from brumation between mid-March and mid-April, however weather dependent. Following emergence, individuals may exhibit long-distance movements associated with migration between permanent wetlands to ephemeral wetlands, which serve as areas for feeding, mating opportunities, and staging habitat for nesting females (Grgurovic and Sievert, 2005). Adult Blanding's Turtle individuals are omnivorous, feeding on a variety of crustaceans, insects, snails, fish, aquatic/emergent plants, berries, and carrion (DeGraaf and Yamasaki 2000). While nesting sites may occur within close proximity to ephemeral wetlands, females have been observed to travel over 1 km (3280 feet) to find appropriate Nesting Habitat (Grgurovic and Sievert, 2005). Nesting activity primarily occurs in June within well-drained loamy or sandy soils (NHESP Fact Sheet). Blanding's Turtle females will also utilize anthropogenic habitats, such as lawns, gardens, mulch piles, and power line right-of-ways to nest (Grgurovic and Sievert, 2005).

During the summer months, Blanding's Turtle are known to aestivate within both upland and wetland habitats; often intermittently from late July to late August (Ross and Anderson, 1990; Joyal, 1996). Additionally, Blanding's Turtle movement activity during the summer months and into early fall is also typically tied into the return to permanent wetlands for overwintering. The McGregor Pond/Marsh and Converse Meadow Pond/Marsh systems provide ideal Blanding's Turtle Overwintering and Feeding (Foraging)/Breeding Habitat. The surrounding Forested Wetlands, Forested Uplands and Early Successional Habitat conditions within the ROW provide suitable Aestivation Habitat. Viable Nesting Habitat may be limited to open sandy conditions found within the utility ROW. Additional open sandy conditions are located to the east and southeast of the CONVERSE MEADOW

#### CONSERVATION AREA.

##### *Smooth Green Snake*

Smooth Green Snakes (Special Concern) were listed as a species of 'High' conservation concern in the northeast United States (NEPARC 2011, Northeast RSGCN list 2014). As stated within the NH Wildlife Action Plan's Species Profiles, Smooth Green Snakes may be found in a variety of open or lightly forested habitats such as pastures, old fields, wet meadows, marsh borders, coastal grasslands, pine barrens, blueberry barrens, and grassy hilltops (Klemens 1993, New Hampshire Reptile and Amphibians Reporting Program 2015). Smooth green snakes feed primarily on invertebrates including arthropods, caterpillars, grasshoppers, slugs and earthworms. Females may lay two or more clutches of welldeveloped eggs a season, usually in July- August, in piles of rotting vegetation or sawdust, rotting logs and stumps or mammal burrows (Ernst and Ernst 2003). Ant mounds, rock crevices and mammal burrows may be used during hibernation (Carpenter 1953, Ernst and Ernst 2003).

The on and off-site utility ROW may provide suitable habitat conditions for the Smooth Green Snake.

### *Wild Lupine*

Wild Lupine, listed as Threatened species in New Hampshire, is primarily found within open to partially shaded habitats containing dry, sandy soils, including utility ROW corridors and/or other open areas that are maintained as early successional habitat.

Wild Lupine functions as the host plant for the Endangered Karner Blue Butterfly (*Lycaeides melissa samuelis*) larvae. While the Karner Blue Butterfly hasn't been historically documented within Rindge, a reintroduction program has been initiated at the Concord pine barrens/Concord Municipal Airport following extirpation in 2000 (Amaral 2000).

LEC did not observe any Wild Lupine within the utility ROW occupied by relatively dense patches of blackberry and gray birch saplings, but a comprehensive survey was not conducted. Suitable habitat for the species may be present within upland portions of the utility ROW corridor outside of the CONVERSE MEADOW CONSERVATION AREA.

## **Wetlands Evaluation**

### **Prime Wetlands**

In New Hampshire wetlands of particularly high value can be recognized by individual municipalities, under RSA 482-A:15 and administrative rules Env-Wt 700 as "Prime Wetlands". A wetland receives this designation because of its size, unspoiled character and ability to sustain populations of rare or threatened plant and animal species. To date, the Town of Rindge has not chosen to engage in the formal or statutory process of designating Prime Wetlands. Regardless of the regulatory status, the qualities that make a wetland "Prime" may be evaluated anywhere.

In the course of our evaluation of the wetlands on this property, we observed and examined wetlands that have a high probability of meeting the requirements of a Prime Wetland. The statute requires that a Prime Wetland: "shall be at least 2 acres in size, shall not consist of a water body only, shall have at least 4 primary wetland functions, one of which shall be wildlife habitat, and shall have a width of at least 50 feet at its narrowest point." (RSA 482-A:15, I-a.). In addition, the regulations specify that: "wetlands designated as prime shall meet the following minimum criteria: (1) The wetlands shall have the presence of hydric soils, hydrophytic vegetation, and wetlands hydrology; and (2) At least 50% of the prime wetland shall have very poorly drained soils and the remaining soils shall be poorly drained soils" (Env- Wt 701.04).

It is our opinion that the wetlands on this site, listed in the following table, would meet the criteria for Prime Wetlands in New Hampshire:

LEC Map Unit	USFWS Class	Approximate Total Area of Wetland
W-CM-1	PSS-3-Eb	13.3 acres
W-CM-2	PEM-1-Hb	3.7 acres
W-CM-3	PUB-4-Hb	19.2 acres

### **New Hampshire Method**

The following provides a cumulative summary of ecological integrity, wetland-dependent wildlife habitat, fish & aquatic life habitat, scenic quality, education potential, wetland-based recreation, floodwater storage, groundwater, sediment trapping, nutrient trapping/retention/transformation, shoreline anchoring, and noteworthiness. The Wetland Evaluation form is included as Attachment B.

### **Ecological Integrity**

The CONVERSE MEADOW CONSERVATION AREA maintains a fairly high level of ecological integrity. Aside from the utility ROW abutting to the northwest and Route 119/Converseville Road to the south, no

other roadways occur within 500 feet. Forested areas dominate the landscape and minimal residential development is located within this zone. Beyond 500 feet, the CONVERSE MEADOW CONSERVATION AREA is bounded by Old New Ipswich Road (west), Perry Road (north), and North Street further to the east. Beaver activity has influenced hydrology within McGregor Pond/Marsh system.

### **Wetland-Dependent Wildlife Habitat**

McGregor Pond/Marsh system has significant wildlife habitat value. Greater than 50% of the system contains open water habitat and varying vegetative classes are associated or immediately abut (PEM, PSS, & PFO). The system provides habitat for various avian, including waterfowl and wading birds, mammalian, reptilian, amphibian, and fish species, in addition to dragonflies and damselflies.

The connected Converse Meadow Pond/Marsh system greatly enhances value of wetland habitats on the CONVERSE MEADOW CONSERVATION AREA. Two state-listed species of Special Concern, the Ebony Boghunter and Banded Sunfish, have been identified on the CONVERSE MEADOW CONSERVATION AREA property (Converse Meadow Pond/Marsh) and comparable habitat conditions are present within McGregor Pond. Furthermore, the Endangered Blanding's Turtle has been documented within 1 mile of the CONVERSE MEADOW CONSERVATION AREA and ideal habitat for the species is present on-site.

### **Fish and Aquatic Habitat**

While not surveyed, the 19± acre open water McGregor Pond likely provides habitat for a variety of fish and aquatic life buffered by the abutting PEM, PSS, and PFO wetlands. Floating and submerged vegetation are present throughout. Beaver activity within the northeastern portion of the Pond has likely increased water levels and available fish and aquatic habitat.

As noted above, the Blanding's Turtle has been documented within the vicinity of the site

### **Scenic Quality**

The scenic quality associated with the McGregor Pond/Marsh system is relatively high. Views are established from walking trails on the CONVERSE MEADOW CONSERVATION AREA and include the varied wetland classes (PEM, PSS, and PFO) and open water habitat. However, the overhead electric lines are visible in the background, albeit mostly off-site.

### **Educational Potential**

The CONVERSE MEADOW CONSERVATION AREA is open to the public and educational activities currently take place.

### **Wetlands-Based Recreation**

McGregor Pond/Marsh system has opportunities for wildlife observation from the ROW. Canoe/kayak is possible but limited by way of access via 1/2 mile of maintained trail.

### **Floodwater Storage**

Utilizing the NH Method, the McGregor Pond/Marsh system has moderate flood value. The wetland is relatively large in relation to its watershed (about 20%) enabling it to hold a large amount of water produced by the watershed during times of high flow.

### **Groundwater**

The CONVERSE MEADOW CONSERVATION AREA lies directly over a small portion of a Rindge's second largest stratified drift aquifer. The entire aquifer spans the New Hampshire/Massachusetts border with an approximate 857.02-acres within the town of Rindge. The portion of the aquifer that lies within the CONVERSE MEADOW CONSERVATION AREA boundary measures approximately 114.4-acres (13.3% of the total aquifer area in Rindge).

One of the primary management goals of the CONVERSE MEADOW CONSERVATION AREA is to pro-

tect the water resources for use as a potential future drinking water source for Rindge.

### **Sediment Trapping**

The wetland system has high value for detaining and directing storm water and for collecting sediment and attenuating pollutants. While the wetland system has a moderate Wetland Flood Storage capability, a large ponded open water area with limited sediment removal capacity exists. However, a very mild gradient contributes to a moderate sediment trapping function that is moderate to high.

### **Nutrient Removal / Retention / Transformation**

Considering the size of open water, often deep in locations, the overall wetland system has a low to moderate ability for nutrients retention, removal, and/or uptake.

### **Shoreline Anchoring**

The McGregor Pond/Marsh system has a moderate shoreline anchoring capacity, a function of multiple wetland vegetation types along the shoreline (emergent, shrub, and forested), high vegetative density, and wider wetland areas.

### **Noteworthiness**

The McGregor Pond/Marsh system ranked highly in a number of functions referenced above. The system is connected to the larger Converse Meadow Pond/Marsh system and ultimately to the Connecticut River at Millers Falls in Massachusetts via the North Branch (Millers River) and Millers River.

The “Marsh & Shrub Wetlands” that occur on-site are listed on the New Hampshire Wildlife Action Plan focal habitat list, 2015.

NHB has confirmed that presence of the Ebony Boghunter and Banded Sunfish on the CONVERSE MEADOW CONSERVATION AREA property, while the Endangered Blanding’s Turtle, identified within the NH Wildlife Action Plan as a “Species in Greatest Need of Conservation”, occurs within 1 mile of the property. Potential habitat for these species exist within the McGregor Pond/Marsh system.

### **Conclusion**

The wetland and upland cover types found on the CONVERSE MEADOW CONSERVATION AREA property form a mosaic of habitats functioning for wildlife habitat, scenic quality, education, recreation, floodwater storage, groundwater protection, and sediment trapping. Despite the presence of the utility ROW abutting the McGregor Pond/Marsh system, the ecological integrity surrounding the wetlands are relatively high with only minimal residential development within 500 feet. The CONVERSE MEADOW CONSERVATION AREA contains a diversity of habitat cover types providing a myriad of unique functions and values.

While these wetland systems perform important functions, the ecological integrity of the McGregor Pond/Marsh system is susceptible to disturbance or degradation due to the abutting active utility ROW. Any major disturbance such as soil excavation, vehicular traffic or excessive disturbance of plant cover in the wetlands, or immediately adjacent uplands, will significantly affect their ability to perform the functions identified. It is our opinion that any additional impacts should be prevented that adversely affect the high-value McGregor Pond/Marsh system.

LEC is pleased to provide this baseline information. Should you have any questions or require additional information, please do not hesitate to contact Tom Peragallo at 603-899-6726 or tperagallo@lecenvironmental.com.

Sincerely,

### **Rivers Alliance of Connecticut**

Kimberly D. Bose, Secretary August 28, 2015”

Federal Energy Regulatory Commission

888 First Street, NE, Room IA

Washington, DC 20426

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/

Kinder Morgan (FERC Docket No. PF14-22-000)

Dear Secretary Bose:

Rivers Alliance of Connecticut is the statewide, non-profit coalition of river organizations, individuals, and businesses formed to protect and enhance Connecticut’s waters by promoting sound water policies, uniting and strengthening the state’s many river groups, and educating the public about the importance of water stewardship.

Rivers Alliance of Connecticut strongly urges you to disapprove the section of the above referenced project that crosses highly protected drinking-water lands on the property of the Metropolitan District Commission in Hartford. ‘Connecticut law provides the highest protections in the nation for drinking water. First, no water body that has received a waste discharge can be used for public supply of potable water. Second, water utility land hydrologically linked to drinking-water reservoirs must be kept as natural open space and cannot be disturbed in any way other than certain limited permitted actions necessary to maintain operations. By statute the protected lands are termed Class I (closest to the source) and Class II (also impacts the source).

Protection of Class I and II lands is the highest priority in our state water policy. violate this protection would set a precedent that would put at risk Connecticut’s drinking water sources. The state’s standards for drinking water are uniquely high (only Rhode Island has similar standards). These high standards are increasingly justified as science reports document the myriad new pharmaceuticals, plastics, pesticides and other toxins in ordinary wastewater. Existing treatment methods cannot adequately define or manage this array of toxins.

As an advocate for water health, Rivers Alliance of Connecticut frequently works on land-use policy. Thus, for example, I am a member of the statute-based, state landconservation board (Connecticut Natural Heritage, Open Space, and Watershed Land Acquisition Review Board); and I am co-chair of the Watershed Lands Sub Committee of the statute-based Water Planning Council Advisory Group.

Two lesser points. We are aware that Kinder Morgan has a small easement on the property it wishes to cross; the easement pre-dates the law that defines and protects source water lands. I attended a Kinder Morgan open-house presentation in Farmington, Connecticut, on August 13. There was no suggestion or evidence that the current project could be done within that easement. I also saw no detail on alternative paths for the pipeline. Until alternatives are fully described and reviewed, there is no reason to approve a pipeline path that would necessarily disrupt the hydrology of the site and would undermine the state's legal protections for drinking water.

Thank you for your consideration,  
Mararet Miner,  
Executive Director

**20150828-5268**

Kenneth Stokem, Castleton on Hudson, NY.

Please redo the live FERC Scoping Meetings for the Northeast Energy Direct pipeline and start over with a new Notice of Intent and new Scoping Meeting Schedule.

The FERC hearings for NY and PA had already concluded on Thursday, July 16th when Kinder Morgan dumped 6,500+ pages of new Resource Reports for a new scale of project on July 17th. Those of us who attended and commented at the NY scoping meetings did so without any knowledge of this new information and those who attended the New England hearings had little time to learn of and digest the 7/16 document dump.

Providing new sessions will provide citizens with another adequate time to pick through the mountain of added information. A reported preliminary search of the new documents shows over 10,000 entries of "TBD" - To Be Determined - where critical information on infrastructure and impact should be. With all the TBD entries, even with this new information, that public will not be adequately of many facts on this project.

Please provide a second opportunity to my family, neighbors and community to provide oral statements to FERC by providing a second round of FERC scoping sessions.

**20150828-5269**

Tony Mitchell, New Hartford, CT, CT.

I agree with Rivers Alliance of Connecticut and strongly urge you to disapprove the section of the above referenced project that crosses highly protected drinking-water lands on the property of the Metropolitan District Commission in Connecticut. In our state water utility land hydrologically linked to drinking-water reservoirs must be kept as natural open space and cannot be disturbed in any way other than certain limited permitted actions necessary to maintain operations. By statute the protected lands are termed Class I (closest to the source) and Class II (also impacts the source). Protection of Class I and II lands is the highest priority in our state water policy, and to violate this protection would set a precedent that would put at risk Connecticut's drinking water sources.

**20150828-5270**

Kenneth Stokem, Castleton on Hudson, NY.

Please mandate that all transport and storage of natural gas products as well as gas transport structures such as and specifically including the Northeast Direct Energy (NED) pipeline demonstrate and maintain adequate insurance to cover catastrophic and other accidents and resulting damages, losses and costs to neighboring properties, farms, businesses, communities, water and other natural resources and to local municipalities and emergency services and to state governments. This level of insurance should be more than sufficient to make such victims whole from any damages that may arise from the construction, operation and duration of the NED and other such pipelines in the United States.

Additionally, please mandate that all transport and storage of natural gas products as well as gas transport structures, including compressor and pumping stations in the United States and including the NED must demonstrate adequate insurance and assurance and maintain financial resources for end of useful life removal, remediation and restoration of facilities and lands utilized in transport or storage of those products. The funds should be sufficient and readily available to remove all pipelines and facilities and restore the land to its natural or pre-pipeline state to the satisfaction of landowners and the public.

### **20150828-5283**

Kenneth Stokem, Castleton on Hudson, NY.

To protect my family, community, and country, I oppose the Northeast Direct Energy (NED) pipeline project for the following reasons:

- New Yorkers and specifically my community will not receive any of the gas; most of the transported gas will likely will be exported to foreign markets. Gas products should not be sent overseas at the expense of ordinary Americans who will pay higher costs without any meaningful share in the profits from overseas sale.
- Pipeline safety standards in rural areas are much lower than in urban areas, effectively treating constituents who live in the rural communities along the proposed route as second class citizens. Standards should be same for the NED in rural areas as they would be in urban areas.
- The governing federal and state regulations and the resources used to ensure pipeline safety during construction, operation and decommissioning phases are woefully inadequate.
- Only landowners whose lands abut the pipeline route may receive compensation. All other residents along the pipeline corridor, even those within the "incineration zone," involuntarily assume the risk of death, personal injury and property damage in the event of a rupture, but receive no compensation for their risk and diminished quality of life.
- Property values along the pipeline will decline and reduce assessed valuations. This in turn will increase the tax burden on properties further away from the pipeline. The NED, should it be built should compensate all nearby landowners for risk and property loss.
- The federal process for approving and constructing gas pipelines violates the requirement of the National Environmental Policy Act (NEPA) to minimize cumulative negative impacts that federal agency decisions may have on public safety, health and the environment.
- No single federal entity oversees the NED project as a whole. For example, the Federal Energy Regulatory Commission decides whether and where the NED is built. The Department of State decides whether the gas may be exported. The Pipeline and Hazardous Material Safety Administration governs pipeline safety. Each agency pleads lack of jurisdiction to review or do anything that could be seen as falling within the jurisdiction of another agency. Oversight of the project is therefore segmented, hindering the public's ability to effectively review and voice concerns about the NED.
- We should be investing in renewable energy and associated technology to avoid being economically eclipsed by countries that are investing in green energy. Fracked gas is methane, a dirty 20th century fuel. America and American businesses such as Kinder Morgan should be investing in energy solutions that do not contribute in any way to global warming by producing beginning or end stages greenhouse gases.

### **20150828-5289**

Nancy Goldsmith, New Ipswich, NH.

We are writing to vehemently oppose the Northeast Energy Direct Project, Docket No. PF14-22-000.

We live in New Ipswich, NH and our property abuts the proposed pipeline route. Our home is located less than 200 feet from this route. As such, our well is in serious danger of being compromised by the blasting process and/or pipeline leakage. If this happens our home would become worthless, and as such, represent

a true disaster. This is a very real possibility based on past results from pipeline construction. Since a large percentage of homeowners in this area (ourselves included) are totally dependent on private wells, hundreds of families could potentially be affected. Furthermore, a 40,000 horsepower compression station is slated for New Ipswich. The resulting air, noise and light pollution would be devastating to this pristine region, undoing all the many years of hard work to protect our forests, rivers, water and wildlife for ourselves and future generations by land conservation and by preventing heavy industry.

On March 23, 2015 the Boston Globe reported that Greg Cunningham, director of the clean energy program at the Conservation Law Foundation stated that LNG imports can meet peak demand. He further stated that LNG prices plunged by about 50% earlier this year and that the prices should stay low for years because of the vast increase in global supplies.

On March 29, 2015 the Boston Globe reported that Ann Berwick, Undersecretary for Energy and head of the Department of Public Utilities under the Patrick administration in Massachusetts, urged enlarging existing pipelines and using existing pipeline routes rather than building new ones in pristine territory. She stated that experts disagree about whether natural gas is actually cleaner overall than coal. This is due to the fact that methane, which seeps from pipelines and distribution lines, is a far more potent greenhouse gas than carbon dioxide.

On April 24, 2015 The Boston Globe reported that Governor Baker of Massachusetts indicated at an energy summit in Hartford with other New England governors that he favors a plan led by Spectra Energy Corp to expand the existing Algonquin pipeline.

On July 6, 2015 the Boston Globe reported that Attorney General Healey of Massachusetts is heading a study on the region's electricity supply, due to be completed in October of 2015. This has prompted AG Healey to ask the DPU to rigorously study natural gas capacity needs before making decisions regarding pipelines. Furthermore, she has asked the DPU to stay its approval of certain local gas distribution companies proposed contracts to purchase gas on the Kinder Morgan pipeline.

On August 16, 2015 the NH Sunday News reported that Governor Hassan of New Hampshire urged the FERC to fully investigate alternative pipeline routes. She has concerns that the project is not needed in New Hampshire and that any regional benefits won't outweigh the impact on the 17 towns along the proposed route.

On August 21, 2015 the Boston Globe reported that due to a new state law in Massachusetts requiring utility companies to report the location and age of all known gas leaks, it has been revealed that approximately 20,000 potentially dangerous and environmentally damaging leaks exist. In January of this year scientists from Harvard reported that leaked gas in the Boston area is enough to heat approximately 200,000 homes per year and is valued at \$90 million per year. Methane in natural gas is 25 times more impactful than carbon dioxide to global warming. Hence, the Obama administration recently released a plan to cut methane emissions by nearly half nationwide over the next decade.

On August 26, 2015 the Boston Globe reported that Joel Wool of Clean Water Action in Boston stated that serious evaluation should be given to any proposals to expand natural gas infrastructure without first addressing the much-needed repairs and clean energy opportunities before us.

The above comments are only a handful of the reasons why we urge you to deny, or at least delay, a permit for this proposal.

Sincerely,

Gary & Nancy Goldsmith

RE: Docket No. PF14-22-000

Dear Ms. Bose,

Enclosed, please find a response statement from the Board of Selectmen for the Town of Deerfield, in response to the proposed Northeast Energy Direct Project (Project) involving construction and operation of facilities by Tennessee Gas Pipeline Company, L.L.C. (Tennessee Gas) in Pennsylvania, New York, Massachusetts, New Hampshire, and Connecticut.

The focus of this response is broad, but docs in a great measure address environmental concerns, including the proposed path of this project as it crosses through two rivers, several delineated wetlands, and other ecologically sensitive areas.

Thank you for your attention to this response.

Cordially,

Douglas C. Finn  
Executive Assistant  
Town of Deerfield

PIPELINE IMPACT ON ARCHAEOLOGY  
IN THE TOWN OF DEERFIELD, MASSACHUSETTS

August 18, 2015

written by  
Bud Driver, Commissioner  
Deerfield Historical Commission  
with  
Philip Zea, President  
Historic Deerfield, Inc.

Lake Hitchcock was “dammed” in the Connecticut River Valley about 17,000 years ago from glacial deposits left behind just south of today’s Middletown, Connecticut. The lake flooded northward to Newbury, Vermont. It drained 4,000 years later entering Long Island Sound at Old Saybrook rather than its ancient entry point at New Haven, Connecticut. Paleo hunters traveled to Deerfield 12,400 years ago leaving behind many campsites on the floor of the empty lake for accurate carbon dating. The lush Connecticut River Valley and its watershed attracted game including great herds of migrating caribou, waterfowl, and fish--a Paradise.

During the following millennia, significant changes occurred with New England’s climate, the landscape and game availability for hunting and trapping. New peoples moved into the area; local resources were intensively exploited and long-distance trade at times brought materials from as far away as Labrador, upper Michigan peninsula and the Gulf of Mexico. Entire cultural systems evolved. Corn Horticulture was established in the Deerfield area by roughly A.D. 500. This stable food supply allowed communities to develop a more sedentary way of life. Large scale fishing in the spring around water falls and geological shale beds that extended into the Connecticut River acted as sluice-ways for spearing and netting the migrating fish. Hunting and trapping in the high country to the west in autumn season remained parts of their annual life cycle.

One of the areas to be intensively used was Pine Hill, located in the North Meadows--a distinct geologic feature of elevated land that served as their granary and related corn storage above the annual spring floods. Proof of the size of their crops of maize, beans and squash is recorded by the sale of 500 bushels of corn to starving English settlers of Springfield in the spring of 1637 without sacrifice to themselves. Planting fields and encampments surrounding Pine Hill were used for centuries, forming what archaeologists call “multi-component” sites that date back to the Archaic and Woodland (Ceramic) time periods. Native cemeteries reflect the sedentary lifestyle of the local Pocumtuck Indian communities. Artifacts and cultural features have accumulated at such sites over the past 9,000 years.

Throughout this time, glacial landforms, such as moraines, lacustrine deltas and till-covered hillsides, have been modified by Lake Hitchcock draining and by the Deerfield River as it meandered across the valley leaving higher landscape features and valley edge terraces in its wake. These landforms above the broad alluvial floodplains and wetlands are saturated with cultural debris left behind during various Native American occupations. An artifact collection of 13,000 objects from Pine Hill alone was recently inventoried and is accessible at the Department of Anthropology, University of Massachusetts. The artifacts, relics and tribal gravesites are tangible proof of a longstanding and complex society based here in the Deerfield Valley. These sites are a significant part of our region’s cultural legacy and a resource that cannot be replaced once disturbed.

David Costello, a retired road engineer, has created an accurate map of Deerfield depicting the Contact Period (1600s) co-existence of Natives with the newcomer English beginning in the 17th century. His research is used by scholars to promote more accuracy in determining the evolution of human occupation here in Deerfield, a place of remarkable preservation in the Northeast where so much has otherwise been destroyed. The two-volume History of Deerfield, written by George Sheldon (1895-96) remains a valuable source for understanding Native and English interaction on the Deerfield landscape.

The Massachusetts archaeological permitting process mandates due diligence in site reports and thorough investigation by professionals into legal documents pertaining to the cultural history of the towns affected by the projected pipeline. Section 106 of the National Historic Preservation Act also requires federal licensing agency to take into consideration significant historic properties and to avoid or mitigate any adverse effects that may be caused by a project. Deerfield, as “the best documented small town in America,” is a valuable national case study in this regard. On the archaeological front alone, UMASS archaeologists began professional excavations in Deerfield a half century ago and curate reports reflecting the findings of at least 43 excavations as recorded by the Massachusetts Historical Commission Site Files and State Inventory List. This layered research and analysis “strongly support the following point”: The Town of Deerfield possesses a rich and complex Native presence that spans 12,400 years and after millennia is now threatened by the proposed natural gas pipeline through burial sites, Native villages, battlefields and forts east and west of Pine Hill, the 1704 English, French and Native battlefields just west of Pine Hill, as well as ancient paths and trade routes through the flanking mountain escarpments around the Deerfield Valley.

Because of the negative impact it is likely to have on our ability to understand and preserve our anthropological, historical and geological past; our recommendation is not to allow the Pipeline through our Town of Deerfield. The cultural crossroads beneath today’s Deerfield is simply too significant to lose through either construction or calamity now or in the future.

Questions:

- 1). Would you please clarify in writing how does F.E.R.C.Pipeline archaeological permit allows the “taking” of private land-owners personal property such as artifacts found during the 1/4 mile-wide foot print archaeological survey of the proposed pipeline route through private land in the Town of Deerfield?
- 2). Can the private land owner continue private archaeological excavations on private land within this Y4 mile-wide footprint without interferences by government agencies?
- 3). Is their any legal attachments and or encumbrances within the Y4 wide footprint that will change the usage of land that is private property’
- 4). Will the proposed pipeline route that runs along “Pine Hill” affect the value of the only existing house and building lots located at the south end of this hill?
- 5). Will the pipeline compensate the private landowner whose real estate sale of his home and land was lost because of this proposed pipeline route?
- 6). Can house development continue within the pipeline Y4 mile wide footprint?

Exhibit’s

- A). Three (colored) archaeological sensitivity maps showing proposed pipeline route through archaeological sites in Deerfield.
- B).One transparent overlay showing historical events that will be negatively impacted within the proposed pipeline route in Deerfield.
- C). One (black and white) copy of a map section from a Mohawk Trail historical map book depicting pre-historic and historic events within the footprint of the proposed pipeline in Deerfield.
- D). The Town of Deerfield’s Archaeological Accountability Policy promoting transparency and the protection of the private land-owner and their property rights.

**OUR LADY OF HOPE RETREAT HOUSE**

400 Temple Road  
 New Ipswich, NH 03071

Mr. Norman C. Bay, Chairman  
 Federal Energy Regulatory Commission  
 888 First Street NE  
 Washington, DC 20426

RE: Docket No. PF14-22-000

Dear Chairman Bay:

I respectfully request that the Federal Energy Regulatory Commission REJECT Tennessee Gas Pipeline Company's proposed Northeast Energy Direct (NED) Project. I base this request upon the following:

1. The pipeline, which will abut our complex if it follows the pipeline project, and the compressor station are located too close to Our Lady of Hope, our religious retreat facility. This high-pressure, high-capacity station will bring significant human safety risks to our Sisters living there and our guests.
2. The pipeline and compressor would also be in close proximity to Lukas Community which is a residential facility for disadvantaged adults.
3. The pipeline and compressor station are located too close to the Temple School whose heating system uses outside air to heat the facility. The high-pressure, high-capacity station will bring significant human safety risks to the teachers and children attending the school.
4. The pipeline and compressor station are located too close to a farm containing Newfoundland ponies, an endangered animal. There are only 250 left on earth.
5. The pipeline and compressor station are located too close to an annual migration path of thousands of raptors. The high-pressure, high-capacity station's exhaust plumes of heated gases will bring significant safety risks to these birds.
6. The pipeline and compressor station are located too close to our water supplies; the towns do not supply town water and all homes must have wells. The pipeline and compressor station are too close to parks and conserved land and will bring significant environmental hazards.
7. FERC has already approved another pipeline to satisfy New England's natural gas-fired electric generation needs on the coldest days of winter. We do not appreciate the need to add more supply especially since, for the most part, the pipeline supply will be shipped to Europe and Asia. **OF WHAT FINANCIAL BENEFIT WILL THIS PIPELINE AND COMPRESSOR STATION BE FOR NEW HAMPSHIRE?** Add to these negative impacts is the devaluation of property for all homeowners in the affected areas.
8. The towns have volunteer fire departments, limited budgets for police and first responders and emergency management. Who can adequately respond to explosions and fires and who foots these bills in case of explosions and fires? Town taxes will increase and add additional financial burdens to residents.
9. The gas that would be carried in the proposed pipeline is likely to be particularly high in toxins and radiation and the health impact upon our families, animals and plants must be avoided.
10. The proposed pipeline route requires a new right-of-way that would cut through many miles of environmentally sensitive areas and take permanently protected land out of that protection.
11. Some "fracking" compounds and chemicals negatively impact the skin, eyes, sensory organs, the respiratory system, the gastrointestinal system, the liver, the nervous system and are endocrine-disrupting chemicals. Endocrine-disrupting chemicals (EDCs) present unique hazards, particularly during fetal and early childhood growth and development. We do not want to be exposed to any of these chemicals.

I urge you to take all these comments into consideration when making decisions relative to the pipeline and compressor station project.

Thank you.

Respectfully submitted,

Sister Lorraine Trottier

• Re: The proposed Tennessee Gas Pipeline Company I Kinder Morgan NED Project Docket # PF14-22-000  
August 22, 2015

Chairman Norman C. Bay  
Commissioner Tony Clark  
Commissioner Colette D. Honorable  
Commissioner Cheryl A. LaFleur  
Commissioner Philip D. Moeller  
Mr. Eric Tomasi, Project Manager  
Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

Dear Chairman Bay and Commissioners Clark, Honorable, LaFleur and Moeller, and Mr. Tomasi:

Thank you for considering the thoughts of U.S. citizens in preparing your upcoming decision to either authorize or disallow the Northeast Energy Direct (NED) project proposed by Tennessee Gas Pipeline I Kinder Morgan.

With the responsibility for making this critical decision, you hold tremendous power over thousands of people's lives and futures, homes, and regional economies, as well as miles of wildlife corridors and aquifers, and the quality of the air borne on the wind into our ears and lungs for years to come.

You've likely heard these thoughts in many forms by now. Many of these concerns were expressed at the July 29th scoping session in Nashua, NH that I and many others attended, and I appreciate Mr. Tomasi's forbearance with the volume and intensity of the comments set forth that night. People know what's riding on this. Our backs are to the wall and our only hope is you.

NED isn't just a Southern New Hampshire issue or one confined to five regions of the United States. The ruling made on this pipeline will have profound implications beyond our borders. It will show the world what we as Americans believe is proper to do, what our priorities are, and what we have created with democracy.

It may inform countries wondering whether freedom is worth fighting for what the end game of that freedom

is.

We send sons and daughters across the world to fight for freedom and convince others that free enterprise is best-but if this project is authorized, more than a few soldiers will return to nothing, finding their home taken by a corporate entity designed by the very system they risked their lives for.

Despite the threats posed by the proposed pipeline, New Hampshire's Governor has been fairly silent on this matter, and the word is that she is obliged to Kinder Morgan. I do not want to believe that our Governor would abandon her responsibility to protect the state's residents and natural resources for material or personal gain. So we are driven to thoughtfulness by her silence.

Money talks, of course. Does it really need to be said that it would be unethical of Kinder Morgan to use its corporate wealth to bribe and/or influence government entities to pass down decisions that would further its insular self-interests at the expense of thousands of U.S. citizens?

There are far more stakeholders of the United States of America (we, the voters and taxpayers, i.e., the shareholders of this nation) than there are shareholders of TGP and KM combined. So our views should be weighed in proportion to theirs.

And there are so many more risks than benefits to citizens with this proposed pipeline that it shouldn't even be under consideration: The NED project will unequivocally rape our environment, take homes by eminent domain, decrease surrounding housing values, create an exodus of area residents and drain our fragile economy, bring little or no natural gas here, increase electric rate tariffs, contaminate our air with noise and hazardous chemicals, possibly contaminate well-dependent water supplies, put us in harm's way of a catastrophic leak or explosion near electrical power lines that small towns have no means to cope with, deplete America's limited fossil fuel resources in general while exporting finite natural gas out of the country, and endanger the health of populations for generations.

The entire pipeline route and environs would suffer these ill effects, risks, and dangers in perpetuity all the while TGP/KM protects itself with lawyers, money, legal language, and "limited liability .....

Do we, as a democratic country, think it wise to grant one corporation so much power? Has the pursuit of wealth in America, once considered the American Dream, devolved to destroying the people who espoused it? What should take precedence and which is more important-a corporation's plans to further its already healthy bottom line profits-or the lives of American citizens and natural resources that its plans will devastate? Will we Americans decide of our own free will to enslave ourselves, our heirs, and our resources to the corporate engines we have made? What is the message about what this country stands for, and what we have become, that we want to give our own people as well as other countries considering democracy? We have a great country and there is hope, but someone has to take a stand for it to live.

The Federal Energy Regulatory Commission has a critical responsibility now. Your decision will answer these questions, and I believe that not only five U.S. states but the rest of the world will be watching.

Very truly yours,

Linda Stonehill

Washington, DC 20426

Docket No. PF14-22-000

Dear Secretary Bose,

My name is Mark Salisbury and I live in Temple, New Hampshire. I own and operate a grass fed beef cattle farm that has been in my family since 1941. This is my family's home and place of business. My property abuts the land where the proposed compressor station is to be built in New Ipswich, NH.

I have received documentation from the New Hampshire Department of Environmental Health Services stating that there will be 50+ chemical emissions from the compressor station as noted in the attached document (Southwest Pennsylvania and Compressor Stations Environmental Health Impact Project - Summary on Compressor Stations and Health Impacts - February 24, 2015).

My cattle will be grazing within 500 feet of this proposed site and I have concerns that I would like to bring to your attention:

What will the emissions do to my cattle?

What kind of chemicals will be released - not just in the air, but in the soil as well? What will these emissions do to my cattle?

How will they affect the people that eat the beef and the people that live around here?

In the other attached document please find the results from research into these questions. This report (Impacts of Gas Drilling on Human and Animal Health) details the known effects of the emissions and pollution from compressor stations on both people and livestock. In other words - my family and my livelihood. My customers have already stated that if this proposal goes through, they will no longer buy my cattle or my hay. If this happens, I will suffer complete financial ruin, being as this farm and my cattle are my only source of income.

This will be largest compressor station on the pipeline. With all the noise and the emissions coming from the compressor station, this will have an extreme negative effect on the children that attend the elementary school across the street as well as my cows.

The school is downwind of the proposed compressor station and will be directly in line with the exhaust plume from the general running of the station and the expelled gases during -blow downs.

Also, the school gets its water supply from a reservoir that is fed by a stream originating on the site of the proposed compressor. As the construction site is intended to be placed on a brownfield site, heavily polluted with lead, the disturbance of the topsoil involved in the construction phase, will leach lead directly into this stream and consequently into the school's water supply. It should be noted that the same reservoir is also the water supply for the nearby town of Greenville.

The prospect of an industrial size compressor in our quiet, agricultural surroundings, running 24/7 is appalling. This will totally destroy the peace we have come to regard as the natural state of our small community.

So - to summarize- we are faced with noise, chemical emissions, a threat to the water supply of our farm, the school, and the next town all for the profit of a remote, huge corporation with a known record of poor maintenance to its pipelines and compressors. In addition to all this it would seem most likely I would lose both my cattle and farm and the land would be ruined for all future agricultural use.

Can you imagine living next to a compressor station that is running 24/7?

All I ask is that you please take the time to read the attached documents. I know they are not an exciting read, but there is a lot of relevant information there about what can and will happen to the surrounding area if this pipeline is approved.

Thank you for your time and consideration.

Mark Salisbury

**IMPACTS OF GAS DRILLING ON HUMAN AND ANIMAL HEALTH**

MICHELLE BAMBERGER

ROBERT E. OSWALD

ABSTRACT

Environmental concerns surrounding drilling for gas are intense due to expansion of shale gas drilling operations. Controversy surrounding the impact of drilling on air and water quality has pitted industry and lease - holders against individuals and groups concerned with environmental protection and public health. Because animals often are exposed continually to air, soil, and groundwater and have more frequent reproductive cycles, animals can be used as sentinels to monitor impacts to human health. This study involved interviews with animal owners who live near gas drilling operations. The findings illustrate which aspects of the drilling process may lead to health problems and suggest modifications that would lessen but not eliminate impacts. Complete evidence regarding health impacts of gas drilling cannot be obtained due to incomplete testing and disclosure of chemicals, and nondisclosure agreements. Without rigorous scientific studies, the gas drilling boom sweeping the world will remain an uncontrolled health experiment on an enormous scale.

Keywords: hydraulic fracturing, shale gas drilling, veterinary medicine, environmental toxicology

Project docket number PF14-22-000

Natural Gas (methane) pipeline expansion, aka NED Project

The following are comments on the proposed NED pipeline expansion.

The Northeast Energy Direct (NED) pipeline expansion is not in the best interest of the public, the environment or rate payers. I'm writing these comments in the facade of democracy. Below are many of the categories under which the NED project should not go through.

Environment:

“Under NEPA: An EIS is: Environmental consequences: A discussion of the environmental impacts (direct, indirect, and cumulative impacts) of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided, and the means to mitigate adverse environmental impacts.” A complete EIS on the NED project would reveal “direct, indirect, and cumulative” local and global adverse environmental impacts.

Under the environmental criteria used by FERC to approve/disapprove gas/oil infrastructure projects, the NED pipeline CANNOT be approved. Using all environmental criteria, natural gas (methane) pipelines are a disaster for the environment, both locally and globally. Methane is a local air pollutant (compressor stations and pipelines) and is 86 times more potent as a heat trapping gas than CO2. Methane leaks along all phases of production have been well documented.

*Office of Fossil Energy, U.S. Department of Energy*

*Under the Natural Gas Act of 1938, as amended, the DOE has jurisdiction over this natural gas export approval. The significant environmental consequences of the induced gas production in Pennsylvania 'Iru the significant environmental consequences resulting from the pipeline construction and operation of natural gas transmission pipeline infrastructure in Pennsylvania, New York, Massachusetts and New Hampshire is a direct effect of this project. The significant environmental consequences of this export application are due to green house gas emissions which result from drilling, transmission, liquefaction and consumption.*

*James Carvalho*

So if you approve this pipeline (and others) over increasing clean renewable energy, the viable alternative, you are not following your own rules. That would beg the question: why is FERC in existence?

Public need:

The gas not needed here, it's for export. 56% of all gas through these pipelines is going to Goldboro NS or Dracut Massachusetts for export so it can be sold to European and Asian markets for 2 to 4 times the profit. Connecticut actually has to use rate payer funds to pay for incentive subsidies so people will convert to natural gas heating as a way to justify these pipeline expansions. (CES has provided estimates for New England future gas needs. How did they arrive at these estimates? Who funds CES?)

Public health: If you won't take environmental concerns into consideration, maybe public health is a strong enough criterion. Compressor stations have been proven to be a public health hazard because of the local air pollution they cause with intended and unintended methane leaks and noise.

Rate payers With all the complaints about high electricity costs during the recent scoping meeting in Connecticut, you would think they would be against a pipeline in which the construction and operation costs will be passed on to all electric rate payers whether they use electricity from a gas plant or not. I realize there is a mix of fuels in the ISO New England grid but this is like asking all drivers to pay a premium at the pump which would go to a car manufacturer who wants to build a new plant.

Jobs: Yes, let them play the "jobs" card again. What guarantee says the jobs will go to Connecticut residents? Is there a law that says Kinder Morgan (or anyone) has to hire union Connecticut residents? There are more good paying, longer lasting jobs to be had in renewables but are the pipefitters only interested in these pipelines because they feel they can't do anything else?

So they can stop with the "we have to feed our families" line; it's embarrassing. It's a simple question: if it could be proven, to your satisfaction, that your job was actually hurting your family, would you still do it? It's not actually such a silly question. Remember how they sold gas guzzling SUV's? ("you want your kids to be safe, don't you?") Who would say no to that? But it was a distracting question meant to elicit emotions not reason. When faced with a decision, the brain will choose emotion over logic almost every time.

{text + graphic not OCR convertible, omitted}

The danger of explosions could come from weather, construction accident, local digging, corrosion of the pipes, age of the pipes, even malicious intent. U.S. infrastructure. which includes but is not limited to pipelines (oil/gas), sewage treatment plants, bridges, was hacked 79 times in 2014 alone. With the exception of the "Smart Grid," it's very difficult to hack into a solar panel. (ps beware of anything with the word "smart" in it. Smart phone, smart grid, smart bomb. etc)

Lack of consideration of the public interest:

I have, reluctantly, gone through hearings over the last year, This is difficult to do because I feel it may be as futile as playing tic-tac-toe. During this time I have also researched the history of FERC. Through all this my level of trust and faith in PERC and the system couldn't be much lower. The reason for this is the "rubber stamp" pattern of permits for oil and natural gas projects. According to your own website you're supposed to acknowledge and find resolutions to stakeholders' concerns.

**(<http://www.ferc.gov/industries/gasiindust-actipipelines.asp>) ..... to engage stakeholders in the identification and resolution of stakeholder concerns prior to the filing of a certificate application with the Commission.”**

Other people feel the same way. This is from bipartisan members of the New Hampshire House:

“Our constituents have expressed frustration about the lack of information from FERC [Federal Energy Regulatory Commission] and the limited extent that public input is considered in the Commission’s review and approval process for energy infrastructure projects,” Granite State senators and House members told U.S.

Department of Energy Inspector General Gregory Friedman in a recently released July IS letter.” .

This is from a member of the public in a comment period from last year:

In FERC’s history; they have NEVER denied a permit for any oil and gas infrastructure project unless the operator withdrew the application. The FERC regulatory/permitting process is designed and orchestrated to render public opinion meaningless, ineffective, and destined to fail. (John Trallo)

Here ends my feeble attempt to point out all the reasons the NED pipeline expansion should not be permitted to take place.

John D. Calandrelli

Re: Comments on Tennessee Gas Pipeline - Northeast Energy Direct Pipeline Project  
FERC Docket # PF14-22-000

Dear Secretary Bose:

The Metropolitan District (the eMDC” or the eDistrictn) is extremely concerned about the Northeast Energy Direct Project (NED Project) gas transmission line proposed by the Tennessee Gas Pipeline Company, L.L.C. and Kinder Morgan. This project has the potential to directly impact the District’s critical public water supply watershed lands and drinking water reservoirs at its West Harford and Reservoir 16 facilities. These facilities include, among other things, dams, water transmission pipelines, and underground tunnels.

The MDC provides potable water services to over 400,000 people in the greater Harford area. The MDC is a public, non-profit, municipal corporation consisting of eight member towns, which include Hartford and the seven adjacent towns. Protecting the health and integrity of our public water supply reservoirs and watershed lands is our highest priority.

The Tennessee Gas Company’s NED Project — Proposed 24” Pipeline Segment S 300 Line CT Loop, as we understand, would be constructed through public water supply watershed lands in Farmington, West Harford and Bloomfield, spanning a distance of over 6 miles running north-south. It would pass directly through the watersheds of MDC-owned Reservoirs 12,3, 5 & 6. The majority of this watershed property (over 2,000 acres) is owned by the MDC.

Given the proximity of MDC property to these water resources, this property is classified in Connecticut as Class I or Class II watershed property, all of which is highly and closely regulated by the State of Connecticut Department of Public Health (DPH). Unfortunately, the Tennessee Gas Company's second draft Resource Reports (issued 7-24-15) do not address or consider this important designation, nor do they address or evaluate the potential long and short term impacts to NIDC's public drinking water reservoirs or water supply watersheds. Only brief reference is made in Resource Report 2 (Section 2.2.6.1.5) stating, "Tennessee will consult with the MDC to avoid, minimize or mitigate impacts to these watersheds."

Given the fact that state regulated public water supply watershed lands were not considered in Tennessee's July 24, 2015 Environmental Reports, it therefore follows that Tennessee's comments pertaining to the environmental impacts of the proposed 300 Line CT Loop pipeline are incomplete. In addition, the project details provided by Tennessee are also incomplete and are not site-specific with regard to construction plans and mitigation measures that will be implemented for the installation of the 300 Line CT Loop across these important public water supply watershed lands.

The protection of drinking water supplies is critically important to our state and to our citizens. Given the lack of information made available to the MDC, the MDC must express the concern that the proposed project may conflict with Connecticut's drinking water protection goals. Absent adequate protections, the project could have significant ramifications both, during and after construction activities. The MDC suspects that a significant amount of watershed land area would be required for the actual work on the pipeline and for temporary work space, pipe and equipment storage yards, as well as the construction of temporary and permanent access roads for contractors and equipment to reach the 6-mile long stretch of pipeline.

Construction of the pipeline will potentially disturb surface and ground water flows along the 6-mile stretch, and may alter drainage patterns, which could impact the watersheds' quantity and quality of water reaching our drinking water reservoirs. Associated concerns include soil erosion and runoff, fuel and other hazardous material spills, spread of invasive plants, increased use of chemicals such as fertilizers and herbicides, and other matters of potential concern to public health and safety. In addition, the proposed project occurs on watershed lands that are open to public recreation throughout the year, and, therefore, ensuring the health and safety of our visitors is also a vital concern.

In view of the above, the MDC requests that the Tennessee Gas Company be required to publically address, in a forum setting, the following concerns, and that the MDC and its member towns be given the opportunity to review and comment on Tennessee's responses prior to the formal filing of the final Resource Reports and the issuance of a FERC certificate of public convenience and necessity:

1. Tennessee Gas Company's numerous Resource Reports only consider resources and impacts within a narrow corridor of land where the pipeline is proposed to be built. These reports do not identify, nor do they address, potential impacts to drinking water supply watershed areas or MDC's public water supply reservoirs. The Resource Reports are not site-specific and detailed enough to fully evaluate potential impacts to MDC watershed lands and water supplies.

We therefore request that watershed drainage areas be identified, mapped (illustrating the water supply protection area and the source location) and evaluated to determine potential construction impacts on public health, safety and water quality. This information must be site specific to MDC lands, including the location and description of the 24 streams and other wetlands that are proposed to be crossed as part of the project. The alternative route options examined should be explained as to why they were not selected.

We request that detailed construction plans, procedures, environmental controls and mitigation measures, as well as restoration methods be identified by drainage area for each of the 24 proposed stream crossings and any additional wetlands crossings that are proposed for MDC's public water supply watershed lands. The specific methodology to be used for each stream crossing must be addressed; and

2. We request that detailed construction plans, procedures, environmental controls, mitigation and restoration measures, as well as post construction monitoring procedures and maintenance protocols, be developed

that are site specific and customized to address existing conditions on our watershed lands and also reflect the necessity of protecting MDC's drinking water supplies for the future. Overall, the following basic information is requested for evaluation:

- a. Detailed plans showing the proposed location, width and depth of the new pipeline with the level of specificity which will allow the MDC and State regulatory agencies the opportunity to conduct a meaningful review;
- b. Such plans should include, but not be limited to, the type and grade of pipe to be used, back fill material and the depth to which it will be buried and the height to which it will be filled for each specific site along the route, with special consideration for planning future vehicular access across the pipeline;
- c. The size and specific locations of the existing permanent easements, proposed permanent easements, temporary work spaces and any additional temporary workspaces that will be needed. This includes all construction work areas: staging areas; pipe and equipment storage yards; contractor yards; storage locations for hazardous materials, including chemicals, fuels, lubricating oils; timber yarding and log storage areas; borrow and disposal areas for woody debris and other unwanted vegetation, etc.;
- d. The types of hazardous materials, herbicides and other chemicals, fuels, lubricating oils, explosives, etc., to be used on-site during construction, and their specific locations and storage methods. The plans for treatment of wastewater discharges and disposal of construction waste, dredge spoil, and other materials must also be addressed;
- e. The specific spill prevention and emergency response plan to be used on-site, including the protocols for reporting spills, leaks (and other emergencies) to the Connecticut Department of Energy and Environmental Protection ("DEEP"), the Connecticut DPH and the MDC, as well as local fire departments;
- f. The extent to which blasting will be required and its impact on hydrography and water supplies. Areas of geotechnical concern also must be identified;
- g. The site specific plans to be implemented for erosion and sediment control, and stormwater runoff, including site specific erosion and sediment control practices that will be used before, during and after construction activities to reduce runoff and the pollutants in runoff;
- h. The mapped location and extent of proposed tree clearing (including an estimation of board foot volumes by species) and other vegetation planned for removal as part of all construction activities, and the location of access points where logging equipment, emergency vehicles and other heavy equipment could safely cross the pipeline after completion of construction;
- i. The plans for accessing the construction site and a map showing the location of any proposed new roads and any existing roads. The MDC's current position is that access for construction and maintenance activities should be restricted to the existing easement area granted to Tennessee Gas by the MDC in 1952, long before enactment of the Federal Clean Water Act and state statutes and regulations regarding classification and regulation of watershed lands;
- j. The location and extent of any recreational trails crossed or impacted by the project's construction activities, including any of MDC's roadways or trails, and any areas of the National Scenic Trail System (Metacomet Trail);
- k. The site specific plan for invasive species management for MDC water supply lands and surface waters. The plan should document the BMPs that will be used to prevent the spread of invasive species between work sites, including the potential transport from withdrawal water sources to the receiving waterbody during hydrostatic testing. Preventing the spread of invasive species is crucial to health of watershed lands;
- l. The proposed sources of hydrostatic test water, the quantity required the methods for withdrawal, the type of contaminants contained in the discharge water, proposed treatment methods and locations of discharges and any waste products generated. The MDC submits that MDC water resources will not be available for such uses. In addition, any such use and/or discharge would be subject to the DEEP and

DPH review and permitting process;

m. The long-term right-of-way maintenance techniques planned for the project and how they will impact watershed lands; including gates, fencing and other security measures; vegetation management techniques; and long-term maintenance of water runoff and soil erosion issues on steeply sloping pipeline corridors or those impacted by heavy recreational use; and

n. An examination of alternative gas pipeline routes, including the existing gas pipeline corridor as well other existing public utility rights-of-way, which may be utilized to accommodate the proposed project that may minimize potential environmental impacts.

3. In addition, the MDC requests that water sampling and testing be undertaken in key locations as determined by MDC to establish baselines for water quality and existing flow rates in its water supply watersheds. In addition, MDC requests that water quality monitoring be continued through the duration of the project to assess potential contaminants associated with the pipeline construction and operation. In the event of water supply contamination, Tennessee Gas should identify the procedures that will be implemented to remediate the situation and indemnify the District from any direct or indirect consequences resulting from such contamination.

4. Based on rough calculations, the MDC believes that the new gas pipeline may disturb up to 250 acres of its watershed property, all of which is closely regulated by the CT DPH. Specifically, Conn. Gen. Stat. §25-37c provides that there are three classes of property owned by water companies: i) Class I property which is within 250 feet of a reservoir (heavily regulated); ii) Class II property which is watershed property that is not Class I property (closely regulated); or iii) Class III property which is property that is off the watershed (minor regulation). Based on maps the MDC has seen, it appears that all of the proposed activity will occur on either Class I or Class II watershed land.

The regulations promulgated by DPH (Conn Reg. Sec. 25-37d-1 et seq.) provide that a water company shall NOT "...sell, lease, assign or otherwise dispose of or change the use of any watershed lands, and any off-watershed Class II lands ...without a written permit from the Commissioner of Public Health." The grant of an easement for these purposes falls within these parameters. The regulations further provide that only a water company may apply for the permit; it is questionable whether a third party such as Tennessee Gas could apply on its own behalf. Any application filed is reviewed by a team of experts consisting of representatives from DPH, the Department of Energy and Environmental Protection, the GFice of Policy and Management, and, if warranted, outside consultants. These experts would advise the DPH Commissioner on whether there is a significant adverse impact resulting from the proposed activities.

If an application to allow for a change in use of this property were filed, the Commissioner's consideration is focused on the potential impact on the water source and whether the activity would disturb ground vegetation which is important to support the Class I water source. Whether a public hearing is held is a factor of whether there is a finding by the Commissioner of significant adverse impact by the proposed activities. This ultimately is a judgment of the DPH. In addition, as noted above, depending on the specific proposed construction and associated activities, it is possible that CT DEEP review and approval may be necessary.

In summary, the MDC lacks the fundamental information that will enable MDC policymakers to make informed decisions. It is absolutely essential that the MDC be provided accurate and complete information. In addition, given the obligations the MDC has to the CT DPH and DEEP, these agencies must also be provided this information. As a practical matter, the information would be fundamental to any application that would be filed pursuant to applicable state statutes and regulations.

5. Finally, Tennessee Gas has made several requests to the MDC for a temporary easement in the general vicinity of the proposed pipeline for purposes of survey. The MDC will not consider granting this survey easement unless and until Tennessee Gas holds a well-advertised public forum in a MDC-member town where Tennessee Gas or its representatives give a formal public presentation about the details of this project as they apply to our public water supply watershed lands. Although Tennessee Gas has hosted various "open

houses,” the methods in which these meetings have been conducted have failed to provide an adequate opportunity for the general public to become familiar with this project. This request was reiterated in correspondence to Tennessee Gas on August 19, 2016.

We look forward to receiving insightful answers to our questions and concerns. Thank you for your attention, and do not hesitate to contact me if you have any questions.

Sincerely,

THE METROPOLITAN DISTRICT

**20150831-0062**

Hello,

I am a proud resident of New Hampshire. I have until recently remained open minded to the proposed NED Kinder Morgan Pipeline Project. After much research, both pros and cons, I have come to the only possible conclusion. This project brings zero value to the state of New Hampshire.

In fact I firmly believe it will have devastatingly negative impacts on many aspects. This pipeline is intended for export, it does not benefn New Hampshire home owners. We will actually be burdened with a tariff on our electric rates to fund the cost to build this pipeline. Allowing Kinder Morgan, a privately owned company, zero costs and accountability.

I am extremely concerned for the environmental damage, effects on wells and aquifers, disruption and elimination of wildlife (falcons in particular) loss of property/adverse property value with no compensation or accountability for voe pollutants, excessive noise levels, elimination of “night skY”, and most importantly our health and safety. Kinder Morgan historically has a poor safety record. This project would also take away from important National and State goals for renewable energy. Let’s not take a step backwards!

I am also very concerned that Eminent Domain is being considered. Without a need from New Hampshire residents how can this process be legally acceptable?

All towns affected would be forced to bare the added burden of funding addition safety needs, fire, police, safety, and evacuation requirements that need to be implemented for accident preparations. This will be an enormous financial burden for all our New Hampshire residents.

After taking all things into consideration I strongly feel this is greed, not a need.

I oppose the NED Kinder Morgan Pipeline Project!

Regards,

Rebecca Belanger

Hand written FERC Comment form: Theresa Garcia, PO Box 453, 175 Collins Pond Rd, Fitzwilliam, NH 03447: opposing

**20150831-0064**

Dear Kimberly,

I’m writing to voice my concerns about project docket number pF14-22-000 and the acquisition of yet another potential easement on my property. My husband and I purchased this property as a retirement home knowing that the Constitution Pipeline is scheduled to come through the property. It was a hard decision to make because of that possibility. We have concerns about the project affecting our water table, the loss of trees and wildlife habitat. We received no compensation. No sooner did we sign the sale papers for the property when the Tennessee Pipeline packet shows up in our mailbox. Our concerns have now doubled. This new pipeline will supposedly be put in right next to the Constitution one. Our property sets on a rocky hillside. More blasting, potential displacement of our water supply and more loss of large trees and wildlife habitat. We already have a telephone line easement running parallel to these potential pipelines. This latest pipeline would be three easements. We also have concerns about a natural spring and small slate quarry on the property. A family of porcupines live by the quarry. Two pipelines will just about destroy much of our wildlife habitats.

It is our opinon that this pipeline is not in the public convenience and necessity. It surely won’t be a convenience for us. It fills us with dread. We hope you and the commission will decide against this project or find an alternate course.

Sincerely,

Donald and Kathy Bessler

Washington, DC 20426

Re: docket Number PF14-22

I am sure that you have received extensive data questioning the actual need for the proposed pipeline from

Wright, Ny to Draco. I have endorsed some of the concerns that I have read regarding the need for additional lines and some proposah for alternafive energy .I question why the Federal Government would want to agow a private company to finandagy benefit from a plan to sell fuel overseas while putting the local population at risk There seems so be a spin put on the information that promotes gas as an environmental fuel source and that more pipe lines are needed.

There have been some documented studies showing that formaldehyde and benzene are being released at Compressor sites. There is no requirement to study and monitor air around these and proposed Compressor sites. Who will be responsible for the health or the surrounding population of up to a mile down wind from the site. I have also read that the Methane released from the Compressor Stations and from leaking pipes is overag more dangerous to global warming that the pollution of oil or coal.

As an effected landowner I am also very concerned about my famgy's safety. A high pressure gas line ex-plodon would damage everything within 1,000feet That would be most of my property including my house. While we have received requests to survey our property from Kinder Morgan, no one has acknowledged that placing a high pressure gas line so dose to my home is Dangerousl No one has acknowledged the financial damage that we will sustain because of decreased property value. How many other homeowners will have to worry and have sleepless nights because they cannot afford to move.

My home is a passive solar home with solar panels. For thirty years we have been conserving energy and only using renewable resources to heat such as solar and wood. The federal government should not allow Kinder Morgan to build new gas lines. They are not needed and they are not safe. Please put more eil'ort into supporting renewable resources and protect our people and planet for years to come.

Sincerely,

Patrick Timme

Subject Northeast Energy Direct Project —New Hampshire Impact

Please consider this notice of my opposition to the Tennessee Gas Pipeline Company's plan on constructing a natural gas pipeline in southern New Hampshire. I am against this proposal due to the following reasons:

- ~ Impact on forests, lakes, rivers and homes. This project will scar the scenic landscape that New Hampshire is known for and am also concerned this will impact the tourist industry.
- ~ Safety Record Concerns —from 2003 - 2013 Kinder Morgan experienced 36 signIcant incidents of explosions and spills. I really believe this is putting the NH residents at a very serious health risk.
- ~ Gas production will not benefit New Hampshire. This project is putting the NH residents at risk so Kinder Morgan is able to increase profits.
- ~ Eminent Domain. Really feel it is a crime that people will be forced to have this pipeline forced on their property. This seriously impacts the value of their homes as well as their safety.
- ~ This pipeline will be carrying highly flammable gas throughout residential and non-residential aieas across Southern New Hampshire.
- ~ The claim has been made that this will increase employment opportunities, however only 3 permanent jobs will be created.

Thank you for consideration.

Jeanne Bennett  
New Hampshire Resident

Washington, DC 20426

Dear Ms. Bose,

This letter is in regard to Docket PF14-22.

My concern is that our well water could very well be contaminated by the blasting and use of chemicals on the NED project. This has happened in other pipeline projects. We are dependent on our wells, and Kinder Morgan has not been cooperative when they have ruined people's wells in the past.

Home insurances do not cover damage from pipeline projects, so homeowners are left with no recourse, and with a home that is essentially without value. Since Kinder Morgan will make millions of dollars on this project, they should be made to at least protect the citizens and their property as much as possible,

They should at the very least be made to do the following:

1. Test our wells before the project begins and afterwards at specified intervals. These tests should include VOC testing.
2. Since this company has proven itself unreliable in reimbursing people for damage to their property, they should be made to set up a fund before construction begins. This fund should be overseen independent of Kinder Morgan.

We have worked our whole lives to have a decent home and community. If the pipeline does go through, Kinder Morgan and our government should at least treat us as fairly as possible.

Sincerely,

Kathryn Walters

RE: Northeast Energy, Direct Docket 1PF14-22

Dear Ms. Bose,

Please help us to maintain our beautiful town land by not allowing Kinder Morgan to run its pipeline through our back yards and add a horrific compressor station that is so huge it will pollute our air that we breathe and our land that we so treasure. Never mind the noise it will create and the dangers of it all.

This is just wrong!

The gas from this pipeline does not even benefit anyone in the area or our country as it is proposed to be shipped overseas.

But you know all of this already. Please help us to preserve our lands. We should at least have a choice. This is America right? Yes, I know that is na'Ive, but I am a regular person that is going to see the land tom to pieces that I love and a huge pipe put in place that puts us all in danger if it leaks or explodes.

Please hear our cry for help in putting a stop to this powerful company.

Sincerely,

Debbie J. Drumm

**20150831-0076**

Hello,

I am a proud resident of New Hampshire. I have until recently remained open minded to the proposed NED Kinder Morgan Pipeline Project. After much research, both pros and cons, I have come to the only possible conclusion. This project brings zero value to the state of New Hampshire.

In fact I firmly believe it will have devastatingly negative impacts on many aspects. This pipeline is in-tended for export, it does not benefn New Hampshire home owners. We will actually be burdened with a tariff on our electric rates to fund the cost to build this pipeline. Allowing Kinder Morgan, a privately owned company, zero costs and accountability.

I am extremely concerned for the environmental damage, effects on wells and aquifers, disruption and elimi-nation of wildlife (falcons in particular) loss of property/adverse property value with no compensation or ac-

countability for voe pollutants, excessive noise levels, elimination of “night skY”, and most importantly our health and safety. Kinder Morgan historically has a poor safety record. This project would also take away from important National and State goals for renewable energy. Let’s not take a step backwards!

I am also very concerned that Eminent Domain is being considered. Without a need from New Hampshire residents how can this process be legally acceptable?

All towns affected would be forced to bare the added burden of funding addition safety needs, fire, police, safety, and evacuation requirements that need to be implemented for accident preparations. This will be an enormous financial burden for all our New Hampshire residents.

After taking all things into consideration I strongly feel this is greed, not a need.

I oppose the NED Kinder Morgan Pipeline Project!

Regards,  
Rachel E. Moorman

LINDA DEAN CAMPBELL  
STATE REPRESENTATIVE  
15th ESSEX DISTRICT

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE Room IA  
Washington, DC 20426

Docket Number: PF14-22-000

Dear Secretary Bose,

I am writing today to convey the concerns that have been raised by many of my constituents in the 15<sup>th</sup> Essex district, particularly those in the city of Methuen who will be directly impacted by the proposed North-east Energy Direct (NED) Pipeline.

First and foremost, I have yet to see definitive proof that the Commonwealth is currently facing a natural gas shortage and that a significant increase in natural gas supply brought about by a new pipeline will truly result in lower prices for my constituents.

The extent to which Massachusetts and New England has faced high energy prices in recent years largely seems to be due to a combination of mismanagement on the part of suppliers. In fact, the most recent winter of 2014-2015 actually featured lower prices than 2013-2014 despite being colder on average.

Kinder Morgan has also repeatedly changed the proposed size and distribution routes of the NED pipeline, suggesting that they do not have an accurate projection of natural gas demand for the region and that their main objective is to expand the pipeline to take advantage of export opportunities. (In my district, meeting times for constituent questions/feedback also changed repeatedly.)

This is a significant problem for a number of reasons:

The price of natural gas is highly volatile and an increase in our region’s dependence on natural gas will make ratepayers vulnerable to price spikes.

Energy consumption actually appears to be decreasing in our region due to efficiency improvements and this only increases the likelihood that this expansion will be used to serve as an enhancement for export across the Atlantic.

Given these issues, I do not accept the premise that we can do and should do nothing in Government to en-

sure that this expansion benefits New England and Massachusetts whose ratepayers will likely bear the cost of this pipeline's construction.

With that in mind I ask that you also review the potentially significant local impacts that this pipeline could have on the property and safety of constituents in my district.

In Methuen, this pipeline is very dangerously close to homes, (within a few yards in some cases) and it transverses neighborhoods and driveways and through many wetlands.

Residents have legitimate concerns regarding investments in mature landscaping that will be removed by this expansion, particularly, mature trees that add considerably to their property value.

I also ask that you review the impair that this project will have on the Merrimack River which is the source of drinking water for the City of Methuen and vital to the safety and wellbeing on the region.

Thank you for receiving my comment on the proposed NED pipeline and allowing me to echo the concerns of experts, families, and property owners in my district. I hope that you will demand detailed evidence demonstrating that this pipeline will benefit the New England and the Commonwealth of Massachusetts.

Most Sincerely,

Linda Dean Campbell  
State Representative  
15<sup>th</sup> Essex District

**Board of Selectmen  
Town of Montague**  
Turners Falls, MA 01376

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

**Docket No. PF14-22-000- Public Scoping Comments, Response to Environmental Impact Statement**

Dear Ms. Bose,

Montague, Massachusetts is community of 8,500 along the Connecticut River in Franklin County. The proposed Kinder Morgan pipeline's 4.7 mile reach through Montague will bisect the Town where it will pass through environmentally sensitive areas, areas protected for open space by the Commonwealth, and land that is designated or regulated for public water supply protection. The community is very concerned about the environmental impacts of the project.

To assure a complete and comprehensive review of the project we ask that the Federal Energy Regulatory Commission (FERC) mandate the project adhere to Mass Drinking Water Regulations, the Mass Environmental Policy Act (MEPA) process and the Wetlands Protection Act process. We also urge FERC to honor Article 97 and require Tennessee Gas Pipeline to obtain legislative approval to develop permanently protected land as a condition of any certificate.

The Town has compiled a list of community concerns and requests, drawing from municipal plans including the Montague Open Space and Recreation Plan, The Natural Hazard Mitigation Plan, and the Montague

Comprehensive Plan. We ask that FERC respect the community's goals identified in these documents.

Economic Impacts: There are approximately 15 homes within 500 feet of the proposed pipeline. The Town is concerned about reduction of home values, difficulties in refinancing, and difficulties in obtaining homeowners Insurance for these properties. There is also a concern about resident's rights to pass over pipeline right-of-way to access privately and publicly owned back lots. Lack of access to some affected lots could have an impact on forestry, recreation, and agriculture in Montague.

Water Resource Impacts: The pipeline bisects the Hannegan Brook Water Supply Protection Area that supplies water to over 5,000 households in the Turners Falls Water District and the route impacts at least two wetlands and crosses two major rivers in Montague: the Connecticut and the Millers. Because of these reasons, the Town is concerned about Contamination of public water supplies and damage to wetland and water bodies. We request that The Mass Wetland Protection Act and River&out Protection be applied to this project. The applicant's draft EIR suggests that the project will affect 0.02 acres of jurisdiction wetlands, which is suspiciously low, as no formal wetlands survey has been conducted for this part of the Commonwealth.

Open Space and Recreation Impacts: The Montague Plains are a unique and pristine natural pine barren ecosystem. The Plains are used extensively for recreation including hunting, and passive recreation like hiking, bird watching and cross country skiing. The proposed route includes approximately one (I) mile of new right-of-way over land held in public trust by Mass Dept of Fish and Wildlife. Thus the Town is concerned about the Change of use for one mile of Article 97 protected lands, as well as the Impact on hunting, recreational trail use, and habitat.

Public Safety Impacts: Montague's two independent Fire Districts do not have the manpower or equipment to address pipeline accidents. The Montague Plains are wildfire hazard area. Historically, there have been devastating wildfires on the Montague Plains, where such an occurrence happens naturally. Montague Natural Hazard Mitigation Plan identified wildfire on the Plains as one of the most significant hazard for Montague — as it would threaten the villages of Lake Pleasant, Millers Falls, and the Airport Industrial Park. A pipeline accident response will strain Montague's staff resources. To mitigate against the problem, a regional response plan should be prepared before construction begins.

Cultural Impacts: Montague, like surrounding towns is rich in Native American History. The project is in very close proximity to the Turners Falls Cultural Landscape District, designated by the National Park Service. We urge FERC to require a vigorous archeological survey and to work closely with affected Tribes.

Geological Impacts: The Pipeline is being constructed to bisect the Montague Sand Plains. We are concerned about the safety of pipelines in sandy soils. The Pipeline will also traverse areas with shallow bedrock between Route 63 and Millers River. Depth of pipe should be at a level to not prevent farming or recreation.

Construction Impacts: The Town is concerned that heavy equipment during construction will damage town roads. We are also concerned about proximity to the power lines. We feel that the critical nature of construction should mandate an independent 3 party construction monitor and certification.

To protect these interests The Montague Board of Selectmen has resolved to be in full support of all the specific study requests made by the Franklin Regional Council of Governments (FRCOG) on behalf of affected towns in Franklin County. These study requests made by FRCOG speak for the Town of Montague and they are individually listed below. Details about the study requests can be found in FRCOG's written comments.

~ Conduct a detailed Alternative Route Analysis to Avoid Permanently Protected Open Space, Federal and State Rare 4, Endangered Species Habitat, Water Resources, Forests, and Farmland

~ Conduct a Comprehensive Analysis of the Need for the KM NED Pipeline Capacity to meet Natural Gas Demand in New England

~ Conduct an Analysis of Air Quality Impacts and Greenhouse Gas Emissions Related to the Construction and Operation of the Pipeline

- ~ Conduct and Analysis of Archeological 4 Historic Resources Study of Pipeline Route
  - ~ Analysis of Private Property Real Estate Values, Homeowner and Municipal Insurance, and Municipal Tax Revenues
  - ~ Analysis of Potential Safety Impacts Including Identification of Hazard Zone(s) if Pipeline Fails
  - ~ Analysis of Training, Equipment and Facility Needs for Local Emergency Responders
  - ~ Analysis of Impact on Heritage 4 Recreational Tourism and Forestry
  - ~ Analysis of Impacts on Private 4 Public Water Supplies and Water Resources related to Construction (blasting th drilling), Pipeline Operation and Hazardous Materials Storage dt Use
  - ~ Analysis of Impacts on Rare 4 Endangered Species
  - ~ Analysis of Impacts of Construction and Equipment on Existing Infrastructure (Roads, Bridges, Culverts, Water, Sewer, etc.) and Impacts from new Access Roads and Staging Areas
  - ~ Quantification of Benefits of Reduced Natural Gas Prices as a Result of the NED Pipeline Capacity
  - ~ Analysis of Light 8I, Noise Impacts from Pipeline Construction th Operation and Compression Stations (to be provided)
  - ~ Analysis of Invasive Species Impacts during Construction th Operation of the Pipeline
- ~ Analysis of Impacts to Agricultural Lands and Economy

Thank you for your considering our requests.

Sincerely,

Michael Nelson, Chair    Christopher M. Boutwell    Richard Kuklewicz

Washington, DC 20426

Re: Docket No: PF14-22-00 Proposed Tennessee Gas Pipeline Project

Dear Ms. Bose,

We are issuing a statement of concern with regard to the noise and building vibrations which will likely occur as a result of excavating for the pipeline. As we know from past excavations in the area, there are significant amounts of ledge which require blasting or high impact excavation. The resulting noise and vibrations are close to our laboratories. Our laboratories house research models used in the drug discovery process. Our research models are sensitive to noise and vibrations which affects their suitability for scientific research. We ask that the EIA committee include a reputable scientific advisor familiar with the drug discov-

ery process.

Should you wish to discuss this further, please do not hesitate to contact me at the number below.

Yours truly,

Ivan Kousidis

August 24, 2015

Dear Senator Shaheen,

We are writing to oppose the Northeast Energy Direct (NED) pipeline proposed by Kinder Morgan. In looking over all the information we find no benefit to New Hampshire, however, it will bring much benefit to Kinder Morgan. Corporations have too much control over our government and we have no rights.

The pipeline will break conservation easements, bring an additional tariff on our electric rates to pay for this private project, bring financial burden for landowners who lose property value or increased insurance premiums, water quality will be affected.

This pipeline will not bring fuel directly to homes for heating —this is a distribution line. Pipelines require compressor stations and they are ginormous polluters. All pipelines leak! The pipeline companies have no obligation to fix them, only to identify, categorize and monitor.

Kinder Morgan hires locals to speak positively about the pipeline in our communities and to say we are overreacting! Are we?

After doing the research I am convinced the pipeline construction process will pollute our air, contaminate our aquifers, wells and other water resources. Families will lose their homes and it will destroy conservation lands. It will harm the tourist industry and rural character of New Hampshire.

Stand up and stop Kinder Morgan from trampling your people and our state!

Most Sincerely,

Roger & Joan Crooker

Re Northeast Energy Direct project; PFI4-22-000

Dear Ms. Bose:

I offer the following comments on the contents of the proposed scoping document for FERC's review of the Northeast Energy Direct project, PFI4-22~ under NEPA.

Sincerely,

Charles E. Sullivan, Jr.

---

### **Initial comment**

While Kinder Morgan Energy Partners, L.P., through its subsidiary, Tennessee Gas Pipeline Company, L.L.C., (collectively, "KM") recently "downsized" its proposal to design, construct, and operate the Northeast Energy Direct project - a pipeline system, intended to be operational in 2018, connecting Pennsylvania's high volume hydrofracked natural gas wells to Dracut, Massachusetts, that includes a compressor station proposed for the Town of Nassau in order to maintain the gas's pressure and speed, it remains a project presenting significant substantive environmental, public health, economic, and other issues in need of addressing before it may be even considered to be authorized to proceed. This "downsized" project will cause the same amount of environmental and economic upheaval and disruption to landowners during construction as a larger pipeline would, except, as discussed below, further disruption should be expected in coming years, with "compression expansions" either in the towns currently targeted for compressor stations, or new ones to be determined. Authorizing this "downsized" pipeline project paves the way for future expansion by means of larger pipes, higher operating pressures, and more system support structures, such as more, and larger, compressor stations.

FERC's NEPA analysis, and FERC's decisionmaking flowing from that analysis, must consider mitigative measures even for impacts that by themselves would not be considered "significant." 46 F. Reg. 18,026 (Q. 19a) (March 23, 1981). Thus, even individual or smaller harms to any component of the natural or manmade environment must be evaluated and mitigated.

FERC's NEPA analysis also must address how inconsistencies between the proposed project and any State or local law will be reconciled. 40 CFR 1506.2(d). Thus, FERC's NEPA analysis must examine the project's compliance with state laws, such as, but not limited to, the 2011 Town of Nassau, New York Zoning Law. Such a condition would be consistent with FERC's general expectation that natural gas companies will "comply with state and local requirements, to the extent that doing so does not interfere with actions that the Commission has determined are required by the public convenience and necessity." Letter from Cheryl A. LaFleur, Acting Chairman, FERC, to Rep. James P. McGovern (June 18, 2014).

### **More detailed Comments**

#### **1. Definition of "project" subject to NEPA review**

- a. Project can be for domestic gas supply only if eminent domain is to be considered

KM openly admits to having to "sell" the merits of its pipeline to exporters in order to get the pipeline's capacity full subscribed.' As a result, FERC may not have the authority to issue a Certificate of Public Convenience and Necessity since the pipeline's main purpose appears to be to transport natural gas to exporters, and Section 7(a) is couched in terms of domestic consumption of the transported natural gas. Flowing from

this is that KM will not be avail itself of the eminent domain authority and powers under the Natural Gas Act in order to get the pipeline path under its control since FERC's authority to issue a Certificate of Public Convenience and Necessity leading to the empowerment of the Certificate holder with the power of eminent domain appears to extend only to a project transporting natural gas exclusively for domestic consumption.

b. No "project" segmeatatioa

Extraction, transportation, and sale of natural gas are interdependent activities. Without a market, there is no need to extract; without extraction, there can be no market since no product to market; without a transportation mode, there can be no connection between extractor and purchaser. A pipeline project, then, has three interrelated components: a pipeline and the two sets of customers depending on it: extractors at one end of the pipeline and purchasers at the other.

In this case, the pipeline that KM seeks FERC permission to design, construct, and operate seeks to connect for the most part - whether presently or in the future -- the fracked gas fields of Pennsylvania and elsewhere to export terminals in the Northeast and Canada. This pipeline does not stand alone; its very reason for being and its financing depend upon the existence of long-term supply contracts between the gas extractors in those fracked gas fields and those consumers, be they domestic or foreign. Therefore, the "project" subject to NEPA review consists of the extraction, transportation, and fate of ftacked gas proposed to be carried in KM's pipeline.

The fact that FERC's jurisdiction extends only to the pipeline's necessity and not to natural gas extraction or sale does not change the legal requirement that FERC is the NEPA lead agency in this matter and so, must ensure that the NEPA document generated for this project properly, fully, and comprehensively analyzes all aspects of this project, from extraction to export.

## 2. Need for this project

Before approving this project, FERC must determine that it is "necessary or desirable in the public interest." 15 USC 717f (c): when the project's projected public benefits outweigh its potential adverse consequences. FERC Statement of Policy, "Certification of New Interstate Natural Gas Pipeline Facilities," 88 FERC (CCH) 61,227 (1999)~ orders clarifying policy, 90 FERC (CCH) 61,128 (Feb. 2000) and 92 FERC (CCH) 61,094 (July 2000).

"Need" has a number of components: need for this particular energy source among the many available; need for natural gas at the destination; need for natural gas in the quantity the pipeline will transport; need for the pipeline to travel the path proposed; etc. FERC's NEPA evaluation, then, must encompass all environmental impacts associated with all components of "need."

This comprehensive understanding of "need" is quite important to my family since we live along the proposed pipeline's path and not far from the compressor station proposed for the Town of Nassau, Rensselaer County, New York. Since I understand that the potential blast impact radius for the proposed 30 inch pipeline operated to transport 1.3 BCFD of natural gas will operate at pressures that will generate an approximately 800 foot blast radius, requiring that pipeline to transport only that amount of natural gas sufficient to address the current gas supply needs of New England and nowhere else will help to minimize the safety impacts upon my community.

### In terms of need for this particular energy source, consider:

- Energy conservation and renewable energy are the first priority for meeting future energy needs - green buildings, energy efficient appliances, flattening peak energy demand, wind generation, etc. and that more can be done to reduce reliance on fossil fuel sources. In fact, energy efficiency is decreasing the need for energy resources, fuel-free renewables are supplanting polluting power plants, and liquefied natural gas has become cost-competitive and available at times of peak need.
- ISO-New England has expressed concern about over-reliance on natural gas as the primary means of electricity generation.

In terms of need for the additional domestic gas supply, consider:

- KM has marketed this project as answering a New England-wide need for additional gas supply to, among other things, promote energy reliability. However, the report prepared by July 12, 2013 Synapse Energy Economics, Inc., “Avoided Energy Supply Costs in New England: 2013 Report,” which is one of KM’s cornerstone substantiations, projected a potential shortfall in future electricity generation capacity in Massachusetts only for peak demand on certain days of the year; and that report has been criticized for not adequately taking into account future benefits from improved energy efficiencies, as well as the growth of renewable sources.
- The analysis of need for additional domestic gas supply should encompass the study announced by MA AG Healey on electricity reliability needs, including natural gas capacity demands, in New England. A key focus of the study will be the question of whether more natural gas is needed in the region, and if so, how much more capacity is needed. Analysis Group, a Boston-based economic and financial consulting firm, will begin work on the study, which is slated to be completed by October 2015.
- In mid-July 2015, an independent consultant, London Economics International (LEI), hired by the Maine Public Utilities Commission (PUC) concluded that Maine should not enter into contracts to purchase gas pipeline capacity because the costs of doing so would outweigh the benefits to Mainers. Conservation Law Foundation: <http://www.clf.org/blog/clean-energy-climatechange/maine-doesnt-need-new-gas-pipelines/> “Experts Weigh In: Maine Doesn’t Need New Gas Pipelines”; Jul 17, 2015 by Ivy Frignoca
- As KM noted above, (see til. 1), KM is actively seeking exporters to provide demand for the pipeline’s capacity. Although KM proposes no new LNG storage facilities, the fact is that Pieridae Energy’s October 24, 2014 application to the Department of Energy seeks to export domestically produced natural gas out of Canada. The gas for this proposal would reach Canadian LNG export terminals via the Maritimes and Northeast pipeline that the Northeast Energy Direct pipeline, among others, would feed by reversing the flow of that pipeline to allow gas to reach Canada as part of the Northeast Energy Direct project. Thus, KM itself needs the extra capacity in its pipeline project not to provide domestic demand but to supply export markets.

In terms of whether there is a public need for the pipeline at all, consider a new study issued by Energyz Advisors LLC and commissioned by France-based GDF Suez, an LNG importer, that challenges the notion that new natural gas pipelines are needed for the New England market, contending that demand for the product is expected to decline and noting that the region will benefit from a diversification in power generation resources. The Energyz report concluded: “Even during extreme winter conditions, new pipeline capacity is not required to meet New England natural gas demand needs given existing infrastructure, current market conditions and policy initiatives.” See also ENE, “Pipeline Alternatives Assessment: Energy Resources to Meet New England’s Winter Needs” (June 2014), available at [http://academiccenter.org/wpcontent/uploads/2014/09/ENE\\_Pipelines\\_Alternatives\\_Assessment\\_14\\_0612\\_RF.pdf](http://academiccenter.org/wpcontent/uploads/2014/09/ENE_Pipelines_Alternatives_Assessment_14_0612_RF.pdf); and Feldstein, M. and Kessler K., “Burden of Proof: The Case Against the Proposed Northeast Energy Direct (NED) Fracked Gas Pipeline,” (Aug. 2014), available at [www.nofrackedgasinmass.org/wordpress/wpcontent/uploads/2014/09/BurdenOfProof.pdf](http://www.nofrackedgasinmass.org/wordpress/wpcontent/uploads/2014/09/BurdenOfProof.pdf).

In terms of whether there is a need to consume additional carbon-based energy resources, consider

- the long-term public health impacts of continued reliance upon carbon-based energy sources, especially when there already exist better alternatives. See, e.g., the wide-ranging and peer-reviewed report issued by the Lancet Commission on Health and Climate Change (The Lancet is a UK-based medical journal), Health and climate change: policy responses to protect public health, which declares that the negative impacts of human-caused global warming have put at risk some of the world’s most impressive health gains over the last half century; and that continued use of fossil fuels is leading humanity to a future in which infectious disease patterns, air pollution, food insecurity and malnutrition, involuntary migration, displacement, and violent conflict will all be made worse. When climate change is framed as a health issue, rather than purely as an environmental, economic, or technological challenge, it becomes

clear that we are facing a predicament that strikes at the heart of humanity . Health puts a human face on what can sometimes seem to be a distant threat

- the argument major economists and investors are making for divesting from fossil fuels such as natural gas. See, e.g., “Keep it in the ground; The argument for divesting from fossil fuels is becoming overwhelming” by Alan Rusbridger (Monday 16 March 2015 09:06 EDT), found at <http://www.theguardian.com/environment/2015/mar/16/argument-divesting-fossil-fuel-overwhelming-climate-change>: This is why the divestment movement has changed from being a fringe campaign to something every responsible fund manager can no longer ignore. How could they, when even the governor of the Bank of England, Mark Carney, has warned that the “vast majority of reserves are unburnable” and the bank itself is conducting an inquiry into the risk that inflated fossil fuel assets pose to the stability of the financial system? When the president of the World Bank, Jim Yong Kim, urges: “Be the first mover. Use smart due diligence. Rethink what fiduciary responsibility means in this changing world. It’s simple self-interest. Every company, investor and bank that screens new and existing investments for climate risk is simply being pragmatic”? When the Bank of England’s deputy head of supervision for banks and insurance companies, Paul Fisher, warns, as he did this month: “As the world increasingly limits carbon emissions, and moves to alternative energy sources, investments in fossil fuels - a growing financial market in recent decades \_ may take a huge hit”? Or listen to Hank Paulson, no bleeding liberal, but secretary of the Treasury under Bush and former CEO of Goldman Sachs: “Each of us must recognise that the risks are personal. We’ve seen and felt the costs of underestimating the financial bubble. Let’s not ignore the climate bubble.” President Obama puts it most pithily: “We’re not going to be able to burn it all.”
- The Administration’s current efforts to combat climate change, which, among other things, seek to incentivize building renewable energy infrastructure and not new fossil fuel infrastructure.

In terms of the necessity for the proposed route, the NEPA assessment should encompass analysis of alternative routing and the rationale for the proposed route, which consumes so much “greenfield,” when it already has a path more its control sufficient to run the pipeline.

All the above, of course, raises the question, whether it is in the public interest to foster continued construction of carbon-fuel infrastructure such as this project, which will delay the changeover to more public-health and environmentally friendly alternatives.

### **3. Impacts on natural environment**

#### **a. Path on CERCLA site(s) of contaminated water**

KM needs to address its project’s impacts on the proper investigation and remediation of contaminated sites along the pipeline pathway. I raise this because of the following:

- I understand that KM proposes to draw water from the Dewey Loeffel federal Superfund site that is under active remediation, in order to use the water for pipeline integrity testing. Aside from the fact that doing so will result in KM’s possibly becoming a Potentially Responsible Party for the site and its pipeline becoming part of that site, there is no description of how much water will be used and its fate once testing is complete \_ water that not only contains contaminants from the Dewey Loeffel site itself but contaminants within the pipeline.
- the pipeline project must cross the Hudson River, a federal Superfund site. Disturbing the riverbed, the river’s sediment, or the soil in the river’s floodplain invites PRP status. Since KM presently is not a PRP for the site and since state water quality requirements prohibit the introduction of PCB into the Hudson River and since any disturbance will result in introduction of at least a small amount of PCB into the water column, it does not appear that the New York State Department of Environmental Conservation will be in a position to issue a certification under the federal Clean Water Act. I intend to inform NYSDEC and the General Electric Company of my opinion on this matter to alert them to the possibility of KM’s attempt to cross the river.

#### **b. Water resource protection**

Implementing the Northeast Energy Direct Project proposal to dredge, horizontally drill, and blast a continuous excavation large enough to contain what is now proposed to be a 30-inch diameter pipe will perforate and hydraulically connect scores of miles of north-south trending aquifers, aquitards, streams, wetlands, and water-yielding bedrock strata through New York, Massachusetts, and New Hampshire, creating an extremely large manmade preferential groundwater contaminant transport pathway crossing state lines. This has the significant potential to cause a foreseeable harmful impact to drinking water and human health and needs careful comprehensive study and analysis.

Private drinking water supply protection is absolutely vital to sustain a viable rural residential existence. Residents of the Town of Nassau obtain their drinking water exclusively from private wells and are not alone in this regard: certainly this is the case throughout Schoharie, Albany, and Rensselaer Counties in New York and, as I expect throughout the rural portions of Massachusetts and New Hampshire along the pipeline's pathway.

The NEPA analysis must assess protection of those supplies from contamination emanating from this project's design, construction, operation, and closure. Of course, the first step must be to obtain a complete list of chemicals to be used during design, construction, operation, and closure of the pipeline system, as well as the chemicals passing through the pipeline – not only the natural gas but the chemicals contained in that gas coming from the gas extraction process. Post-construction water runoff characteristics will differ from preconstruction conditions, as will land contours, vegetation, water retention capacity, etc.. The analysis must include assessment and identification of measures to be taken to prevent petroleum contamination during design, construction, operation, and closure and to prevent pesticide contamination (and in this regard, integrated pest management as an alternative to chemical control should be assessed).

PERC's NEPA analysis should encompass such matters as: where will the waters used for testing come from, and where will they be taken for disposal; and what contaminants will they contain and how will those contaminants be addressed to ensure that they do not enter the environment?

#### **c, Air resources protection**

Air quality, environmental, and human health impacts of planned and unplanned blowdowns and main line valve releases are significant substantive concerns. The proposed path through the Town of Nassau is surrounded by hills. Depressurized natural gas released from the pipeline is expected to be significantly colder than the surrounding air; and this denser natural gas-contaminated air contains compounds left over from the high volume hydrofracturing process used to produce that gas within the pipeline. With prevailing winds, those gases will travel to neighboring residences resulting in potential health and safety issues and potential contamination of organic farms that already operate along the pipeline's proposed path within the Town.

#### **d. Critical habitat areas and threatened and endangered species protection**

As currently proposed, the NED project crosses miles of pristine land that has been protected, or whose merits have been studied or have been touted, using state and federal dollars. One such land area is the Rensselaer Plateau. The NEPA review must encompass the need to run a pipeline directly through land within the Plateau and through other lands in Massachusetts and New Hampshire.

#### **e. Noise impact minimization**

The pipeline project lies within the Town's Rural Residential District. To ensure that this project, which is otherwise incompatible with the objectives of that district, does not disturb that district's allowed uses, FERC NEPA analysis should consider not only evaluation of project noise using the dBA scale for ambient noise but also using the dBC scale to evaluate the sharp noises inherent in compressor station operations. Further, the NEPA analysis should analyze the implementation of a requirement that there should be no gain of ambient noise at the boundaries of the easement, or other property subject to the control of KM, from the perspective of both the dB(A) and the dB(C) scales.

Pre-construction sampling and operational monitoring of ambient noise using such scales should be required as part of the environmental controls on the project, as well as should be allowing local governments to

enforce the requirements directly.

#### **f. Visual impacts**

The Town of Nassau is a rural location noted for its scenic beauty. Scenic tourism contributes to the local economy. The pipeline pathway passes through other areas of rural beauty as it goes from Wright to Dracut. The NEPA assessment needs to encompass an analysis of the impacts on the scenic viewshed that this project will cause during all its phases - siting, design, construction, operation, and closure.

#### **4. Impacts upon manmade environment**

##### **a. Local infrastructure protected (roads, bridges, culverts, electric transmission lines, etc.)**

As a taxpayer, I am concerned that the equipment used to lay and to maintain the pipeline and to build and operate the compressor station proposed to be located near my home will ruin our town's roadways, most of which are unpaved; and that my tax dollars will be spent either repairing them or upgrading them, all to benefit a private enterprise that burdens me with the risk of damage or loss without any compensation whatsoever. KM needs to develop an in-depth analysis of the Town's roadway/bridge/culvert infrastructure to determine and to minimize the project's impact on same and to evaluate the best financial mechanism to ensure that it has the money to upgrade the roads it seeks to use and to maintain them during all phases of the project's life, until the pipeline system stops operating and the pipeline and pipeline infrastructure is dismantled ..

##### **b. This project as an economic disamenity**

Pipelines, once constructed and buried, are out-of-sight and perhaps out of thought - at least until an explosion or other incident brings to mind the reasons for having opposed its construction in the first place. However, compressor stations, with their associated noise, lighting, gas release, and accidents, cannot be out-of-sight or out-of-mind. They are economic disamenities whose presence suppresses real estate sales prices and lengthens the time needed to sell a property.

FERC's NEPA analysis needs to evaluate the project's impacts on local real estate sales and marketing and what can be done to eliminate those impacts.

##### **c. Business development protection**

The construction and operation of the pipeline and its compressor station in the Town of Nassau could create significant impacts on farming and other agricultural activities, resulting in significant loss of revenue for established farms. The Town has at least one organic farm near the proposed compressor station. Emissions from that station, especially from blowdowns, could affect the organic certification, to the detriment of that family-owned small business to continue in operation.

Loss of revenue for commercial business along the pipeline's path and near the proposed compressor station and other infrastructure needs close examination, especially since loss of revenue for the businesses translates also to loss of taxes \_ taxes that I and other landowners will have to assume in order for my Town to remain financially viable \_ and to relocation of businesses, leading to further loss of taxes that I shall have to assume.

##### **d. Government revenue protection (taxation; orderly development; etc.)**

The Town of Nassau is a rural residential community. Its revenue structure depends heavily upon land tax receipts.

As noted above, this project, if implemented, may result in the creation of a significant economic disamenity in the northern part of the Town, with this disamenity pathway actually running from Wright to Dracut. Thus, the fiscal impacts upon the Town of Nassau's tax base are not inconsiderable and are not unique to it.

KM asserts that that the project will generate taxes. However, to evaluate whether the project will actually benefit this Town and the other municipalities in the project's pathway, FERC's NEPA analysis should encompass, among other things, a comparison of anticipated revenue from the pipeline over its entire life and loss of non-pipeline tax revenue over that life.

### **e. Public safety protection/emergency response**

A pipeline is critical infrastructure. A high tension electric transmission line also is critical infrastructure. Both are prime targets for a terrorist target, which could be a considerable threat to nearby residents and visitors.

This project calls for a close paralleling of the pipeline with a high tension electric transmission line.

None of the towns along the pipeline's pathway, from Wright to Dracut, has the resources needed to secure the pipeline from attack. In any event, none of them should be burdened with that expense, both during construction and during operation.

FERC's NEPA analysis should evaluate the consequences of damage to, or loss of, pipeline system infrastructure (pipeline, compressor station, etc.) occasioned by deliberate malicious acts and the measures KM must take in order to keep those along the pathway, and their property, safe from harm. All forms of attack, not just from explosives or rifle shots, should be assessed in this evaluation?

Third party excavation activity is a significant cause of pipeline ruptures; and roads that cross the pipeline are areas where excavation activities are more likely to occur and damage the pipeline. The NEPA assessment should analyze this issue (in the Town of Nassau, for example, the pipeline path is expected to cross State Route 66 near a high tension electric transmission line. A rupture there could trigger not only a fire and blast but also loss of electrical supply to western New England's grid) and determine measures to eliminate a rupture from occurring ..

Additionally, PL 112-90 obligates PHMSA to carry out scores of actions aimed at further ensuring that interstate natural gas pipeline transportation is conducted in a safe and environmentally protective manner. PHMSA yet to comply fully with that law, which is to sunset in September. FERC's NEPA analysis should address the project's compliance with the requirements of that act so that compliance will be assured once the law is reauthorized; or the project should be delayed until the law's requirements are reauthorized.

As previously noted, the potential blast impact radius for the proposed 30 inch pipeline operated to transport 1.3 BCFD of natural gas will operate at pressures that will generate an 800 foot blast radius. Requiring that pipeline to transport only that amount of natural gas sufficient to address the current needs of New England and nowhere else will help to minimize the safety impacts upon my community. Further, in view of the blast radius' size, KM needs to provide a detailed emergency response plan covering, at a minimum, the thermal, concussive, shrapnel, downwind, and emergency access aspects of an incident. Part of that response plan should be KM's equipping and training at its expense of the emergency response personnel of all emergency response entities along the pipeline's pathway. Simply put, it is not enough simply for KM to say \_ as it has done so far -- that when an incident occurs, local emergency responders should contact KM, evacuate local residents, and let the fire burn out.

### **5. Cumulative effects**

As with all other aspects of this project, all assessment and resulting mitigative measures and plans must be location/municipality-specific. This is so to ensure that the analysis covers not only the unique characteristics of each location in the pipeline pathway but also to disclose the full extent of the cumulative effect of this project along its entire pathway. Thus, while I may discuss impacts to my Town, the Town of Nassau in Rensselaer County, New York, the NEPA analysis must discuss all the specific impacts \_ major and minor \_ to all locations, from Wright to Dracut.

The NEPA cumulative analysis for this project also should encompass the cumulative effects associated with the multiple pipeline projects presently under FERC review that purportedly seek to provide the same region with additional natural gas supply. "[P]roposals for ... actions that will have cumulative or synergistic environmental impact upon a region ... pending concurrently before an agency ... must be considered together. Only through comprehensive consideration of pending proposals can the agency evaluate different courses of action." *Kleppe v. Sierra Club*, 427 U.S. 390,410 (1976). The fact that these various projects may have different timeframes does not necessarily allow FERC to evade its cumulative effects assessment responsi-

bility. For example, in *Riverkeeper Network v. Federal Energy Regulatory Commission*, 753 F.3d 1304 (DC, 2014), the projects that the Court ruled should be measured cumulatively were constructed over a three year period. Additionally, NEPA requires FERC to consider connected, cumulative, and similar actions.<sup>3</sup>

I am not the only individual to raise this issue. For example, on June 30, 2015, New York State Senator Jim Seward urged FERC to reject this project on cumulative impact grounds, noting that the project, coming on the heels of the proposed Constitution Pipeline, would make the region a natural gas pipeline “highway” that is “not in harmony with what residents want or support.” “The cumulative effect of multiple pipelines through portions of [New York’s] Delaware and Schoharie Counties should be reviewed by FERC. It is not unreasonable to project that multiple pipelines would place arithmetically higher pressure on public infrastructure and public services, land values and the environment This ‘multiplier’ effect should be evaluated carefully ... , [L]ong-term environmental and safety costs can also be anticipated. If the KinderMorgan project is given federal approval, none of these expenses should be the responsibility of local property taxpayers who are receiving absolutely no benefit and being forced to assume all of the risks associated with the unwanted pipeline.”

The U.S. Court of Appeals for the DC Circuit ruled in 2014 that FERC failed to provide a cumulative impact analysis for a series of upgrades to the Tennessee Gas Pipeline system. *Delaware Riverkeeper Network v. Federal Energy Regulatory Commission*, 753 F.3d 1304 (DC, 2014) (2014). The court has defined such an analysis in this way: “A meaningful cumulative impact analysis must identify (1) the area in which the effects of the proposed project will be felt; (2) the impacts that are expected in that area from the proposed project; (3) other actions—past, present, and proposed, and reasonably foreseeable—that have had or are expected to have impacts in the same area; (4) the impacts or expected impacts from these other actions; and (5) the overall impact that can be expected if the individual impacts are allowed to accumulate.”

## **6. Need for comprehensive health impact assessment**

While FERC’s natural gas pipeline system infrastructure project review process encompasses environmental impact analysis, it does not encompass a comprehensive health impact assessment.

It should.

In June 2015, the American Medical Association recognized this gap in critical information concerning the potential impact on human health associated with natural gas infrastructure; and it resolved to support legislation requiring comprehensive health impact assessments regarding the health risks that may be associated with natural gas pipelines as an integral part of the regulatory review of gas pipeline proposals,”

The typical regulatory agency approach estimates the total short-term and long-term emissions directly sent into air or water by the project under consideration. Estimated total emissions are then compared with Federal or State standards for “acceptable” emissions. If the estimated levels fall below critical thresholds, the project is assessed as having a non-significant health impact.

This approach is inadequate. For example, the following are but three examples of impacts that FERC, in applying this approach, presently does not include in its reviews:

- **Emission spikes.** Regulatory agencies measure emissions in terms of averages taken over numerous short (for example, one hour or less) or long-term intervals (for example one or more days). Recent studies have found that these averages do not reveal the occurrence of very high levels of “peak” emissions that may occur at irregular intervals. These peaks may have serious adverse health impacts that are not captured by averaging over longer periods of time. A comprehensive assessment performed according to public health professional standards would capture information on peak emissions and their consequent health implications.
- **Dynamic evolution of emissions.** Regulatory agencies take a very local and static view of toxic emissions, assessing them in isolation from each other and only at the time and place immediately adjacent to their source. Many if not most standards are based on single chemical emission, while under most

circumstances it is a mixture of different chemicals that are emitted. In addition, any single emission can disperse widely, evolve, and combine with other emissions and atmospheric conditions and become reabsorbed into distant water and soil. Only a comprehensive health assessment can properly evaluate the full range of emission impacts.

- Downstream and upstream impacts. Regulatory agencies restrict their assessment of impacts to the operations of the project in question. However, pipeline impacts extend far beyond pipeline operations. Pipelines are a “midstream” structure, placed between the start-point of gas well production sites and the endpoint of commercial or residential consumption. Adding a pipeline has the impact of expanding both production and consumption; and many studies have reported that the endpoint use of pipeline-provided gas in residential stoves has adverse impacts on respiratory function. Only a comprehensive health assessment would, correctly, view this as a pipeline impact.

These examples are not exhaustive. The issue of vulnerable sub-populations (such as people with pre-existing asthmatic conditions) is not routinely addressed by regulatory agencies, but is a key part of comprehensive health impact assessments.

PERC should include as part of its review process a more complete and informative look at environmental impacts from a human health perspective, as outlined as a set of research protocols by the centers for Disease Control and Prevention, and by the National Academy of Sciences.

## **7. Other matters**

### **a. Frost line**

There is a number of instances of pipeline fractures attributable to frost heaves.

The frost line in eastern New York is about four feet - and that is when the bedrock is deep enough to allow there to be frost-free soil above it. In many locations in Rensselaer County in the proposed pipeline’s path, the bedrock is less than four feet below the surface.

### **b. Design/construction matters**

FERC’s NEPA assessment needs to address pipeline construction effects, both surface and underground. I note above some of the analysis needed as, for example, groundwater diversion and contamination. However, the analysis should encompass the effects of the chemicals used during construction (as well as during other aspects of design, construction, operation, and closure) on humans, fish, and other organisms.

The assessment should cover the actual details of siting, design, construction, operation, and closure. It is not enough to discuss these phases of the project in general terms, such as “conformity with recognized procedures, etc. Lack of detail prevents citizens from responsibly commenting on the adequacy of design, operation, closure, etc.

Necessity for the proposed route: Why is there a need for “greenfield” locations when KM already has a path within its control?

The NEPA analysis should detail the methods and procedures used for blasting. It is not enough to state that blasting will be conducted by licensed blasters using accepted methods and procedures. Each method, each procedure, has its own set of circumstances, including chemicals used and released into the environment. Baseline testing of private and public wells should be included as a requirement of this project, as should post-blast testing of wells on a complaint-driven basis, with KM bearing all costs to sample, analyze, and report to the well owner.

The NEPA analysis needs to assess the environmental, safety, and engineering consequences of locating a pipeline, or a component of the pipeline infrastructure near high tension electric transmission lines, as KM proposes to do. Since material, weld, and equipment failure and corrosion are the leading causes of natural gas pipeline significant incidents, the analysis should encompass, at a minimum, analysis of risk of equipment failure, longevity of sacrificial cathodes in cathode beds, and evidence-based maintenance plans.

The NEPA analysis should assess the sufficiency of a pipeline design -construction - operation - maintenance

nance regulatory program applicable to this project that gives rural residents a lower level of protection, to such an extent as to treat them as second-class citizens in that regard. This is a critical environmental issue as it directly concerns the safety of this pipeline project. It comes from the basis for the regulatory program: natural gas transmission pipeline regulations establish pipe strength requirements based on population density near the pipeline. Locations along gas pipelines are divided into four “classes” by counting the number of dwellings within 660 feet of the pipeline for one mile (in the case of Classes 1 to 3) or by determining that four-story buildings are prevalent along the pipeline (Class 4). Pipelines in Class 1 locations - rural areas, which is the majority of the proposed pipeline corridor in New York as well as in Pennsylvania, Massachusetts, and New Hampshire \_ are allowed to have greater allowable pipe stresses, as a percentage of specified minimum yield strength (SMYS), than are allowed for pipelines in Class 2, 3, or 4 locations. Design factors, which are used in the formula to determine the design pressure for steel pipe and which generally reflect the maximum allowable percentage of SMYS, are 0.72 for Class 1, 0.60 for Class 2, 0.50 for Class 3, and 0.40 for Class 4.5 Thus, the possibility of greater personal and property loss in densely populated areas and consequent greater insurance industry payouts, as compared. against those in rural areas, drive the pipeline safety regulations of the Pipeline and Hazardous Materials Safety Administration.<sup>6</sup> In actual fact, then, rural residents and their property get a lower level of protection and so, are treated as citizens less worthy of protection through no fault of their own other than to have chosen to live in a rural environment. For example:

- sectionaiizing block valves (used to seal off sections of pipe in the event of an emergency, among other things) can be ten miles apart in rural areas, as opposed to 2-112 miles in more densely populated areas<sup>7</sup>
- pipe used to transit rural areas can operate at pressures higher than is allowed in more densely populated areas<sup>8</sup>
- plastic pipe can be used for higher pressured gas in rural areas than is allowed in more densely populated areas<sup>9</sup>
- nondestructive testing of ten percent of each day’s field butt welds must be undertaken in rural areas but such testing of all such welds must be undertaken in more densely populated areas”
- soil cover of the pipe is less in rural areas (30 inches) than in more densely populated areas (36 inches).
- on steel pipe manufactured before November 12, 1970, with welded seams, the pipe must be tested to at least 1.25 times the maximum allowable operating pressure if it is to be installed in a rural location but to at least 1.5 times such pressure if installed in a more densely populated area. II

Further, it does not appear that present-day federal regulation provides for many common-sense requirements that should have been put into place years ago had public safety been the key driver of pipeline safety requirements. Examples of such common-sense requirements include: <sup>12</sup>

- Nondestructive testing of all girth welds at the time of construction, nomatter the class location
- Close interval surveys
- Ensuring that pipe in a cased crossing can be assessed for metallic and electrolytic shorts
- Coating surveys (for example, to assess whether pipe coatings on the pipeline and girth weld joints are, and remain, non-shielding to cathodic protection) and remediation
- Stress corrosion cracking surveys (SCC) and segment replacement (if a sec threat is found and not remediated)
- An ongoing monitoring program for DC currents and induced AC currents in highvoltage power transmission line corridors (including proper remediation plans) \_ this is an especially important matter here since the pipeline is proposed to follow a high voltage transmission line’s right-of-way
- In-line tool inspections (ILI) to inspect for pipe metal loss (corrosion), cracks, hard spots, weld seams, and other integrity threats in steel pipe (ILI tool evaluations for metal loss must use specified-or-greater interaction criteria to ensure defects meet a minimum integrity criterion)
- Repairs to defects within a periodic time interval that is based on maintaining the pipeline design

safety factor with a maximum pipe wall loss

- Pipe surveys of the depth of cover over buried pipelines
- Data integration of all surveys, excavations, remediation, and other integrity threats
- Pipeline remediation based on assessment and data integration findings (for example, assess pipe seam quality issues and remove from service those pipes with quality or integrity concerns)
- Performance of monthly ground or aerial right-of-way patrols
- Conducting a root cause analysis to determine the cause of aU in-service and hydrostatic test failures or leaks
- Requiring all sectionalizing block valves to be remotely and automatically activated upon occurrence of a pipeline leak or rupture

FERC cannot dodge its responsibility to address this issue by simply stating that pipeline design/construction/operation matters do not fall within its area of responsibility or that the pipeline will be designed, constructed, and operated in accordance with applicable legal requirements. FERC as lead agency has the responsibility to ensure that the project can proceed safely; and authorizing a project to proceed that allows a lower level of safety to rural residents than that required to be given for urban residents is unsatisfactory. Thus, it has the requisite authority to require standards more stringent than that required under regulation when the circumstances so require. This is one of those circumstances.

### **c. Operations matters**

FERC's NEPA analysis should identify all chemicals that will be encountered during the course of operation: those used in normal maintenance, those encountered in the gas itself, those needed to address emergency situations, etc. The analysis should then evaluate whether there are any less harmful chemicals that could be used to achieve the same operational or emergency response objectives.

The NEPA analysis should encompass the evaluation of the leakage potential of the pipeline system and the determination of methods to employ during design, construction, and operation to eliminate them and, that failing, to respond quickly to eliminate a leak should one occur.

Since a pipeline easement can cut across a parcel, the NEPA assessment should include a discussion of the maximum equipment weight, speed, and angle that is safe to drive over the pipeline. These are important considerations in my Town, which has many people engaged in forestry occupations.

Since blowdowns are seen as a normal component of pipeline operations, the NEPA assessment should analyze and decide upon the best course of action to eliminate blowdowns to the maximum extent practicable and to minimize the migration of blown-off gases. In line with this, the analysis should provide an accurate estimate of the quantity of gas released each quarter at each location along the pipeline project's pathway where blowdowns and other authorized releases occur (for example, at compressor stations), at STP.

-----  
I FROM: <http://seekingalpha.com/article/3329175-kinder-morgans-kmi-ceo-steve-kean-on-q2-2015-earnings-call-transcript?part=sinile> "Kinder Morgan's (KMI) CEO Steve Kean on Q2 2015 Results - Earnings Call Transcript; Jul. 15, 2015 11:53 PM ET":

Becca Followill- U.S. Capital Advisors: [W]idit capacity of 1.3 BCF a day, contacted 550, I know you said you're comfortable; it's picking up volumes, maybe, especially in the winter. But how do you phase this in? If you don't get any additional contracts do you go forward with the full 1.3 assuming it's only 42% contracted? Or do you - how do you phase it in so that you can maybe not be so under contracted? Steve Kean - President and CEO: Yeah, good question. If we get the pipe laid, the compression additions can be separate decisions. And so, when I talk about ILL being able to phase in as the commitments come in. we're going to ask to authorize the whole thing, and we will be able to make decisions on individual compression capacity additions as the commitments come through. Jesse Arenivas - President, CO2: [W]e're really kicking off the project for 600,000 a day. But certainly with the compression expansions we can scale it up as we get additional firm commitments, up to the 1.3, and that won't affect the original timing of serving of original customers because they are just compression expansions. Steve Kean - President and CEO: clearly what affects OI's customers affects us ... , even in a down market; our network is well-positioned for the places where there is growth.

Omen Horowitz - Raymond James; with respect to all the recently proposed acquisitions and volatility across aU orthe NOL dynamics, including price expedations in the Northeast, how do you guys think about Northeast NOL supply/demand balance? How do you think it could cbange? Steve Kean - President and CEO: Okay, yeah, so a few things there. I mean one is, again, lower commodity prices do dampen the enthusiasm for making longer term commitmen1s by the producers. But having said tbat, the long-term outlook, we think, for NOL production out of that region is very robust. ... quite frankly, we started working 011 the marlcet side of this. And Ron McClain and his team have been talking to international off-talcers who have a different timeframe and perspective that they bring to the table. And so, we're branching out, outside o/just the traditional producing community and trying to find a way 10 cobble this together by fOCII Sing on the demand side, as wel~ with the marlcet end of it as well. [emphasis added]

See also <http://blogs.wsLcom/moneybeatl20150217/fundin&=dries-up-for-new-u-s-gas-export-terminals> 3:37 pm ET, Feb 17,2015: "Funding Dries up for New U.S. Gas Export Terminals" by Tim Puko: "Oil and gas produc: ers are flooding the market, sinking prices and giving pause for what had been one of the most active sectors in finance. The U.S. shale-gas boom has pushed producers to look abroad to boost their returns. Prices in overseas markets, especially Asia, have been four times as high as the U.S. benclunark. That convinced producers to seek federal permission to export as much as 3S billion cubic feet a day, half of all U.S. production. according to the Department of Energy." LESSON: Thus, the need is foreign, not domestic demand.

2 Damage or loss does not have to come &om explosives, either. For example, For cyber-attacks on energy instalJa- tions, see <http://www.bloombem.com/news/articlesl20150610/hackers-favorite-target-bie-oil>

3 "CODJleCted aWous" are closely related and therefore should be discussed in the same impact statement Actions are CODDCcted if they are interdependent paras of a larger action and depend on the larger action for their justi- fic:ation.

"Cumulative actions" are actions that when viewed with other proposed actions, have cumulatively significant im- pacts and should therefore be discussed in the same impact statement.

"Similar acUoos" are actions that when viewed with other reasonably foreseeable or proposed agency actions. have similarities that provide a basis for evaluating their environmental consequences.

Washington, DC 20426  
REF: Project Docket I PF14-22-000

24 August 2015

Dear Secretary Bose:

Speaking for our extended family that owns and lives on Sandy Pond Richmond NH, I am enclosing a scientific and social description in opposition to the Kinder Morgan Ltd. NED pipeline. Our property location makes it extremely vulnerable to the possible destructive impacts of the pipeline construction and its maintenance. The entire lived portion of our property lies within incineration zone, from the lakeshore to the top of the watershed. The property and the entire lake have both historic and present values, Le. the 1810 home (built on the historic carriage stop of the north-south route to Keene), family graveyard, Original YMCA camp, and a unique small lake ecosystem (described by Shaun Bennett's Itr 21 August 2015).

**Outline of Public Concerns about the Proposed New Hampshire Gas Pipeline.**

**Issue.**

Kinder Morgan Ltd. is proposing to construct the Northeast Energy Direct (NED) pipeline across southern New Hampshire to transport fracked methane gas to a Massachusetts Port. The pipeline proposal is expecting to share the easement strip with the existing Public Utility power line across southern New Hampshire. The pipeline is mostly above ground, 36-inch diameter and of variable thickness, and its installation will require excavation, blasting and heavy vehicle access. The affected area at risk extends a quarter of a mile on either side of the pipeline.

Permission for the pipeline easement is in process. Southern NH citizens do not want their land to be used as conduit and bear the burden of the environmental and social costs so incurred. NH has refused this offer

because they do not need more power generation but they do need better power distribution. They already generate an excess of power, which they mostly export to Massachusetts. The argument that NH needs more gas (via laterals from the pipeline) is falsely being used to justify its passage through the state.

### **Purpose.**

As the public is belatedly learning about the pipeline project, landowners directly impacted and community enterprises indirectly impacted are raising extreme concern. Local activists are busy speeding up the process of informing the public to get more citizens involved. The purpose of this document is to provide a more scientific discussion of public concerns about the various impacts perceived by the community. Unfortunately, the content cannot serve as a critique of the Environmental Impact Statement (EIS), as it has not yet been available. We hope that when it does, we can have a fully informed response. Fortunately, progress to legally oppose has begun with a collective effort of the seventeen community segments stretching across the state. They have formed the NH Municipal Pipeline Coalition (NHMPC) that has retained a lawyer, Richard Kanoff of Burns and Levinson, to legally challenge the pipeline.

To support these efforts, this draft outline presents a list of environmental and social concerns, that, should be discussed, not just by the population directly affected, but also as a statewide issue of the use of state property to be a conduit of energy to other states (or export) without adequate consent and public approval. To facilitate a wider discussion, we suggest that there remain several actions lacking or not completed that could better define and strengthen the opposition:

1. A document that clearly states the objections and concerns of the NH pipeline, i.e. a concise Statement that the majority can agree on in order that we can address our concerns to a wider audience, e.g. similar to this draft document but updated and better referenced for facts and legalities.
2. The distribution of the Environmental Impact Statement for the pipeline, i.e. so that we can rebut or agree more specifically in our opposition Statement.
3. An interactive website where citizens can constructively improve this document and support the funding of the legal pipeline opposition.
4. Construct an avenue for direct audience with the political hierarchy behind this proposed pipeline, independent of the legal effort involved, e.g. declared opposition by state and US politicians. This will emphasize a national issue that a number of other States are facing, i.e. using private and public lands for the profit of special corporations and convenience for other states.

### **Scope.**

This issue is not just an isolated case of a group of inconvenienced landowners, it has repetitions in other states, and it directly relates to the US Energy strategy. The issue raises the question of whether the public has a say in this issue or the public defaults its rights to energy corporations. Some concerns are:

#### **A. National**

1. How does the NH pipeline fit into the National Long-term Energy Plan?
2. Who has drafted the required Environmental Impact Statement, and what are the requirements set by EPA, DOE, & DOI (check which?)
3. Who has the ultimate political authority to approve or disprove the pipeline and its path?
4. Is the strategy behind this pipeline essential to attaining sustainable energy for the US; or is it a mechanism to offset the US trade deficit, i.e. trading our resources for imports that we could manufacture ourselves?
5. The US has not yet written its National Strategy for Sustainable Development, but likely it will do so to match the requirements of the UN Summit Meeting in December 2015. This is important because neither the fracking itself nor the unregulated sale of natural gas (as a fossil fuel) would be an action towards Sustainable Development.

6. Sustainable Development requires that Cost-Benefit Analyses be performed for the purpose of policy decisions. This requires a more complete accounting for environmental costs and benefits as well as the social costs and benefits involved (present and future). The current practice accounts just for short-term financial costs and benefits, and the assessment is often contracted to a biased party. In contrast, an assessment for sustainable decision-making requires that it be conducted by a third body of experts that are not biased by the political or economic issues involved.

## B. State

1. Since New Hampshire currently has no need for additional gas for electric power generation, who will decide what benefits will it receive for the use of its land throughout the existence of the pipeline and in what form would these benefits will be?
2. How are other states dealing with granting Public Domain for use of private property for special interests, especially when they receive inadequate financial benefits and instead must pay for the social and environmental consequences and their risks (detailed below)?
3. Was the pipeline path distorted to pass through NH because they expected less opposition? What they might gain by routing through an area of less population density, they will lose by the area's complicated topography and hardrock geology. Alternative routes exist, or the gas could be locally liquefied or conserved until shipped to a closer port or utility.
4. The writer has no information on whether or not the justification of the NH path is based on some plan to convert its older power plants to natural gas, which should result in more efficient power generation with a reduction in electrical power costs.

## C. Environmental

It is expected that the Environmental Impact Statement (EIS) will address a number of the environmental impacts expected with the construction and maintenance of the pipeline. Here we mention list some concerns, which might need editing in response to the EIS. The italics indicate significant concerns in following paragraphs.

**1. Methane Pollution.** Methane (CH<sub>4</sub>) is a more powerful Green House Gas (GHG) than Carbon Dioxide (CO<sub>2</sub>), but has a lower residence time in the atmosphere. Apart from the large methane leaks associated with its mining through fracking, there are leaks associated with its transport through pipelines. If small leaks are numerous over the extent of the pipeline, they can pose a significant contribution to Climate Change. Prevention requires greater monitoring of the pipeline - an expensive exercise especially in rugged terrain, as in NH.

**2. Methane Explosions.** If the pipeline is ruptured (e.g. due to ambient temperature changes, weaknesses where the line bends to conform to the terrain), accidentally shot at, or deliberately bombed, the resulting explosion and fire can be locally devastating. Any response to such an event is slowed in the rough terrain, by the distance, and the ease of access to the site of qualified emergency responders. These are essential factors to ensure the safety of residents and the preservation of their homes and environment. Obviously, the thickness of the pipeline and surveillance are also serious factors that should not be minimized in the design of the pipeline through scarcely populated areas. A lack of assurance about these safety factors will be of continuous concern throughout the lifetime of the pipeline (see also C.3. security).

**3. Construction.** Given the glacial bedrock prevailing throughout the proposed route coincident with the existing electrical power line, will require a more expensive and difficult installation of the gas pipeline than would a pipeline through a flat sedimentary geological setting. This is of concern to the public because of disruptive blasting, loud noise, falling debris, and the traffic of heavy machinery through their property.

**4. Water Pollution.** The bedrock subsurface, the vegetation, and the topography all make the distributions of surface runoff and the shallow aquifer (water table) spatially very complicated and mostly unknown. The visible surface water in brooks, streams, wetlands, rivers. and lakes are surface manifestations of the

shallow aquifer, which is supplied by the drainage after a rain. The portion of rain that penetrates into the ground may take another route, which is mostly occurs at recharge areas, where the surface soil is permeable and water can find a route through the bedrock distribution. This water can also feed the surface waters, i.e., in the form of springs. A portion of the surface aquifer finds its way to an even deeper aquifer that is often tapped for drinking water when the surface aquifer is locally insufficient or polluted.

The underground route of water acts to filter out particulates and oxidize organic matter, including bacteria, etc. It does not filter out dissolved substances such as Nitrogen and Phosphorus, which are necessary elements for healthy aquatic systems. However, if either of these is in excess of its normal concentration range, it can cause problems in the receiving water body. In ponds, wetlands, slow rivers, and lakes they can cause eutrophication (too much algae), which then generates anoxic conditions fatal for fish and change the lake's trophic system. Excess of these chemicals, particularly nitrates and synthetic compounds, pose health risk in well water. E-coli can easily enter into the surface aquifer (dependent on septic treatment and location) and pass into a stream or lake. Their lifetime is a matter of days but if the supply is relatively continuous it poses a health threat. This problem would not be connected to the pipeline unless during construction septic systems or their leach field are disturbed.

Rain and its surface runoff from the pipeline area simply transports these dissolved chemicals to the larger receiving body, either via the surface runoff or the shallow aquifer (as springs). Herbicides used to suppress vegetation along the pipeline's cleared area are transported primarily by their tendency to attach on to eroded soil particles transported to the receiving water body. The primary herbicide component, Glyphosate, is of less concern than the commercial mix of chemicals added to Glyphosate used to maximize herbicidal coverage and its penetration in to plants. Recent studies in Europe and elsewhere are raising red flags concerning the risks to human health of overexposure to herbicides (Wikipedia). In water glyphosate breaks down slowly from 1 to 12 weeks and can be toxic to aquatic organisms. Restoration of damaged ecosystems can take decades. Such ecosystem disruptions have already been documented in NH, specifically in association with the Power One installation and maintenance (see letter Shaun Bennett dtd 21 Aug. 2015).

The concerns are that there will be water pollution problems in general and, specifically, for those land owner's down stream of the pipeline; that is:

- During the construction period, when considerable erosion and transport of pollutants via air or water occur and might initiate a pollution process that will continue.
- During the lifetime of the pipeline, when there are persistent reapplications of herbicides and during maintenance by heavy vehicle traffic that will continue generate the transport of sediment and pollutants to the downstream aquatic ecosystems where it will accumulate faster than it can self-purify.
- These accumulations can pose expensive risks to drinking water, to aquatic recreation, and to the health of the aquatic ecosystems, that might require protective closure and/or expensive monitoring.

**5. Forest Habitats.** The existing power line space effectively fragments the larger-scaled forest ecosystem, making a vulnerable space for passage of small animals and reducing the range space for larger animals. A 36" diameter pipeline elevated above the surface will provide a barrier for larger sized animals forcing them to use the portions of the pipeline that are buried or elevated, e.g. to pass under roads and over rivers. The concern is that the pipeline will act as a barrier to the free movement of forest animals, causes them to more frequently encroach on human settlements, and make the goal of wildlife preservation more difficult and degrade the recreational and intrinsic value derived from a healthy forest ecosystem.

In sum,

- The public wishes to preserve the function of healthy ecosystems and the goods and services that they provide.
- The public does not want to pay for restoration of the environments/ damages or to bring a class action suit to gain reparation for their environments/losses.

#### **D. Social**

It is expected that the Environmental Impact Statement (EIS) will also address a number of the social impacts expected with the construction and with the maintenance of the pipeline. Here we list some concerns. The italics indicate significant concerns in following paragraphs.

**1. Health.** Many local habitants live in NH because they favor the clean air,

water, and forest environment. For them to experience a sudden change to a noisy, polluted living situation would cause them stress and anxiety. In particular, if they are allergic, asthmatic, or sensitive to air and water pollutants, they become concerned that these environmental changes are ruining their health, either causing them increased medical expenses or causing them to sell their home at a loss due to property devaluation, or both.

**2. Property Devaluation.** There is no question that the market price of properties in the vicinity of the pipeline will be diminished. The amount of devaluation can be approximated from comparative studies with similar incidents, e.g. devaluation of real estate prices of homes in vicinity of a major highway construction. Landowners are concerned that they might have sell their homes at a loss and/or they will not be compensated justly for their property devaluation.

**3. Security.** Fear of a pipeline accident during construction or after the pipeline is installed is probably the most stressing concern, i.e., that they lose their home and lives due to an accident involving blasting, fire (lightning, forest, or power line shortage), explosion (accidental or due to gun shots or bombing). Such an accident is possible, but unannounced, causing a low-level of fear to endure. For people living near the pipeline in scarcely settled areas the fear level is higher due to the fact that they live far from rescue, fire fighting, and/or ambulance services. Some NH towns along the pipeline strip do not have local access to these services. These towns might feel obligated to pay with tax revenue to make these services more readily available, and landowners may have to pay increased coverage for insurance. People living in or near the half-mile 'incineration zone' or in the near proximity are ~ that they will not be adequately assured about the probability and intensity of pipeline accidents and that they will not be compensated for damage to their homes ;J;iniUries.

**4. Cultural** .. Concern is felt for the community infrastructure that could be a~ by a Pipeline accide- • or Its existence and maintenance, for example, activities and sites like ol'4"e yan....o:- camps and recreational facilities schools churches, historical sites,. small roads th~t are blocked, etc. “

**5. Morality.** Some folks oppose the peline on moral or practical reasons.

1. Why are we facilitating the comb JStion of Fossil Fuel, when it contributes to Climate Change, and when we sh uld be phasing out its depleting resources instead of conserving them for fut re generations?
2. Why are we investing in a huge p 'paline for tracked gas when the lifetime of most small tracking wells is a tar of years and their operation is posing great environmental damage for a r friends in PA and elsewhere? Note, out of the 35 thousand tracking wells in the US, only a few of the larger wells have a longer lifetimes of up to sey ral decades.
3. Why are we investing in a disruptiv I interstate pipeline involving the expense of energy transport when we know 'hat energy in the future will be produced locally, e.g. solar, wind, hydrogen, X"dal, and bio-fuel from organic waste & sewage, and that it will be distribut ld locally through computerized energy networks?
4. Why are we investing in a fossil-fu 91 infrastructure, when we should be investing in renewable energy infraStnK. ~re of the future?
5. Why are Oil Corporations getting rich u\~ing our property when we didn't vote for it and we won't receive just compe~sation for it?
6. Why are people in NH, PA, and other ~tes suffering so that Oil Corporations can maintain their dominance over our energy policy?
7. Why would the state with the motto "Live free or Die", put up with false justifications of helping our

State instead of damaging it?

Respectfully submitted,

Thomas Sawyer Hopkins

Washington, DC 20426

Docket 4 PF14-22-000

August 24, 2015

Dear Secretary Bose,

I am writing with great concern to oppose the proposed pipeline through Richmond, NH and my property at 119 Sandy Pond Road, Richmond, NH. This property bought by my grandfather in 1910 and has been the focal point of our family ever since. For me and my children it is the one constant in our lives — a place where we gather with family and go to renew ourselves and our family has done so for over one hundred years.

We are deeply concerned about the proposed pipeline. Its impact on our environment would be hugely negative and far reaching. Dr. Shaun Bennett, our neighbor, is an expert on Sandy Lake having written his PHD dissertation on the uniqueness of this lake, its fauna, its watershed, and its ecosystem (see his letter submitted August 21, 2015). My husband, Dr. Thomas Hopkins, Professor Emeritus North Carolina State University, has submitted a letter on August 24, 2015 outlining his environmental and social concerns. He cites pollution concerns relating to methane leaks associated with its transport through pipelines, methane explosions, the consequences of construction through bedrock subsurface, the topography of our area, and the complications of blasting our granite formations and that impact on our shallow water table. The water our neighbors and we drink is threatened. The proposed pipeline runs through the largest recharge area of water in our aquifer. Nobody knows exactly where the veins of water run and therefore it is not possible to predict how long it would take for the disruptions to affect these veins of water. There is no plan to monitor water quality routinely after the pipeline is installed. The wetlands, numerous watersheds, the local streams and brooks including the brook that traverses the proposed pipeline area and feeds our lake, will all be affected adversely.

Our social concerns about this proposed pipeline are many and include concerns about adverse health effects, property devaluation, and safety concerns, especially for those within the quarter mile wide incineration zone as we are. The graveyards behind our house and down the road, the YMCA children's camp on the lake, the historical sites on and around our property are all within this incineration zone. Our town of Richmond has only a volunteer fire department and no ambulances at all should an explosion happen. There are no nearby medical facilities. Nearby towns are in similar circumstances. Most of the pipeline would not be accessible by road and firefighters would need to carry water by foot or on ATV vehicles. Depending on how the wind was blowing, fire would be hard to contain.

We know that there is no need for this oil in NH as NH produces 50% more energy than it uses and that contrary to what is being claimed there is no agreement to "co-host" with local public utility companies. There

will be increased local costs due to the impact on our roads, surcharges that will be added to our utility bills to maintain this proposed pipeline that NH will not benefit from. Why should out of state companies (Kinder Morgan and Tennessee Pipeline) get rich at our expense? We haven't voted for this. Our democratic processes are being ignored.

Secretary Bose, please block this proposed pipeline, which is of no benefit and greatly threatens our safety, our environment, our economy, and our quality of life.

Sincerely,

Dartha Hopkins, homeowner and citizen  
119 Sandy Pond Road  
Richmond, NH 03470

### **20150831-0093**

Regarding Docket PF 14-22: Socio Economic

The towns in the Western portion of New Hampshire which your gas pipeline will cross are small in population. The 2010 census lists them as follows: Mason 1382, New Ipswich 5099, Rindge 5096, FitzWilliam 2396, Troy 1221, Richmond 1155, and Winchester 4341. If one were to check with each Town today, the populations would actually be less. During the recent recession, many lost their employment and moved away. Although your impact reports state that the jobs in Cheshire County are in 3 areas:

Health and Social Service, Manufacturing and Retail, many of the residents travel to Massachusetts for their employment. With just 169 hospital beds in 5 hospitals in Cheshire County, you can be sure the large hospitals of the Greater Boston area employ many of these workers. These towns would be described as small working class areas, mostly bedroom communities. The largest employer in Rindge is the Market Basket grocery store, which is then followed by Franklin Pierce University. There is hardly a large manufacturing presence. The towns of Rindge and New Ipswich had many skilled people involved in the building trades, a segment that has yet to recover in this area. Many of these workers moved south, often leaving behind their foreclosed homes and bankruptcies. It would appear our unemployment rate is low, but there are a great many who lost their jobs and now handle 2 part time jobs, without benefits, to barely make ends meet. The unemployment rate does not count those who have given up seeking work or who have left the area completely. One area you don't even mention is our tourism. The summer population greatly increases as seasonal residents return for our cool summer weather. They flock to their summer homes on our many lakes and ponds, and return to the campgrounds they had enjoyed for years. Our area provides swimming, boating fishing, hiking and many more outdoor sports. In winter, many seek the area for Cross Country Skiing and snowmobiling. Your resource reports show our many camping and RV areas where your workers will stay; these are booked year after year, in advance, by the same seasonal residents. Your report lists one campground 2 times and mentions another available one which is actually about 2 1/2 hours north in Lancaster NH, not anywhere near Cheshire County. Those little errors sure make it look like there is a lot available. The report gives a false sense that Kinder Morgan has planned well. The Park and Drive area on Route 101/9 at Chesterfield Gorge, also in your report, is over an hour away and can accommodate 40 cars, 2 of which are handicapped, which one can assume these workers are not. Will this accommodate your many workers, SO96 by your estimate, to be local, who will be able to car pool as to not congest our roads? Another area mentioned in your report is agriculture, stating disruptions will be temporary. The area supports many organic farms and locally raised meats. With not having to answer for the emissions of the Compressor Station, can you assure us our crops and foraging animals will be safe from contaminants? There is NOT ONE permanent job listed for Cheshire County. How do this justify the disruption of our clean waters, air and rural environment, taking of our lands for a project that we has no direct benefit for the people you disrupt? Your report lists New Ipswich, MA, a town that does not exist, for mid section 4 Metering Station. Is this a Compressor Station? Certainly, the residents of New Ipswich NH will be thrilled to hear you have a better plan! This whole report is vague, inaccurate and sloppy. There is little knowledge of our area, short of

the textbook descriptions and inaccurate tables you supply.

The 7 small communities, listed above, are having a difficult time making ends meet, as the services they provide change little, despite a smaller population and decreased tax revenue. The Schools still need to be open, even with less students, the snow still falls in the winter, the core of Town workers, that is bare bones, need to continue to provide our merger services. Presently the town of Rindge is auctioning off abandoned, foreclosed, bankrupt properties in an attempt to get them back on the tax payrolls. NH residents already pay high Real Estate taxes, actually among the highest in the nation. With 90% denial of access rate in some areas, much land will need to be taken by Eminent Domain? There are more than double the amount of properties that are affected than what Kinder Morgan has identified. Reduced assessments will result from the taking of our lands, leaving a heavier burden on the rest of the taxpayers. We require all monies lost from the tax abatements will be more than returned to the towns by KM/TGP for a period of twenty years. It should be mentioned that NH has no State or Town income or sales tax, so the benefit to state and local towns does not exist, as your report states as a benefit.

The financial burden you will place on these small towns is huge, not to mention the what you will do to our clean water, air, and rural character. We feel to Insure our safety all additional studies need to be financed by Kinder Morgan/ TGP and done by an independent party, of each town's choosing.

We request the following studies:

1. A comprehensive review of all existing options and alternative solutions to supply gas/energy to the REPORTRD need. NH exports electricity. This pipeline does nothing for the communities who are placed with the burden of being hosts. Explain the math used to lower our electric bills, when not one power plant has signed up to be a customer? Reassure us there will be NO tariff on our Electric rates to pay for this project, and that it will be entirely paid for with KM/TGP monies I
2. A review and identify of the aquifers and how they feed our private wells, the town's only source of water for homes and businesses. Assure us these sources will not be impacted or disrupted.
3. NH is called the Granite State, and for good reason. We request that all blasting be done by the least invasive method, and that best practices be used at all times. The work needs to be supervised by a person who is certified in this area, and is chosen by the towns. All blasting within 400 feet of a private well will be by the least invasive method. The said wells will be checked before and after the blasting for output and quality, and again at completion of the project area, and for 1 year thereafter, at 6 month intervals. Any damaged/contaminated wells will be replaced. "Pigs" are not an acceptable solution.
4. That wetland areas be totally studied, in the Spring, and matting be provided where they occur as to not compact the soil. Critical areas will be totally avoided with an alternate route. These studies are to include an wetlands 300ft from the edge of the ROW.
5. That the entire ROW and 300ft from its' edge be studied for endangered, special concern and threatened species of birds, amphibians, reptiles and mammals. An alternate route will be named for anything endangered, including flora and fauna.
6. Identify all water sources to be used in construction and how they will be disposed of so no contamination occurs. Be sure in this process, that invasive varieties of plants will not be transported to new locations. Request that the products of construction do not contaminate the soil and are properly removed. The soils should be protected from sas spills, and any other hazardous products used in construction.
7. Identify roads to be crossed and traveled, and where new ones will be created. Understand the weight restriction of the roads used. How will dirt roads be utilized in the Spring? A car transversing them is far different from extremely heavy equipment. All roads to be returned to original state of repair and any new ones mitigated.
8. Identify how the Fire Department will be trained to prepare for an emergency. Explain how a volunteer organization will meet this need. Supply any additional training and equipment necessary to insure residents safety. With no fire hydrants, explain how our water tanker can, in any way, meet an emergency need? Pro-

vide comprehensive Disaster traininB for both Fire and Police.

9. Our Police Department does not have 24 hour/7 day /week coverage. A Regional dispatch is available for off hours. Explain how the police would be available for emergency during off hours? Police Details would be required while work is in progress near roads. Would such a detail be available? Your report mentions a County police capability; please study this as there is probably only a sheriff. NH does not believe in big government.

10. Explain how the noise, light and harmful exhaust at Compressor stations would be handled? How can we protect our crops, air, wildlife, grazinB stock animals, water, not to mention all the humans who will come in contact with the fouled air the project will provide?

11. Identify an water crossinss and how each will be handled. Each crossins is unique and with its' singular challenges. There are critical crossings, that are not necessarily wide. How will they be indentified and handled?

12. How wide will the ROW corridor need to be expanded? How many trees will need to be removed? This operation and its' mitigation should be handled by a certified Forester, paid for by KM/TGP, and chosen by the towns. All removed timber and chips will be given to the Poor for heating purposes.

13. Replaced trees, shrubs and vegetation will be native species. The trees replaced to be the largest feasible that will likely survive. The forester, as above, should cover this return of our environment for at least 5 years.

14. Explain how this pipeline steers away for fossil fuels, and insures the State's 10 Year Plan toward renewable energy?

15. There are better solutions than plOwing through 70+ miles of NH just to return to Massachusetts where the purported shortfall of energy/gas supposedly exists •. There is much to be said for simple energy conservation and investing in those approaches. There are "sreen" alternatives, such as solar and wind. The Bas pipeline along the MA pike (Route 90) is aging and leaking. Consider replacing it with a larger, more efficient pipe. The SPECTRA proposal makes much mare sense, and those communities are far better equipped to deal with its' impacts. WE ARE THE DISRUPTED HOSTS FOR A PROJECT FROM WHICH WE WILL RECEIVE NO BENEFITI Kinder Morgan Is a for profit company, answering only to shareholders and corporate greed. Please consider the whole picture I

Marilyn Griska  
Rindge, NH 03461

Washington, DC 20426

Northeast Direct Pipeline Project

Docket no. PF14-22-000

To Whom it May Concern,

We'e received the notices of your intended pipeline plans and invitation to comment. Until 2013 we lived and owned 2 lots on Breezy Lane in Schoharie, NY; one with our home (130Breezy Lane) and an adjoining lot which we cleared and maintained for recreational and aesthetic purposes. Conditions in New York suddenly became intolerable for us in early 2013 and we moved to Tennessee two years ago and put our properties on the market. We had put huge amounts of money, love and work into our home so leaving was not easy It was even more heartbreaking when the house took nearly two years to sell and that at a huge loss; over \$50,000. We still own the lot (tax parcel key 434289 59.-2-25.114)but after over two years and two real estate agencies have not had any interest even though we'e asking much less than we paid for it; \$10,000

less.

During these past two years not only did we lose the STAR and veteran discounts on our taxes because we moved but we saw our taxes raised even more because the assessment was arbitrarily raised when the county declared the land to be “prime” real estate due to the beautiful view. We spent tens of thousands during those 2 years on taxes, plowing in winter, partial mowing around the house, utilities and general repairs and maintenance as deterioration took its toll hurting”s even more.

Several months ago we let the listing of our lot expire since there was no interest at the time and hopes of a casino that would bring more jobs and interest in our property fell through. We decided to wait until conditions for sale improved, instead they have worsened in a way that we never anticipated; you chose to put in a natural gas compression station literally in our back yard. Regardless of how beautiful the view is in front, no one will want to build and raise a family with a toxic bomb in the back yard that would destroy everything in the event of a disaster.

The reason we chose to live there (and our neighbors as well) was it is beautiful, rural, quiet and safe without all of the crime, traffic and pollution of the cities. That’s why we chose to spend huge amounts of money on taxes to live in a place that had no trash pick up, no city water/sewer, no paved road or maintenance of the road by the town during brutal winters and outrageous school taxes for which people with no children receive absolutely nothing in return. We commuted 30 miles each way to work every day but it was if worth it when we could get away from it all when we were home. That’s the attraction for people, like us and our neighbors but all that is lost if a facility such as you propose is placed right next door.

Recently there was a CSX train derailment near us here in Tennessee. Several of my friends were forced to evacuate and stay in motels for days while the hazmat spill was cleaned up. Their wells are still being tested and dead fish are being found everywhere. We intentionally choose not to live near a railroad for that reason yet you intend to put the equivalent of that right next door, worse still a disaster at your station could come with no warning at all; just an explosion that levels or burns everything.

As a potential buyer I would not even consider such a condition even if the property was otherwise exactly what I was looking for. Why would I want to make my biggest investment and place the people I love most next to a facility that could have a tragic accident that would take out everything? What if a terrorist or some other nut case decided to disrupt the infrastructure for millions on the east coast by hitting a rural soft target like your station? With all the hunting that takes place in that area what if a stray round found its way to a sensitive part of the station? Even if the facility runs quietly and maintenance traffic is minimal (I don’t know that that’s that case) the potential for a catastrophe like I’ve mentioned would always be on my mind but I would also wonder what was in my well water every time I turned on the faucet, a disaster of a different sort but potentially just as devastating. The peace, quiet, safe, tranquil environment would be non-existent and I would look elsewhere. How can we expect to sell our property now under these circumstances? I’m not sure we could give it away. Everybody’s property values could drop but I doubt the tax liability for property and school tax would be reduced at all without a huge fight. Many could find themselves underwater with their mortgages as a result. For an area that was already struggling before it was devastated by hurricane Irene and tropical storm Lee in 2011 and has not yet fully recovered, this could destroy the lives of many on Terrace Mountain and beyond. Putting their lives in danger, destroying the culture/environment that attracted us to the area, wiping out home values after pouring everything into them and making them difficult if not impossible to sell at anything near their current value all for a natural gas line that they can’t even benefit from as we all use electric, oil or propane. It’s ironic that those of us on Breezy Lane have an appendix on our deeds that prevent us from having a number of things on our properties among them is windmills which were seen as detractors to the view and property values which is precisely what you are proposing with your compression station only it poses a far greater risk to those living nearby than the aesthetic inconvenience of a windmill.

The people of Schoharie have suffered enough through natural disasters and government taxation, regulation and mismanagement at all levels. That’s why we left the home we loved at tremendous personal expense

and emotional pain. We know we will take another huge loss on our remaining property (we already have) as it has already returned to what it looked like when we bought it but if you put this compression station where you propose we will likely not be able to sell at all or at best let it go for pennies on the dollar just to be rid of it. At least we no longer live there, unfortunately for our friends and former neighbors they cannot say the same. I'd like to think that the local officials in Schoharie will have the decency and foresight to oppose this before they lose still more residents but I'm not confident that they will yet we will send a copy of this to them as well. Please reconsider the location of your pipeline and its stations.

Sincerely,

Mark and Michele Fellows

cc:Pamela Foland, Schoharie Tax Collector; Steven Rubeor, Tax Assessor, Schoharie Area, Eugene Malone, Town Supervisor; Pete Lopez, Assemblyman; Chris Gibson, Congressman

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Docket 1PF14-22-000

August 27, 2015

Dear Secretary Bose,

Construction of the pipeline would not only violate our rights as landowners, but slowly destroy the place that so many in my family (and the rest of the public) call home. When my family escapes the hustle and bustle of a busy New Jersey life, we come up to New Hampshire for quiet. We want to be alone with the pond, the trees, and the animals. But a pipeline the size of a six lane freeway would destroy that. This fact is so clear, yet is seemingly being ignored. Why? Why would some company want to destroy many people's happy place? Well the answer is extraordinarily confusing. It's not like in the state of New Hampshire we are in desperate need for natural gas. In fact New Hampshire produces 50% more energy than the state actually uses. By installing this pipeline you are destroying a habitat and home to animals and people, just so we can have a pipeline for ten years. Instead we should use those ten years and our extra energy to research a renewable source of energy such a solar energy. In one second, our sun produces enough energy to meet the current needs of the entire Earth for 500,000 years. So instead of constructing a pipeline surrounded by such controversy and negativity, how about we put our brain power together and create a solution that fulfills all of our needs.

On a more personal level this construction will affect my future and life. Our home in the rolling hills of Richmond, New Hampshire has been in the family since 1910. Our home passes down from generation to generation. In the future, I will be a recipient of this home. But now, looking at the plans for this pipeline, I am not sure I will have anything to receive. When saying this I am not even considering the fact that our home might blow up due to being in the incineration zone. I am saying this because fracking poisons our air and water, and a pipeline's construction destroys our local habitat. Sandy Pond might become unswimmable and the air polluted. What would be the point of getting away, and escaping reality" when there is nothing to escape to'8

This is only considering my own personal life though. More importantly, what would happen to Camp Wiyakaf Camp Wiyaka is a camp that kids can go to and escape the stress of everyday life, where they don't have to worry about the difficulties in their lives, but instead worry only about which activity they should sign up for. And what good is a camp without its heart and soul —its lake? Anyone that has attended this camp will tell you about the healing powers that Sandy Pond provides. The heavy, dark, silky water, on your worn out body. But this would soon be gone. My childhood memories of snorkeling until the sun has set,

having races with my cousin, catching frogs and trying to turn them into princes, trying to bring up rocks from the bottom of the lake, and most importantly being one with nature would become just memories, not things my children would look forward to sharing with me. I was always so thankful that Richmond was not touched by pollution.

If there is one thing that I can get you to understand it is that the pipeline will destroy our home. The pipeline is not a clean source of energy. It is a plan that is not only violating our rights, putting many people's lives in danger but also destroying the ever disappearing place we call nature.

Sincerely,

Elena Kotsen (age 14, future homeowner)  
119 Sandy Pond Road  
Richmond, NH 03470

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Docket 1 PF14-22-000

August 27, 2015

Dear Secretary Bose,

I am writing to express my extreme dismay over the proposed pipeline. I do NOT want a pipeline in my literal back yard, or anywhere in its region. I do not grant Kinder Morgan or the Tennessee Gas Pipeline Company access to my property.

The proposed pipeline is to be built just a few hundred feet behind our two hundred and five year old farmhouse, "Hillside." Our house, and half of the lake it sits on, is scheduled to be in the incineration zone of the pipeline.

This house is special to all who visit it because it has remained so unchanged throughout the years. It has most of its original windows. It has all of its original hardware. The door is the same, the door hinges are the same, the granite steps the same. Even the paint color is almost the same. It is hard to find places like this in America these days.

The house was built in 1810 by the son of a Revolutionary War veteran on land that his father had been granted for his military service. When my great grandfather bought the house one hundred years later in 1910, it had fallen into a state of disrepair. He rebuilt it with his own hands, using wood from the property, and preserving it as much as he could. This same great grandfather later served in World War I as a Navy chaplain with his two eldest sons. All of them wrote home letters about how much they missed their house in the Richmond hills. We have these letters in our attic. My great grandfather died while doing relief work in Armenia with the Navy and his eldest son died as a result of injuries sustained in the war. Later, when World War II broke out, my great grandmother had to wait for two more of her sons to return from war. Unde Herbert, already a WWI veteran, re-enlisted from the Philippines where he had gone as a medical missionary and started a hospital. As an officer, he was taken prisoner of war and pronounced missing. He never returned. My grandfather also served as a Navy officer and looked tirelessly for his older brother. We have all these letters, written home to Richmond. Through the years, this house was passed down to the sons of my great grandparents. Then, it was passed down to all the cousins in my mother's generation. Now, it is my generation that cares for and loves this house. We cannot in any way stand by and let its land be dynamited or its care be risked by sudden incineration.

This house and its town teach us all about America's history. Literally by seeing this house and its region, we know how America was settled, how stage coach highways laced its hills (our driveway is indeed, part of

that vast, still visible network), and how New England residents eked out livings sheep fanning and lumbering. We know what that lumber looked like two hundred years ago because we walk on it every day. We know how hard our family worked to keep the house standing during the Depression, we know what church my great unde preached in on occasion; it is the same church I chose to get mamed in because I, like many New Hampshire residents, honor and chensh that connechon to the past.

The changes that inevitably arrived with time —electricity and paved roads —were modest and sweet compared to what a pipeline running through our town and lust feet from our house would bring. Trucks hauling, dynamite blasting, herbicide spraying, as well as a huge path of wildlife destruction and our constant fear of fire are not a part of the normal march of time; it is the destruction of a way of life. All for a means of energy transport that is unnecessary and will soon be outdated.

Richmond, New Hampshire is a wonderful town. It has a church, a blinking stoplight, and many kind and devoted residents. It has a volunteer rescue squad who helped my great aunt several times when she was at the end of her life. Richmond does not, however, have an ambulance. There is also no road access to our property behind the house. Volunteer rescue efforts in the case of pipeline incineration would have to happen on foot or with ATV. That is not, in any way, a safe plan.

Across the road from us is a small, tented YMCA camp. It serves local childxen from Athol, Massachusetts. It is not fancy or expensive. Many generations of our family have gone to that camp. From our house during the summer, you can watch children play in the field and lake. Every summer, campers return and reminisce fondly about how camp changed their lives for the better and how much it meant to them. Alumni joyfully send their children and raise money for camper scholarships. All of these camper's lives would be necklessly and needlessly endangered to put the pipeline in their path. The fact that the incineration zone lands squarely on Camp land proves how carelessly this pipeline has been planned.

Part of what makes Richmond special for Camp Wiyaka and many Richmond residents is a healthy, beautiful Sandy Pond. In the past, herbicides from the power lines have endangered the health of the water, making it almost unusable because it was choked with weeds. If dynamite were to disrupt the brook that feeds the lake, I do not think the lake could survive. The loss of this lake would be a huge loss to the entire community. You, Tennessee Gas Pipeline Company and Kinder Morgan need to address the concerns that Dr. Shaun Bennet and my father, Dr. Thomas Hopkins, have addressed in their letters to you. As property owners, part of our stewardship is the care of Sandy Pond. We share a beach on the lake with town residents who, over the years have grown attached to the nd. Good citizens work to keep it clean and, when we see them, sing the praises of autifulL pristine Sandy Pond. Hurting Sandy Pond would hurt all who love it and shaxe in its beauty.

Recently, we put in a new well. Before that, we manually pumped water from the well off the front porch. Richmond water is excellent. I am disturbed that the pipeline company would be so careless as to not plan around the many aquifers in the area and not plan to regularly monitor water quality. For their own financial gain, they plan to disregard such a valuable resouxce and something that is so critical to an entixe xegion. This is wildly shortsighted and not at all a reasonable plan for New Hampshixe.

This proposed pipeline would force us to sacrific everything that we hold dear about our home, town, and region. We would have nothing to gain for this sacrifice. New Hampshire produces fifty percent more energy than it needs, and we do not want or need any laterals coming off the pipeline. An underground pipeline would require dangerous dynamiting through granite, and an above-ground pipeline would require careful maintenance since the static electricity from nearby power lines is corrosive to the thingrade metal our pipes would be made of due to our rural area. The pipeline, underground or above ground, will require a width of highway 91 cut through the woods, and it would ruin the pristine remoteness and simplicity of our property. When you look at photos of our house from 1910or 2015, you see that our home is named after its setting, the pristine hill it is nestled in.

Most shockingly, the pipeline puts our very lives at risk.

This summer, evety time thunder rumbled and lightening struck, I imagined what it would be like to sit on

the porch and brace for incineration.

Sincerely,

Faith Hopkins Kotsen, homeowner  
119 Sandy Pond Road  
Richmond, NH 03470

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20428

Docket 1PF14-22-000

August 27, 2015

Dear Secretary Bose,

Every summer I have gone up to our house in Richmond, New Hampshire where I learned to swim, made fairy houses, and developed a love for nature. I remember the first time I was allowed to try white bread, swim in the deep end, and go down to campfire to sing songs. My mom always used to tell me bedtime stories when I was little of her days at New Hampshire as a kid: her dog attacking a skunk, ghost stories in the forest, listening to Aunt Helen talk about corn. My early memories of Richmond are some of my fondest and they are what I remember when I think of my childhood. A pipeline being built in our backyard would not only destroy our property, it would destroy our memories.

Our home, "Hillside," is an oasis to my family and me. It is there where we can escape from the busy of our daily lives and disconnect from technology. The lack of modern technology is in fact what makes Hillside so great. The roads are barely paved and you can wander for hours on our property without finding a trace of modern humankind. There are majestic trees, stone walls dating from the 1700's and tons of precious wildlife. We have tried to leave our property as little touched as possible for we want an environment that is as inviting for nature as possible.

Building a pipeline would not only cause mass destruction to the building site, it would be detrimental to the critters and nature that inhabit the areas. Many residents' water comes from wells or aquifers near your planned building areas. The pipeline could easily contaminate residents' drinking water, causing mass catastrophe. We also have a lake dear to the town, Sandy Pond. Residents from all over the town go swimming there on hot summer days to escape from reality. Chemicals could easily be flushed down into the lake contaminating not only the creatures and nature that inhabit the lake, but it would take away one of the town's favorite places.

A camp, Camp Wiyaka, also sits on the lake. This camp brings in kids from Athol Massachusetts. Too many of these kids are underprivileged kids living in poverty. As an alum of the camp I have experienced first hand the fact that this is the kids' only oasis in a life that no one deserves. These kids are able to eat nutritional food, swim and hike, make friends, and realize that they are worth it. The pipeline has an incineration zone which includes not only my house, but Camp Wiyaka. Since Richmond is so small, they lack a permanent fire and rescue team and paramedics. If the pipeline was to explode while camp was in session, we would be talking about hundreds of casualties. It certainly is not safe to build a pipeline in a town with no fireman or paramedics. And if Camp Wiyaka has to close its doors, I can promise you that those kids would suffer unimaginably.

I can imagine that you have received many letters describing the detrimental damage the pipeline will do to the nature in Richmond. However, this letter addresses more of the ethics of this issue. Is it ethical to put hundreds at risk of death? Is it ethical to destroy someone's property they have had for over a hundred years? Is it ethical to fool the public into thinking that we need this energy when really we have enough? Shouldn't

we be researching sustainable, renewable sources of energy that will power our future? Personally, I think that the overall well being of humans and nature is more important than a quick money source. But this is up to you.

Do you want to see a bright future for the Earth and humankind or a bright future for those who would profit from short term pipeline use?

Thank you,

Earns Kotsen, (age 14, future homeowner)  
119 Sandy Pond Road  
Richmond, NH 03470

## **20150831-0099**

Federal Energy Regulatory Commission  
888 First Street, NE, Room I A  
Washington, DC 20426  
Docket # PF14-22-000

August 27, 2015

Dear Secretary Bose,

I am writing in opposition to the proposed gas pipeline by Kinder Morgan, on behalf of the property owners of the 119 Sandy Pond Road, Richmond, New Hampshire household —the Brokenshires. I married Faith Hopkins Kotsen and we support this summer property by paying New Hampshire real estate taxes each year. Faith and I were married at the Richmond Church in June 2000, and I have been visiting the property since 1998, every summer.

My perspective as an outsider coming into the Brokenshire family in this area of New Hampshire has been one of amazement at the love that this property and surrounding areas generates for all the Brokenshires/Moodys/Hopkins families and now our family as well. This property and surroundings is our home and a big reason we were married in Richmond.

The proposed gas pipeline by Kinder Morgan is a serious threat to the habitat, local ecology in and around Sandy Pond and specifically to the Brokenshire property, along with our peaceful way of life in Richmond. Having spent seventeen years there, I continue to marvel at the wonderful pristine environment that is now threatened by a proposed gas pipeline that is not even needed, since NH has more than enough energy from other sources. I have spent a lot of time at the waterfront with my children as well as nieces, nephews, other relatives, and children at Camp Wiyaka. I have waded, swam, snorkeled, sailed, boated, and fished the lake each year. I have run, hiked, and mountain biked throughout this area.

As Dr. Hopkins and Dr. Bennet discussed, the lake has a very sensitive ecosystem, which is now seriously threatened. I have spent countless hours with many of the children catching salamanders, frogs, toads, fish, and also noticing the birds, herons, owls, and wild turkeys in the neighborhood. This small sampling of animals has been an inspiration to all the youngsters and us adults as well, creating powerful experiences and memories to all the visitors, as we blend into nature each year at this wonderful place.

I attempt to pass on the sense of the beauty, wonderment, and awe of this environment to the younger generation in hopes that they will preserve the beauty of this environment for their children and grandchildren, and great grand children as well. The environment is a warm juxtaposition to the hectic, frenetic pace of our New Jersey life, so this beloved New Hampshire area feeds our souls as individuals and extended family members.

Also, more specifically, the Brokenshire family has a cemetery on our property, very, very near the proposed gas pipeline zone. Like the surrounding nature, this completes this place's cycle of life. The sacredness of this hallowed place is now also at risk, as this would be near the bulls eye of the "incineration zone" of the

proposed pipeline.

So basically, this is all at risk. The proposed gas pipeline by Kinder Morgan would destroy all of this, with no justification other than corporate profit, with no input from the property residents, and with no concern for the habitat and ecology of the surroundings, or concerns for the well being of us tax-paying residents. As Deveda Bmkenshire Prochilo indicated, there is no compensation price for giving up this serene setting. A pipeline for ten years of use is not worth the destruction of our environment, our historic property, and maybe even our lives.

Chris Kotsen, homeowner  
119 Sandy Pond Road  
Richmond, NH 63470

Re: Docket PF14-22 Kinder Morgan Gas Pipeline in New Hampshire

Dear Secretary Bose:

The plan to construct a gas pipeline through Richmond, NH is flawed. It has not been widely presented and few of the land owners along its wide corridor have been notified of the proposal, possibly to limit the criticism it deserves. I am one of those un-notified land owners, with property along the shore of Sandy Lake and along Bullock and Lang Roads in Richmond (Map 405, lots 20, 22 and 25).

Sandy Lake is a rare, valuable, vulnerable water body. It is pristine because its watershed is undisturbed save for Sandy Pond Rd. and a transmission line that is the proposed pipeline's path. The Lake's shoreline is undeveloped, with almost no buildings, and no year-round residences. Undisturbed water bodies are very uncommon in Southern New Hampshire. This is a precious natural resource.

The Lake is unusually deep, 15 meters (50 feet), providing a large hypolimnion region and a longer "residence time" for water (and any contaminants) than in the typically shallower lakes of the region which "flush" more rapidly. The Lake's fauna includes fish, water birds (e.g., kingfishers and great blue herons, ducks, geese), raptors (e.g., osprey) and nighthawks, reptiles (turtles and snakes), amphibia (breeding green frogs, bull frogs, american toads, spring peepers, and the densest population of eastern spotted newts ever reported in the scientific literature, as well as red backed salamanders and two lined salamanders). Mammals include occasional beavers and otters, and a substantial bat population (a threatened group that could be adversely affected). Historically the brooks of Sandy Lake had an annual run of alewives that reproduce upstream of the proposed pipeline. The run's status is uncertain, at best it is endangered and disturbances in the watershed and streams could cause its extinction.

Trucks will damage roads on the western shoreline and along the northern shore. Pipeline construction will require many large, heavy vehicles over a long period with consequent degradation as these few roads provide the only access to long stretches pipeline route. Repairs will introduce sediments and noxious chemical agents from repair vehicles and from the needed new pavement. Assignment of the repairs' cost is an additional issue.

Most of Sandy Lake's watershed is to the north. There is virtually no runoff coming from the east or west. The southern watershed limit is a hundred meters or so from the shoreline with this zone constituting less than 10 percent of the watershed and contributing a correspondingly small proportion of water.

In other words, nearly all water entering the Lake comes from the area impacted by the pipeline. Actions affecting water quality in this zone have a maximum effect on the quality of Sandy Lake and its ecosystem. The wide margins of the corridor insure that it will affect nearly all of the watershed.

The most obvious impacts, forest clearing and excavation of soil and bedrock leading to erosion are damaging. More devastating will be herbicidal control of vegetation. Construction and maintenance of a pipeline corridor using chemical vegetation control will be disastrous to Sandy Lake, regardless of the toxicity of the chemical agents used.

The most common herbicide uses glyphosate, determined by the World Health Organization's International Agency for Research on Cancer to be a likely human carcinogen. The children's summer camp, Wiyaka, has used the Lake for swimming, boating, and, in the past, even drinking water. Introduction of a harmful chemical would be irresponsible in the extreme. Herbicides are, by definition, toxic. They kill plants. (Some herbicides may be less toxic to humans.) Sandy Lake is comprised of an ecosystem based on plants at its most basic trophic level. Any herbicide that enters the Lake will inevitably have a deleterious effect on plant life. The prolonged residence time of water (and substances in it such as herbicides) in Sandy Lake insures maximum negative effect.

There is a more insidious effect of herbicide use in a watershed: Research conducted in the Hubbard Brook Experimental Forest in northern New Hampshire under the US Forest Service and collaborating universities including the University of New Hampshire, Dartmouth, Cornell, Yale and others over 6 decades shows the

essential role of living plants in retaining plant nutrients within terrestrial ecosystems like the Sandy Lake watershed. Research led by Professors Gene Likens and F. Herbert Bormann and including contributions from dozens of others show that when a forested ecosystem is cut and prevented from re-growing through the use of herbicides, enormous amounts of nutrient materials are dissolved in rain water and lost from the ecosystem in runoff. The runoff water may appear normal, but the dissolved content may exceed acceptable levels for potable water.

Plant nutrients that sustain terrestrial ecosystems' growth can be thought of as fertilizers. Large amounts entering an aquatic ecosystem will fertilize it as well. Increased growth of aquatic plants including undesirable and noxious species result. Organisms at higher trophic levels — plankton, invertebrates and fish — will be adversely affected by the disruption of the plants on which they depend. The biomass will eventually die and may overwhelm the ecosystem's capacity to decompose it aerobically, resulting in foul anaerobic decomposition. Aquatic organisms that normally obtain oxygen from water can no longer do so and they die as well. Note that this chain of events is unrelated to which herbicide is used and how expertly it is applied.

Could this happen in Sandy Lake? Initially vegetation on the transmission line that is the pipeline's path through the watershed was controlled by herbicide. This caused growths of a previously absent vascular plant known as bladderwort or *Utricularia* in the Lake. The plants grew in large mats at the water surface (up to several square meters in area and half a meter thick). They were unpleasant and potentially dangerous to swimmers who could become entangled. After a few years during which this plant growth increased, the maintenance of the transmission line was changed to mechanical vegetation control and the *Utricularia* disappeared.

To summarize, Sandy Lake is a rare and threatened habitat: a deep, undeveloped, pristine aquatic ecosystem. The Lake supports wildlife populations including threatened organisms as well as public recreation and a children's summer camp. The planned pipeline will pass through the watershed that is critical to Sandy Lake's health and will inevitably have an adverse impact on the lake. Herbicidal control of vegetation will dramatically exacerbate the harm done by the pipeline regardless of the type of herbicide and the care with which it is applied.

It can only be concluded that routine transmission line through the Sandy Lake watershed is the result of ignorance and/or a lack of concern.

Re: Tennessee Gas Pipeline Company, L.L.C.  
Proposed Northeast Energy Direct Project, FERC Docket No. PF14-22-000  
Scoping comments on NED NOI from June 30, 2015

Dear Secretary Bose,

The Warwick (MA) Conservation Commission (further — Commission) is writing to offer its comments on the scope of studies to be done for FERC's Draft Environmental Impact Statement on the proposed Northeast Direct natural gas pipeline project.

To ensure proper determination of environmental impacts from proposed pipeline construction and main-

tenance activity Commission would like to request the following studies and surveys to be performed in course of EIS draft preparation:

1. On-the-ground delineation of wetlands and streams for the entire project corridor and buffers.
2. On-the-ground surveys for vernal pools within 1,000 feet of the potential project corridor. These surveys should be performed during the relevant breeding seasons. The time frame for preparation of the Draft EIS should be extended accordingly.
3. Identification and prior testing of drinking water sources within 5 miles of the potential project corridor.
4. Baseline sampling of ambient air quality and noise levels within 5 miles of proposed compressor stations and other pipeline facilities.
5. Baseline study of bird migration in the nearby portion of the Connecticut River flyway.

A number of reasons for these studies and surveys were listed in our previous letter filed with FERC 8/4/2015 Submission ID: 597295.

In addition, we would like to bring to your attention our experience that wetland resources in the town of Warwick, as shown on Massachusetts Department of Environmental Protection map layers, are under-represented by a factor of several times. We believe that forested wetlands, intermittent streams and vernal pools are the most seriously under-represented types of wetland resource areas. We also believe that this under-mapping of wetlands is typical of all the Massachusetts municipalities where the proposed NED project would be located.

This under-reporting is due to the fact that map layers are developed chiefly by interpretation of aerial photos. The great majority of land in our town, as well as in many other towns along the proposed pipeline route, is forested and large numbers of wetland resources are hidden by the forest canopy, especially in areas dominated by coniferous trees.

The thorough delineation of vernal pools, almost all of which are located under tree cover, is of particular concern to us. This Commission has devoted attention each spring to certification of vernal pools in Warwick, and it is our experience that their actual frequency is several times greater than what is suggested by the DEP map layer for potential vernal pools. Based on our findings, the Massachusetts Natural Heritage and Endangered Species Program certifies several vernal pools a year. Nevertheless, we believe that only a small fraction of certifiable vernal pools along the potential NED corridor have actually been certified.

Obligate amphibian species, including several identified as rare under the Massachusetts Environmental Policy Act, are entirely dependent on these vernal pools for breeding. Since these species have an upland range of up to 1,000 feet from their breeding pools, we would like to request on-the ground surveys for vernal pools within 1,000 feet of the potential project corridor. Reconnaissance in our area must be done during the brief breeding season in April and May. Not accurately delineating these pools risks destroying whole local populations. Vernal pool habitat cannot be reliably replicated, making mitigation all but impossible.

The protection of perched wetlands, which form in depressions in the underlying bedrock, is also a great concern for us. Perched wetlands are particularly vulnerable to destruction by the opening of drainage fissures resulting from blasting during pipeline construction. Mitigation by replication is not possible for this class of wetlands. Because of so much shallow bedrock topography along the proposed pipeline corridor in Warwick and other hilltowns, thorough on the ground delineation of perched wetlands is imperative.

Identification and prior testing of drinking water sources is another important concern of the Commission. The town of Warwick is entirely dependent on private springs and wells, both shallow and artesian, for its entire drinking water supply. Also, the Grandin Reservoir and its watershed of over 400 acres lies immediately downgradient of the proposed pipeline route in Warwick. The steep watershed of this reservoir is particularly vulnerable to erosion and pollution. Because much of the hydrology of our area is unknown, we request that the Draft EIS include testing of all private wells and public drinking water supplies within 5 miles of the proposed pipeline corridor. We believe that testing has to be performed by an independent party. It is important to establish an objective baseline for water quality prior to natural gas pipeline construction.

Because the town of Warwick is immediately adjacent to and downwind of the proposed super powerful gas-fired compressor station in Northfield, the Commission also requests that the Draft EIS include prior baseline sampling of ambient air quality and noise levels within 5 miles of the proposed facility. Negative impacts from compressor stations, including noise and air contamination within a 5-mile radius, are well documented. Since the Warwick State Forest is one of very few unbroken wildlife habitats remaining in Massachusetts, this sampling should be performed year round and at different times of day. In addition, we request a baseline study of bird migration in the nearby portion of the Connecticut River flyway, a major migration route.

The Commission also wants to see the Draft EIS include an evaluation of the cumulative effects of the project on the large contiguous blocks of forest that comprise most of the potentially affected towns in Franklin and Berkshire Counties. Over 90% of our town is forest and over 50% of our land area is public conservation land protected under Article 97 of the Massachusetts Constitution. This largely unfragmented forested area is relatively free of invasive species and provides ideal habitat for a wide variety of animal and plant species, both common and rare. The combined effects of the proposed pipeline route drawn across this intact landscape could severely degrade its ecological integrity.

The Conservation Commission also requests that the timetable for studies used in the preparation of the Draft EIS be extended to a minimum of one full year. We do not believe that complete and accurate delineation of wetlands resources, particularly those which serve important seasonal functions in breeding and migration for wildlife, can be conducted in a shorter time frame.

Sincerely

Gregory Brodski, Co-Chair

Re: Docket # PFI4-22-000

I am sending for your review information regarding the use of explosives near Brownfields in limestone Karsk soil conditions:

- 1) A local law (1) restricting the use of explosives within two miles of a Brownfield.
- 2) Two well written news stories regarding the events between 1996 and 1997. Note that the pollution was caused by a DEC Spill Fund contractor over many years.
- 3) A map of the affected area prepared by the Tennessee Gas Pipeline Company.

The site sits 230 feet above a public reservoir serving the towns of Bethlehem and New Scotland. The soil condition is Karsk limestone with numerous fissures and channels which have been known to allow liquids to travel freely for distances. The pollutants that were detected in samples of water in the area were MTBE, Acetone, Benzenes, Arsenic, Barium, Chromium, Lead, Mercury and Napthalene.

Respectively,

Herbert W. Reilly, Jr.

---

LOCAL LAW NO. "J" FOR 2015

A LOCAL LAW OF THE COUNTY OF ALBANY, NEW YORK, TO BE KNOWN AS THE PUBLIC DRINKING WATER PROTECTION LAW

Introduced: 8/10/15 By Mr. Reilly:

**Section 1. Title**

This Local Law shall be known as the "Public Drinking Water Protection Law."

**Section 2. Legislative Findings**

The Albany County Legislature hereby finds and determines that public water systems are sourced from streams, rivers, lakes, and reservoirs. Certain industrial activities, including blasting, pose a potential threat to public drinking water supplies. Residents are at a high risk of developing significant health issues from ingestion and exposure to contaminated drinking water, including gastrointestinal illness, reproductive problems, and neurological disorders. Infants, young children, pregnant women, the elderly, and immunocompromised persons may be especially at risk for becoming ill after drinking contaminated water.

The Albany County Legislature hereby further finds and determines that the Safe Drinking Water Act (SDWA) ensures the quality of drinking water in the United States. Under SDWA, the U.S. Environmental Protection Agency (EPA) has established National Primary Drinking Water Regulations (NPDWRs or primary standards) that set mandatory water quality standards for drinking water contaminants to protect the public against consumption of drinking water contaminants that present a risk to human health by limiting the levels of contaminants in drinking water. The EPA also oversees the states, localities, and water suppliers who implement those standards.

The Albany County Legislature hereby further finds and determines that municipalities play a crucial role in

managing activities that affect source water quality and availability.

The purpose of this local law is to protect public health and safety by requiring blasting entities, as part of their best management practice, to notify municipalities located within Albany County prior to any blasting if such blasting occurs within a two mile radius of a municipal water source.

### **Section 3. Definitions**

As used in this local law, the following terms shall have the meanings indicated:

(A) “Municipal Water Source” is any reservoir or well located within Albany County which serves as a source of public drinking water supply for Albany County residents.

(B) “Municipal filtration plant” is any facility that treats and provides public drinking water through a public water system.

(C) A “public water system” is a system for the provision of water to the public for human consumption through pipes or other constructed conveyances, if such system has at least fifteen service connections or regularly serves an average of at least twenty-five individuals daily at least 60 days out of the year, as defined in the National Primary Drinking Water Regulations. .

(D) “Blaster” is a person licensed as such by the New York State Department of Labor.

(E) “Blast” is the rapid release of heat and large quantities of high-pressure gases that expand rapidly with sufficient force to overcome confining forces resulting from the very rapid decomposition of a chemical compound or mixture initiated by heat, shock, impact, friction, or a combination of these conditions.

(F) “Blasting entity” is a person, a corporation or other legal business entity that blasts or engages a blaster to blast either on its own behalf or on behalf of another person, corporation or other entity within Albany County.

(G) “Blast effect area” refers to the area within a two mile radius of a blast.

(H) “Blasting notification” is defined as a written notice in which blast information is provided by the blaster or blasting entity, to include, but not be limited to, the following: the blasting area, the date(s) and time(s) of the blasting, how access to the blasting area will be controlled and the types and patterns of blast warnings and signals that will be used.

(I) “Quality” is defined in the Albany County Department of Health’s promulgated rules and regulations pursuant to Section 6 of this Local Law, and shall reference the list of contaminants and their maximum contaminant levels (MCLs) set by the National Primary Drinking Water Regulations.

(J)

### **Section 4. Notification Responsibility of Blaster:**

a. Blasting Schedule: Any blaster or blasting entity who intends to blast within Albany County shall notify by United States certified mail, the governing body of a municipality, prior to any blasting, if such blasting occurs within a two mile radius of a municipal reservoir or well providing drinking water to residents of such municipality. Such notification shall occur at least sixty (60) days in advance of the blast date. Additionally, a copy of the blast schedule shall be sent by United States certified mail to the Commissioner, Albany County Department of Health.

The notification shall include the following information:

1. The specific location of the blast;
2. The date and time the blast is scheduled to occur;
3. A description detailing how access to the blast effect area will be controlled to prevent property damage and personal injury; and
4. The types and patterns of blast warnings and of signals that blasting has been completed and passage through the blast effect area is safe.

b. . Additionally, at least sixty (60) days in advance of the blast date,

any blaster or blasting entity must contact the New York State Department of Environmental Conservation and the governing bodies of all municipalities within the blast effect area and inquire whether there are any known or suspected subsurface contaminants within the blast effect area. If there are any known or suspected areas of contamination, then the blaster shall disclose the same to the Albany County Department of Health, which is authorized to require an investigation to be conducted at the blaster's expense to confirm the nature and extent of such contamination. If any such contamination is confirmed to exist within the blast effect area, then the blaster shall be obligated, prior to the start of blasting, to immediately remediate the same to the satisfaction of the Albany County Department of Health. . .

Pursuant to Section 6 of this local law, the Albany County Department of Health is permitted to promulgate regulations that supplement this list and the requirements of this Section.

### **Section 5. Blast Records**

Records of all blasts must be maintained by the blasters or blasting entities for a period of at least five (5) years from the date of a blast, or the date of the last blast, if more than one blast occurs in a blasting program. These records shall be made available for inspection upon written request by, and at no cost to, the public.

### **Section 6. Albany County Health Commissioner's Authority**

The Albany County Health Commissioner is authorized to promulgate rules and regulations and take any and all other reasonable actions necessary to implement and enforce this local law. Any rules and regulations so promulgated shall be made available on the county of Albany website in a manner approved by the Commissioner.

### **Section 7. Penalties**

(A) Civil Penalty for Lack of Notice:

If the Albany County Department of Health finds and determines that any blaster or blasting entity failed to meet the pre-blast notification requirements in Section 4 of this Local Law and as further described in the Albany County Department of Health rules and regulations promulgated under Section 6 of this Local Law, such violation shall be punishable by a civil penalty not to exceed \$15,000 per violation.

(B) Rebuttable Presumption:

Increased levels of contaminants above maximum acceptable contaminant levels set by the National Primary Drinking Water Regulations, when detected at any municipal reservoir, municipal well, or any municipal filtration plant(s) sourced by such reservoir or well, within six months of blasting activity(ies) shall, unless proven otherwise by clear and convincing evidence, be attributable to said blasting activity, if the blast effect area is within two miles of such municipal reservoir or well.

(C) The Blasting Entity will be liable for all reasonable costs incurred in remediating and restoring any public water supply to its pre-blast condition

(D) Nothing contained herein shall be construed to prevent or prohibit the commencement of any civil or administrative action or proceeding to enjoin any conduct constituting a violation hereof or to recover any penalty therefor or any damages occasioned thereby,

(E) The Health Commissioner may, in his absolute discretion, require the posting of a bond or other security in an amount deemed adequate to guarantee sufficient funds are available to remediate, as set forth above.

### **Section 8. Health Commissioner's Power to Suspend or Modify**

The Commissioner of Health may, in his/her absolute discretion, suspend or modify the requirements of this law:

(A) when he/she deems it necessary to do so to protect the health, safety, and welfare of the public or

(B) for State, County or Municipal projects if, in his/her opinion, adequate safeguards have been implemented to prevent well contamination.

## **Section 9. Mines and Water Well Drillers**

This Local Law shall not apply to:

(A) mines subject to local municipal regulation or state regulation under Title 27 of Article 23 of the Environmental Conservation Law or

(B) water well drillers subject to state regulation under Title 15 of Article 15 of the Environmental Conservation Law.

## **Section 10. State Environmental Quality Review Act Compliance**

This County Legislature determines that the adoption of this Local Law constitutes a “Type II action” as said term is defined in the State Environmental Quality Review Act (“SEQRA”), and that no further action with respect to same is required under SEQRA.

## **Section 11. Preemption**

If any part or provision of this Local Law is inconstant with any federal or state statute, law, rule or regulation, then such statute, law, rule or regulation shall prevail. If any part or provision of this Local Law or the application thereof to any person or circumstance be adjudged invalid by a court of competent jurisdiction, such judgment shall be confined in its operation to the part or provision of or application directly involved in the controversy in which such judgment shall have been rendered and shall not affect or impair the validity of the remainder of this Local Law, or the application thereof to other persons or circumstances.

## **Section 12. Reverse Preemption**

This Law shall be null and void on the day that statewide or federal legislation goes into effect, incorporating either the same or substantially similar provisions as are contained in this Law, or in the event that a pertinent state or federal administrative agency issues and promulgates regulations preempting such action by the County of Albany. The Albany county Legislature may determine via resolution whether or not identical or substantially similar statewide legislation has been enacted for the purposes of triggering the provisions of this Section.

## **Section 13. Severability**

If any clause, sentence, paragraph, section, subdivision or other part of this Local Law or its applications shall be adjudged by a court of competent jurisdiction to be invalid or unconstitutional, such order or judgment shall not affect, impair, or otherwise invalidate the remainder of this Local Law which shall remain in full force and effect except as limited by such order or judgment.

## **Section 14. Effective Date**

This Local Law shall be effective immediately upon filing with the Office of the Secretary of State.

Favorable Recommendation. - Conservation and Improvement Committee. 7/28/15

Washington, DC 20426

RE: Northeast Energy Direct Project, Tennessee Gas Pipeline Company, L.L.C.  
Docket No. PFI4-22-000

Dear Ms. Bose:

Thank you for the opportunity to provide comment on the Northeast Energy Direct Project (Docket #PFI4-22). The Conservation Land Stewardship Program, on behalf of the Council on Resources and Development (CORD), is responsible for monitoring and oversight of conservation land interests that were acquired through the State of New Hampshire's Land Conservation Investment Program (LCIP). Between 1988 and 1993, the State of New Hampshire through this program invested almost \$50 million to protect approximately 100,000 acres of land, including some of the most pristine lands in the state.

The current NED proposal crosses six parcels of land that were protected through the LCIP in the towns of Amherst, Mason, Troy, and Richmond. These properties are shown on the attached maps. It is important to understand that lands and interests in lands that were acquired through this program are held in public trust and that State law specifies that the sale, transfer, conveyance, or release of any such land or interest in land from the public trust is prohibited absent legislative action by the New Hampshire General Court.

We understand that Kinder Morgan (KM) may be working to develop alternatives that would avoid impacts to one of these parcels in the Town of Amherst. We would respectfully request that alternative analyses be performed to avoid and minimize impacts to the other lands protected through the LCIP, as well as to avoid all protected conservation lands in New Hampshire (including both those protected in-fee and through conservation easements). The State of New Hampshire, municipalities, non-profit land trust organizations, and residents of the state have invested immeasurable time, effort, and money into legally and permanently protecting many of the State's most important environmentally sensitive resources, forests, agricultural lands, recreation lands, and other open spaces. It is critically important that potential impacts to these already protected lands be taken seriously and that the alternatives analysis be thorough, rigorous, and transparent.

We would request that information submitted by KM and included in the Draft Environmental Impact Statement (EIS) clearly depict all protected conservation lands in New Hampshire. It is not clear based on the information submitted by KM to date that all protected conservation lands in New Hampshire are included. We would also request that both the Environmental Resource Reports (ERR) developed by KM and the draft EIS clearly show the location of protected conservation lands in relation to all impacts that are being proposed. The boundaries of protected conservation lands should be shown on ERR detailed alignment sheets and any other detail maps where impacts (both temporary and permanent) are proposed on or adjacent to conservation lands. Without this information, it is not possible to properly quantify or evaluate the potential impacts resulting from the project to conserved lands or important resources on those lands, or to assess alternatives that could avoid these protected lands or other important resources.

Finally, we would ask that FERC, as part of its draft EIS, evaluate the need for this particular project in the context of all other projects that are being considered in the region, and whether those projects could provide the necessary capacity with less impact to protected conservation lands and important environmental natural resources.

Thank you for considering these comments.

Sincerely,

Tracey L. Boisvert, Program Director  
Conservation Land Stewardship Program

**20150831-0106**

Susan and Richard Carpenter  
15 Patricia Lane  
Amherst, NH 03031

August 21, 2015

Chairman Norman C. Bay  
888 First Street, NE  
Washington, DC 20426

Dear Chairman Bay,

Meetings were held Wednesday and Thursday 7/29 and 7/30 in Nashua and Milford, New Hampshire, respectively. It was abundantly clear that the residents of New Hampshire want nothing to do with the pipeline. There is absolutely NO benefit to New Hampshire residents and taxpayers to warrant the disruption and devastation of a pipeline going through our state, which would end in Dracut, Massachusetts,

I live on Patricia Lane in Amherst, NH, named for my sister-in-law, who died from melanoma cancer. My husband Rick, a builder/developer, started developing the subdivision in 1999. We built our own home at the end of this lovely private road, along with 17 other homeowners and 10 condo owners.

My husband's left a line of trees behind each home along Patricia Lane for privacy as well as block the power lines directly behind the homes. We have an electrical easement going through the middle of the subdivision that separates the singlefamily homes from the 10 condos he built on the other side of this easement. (See plot plan.)

The proposed pipeline would affect all 17 residents on Patricia Lane and change the character of the place we have called home for 12 years. If the tree line were removed, all residents would have to look at the power lines. They are currently hidden due to the buffer of mature trees.

There is a Christian Church at the entrance to the subdivision, which serves as a school during the week. The proposed pipeline route would cut directly through this property.

My neighbor, an Amherst policeman, lives at the beginning of the subdivision with his wife and 2 children. The proposed route would go through the middle of his lovely home; needless to say, he and his family are distraught over the possibility.

I have never felt so helpless. Our final home, which my husband and I built in 2002, would be changed forever. My husband planned the subdivision with such care; all of our neighbors would see their home values go up in smoke. No one will want to buy any of these homes or condos if the pipeline takes the trees situated behind them; all of our neighbors would see their home values go up in smoke. No one will want to buy any of these homes or condos if the pipeline takes the trees situated behind them. Approximate real estate value before pipeline: \$7,8 IRULioll. The removal of the trees impacts all 27 owners.

The affordable housing project, planned for a tract across the road from Patricia Lane, has been put on hold until it is determined what route the pipeline will take.

First of all, why should the route come through New Hampshire? Secondly, why not pick a less populated area if it must be situated in our state? I understand that power line easements are popular routes with the

pipeline planners, but this isn't a rural area.

At the town hall meetings with FERC, in Nashua and Milford, NH, Governor Hassan, as well as Senator Shaheen and Senator Ayotte, were conspicuous by their absence. I have gone to several meetings and forums, where all who spoke, felt their rights were being negated by the pipeline. No one spoke in favor of the pipeline.

Duval Patrick was able to sway your agency and subsequently, Kinder Morgan, to redirect the pipeline from Massachusetts to New Hampshire. Homs, NH managed to convince your agency that it was not in the best interest of the town, When it benefits Massachusetts, why route the pipeline through New Hampshire? After the meetings in July, which were lengthy, Channel's news coverage of the 2-day event amounted to a 30 second spot with a 14 year old, underplaying the importance of the meetings and impassioned pleas of all present not to allow the pipeline in NH.

I am including photos of my yard and the proposed view if the pipeline is routed across my back yard as well as a plot plan for the subdivision. Please don't come back with the "Northeast Energy Direct Newsletter", I have already received the printout (propaganda) from Tennessee Gas Pipeline touting the benefits to New Hampshire. Try contemplating it from my neighborhood.

Please STOP tile pipeline from coming into New Hampshire.

Sincerely,

Susan and Richard Carpenter

Re: Docket No. PF14-22/ TGP Northeast Energy Direct

Dear Secretary Bose:

First, I'd like to ask that FERC extend the comment period and reschedule scoping meetings given KM (Kinder Morgan) has just released a second resource report for an entirely newly designed project. And, to hold these meetings in locations convenient to impacted stakeholders.

From an impacted landowners' point of view, my comments tonight address my experience of the FERC process. My hope is to convey that it is designed to be in the public's inconvenience and is not for our necessity.

In February of 2014, I received a letter from KM (Kinder Morgan) requesting to survey my land. I did not receive any details from them otherwise until they invited me to open houses a year later. Fortunately, my community came together and educated itself on the NED project. We asked KM to do a presentation in our town. Many of us were left with unanswered questions. I attended 5 open houses and on questions like health and safety was shuffle around the room to different experts only in the end to still not have my questions answered.

What I have learned is that;

- My property value may be depreciated
- Some mortgage contracts do not allow explosives on lien lands
- I may be held liable for fires or accidents from pipeline explosion
- KM plans to only compensate me \$1,800
- I'll continue to pay taxes on the easement
- I can't use the easement for growing trees anymore
- And I may have to finance this pipeline with a tariff on my utility bill

All in all, my one and only asset, and the home I built with my own 2 hands, is rendered worthless. I'll have to abandon it because of health and safety issues ... penniless.

On the other hand KM hugely benefits from gas sales in Europe. It won't even cost them to build the pipeline and FERC has provided them every necessity needed to meet their permit and construction deadlines. I suppose that is because your institution is financed by gas permit fees.

Natural Gas is not a bridge fuel to renewables. The gas industry will exploit our entire US gas resources over the next 10 years for profit if FERC permits it! Natural gas is the gas industry's drug to riches and FERC is their enabler.

It is not in our national interest to support this boom and bust business. Our future generations need this gas here in the US. So I ask tonight that you please do your job by evaluating the true public necessities and conveniences and please ... stop enabling this industry to, in the end, frack us all.

Thank you for this consideration.

Polly Ryan,

11 Windsor Avenue,  
Plainfield MA

Re: Docket No. PF14-22, TGP Northeast Energy Direct

Dear Secretary Bose:

First, I'd like to reiterate too that I feel these scoping hearings are being conducted prematurely, especially in light of Kinder Morgan (KM) having only just released their second 6500 page resource report that still has over 10,000 To Be Determined (TBD) in it. My experience to date, as a directly impacted landowner on the proposed path, is that I have been continually either not, under or misinformed of projects' details, making it very hard to comment effectively this evening on the scope of the Environmental Impact Study (EIS). Please know that I have attended 5 of KMs' open houses, 2 of their presentations and! I've read the first resource report and still don't have answers to questions that concern me.

In terms of the scope of this EIS, I'd like you to please conduct an objective study, meaning one not funded by the gas industry! using established reproducible scientific methods to determine the cumulative methane emissions that the entire US gas industry will produce over the next ten years and determine the impact of these emissions on global warming. To evaluate this properly, you'd have to first determine the amount of natural gas available for extraction in the shale regions and then how much of it is anticipated to be drilled over this ten year period. Clearly! one can assume that the extracted gas's inevitable destination will be in our atmosphere regardless of whether those emissions occur in Europe.

The reason I am requesting this research is because scientist have determined that methane is 84 times more potent a greenhouse gas than carbon dioxide over a 20 year span (1). And according to the Union of Concerned Scientist who published the Climate Deception Dossiers, there has been "a coordinated campaign underwritten by the world's major fossil fuel companies and their allies to spread climate misinformation and block climate action" (1). I'm also requesting that this study get peer reviewed and then published so we can see the data. And, until it's available to us, I suggest a moratorium on all new FERC gas infrastructure permits.

While the moratorium is in effect, the gas industry should be required to do repairs to existing infrastructure so there no more gas is lost in transmission. According to the Environmental Defense Fund enough natural gas is lost each year to fuel 6 million homes. This is the equivalent annual emissions of 117 million cars or roughly half the cars in the United States (2).

It's time for YOU to reveal the truth on this subject before we are all FERC'ing fracked.

Thank you for this consideration.

Polly Ryan,

“Climate Change is the mother of all battles. If we don’t win this one, all the others may not really matter.”(NRDC -President Rhea Suh)

Like you and everyone in this room, I want to keep this country strong, keep our economy sound and give our children a future full of promise and opportunity. That is precisely why we need to begin to address climate change now.

The job growth rate in the solar sector is 20x faster than the overall job growth rate (2014). Every 2.8 minutes another rooftop solar home project was completed. US now has the equivalent of six nuclear power plants worth of solar capacity installed. Solar is an increasingly important part of combatting dependence on fossil fuels. ). People want to take actions like these. Renewables unfortunately do not enjoy the same subsidy level of support from our government.

Shell oil has gotten permission to drill in the Chukchi Sea of the Arctic. Approval has been granted for drilling for oil off the East Coast,

The Keystone pipeline is still being constructed despite the controversy over the toxic and expensive tars sands oil it would carry.

The insurance industry knows that climate change is real. Their premiums on property have gone up to reflect their assessments of increased risks. Our Nation Defense planners know that climate change poses dramatic threats to our way of life, even our very existence in the future. Climate scientists world-wide, including the IPCC of the United Nations publishes reports on their collected data showing trends that become ever more frightening to read.

Lies and doubt are sewed by scientists whose research and words are paid for by BP, Chevron, Peabody Energy, Conoco Phillips, Exxon Mobile, Shell, The Koch Brothers, The American Petroleum Institute and probably Kinder -Morgan and others who specialize in fossil fuel infrastructure.

Citizens like myself are not won over by their misleading tidbits meant to keep us from taking action. The actions we clearly need to take IMMEDIATELY as a society in crisis as we are are to replace our use of fossil fuels with renewable energy, renewable infrastructure and conservative living practices not based on excessive consumption.

The Environment is global. What we do here, affects the entire planet. Half of the industrial carbon emissions have been released since 1988. That trend needs to shift and fast. This Tennessee Natural Gas Pipeline is exactly the type of project we MUST abandon and replace with investments instead in renewable infrastructure. The extraction, distribution and combustion of natural gas result in the leakage of methane. Ton for ton, Methane is 87x more potent a climate heating gas than CO2 during

Ton for ton, Methane is 87x more potent a climate heating gas than CO2 during the initial 20 year period after release. Thereafter, the potency declines

Obama Administration has announced a plant to start cutting rampant methane pollution from the nation’s oil and gas operations with a goal of making as much as a 45% cut over the next ten years.

Instead of doubling down on natural gas to replace coal and meet our growing electricity demand, we should prioritize investments in renewable energy and energy efficiency. (UCS Jeff Deyette) The extraction, transportation and burning of fossil fuels has numerous collateral damages that have been measured and studied.

1.The water cycle is one of the first casualties of human produced climate change. Fossil fuels all rely heavily on water in order to be produced. Increased moisture content in the air leading to increasingly heavy down pours during rain events and “Freak storms” are increasingly common. There has been a 71% increase in severe precipitation events in New England. These storms lead to property damage, crop destruction, and loss of life. Simultaneously, increased temperatures lead to droughts and severe fire seasons. Growing of traditional crops that we have come to rely on becomes increasingly difficult as we hit unpredictable extreme weather coupled with new patterns of insects and plant diseases as the climate changes. Ironically, Fossil fuels all rely heavily on water in order to be produced

2. Ocean acidification leads to ocean death as ecosystems collapse. Higher ocean temperatures lead to increased storm destructiveness. A large majority of land glaciers are in dramatic retreat. Some of the world's largest human populations depend on these glacial waters to feed rivers that they depend on for drinking water and agricultural irrigation. When there is no water, this will create refugees of very large populations. Melting glaciers also raise the sea level and cause low lying areas like New Orleans, New York City, London, and the nations of Bangladesh and Holland to see a dead end in their futures as they will be flooded.

3. Arctic areas have experienced some of the most dramatic warming. The disappearance of sea ice from the Arctic poses threats to the lives of many keystone species such as the Polar Bear and the Walrus. Endangered populations lose their struggle to survive and we now know that we have entered the sixth mass extinction on planet earth! Ocean warming also threatens to alter critical circulation patterns that we all rely on to keep temperatures, weather and ecosystems functioning.

We need to stop building more fossil fuel infrastructure and start building wind, solar, tidal, geothermal, micro hydro and any other sustainable energy system human ingenuity can create for a living world.

Lenore Gaudet, Northfield, MA.

I am against the Kinder Morgan pipeline in Northeast. It will ruin an entire rural area with farm lands & small quiet historic towns w/mostly volunteer fire departments which will not have the manpower to attack any "failures" in the system. Hundreds of people who own homes within a 200' distance( or even further)from pipeline will not be able to get insurance or sell their homes. KM is a Texas-based BIG oil company, & the gas they will pump is not even staying in Massachusetts, much less in the U.S. This is definitely a matter of money versus quality of life. It is going through conservation land, working farms and small bucolic towns.

The compressor station is being situated in quiet, beautiful Northfield, MA. The roads in this area are very curvy and narrow, & not conducive to much heavy truck traffic. Noise will be a lot louder than a locomotive (no more quiet peaceful and beautiful Northfield), & the off-gassing will waft down into the Conn. River Valley polluting farms, homes, rivers, etc. We also do have seismic activity in this area, & they are planning to go under 2 rivers, the Connecticut & the Deerfield. This is worrisome since being in a rural area, KM will be using thinner pipes and fewer rivets and welds, because they allowed to. This would lead to possible breaks in the pipeline that will cause devastation. Once built this pipeline will absolutely ruin a beautiful part of our state & the tourism that comes to this area, & is definitely not necessary to Massachusetts.

Re: Tennessee Gas Pipeline Company, L.L.C., Docket NO. PF14-22-000, Northeast Energy Direct Project

Dear Kimberly D. Bose, Secretary:

I am writing this letter to express my opposition to the Northeast Energy Direct Project (NED). As a resident of the town of New Ipswich, NH, I am vehemently in opposition to the proposed plan to run gas pipeline through the town of New Ipswich as well as the proposed compressor station that will be within a mile of our home. I would like the Federal Energy Regulatory Commission (FERC) to truly consider the need for this pipeline carefully before writing Kinder Morgan a blank check to destroy the beauty and serenity of our town.

I can't imagine any person would look at the information available and come to any other conclusion that this pipeline is most certainly not needed. I ask that you take seriously the concerns and opposition of the many residents in the towns where this proposed pipeline will be run through. Our livelihood, quality of life, our homes and families are all being unnecessarily put at risk for the sole purpose of the pursuit of profit.

Sincerely,

Sherry Peaslee

### **20150831-5003**

Sulli Sullivan, New Ipswich, NH.

Jane Goodall stated: "We are interconnected, people, animals, our environment. When nature suffers, we suffer. When nature flourished, we all flourish".

What Kinder Morgan/TN Gas Pipeline Company/NED want to do is make nature suffer. What Kinder Morgan/TN Gas Pipeline/NED want to do is make the people of New Hampshire suffer.

In my opinion the installation of the pipeline & compressor station in southern New Hampshire is akin to a rape. Our country side, water ways, including our rivers, streams, ponds, brooks, aqua-filters and drinking water is going to be subjected to a rape by the Tennessee Gas Pipeline Co/Kinder Morgan/NED with FERC's approval. The compressor station in the

towns of New Ipswich & Temple, New Hampshire will forever change our rural way of life.

This pipeline/compressor station is not needed. This pipeline/compressor station is not wanted in the State of New Hampshire. This pipeline/compressor station is not wanted by the people of New Ipswich and Temple.

I was at the scoping meeting in Nashua, NH. I was at the scoping meeting in Milford, NH.

In Nashua about 28 elected officials spoke. Not one of these elected officials wanted this pipeline/compressor station. Of about 45 private individuals who spoke there were only about 4 union members who wanted this pipeline/compressor station. That left about 41 private individuals who were against the pipeline/compressor station.

In Milford not one person who spoke, not one elected official of the 28 elected officials who spoke was in favor of this pipeline/compressor station. Not one of the 43 private individuals who spoke was in favor of this pipeline/compressor station. There was not a pro pipeline/compressor station person in sight.

If FERC is truly listening to the people of New Hampshire there is nothing to do but deny this application from Kinder Morgan/TN Gas Pipeline Company/NED.

If FERC is in the "pockets" of Kinder Morgan/TN Gas Pipeline Company/NED there is nothing FERC can do but approve this application.

So me that FERC is an independent commission. Show the people of New Hampshire that FERC is an independent commission. Show me that FERC HAS been listening to the people of New Hampshire. Show me that FERC HAS been listening to the elected officials of New Hampshire. DENY this application for a pipeline/compressor station to Kinder Morgan/TN Gas Pipeline Company/NED.

Thank you.

**20150831-5004**

Paul D Bush, New Ipswich, NH.

I wanted to register my opposition to the Kinder Morgan/Tennessee Gas pipeline plan for southern New Hampshire. This choice is based more on the region's residents' inability to match the wealth and power of Massachusetts residents, rather than on a logical route for the pipeline.

This route has been chosen to take advantage of a more conservative, less organized local population instead of based on construction considerations. FERC should not facilitate this sort of decision making: FERC's duty is to all Americans, without consideration of their wealth, status or organizational abilities.

I am troubled by reports that 80% of the pipeline's gas would be bound for foreign markets. If true, it means that any energy benefits are secondary to Kinder Morgan/Tennessee Gas's profits. I question whether a federal agency, FERC, should serve a corporation's interests to the detriment of 15 or more communities in New Hampshire.

Furthermore, I believe that if the percentage of gas that is bound for domestic consumption will benefit primarily residents in Massachusetts, then that state should bear the burden of the delivery system. That is only fair.

If FERC decides that this pipeline provides such a benefit to the American people and their nation that it is essential, then it should be routed in the most direct manner possible. Yes, Kinder Morgan/Tennessee Gas would have to deal with angry Massachusetts citizens, but that is not a matter that should factor into FERC's decision making. FERC's duties should be to the American people and not to easing the pain of Kinder Morgan/Tennessee Gas.

**20150831-5005**

Ara Lynn, New Ipswich, NH.  
Pipeline Depth in Monadnock Region

Is frost line taken into consideration when determining the depth at which the pipeline is buried? If so, then the pipeline in the Monadnock Region of southern New Hampshire needs to be buried 4', not 3' below ground, because that is where our frost line is. Given the large variability in our soils—ranging from bed-rock close to or at the surface, extensive granite, glacial rock and gravel deposits, and areas with a great deal of clay—there is great deal of irregular ground movement during our seasonal freezing and thawing cycles.

**20150831-5006**

Ara Lynn, New Ipswich, NH.  
Unanticipated Consequences of following Power Lines

I see no wisdom in allowing a high-volume, high pressure gas line to be sited in the proximity of high voltage power lines. In the event of a pipeline failure leading to fire and/or explosion, our disaster will be greatly compounded by the proximity of the power lines. Few roads, unimproved roads, difficult terrain, will seriously hinder the ability of emergency units to respond. Interruption of the electric service will not only affect the local area of the accident, but also the entire region serviced by the power lines.

**20150831-5007**

Ara Lynn, New Ipswich, NH.

Use land already in eminent domain for pipeline route

Please send this pipeline down the median of a highway which is much more direct than the proposed meandering route. There are SO MANY ADVANTAGES to doing so. There is already a public right of way there, you are not disrupting the lives and homes of countless people and businesses and wildlife areas. There is easy access for construction, maintenance, and emergency crews. The soils have already been disturbed for building the highway, you are not making new disturbances to wildlife movement routes, you're destroying any vernal pools, people are used to the higher noise levels, so sounds of things like the compressor stations won't be as disturbing to the area. People have a choice of detouring on other roads if they don't like the idea of driving along a pipeline route. You have easy ability to monitor the route with cameras if you want—in fact the cameras can monitor both traffic movement and pipeline issues.

**20150831-5008**

Ara Lynn, New Ipswich, NH.

Who's going to pay for the environmental degradation we are going to suffer because of the pipeline?

This pipeline has absolutely NO BENEFIT to the vast majority of the communities it is affecting. Our soils and waters will be polluted with leakage of toxic chemicals used in extracting the shale gas. Our air and soils and water will be polluted by the blowdown events from the compressor stations. We didn't ask for this, and we don't deserve to suffer this. Presently our air is clean, our water is pure and mostly unpolluted, and certainly it is not polluted by carcinogenic chemicals. Kinder Morgan wants to come through and change all that for us just for corporate profits. The supposed tax benefit to our town is paltry compared to the extra medical expenses we will incur and the damages to our natural resources. Who is going to replace our water? Who is going to give the wildlife access to clean water and clean air? You cannot run my farm on bottled water. Or even tankers full of water. To try would be to expend humongous extra expenses in energy, shipping, manpower, my personal hassle--it boggles my mind. Who is going to pay for it? Who is going to pay the extra medical expenses or compensate families for early dying of people whose health is damaged by Kinder Morgan pollution? We are going to be shafted by this corporation, and we don't deserve it.

There is no price tag attached to air and water, but these things are invaluable, priceless. So Kinder Morgan has no incentive to take care of these things, unless you force them. The supposed tax benefits won't even compensate our towns for the extra infrastructure and maintenance we will need for our roads, nor the extra emergency services we will need to prepare for a pipeline-caused disaster.

**20150831-5009**

Ara Lynn, New Ipswich, NH.

This Project is not eligible for eminent domain!

When land was taken by eminent domain for the highways, everyone could use the highway. When land was taken by eminent domain for the power lines, everyone had access to electricity. In fact, I know people still living in this area who remember these takings, and who were personally affected by them. But there was a clear public benefit, even for the people whose land was taken. THIS taking of land has no public benefit, and it is giving a double whammy to landowners who already had land taken for the power lines. There is no feasible way for the people in the affected communities to have access to and be able to benefit from the use of the natural gas. Even the people through whose land the pipeline runs cannot tap into it to use it. It is NOT for the good of the public. This gas is mostly destined for export, a very few cities, and the benefit is mostly to one corporation. That is NOT the American way, and as representatives of our government, please do not allow this gross misuse of eminent domain laws.

**20150831-5010**

Ara Lynn, New Ipswich, NH.

Air Pollution, Important, Please Act, don't Average Blowdown Event emissions!

Please change FERC's way of dealing with pollution from compressor station blowdown events. It is not the averages over time that matter to the people on the ground. It is the high concentrations of toxins that come with each event. These high concentrations from each single event affect people's (and wildlife's) health and well-being. Previously, we had ZERO exposure. When the compressor station operates, we deserve to continue to have zero exposure. Make sure they install the technology necessary to prevent our exposure to air and water pollution, not by averages, but by highest peaks of individual events. Make them install noise cancellation technology so our stress levels and well-being are not affected by the sounds of the compressor station in our quiet rural environment.

Many of us chose to live here (I did 30 years ago) because we didn't want to live in a noisy, polluted environment. What right does Kinder Morgan have to come in here and mess that up for us? They are not going to compensate us because we are not in the direct route so our land will not be taken on the books. But my land WILL be polluted by fallout from the compressor station blowdown events. My air will be polluted, and the water source for the entire town of Greenville will be polluted. Who is going to fix their water problem? Who is going to fix their and my compressor-station-caused health problems? Kinder Morgan is going to walk away from this and we are going to be stuck with life-changing degradation, expense, and hassle. Please don't let this happen.

**20150831-5011**

Ara Lynn, New Ipswich, NH.

Prevent the pipeline from degrading our environment

Some neighbors say they will move. But our land values in New Ipswich have already tumbled. How could we even sell—home buyers are being advised to stay away from New Ipswich because of the pipeline and compressor station. My property is worth less than it was before Kinder Morgan proposed this pipeline route. I've spent 30 years of my life building this farm and business, and my husband is too old to get a comparable job elsewhere, and yet we are too young to retire. We are stuck with this mess. What is Kinder Morgan doing to help us? Nothing. What can you do to help us? Deny them the pipeline permit. If you must give them a permit, require them to build a state-of-the-art containment building and use state-of-the-art noise cancellation technology so that corporation is not causing degradation of and pollution to our air, water, and environment.

**20150831-5012**

Ara Lynn, New Ipswich, NH.

Noise Issues!

When I am in my favorite part of my woods, I can stand there and hear quiet. BUT, I can also faintly hear ordinary vehicle road sounds from Route 124, which is one and one-half miles away. That is how quiet it is in our area. If the fire horn blasts downtown, I can hear that from my house, which is not as quiet as my woods. My house is 3-1/2 miles away from the fire station. My house is also 3-1/2 miles away from the site of the compressor station. I do NOT want to be hearing that noise. Please require Kinder Morgan to build a building that dampens the sound so much that it does not disturb neighbors and other people in town like myself. Make them use noise cancellation technology, if necessary. They owe it to us, to the elementary school(s!) within earshot, and to the convent. They owe it to the wildlife they are going to be imposing their project on. They owe it to my chickens that get so frightened by loud sudden noises that they fly into a pile in a corner of the barn and smother to death. WE WERE HERE FIRST!!!

**20150831-5015**

John Leoutsacos, Temple, NH.

New Hampshire's unique values and Viewsheds, draw several thousand tourists to the southern part of the state annually. In particular Mount Monadnock ( the most hiked mountain in North America) "Wikipedia". This will also irreparably harm the towns of Temple, New Ipswich and Greenville beyond any factor of possible mitigation.

**20150831-5017**

Heather Burgett, Santa Monica, CA.

I wasn't aware of this, but my mother in Northfield informed me of the following gas pipeline plans..."Kindermorgan is putting in a compressor station up on the mountain behind our house which is louder than a locomotive and will vent gasses from the process that will waft over the whole valley, and a gas pipe line through Northfield, Deerfield, under the CT River, and the Deerfield River. It's so discouraging because Kindermorgan is a Texas based big oil company and the gas that they are pumping is not even staying in the United States. Along the pipeline they are clearing a 100' easement that will be treated with something like Roundup in perpetuity. This line is going through conservation land, through areas near Old Deerfield that have Indian relics that they are just being allowed to dig up, through existing working farms (Clarkdale and others). Once the line is in, people within 200' of the line will not be able to get insurance, so not able to sell their homes."

Northfield is my hometown and where I went to Northfield Mount Hermon School (preparatory school). Currently, I run my own PR firm in Los Angeles, CA. I am adamantly opposed to a project like this running through this region, which is so pristine, quiet and clean. All around, this sounds like a negative impact for the local residents and environment. I hope that a project like this will never be completed. But if it ends up in effect, what compensation will be made to the local towns and cities that are disrupted, polluted and potentially destroyed by this project, especially if an accident happens? Northfield has volunteer fire fighters, so if there ever were an accident, the town would not be equipped to handle it.

This does not sound like a company or project that is taking into consideration the human and environmental impact.

**20150831-5018**

John Leoutsacos, Temple, NH.

How could a federal law pertaining to Eminent Domain be perverted to the point that big corporations can steal land from the citizens of this country with little to no repercussion?

**20150831-5019**

Marilynn Acker Ezell, Temple, NH.

I feel a great certainty that the building of a gas pipeline and a compressor station in my neighborhood will reduce the value of my property. Whenever I mention to anybody where my house is relative to the proposed pipeline, they offer their sympathy. I have heard Allen Fore of Kinder Morgan say that property values do not diminish due to the location of a nearby pipeline/compressor station. Well, if they really believe this, then let them buy my house and all the houses on my street. Because no one will want to live here if this plan goes through. Surely they would be able to sell the houses at a profit! Not!! So my 32 year investment in my house and yard, constantly trying to improve it, will be worth a fraction of what it would have been worth if this had remained a quiet rural neighborhood. People don't move to live in a little town like Temple, NH, looking for noise and pollution. They move here because they like peace and the health benefits of living in such a place are important to them.

Tina Miller, Ashfield, MA.

My husband, Seth Miller and I have just built a brand new home in Ashfield, Ma. We own land that is adjacent to high tension lines and is now a spot of consideration for the gas pipeline. The address is 300 Ashfield Mountain Road.

We have been approached by Kinder Morgan numerous times in regards to doing a survey of our land, etc. We have not allowed Kinder Morgan or anyone else on our land. We were then called about 8 months ago from another Kinder Morgan representative who told us the pipeline will be coming in and it will be on our land. When we were approached Kinder Morgan didn't even know we had a house on the land they thought it was just woods, they aren't using current maps and made plans to put a pipe line in just feet away from our home because they aren't using up to date maps. Shame on them ! There is also a Vernal Pool right where the pipeline will be going through where frogs and spotted lizards and other animals live. They are going through a beautiful pond that will be gone. The overall terrain Kinder Morgan needs to go through for this pipeline near our house is ledge, hills and overall impossible to get through. We have NO idea how they would even accomplish this.

When we did some measurements, we determined that the pipeline will be only feet away from our home. Our NEW home we just built, that my husband built all by himself for our family and kids to grow up in and we are now faced with the fact that our small children will be playing RIGHT next to an enormous gas pipeline !

Kinder Morgan has told us there is nothing we can do about our land, that if we want to fight them we have to go to court. We are very concerned over the risk of having a gas pipeline this close to our house.

In order to put the gas pipeline in, Kinder Morgan needs to cut down almost all of the trees we have kept up to not only hide the powerlines for our house view but they are trees on OUR land that WE saved !!! The value of our home is going to go down tremendously if there is a clear sight line to high tension lines AND a gas pipeline on our land.

I have spoken to a lawyer and he is very concerned over what this could do to our property value and the health of our family overall.

I feel like NO ONE in government is supporting us, I feel like this is all about making money, not about what the citizens want. We moved to Ashfield, MA to live in the country, to be safe, and to live in a NEW beautiful home on a nice piece of land we cleared and made our own.

Kinder Morgan has not only made moving into this new home stressful, they have made it depressing and fearful. We keep thinking we made a horrible choice to build here and we can NOT believe no one is standing behind all of us that this is effecting.

I can only hope that government makes the right decision for all of us hard working citizens for once. The people who work hard and have worked hard to build homes, to work on these farms, to protect the land and environment.

Does Kinder Morgan have any idea how much they will have to blast if they try to put this pipeline along the mountain. We could barely get a drive way in we had to blast so much ledge.

All of the above has done numbers on my health and stress levels. I am scared to death of what the future means to us if this happens. We will have all we worked so hard for taken away from us and I would EXPECT if Kinder Morgan gets their way, we will be WELL compensating for all our pain and loss.

Kinder Morgan told us they would start in 2017 and be working on the area for months. That is MONTHS we would have strangers, machinery, dynamite for blasting and who knows what else on OUR land using our driveway, interrupting OUR lives so they can win and get this gas pipeline in and make the money they want. We have SMALL children who nap during the day, I work from home. We can not have all this noise and disturbance. It's not fair, it's not right and we need someone to help us and stand behind us. Please think this through and do the right thing for all of us directly affected by this pipeline. The pipeline will be on

OUR LAND !!!! but not help us AT ALL.... it makes no sense and at some point in life, there has to be some fairness and respect to us as land owners. How can we buy land, PAY for it with OUR money, build OUR house on it, then get told by the government that THEY can take some of it without our permission and just put a gas pipeline on it and while at it, cut down thousands of trees on our land that we want to keep. You mine as well buy our house and the rest of our land too so we can rebuild and start a new life away from all of this ! How bad would that be if we had to do that ? It took my husband 3 years to clear land and build our home and you guys wouldn't even blink about taking all of that away from us.

We also know the neighbors on the other side of the powerlines are willing to sell and have the gas pipeline on their side of the lines, Why hasn't Kinder Morgan considered this for us. It would still be close but at least it wouldn't be on our land and feet away and they wouldn't have to cut down our trees.

I would love to be contacted directly by someone at FERC, I have felt left out and in the dark of what is going on even though we go to all the meetings and read all the letters. I can be reached at 413-628-3813.

Thank you for your time

### **20150831-5022**

Marilynn Acker Ezell, Temple, NH.

I am very concerned about the noise that will be emitted by a compressor station built in my quiet neighborhood if this project is approved. I wrote to Kinder Morgan on a website they set up for the purpose of communication between themselves and "stakeholders" a month and a half ago. This is what I asked them: "How much noise is allowed to be emitted by a compressor station? How is the noise measurement weighted: A or C weighting? Can you please explain how average noise is figured out? Is it over a 24 hour period starting at midnight or some other time frame? What measures do you take to reduce noise pollution? What are the consequences of exceeding noise limits?" I have gotten no answer and not even an acknowledgment that I asked a question. So much for their desire to communicate. I want to know because I am trying to establish a baseline for the amount of sound in the neighborhood. I know they were trying to do this also, because I saw 2 pieces of sound detection equipment that were placed down the road from my house. Well, I don't trust them to do this honestly, so I would like to measure the sound myself, but need to know what the standard is for taking these measurements. I can tell you that Temple, NH is a very quiet place and everyone I know wants it stay this way.

### **20150831-5024**

Edward and Jeanne Dery, Fitzwilliam, MA.

FERC – Docket #PF14-22-000

To Whom It May Concern:

We ask that you DENY the Northeast Energy Direct Project (FERC Docket no. PF14-22-000) proposed by Kinder Morgan and the Tennessee Gas Pipeline Company, LLC.

We strongly oppose any pipeline crossing our property in Fitzwilliam, NH and will fight our land being taken by eminent domain. We have been married for forty-nine years and worked hard all of our lives to get to the point that we could build the log cabin that my husband had wanted from the time he was a young boy. In late 2007 we found an amazing piece of land that filled our dreams of living in a rural area that would allow us a view of Mount Monadnock. This eighty-four acres of land is separated by two sets of power lines, and although that seemed a drawback we realized that it was an acceptable tradeoff to give us open trails, wetlands and four seasons of beauty. Putting a large gas pipeline along side of the power lines is unacceptable in every way!

From the first time we walked our land we talked about how wonderful it would be if the wind that blows along the power lines could be put to use for energy. We never in a million years expected that anyone would propose blasting through our large areas of granite that run along the power lines to put in a pipeline carrying fracked gas that could destroy the natural aquifers, vernal pools and acres of wetlands that are close

to the proposed route.

Allowing this NED project to go through will affect our future use of our land, and will have a negative impact on the vegetation and wildlife we enjoy daily. It will destroy the natural life we worked so hard to build for our family. Instead of building an oversized and unnecessary pipeline we ask that you direct the current pipeline owners in New England to repair all the leaking gas lines. It is time for the carriers of gas to be responsible for all the gas they generate. No route is acceptable for this pipeline that will carry dirty fracked gas through an area that will never benefit from the taking of land. It is past time for FERC to stop the theft of our future generation's health. Clean energy such as wind and solar will make our future generations healthier and happier.

Jeanne and Edward Dery  
164 Gap Mountain Road  
PO Box 343  
Fitzwilliam, NH 03447

**20150831-5027**

Suzanne McClure, Castleton, NY.

We strongly oppose construction of the gas pipeline. With oil filled rail cars and a pollution emitting cement plant in the vicinity, we do not need another polluter to cause further health problems.

**20150831-5028**

Bob Schuman, Nassau, NY.

I would like to take this opportunity to add further to my previous comments regarding the proposed North-east Energy Direct Project.

By now it should be abundantly evident that the residents in the Town of Nassau and the surrounding communities in Rensselaer County are strongly opposed to the project due to the project's assured negative impact to the environment.

As a resident of Clarks Chapel Road in Nassau, I am extremely concerned about the proposed 90,000 horsepower compressor station that is to be located within 1/2 mile of my house. Of the 1400+ compressor stations in the United States, the proposed station would be one of the 10 largest in the nation. The countless negative impacts to our home and the families that live within the 1/2 mile "Impact Area" will cause permanent harm and likely result in forcing us to uproot our family.

The impacts that are already well documented in the 1400 current compressor station locations include noise, air, light and water pollution. Most of these stations are an order of magnitude smaller and still have negative impacts. It's hard to imagine how significant the impact will be from a 10 acre, 90,000 horsepower station.

Such a station, if at all necessary, should be placed in an commercially zoned area, not a residential area such as ours.

My initial request to FERC to reject the proposed project outright. The nation already has 300,000 miles of pipeline and 1400 compressor stations, which should be more than sufficient to transport natural gas throughout the nation.

If FERC deems the pipeline necessary, then at a minimum I request that the location of the proposed compressor stations along the pipeline be in areas properly zoned for such industrial factories, not in rural communities such as Clarks Chapel Road in Nassau.

Thank you for the opportunity to voice my opinion.

Bob Schuman  
Nassau, NY

"Grass, not gas!"

**20150831-5032**

Marilynn Acker Ezell, Temple, NH.

I don't want Kinder Morgan/TPG to do blasting to build a compressor station in New Ipswich, uphill from my house. They could completely change the quality and quantity of water flowing down to my well. My well has been tested numerous times and the water has always been exceptionally pure. No wonder this watershed was chosen to serve the public water supply for the town of Greenville, NH as well as all the private wells in the area and the Temple Elementary School. There is no public water supply in the town of Temple, so if my well were to become fouled or less productive, it would not be practical to live here. What would Kinder Morgan do for me and the town of Greenville and the school and all the neighbors then?

Blasting in this area not only has the potential to release radon and other naturally occurring substances, but also could disturb the lead sitting on the land just to the south of the proposed compressor station site in New Ipswich. This site was previously a sporting clays shooting range. Apparently it considered a brown-field, but if it is left undisturbed, then the lead is not finding its way into the water. Blasting could ruin everything!

**20150831-5035**

David Brule, Erving, MA.

August 28, 2015

Docket No. PF14-22-000

TO: Federal Energy Regulatory Commission

FROM: **Erving Conservation Commission (MA 01344)**

RE: Docket No. PF14-22-000 Comments on Kinder Morgan NED Pipeline Project

Attn: Kimberly D. Bose, Secretary

Dear Ms. Bose and members of the Federal Energy Regulatory Commission,

The Erving Conservation Commission wishes to state its concerns regarding the potential siting and potential impacts of the K-M pipeline on the Town of Erving.

First and foremost, as we are sure has been reiterated to your Commission, the lack of clear information forthcoming to the public and to the Conservation Commissions of the Commonwealth from the Tennessee Gas Pipeline Co, LLC render a listing of concise concerns very difficult. This strategy on the part of the project proponent is very unusual and clearly quite unfair and unjust. This deliberate lack of transparency in providing details to our citizen volunteers is very disturbing.

What we do know is that if and when the pipeline project does enter the Town of Erving:

1. It will necessarily enter Erving by crossing beneath the Millers River from the Montague side. This will inevitably affect the riverbank, land under the waterway, the riverfront zone of two hundred feet, and the zones of estimated Habitats of Rare and Endangered Species, interests which we are sworn to protect.
2. It will follow a high tension line corridor, requiring an additional two hundred feet of clear-cutting, producing a large-scale additional negative visual impact on our Town, as well as providing a corridor for invasive species along this clear-cut swath. The proximity to the power lines is of great concern to the Conservation Commission, due to potential accidents and subsequent releases of heavy metals and substances detrimental to our air quality.
3. It will require blasting through a bedrock volcanic metamorphic ridgeline and thereby affecting the hydrology of the highlands, from which flow significant springs and sources of groundwater that provide drinking water to the Town. We therefore have significant concerns for the geology and impacted hydrology of our upland drinking water resources.

The necessary drilling and blasting, and subsequent shock waves could produce disastrous effects along this ridge line route. This effect did occur in the 60s and 70s when blasting for the Northfield Pumped Stor-

age Project caused landslides and rockslides along the fault lines near the mouth of the Millers River. There could also be significant impacts on home foundations in the center part of Erving due to this blasting.

Vernal pools and waters contributing to our local freshwater fisheries will be impacted by the required blasting, not to mention the potential effects of heavy metals and chlorinated solvents associated with the pipeline.

Given the lack of information provided us, that is: no specific hydrological maps, no specific drilling and blasting depths, no information on locations of fault lines and fractures, no information on what water-bearing lines will be impacted and how water flowing to home wells will be impacted,(etc.) we Conservation Commissioners are operating in the dark.

4. In summation, this project will cause significant negative impacts on the above-mentioned resources of vegetation and wildlife, plus impacts on the interests that we are appointed to oversee and protect, to wit:

--public and private water supplies

--ground water supplies

--prevention of pollution

--fisheries

--wildlife habitat.

All of which make it imperative that your Commission give our comments your utmost attention.

In our eyes, the deliberate ambiguity of the information provided to volunteer citizen commissions such as ours, extant under Massachusetts General Laws, renders the task of our Commission in protecting the interests of the Town in this matter extremely difficult.

Please accept the above comments for your consideration in the preparation of your EIS.

Sincerely,

David Brule, Erving Conservation Commission Chairman

## **20150831-5036**

Gregory Blais, New Ipswich, NH.

We, Carol & Greg Blais & Family are homeowners living on a 42 acre lot which the proposed NED pipeline would cross. Our home is located within 350 feet of the proposed pipeline path. Approximately 1/4 mile of the proposed route runs right through the middle of our lot, and splits it in two. This would render our property of very little value. We are concerned that the planned construction will be disruptive and adversely impact our quality of life.

Of primary concern is contamination or damage to our well, which is our only source of water. There are considerable amounts of ledge where the proposed pipeline would cross our property, making it necessary to blast or drill.

Another concern is for the wetland and natural springs located on our property. I am also worried about contamination of the aquifers in the area.

We are concerned about the blasting & drilling activity impacting our foundation and septic system. Our foundation has some minor cracks in it already and we believe the construction will only make it worse. This could cause structural damage to our house & further reduce the value of our property.

We have a disabled (autistic) son living with us and we suspect that the proposed construction, noise, and contamination of the air, ground and water will be very disruptive to him. The use of herbicides as proposed for maintenance activities of the pipeline route.

We have children in college and high school and believe this project will be disruptive to their studies. We also were relying on our property value to increase to provide us with the means to send our younger children to college.

Not only is this project of no benefit to NH or America, it is of no benefit to the citizens affected along the path of this pipeline. We ask the FERC to consider the impacts on lives of us citizens and disapprove the NED pipeline project.

Washington, DC 20426

Re: FERC docket number PF14-22-000

August 29, 2015

Dear Ms. Bose:

I am writing to oppose Kinder Morgan's proposed natural gas pipeline through Massachusetts' Ipswich River Watershed for the following reasons:

**ENVIRONMENTAL AND PUBLIC HEALTH RISKS :** The proposed pipeline would cross the Ipswich River and Ipswich River Watershed, the source of drinking water for 350,000 local residents and the employees and customers of local businesses, and water needed to irrigate farms and sustain wildlife habitat.

Kinder Morgan's website states that "a pipeline incident, although rare, can be serious." Emergencies listed include "an event with the potential to cause harm to the public, property, or the environment" such as "a damaged pipeline, a fire or explosion near or directly involving a pipeline, a natural disaster affecting the pipeline such as an earthquake, flood, or landslide, a leaking pipeline, dangerous, unusual, or suspicious activity around the pipeline." In the event of an emergency, the website instructs those nearby to "turn off running vehicle engines; do not drive away or operate electrical devices; leave the area immediately, on foot and in an upwind direction."

According to the Pipeline Hazardous Materials Safety Administration, a branch of the US Department of Transportation, in 2012 there were more than 80 explosions and fires along high-pressure pipelines carrying gas from production areas to distribution hubs. Smaller pipelines carrying gas to residential and commercial customers accounted for 71 incidents, nine fatalities and 21 injuries. Eastern Massachusetts is heavily populated and depends on fragile and priceless environmental assets for its quality of life and economic prosperity. Rapid evacuation is not feasible.

Moreover, methane is a greenhouse gas more powerful than carbon dioxide. Leaks and venting occur. Hydraulic fracturing requires millions of gallons of pressurized water for each well drilled, and water contaminated with hundreds of chemicals is then pressure-pumped underground or left in surface pools. Governor Cuomo formally banned the hydraulic fracturing in New York, citing "insufficient scientific evidence" to assure the public's health. Pennsylvania is the main source of proposed additional gas and the public's safety from there to here is not assured.

**OVER-RELIANCE:** Massachusetts already depends on natural gas for almost 60% of its electricity generation. Alternatives exist. On June 9th of this year, Germany generated more than 50% of its electricity from solar energy. In 2014, Denmark produced almost 40% of its electricity from wind power. Massachusetts currently generates just 3% of its the electricity from solar energy. Other options should be assessed as a way to diversify electricity generation before subjecting Massachusetts residents to massive pipeline infrastructure construction and overreliance on natural gas that leaves us vulnerable to shocks from extreme weather, accidents, price spikes, breaks in supply and terrorism.

**HIDDEN AND UNKNOWN COSTS:** A January 2014 letter from the New England States Committee on Electricity to the head of ISO New England promises "recovery of the net cost of any such procurement of firm pipeline capacity" through a tariff, or tax, on customers. Before approving this and other proposed

pipelines, Massachusetts residents should be given the time necessary to assess whether a tariff on natural gas is a better way to achieve our economic goals pricing carbon and letting all energy markets respond.

**MORE TIME NEEDED FOR REVIEW AND ASSESSMENT:** Morgan Kinder insists the additional gas carried by the proposed pipeline will be used domestically, Canada's Downeast LNG, "an LNG export project with the nearest access to the stranded northeast Marcellus gas reserves" explains that "a natural gas pipeline will connect the facility to the existing Maritimes and Northeast Pipeline."

Residents deserve more details and more time to weigh the case being made for local need before FERC allows this proposal to proceed. On July 6th, Massachusetts Attorney General Maura Healy announced a comprehensive assessment due in mid-October that will evaluate "all potentially available energy resource options to meet reliability needs, including natural gas (both natural gas pipelines and LNG), oil, hydro imports, energy efficiency, demand response, and renewables" through 2030. It includes an assessment of costs and benefits, including "the price impacts of each option." Massachusetts residents deserve the time needed for completion of that study and for a thorough review of its findings.

Based on these documented concerns, I oppose Kinder Morgan's preliminary proposal in its current form and request an extension of public comment to at least the end of the 2015 to allow for more thorough assessment.

Thank you for your consideration.

#### **20150831-5041**

Steven D Sirois, Salem, NH.

I OPPOSE this project, in particular, the "Haverhill Lateral", for many reasons.

I believe this lateral is NOT needed in this area. We already have three high pressure lines that run into Haverhill, MA; a 10in and 12in line run from Dracut, MA through Methuen, MA, through Salem, NH and into Haverhill, MA Those lines are maintained by Tennessee Gas. There is also a 36in line that runs from Nova Scotia, through Maine, into Dracut, MA which is maintained by Maritime East.

The reason why I believe this line/lateral is NOT needed is that back in 2013 there was a proposal to build a gas-to-electric generating plant in Methuen, MA and there was sufficient gas in the 36 inch line at that time to supply this facility to run this generator. Now the lateral that is proposed would remove the 10in line and replace it with a 20in line that is not going all the way into Haverhill, but is, in fact, stopping in Methuen. This line does NOT benefit any of the communities that are directly affected by its construction. It does, however, cause major disruption of neighborhoods, eco-systems, wetlands, conservation land and direct homeowner properties. The company has never fully addressed why the Route 213 option wasn't viable to be used, they just say "It isn't viable". Also, if the main line from Pennsylvania is to go into the Dracut area for more gas, why can't they just connect the 36 inch line that already runs to Dracut from Nova Scotia then reverse the flow and have the gas flow from Dracut to Haverhill. I do realize that Tennessee Gas and Maritime East are two separate companies, but it seems that if the need was really there, there would be collaboration between the two, rather than a competitive situation to get their share market value. Kinder Morgan has been less than forthcoming in their explanations to any of the property owners adjacent to the existing easement. They have suggested they need the line to supply Bay State Gas in Lawrence, MA and National Grid in Haverhill. But in order to supply both companies, the new line would have to directly cross paths with the 36in existing line, so why can't these companies just purchase their gas from Mass Maritime.

On a personal note, the proposed expansion would directly affect my home and family. I realize that the existing line and easement runs through my property. If the proposal is approved, there would be a 20in high pressure line closer than 30 feet to where I sleep. Right now, the easement is 2ft from my garage and have been told by Kinder Morgan that a larger easement would be needed to put in the new line. If that is the case, my driveway, garage and front entrance to my home would be impacted. The new line would basically run THROUGH MY HOME. I would like Kinder Morgan to fully address or answer the questions that I have. Below I have listed a summary of my concerns:

I would like full explanation as to why this lateral is needed instead of just suggesting that “more gas is needed”.

Why is a 20in line and a 12in line stopping in Methuen, MA and then continuing on with the same smaller lines (the 10in and 12in) with no usable customers in between.

Why isn't it viable to use the Route 213 corridor, rather than disrupt properties and neighborhoods.

Why can't they reverse the flow of the existing 36in line that is already in place.

The choice for running a high pressure line through multiple neighborhoods is detrimental, so why aren't suggested alternative routes being considered.

Why was the route changed from the original proposal. The old route, although it did cross my backyard, the impact was less and did not take away part of my home.

They have told us that a larger easement is needed, but have not disclosed the size or placement. Do I as a homeowner have any input of the path that is crossing my property.

Have they considered that my property, which is located on a dead end street, has a lake at one end and an elementary school at the other, both will be negatively affected.

Where does this leave me, as a directly affected homeowner. Will Kinder Morgan disclose their exact route to me before they are granted approval by FERC. My home may be taken, my family's life disrupted and forever changed.

One of their representatives had stated that the need was to generate more electricity. This gas goes NO WHERE NEAR any gas generating powerplants. So again, why the need.

I hope FERC will DENY the proposed Kinder Morgan/Tennessee pipeline lateral. As I stated before, the community will be severely and negatively impacted and does not have any positive effects with this project. The only gain is for Kinder Morgan to gain a marketing edge over Mass Maritime. It is apparent that their proposal is not about the need for more gas in this area, but rather who is selling it and at what profit.

#### **20150831-5044**

Judith Allen, West Hartford, CT.

PF14-22

Comments regarding The Tennessee Gas Company Northeast Energy Direct project.

In CT we are mandated by statute to reduce our GHG emission to 80% below 2001 levels by 2050. Any expansion of natural gas capacity will work against attaining these levels. NED is designed to be used for decades. CT needs to move rapidly to renewable energy sources.

How will the NED project affect CT's mandate for reduction of GHG? Does the project intend to meet with the Governor's Council on Climate Change who are charged to create a plan to achieve this mandate?

Information regarding NED on Kinder Morgan website claims increasing use of renewables will increase our need for natural gas. This is based on antiquated reasoning that the sun doesn't shine at night and the wind doesn't always blow. Renewable technology has solved these problems through use of batteries, tidal wave technology, hydro-electricity, etc.

One gas pipeline expansion project has already been approved and is under construction. Two other projects are currently under consideration, the Atlantic Bridge Project, and the Access Northeast project, proposed by Spectra Gas.

How will the NED project affect these other projects? How will the accumulative impacts be calculated with multiple pipeline projects? If just one project approved, how will decision be made? How can it be determined one project has more or less environmental impact than others? Before any one project can be approved, a determination of other projects needs to be made to calculate the true impacts of one or some of the proposed projects.

This project is also based on a supposed need for additional gas capacity during peak electricity use times, citing recent winters as examples when additional gas supply could have made a difference. In CT, CL&P, Now Eversource, asked for and received permission to increase a flat rate to all customers based on the reduced use of electricity due to energy efficiency measures, customer conservation, and the installation of solar PV systems. Clearly these measures are working.

Also on Kinder Morgan's website is a link to an economic analysis regarding investments in renewables vs. natural gas. It makes clear extraction of natural gas contaminates ground water, increases seismic activity, and unavoidably releasing methane

On the Kinder Morgan website is estimated savings to customers of \$2.98 billion per year. Using Kinder Morgan's statistics for whole sale power costs during the winter months of Dec. through March over a consecutive 4 winters including the winter of 2013/14 the average costs to consumers was \$2.8 per year. Yet the proposed project claims to save \$2.98 billion per year. How is that possible?

The NED project description includes an estimate of 3,000 jobs, 50% expected to be local. One economic estimate is based on a worker making \$65 hr and working 60 hrs per week. What kind of worker would earn \$65 hr? Does 60 hr work week include 20 hrs overtime? What specific jobs would be needed, how many, at what pay? At a scoping meeting in New Britain, CT there were many labor unions present and made the point that their union members are trained in environmental mitigation. How many jobs would this need employ and at what pay? How many of those jobs would be local.

The NRDC makes the point that sound policies must be in place to ensure that natural gas is not used to replace renewables and will not displace investments in energy efficiency and renewable energy sources and infrastructure.

But NED would do just that. At a public information meeting I asked a project representative about investment in renewable energy infrastructure. He responded no public monies would be used in construction of the pipeline. The will recoup costs from the companies who contract for use of natural gas. Eventually costs get passed on to customers in the form of higher rates or surcharges.

It is my understanding NED construction will be primarily in existing right-of-way and both old and new will create the incremental supply needed. Does old pipeline have ability for new pigging technology? Is this safety feature part of NED project. What measures will be used to ensure old pipe does not create an environmental hazard?

Maps for the proposed route cross MDC property in Hartford County, CT. At scoping meeting a representative of MDC pointed out their land containing area's drinking water and has special classification requiring additional environmental regulation. Will the public be made aware of what measures have been designed to protect drinking water?

This project would requires removal of trees. Regardless of where those trees are removed, it takes 20, 30, even 40 years to grow a mature tree. How will NED truly accept their need to restore an area to its original environmental balance.

This project would serve to create more confusion in the minds of consumers who are already bombarded with industry ads about the safety, environmentally friendly, low cost, future of natural gas. These ads are blatantly untrue. Science has unquestionably told us that we must stop using fossil fuels, we must do it now, and we must ensure that any reserves of gas, coal, or oil stay in the ground

When an industry portrays false information as fact, and NED is designed to further this industry, then NED is designed on false information. It is untrue, at least in CT, that the demand for electricity is rising. It is untrue that the rise of renewable energy means we will need more natural gas. It doesn't even make sense. Renewables are not natural gas. Increasing renewables means decreasing use of non-renewables. Natural gas is a non-renewable. It's really quite simple, we need less natural gas, not more.

**20150831-5048**

Gilda Guttman, Londonderry, NH.

The NED Kinder-Morgan pipeline is not beneficial to NH's population or environment. The proposed pipeline crosses the Merrimack Rive multiple times and will run through numerous residential neighborhoods.

The proposed path through Londonderry, NH goes through areas of granite ledge which will require blasting in order to place the pipes below ground. This blasting will be taking place less than 100 yards away from people's front yards.

Any small pipeline problem will endanger the nearby homes and residents. Our property is on a dead end street. The residents of this road have no way of getting safely away from a pipeline accident, as it will cross the only access road we have. The value of our property is also diminished as it would become unsalable - we are living within the danger radius pipeline.

I have recently returned from a trip to the Berkshires. There is no support for a pipeline running through the farmlands and conservation areas of Western Massachusetts, either. How poorly planned, how short-sighted. Especially since the gas would go to the highest bidders - and probably would end up far away from New England's shores.

We don't want this pipeline in our neighborhoods!

**20150831-5049**

Charleen, Londonderry, NH.

This poorly designed pipeline plan crossed our Merrimack River 4 times, runs through conservation lands and worst of all, goes through residential neighborhoods.

WE live on Granite ledge. Can't get through this without blasting. This will be happening less than 300 feet from our homes. Safe? I don't think so....

Certainly not beneficial to our property values. Who wants to buy a house that falls within the blast zone of a high-pressure gas pipeline.

Run through our rivers, across our orchards, through our neighborhoods -- run through the best of NH?  
NEVER!!

**20150831-5051**

Aldene M Fredenburg, West Swanzey, NH.

I am writing to oppose the proposed pipeline through parts of Winchester and Richmond, NH.

The pipeline will run very close to homes in an area of Richmond – in one instance within 10 feet of one house – disrupting many lives, and will cut through a stream that runs through the property. It will disrupt privately preserved habitats of wild turkeys, deer, moose, bears, foxes, coyotes, and a wide array of birds. Herbicides used to maintain the pipeline, possibly including Roundup, have been implicated in the killing of bees and in gluten sensitivity in humans that leads to an array of serious medical symptoms. The herbicides will end up in the land and the groundwater.

With any pipeline, the question is not if it will leak, but when. Part of the plan is to run the pipeline, which will transport thousands of gallons of volatile natural gas, along the route of high-tension electrical lines. What could possibly go wrong?

I have friends who live 500 yards from the proposed pipeline. They have made all the right decisions, living frugally and acting as responsible stewards of their land. Their lives and the lives of their neighbors will be horribly disrupted by this pipeline. They are in their sixties and live in modest homes with paid-off mortgages. When this neighborhood is torn to bits, how are they supposed to start over at their age?

There is something violent and arrogant about a pipeline blasting through this quiet rural area at the behest

of profit-making corporations. It seems to be the norm that corporations are allowed to do whatever they want and ordinary citizens are expected to just step aside, no matter how much suffering the corporations' actions cause.

There is no guarantee that the natural gas will lower heating costs in New England; more likely, the gas will be loaded onto ships near Dracut, MA, and shipped to Europe as an incentive for Western countries to support sanctions against Russia. If so, our quiet, pristine area will be sacrificed for politics.

Unacceptable!

## **20150831-5053**

Curtis Felix, Wellfleet, MA.

I was provided a copy of "The Trustees", comments and concur entirely with their assessment of the negative impacts of the current siting proposal. The Trustees carefully lay out exactly why a project such as this, in the year 2015 should never be sited in virgin or green locations with so many other alternatives. They carefully document the externalities but it is up to FERC to make sure they are properly monetized and included in the analysis of alternatives. There are sufficient gray and black corridors that eliminate the preponderance of these externalities are not adequately presented in the current application. Some of these unrepresented alternatives could surely meet:

- 1) The public necessity
- 2) The needs of the applicant
- 3) The needs of the public and private companies
- 4) And minimize the externalities:
  - a. Public takings
  - b. Wildlife impacts
  - c. Water shed impacts
  - d. View shed impacts
  - e. Ecosystem impacts
  - f. Wetland impacts
  - g. River system impacts

Given existing gray corridors such as Route 2, the Mass Turnpike and other thoroughly and previously excavated and constructed corridors, there are easy siting opportunities that eliminate most of the negative impacts, reduce cost to the applicant, reduce cost to society and produce a superior, win-win outcome for the public. More importantly forcing the externalities on New Hampshire, when the lion share of benefits accrue to Massachusetts and the proponent would be irresponsible.

As FERC is well aware, Massachusetts needs expanded natural gas supplies for potentially re-powering, Pilgrim, Canal, Salem, and the Fall River, Somerset & New Bedford former coal power plants and is the predominant gas consumer that will benefit from this supply expansion. While significant fuel switching plans have been investigated by the various utilities, over the decades, a routing of the Kinder Morgan pipeline further north away from these consumers, makes it more difficult and expensive to get large volumes of gas to the major gas consuming centers. It could also delay for decades, additional access to natural gas for large numbers of residential consumers in the region for home heating as a cheaper and cleaner alternative to oil. FERC is well aware of expansion constraints in densely populated areas of Eastern Massachusetts, Cape Cod and the Islands. As you know there is a current moratorium on new gas hook-ups on Cape Cod due to a lack of capacity, notwithstanding on-going upgrades and current attempts to improve capacity. A major policy re-think is critical for both FERC and Massachusetts:

- 1) Metro Boston is the gas sink (the Nova Scotia/New Brunswick proposals were to help relieve winter extreme conditions and those low pressure/peak problems continue to persist)
- 2) Powerplant sites are likely to and should remain the focus for power production since they are already

brown sites and were constructed because they have a unique collection of critical attributes such access to cooling water, transmission interconnect, existing brownfield site, distance from residential locations, fuel supply access to the facility, fuel storage, grid support etc.

3) Repowering with domestic natural gas is a win-win-win

4) A NED pipeline route on the Mass Pike or Route 2 has huge advantages for Massachusetts, FERC and the Applicant:

- a. Revenue for right away access
- b. Better location for high pressure supply to needed areas such as the power plant sites, Boston and Cape Cod

5) Using Mass Pike or Route 2 has huge advantages for NED

- a. Known previously excavated soil types and structures along existing grey corridor
- b. Far fewer entities for right of way negotiation and eminent domain takings
- c. Use of existing grey land rather than proposed NH siting in unknown soil structures (granite, wetlands, river crossing, heavy rock formations) with tremendous local opposition and public land takings by eminent domain

FERC should reject the proposed Northern route due to its inherently large negative externalities, eminent domain requirements, hugely negative private property impacts, negative watershed, riverine, wild life and ecosystem impacts and request the Applicant to pursue siting proposals that minimize the cost including externalities.

The current proposal is a deleterious infrastructure placement which will force the applicant to resort to export markets for the gas due to less access for domestic consumption and superior nature of trade opportunities that are provided for the proposed siting. This would be a terrible domestic energy and environmental policy outcome for the United States! New gas pipeline siting on Route 6 on Cape Cod and substantial wastewater infrastructure on Route 6 in Provincetown are some Massachusetts examples. Placing the NED pipeline on the Mass Pike or Route 2 is an ideal solution compared with all other alternatives. While the Eversource/PSNH right of way may appear attractive to the applicant due to a greater degree of control of land for its proposed siting, and perhaps due to internal financial considerations, the full impact of external costs of public takings and environmental impacts are not considered in private financial analyses.

It is FERC's responsibility to fully monetize these externalities so they are considered within the siting alternatives analysis. The proposed NH routes require major excavation through uncharacterized virgin soils, granite structures, wetlands and sensitive wildlife habitats. Construction in known previously excavated locations like the Pike, Route 2 and 128 provides lower risk, lower cost, lower environmental impact and greater certainty to the project and greater benefits to the public. The public highways should be more available for these kinds of projects and a more positive public/private structure created to enhance the public/private cooperation necessary for these projects and to reduce the unnecessary impact on private citizens, private property and the environment.

Reject.

Julia Steed Mawson, Pelham, NH.  
FERC Comment: August 30, 2015

Norman C. Bay, Chair  
Federal Energy Regulatory Commission  
888 First St. NE  
Washington, DC 20426

Dear Dr. Bay, (re docket PF14-22-000)

I am opposed to the Kinder Morgan (NED) for-profit, export pipeline on grounds related to the moral questions of placing NH communities at risk with no benefit to them.

I am an abutter, a shore-owner, who also lives on Little Island Pond in Pelham NH (which is less than 2,000 feet from the proposed pipeline), and a citizen, concerned not just about my property, but that of my neighbors across southern NH and the region. In my situation, should a pipeline explosion and fire occur in the heavily wooded areas of my property, the fire would burn to the lake, consume the homes that surround this area, destroy the conservation land near it and severely compromise the water quality of the lake and wetlands that are part of this aquatic system. And this can be repeated anywhere to the west of me in our rural treasures of southern NH where valves could be even further apart, which means longer times where local firefighters will be told to “stand down” for at least an hour until the 10 to 20 miles of gas in 30” – 36” pipe burns off.

We all know that there is an enormous push to sell fracked gas from the Marcellus shale fields. And that means big money in exports. As a result, development can occur rapidly without adequate oversight and real research into the long-term unintended consequences that follow. Simply put, risk is related to probability. Increase the number of pipelines being built, increase the risk. Add to the mix that Kinder Morgan has a poor track record concerning safety.

Pipeline failures and the catastrophes that follow are on the rise and current research illustrates that pipes are leaking in every community and have for many years. These pipelines and related structures cannot, and have not been monitored/repared well enough because of the lack of “boots on the ground” (and will) in towns, states and regions, to do so. This is of particular concern in NH where our state resources are slim and state agencies are heroically doing double duty work. Building more pipelines makes no sense where there is other work to be done to rectify these problems and safety concerns. It makes no sense and it is a social justice issue in NH where we are just being sacrificed for someone else’s profit. Deny this pipeline.

Sincerely,

Julia Steed Mawson

Bonnie Karkowski, Windsor, CT.

To FERC

Re: NE Energy Direct Project's Tennessee Gas Pipeline in CT

As a customer of MDC, I share their concerns regarding the violation of Class I & II lands. The value of clean, safe drinking water far exceeds the need for this pipeline. Water, for which there is no substitute, is essential for human life. There are other alternatives for energy.

If the pipeline is a danger to MDC's water sources, then it is also a danger to other water sources, particularly aquifers beneath other portions of the pipeline's path. As a resident of Windsor, I am concerned about the water quality for all those using well water, particularly those in the NW corner of our town where expansion of the pipeline is proposed. My elderly mother lives in that area and relies on well water.

Aside from water issues, I have grave concerns about safety with a pipeline carrying that much fuel. It will also require a tremendous increase in fracking in order to keep the gas flowing through the pipeline. The fracking process is destroying our environment and should be stopped, not encouraged.

Please rethink this project!

**20150831-5057**

Heather Long, Temple, NH.

As someone who is located within a half mile of the proposed compression station in New Ipswich, we are strongly opposed to the entire pipeline project. Like many others in New Hampshire, we moved here for the peace and quiet, clean water and air, and healthy environment New Hampshire provides. However, with the pipeline and compression stations possibly invading our lands, we will no longer have the quiet we so love. Instead, we will hear the constant noise generated by the compression station. The sounds of the birds and frogs will be drowned out by the loud rumble of a compression station. What is even more concerning however, is the environmental effects the compression station will cause. Not only do we live very close to the proposed site, but our town's elementary school is located within a quarter of a mile of the proposed site. What effects will this have on our children? Will it be discovered 20 years from now that there is an increased rate in cancer in our children all due to this compression station? What will this do to our water and air quality? I for one do not want my children to have to live with lifelong effects from this project. Any profit a large company is expected to make does not outweigh the lives of our children!

The project will also devalue many of our homes in New Hampshire. Because of this, the small quintessential town of Temple will no longer be. The dynamics of so many of these small rural towns we have grown to love will change drastically. No longer will we be the quaint town we love but instead will be home to many vacant homes, lower income families and businesses. Who else will want to live in our town once the compression station is built?

Finally, what will happen to our homes if there was a possible explosion to the station? As a small town, we are not prepared for this kind of disaster to our town. We could lose our homes or even worse, people's lives to a major disaster this compression station could cause. Since this will be an unmanned station, I feel something could very easily go undetected until it is too late. Our insurance rates will increase due to this treat and who will help us with these costs?

Until more is known about the possible effects this station will cause to our quintessential town as well as many other towns in New Hampshire, I, like so many others in New Hampshire, am strongly opposed to the building of the pipeline and compression stations in New Hampshire!

**20150831-5058**

toby tousley, keene, NH.

I am in favor of this project. It will bring much needed energy relieve to NH. It will also allow manufactur-

ing a chance to come back to the area.

**20150831-5059**

James Brokenshire Moody (home owner), Richmond, NH.

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street, NE, Room 1A

Washington, DC 20426

Docket#PF14-22-000

August 27, 2015

Dear Secretary Bose,

I am writing to state that I do not want a pipeline in my back yard – it is sacred ground! No doubt your office has received many letters stating similar concerns. I'm certain you understand the technical reasons a high pressure gas pipeline should not be built within yards of a home as is the case in our situation – our family is within the blast zone should an explosion occur. Since we're rural the pipe itself is thinner than in a more populated area. You know the facts.

It is critically important our message be heard, understood, and taken into consideration to stop the pipeline from being built on its proposed route & across our property. My great grandfather, U.S. Navy Commander Rev. John J. Brokenshire, purchased our homestead we call Hillside over 100 years ago. He served in WW I in the U.S. Navy as a Chaplain with a long and distinguished naval career. All of his sons enlisted in the U.S. Military and served in WW II; Captain Douglas Brokenshire U.S. Navy (he served on the U.S.S. Sicily) and Gordon Brokenshire, his wife & daughter. All are buried just yards from the proposed pipeline path. The land they rest on is certain to be destroyed. Our memorial to Lieutenant Commander Dr. Hebert Cecil Brokenshire U.S.N.R. is at risk of being decimated by this pipeline. Brokenshire Hospital in Davao City, the Philippines is named after Hebert who stayed behind to help the U.S. war effort & the people of the Philippines after the Japanese invaded on December, 8th 1941. He became a POW, forced to trek in the Bataan Death March, and died on a Japanese 'Hell Ship' serving his country. He received the Purple Heart and other medals from the DOD as did his brothers. \*\*\*We owe it to these men of valor to respect their resting places.\*\*\*

I visited the WWII Memorial in Washington DC this week while dropping off my daughter who will be a freshman at George Washington University. I have great respect for how our country honors our war heroes. We have war heroes on this property and I respectfully request our land be not be ravaged by corporate interests. Our community really needs you as a voice of our government to step up to stop this misguided corporate interest – who does not care about our heritage.

Hillside is being passed down to its fourth generation now and is in a trust to stay in our family.

We care for our land and the environment. A Pipeline means many archers of our land will be clear cut and dug up – permanently. It means disruption to Owl habitat, blasting will put at risk our wells, destruction of tree lines will mean pesticides will be sprayed and end up in our water and food. Stone walls & cellar holes from the 1700's - the birth of our nation - will be completely destroyed. This is not just open land – it is your heritage and my families.

We are all stewards of this land; we must demand this pipeline not be allowed to pass through our sacred ground!

Sincerely,

James Brokenshire Moody (home owner), Vice President MBA HealthGroup

119 Sandy Pond Road, Richmond, NH 03470, 603-239-4838, jimboody@gmail.com

**20150831-5060**

Timothy Parsons, Cheshire, CT.

Dear Secretary Bose,

I am writing in regards to Docket number PF14-22, Kinder Morgan's Northeast Energy Direct (NED) project.

In the environmental impact statement, FERC needs to take into account the increased amount of methane emissions that this large project will pour into our atmosphere. Earlier this month the EPA proposed new standards to reduce methane emissions by 45% over the next 10 years. The EPA recognizes that methane is a potent global greenhouse gas, far worse than carbon dioxide at trapping heat in the atmosphere. The NED project will make those reductions in methane emissions impossible, and will cause irreparable harm to our climate.

Furthermore, these shale gas expansion projects are segmented into two, the Connecticut Expansion and NED. FERC must acknowledge that this is the case, and admit that the environmental harm caused by these two projects is cumulative. They are not separate projects, and FERC has been guilty of illegal segmentation in the recent past.

The potential harm to water has been raised by the Hartford MDC, the municipal corporation responsible for providing clean water to 400,000 people in the Hartford area. In a June 26 letter to FERC, MDC Chief Executive Officer Scott Jellison wrote "to express some concern that the proposed pipeline could potentially impact MDC's public drinking water supplies in West Hartford and Bloomfield, CT." FERC must address the concerns of MDC and the public about the impact of pipeline construction and operation on drinking water.

FERC should take into account the frequency of pipeline leaks and explosions, and factor in the costs to local communities, who bear a burden when environmental harm from pipeline accidents occur. According to the Pipeline Hazardous and Safety Material Administration, leaks and explosions are not uncommon and have increased in frequency in recent years.

Thanks for your consideration,

Timothy Parsons, MD

**20150831-5061**

Marlene Znoy, Conway, MA.

Dear FERC Commissioners:

I am a resident of Conway Ma and am fully against the proposed Tennessee Gas Pipeline, NED project, FERC Docket No. PF14-22-000.

I have lived in Conway for 28 years. This community gave our daughter her educational start in life at its fine, community-involved grammar school. We swim in the South River down the hill during the summer, and when I walk my dog, within a thousand feet of my house I pass protected farm land. Less than two miles down the road, fishermen are often seen in waders fishing the Deerfield River. On Sundays people come from all over to tube that portion of the river down to Stillwater in Deerfield. Hunters arrive in the fall going after abundant turkey and deer. Five months a year, we get our share of food from a community-supported farm that I can walk to. This horse-powered farm is worked by a young farm family using sustainable agricultural methods out of respect for and to preserve the land. I myself commute to work 20 miles away in a hybrid car. We heat partially with wood, and all over the area solar panels are going up on people's homes. I know people whose heating and cooling needs are met by using geothermal energy. We do not have access to natural gas nor will we if this pipeline containing fracked gas is allowed to pass through our farm land and conserved land, animal habitats and waterways; through what we call our home.

As you are addressing the public need and benefits that this pipeline is required to address, I submit that it does not benefit my town, indeed any of the towns along the route. We, in this area, are apparently way

ahead of Kinder Morgan and the fracked gas industry because in so many ways, we represent the leading edge of the green economy. We are trying in our individual ways to protect our environment. We may not be experts in energy production, but we are not fools. We know what the chemicals are that go into fracking. Conway is slated for a blow-down valve just a couple of miles up the hill. Particulates and methane will surely settle down the hill to the river and our beloved community farm. I will then have to drive a half hour each way to get vegetables that have been trucked in from the south or California (or Mexico!). This makes no sense.

It particularly makes no sense when gas infrastructure and right-of-ways already exist on the southern tier of Massachusetts. Berkshire Gas, a subsidiary of the Spanish company, Iberdrola, is basically holding Berkshire Gas customers hostage with no new or expanded service. Yet, Berkshire Gas will not fix its leaks. Nor will it offer customers conservation alternatives. If there is a need for increased capacity for Massachusetts, why not go the route of upgrading and conserving the transmission that is already in place? Many people feel that the answer is that the fracked gas, in the long run, is actually meant for export. Which in no way benefits the ratepayers in Massachusetts. It is only a corporate shell game to make money for the bottom line and gas industry shareholders. The stakeholders in this pipeline—communities like mine—will be left to pick up the pieces. In fifty years when the pipelines, long since abandoned because the short-sighted fracked gas boomlet has passed, begin to corrode and leak their toxic waste, Kinder Morgan will certainly not be around to fix the problem. (Just recently, we saw out west how a long-abandoned mine lost its toxic sludge to a river.)

And what would we in the northern tier be left with? Despoiled agricultural and conserved land; wetlands and animal habitats disturbed and polluted; pipelines containing toxic chemicals under our rivers; noise, air and light pollution. This pipeline will never benefit us, and in the long run, it will not benefit the Commonwealth of Massachusetts. What would benefit the energy needs of Massachusetts would be Berkshire Gas fixing its current infrastructure and modernizing its transmission. Or adopting liquefied natural gas as an alternative as we move toward a green economy when all the buildings at UMass might use geothermal heating and cooling or solar power on the roofs of their buildings.

I keep wondering, ‘Where is the green economy?’ It’s the only sustainable solution. I’ve come to the conclusion that individuals are more than happy to make sacrifices toward that end. What we in northern Massachusetts are not willing to do, is to make sacrifices that take us backward. It is not a rational position to add more chemicals to an environment that is already ailing from the ignorance of that approach. Just because they can frack, does not mean it is a wise approach to energy needs (see: earthquakes in Oklahoma; polluted watersheds in Pennsylvania). And transporting this gas through pristine land just spreads the damage.

Where is the green economy? Since individuals are willing to go forward, what we need from the government and the regulators is leadership. Please be leaders in this instance. Require Berkshire Gas to end the moratorium, fix the leaks, conserve and offer alternatives. And please: reject this backward-looking pipeline that will have unalterable adverse impacts on our beautiful, precious expanse of the Commonwealth. On my home.

Thank you.

Marlene Znoy  
82 Elmer Rd.  
PO Box 155  
Conway, MA 01341

**20150831-5063**

Diane Hicks, Ashfield, MA.  
August 30, 2015

To Whom It May Concern (FERC),

I am writing to express my distress about the proposed Tennessee Gas pipeline extension that will run through

my town and others like it in Northern Massachusetts and Southern New Hampshire. This pipeline poses a threat to our health, community, businesses, and way of life. Across Massachusetts, the proposed pipeline would run through--or within 200 feet of--148 permanently protected parcels of land including 19 conserved farms, six state forests, five state wildlife management areas, 26 town forests, 10 protected watershed areas, five sections of National Scenic Trails, and 12 land trust properties. Some of the most pristine, sensitive and up-to-now-protected areas in New England are in jeopardy, affecting the quality of life for residents and livelihood of organic farmers. On top of that, residents who have solidly voted against the pipeline, will likely be forced to pay for its construction and suffer its impact via noise, pollution, and potential contamination of ground and well water, etc. As a voter and taxpayer, I expect to have a voice and a choice. This project is benefiting one gas behemoth, Texas-based Kinder Morgan, which plans to export substantial amounts of gas to Europe. The proposed pipeline will not provide a necessary service to residents of this state as only 1.5% of the gas transported via this pipeline will go to Massachusetts residents, while 98.5% will be exported to Europe. Berkshire Gas and the state of Massachusetts could meet needs through efficiency measures and renewables that would save individuals and communities so much in the long run. Since the moratorium Berkshire Gas placed on new and expanded accounts, many residents have already adjusted by supplementing with propane, switching to oil or implementing solar. In short, the need is diminishing already.

The lack of need across the state and potential for other sources of energy should negate the use of Eminent Domain to acquire rights to property. My town, like most towns in Northwestern Massachusetts, doesn't even have the infrastructure to use natural gas. Homes in this area use oil, electric, liquid propane or solar. We have our own septic tanks and wells, meaning that our water can be contaminated when hazardous chemicals are introduced into the ground. Likewise, we get all of our vegetables and most fruits and meat from local farms. This pipeline would run alongside the farm that supplies us with most of our food. Because the farm sits in a depression downwind of a planned blow off vent, it is all too possible for the fracking chemicals released into the air to end up contaminating crops. This is a fully man-powered, organic farm dedicated to nourishing the community with high quality, clean food. Farmers here have dedicated their lives to their businesses and the communities they serve. This area is unique in that it is a thriving rural area, brimming with local businesses that rely on the land.

Residents have solidly voted against the pipeline in every town in this county. We are simply attempting to live our lives and run our businesses without the imposed hardships the pipeline would bring. Please support our efforts and rights as Americans to preserve our businesses, communities and way of life. Please stop Kinder Morgan from exercising Eminent Domain to take land owned by hardworking citizens and parcels that have been protected at great expense for generations.

Sincerely,  
Diane Hicks  
228 Steady Lane  
Ashfield, MA 01330

**20150831-5064**

Ted Walls, Ashfield, MA.  
08/30/2015

To: Federal Energy Regulatory Commission

Regarding the proposed Kinder Morgan gas pipeline through Western Massachusetts and New Hampshire. I live in Ashfield Massachusetts within a mile of the proposed pipeline route. I am writing to urge you not to allow the building of the proposed pipeline. Our area is a thriving rural community home to many successful small businesses, organic farms, and long protected natural areas visited by thousands of tourists each year. As a community we have worked hard to protect this beautiful and environmentally sensitive place where almost every town dates back to Colonial times and most homes and buildings are over one hundred years old. My own house dates back to the 1840's and has been lovingly preserved through the generations. The

water for my house, as is true for most rural homes in Western Massachusetts, comes from a deep well located on my property. Leaks from the pipeline could contaminate our wells and render our homes uninhabitable. Leaks could also contaminate the soil having a devastating impact on our farms. The noise and light from compressor stations will drastically alter the lives of those living near them and have a negative impact on wildlife.

In addition, rural Western Massachusetts has no infrastructure for the use of natural gas so the pipeline would have no benefit for any of our communities. I have read reports stating that only 1.5% of the gas going through the pipeline would be used in Massachusetts or New Hampshire by Berkshire Gas. The rest would be exported to Europe by the Spanish company that recently bought Berkshire Gas. For these reasons, Eminent Domain should not be allowed in this case because the benefit to the greater good is almost nonexistent. All of the towns and counties along the proposed route, with the exception of the town Lee, have voted against it and our state representatives have come out in opposition to its construction.

For all of the above reasons I again urge you to not let this pipeline be built.

Sincerely,

Ted Walls

228 Steady Lane

Ashfield, MA 01330

#### **20150831-5065**

Gregory Blais, New Ipswich, NH.

The NED pipeline project includes no benefit to us or to NH and no investments in infrastructure

- New Ipswich, NH is not on the natural gas grid and there are no plans to provide this service here so we will not receive any benefit from this project. Very few communities in the state, if any, will benefit.
- Most of the gas passing through NH in the proposed NED pipeline will be used outside of NH or exported outside the US.
- NH is a net exporter of electricity so NH will not benefit from any claims of rate reduction from natural gas fired electric plants
- KM has not detailed any plans to make any improvements or invest in infrastructure (roads, schools, first response teams, conservation land, etc.) in the local communities.
- KM has not offered to make restitution for damages due to construction or make any improvements to properties belonging to the public or private citizens impacted by the project.
- No local contractors from the area being hired for this construction project. Any jobs created locally will be temporary.
- Local property values have already declined in the communities surrounding the project and they will continue to do so. Realtors have already reported that clients are not interested in relocated to communities near the NED pipeline.
- KM has already admitted publically that the taxes they would be paying to local communities for the pipeline right of way, metering stations and compressor station will decrease over time. This will shift the tax burden to the towns required to spend more to upgrade infrastructure, first response resources, equipment, etc. Ultimately, us citizens will be footing the bill for this and since we have already experienced declining property values and high taxes, will be leaving these communities. This will result in a downward spiral.
- The NED pipeline is not necessary. There are already other existing projects in the works which will provide NH with lower energy costs such as the Spectra Pipeline and the Northern Pass Project which brings low cost, renewable, hydro-electric power to NH from Canada.

## 20150831-5066

Gregory Blais, New Ipswich, NH.

KM needs to identify what they plan to pay us & the local communities for land if the project gets approved, so the FERC can do a proper cost-benefit assessment.

- I suggest the FERC require that the amount of payment each landowner would receive for exchange of the proposed right of way be provided publicly or perhaps specified in their report to the FERC.
- The FERC should require that the report include the amount of real estate taxes that KM will pay to each community over a specified amount of time, for example, 20 years.
- How is the FERC or us citizens prepared to weigh the benefits of this project without first knowing what the benefits are?

## 20150831-5067

Gregory Blais, New Ipswich, NH.

Kinder Morgan Continues to Expand Its Growing Product Tanker Fleet

It is unlikely that the local communities along the NED pipeline benefit from the prospect of cheap, natural gas. If one goes to Kinder Morgan's official website, it is clear of their intent to export most of this natural gas. The first news article I found there was titled "Kinder Morgan Continues to Expand Its Growing Product Tanker Fleet for the Jones Act Trade" dated .

<http://ir.kindermorgan.com/press-release/all/kinder-morgan-continues-expand-its-growing-product-tanker-fleet-jones-act-trade>

In summary, the article goes on to state the following:

- \$568 Million Transaction Will Boost KMI's Product Tanker Fleet to 16 Ships By Late 2017
- Kinder Morgan, Inc. (NYSE: KMI) today announced it is expanding its growing fleet of Jones Act product tankers and has signed a definitive agreement valued at an all-in price of \$568 million with Philly Tankers LLC to take assignment of contracts for the construction of four, new 50,000-deadweight-ton, Tier II tankers to be constructed at the Aker Philadelphia Shipyard in Philadelphia, Pennsylvania.
- Each LNG-conversion-ready tanker will have a capacity of 337,000 barrels. The vessels will be delivered to Kinder Morgan between November 2016 and November 2017
- Kinder Morgan currently has seven product tankers on the water and five tankers that are in various stages of design and construction at the NASSCO shipyard in San Diego, California, scheduled for delivery between late 2015 and mid-2017.

## 20150831-5068

Dr. Sanjay M. Joshi, Andover, MA.

Dear Federal Energy Regulatory Commission,

We received a request for comment on the Northeast Energy Direct Project, Docket No. PF14-22-000. We are residents and homeowners in Andover, MA, in the Market Path Tail section of the Eastern Portion of the pipeline.

We strongly oppose the construction of this pipeline. Increasing the supply of natural gas to the region will only result in more green-house emitting energy consumption. We are already guilty of global climate change and it shocks us that we are undertaking this bigger project to make the situation worse. Are we focusing too much on profits for large energy corporations and short-term job creation at a time when unemployment is not even a remote threat, and ignoring the disastrous levels of green-house gases? We should strive to reduce our energy footprint instead!

On the other hand, the impact on environment cannot be ignored. The history of energy industry is splattered with environmental disasters, despite their claims of taking utmost precautions. The environmental

balance is already in a delicate unstable equilibrium. Just one accident can ruin the beautiful nature and decades of preservation work by our thoughtful forefathers.

Let us be on the right side of history and focus on the larger good, beyond the costs of energy, which are already lower in the United States than many parts of the world. Please stop the pipeline!

We thank you for the opportunity to voice our opinion.

Dr. Sanjay M. Joshi  
Sumedha S. Joshi

## **20150831-5069**

Mark Silverman and Susan Fields, Conway, MA.

We are writing to FERC regarding the proposed natural gas pipeline through upstate New York, Massachusetts and southern New Hampshire by Tennessee Gas Pipeline and Kinder Morgan.

Though your responsibility is to maintain the energy supply, it is imperative that you consider the true needs of the Northeast and the carnage, both economic and environmental that this pipeline will inflict on the Northeast.

FERC has the reputation, perhaps the track record of rubber stamping proposals such as these. We implore you to review this proposal on its merits, deeply consider the arguments against it and heed the groundswell of opposition concerning it.

There have been fears of potential environmental catastrophe, based on the track record of Kinder Morgan and its disregard for safety, the adage of asking for forgiveness rather than permission. The dangers, as well as past safety compromises by Kinder Morgan, with regard to blow off valves, compressor stations and poor maintenance in general have all been well documented.

However, our greatest concern is of how the consumers of the Northeast would be victimized economically, were this proposal approved. In addition, the extortion by Berkshire Gas regarding a moratorium on new customers or needs is shameless because of the alternatives of repairing leaks in existing pipelines and alternative energy sources. With the documentation showing conclusively that the vast majority of the gas will be going for export, it is unconscionable that rate payers be charged a surcharge for the construction of the pipeline, and that landowners will be forced to give up their property with eminent domain being invoked.

This issue has become the essence of true democracy: impassioned and knowledgeable protest of citizens, towns meetings and elected governmental representatives. Were the need for this pipeline clear and real, these protests could be deemed mere NIMBYism. Instead, the arguments against it are so clear and should be so persuasive to FERC. It is imperative that you use these in making your decision.

Sincerely,

Mark Silverman  
Susan Fields

Georgette Y. E. Henrich, Dracut, MA.

Dear Federal Energy Regulatory Commission;

My name is Georgette Henrich and I am a resident of Dracut, MA. I am writing to you to express my concerns involving Kinder Morgan's plans to install a high pressure gas line and compression station in my town. The docket number is PF14-22.

As someone who considers herself an environmentalist, the negative ramifications of this gas line and compression station far outweigh the positive benefits to the town. I am concerned that the emissions into the air, ground and water will permanently affect any inhabitants, both human and animal, living in the area.

The pollution generated not only will involve chemicals released into the environment but will also generate noise that will have a lasting effect on anyone within a few miles, especially those living within earshot of the compression station. Kinder Morgan has not surrendered any valid information concerning emissions related to this project. Any information they have released has been modified over and over, so it has become clear to me that they aren't being truthful in their reporting. I feel this is being done to confuse the residents of Dracut in order to make us believe this is a safe endeavor.

Not only am I concerned about the environmental impact but I am very concerned from a safety perspective. I have worked for many major corporations where the safety of its employees is paramount. This project could spell disaster for this town and surrounding communities. The thought of an "incineration zone" sounds like something out of a science fiction movie. We just saw recently in the news of the major chemical explosion in Taiwan where dozens of people died and many more were injured. We, the residents of Dracut, cannot imagine something of this magnitude happening here. Not only do we not have the manpower in our fire and police departments, but we do not have disaster training for something like this nor would we garner enough revenue from whatever Kinder Morgan projects this town will make to fully support such a project. So now we will have an inadequately staffed and trained emergency response team who will be putting their lives on the line because of a gas line that is not needed all in the name of big business.

In closing, I ask that you carefully weigh and consider all of the facts, including Kinder Morgan's ploy in making everyone believe that this project is for the good of the public. The only good it is guaranteed to do is put money in the pockets of those who are willing to risk the lives and livelihood of people whom Kinder Morgan has no vested interest in.

Respectfully submitted,

Georgette Y. E. Henrich  
14-4th Street  
Dracut, MA 01826

FERC

[ferconline.ferc.gov/eFiling.aspx](http://ferconline.ferc.gov/eFiling.aspx)

Re: Docket#PF14-22-000, Kinder-Morgan proposed NED pipeline.

08/30/15

Hello-

As an almost 20 year resident of Temple, NH, a truly quiet rural area, and with a home close enough to the proposed New Ipswich Compressor Station to be considered in the Incineration Zone (some here refer to this as a “kill zone”), I have a few comments/questions.

Has FERC either routinely or ever, sited natural gas compressor stations near active elementary schools? The Temple NH Elementary School is less than a half mile from the proposed New Ipswich compressor station location.

The Temple Elementary School is additionally the town’s designated Emergency Shelter for disasters, both natural and man-made. In case of a compressor station emergency, where would our townspeople go? How is FERC going to insure residents’ access to a safe location?

The Temple Police Department is a joint effort with Greenville NH and the police station is physically located in Greenville. What can FERC do to enable the Police Department’s timely response in getting to Temple in the event of a compressor station catastrophic event?

Does FERC either routinely or ever, site natural gas compressor stations in close proximity to municipal water supplies? The municipal water reservoir for the town of Greenville, NH is also approximately a half mile from the proposed compressor station.

Abutting the proposed compressor station property is a farm raising grass fed beef from grass grown on site. Can FERC guarantee that the compressor station is safe for that business to continue?

What does FERC do to prepare and aid local volunteer fire departments and other first responders to be able to deal with the kinds of emergency situations that are possible results from a large compressor station’s potential problem set?

What can FERC do to insure that all required lighting for the compressor station site be controlled to keep night skies dark and avoid disruptions to normal plant, animal, and human environments?

What can FERC do to insure that the disruptive noise levels from both normal and special compressor station operations are controlled and kept at very low decibel levels? Can there be sound reducing enclosures built around the major noise sources included in this plan?

Since normal compressor station operations include such things as pipeline scrubbing wastes and “blow-downs” of excess pressures of natural gas and the separated contaminants found in those gases, will industrial “best practices” be employed to not allow air and water quality degradation?

Does FERC realize that the Scoping Meeting held in Milford NH on 07/30/15 was not acceptable? Short notice on a lengthy document of changes with thousands of “TBDs” held in a very overcrowded venue with many people in a separate room and many more in long lines out on the sidewalk. There was certainly not enough time to evaluate the revised document prior to the meeting. There was not enough time or space at the meeting to have all interested residents speak their concerns effectively.

Does FERC make it a habit to upset the lives and livelihoods of residents in quiet rural areas?

Is it normal for FERC to allow quiet rural areas to be severely disrupted with no possible benefit from the disruption and to further suffer the consequences of lowered property values, resulting in increased property tax rates and decreased quality of life?

We have recently heard that New Hampshire Governor Hassan is considering not signing off on this project after all. The majority of New Hampshire’s residents are in favor of her not signing.

Thank you very much. I look forward to FERC’s responses to the above questions/concerns.

Re: Docket#PF14-22-000, Kinder-Morgan proposed NED pipeline.

Good day-

As an almost 20 year resident of Temple, NH, a truly quiet rural area, and with a home close enough to the proposed New Ipswich Compressor Station to be considered in the Incineration Zone (some here refer to this as a “kill zone”), I have a few comments/questions.

Has FERC either routinely or ever, sited natural gas compressor stations near active elementary schools? The Temple NH Elementary School is less than a half mile from the proposed New Ipswich compressor station location.

The Temple Elementary School is additionally the town’s designated Emergency Shelter for disasters, both natural and man-made. In case of a compressor station emergency, where would our townspeople go? How is FERC going to insure residents’ access to a safe location?

The Temple Police Department is a joint effort with Greenville NH and the police station is physically located in Greenville. What can FERC do to enable the Police Department’s timely response in getting to Temple in the event of a compressor station catastrophic event?

Does FERC either routinely or ever, site natural gas compressor stations in close proximity to municipal water supplies? The municipal water reservoir for the town of Greenville, NH is also approximately a half mile from the proposed compressor station.

Abutting the proposed compressor station property is a farm raising grass fed beef from grass grown on site. Can FERC guarantee that the compressor station is safe for that business to continue?

What does FERC do to prepare and aid local volunteer fire departments and other first responders to be able to deal with the kinds of emergency situations that are possible results from a large compressor station’s potential problem set?

What can FERC do to insure that all required lighting for the compressor station site be controlled to keep night skies dark and avoid disruptions to normal plant, animal, and human environments?

What can FERC do to insure that the disruptive noise levels from both normal and special compressor station operations are controlled and kept at very low decibel levels? Can there be sound reducing enclosures built around the major noise sources included in this plan?

Since normal compressor station operations include such things as pipeline scrubbing wastes and “blow-downs” of excess pressures of natural gas and the separated contaminants found in those gases, will industrial “best practices” be employed to not allow air and water quality degradation?

Does FERC realize that the Scoping Meeting held in Milford NH on 07/30/15 was not acceptable? Short notice on a lengthy document of changes with thousands of “TBDs” held in a very overcrowded venue with many people in a separate room and many more in long lines out on the sidewalk. There was certainly not enough time to evaluate the revised document prior to the meeting. There was not enough time or space at the meeting to have all interested residents speak their concerns effectively.

Will FERC allow quiet rural areas to be severely disrupted with regard to noise, light and pollution with no possible benefit to landowners from the disruption and to further suffer the consequences of lowered property values, resulting in increased property tax rates and decreased quality of life?

We have recently heard that New Hampshire Governor Hassan is considering not signing off on this project after all. The majority of New Hampshire’s residents are in favor of her not signing.

Thank you very much. I look forward to FERC’s responses to the above questions/concerns.

Gregory Blais, New Ipswich, NH.

We are one of the very unfortunate families who own property where approx. 1/4 mile of the proposed NED pipeline will cross our property and would run within 350 ft of our home. We are concerned for our safety for the following reasons:

- There is a massive amount of extremely flammable and highly explosive fuel practically on our doorstep.
- Our home is within 350 ft of the proposed pipeline & within the “incineration zone”.
- The cost of homeowner’s insurance for anyone along the pipeline, (if we can even still be covered) will increase significantly.
- If an explosion was to occur, I am concerned about fire, explosions & sections of pipe being thrown long distances. Not only could damage occur to our property from the pipeline but also the risk of pipeline causing secondary damage to the co-located powerlines, which could cause fires.
- Kinder Morgan proposes to use cheaper, thinner, lower quality pipe in rural areas, such as our area. Since it is not densely populated, therefore, they are not required to use the higher quality pipe. This concerns us since we are so close to the pipeline path, and the risk of explosion, leakage, and corrosion over time increases, and will potentially cause more catastrophic results. It also tells me that KM believes that our lives in rural areas are less valuable than occupants of densely populated areas, and that their primary focus is maximizing profits and not safety.
- Kinder Morgan has an abysmal safety record. Since 2003, Kinder Morgan has had 20 major accidents that were serious enough to be reported to the Pipeline and Hazardous Materials Safety Administration.
- There are is always allowable leakage in these pipelines, even in new pipes. I am concerned about leakage and gas build-up underground and since it is co-located on an electric transmission line, the increased possibility of a spark or lightning strike triggering an explosion and/or fire.
- If KM claims that these pipelines are so safe, why not put their own staff on the frontlines for a disaster first response? Our communities do not currently have the means of dealing with a disaster caused by a pipeline explosion or fire. Kinder Morgan has not proposed to provide any financial support, resources, equipment or even training to the local first responders to handle such a disaster. The FERC should require KM provide a disaster plan, including, for example, KM financed fire stations at pre-determined intervals along the route staffed with KM payrolled first responders prepared to deal with a disaster of this type.

**20150831-5077**

Sean Radcliffe, Temple, NH.

The southern New Hampshire and Monadnock region has many excellent local foot races. Nearly every town has a 5K. There are many choices of beautiful half marathons with Keene’s DeMar being the classic marathon in the fall. Running races in the Monadnock region are always enjoyable because the races take you on country roads through farmlands and quaint New England towns. People travel to the Monadnock region from cities all over the country to enjoy our refreshing local races.

The Temple, New Ipswich and Greenville area has a number of foot races. Namely the upcoming Mascevic Viking 5K Road Race in New Ipswich on Saturday, September 19, the Friends of the Poor Run/Walk in Greenville on September 27 and of course the Temple Peanut Butter Chip Chase 5K on New Years Day. These races support great local causes.

I have a concern that the NED export pipeline 41,000 HP compressor station that is slated to be at the corner of New Ipswich, Greenville and Temple, will have negative impact on runners in the area. Texas and Pennsylvania studies of compressor station emissions found that “Short-term exposure can cause eye and respiratory tract irritation, headaches, dizziness, visual disorders, fatigue, loss of coordination, allergic skin reaction, nausea, and memory impairment.” Depending on the chemical or pollutant, the effect varies. The some

of the studies can be found at:

<http://www.environmentalhealthproject.org/wp-content/uploads/2012/03/Compressor-station-emissions-and-health-impacts-02.24.2015.pdf>

As a runner, this doesn't make me comfortable running around a fracked gas compressor station. Why would runners take the risk with their health? These local races are as close as two miles from the proposed New Ipswich compressor station site. Emissions could affect runners. Many runners are decidedly health conscious. If you were a healthy runner, would you want to potentially expose your eyes, nose, throat and lungs to the risks of emissions of an extremely large fracked gas compressor station? Runners may avoid these races due to health risks. Reduced attendance at races means reduced financial contributions to the charities these races support.

#### **20150831-5078**

Gregory Blais, New Ipswich, NH.

My understanding is the NED pipeline will be exempt from several Federal, State and local regulations and local zoning laws and ordinances. I believe this is a mistake for a project that many feel is unnecessary for this region. I also disagree with the position that this is a local problem since the federal regulations exempt this project from compliance with Federal, State & local Regulations. The FERC should require KM to comply with all applicable Federal, State and local regulations and local zoning laws and ordinances.

#### **20150831-5081**

Jackie Gauger, Worthington, MA.

As a long-time resident of Worthington, MA, I am against building yet another gas pipeline in western MA. There are already a couple of pipelines here. Using those makes more sense. We don't need to expose our residents & the environment to the noise, explosions, huge compressor stations, cutting of forests, taking of property, etc. in order to continue our dependence on fossil fuels.

Mass. has committed itself to clean energy goals, which I support. This pipeline goes against those. We must continue to wean ourselves off fossil fuels. Not approving this pipeline is a great way to do that.

Among other concerns, I'm very concerned about FERC's means of dealing with all vernal pools within 500 yards of any pipeline segment, work area or staging area associated with pipeline construction I'm also equally concerned about the effect the project would have on appraised property values within one mile of the proposed route.

Please, FERC, consider the huge human, animal, & environmental impacts of approving this pipeline. I'd like to see FERC put more of its resources into supporting renewable energy. Yes, that's a challenge; but we need to get there. Approving this pipeline moves us backwards.

Thank you for the opportunity to comment on this critical issue.

#### **20150831-5084**

Rosemary Ganser, Ridgefield, CT.

Dear Secretary Bose,

I am writing in regards to Docket number PF14-22, Kinder Morgan's Northeast Energy Direct (NED) project.

In the environmental impact statement, FERC needs to take into account the increased amount of methane emissions that this large project will pour into our atmosphere. Earlier this month the EPA proposed new standards to reduce methane emissions by 45% over the next 10 years. The EPA recognizes that methane is a potent global greenhouse gas, far worse than carbon dioxide at trapping heat in the atmosphere. The NED project will make those reductions in methane emissions impossible, and will cause irreparable harm to our climate.

Furthermore, these shale gas expansion projects are segmented into two, the Connecticut Expansion and NED. FERC must acknowledge that this is the case, and admit that the environmental harm caused by these two projects is cumulative. They are not separate projects, and FERC has been guilty of illegal segmentation in the recent past.

The potential harm to water has been raised by the Hartford MDC, the municipal corporation responsible for providing clean water to 400,000 people in the Hartford area. In a June 26 letter to FERC, MDC Chief Executive Officer Scott Jellison wrote “to express some concern that the proposed pipeline could potentially impact MDC’s public drinking water supplies in West Hartford and Bloomfield, CT.” FERC must address the concerns of MDC and the public about the impact of pipeline construction and operation on drinking water.

FERC should take into account the frequency of pipeline leaks and explosions, and factor in the costs to local communities, who bear a burden when environmental harm from pipeline accidents occur. According to the Pipeline Hazardous and Safety Material Administration, leaks and explosions are not uncommon and have increased in frequency in recent years.

Yours,

Rosemary Ganser

#### **20150831-5085**

Henry Collins, Averill Park, NY.

Thank you for the opportunity to comment on this application. I live approximately one my from the proposed location of the compressor station.

Starting at the end- this is madness. It would be difficult to overestimate the profoundly negative impact that the proposed project, including the proposed compressor, will have on our area: the negative impacts on our environment, the impact on our rural way of life, the impact on the quiet beauty of our area.

It will compromise the health and welfare of all the people who live here. In the event of a catastrophic development, e.g., an explosion, it will destroy our way of life.

It will impact our air quality, our water quality, it will create noise and light pollution. It is utterly inconsistent with the rural nature and quality of this area. It will impact our property values.

I urge FERC to research and consider the following: the potential impact of the release of toxins by the compressor; the potential impact of an explosion; the potential impact on residential wells in the area proximate to the compressor station.

On that latter point, I would request that the applicant be required to test my well before any construction as well as during and after any construction, in the event the application is granted and the applicant is permitted to proceed.

I’m not sure there is any good area for the proposed compressor and pipeline, but I’m quite sure that locating it here, in a rural, residential, bucolic area, is a really bad location.

Again - do not let this ill-advised project destroy the life that I and my neighbors have carved out in this beautiful rural setting.

Thank you.

#### **20150831-5086**

Leslie Carey, Averill Park, NY.

I am stridently opposed to the NED. I implore your agency to protect us from this monster.

The environmental impact: the contamination of my air, soil, and water. My well is fed by a stream that is in the path of this proposed pipeline. The process of construction would decimate my water supply. The potential for gas leakage is high.

Health and safety: the NYS DOH and the AMA have expressed concern about the impact of fracked gas on health. The unreliable infrastructure means that fracked gas can leak and poison us. In addition, if one of the large diameter, shallowly placed pipes were to explode, my property is in the incineration zone. I or my family members or my animals would be killed.

Financial: this pipeline will decrease my property value, and it is doubtful that I would be able to sell it. There was a 52% increase in foreclosures in Rensselaer county last year. This project spells disaster for the fragile economy here, with absolutely no benefit to us.

Mental health: the specter of this project has already caused increased incidents of depression and anxiety. These disabling conditions disrupt the ability to manage activities of daily living including self care, working, caring for family and home, paying bills, etc.

We are hard working people who do not want this project approved, here or anywhere. NYS has banned fracked gas. Please do your job and protect the public good and safety.

#### **20150831-5087**

eric haeseler, suffield, CT.

Please note that on the above screen I have been unable to remove "Hydro Power Search" from the docket field even though I have selected PF14-22 a gas pipeline docket issue. My comments follow.

Dear Secretary Bose,

I am writing in regards to Docket number PF14-22-000, Kinder Morgan's Northeast Energy Direct (NED) project.

In the environmental impact statement, FERC needs to take into account the increased amount of methane emissions that this large project will pour into our atmosphere. Earlier this month the EPA proposed new standards to reduce methane emissions by 45% over the next 10 years. The EPA recognizes that methane is a potent global greenhouse gas, far worse than carbon dioxide at trapping heat in the atmosphere. The NED project will make those reductions in methane emissions impossible, and will cause irreparable harm to our climate.

Furthermore, these shale gas expansion projects are segmented into two, the Connecticut Expansion and

NED. FERC must acknowledge that this is the case, and admit that the environmental harm caused by these two projects is cumulative. They are not separate projects, and FERC has allowed illegal segmentation in the recent past.

The potential harm to drinking water has been raised by the Hartford MDC, the municipal corporation responsible for providing clean water to 400,000 people in the Hartford area. In a June 26 letter to FERC, MDC Chief Executive Officer Scott Jellison wrote “to express some concern that the proposed pipeline could potentially impact MDC’s public drinking water supplies in West Hartford and Bloomfield, CT.” FERC must address the concerns of MDC and the public about the impact of pipeline construction and operation on drinking water.

FERC should take into account the frequency of pipeline leaks and explosions, and factor in the costs to local communities, who bear a burden when environmental harm from pipeline accidents occurs. According to the Pipeline Hazardous and Safety Material Administration, leaks and explosions are not uncommon and have increased in frequency in recent years.

There are not currently gas shortages and increased energy efficiency programs and implementation of solar and wind energy projects should eliminate the need for these projects. Please take action to protect public health and preserve the environment.

Yours,

Eric Haeseler

Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Docket#PF14-22-000

August 27, 2015

Dear Secretary Bose,

I am writing to tell you that I do not want a pipeline constructed on our family property. My great great grandparents purchased our home we call Hillside over 110 years ago. Hillside is built on 160 archers of land and is close to beautiful Sandy Pond. As a 16 year old my two sisters and cousins will assume ownership in the coming years as we are named in the Brokenshire Trust – which has been passed down through the generations for the last 110 years.

It is just not right that our family legacy will have a high pressure gas pipeline built within yards of our cherished home. I am very concerned our safety will be at risk because my family will be within the blast zone should an explosion occur. Our community really needs you, as a voice of our government, to stop this pipeline project

We care about our land and the environment. A pipeline means about 40 archers of our land will be clear cut and dug up – permanently. It means disruption to owl & bobcat habitat, blasting may affect our well, destruction of tree lines will means pesticides will be sprayed to keep more trees from growing and end up in our water and food. Stone walls & cellar holes from the 1700’s will be completely destroyed. This is not just open land – it is my heritage. We are all stewards of this land; we must demand this pipeline not be allowed to pass through our home!

Sincerely,

Margaret Moody

Brokenshire Trustee - home owner  
119 Sandy Pond Road  
Richmond, NH 03470  
603-239-4838

**20150831-5092**

Scott Campbell, New Ipswich, NH.

According to 5.10.2.6 in the socioeconomic resource report 5 “No major impact on insurance rates, property sales,

demand for properties, or development of surrounding properties is expected. Therefore, the Project will not cause any direct or indirect impacts that will contribute to a cumulative impact on property values.”

That’s interesting. I would not have bought my house knowing there would be a pipeline and compressor station in the town. So therefore the value of the property that I currently now own would drop. This is simple economics. If there is an area that is less desired due to an outside factor then the price will drop in order to sell. Kinder Morgan or Tennessee Gas Pipeline Co. LLC will not reimburse me for this. None of us in the town of New Ipswich want this to drop our property values.

Thanks,

Scott Campbell

**20150831-5094**

Scott Campbell, New Ipswich, NH.

Most if not all of us in New Ipswich rely on our own wells for water. If there is ever an issue with a leak then we will be affected. The cost of delivering clean water to us would be sky high. Kinder Morgan should build for every home a safe drinking water system if they were to put a pipeline or even compressor station in a town where they want a pipeline or compressor station to be in. In other words, my water is fine now. Kinder Morgan comes in and puts what they want. Accident happens as we all know it does. My water is not fine. Where’s Kinder Morgan? Not helping me with my water. I work 12 hours a day on average. Now Kinder Morgan is adding work time in my day just to get clean water.

**20150831-5096**

Ronald Berg, North Reading, MA.

My comments refer to the proposed pipeline extension through North Reading, MA. As an abutter and a concerned resident of North Reading, my objections to the pipeline include the following.

The pipeline could seriously affect the Ipswich River watershed which provides drinking water for this and neighboring towns. I am concerned about the environmental impact of constructing the pipeline through the watershed and under the river. Also concerned about possible damage in the future including potential leaks of natural gas.

I’m concerned about the scale of this pipeline and the construction project. The damage caused by dredging and removing trees along the site of a major pipeline like this is not trivial and would have a serious impact on the land and houses and on the community here.

If I understand the siting information correctly, there are alternative routes for the pipeline extension here. The alternatives would cause less environmental damage and less disruption and danger for the towns and communities here, but could have a higher cost of construction. If the pipeline project is worth doing, I argue it’s worth doing right and I hope that FERC takes this into consideration.

Daniel K Berry, Amherst, MA.

My name is Daniel Berry and I am a resident of Amherst, Massachusetts. I am submitting this comment to voice my strong opposition to the proposed Kinder-Morgan Northeast Direct (NED) Gas Pipeline.

By profession I work in the solar-electric energy trade, but I am also a local farmer and beekeeper. Prior to working in the solar energy field, I was for several years as an apprentice in Natural Roots Farm in the town of Conway, located less than 1 mile away from the proposed NED pipeline path. Natural Roots is family-owned organic farm that has operated for over 13 years and now serves over 120 families under a community-shared-agriculture (CSA) business model. The farm is also a host to many of my honeybee colonies used for the production of local honey and queen bees.

The NED pipeline threatens the health and viability of farms in our geographic area.

The emissions released by pressure-relief valves along the pipeline's path (one of which is located less than 1 mile from Natural Roots Farm) threaten both the environmental quality of the pipeline's immediate surroundings and the economic viability of food-production operations that rely on clean air and precipitation, as well as a landscape that is up-kept and clean. The prospect of noise- and air-pollution in Conway (as well as all communities along the pipeline's path) jeopardizes both the perceived and actual health of farm environs, and as such could lead to the demise of many agricultural operations along its path. The loss of these farms would cost not only the livelihood of its proprietors and workers, but would also be a blow to the valued New England landscape which they collectively form.

The current path of the NED pipeline threatens the viability of my agricultural business.

Entomologist Jerry Bromenshenk of the University of Montana, Missoula, has described bees as acting "like flying dust mops." Bromenshenk and his colleagues at the Sandia National Laboratory have shown that as bees forage for nectar and pollen, they attract particles of dust, airborne chemicals, soil, and pollen to their plumose, electrostatically-charged bodies. These particles are then brought back to the hive, where they can become embedded in the wax matrix in which brood is reared. Brood, particularly bees in larval stage, can be severely impaired by contamination of wax because this substance can absorb and retain foreign substances for long periods of time. The situation is compounded when various poisons come in contact and react with each other within the hive—a condition known as synergistic toxicity.

Because pressure-relief valves will be releasing hydraulically-fractured natural gas (and any potential number of publicly undisclosed chemicals related to its mining process) within my hives' foraging grounds, my colonies run the risk of suffering from airborne contamination stemming directly from the NED pipeline. Such contamination could potentially aggravate or decimate my livestock, as well as (actually or perceptually) taint the honey I harvest, thus decreasing the sale-ability of my farm products and the viability of my agricultural business.

The NED pipeline lengthens our economy's dependence on hydrocarbon fuels.

While it burns cleaner than fuel oil, natural gas is still a hydrocarbon fuel that generates significant emissions. Hydraulically-fractured gas, in particular, creates a tremendous amount of emissions as it is mined (a sizable percentage of it is not captured during mining and seeps into the atmosphere) and transported (valves release it into the atmosphere to equalize pressure at multiple points throughout a pipeline's trajectory). Methane, which constitutes the bulk chemical composition of natural gas, is a powerful greenhouse gas and ozone-depleting agent. Furthermore, hydraulically-fracked natural gas mining utilizes copious amounts of water that is laced with hundreds of chemical agents (many of them known carcinogens). Such a process pollutes water supplies in areas where the gas is extracted.

A better use of our energy resources would be to not increase our use of hydrocarbon fuels, instead investing in cleaner technologies such as solar-electric power and programs that promote energy efficiency. Mass Save, an initiative that subsidizes home energy audits and provides incentives for switching to energy-efficient appliances, is a great example of such a program. Together, these these technologies and initiatives

could provide not only a substantially lower carbon footprint, but also far more jobs—and a far more widespread distribution of economic benefits—than the NED pipeline, which would create comparatively fewer, more short-lived employment opportunities and would concentrate economic benefits in Kinder-Morgan’s pockets.

Finally, I ask that you delay the NED’s environmental permit application process until results from Massachusetts Attorney-General Maura Healy’s regional gas capacity study are made public. The stated goals of this study are to “better understand the need for additional gas capacity in the New England region,” and “to better identify and evaluate options to address electricity reliability needs, including natural gas capacity and demand, in New England through 2030.” The scope and source of this study are offer a significant opportunity to the citizens of Massachusetts to better and more objectively understand the status quo of our region’s energy infrastructure and needs. The claim by pipeline developers that New England needs more natural gas may not be an accurate one. Waiting for the outcome of this study to be shared with the public, and extending the opportunity for more voices to be heard in light of the information it reveals, would be a fair and prudent decision for the FERC.

Thank you kindly for considering my comments on this project. Sincerely,

Daniel Berry  
Invisible Cities Apiary

August 30, 2015

Re: Docket No. PF14-22-000

Dear Sir/Madame-

I am writing today to strongly urge FERC to agree with the thousands of people in MA, NH, and NY who understand that the North East Direct pipeline proposed by Kinder Morgan is a terrible idea which will ultimately produce horrific results for the people in the destructive path of the pipeline. I live on Main Street in Hancock a small village and idyllic community off of route 43 in MA. The currently proposed pipeline will cut through the southwest end of the village, following the track of the power lines. All the homes on Main Street are serviced by private wells which will be rendered unusable by any leakage from the proposed gasoline. What are the contingency plans (if any) when the only source of drinking water for the 50+ families in the village becomes toxic? I refer you to an article in Chemical and Engineering news describing the chemicals found in fracking wastewater, March 16, 2015: ([http://www.cendigital.org/cendigital/20150316\\_ROW?sub\\_id=ufISUmRyh6mR#pg10](http://www.cendigital.org/cendigital/20150316_ROW?sub_id=ufISUmRyh6mR#pg10)). Utilizing sensitive mass spectrometry analysis, thousands of compounds were found, “There is a huge diversity of chemicals in the produced water... [We] have identified more than 10,000 mass spec peaks, which can be assigned more than 2,500 chemical formulas.” Many of these formulae have not yet been identified. As for the concoction, this fracking fluid may change with every dig and is currently a trade secret for those doing the drilling: [http://www.cendigital.org/cendigital/20150316\\_ROW?sub\\_id=ufISUmRyh6mR#pg15](http://www.cendigital.org/cendigital/20150316_ROW?sub_id=ufISUmRyh6mR#pg15). Those non-polar compounds will tend to travel with the natural gas, coursing through the pipeline. The catastrophic nature of a spill, or more insidious- a slow leak over months- is underscored by the fact that we DO NOT KNOW the IDENTITY of the chemicals traveling with the natural gas. The expectation of water free from probably carcinogens is a basic human right and I implore FERC to follow their scientific principles and moral compass to deny this pipeline.

Sincerely,

Dr. Cathleen Duffy, PhD  
161 Main Street  
Hancock, MA 01237

**20150831-5099**

Deborah Donaldson, Conway, MA.  
FERC

I am a resident of Conway, MA, a jewel of a town if the foothills above the Connecticut River Valley. We pride ourselves in being self sufficient New Englanders, growing a lot of our own food in a sustainable, healthy environment. We strive to maintain a home of native populations of flora and fauna. Cutting a new pipeline through some of the most pristine land in the state is a crime that will disrupt the delicate balance we work so hard to maintain.

**20150831-5101**

Isabel VB Berg, North Reading, MA.

I am writing to register my opposition to the proposed Tennessee Gas Pipeline Company's Northeast Energy Direct Project that seeks to run a major gas pipeline through North Reading, Massachusetts, entering from the Wilmington town line and exiting near the Lynnfield/Reading town line, generally following the National Grid easement. I am an abutter.

This pipeline would pass through and affect protected wetlands. It would pass through the Ipswich River watershed which supplies our Town's drinking water. It would pass through vernal pools. It would pass through and disturb several recently discovered Wampanoag campsites. It would significantly impact many of our neighborhoods, including the neighborhoods near Walmart, the Damon/Park/Gould Street neighborhood and the Scotland Heights/Mentus Farm Lane neighborhoods. It would cross major streets in our Town including Main Street near Wal-Mart, Park Street near Damon Street and Haverhill Street near Mentus Farm Lane.

This pipeline has the potential to cause serious and irrevocable harm to our town's water supply, and it could damage and destroy the natural resources of our region. Our neighborhoods could see spills or leakages that would result in the polluting of the aquifer. Gas leaks could also result in major explosions that would destroy our neighborhoods.

This pipeline will cut a scar through the region, causing irreparable harm to our community and our property values that cannot be mitigated.

It is my understanding that no determination has been made that additional gas pipelines going through the Town of North Reading are critically necessary now or in the foreseeable future. Even were such a determination to be made, it is my understanding that existing gas pipelines in neighboring towns could be expanded with significantly less of an impact.

For all these reasons, I oppose the construction of this new pipeline through our neighborhoods in North Reading, Massachusetts.

**20150831-5102**

Cathryn McDonough, Conway, MA.

As a 10 year resident of Conway, MA, I am writing to express my deep opposition to the proposed Northeast Energy Direct pipeline. The risks of moving forward with the pipeline are myriad and far outweigh the potential benefits.

Construction of the pipeline will destroy pristine land here in western MA, damaging fragile ecosystems including precious native plants and wildlife.

The pipeline will pass within short distances of homes and farmland. We get our food from one such farm, Natural Roots CSA, in Conway. Gases and chemicals released from the pipeline will contaminate the nearby air, water and soils, and ultimately the food we eat.

Property values are already dropping due to the proposed pipeline. We know of homes that are now "unsalable" because they are in the "incineration zone" and nobody wants to live there. The current home owners

are likely to lose many hundreds of thousands of dollars--their life savings and their dream of living safely in this beautiful area.

Building a pipeline is not forward thinking. We need to reduce our reliance on fossil fuels and invest in new clean technology and energy conservation. Also, the owners of existing pipelines could save large sums of money and provide more gas by repairing leaks in their pipelines.

If for no other reason, we should reject this pipeline in the interest of future generations. By doing so, we are taking steps to preserve the precious land, air, and water for our children and grandchildren. Once we destroy and foul up these natural resources on which we rely for our very survival, they may be gone forever.

Sincerely,

Cathryn McDonough

Washington, D.C. 20426

Attention: Kimberly D. Bose, Secretary

Reference: Docket No. PF14-22.000

Dear Ms. Bose:

I would like to make the following comment on the above mentioned docket. Constitution Pipeline's initial preferred route (CP13-499) located the pipeline 25 feet from the front door of my dwelling. On December 2, 2014, FERC issued an order making Constitution move the pipeline slightly to the North, about another 50 feet or so away from my dwelling. FERC also ordered the right of way and temporary right of way be reduced to 75 feet total. With this being ordered, there is absolutely no room for TGP's 110 foot wide work-space area, let alone a 50 foot permanent right of way, between Constitution Pipeline and my dwelling.

On April 7, 2015, I attended TGP open house in Davenport, New York. TGP representative that I spoke to was James Considine. He and other representatives for TGP assured me that TGP would never dislocate a dwelling from their pipeline route. James Considine said, "TGP would relocate the pipeline".

Sincerely,

George Meszaros, Jr.

TESTIMONY FOR FERC SCOPING OF ITS EIS ON THE NED PIPELINE PROPOSAL, FERC Docket PF14-22-000

My name is Fred Jennings and I live in Ipswich, MA. I am currently the elected president of both the Greater Boston chapter and the Nor'East (MA) Chapter of Trout Unlimited (representing a total of about 1500

concerned MA citizens), and am an avid fly angler for trout and other species. I hold a Ph.D. in economics and consider myself, among other things, an ecological economist. I am president and founder of the Center for Ecological Economic and Ethical Education.

I have several concerns about this pipeline project that I'd like to raise here. First, is it necessary? Second, is it being conducted in a legal manner? Third, and perhaps most importantly, what will be its impact on MA's brook trout?

First, is it necessary? The proponents of this pipeline claim that it is needed to meet local energy demand, yet they are also explicitly proposing a reversal of flow of natural gas into Canada – Nova Scotia specifically – to export it to Europe and elsewhere for a far greater profit than local sales would bring them, while the costs of construction of this pipeline project are to be fully borne by local rate-payers. In July, MA Attorney General Maura Healey announced that her office will undertake a study to assess long term energy needs and alternatives. According the attorney general's press release, "a key focus of the study will be the question of whether more natural gas is needed in the region, and if so, how much more capacity is needed." The announcement goes on to say that in prior studies assessing energy needs, "none have answered the precise question of how much additional gas is needed in the New England region and whether that gas can be supplied by LNG or [whether] additional pipeline capacity is needed." Two reports from the Greenfield Recorder on 20 Aug 2015 suggest the NED pipeline project is not needed in this state. These alleged needs should be validated.

Furthermore, are there alternatives? Current alternative proposals include upgrading the Algonquin pipeline to increase capacity to a level adequate to meet the region's alleged energy needs with little or no adverse environmental impact in Massachusetts, and no impact on environmentally sensitive areas in western Massachusetts. The NED pipeline project is a new route that will be very destructive to local ecologies and watersheds, with a proposed 100-foot right-of-way for construction and a permanent right-of-way of 50 feet in width for the entire length of the pipeline, to be maintained with pesticides, mowing and other intrusive means, plus large intermittent boosting facilities along the entire route. If there are alternatives less destructive to our valuable environmental resources, those alternatives should be pursued.

Second, is this proposal being conducted in a legal manner? I am neither a professional attorney nor an expert on MA environmental law. However, it is my understanding that protected conservation lands, at least those designated as Article 97 lands, cannot be turned over to private interests without a two-thirds vote of the MA legislature. Yet this pipeline plan is sited to cross Article 97 lands and through other areas strongly protected by conservation restrictions as well as sensitive wetlands and watersheds. These siting decisions have been made by intention, to cross through realms of lower population density so there will likely be fewer landowners to object to the project. Yet no provisions have been made (to my knowledge) for such legislative approval. Such a flouting of the State Constitution is unconscionable.

Third, and perhaps most importantly, what will be the impact on MA's remnant populations of native brook trout? The proposed course of this pipeline involves many stream crossings, which can be engineered in multiple and diverse ways, all of which impose some major risk to the watersheds involved in these crossings. One hundred years ago, much of New England, and certainly all of the Berkshire region and Pioneer Valley, had healthy brook trout streams. Today, after decades of land development, brook trout have entirely disappeared from 7% of their historical habitat, have been greatly reduced in another 28% of this habitat, and reproducing populations are unknown in another 42% of their historical habitat. (<http://www.mass.gov/eea/agencies/dfg/dfw/fish-wildlife-plants/fish/trout-information.html>)

Furthermore, according to the 2006 Eastern Brook Trout Joint Venture Report on the status and threats to the species, analysis reveals that in only 5% of the wild and native brook trout's historical habitat does a fully sustaining brook trout population exist, with a reduced but sustaining level in 9% of this historical habitat. (<http://easternbrooktrout.org/>) Virtually all of these intact populations reside in the western part of the state where the NED project will be located. This is another important argument in favor of finding alternatives to this ecologically destructive proposal. But if it is indeed pursued, then someone must speak for the trout to

assure all stream crossings will be built for minimum impact.

Here are some of the issues that should be addressed in FERC's Environmental Impact Study (EIS) with regard to the proper protection of these few remnant wild and native trout populations in our Massachusetts watersheds:

- A full evaluation of the potential impacts on native and wild trout populations and their watersheds is needed, especially with regard to the effects on water temperature and trout reproduction of silting and land clearance. This should include the impact which deforestation of thousands of acres will have on water temperatures in the affected watersheds (i.e., Hoosic, Housatonic, Westfield, Deerfield, Millers, and Connecticut Watersheds) at the level of first order tributaries through to the large rivers. In addition, approximately 15 different direct negative effects from sedimentation have been demonstrated to impact trout and salmon, ranging from stress, altered behavior, reductions in available invertebrate prey, reductions in growth and direct mortality. There must be an assessment of the quality and turbidity impacts of any proposed efforts to mitigate the potential for erosion and sedimentation effects from construction of the NED pipeline on MA trout streams' water quality and aquatic life.
- The FERC EIS should include a detailed analysis of alternative routes and construction methods that avoid or minimize impacts to native and wild trout populations and their watersheds, including smaller rights-of-way (e.g., 50 foot rather than 75 foot and 150 foot rights of way), which might be made feasible by using alternative construction methods, a careful study of which should be conducted as part of the approval process.
- Complete stream restoration plans must be made for each stream crossing, based on the best available science, that work to restore these streams and streambeds to their original status with harmful long-term impacts avoided. Stream crossing methods should be determined on a site-by-site basis founded on a study of field conditions and stream characteristics at each crossing, and with an accounting of potential flood conditions. These analyses should be based upon actual field conditions and not just a desktop analysis. The wet crossing method should not be used for any crossings on native and wild trout streams. If dry crossing methods are specified, then the type of dry crossing method should be identified as each type of dry crossing has unique impacts that must be identified in the EIS so that appropriate mitigation measures can be included therein. Also, adequate information about stream characteristics should be collected at each proposed stream crossing, which should include, at the very least: proximity to the nearest confluence up and downstream; stream discharge, channel gradient, channel sinuosity, stream substrate, cross-sectional surveys, channel debris; sediment storage, and stream order; information about bed and bank stability, scour depth and depth of pools; and a scour depth analysis to determine the potential for vertical or lateral adjustment of each stream. Any stream not previously assessed by the Massachusetts Division of Fisheries and Wildlife for fish bearing status should have this status determined and have careful protections set in place for all species of fish therein. Further, all stream crossing installations must be able to handle a certain percentage of the 10-year, 50-year or 100-year stormflow, based upon site specific conditions at each stream crossing. This is the only way to limit potential flooding impacts. A critical shear stress analysis for all sites with any definable risk of bed scour is needed to ensure that the stream bed remains stable under flow conditions associated with 100-year storm events and that the pipeline company is using the best engineering practices to assure that stability. No crossing should compromise channel stability.
- The FERC EIS should insist on geotechnical feasibility studies for each stream crossing to determine if horizontal directional drilling, Direct Pipe™ or other conventional bore methods are appropriate and feasible in each case, and the depth that the pipe is buried beneath the stream must be determined on a site-by-site basis, based upon the potential for vertical or lateral adjustment of the stream. Also Kinder Morgan should be required to observe the setback requirements for vegetation cutting promulgated by the Massachusetts Rivers Act.

The impact of this pipeline proposal should not be allowed to destroy what few are left of MA's remnant and surviving populations of native and wild brook trout, just so one big private company can make a profit

exporting natural gas for a short period of time. There is an enormous effort underway by many governmental and non-profit NGOs to bring back these special native species of wild brook trout to our state waters throughout the northeastern United States. This NED pipeline proposal should make every effort not to undermine these ongoing efforts and must protect these watersheds!

In sum, I've asked three questions. First, is this pipeline necessary, if its primary purpose is for one large energy company to profit by piping natural gas to Canada for export to Europe in order to get a much better price than is available in the domestic U.S. market, while local rate-payers foot the bill for this project's construction? Second, is this NED pipeline proposal being conducted legally, if it flouts the provisions for protecting conservation land as specified very clearly in our State Constitution? Third, are the few remaining remnant native brook trout habitats in this state being properly and duly protected in this proposal, along with the watersheds they need to survive, or will what is left of our wild native brook trout be extirpated by this ill-conceived project? Who will stand up to speak for our trout and their watersheds?

Given the fact that the Massachusetts attorney general seeks time to understand the needs and alternatives more thoroughly, and the fact that there are several proposed alternatives to this ecologically destructive pipeline project, I respectfully request that FERC reject the NED project, or at least extend the comments period to allow the results of our attorney general's study of need to be fully and properly accounted for in this decision, despite Kinder Morgan's attempts to fast-track this project.

Because this construction project is clearly adverse to trout habitat and will contribute to its long term degradation if not the potential extirpation of wild and native trout populations in this state, your diligence in ensuring that the effects of this pipeline are mitigated, remediated, or eliminated is of critical importance. Consequently, I would respectfully request that FERC vote to reject this NED pipeline proposal and take "no action" thereon.

Sincerely,

Frederic B. Jennings Jr., Ph.D.

## **20150831-5105**

Penny Schultz, Haydenville, MA.

The pipeline will have a negative and disruptive effect on the land through which it is built: deforestation, pollution of streams, many acres of conservation land torn up, sensitive ecosystems threatened, private land taken against the wishes of the owners.

The claim that New England needs more natural gas capacity, especially in peak periods, and therefore needs this pipeline, is a fallacy. Most of the gas that will move through it is slated to be sold overseas.

Given the urgency of climate change, building another natural gas pipeline is the wrong thing to do. First, fix the well-documented leaks in the current pipelines. Doing that, in addition to the government and people in Mass investing in more solar installations and more energy conservation, will go a long way towards solving New England's energy needs.

On a personal note, my church is located a few miles downhill from the planned compressor station in Windsor. I also have many friends who live within a small radius of it. This compressor station is of a scale so huge that nothing anywhere in the Hilltowns is equivalent to it. The noise it will generate, and the powerful lights which will burn 24/7 will ruin the rural quality of life for miles around, and the lives of the people who have chosen this spot to live in for the exact qualities that will be destroyed by it.

Finally, who is paying for installing this pipeline? The gas customers of Massachusetts are paying through their gas bills. So, the public is paying twice- through loss of farmland, damage to conservation land, and pollution, as well as through the pocket book.

**20150831-5106**

Evelyn Taylor, New Ipswich, NH.

I just took this from Kinder Morgan's web site: "We ensure public safety and safe pipeline operations through employee training, regular testing, right-of-way aerial and foot patrols and adherence to our comprehensive Integrity Management plan and procedures."

FERC needs to review the history of safety violations by Kinder Morgan/Tennessee Gas as it does not show they ensure public safety. To ensure is to make certain and they have done that as people have been harmed. Furthermore, test procedures and results are not public and thus there is no proof of being safe. Pipeline activities are under protective cover similar to what we faced with cigarette companies.

They also state "We are committed to operating our assets in a safe, ethical and transparent manner." They are not transparent as they do not disclose the full nature of accidents and harm. Non-disclosure prevents proper investigation and studies to fairly evaluate the harm that is being done. These techniques are not transparent at all. FERC needs to bring the truth forward.

**20150831-5107**

Stuart Sargent Jr., Dalton, MA.

My name is Stu Sargent Jr.

I was a Dalton, MA selectman for 5 years.

I was on the board when the board voted unanimously to allow Kinder-Morgan surveyors.

I was the most outspoken, reminding my board members that there was a debate about liquid gas coming into Boston harbor on ships after 9/11.

I thought the pipeline would be a safer way to supply energy east of Berkshire County.

In May I stepped down. In June a special meeting overturned the permission to survey. Since then, the only voice you've heard is the opposition. I can tell you that there is a silent voice out there in Berkshire County. Residents with natural gas are happy with the cost. Businesses are happy that the cost of doing business is cheaper.

The opponents keep saying that the experts aren't being truthful about the lack of gas in Massachusetts. One county over they are having a 3 to 5 year moratorium on new gas hookups.

Also, with the local power plants shutting down...Mt. Tom, Yankee nuclear, etc., I can't see New Englanders making enough energy with solar in the wintertime.

I, myself went with gas first and we now also have solar. I use the natural gas as a bridge to a greener home. I feel we should use natural gas as the next step to a healthier world.

The way I see it, if our energy plants, our vehicles, buses, trucks, cars, are all run on natural gas or propane we would cut our carbon footprint in half and be way ahead of our global goal.

One last thing, the protesters keep saying solar and wind...the New Englanders I know that have natural gas use it for heating their homes and cooking.

Thank you for your time.

Stuart Sargent Jr.

**20150831-5108**

Susan Bentley, Averill Park, NY.

Re: NED Pipeline PF #14-22

I am writing to urge FERC to not approve the NED Pipeline. I am a resident of Burden Lake in the Towns of Sand Lake and Nassau, New York. The pipeline and compressor station is proposed to be built 2000 feet from the south end of Burden Lake.

Burden Lake is a recreation lake. It is home to hundreds of families and many species of wildlife. I have lived on this lake for over 50 years. My lakefront property has been in my family for three generations. I want to ensure that myself, my nieces and nephews and great nieces and nephews continue to enjoy the same quality of life. Surrounding the lake, the landscape is farmland, forested and country lanes. People live here because they do not like the hustle and bustle and pollution of city life. My cousins always comment on the starry nights we enjoy.

There are many reasons why this compressor station should not be placed on Clark's Chapel Road in Nassau, New York.

- Safety is first and foremost. NYS has banned fracking because it does not want to subject its citizens to toxins associated with fracking. Therefore, why should the citizens get a compressor station that emits the same toxins. Kinder Morgan has a very poor safety record with many leaks and explosions. These leaks affect contaminate the ground and water, pollute the air, and affect the health of nearby residents, wildlife and plant life. Our water is supplied by individual ground water wells. I fear what will happen when our wells become contaminated.
- Our country lake setting will become an industrial site. We live here because of the beauty, quiet and clean environment. We can start our day with our morning coffee on our deck overlooking the lake and watch the fish jump, the birds fly, the duck swim, the eagle soar and the frogs ribbit. The noises we hear are those of nature not an industrial plant.
- Fracked gas is not in alignment with President Obama's Energy Policy. President Obama recently announced his proposal to cut emissions of methane gas in half in order to reduce impact on climate change. The compressor station contributes too much to climate change. We should not be building more fossil fuel infrastructures. We should be building renewable energy infrastructures. How will approval of this project align with the President's energy policy? I will not and, therefore, should not be approved.
- Eminent domain should not be granted to a private company for its own gain. None of the natural gas transported through the pipeline is intended for those being affected. None is intended for residents of Sand Lake or Nassau, or any resident of New York. This natural gas is for exportation. Yet residents along the pipeline and particularly those close to the compressor station will be bearing the extensive and dangerous burdens of this project. Solely so Kinder Morgan can make more money. This is not only an unconstitutional application of eminent domain – but its un-American. Our forefathers fought long and hard for protection against this kind of injustice.
- Property values will drop. Who is going to pay nearby residents for the decreases in their property values. Payment for easements do not come close to paying residents for the increased safety and health issues. Moreover, only those residents directly on the pipeline will receive payment. What about those of us nearby but not directly on the pipeline? Our property value will be affected. Our health and safety will be affected. Our quality of life will be affected.
- All municipalities involved are opposed this project. Shouldn't FERC defer to these municipalities? After all, they are best to determine what is best for their residents and communities.

We have struggled the past few years with weed growth in our lake resulting from aging septic systems. Both the Towns of Sand Lake and Nassau have spent a lot of money installing sewer lines so that the residents can get off septic and onto sewers in order to improve the water quality of the lake. It seems this expense to the Towns would be for naught if this compressor station is built 2000 feet from the lake since this compressor station.

Scoping meetings were held before Kinder Morgan submitted its impact report. Further, many of the impact in the report was to be determined. FERC should not approve this project without all the information.

**20150831-5110**

Frederick Snell, Andover, MA.

Kimberly D. Bose  
Secretary Federal Energy Regulatory Commission  
888 First Street NE  
Room 1 A  
Washington, DC 20426

re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Dear Secretary Bose and Members of FERC;

Please vote to deny permission to build the Northeast Energy Direct pipeline proposed by the Tennessee Gas Pipeline (TGP) company.

1. TGP says that the pipeline will reduce gas and electric prices in New England. In reality it is uncertain whether this is true. In the winter of 2013-14 when New England experienced price spikes in natural gas, there were also large spikes in Pennsylvania where the gas is coming from. So how can a pipeline help pricing? TGP itself has discussed exporting gas in its literature to shareholders. Exporting to Europe and elsewhere will drive up gas prices all across the US as well as in New England. The citizens of Australia discovered a huge increase in domestic gas prices once LNG exports began. Going forward, they predict a 30% increase in domestic retail gas prices.

2. TGP says that this project will bring 3000 jobs to our region. A friend showed a photo of a survey truck with the name of an engineering firm from Holyoke on the side working on the pipeline route. But a look at the license plate revealed the truck (and likely the surveyor) was from Louisiana.

To operate the incredibly complex equipment to dig and lay the pipe as well as the horizontal drilling rigs to go under rivers and highways requires very specialized workers who travel around the country following pipeline jobs. Many more permanent jobs would be made fixing the many leaks in our existing gas infrastructure and in the growing renewable energy industry.

3. The conversion of our old coal and oil fired electric generating plants to gas is said to help the carbon footprint. But some scientists say that the methane that escapes during the drilling and transportation of the gas may make natural gas conversions not that much better. We get over 44% of our electricity from natural gas today and increasing that fraction may lead us to over-dependence on gas which historically has had volatile price fluctuations. FERC needs to investigate the global warming consequences of this proposed pipeline both upstream for methane emissions and downstream for combustion effects.

4. TGP says that much of the revised route goes along existing utility corridors. What they don't mention is that the pipe cannot go down the center under the poles but will be placed outside of the corridor. In Andover MA, this means that many family homes that were screened from a view of the power lines by trees will get a direct view of five huge electric transmission lines once the trees are cleared permanently for the gas line.

5. TGP says that this pipeline is needed to meet a growing need for gas for power generation and heating. There are other competing pipeline projects that appear to more than meet projected needs by expanding existing lines. Even this capacity may not be needed if we fix gas leaks, convert to LED lighting, convert to more efficient furnaces and boilers, import renewable electricity from Canada, expand solar and wind generation, use existing LNG import facilities to meet the 30 or so days when there is pipeline congestion, and better manage auctions for gas and electricity. A study of gas needs sponsored by Attorney General Healy of Massachusetts is expected to be complete in October 2015. No action on the environmental report by FERC should take place until this is released.

6. The NED pipeline is not wanted by the residents of the area. In the July report to FERC by TGP, it said that only 37% of the property owners along the Market Path agreed to a survey. The Town of Andover voted at Town Meeting in May to oppose this project as well as nearly every city and town through which it passes in MA and NH.

This proposed pipeline is clearly not in the public interest. If built, it will cause untold emotional and finan-

cial stress to family farmers, suburban dwellers, and others who just want a quiet place to come home to. It will enrich only the already wealthy pipeline owners and their shareholders. FERC, please do your job and stop this pipeline.

Sincerely,

Frederick Snell

US Representative Tsongas

MA State Senator L'Italien

MA State Representative Lyons

### **20150831-5112**

Mary Compton, Hamden, CT.

August 30, 2015

Dear Secretary Bose,

I am writing in regards to Docket number PF14-22-000, Kinder Morgan's Northeast Energy Direct (NED) project.

This project fails to take into consideration the environmental impact of producing and using natural gas as an energy source. Methane is 34 times more potent than carbon dioxide at trapping heat in the atmosphere. Fracked gas poses serious environmental and health risks and the rate of leaks and spills is high. The International Energy Agency revealed that a switch from coal to gas would lead to a global temperature rise of more than 3.5 degrees Celsius, a result that is regarded by the scientific community as catastrophic. According to the Pipeline Hazardous and Safety Material Administration, leaks and explosions are not uncommon and have increased in frequency in recent years.

Why is this scientific research ignored? The environmental impact of this project on our communities is too costly and is not a valid solution to our energy needs. Sustainable, renewable energy is possible and along with conservation, is a step towards a future-this project puts on an environmental degradation slide into a future of polluted air and water.

A concerned environmentalist,

Mary Compton

### **20150831-5113**

Kristen Campbell, New Ipswich, NH.

The compressor stations for the pipeline will be minimally staffed if not fully automated and will become a soft target for terrorism.

### **20150831-5114**

Kristen Campbell, New Ipswich, NH.

The natural gas that will be transported through this pipe is not for NH. It is destined for Nova Scotia, where it will be converted to liquid natural gas and exported. So those who believe this gas will lower their energy costs are mistaken. We will be paying world market prices, which are monumentally higher than what we pay now. This pipeline is all risk and no benefits for NH. We should not have to pay for and suffer with it.

**20150831-5115**

Kristen Campbell, New Ipswich, NH.

Pipelines require compressor stations, and compressor stations are ginormous polluters. Their emissions do not have to be disclosed. They do not have to be monitored or managed. Compressor stations are exempt from such regulations. Recent studies of populations in the vicinity of compressor stations show increases in all manner of health issues, from constant bloody noses to cancers to still births. I don't know how this can be ok. These pipeline companies say they want to be good neighbors but they poison their neighbors with all the emissions and no one is held accountable. Why are they exempt from these regulations?

**20150831-5116**

Kristen Campbell, New Ipswich, NH.

Kinder Morgan has, in its FERC application, requested that the costs of building this pipeline be passed on to us. Yes, the people who host this pipeline also get to pay for building it, even though the gas is not for us, even though it will dramatically increase our air pollution. This will most likely come in the form of a tariff on the electric bills that the pipeline supporters think are already too high. I can't figure this out. First they are going to take land away from people to build the pipeline, then they are going to poison us with the emissions from the compressor stations, and we also have to pay to build and maintain this monstrosity?!? With all the money Tennessee Gas Company has, why can't they pay for their own project? Why can't they maintain it? While our taxes rise from this project, our property values decrease. How is this ok?

**20150831-5117**

Kristen Campbell, New Ipswich, NH.

Kinder Morgan has to demonstrate NEED by signing on customers. Liberty Utilities has signed on. But Liberty Utilities is a subsidiary of Algonquin, and Algonquin is in partnership with Kinder Morgan in the construction of this pipeline. So what we have here is a game of smoke and mirrors, not evidence of need. Only a fraction of this gas may be going to Americans in MA. This gas is mostly for export overseas. I thought that FERC has to have clear public need for projects like this. I don't think there is enough public need to warrant this project. Why destroy so many communities so the gas company can make money. This project does not help America!

**20150831-5118**

Kristen Campbell, New Ipswich, NH.

Southern NH has been deemed a "low kill zone," so this section of the pipeline will be built using thinner walled pipe and many more miles between shut off stations. It will leak. It will pollute. It could explode! It may not be as high density here as in a city, but our lives still matter! Why do they get to half ass the project? And the citizens still have to pay for it!? I feel like that alone should stop this pipeline all together. The lack of concern for human life.

**20150831-5119**

Kristen Campbell, New Ipswich, NH.

The gas company will cover any costs of repairing and mitigating for any affected wells within 200' of the pipeline. Blasting can affect aquifers 30 miles away. What about damage to everyone else's wells? This project will negatively effect people for miles!

**20150831-5120**

Kristen Campbell, New Ipswich, NH.

Southern NH has been deemed a "low kill zone," so this section of the pipeline will be built Using thinner walled pipe with many more miles between shut off stations. How is this ok? If there was an accident, our

pristine conservation land would just burn! The whole point of conservation land is to let nature do what nature does and save these places for our children to enjoy. This project would devastate many miles of conservation land and those animals which inhabit it.

**20150831-5135**

**Mason Conservation Commission**

16 Darling Hill Road

Mason, N.H. 03048

August 28, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

Dear Ms. Bose:

The enclosed letter expressing concerns about the Northeast Energy Direct natural gas pipeline project (FERC docket PF14-22-000) was written jointly by a group of conservation commissions in New Hampshire. Thirty-five New Hampshire conservation commissions signed the letter. The Mason Conservation Commission agreed to distribute the letter on their behalf, and will act as liaison to this group should you wish to communicate on this matter. We agreed to serve in this role solely for logistical reasons, to provide a single point of contact. The letter itself is very much a collective effort, and the Mason Conservation Commission is but a single signatory.

Respectfully,

Robert Dillberger  
Mason Conservation Commission

-----  
August 28, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

Dear Ms Bose:

As conservation commissions for the state of New Hampshire, we are dedicated to protecting the natural resources of our towns, and have taken an oath to that effect. New Hampshire state law (RSA 36-A:2) authorizes the creation of conservation commissions “for the proper utilization and protection of the natural resources and for the protection of watershed resources” within their respective towns. We, the undersigned, find that the Northeast Energy Direct (NED) pipeline project (FERC docket PF14-22-000) threatens to damage these resources in many ways. Furthermore, if approved in its current form, the project threatens our ability to perform our duties in the future. We therefore believe our responsibility requires that we oppose the project for the reasons described herein.

**Impact on Future Conservation Efforts.** As currently proposed, the NED pipeline will cross at least 34 conservation properties in 15 New Hampshire towns. Most of the land being crossed by this project was acquired either by gift or by fee purchase authorized by the relevant towns. The protection of this land was made possible by citizens, voters, and donors who believe strongly that New Hampshire’s natural environment is worth protecting now and for future generations.

In many cases, money used to protect these lands came in part from state funds created for this purpose. In particular, the Land Conservation Investment Program (LCIP, established by RSA 221-A, since repealed)

and the Land and Community Heritage Investment Program (LCHIP, established by RSA 227-M) have both provided public matching funds without which some of these lands would have been lost to development. The intent of these laws is clear, as illustrated by this excerpt from RSA 227-M (emphasis added):

The general court finds that **in order to maintain New Hampshire's quality of life and economic vitality for its citizens**, growth and development should be balanced with careful protection of the state's most important natural, cultural, and historical resources. **Permanent protection of these resources**, through acquisition of lands, buildings, and other physical assets, or interests in these assets, must be accomplished along with their planned long-term stewardship .... The intent ... is to conserve and preserve this state's most important natural, cultural, and historical resources .. **for the primary purposes of protecting and ensuring the perpetual contribution of these resources to the state's economy, environment, and overall quality of life.**

Going still further, both programs create a public trust that bestows upon the State of New Hampshire the responsibility to protect these lands in perpetuity (emphasis added):

Resource assets acquired under this chapter through the use of the trust fund for the program **shall be held in public trust and used and applied for the purposes of this chapter**. Notwithstanding any other provision of law relating to the disposal of publicly-owned real estate, **no deviation in the uses of any resource asset so acquired to uses or purposes not consistent with the purposes of this chapter shall be permitted.** -RSA 227 -M:

14

It's worth noting that the law does provide for an exception to this mandate. Specifically, RSA 227-M:13 allows for these lands to be used for minor adjustments to state highways. However, the exception includes a strong qualifier: "Approval shall not be granted if reasonable and prudent alternatives exist nor if individual or cumulative approvals are likely to materially impair the conservation or preservation purposes for which the parcel was originally protected." This wording makes clear that even in the case of an allowed exception, conservation concerns take priority.

Also germane is Article 12-a of the New Hampshire State Constitution which states:

No part of a person's property shall be taken by eminent domain and transferred, directly or indirectly, to another person if the taking is for the purpose of private development or other private use of the property.

Because NED is a private development project, Article 12-a applies. This article is not specific to conservation land but rather applies to all real property within the state. Thus, unlike the LChiP and LCHIP programs, it provides some protection for lands currently being considered for conservation, or for which conservation plans are underway but not yet finalized. Several properties along the pipeline route fall into one of these two categories.

Citizens of New Hampshire have a right to expect these commitments to be upheld, and could lose faith in such protections if NED is allowed to proceed as planned.

The immediate destruction of this land, and the effects on adjacent land, watersheds, and wildlife habitat is bad in itself; we describe these effects in the remainder of this letter. Beyond that, we expect that the loss of even part of this land to a private (i.e., non-governmental) for-profit project by a private company (Kinder Morgan and its affiliate Tennessee Gas Pipeline) will undermine the towns' and state's ability to acquire such protected lands in the future. It seems reasonable to ask why anyone would give such a gift, or authorize such a purchase, if a key justification for such acts-perpetual protection-can be so easily dismissed in direct violation of state law?

Completion of this project as currently planned will send the strong message to the conservation-minded public that state laws can be ignored and protected land taken for private use if a private corporation wishes to use that land for a profitmaking venture.

**Impact on Water Resources.** NED has the potential to adversely affect groundwater and surface water along the proposed route. Both resources are of great concern.

Groundwater is a vital resource in all areas of human habitation, and particularly so in southern New Hampshire where a large proportion of citizens rely on private wells as their sole water supply. Some towns do

have public water, but those public supplies are themselves fed from in-ground wells.

Approximately 18 miles of the planned pipeline route (25% of the total length in New Hampshire) lie within known stratified drift aquifers, yielding 320 acres of pipeline right-of-way (ROW) within aquifer boundaries<sup>1</sup>. Approximately 9 miles of the pipeline route (13%) is planned to pass through soils where blasting is likely to be required<sup>1,2</sup>. Some of these potential blasting zones are near or within these stratified drift aquifers. The remainder of the likely blasting zones are equally troubling, lying within or near the bedrock aquifers from which many private wells derive their water.

Surface waters too are at risk. The pipeline ROW will directly disturb approximately 440 acres<sup>1</sup> of known<sup>3</sup> wetlands across southern New Hampshire. Among their many irreplaceable environmental services, these wetlands collect rainwater that ultimately contributes to aquifer recharge. Additionally, 70 water bodies (streams, brooks, rivers, ponds, and lakes) of varying size will be crossed.

The potential impacts from NED to water resources within these critical and sensitive areas include:

- Well contamination from nitrites or nitrates introduced during blasting.<sup>4</sup>
- Well contamination from previously bound naturally occurring pollutants (such as arsenic and radon) released by blasting.”
- Loss or reduction of well output through changes in bedrock channels caused by blasting. (Many private wells are bedrock wells, although the exact proportion of wells fed from bedrock aquifers and stratified drift aquifers is unknown.)
- Contamination through prolonged herbicide use to control vegetation in certain parts of the ROW.<sup>5</sup>
- Contamination through fluids leaked from construction vehicles operating in wetlands and above aquifers, or fluids spilled during fueling or maintenance.<sup>6</sup>
- Direct disruption of hydrology through soil disturbance (dig and fill), particularly in wetlands where necessary soil layering takes centuries to develop and is difficult to recreate once disturbed.
- Direct disruption of hydrology through changes in topology, affecting runoff patterns and rainwater accumulation needed to recharge aquifers.
- Direct drawdown of aquifers due to hydrostatic testing that might require more water than many of these aquifers normally produce.<sup>7</sup>
- Erosion and sedimentation during construction of water crossings affecting fish and stream life. <sup>8,9</sup> Of special concern is the time period between when construction ends and vegetative cover is re-established. With personnel no longer regularly on-site, the beginnings of erosion can go unnoticed and develop into serious problems that could have been prevented if caught early.
- Increased ground temperature in the vicinity of the pipeline, changing the thermal characteristics of traversed water bodies and potentially affected associated biological communities.

In summary, the cumulative effect on groundwater and surface waters of temporary (during construction) and permanent (post-construction) disruption within these areas is potentially great, yet difficult if not impossible to predict. In our view, the potential (and unproven) benefits of the project are insufficient to justify the risk involved.

**Impact on Wildlife Habitat.** Twenty-four miles of the proposed pipeline route, nearly one-third of its total length in New Hampshire, passes through wildlife habitat rated by the New Hampshire Wildlife Action Plan as “highest ranked” within New Hampshire or our biological region.<sup>10</sup> This habitat is outstanding for its high-quality streams, productive wetlands, and unfragmented forests that sustain a great variety of wildlife species, some of them rare, others threatened or endangered. Healthy fish and wildlife populations that support traditional activities such as fishing and hunting depend on New Hampshire’s highest-ranked wildlife habitat.

In total, the proposed pipeline will directly (i.e., within the planned ROW) affect 421 acres of this important

resource (the area of indirect effect will be much larger), destroying forest buffers that shade trout streams, obliterating vernal pools needed for amphibian reproduction, disrupting natural wildlife corridors that connect feeding with breeding areas, choking streams with sediment from long stretches of exposed soils, diminishing the wetlands' ability to function by compacting wetland soil with heavy equipment, threatening the health of wetland species with the use of herbicides for ROW maintenance, and introducing invasive species that out-compete native wildlife foods.

**Impact on Air Quality.** Potential adverse effects on air quality come in two forms:

1. Direct release of methane into the atmosphere, and
2. Additional air pollutants released at compressor stations as a side effect of burning hydrofractured gas to provide power.

Regarding the first point, methane is a potent greenhouse gas. When burned it produces about half as much carbon dioxide as coal or oil, but when released in its raw form, the effect is far from benign. According to the Environmental Protection Agency, methane has a “global warming potential” twenty times that of carbon dioxide over 100 years<sup>11</sup>, Methane loss has been measured in distribution systems, and at compressor stations (via leaks and deliberate “blow downs”), valve stations, and metering stations along supply lines. Methane loss from leaks in production, storage, and transmission systems is well documented, and recent studies show the amount lost due to leaks is greater than previously thought.<sup>12, 13, 14, 15, 16</sup>

The exact amount of methane lost to “fugitive emissions” remains an elusive figure but no study of the problem finds the amount is zero. On the contrary, estimates on the high end approach 8% of total annual shale gas production volume.<sup>17</sup>, and loss from a single compressor station blow-down releases on average 15,000 cubic feet of methane<sup>18</sup>, Of course, predicting how much gas will escape from the NED pipeline in particular is almost impossible. But given what is known about gas leaks in general, it is unrealistic to think that NED will not contribute to this problem.

As a charter participant in the Regional Greenhouse Gas Initiative (RGGI), New Hampshire has a demonstrated commitment to addressing this issue. Supporting projects like NED would contradict the fundamental principle underlying RGGI.

Regarding the second point (air pollution at compressor stations), numerous reports exist of air pollution near compressor stations (where “near” means as far away as one to two miles). Some pollutants (most notably nitrogen dioxide, which contributes to ground-level ozone production) are produced by burning natural gas. Others (known as “air toxics”, some of which are known carcinogens) such as benzene, toluene, ethyl benzene and xylene are presumed to be mixed with the methane as a byproduct of hydraulic fracturing<sup>19</sup> and are released along with fugitive emissions of methane. Collectively, these and other pollutants contribute directly to adverse health effects such as asthma and other respiratory illnesses, eye, ear, and throat irritation, headaches, cognitive complaints, and many other maladies.<sup>20, 21, 22, 23</sup>

Adding to our concern is the fact that a portion of the proposed pipeline route lies within a region already identified as a “nonattainment area” (NAA) which fails to meet ambient air quality standards defined by the U.S. Environmental Protection Agency.<sup>24</sup> Introducing a known source of air pollution-one that could release measurable quantities of a significant greenhouse gas<sup>25</sup> - would undermine the very standard that established this area as an NAA and under these circumstances seems unconscionable.

Given these data, we think it's clear that NED has the potential to adversely and measurably affect air quality at both a local and a global level. As with our previously stated concerns about impacts on water quality, the precise degree of impact is impossible to predict-although we know it won't be zero-but the lack of proven benefit from NED to potentially affected communities seems poor reason indeed to proceed with the project given these very real risks.

## **Other Impacts**

**Construction Impacts.** In addition to the construction-related issues already described, construction activi-

ties can trigger additional adverse effects including:

- Removal of biological material along the ROW leaving bare mineral soil, a habitat conducive to establishing invasive plants such as Japanese knotweed and oriental bittersweet. These invasive species outcompete native species and reduce the biodiversity essential to a healthy ecosystem.
- Introduction of invasive plants through plant materials inadvertently brought to the site on construction equipment or within fill material. That is, not only will this project create sites conducive to establishing invasive plants, it has the potential to deliver those plants to the sites.
- Fugitive dust and diesel exhaust from trucks and heavy equipment on roadways (southern New Hampshire has many miles of dirt roads which are often the only means of access to planned construction sites). Both pollutants contribute to or exacerbate respiratory problems.<sup>26,27</sup> Indeed, according to the U.S. Environmental Protection Agency, diesel exhaust is already a concern in New England: “Pollution from diesel engines is a widespread problem across New England and it significantly contributes to air pollution ...”,<sup>28</sup>

**Farmland Impacts.** Some evidence suggests that soil disturbance and increased ground temperature in the vicinity of natural gas pipelines (gases in general release heat when pressurized) contributes to long-term yield reductions.<sup>29</sup> The proposed pipeline route includes almost 28 miles that cross important farmland soils within New Hampshire.<sup>30</sup> Although a small percentage of this land is currently under cultivation, the degradation of these soils will have long-lasting effects on agricultural potential.

**Noise Impacts.** Federal guidelines establish a maximum day-night average noise level for compressor stations of 55 dB at the closest noise-sensitive area<sup>31</sup> and we have no doubt that NED compressor stations will comply with this nominal statutory requirement. However, averages can be misleading. For this particular impact, we believe that peak noise level is a more relevant and important metric because the loudest noises at compressor stations occur sporadically (such as during blow downs), not continually.

Peak noise levels of 100 dB have been measured in the vicinity of compressor stations.<sup>32</sup> For comparison, the nominal requirement of 55 dB is roughly equivalent to the sound produced by a modern dishwasher. In contrast, 100 dB is about as loud as a jackhammer.

Noise alone is sufficient to cause health problems including hearing impairment, cardiovascular and other physiological effects, mental health effects, and sleep disturbance.<sup>34</sup> Here, sleep disturbance is of particular concern. Because compressor stations operate 24 hours a day, the potential exists for nighttime sleep disruption. Inadequate sleep is a proven cause of many health problems, and chronic sleep loss “has serious consequences for health, performance, and safety.,<sup>33</sup>

Evidence suggests that the difference between a loud noise and the ambient noise level is a more important factor in sleep disturbance than the absolute magnitude of the loud noise<sup>34,35,36</sup> This fact is another reason we believe peak noise is more important than average noise in this case. Much of the pipeline route in New Hampshire passes through decidedly rural areas where the typical nighttime noise level is around 35 dB. In these circumstances, a nighttime noise of 100 dB would be jarring indeed (being perceived as roughly 90 times louder than the background noise) and is easily loud enough to disturb sleep in most people.<sup>35,36</sup>

Also of concern is the low-frequency noise (LFN) produced by compressor stations.<sup>37</sup> Low-frequency noise (below 100 Hz) has been linked to numerous psychological, emotional, and physiological complaints.<sup>34,38,</sup>

<sup>39</sup> In some ways, LFN can be worse than noise at higher frequencies. In particular, LFN need not be considered “loud” to cause annoyance and irritation, and is found to be more difficult to ignore than higher frequency noise.<sup>40</sup>

In addition to the potential psychological and physiological effects of loud noise on humans, evidence suggests that wildlife might also be adversely affected by loud noise. Laboratory experiments show reactions in some animals similar to those of humans after prolonged exposure to loud noise. Other studies show that anthropogenic noise can interfere with vocalization and communication in some species, leading one author to conclude that “The inability of creatures to successfully communicate or otherwise employ their auditory

senses is detrimental to the long-term survival of these displaced creatures and the overall biological integrity of the environment.”<sup>41</sup>

## **In Conclusion**

Perhaps it’s true that New England needs more energy. However, New Hampshire, as a net exporter of electricity, does not. New Hampshire’s recently completed Ten Year Energy Strategy identifies what the state does need to prepare for the future, that being (among other things) electric grid improvements (including increased use of sustainable energy sources such as wind and solar power) and improved energy efficiency. Efficiency improvements in particular yield the cheapest, cleanest, most plentiful energy source with no adverse environmental effects. And New Hampshire has much room for improvement here; it lags behind neighboring states in adopting energy efficiency measures.<sup>42</sup>

What New Hampshire does not need is an expensive, short-term fossil-fuel fix that diverts us from energy efficiency and energy alternatives and simultaneously destroys wetlands and wildlife habitat, disrupts farmlands, degrades water quality, adds to air and noise pollution, and directly contradicts the legal mandate to hold above all else our precious conservation lands in the public trust.

We the undersigned conservation commissions of New Hampshire believe that the protection of our natural resources is a fundamental right, and that this private taking of these natural resources not only violates this right but is an egregious act against our constitutional guarantee to be protected by the State for the “enjoyment of ... life, liberty, and property”<sup>43</sup>

In closing, we acknowledge that energy unquestionably contributes to our quality of life. But the natural environment is the source of that life. Surely nothing is more important than protecting the source.

### **20150831-5137**

Photos showing apparent survey trespass on the property of Carol & Greg Blais New Ipswich, NH.

On 24 May 2015, my wife & I walked our property to post our land, and discovered a survey marker and several blaze marks along our property line (see attached photos). The location of the marker is along the power line which is the proposed NED pipeline route. This property line borders the land of Robert Sundstrom, who has also recently submitted a filing on 28 Aug 2015 in opposition to this project. This is not only our property line, but is also the town line between New Ipswich & Rindge, and is also the county line between Hillsborough & Cheshire Counties. We immediately called Patty Quinn, of Percheron Field Services, LLC who is the Contract Land Agent to TGP LLC. We got her voicemail & left a message and we did not get a return call for a few days. She denied any knowledge of a survey on our property. We had filed a deny survey permission letter on 3 Feb 2015, so did not expect any survey to occur on our property. The interesting thing is there is no public right of way access to this area without crossing private property. Our property is posted and we will not tolerate any trespass on our property.

James Brokenshire Moody (home owner), Richmond, NH.  
Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Docket#PF14-22-000

August 27, 2015

Dear Secretary Bose,

I am writing to state that I do not want a pipeline in my back yard – it is sacred ground! No doubt your office has received many letters stating similar concerns. I'm certain you understand the technical reasons a high pressure gas pipeline should not be built within yards of a home as is the case in our situation – our family is within the blast zone should an explosion occur. Since we're rural the pipe itself is thinner than in a more populated area. You know the facts.

It is critically important our message be heard, understood, and taken into consideration to stop the pipeline from being built on its proposed route & across our property. My great grandfather, U.S. Navy Commander Rev. John J. Brokenshire, purchased our homestead we call Hillside over 100 years ago. He served in WW I in the U.S. Navy as a Chaplain with a long and distinguished naval career. All of his sons enlisted in the U.S. Military and served in WW II; Admiral Douglas Brokenshire U.S. Navy (he served on the U.S.S. Sicily) and Gordon Brokenshire, his wife & daughter- all are buried just yards from the proposed pipeline path. The land they rest on is certain to be destroyed. Our memorial to Lieutenant Commander Dr. Hebert Cecil Brokenshire U.S.N.R. is at risk of being decimated by this pipeline. Brokenshire Hospital in Davao City, the Philippines is named after Hebert who stayed behind to help the U.S. war effort & the people of the Philippines after the Japanese invaded on December, 8th 1941. He became a POW, forced to trek in the Bataan Death March, and died on a Japanese 'Hell Ship' serving his country. He received the Purple Heart and other medals from the DOD as did his brothers. We owe it to these men of valor to respect their resting places.

I visited the WWII Memorial in Washington DC this week while dropping off my daughter who is a freshman at George Washington University. I have great respect for how our country honors our war heroes. We have war heroes on this property and I respectfully request our land be not be ravaged by corporate interests. Our community really needs you as a voice of our government to step up to stop this misguided corporate interest – who does not care about our heritage.

Hillside is being passed down to its fourth generation now and is in Brokenshire Trust to stay in our family for generations to come. We care for our land and the environment. A Pipeline means 40 +/- archers of our land will be clear cut and dug up – permanently. It means disruption to owl, bobcat, bear, deer & moose habitat, blasting will put at risk our wells, destruction of tree lines will mean pesticides will be sprayed into Sandy Pond watershed and end up in our water and food. Stone walls & cellar holes from the 1700's - the birth of our nation - will be completely destroyed. This is not just open land – it is your heritage and my families. We are all stewards of this land; we must demand this pipeline not be allowed to pass through our sacred ground!

Sincerely, James Brokenshire Moody (Brokenshire Trust - home owner), Vice President, MBA HealthGroup

Washington, DC 20426  
Docket#PF14-22-000

August 30, 2015

To Kimberly Bose and the Federal Energy Regulatory Commission:

There are few places on earth to which I feel so deeply connected as I do in Richmond, New Hampshire. My dad's side of the family owns a home there: Hillside. It was built around 1810, and shows it. Cold air seeps through walls and floorboards, families of mice have taken up permanent residency in the attic, and there is always a surface that needs to be scraped and repainted. Some of my earliest memories are of summers spent at Hillside's gas stove, making pancakes shaped like salamanders we collected from Sandy Pond, which I crossed the road to swim in every day. My sisters and I would lie on the dock and fish salamanders out with our fingers and nets, name them, and race them.

Unlike the house, the water, fields, and forest surrounding Hillside remain pristine since my relatives first moved in. The grassland spanning in front of Hillside's porch blooms with wildflowers each summer, and our view of Mount Monadnock is still covered by the towering pines. The woods of Richmond are expansive and untouched: the epitome of natural purity.

Tomorrow I will embark on my career as a first-year college student. As I settle into my dorm room at Foggy Bottom, it's difficult not to become nostalgic for the places where I feel the most at home.

I urge you to consider my letter and those of my family members as you decide whether or not to approve the proposed pipeline route through Richmond, New Hampshire. Beyond the negative affect the pipeline would have on my family's property, the route's proximity to a home that shelters multiple children is also concerning. The pipeline will be severely detrimental to the well being of Richmond's community, its land, and our larger global environment. I hope our voices will persuade you to oppose the Northeast Energy Direct natural gas pipeline.

Thank you for your time.

Sincerely,

Izzy Moody  
119 Sandy Pond Road Richmond, NH 03470

## **20150831-5152**

I am writing in regards to Docket number PF14-22, Kinder Morgan's Northeast Energy Direct (NED) project.

Before approval of any part of the proposed Northeast Direct (NED) pipeline I request that the FERC require comprehensive, third party, studies and testing of, but not limited to, the following, in regards to impacts of the pipeline throughout its entire proposed 71 miles through New Hampshire and the proposed compressor station in New Ipswich, NH:

1. Acoustic readings done throughout the year and in all weather and wind conditions for more that 72 hours at a time to determine current average noise levels at various locations including residences, farms, hiking trails, wetlands, and the elementary school near the proposed compressor station site. As well as studies to determine how far noise from the compressor station could potentially carry. The final plans for the compressor station must include noise reduction methods sufficient to not disturb nearby residents and wildlife and preserve the very low noise levels of the rural area of New Ipswich and Temple in which it is proposed.
2. Night-time light level readings to determine the current amount of ambient night-time light in the area of the compressor station and ensure that this is not exceeded. If it is determined that outdoor 24 hour lights must be used on the compressor station property they must conform to local dark skies initiatives and be kept to an absolute minimum.

3. Detailed water quality analysis and testing of all wells within 2 miles of the pipeline as well as studies to determine how blasting may affect those wells, aquifers, the watershed for the Greenville Reservoir, which the proposed compressor station is within, and the Greenville Reservoir itself, the supply line for which will be crossed by the proposed pipeline. Studies to determine where any pipeline related leaks or run-off are likely to flow and how that will affect wells, aquifers, the Greenville Reservoir and its watershed. If the pipeline is approved, there should be regular testing of wells during the construction process and yearly after installation for the lifetime of the pipeline to ensure that water quality has not been compromised in any way.
4. A study detailing how the long and short term effects of drinking, cooking, watering crops with, and otherwise using water contaminated with pipeline-related emissions affects the long term health of any humans, animals, or plants that come in contact with the water.
5. Air quality testing and a detailed report of all potential emissions from the construction process, the pipeline, and compressor station, both under normal running circumstances and in the event of an emergency such as a leak or explosion.
6. Studies detailing and how exposure to emissions from the pipeline, pipeline construction, and compressor station, over the short and long term effect the health of humans, including a separate study for the effects on young children; domestic animals; livestock, including livestock raised for meat and for breeding; crops, including organic, grown for food and animal feed; wild mammals, birds, reptiles, and amphibians; and wild plant life of all types.
7. Any additional studies to determine the impacts of the fact that the proposed compressor station is between 1 and 2 miles of the reservoir that provides water for the Town of Greenville and between .7 and 1.5 miles of the Temple Elementary School which serves as an emergency shelter.
8. A third party investigation into Kinder Morgan's safety record on all of its currently running pipelines.
9. A comprehensive emergency plan including training of local emergency services and police, taking into account that these are largely volunteer organizations in this area and enumerating actions and equipment needed for dealing with any pipeline related emergency that might arise including, but not limited to, leaks and explosions. This emergency plan must also take into account that the towns of Greenville and Temple share a police force and that officers may at any given time be on the opposite side of the pipeline route from where an emergency occurs.
10. Kinder Morgan be required to use thicker pipe to prevent leaks, not allowed to use thinner pipe because this portion of the pipeline is in a rural area. That Kinder Morgan also be required to install shutoffs more frequently than every 20 miles and that said shutoffs are easily accessible to local emergency personnel and that emergency personnel are trained in the use of shutoffs.
11. All studies, testing, plans, training, or other actions needed to complete these requirements be paid for in their entirety by Kinder Morgan and no financial burden for any pipeline related activity should fall on the local citizens, taxpayers, or governments. And that Kinder Morgan be required to put money in escrow to cover costs of studies, testing, plans, training, and any future reparations or damages caused by the pipeline, pipeline construction, or the compressor station during normal operation or if an accident occurs. The amount of funds to be determined by an independent third party and approved by local governments as being sufficient.

I encourage the FERC to consider this pipeline not in a vacuum but in relation to the fact that environmental impact of NED is also larger than just the immediate area of the pipeline route. There is also the environmental impact of the fracking process, which has begun to be banned around the world, and the fact that, though better than coal, natural gas is still a fossil fuel and contributions to climate change.

I further encourage the FERC to do an analysis of alternatives to building the NED pipeline focusing on renewable energy, energy conservation, already existing infrastructure, and other proposed pipeline expansion projects already being considered in the region to determine whether this project is even really necessary.

Thank you for the opportunity to comment.

Sincerely,

April Walker  
659 Darling Hill Road  
Greenville, NH 03048

Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Docket#PF14-22-000

August 27, 2015

Dear Secretary Bose,

I am writing to state that I do NOT want a pipeline in my backyard because I am the wife of the current owner and mother of future owners of the home and property at 119 Sandy Road, Richmond, NH 03470. This home and property was purchased by my husband's great-grandfather in 1910 and generations have owned and taken care of it since. I worry about the spoiling of land, water and resources I have grown to love for the past 20 years.

This pipeline is a bad idea for several factual reasons. One critical reason is that Richmond has only a volunteer fire department and no ambulances at all, should any emergency happen. Most of the pipeline would not be accessible by road, and firefighters would need to carry water in by foot or on ATV vehicles.

Another reason is the health of Sandy Pond. Herbicides would run off to the lake and cause damage similar to that of the weedle problem in the 80's. Dynamite blasts could damage the brook and block the source of water to the pond as well.

A third and more feeling reason is that I have concern for the grave site that is on our property. Our beloved, deceased family are interred there. A pipeline would disturb their peace.

The Tennessee Gas Pipeline Company, LLC (a Kinder Morgan Company), its representatives, contractors, sub-contractors or associates do NOT have permission to enter our private property for any purpose to further the pipeline infrastructure project. Any attempt to do so will be considered unauthorized and treated as trespassing.

Sincerely,

Shana Hopkins, wife of current owner and mother of future owners  
119 Sandy Pond Road  
Richmond, NH 03470

Federal Energy Regulatory Commission (FERC)  
888 First Street NE, Room 1A  
Washington, D.C. 20426

Re: Tennessee Gas Pipeline Company, LLC (TGP)

Docket No. PFI4-22-000, Northeast Energy Direct Project -- Comments on Environmental Issues regarding

## Environmental Impact Statement (EIS) for NED

Dear Secretary Bose and Members of the Commission:

I have many concerns about the proposed TGP Northeast Energy Direct gas pipeline. I do not believe that the need for this new proposed huge and expensive gas pipeline has been demonstrated and is thus unnecessary. Recently Tennessee Gas (TGP) scaled back its proposed project crossing Massachusetts and southern New Hampshire from 2.2 billion cubic feet per day of gas to 1.3 billion cubic feet per day. Yet it still has contracts for only 550 million cubic feet of gas per day. This is not near capacity for such a large project and does not point to need. Thus, permitting by FERC for this project should be denied.

### Alternatives

There are many alternatives that should be researched before approving a large scale gas pipeline which continues our use and reliance on fossil fuels. In light of issues regarding greenhouse gas emissions and climate change we cannot afford as a society to continue on this path. Thus, I request that FERC investigate and research the impact of a No Action Alternative relating to the proposed NED project.

### Concerns

A few alternatives to examine include:

- 1) Please investigate and report on the cumulative effect of energy efficiency and conservation. How does this reduce the current demand for gas in generating plants for electricity in the next five years?
- 2) Please investigate and report on the cumulative effects of renewable energy such as solar, wind and hydropower. How does this reduce demand for gas in the next five years?

### A Bit of Background Information on Possible Alternatives

**Energy Efficiency:** Massachusetts has ranked #1 in the country in energy efficiency for the past four years. If Massachusetts continues to strengthen such programs as MassSAVE, upgrade equipment and encourage less use of energy, then this can be one alternative among many that helps lower the need for more gas infrastructure in Massachusetts. The MA Energy Efficiency Advisory Council's annual report for 2013-14 states: "In 2013, the integrated statewide electric and natural gas energy efficiency programs delivered electric savings of over 1.1 million MWh, natural gas savings of 25 million therms, and greenhouse gas emissions reductions of nearly 660,000 metric tons. In other words, Mass Save helped customers save the same amount of electricity as all households in Lowell, Springfield, Taunton and Waltham collectively use in a year. The natural gas savings are equal to heating nearly every single household in Framingham for a year." (I)

**Renewable Energy:** Supporting renewable energy is another alternative way to deal with energy needs in Massachusetts. The graph below shows that in Massachusetts over 900 MW s of solar capacity have been installed, and 107 MW of wind capacity (<http://www.mass.gov/eea/energyutiliti ties-clean -tech! energy - dashboard/>).

*{graphic "Installed Renewables (2008-2015)" omitted}*

Examination of other concerns related to alternatives and the lack of need for the proposed NED project by Tennessee Gas include the following:

### Fixing Gas Leaks in Massachusetts

- 1) Please investigate how gas leaks would cut down on need for new gas infra-structure such as the Northeast Energy Direct (NED) project proposed by Kinder Morgan/TGP.

**Some Background Information:** In the last two years studies have been completed documenting the number of gas leaks in existing pipes in Massachusetts. These studies include a report compiled for U.S. Senator Ed Markey in 2013. According to an analysis completed for the Markey report, "consumers in the United States paid at least \$20 billion from 2000-2011 for gas that was unaccounted for and never used. Natural gas is primarily comprised of methane, a greenhouse gas that is at least 21times more potent than carbon dioxide." (2) In another study released in January, 2015 by a group of atmospheric scientists at the Harvard School of

Engineering and Applied Sciences (SEAS), the study stated that “about 15 billion cubic feet of natural gas, worth some \$90 million, escapes the Boston region’s delivery system. This means that 2.7 percent of the gas that is brought to the Boston region never makes it to customers; it escapes into the atmosphere each year. That is more than twice the lost rate that government regulators and utilities estimate.,(3) Both the Markey study and the Harvard study point to the concept that fixing gas leaks in the distribution system rather than building new gas pipeline infra-structure is the wiser path. Also a recent article in the Boston Globe (August 20, 2015) revealed the presence of 20,000 leaks which need to be fixed in Boston. By law (passed by the MA State Legislature in 2014), the utilities are required to repair immediately leaks that pose a risk of explosion. This state law also requires utilities to repair minor leaks on streets that are under construction or near a school zone. According to the Globe article, “The utilities used to allow those leaks to seep indefinitely, because they didn’t see them as an imminent threat.,(4)

Winter Reliability regarding energy usage and other concerns regarding gas powered generation plants for electricity

1) Please investigate how Massachusetts can meet their gas and electricity needs in the winter without NED. What would the cumulative effect be if the alternatives were considered?

Some Background Information: Studies do exist or are underway to help answer this question. Massachusetts Attorney General Maura Healey has called for a regional gas capacity study to evaluate the need for additional gas capacity and how new natural gas capacity would affect our ability to meet mandatory greenhouse gas reduction goals put in place through the 2008 Massachusetts Global Warming Solutions Act (GWSA, Chapter 298 of the Acts of 2008)(5). This study will “examine options to address electricity reliability needs in New England region through 2030, evaluate costs and benefits of all available energy resource options” and is to be completed by October, 2015 (6). The Attorney General’s study will also investigate other ways to meet energy needs, including energy efficiency and renewable energy generation as well as updating existing infrastructure.

In another recent study, Energyzt Advisors, LLC prepared a study for GDF SUEZ Energy North America on Analysis of Alternative Winter Reliability Solutions for New England Energy Markets. Energyzt’s review and analysis of the current energy situation in New England concluded that lack of pipeline infrastructure is not the problem. For one the report states that during peak times of extreme winter weather “high prices from the winters of 2012/13 and 2013/14 reflect a peaking problem and lack of commercial arrangements with existing infrastructure, not a base load issue that justifies new pipeline capacity.” During the winter of 2014-2015 these peaks were dealt with by better using existing infrastructure. The Energyzt study also points out that federal and state policies do not support new gas pipeline infrastructure as both levels of government deal with the issues of climate change by promoting “non-gas-fired generation such as renewables, low load growth from energy efficiency and demand response, and market-based performance incentives in New England’s competitive capacity markets to ensure electric generation capacity is available when it is needed most. These programs are projected to flatten if not decrease natural gas consumption from the electric generation sector. Emerging technologies such as distributed generation and battery storage are likely to further moderate peak demand.” (7)

Also in the ISO-New England 2014 Regional System Plan released in November, 2014 they forecast that the demand for electricity shows “slow growth in both summer and winter peak demand times with an annual energy use rise of 1 %.,(8) With more energy efficiency and conservation added to the mix along with many other alternatives, there does not seem to be a need for new, large gas infra-structure. With close to over 50% of electric generating plants now using natural gas to make electricity in Massachusetts, it does not seem wise to continue on this path. Diversification of fuels for electricity generation should play into the mix at this time.

A thorough study of alternatives which Tennessee Gas dismissed in their Alternatives section of Resource Report 10 is necessary before saying this project is needed in New England. (9) I believe that using a combination of several alternatives can work, and thus this new gas pipeline is not needed.

In terms of other issues for the Draft Environmental Impact Statement (EIS) issued by FERC, I have many other concerns about the proposed NED project. I want to highlight only a few which concern land use, recreation and sense of place. These are places along the proposed route that I know from living in Franklin County for almost 40 years.

### **Land Use and Recreation**

Crossing of Millers River from Montague (Millers Falls) to Erving - It appears that Tennessee Gas proposes to cross the Millers River from Montague to Erving by going down a rocky steep embankment and using horizontal drilling to cross the Millers River and then up another steep embankment to then go under Route 2 and continue into Erving and Poplar Mountain. The Millers River is a tributary of the Connecticut River and flows for 50 miles from lakes in Ashburnham MA area into the Connecticut River. For the many years after industrial pollution of the river, volunteer citizen groups joined with town and state government agencies to clean up the Millers River. The Millers River is once again a clean living river and a place for fishing, kayaking, paddle board sports, an annual canoe race and other water sports for many people including people from other parts of New England. The Millers River Watershed Council (10) and other groups continue to monitor the quality of the river.

#### **Concerns:**

- (1) Please investigate the effect of possible extensive blasting in the area. How can the impact of blasting be avoided in terms of de-stabilizing steep rocky banks?
- (2) Please investigate the effect of drilling under the Millers River. How can possible impacts on fish and the cleanliness of the river be avoided or mitigated in case of contamination and other water issues?

### **Montague Plains in Montague**

The Montague Plains Wildlife Management Area (MPWMA) has as its primary purpose the protection and preservation of a dry outwash pitch pine-scrub oak barren natural community, its associated biota and its ecological processes. To manage this unique pine barren and its biodiversity in Central Massachusetts, the state in 2000 started doing small prescribed burns for ecological management. These prescribed burns (6-8 a year) take place every year and help in the management and study of this unique area. The burns are necessary to maintain this unique area. (11)

#### **Concerns:**

- (1) Please investigate and report on the impact of a pipeline crossing part of this important and sensitive eco-system so that Tennessee Gas must avoid areas where future management burns might need to happen.
- (2) Continuing prescribed burns for management of pine barren - What are the risks and how can this continue in the future without problems with a gas pipeline?

### **Northfield Conservation Land and Hiking Trails- New England Trail**

In the 1950s, Professor Banfield from the University of Massachusetts first designed the Metacomet-Monadnock Trail- the M&M Trail. For over 50 years this trail which runs through Erving, Northfield and many other towns in Massachusetts continued as an important hiking trail in the region. In 2009 the M&M Trail became part of a 215 mile National Scenic Trail from Long Island Sound in Connecticut through Massachusetts into New Hampshire, now called the New England Trail. This trail is still maintained and supported by a volunteer structure. But federal funds have also help support some aspects of the trail since it became a National Scenic Trail. Many hikers from outside the area as well as local residents use the New England Trail (NET) in Northfield year round where the NED gas pipeline would cross the trail and a proposed compressor station could be constructed.

In a recent issue of AMC Outdoors, Marc Chalufour (senior editor) writes about his experience of hiking this section of the New England Trail and waking from a night at the Richardson Zlogat Cabin on the trail: "Golden light spills over the shoulder of Mount Grace, and Monadnock beckons in the distance. A thin ceil-

ing of clouds divides the crisp blue sky from the lush green forest below .... Right now we stand still, watching the colors grow more vibrant, marveling that this unblemished view, like the trail, has survived.” (12) And it must survive without the hindrance of construction of the Kinder Morgan/TGP NED gas pipeline.

#### Concerns:

- 1) Please investigate and report on ways that there will be no impact on the New England Trail and its surrounding landscape.
- 2) Please investigate and report on ways there will be no impact for the 10,000 hikers who use the New England Trail each year in hiking through Northfield, Erving and Warwick.

#### Conclusion

Concerns about building large new gas infra-structures are not just related to a need for energy in many locations. Larger questions relating to climate change and how we as a society deal with this must be asked and answered now. As a society we must shift our thinking and mind sets to become stewards of the Earth who stop extraction and our ravaging of the Earth. It falls to us to begin the long journey and think in new ways as a society and country. There is no one alternative that will be the answer to the crisis of climate change, no new gas pipelines, but there will be many alternatives which together can get us to rely less on fossil fuels. All alternatives must be investigated with detailed reporting in the Draft Environmental Impact Statement. Such an investigation will hopefully show that the Tennessee Gas NED project is not needed in New England (Massachusetts and New Hampshire).

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, D.C. 20426  
August 31, 2015

Re: Tennessee Gas Pipeline Company, LLC Docket No. PF14-22-000  
Northeast Energy Direct Project

Dear Secretary Bose,

Attached please find the manuscript of my article published in Commonwealth Magazine on April 3, 2015, with accompanying footnotes. The article outlines the weaknesses in the case for need, in particular focusing on the capacity of liquefied natural gas resources to provide the necessary hedge against winter electricity price spikes, making pipeline expansion unnecessary.

The practice of eminent domain to support a private corporation's plan to export natural gas to global markets is simply wrong, especially as there are alternatives to insuring the reliability of New England's electricity supply. The proposal goes against every moral fiber underlying our United States Constitution. You know it. Your Commissioners know it.

Please review the case for need. Verify what the numbers clearly show-the Northeast Energy Direct project is neither necessary, nor convenient. If called upon to do so, I stand ready to appear before your Commission to present the argument, and debate the merits, in an open, transparent, and public forum. Energy industry executives and independent system operators are not the only stakeholders that have done their homework regarding the expansion of natural gas infrastructure in the region.

I know that I speak for thousands of homeowners and landowners across Massachusetts and New Hampshire when I urge you, Commissioners Bay, Clark, Honorable, LaFleur, and Moeller, to adopt the "no build" option when considering the Northeast Energy Direct application in the coming months.

Respectfully submitted,

Vincent E. Premus, Ph.D.  
Pepperell, MA

---

**Gordon Van Welie, do your job-LNG makes pipeline expansion unnecessary'**

**Vince Premus**

**Revised: April 5, 2015**

The U. S. Energy Information Administration (EIA) is a federal agency that "collects, analyzes and disseminates independent and impartial energy information to promote sound policymaking, efficient markets, and public understanding of energy [policy]". According to the agency's data, the six New England states consumed a total of 889 billion cubic feet (Bcf) of natural gas in 2013.<sup>3</sup> The data also show that New England's natural gas inflow capacity is currently 1,709 Bcf/yr, exclusive of the region's three liquefied natural gas (LNG) import facilities, which in the past have contributed additional capacity of up to 150 Bcf/vr." So why, despite a natural gas inflow capacity that is nearly twice the region's annual demand, does Gordon Van Welie, the CEO of the region's power grid operator ISO New England, persist in his claim that we must expand our gas pipeline infrastructure to keep electricity prices down and avoid the threat of rolling black outs in the future?

Recent data on winter price spikes in electricity has shown that, during a handful of days per year, there are episodes where regional demand for natural gas causes prices for gas on the spot market to increase. As a result, generators in New England who have not contracted for firm pipeline capacity may be forced to sit idle on these days."

The way the gas-electric market works, generators that do not commit to long-term contracts with their suppliers are lower on the priority list than local distribution companies that commit to firm supply contracts for gas to heat people's homes. What this means is that electricity price spikes in winter have much more to do with market practice than pipeline constraints, especially given that the same winter price spikes have been observed in parts of the United States where supply and access to natural gas is abundant."

If you were to add up all of the gas required to get through these so called "peak-shaving" intervals during

the course of one year, it is estimated to total on the order of 5-10 Bcf, or about 1% of the region's annual natural gas consumption-roughly the equivalent of one or two LNG tankers.'

To the gas company executive looking to export natural gas to global markets, a massive overbuild of pipeline infrastructure looks like the ideal solution to New England's peak shaving problem. However, to the landowner about to be subject to a forcible land taking via eminent domain, a pipeline expected to deliver in excess of 800 Bcf/yr of natural gas to solve the peak-shaving problem is tantamount to driving an eight penny nail with a 2,000 lb sledgehammer. If ISO New England is truly agnostic with regard to the fuel source that drives our power generation, then the grave impact that this sledgehammer will wield over the thousands of working American families living within this pipeline's projected path demands that we ask: "Is there another way?"

We already know the answer. This year, ISO-NE's 2014-15 Winter Reliability Program (WRP) included tariff-based incentives for gas-fueled generators to stockpile LNG reserves. As it turns out, downward pressure on oil and LNG prices in the global market provided sufficient incentive of their own for power generators to burn LNG-as of March 1, zero LNG was burned under the WRP.<sup>8</sup>

Either way, access to LNG reserves helped keep winter peak electricity prices to roughly 30% of the historic peak prices seen one year ago.? This during what has been reported by climatologists at the National Oceanographic and Atmospheric Administration (NOAA) as the second coldest winter the Northeast U. S. has seen in the last 80 years."

Clearly this winter as a case study shows that, whether the incentives are market-based or tariff-subsidized, access to LNG during peak-shaving periods can provide the sought after hedge against winter electricity price spikes. ISO deserves some credit for expanding their WRP this time, however, they did it only after pressure by ratepayer advocates and LNG interests to expand the previous year's WRP fuel diversity mix. In fact, ISO New England's 2013-14 WRP actually precluded LNG from participating as an alternate fuel source during peak shaving intervals out of concern that "compensating natural gas resources for incremental [liquefied] natural gas could reduce opportunity costs, and thus wholesale electric prices, at times of high natural gas demand, thereby sending the wrong signal during times of natural gas scarcity."!

The desired result was achieved. Electricity rates spiked in December, 2013 and January, 2014 during periods of very high demand when gas-fueled power generators could not gain access to sufficient gas supplies on the spot market." To the informed layperson, this gives the impression that ISO New England may have knowingly attempted to manipulate market pricing signals during the winter of 2013-14, so as to strengthen the case for expansion of gas pipeline infrastructure." This is fuel source agnostic?

On December 16, 2014, Mr. Van Welie graciously hosted a roundtable discussion at ISO's Holyoke headquarters with a delegation of anti-pipeline coalition leaders to discuss the group's concerns over his advocacy for new pipeline infrastructure. At that meeting, which lasted over 3 hours, Mr. Van Welie admitted that ISO's public messaging could be more balanced. Suggestions put on the table included increasing the attention directed by ISO New England toward alternative resources such as wind, solar, demand response, and energy efficiency, and even pitching the state legislatures to consider increasing the carbon tax on gas fueled generation to quantify its environmental impact in terms of a metric that everyone can relate to: cost.

However, in the three months since that meeting, there has been little movement in the message traffic coming out of ISO's Holyoke headquarters. So, out of fear that our December discourse has gone for naught, we now ask this: Stop managing New England's power grid like a man who believes the climate tipping point is a foregone conclusion. Have the courage and foresight to advocate for a strategic energy policy that balances the region's demand for electricity against the impact to our environment, our water supply, our neighborhoods, and our families' health and safety.

Follow the lead of the New York Public Service Commission, whose model introduced in April 2014, re-thinks the central-station utility paradigm and recasts the ISO as a Distributed Systems Operator (DSO).<sup>14</sup> This concept urges the grid operator to view renewables, efficiency, and demand response as "preferred resources," blessed with beneficial impacts rather than as "disruptive technologies".

The DSO assumes responsibility for balancing supply and demand variations at the distribution level and linking wholesale and retail market agents. Make no mistake, this new paradigm will present significant technical challenges, such as large scale production of battery storage technology, and the adaptation of an electrical distribution network largely designed for one-way transmission. However, these are technical challenges that we are confident New England's engineering, technology, manufacturing, and business communities are well poised to tackle.

Not only will these new technologies diversify our energy resource mix as more coal-burning and nuclear assets retire, they will bring thousands of long-term, well-paying jobs to New England, and enhance the region's economic competitiveness for decades to come.

To further embrace natural gas-fueled electricity generation is a policy choice. And a misguided one at that. Ann Berwick would seem to agree. In her recent op-ed piece published in *The Boston Globe*, the former Chair of Massachusetts' Department of Public Utilities wrote, "Natural gas now accounts for about half of the electricity produced in the region, compared with 15% in 2000 ... just as we diversify financial investments, we need to avoid becoming over-dependent on one source of energy." <sup>1</sup>

Reliance on natural gas in the near term as a bridge fuel, through the leveraging of existing LNG resources, is one thing. However, construction of new pipeline infrastructure that further ties us to natural gas for the long term is quite another. An opportunity exists here for ISO New England to establish itself as the standard bearer for large scale integration of distributed, renewable energy resources, and to begin weaning the region off of fossil-fueled power generation. Why not take it?

As an independent, not-for-profit company, ISO New England has a responsibility to serve the interests of the millions of ratepayers throughout New England, not just a handful of corporate stakeholders. We challenge Mr. Van Welie and ISO New England to step up and own this responsibility.

Develop and execute a plan to decarbonize the region's power supply. Do it NOW. Put away the "easy button" and DO-YOUR-JOB! Stop advocating for a solution that is predicated upon eminent domain land takings for private enterprise. Stop advocating for a plan that will irreversibly damage our most precious natural resources. Stop advocating for the sledgehammer because it makes your job easier. Start working with the state legislatures, the business and manufacturing communities, and the ratepayers, to develop and execute an energy policy that is truly sustainable. The climate tipping point is not a foregone conclusion, Mr. Van Welie. Millions of ratepayers across New England are depending on you. Please don't let them down.

---

### **Turners Falls Fire & Water District**

August 31, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

Re: Docket No. PF14-22-000 Northeast Energy Direct Pipeline Project (Project)

Dear Secretary Bose:

Please accept these comments on the above named Project’s intended Environmental Impact Statement (EIS). The Turners Falls Water Department (TFWD) is committed to providing a safe and reliable supply of high quality drinking water to its customers in the Turners Falls Fire & Water District. It is our duty to provide water that meets and often exceeds all state and federal standards set for quality and safety as well as ensuring conservation and protection of our water resources.

As the TFWD has jurisdiction over the town’s water resources and special expertise with respect to the water resources and associated environmental issues, we formally request cooperating agency status to fully participate in the preparation of the EIS. The official contact for that purpose is:

Kenneth Morin, Steve Call and Bruce Merriam, Water Commissioners  
Michael S. Brown, Superintendent  
Turners Falls Water Department  
226 Millers Falls Road  
Turners Falls, MA 01376-1605  
Phone: (413) 863-4542, Fax: (413) 863-3175  
Email: [turnerswater@yahoo.com](mailto:turnerswater@yahoo.com)

### **WATER RESOURCES and WETLANDS**

The Project seeks to bisect the Hannegan Brook Water Supply Protection Area that supplies water to over 2,500 households as well as commercial and industrial businesses in the Turners Falls Fire & Water District and the route impacts at least two wetlands and crosses two major rivers in Montague – the Connecticut and Millers. The TFWD is concerned about possible contamination of public water supplies and damage to wetlands and water bodies. We respectfully request all Massachusetts regulations and procedures pertaining to wetlands, water resources and water quality be followed and applied to the Project. We reserve the right to comment more completely in this area when complete information on the Project’s environmental impacts is known.

### **GEOLOGY and SOILS**

The project seeks to bisect the Montague Plains Wildlife Management Area – also called the Montague Sandplains (Plains) - a fifteen hundred + acre, state wildlife refuge and unique ecological area. The Plains area located on a large sand delta that was formed more than 10,000 years ago when melt water streams from the retreating glaciers emptied into Glacial Lake Hitchcock, a huge lake that covered much of Montague and the Connecticut River Valley during the glacial period. Source: [www.montague.net](http://www.montague.net). We are

concerned about the safety of the Project in sandy soils and the environmental impact to this unique ecological area during construction and operation. Further, the Project seeks to traverse areas with shallow bedrock between Route 63 and the Miller River. Depth of pipe should be at a level to not negatively impact farming, recreation and natural resources.

The TFWD requests specific studies are made in order to protect the Town's water resources and identify associated environmental impacts. Specifically the Project should conduct an analysis of impacts on private and public water supplies and water resources related to construction (blasting and drilling), pipeline operation and hazardous materials storage and use.

### **Reasonable Alternatives and Measures to Avoid or Lessen Environmental Impacts**

TFWD concerns about the Project include:

- 1.) The blow-off of gas to the atmosphere. Some customers have expressed concern there are valves throughout the system blowing off gas while it is our understanding this occurs only at the compressor stations when they are off. Perhaps any gas release can be done into a vessel or tank that can handle the pressure then burn it off or reuse it.
- 2.) Noise pollution generated by the compressor station. The station in Northfield could be built deeper into the ground with dense plantings of conifers (i.e. white pine) to help with natural sound deadening and/or noise pollution.
- 3.) Equipment during construction near the resource area because of soil porosity. Fueling and/or storage of equipment as well as leaking or ruptured hoses need to be addressed with extra caution and care.
- 4.) Concern for soil erosion. When working on TFWD land near the recharge area, extra caution and care should be taken for soil erosion. There are steep slopes/grades and the soil is sandy. The site should be kept clean and stock piling of materials limited. Work in this area should be completed in a timely manner and re-seeding and slope stabilization should be completed as soon as backfilling is complete.

Thank you for the consideration.

Sincerely,

Michael S. Brown, Superintendent  
Turners Falls Water Department

Kenneth Morin, Steve Call and Bruce Merriam, Water Commissioners  
Turners Falls Fire & Water District

### **20150831-5159**

PF14-22

Compressor Station in New Ipswich, NH

I own **Amazing Flower Farm in New Ipswich**, a grower-retail nursery and garden center. In addition to ornamental plants, we grow vegetable starts for our customers, and we raise organic vegetables for local restaurants. We have built such an excellent reputation for healthy plants raised without pesticides that our plant customers come from well beyond the half-hour travel radius typically associated with garden centers. Annually we hire 7 seasonal workers and 2 permanent workers in addition to family members working the farm.

We also raise a unique breed of poultry for meat consumption which we have developed over the past 30 years to meet our customers' specifications. We have up to 1800 chickens at any given time. Our chicken customers come from Massachusetts, Connecticut and Rhode Island. This breed of chickens does not exist anywhere else, and it cannot be replaced through commercial (or hobby) channels, and it would take years to re-create.

I have serious concerns about the proposed compressor station in New Ipswich. Although we are not abutters, our prevailing winds come from the direction of the compressor station site. I am very concerned about

emissions from blowdown events drifting over our land and affecting the health of my workers, my family, my customers and my poultry. I am very concerned about blowdown event emissions being deposited on our organically-tended cropland via weather patterns, polluting the soil and also the food it produces, potentially to the point where my land becomes un-usable and my livelihood is negatively affected. These emissions contain imported and hazardous chemicals that will directly affect our ability to produce organic food for my customers. I am concerned that FERC's method of measuring harmful emissions by averaging does not take into account the serious in-the-field consequences of high levels of pollutants being released into the environment with each blowdown event.

I am very concerned that there is no viable means for me to cleanse my land once it has been polluted by compressor station emissions. I am very concerned that Kinder Morgan will successfully be able to argue in court that it has no obligation to compensate me for the damage the compressor station may do to my land and my livelihood.

I am concerned that I am going to be losing customers simply because our farm is located in the same town as a polluting compressor station. Every time a blowdown event occurs, everyone on our farm is going to hear it and be reminded of what it means: repeated reminders of shale gas-fracking pollution being deposited in New Ipswich. It will be like hearing the fire horn from the fire station in the center of town, only a lot more often.

I have more concerns. Two of my workers live in the town of Greenville. The compressor station abuts Greenville's aquifer and these blowdown events, as well as the pipeline itself and the construction phase (with its ground disturbances and possibly blasting,) threaten to pollute Greenville town water with both imported pollutants, and with excessive radon released from our granite during the construction phase. I am concerned about both my workers' health and also time and capabilities lost to my business when their health degrades from drinking, cooking with, and bathing in water polluted with chemicals imported from fracking fields.

My first preference obviously is that FERC denies the pipeline permit. We did not ask for these hazards to come to our town, we derive no benefit whatsoever from this project. We cannot use the natural gas (contrast this with eminent domain takings for electric lines and highways, which everybody directly benefits from.) Any property tax gain will be offset by our town's increased road maintenance and emergency services costs, and our property values have already gone down. So economically it is a wash and there is no benefit to us; in fact, our taxes are probably going to go up. More importantly, please recognize that no monetary gain can compensate us for the loss of our clean air and water, and the loss of our rural quiet.

So, if FERC does decide to approve a compressor station in New Ipswich, PLEASE, PLEASE require it to be installed AND continually updated with the most advanced anti-pollution technology: insulated buildings and noise cancellation technology; state-of-the-art containment buildings to eliminate blowdown event emissions from escaping into our environment. We are getting no benefit from this project, please require that we suffer no harm.

## **20150831-5162**

Stan Brownell, Troy, NY.  
Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

Ms. Bose:

Re: Northeast Energy Direct Docket #PF14-22

Please note the below comments in opposition to the construction of the Kinder Morgan Pipeline and compressor station in Southern Rensselaer County.

We are writing as **County legislators** representing constituents residing in Southern Rensselaer County. The concerns that we have for the pipeline and compressor station are not only our own, but the same concerns that our constituents have conveyed to us in emails, letters, town halls and phone calls. As a result, we are convinced that the project as proposed is not in the best interests of the residents of Rensselaer County.

As stewards of county finances, we are concerned over the loss of private property due to the construction of both the pipeline and the compressor station. The project, as it stands, may impede future economic development as well as the accompanying reductions in taxable returns to the municipalities and county due to acreage needed for the project and the subsequent easements needed for the construction.

We also believe that the property owners affected by the project will not receive adequate compensation for their loss of property and rights over their land. Many of these properties are rural agricultural areas; division and construction on the lands will cause great disruption to the business and quality of life to property owners. In addition, the project could cause disruption for emergency services operating in the affected communities.

Communities most impacted by the proposal will not have access to the natural gas transported by the proposed pipeline; any benefit will be felt outside of this region and overseas. Furthermore, the long term fiscal, environmental and quality of life issues of the proposed project will not outweigh the benefits, compensation and mitigation offered by the developers of the project to our constituents.

Sincerely,

Stan Brownell, Acting Chairman, Rensselaer County Legislature  
Judith Breselor, Legislator, District 4  
Lester Goodermote, Legislator, District 5  
Martin Reid, Legislator, District 4  
Alex Shannon, Legislator, District 4

**20150831-5166**

### **Rensselaer Land Trust**

Kimberley D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

August 30, 2015

Ms. Bose:

In reply to the request for comments regarding environmental issues related to Tennessee Gas Pipeline's Northeast Energy Direct Project (docket number PF14-22-000), I would like to note some environmental effects that should be evaluated in the Environmental Impact Statement (EIS) for this project. As President of the Board of the Rensselaer Land Trust, my comments will focus on Rensselaer County, New York, but the issues I present are pertinent along the whole length of the proposed pipeline route. Environmental impacts should be evaluated not only of the construction and standard operation of the pipeline and compressor stations, but also of accidental leaks or spills.

#### Wetlands and Aquatic Systems

In Rensselaer County, the proposed route crosses, or passes very close to, hundreds of streams, ponds, and wetlands. The EIS should assess the potential impacts to these resources, including changes in hydrology, siltation, soil compaction, and degradation of water quality, from pipeline construction, trenching, use of heavy machinery and vehicles, and leakage of chemicals and materials. The degree to which the spread of invasive species into these wetlands will be facilitated by the construction, both through disturbances to the substrate and vegetation which result in favorable conditions for invasive species, and through vehicles and machinery transporting seeds and propagules of invasive species to the pipeline site, should be evaluated.

In addition to evaluating impacts on individual wetlands, impacts on aquatic networks should also be addressed. Aquatic networks are systems of connected streams, ponds, and wetlands, and adjacent riparian areas that are critical to the sustainability of the system's aquatic fauna, its good water quality, and its ecological integrity. For example, during the preparation of the Rensselaer Plateau Regional Conservation Plan, two aquatic networks were ranked in the highest conservation priority category for aquatic systems on the Plateau, due to their large size, excellent landscape context (predominantly forested watersheds), and their high water quality capable of supporting native trout and other native plants and animals: the Tsatsawassa Creek network (Town of Nassau) is crossed by the proposed pipeline route in five locations, and the Black River network (Town of Stephentown) is crossed at one location. Impacts of pipeline construction and operation on the ecological functioning of these and other aquatic networks should be addressed.

#### Significant ecological communities (habitats)

The wetlands through which the proposed pipeline route passes through or very near in Rensselaer County include many ecologically significant community types. For example, Crumb Pond (along the proposed route in Stephentown) is a bog lake surrounded by dwarf shrub bog and inland poor fen. These habitat types are uncommon in New York State, and the examples at this site are among the highest quality in Rensselaer County in terms of intact condition and native species diversity.

The wetlands at the outlet of Stump Pond in Stephentown are directly crossed by the proposed pipeline route, and are one of the largest wetland complexes along the route. The Stump Pond Outlet Wetlands contain dwarf shrub bog (and associated uncommon bog flora), inland poor fen, sedge meadow, shrub swamp, red maple-hardwood swamp and hemlock-hardwood swamp. Because the proposed route crosses this wetland, potential impacts need to be evaluated particularly carefully here, including the potential introduction of invasive wetland species such as Phragmites and purple loosestrife.

#### Rare Species

The inland poor fen at Crumb Pond supports the rare Angerman's peat moss (*Sphagnum angermanicum*), which is rare throughout its range, and found predominantly in coastal regions. Although not state or federally listed, potential impacts on this species should be evaluated.

Potential impacts should also be evaluated on species that are rare in the counties through which the proposed route passes. For example, Crumb Pond also has a record for hatpins (*Eriocaulon aquaticum*), a plant rare in Rensselaer County. Stump Pond Outlet Wetlands supports the county-rare alpine cottongrass (*Scirpus hudsonianus*). In the Town of Schodack, the proposed route crosses a sandy site that is unusual in Rensselaer County, and which supports the county-rare plants Bicknell's sedge (*Carex bicknellii*) and scrub oak (*Quercus ilicifolia*), and other plants uncommon in the County.

#### Quality of life

Most residents of Rensselaer County enjoy very high air quality and low levels of ambient noise. The EIS should address the impacts on air quality and the increase in noise resulting from the pipeline construction and of the operation of the compressor stations, and the resulting impacts on residents' quality of life.

More information on ecological and biodiversity resources in Rensselaer County is available from the Rensselaer Plateau Regional Conservation Plan (<http://www.rensselearplateau.org/#!/conservationplan/c8s>), and from the Rensselaer Land Trust (my contact info is below).

Sincerely,

Nick Conrad  
Rensselaer Land Trust  
279-1963  
nbconrad@msn.com

**20150831-5167**

August 27, 2015

Dear Secretary Bose,

I am writing to state that I do not want a pipeline in the backyard of my family's summer house. This house and the land around it has been in my family for so many generations. I have grown up visiting this part of New Hampshire since I was a baby. My earliest memories take place right at this house. I can vividly remember my dad taking me into the backyard to teach me and my sister how to ride a bike. Even though she learned just moments before me, I will never forget the feeling of accomplishment that I had that day. I can remember going on small hikes with my cousins. We would venture into the piney woods behind our house, collecting leaves in the fall. In the winter my sisters and I would cross country ski in the woods, creating paths through the deep snow and exploring the amazing wildlife tracks. When I think of my beautiful home on Sandy Pond Road, I am overwhelmed with so many wonderful memories of friends and family. I am 16 years old and have enjoyed spending every year of my life at my family house. Just a month ago, I spent the week at my family's summer house. While I was there with my dad and great aunt, I realized that right there on Sandy Pond Road is the one place that puts me at complete peace. This feeling made me think of the classic elementary school assignment where your teacher would ask you to draw or describe your "happy place". And every time that this assignment was given, I would describe my family house. It is a place that I know like the back of my hand. A place that makes me feel safe and secure. I want to live the rest of my life feeling that same way. I want to visit my family house, and know that I can still be safe there. I want to ensure that the future generations of my family will have the chance to have a second home that makes them feel just as content and safe as I did for these 16 years. And five years from now, if I am asked to describe my "happy place", I want to be able to say "Sandy Pond Road" without a moment of hesitation.

If pipelines are installed into my backyard, I know that everything will change. I know that the trees that make up my backyard will be cut down. This extreme action will cause so many environmental impacts, from interfering with the carbon cycle to altering the habitat of wildlife such as deer, Barn owls, and bears. Those trees are the trees that make up the woods where my cousins and I once endlessly explored. The precious woods that my sisters and I happily skied through. I have such a deep appreciation these cherished memories, the environment, and for everything in Richmond, New Hampshire, and even though I do not live my life full-time here, I will defend every part of this highly adored community.

Sincerely,

Katherine Moody,  
119 Sandy Pond Road  
Richmond, NH 03470

**20150831-5172**

*{Letter from 35 NH Conservation Commissions to Governor Hassan, see 20150831-5135 above}*

**20150831-5178**

Karen Malloy, Averill Park, NY.  
PF14-22

To whom it may concern:

As a lifelong resident of Averill Park, NY I am deeply opposed to Kinder Morgan's proposed pipeline project and urge you to deny their application.

I am genuinely concerned with the effects the compressor station and the pipeline will have on my children, my grandchildren, as well as our community.

My family has lived in this area for nearly a century. We love this area for its serene, quiet, beautiful neighborhoods filled with trees, lakes and an abundance of wildlife- deer, bears, owls, red tailed hawks, snapping

turtles, wild turkeys, butterflies, bees, woodpeckers, and an assortment of beautiful birds, including the beloved Bald Eagle. The eagles nest on beautiful burden lake, which is located within the half mile buffer zone of the proposed compressor station. All of those animals will be forced to relocate to a less polluted and less noisy area. We raised our children here in Averill Park because we felt it was the safest, healthiest place and with generations here, why move? We have the same hopes and wishes for our grandchildren – to be raised in a safe area where they can breathe clean air, drink clean water and enjoy nature’s beauty. However, with the proposed compressor station less than a half mile from my grandchildren’s house those hopes and wishes are diminishing. They will be forced to inhale deadly toxins. My daughter, my son-in-law and my two grandchildren (ages 5 and 7) live in the incineration zone – Can you assure me they will be safe if there is an explosion?

The pipeline and the compressor station are putting unnecessary risk to me, my family and my community with absolutely nothing to gain. Will there be any benefits to us? What is Kinder Morgan’s incident rate? Has anyone other than Kinder Morgan looked into how many incidents occur each day, month or year? How often will the pipeline be evaluated for cracks or leaks? Gas pumps have to be inspected, will the pipeline have to be inspected on a regular basis?

I ask you to please consider denying Kinder Morgan’s proposed pipeline project. This pipeline/compressor station will ruin the quality of life in our small upstate community. Would you want your family to live in close proximity where fracked gas is being transported? Would you want to endanger your family knowing that the pipe could explode at any time? Would you want to breathe air filled with Methane, Radium and Formaldehyde? Would you want to drink water filled with cancer causing carcinogens? Would you want your homes in your neighborhood to devalue? Please stop Kinder Morgan from ruining our beautiful community.

Thank you for your help with this matter.

Respectfully,

Karen Malloy  
37 Edgewood Dr.  
Averill Park, NY 12018

**PEOPLE FOR A BETTER MASSACHUSETTS**

08/30/2015

RE: Northeast Energy Direct Project, PF14-22-000

To FERC:

We began a petition on November 06, 2014 in opposition to the Northeast Energy Direct Project. Since that time we have collected 1960 responses all opposed to this pipeline.

The petition reads:

*Deny the Northeast Energy Direct Project (FERC Docket No. PF14-22-000) proposed by Kinder Morgan and the Tennessee Gas Pipeline Company, LLC. The Northeast Energy Direct Project proposed by Kinder Morgan and the Tennessee Gas Pipeline, LLC is a “greenfield” natural gas pipeline that crosses Massachusetts. This project will have a devastating and lasting impact on people, communities, conservation land, and the environment throughout Massachusetts.*

*Massachusetts continues to be a leader in clean renewable energy solutions [such as solar, wind, and geothermal]. We need to support efforts to foster clean renewable energy and reduce our dependency on fossil fuel such as natural gas.*

*We, the undersigned, do not support this or any project that has such a negative impact on Massachusetts, especially if it is not aligned with commitments for delivering clean renewable energy to the people*

*of Massachusetts.*

The names and cities of each of petitioners and their comments have been provided in an attached document. We ask that you give their concerns the proper attention. You may view the petition on Change.org at <http://bit.ly/savemass>.

Sincerely,

Richard Crane

#### Comments from petition signers:

Richard Crane Groton, MA 2014-11-08 This pipeline project is a "greenfield" project which means that the entire route for this pipeline will be taken through eminent domain. The lands involved include a significant number of homes, farms, schools, conservation land, water supplies, and much, much more. The negative affects of this project will be felt for generations.

Tim McCormack Allston, MA 2014-11-08 I want my children to have a land unpolluted by gas leaks and fracking.

Keith Dawson Groton, MA 2014-11-09 There is nothing right about this proposal. It would devastate land that the entire population of the state has spent money, time, and energy to protect in perpetuity. The gas is from fracking sources. The pipeline would derail sustainable energy initiatives. Most of the gas could be exported from Canada. There is no guarantee the pipeline would lower gas prices, in fact it is more likely to raise them.

Nicola Crane Groton, MA 2014-11-09 This pipeline crosses schools in a number of towns. It has been proven that natural gas pipelines are dangerous and those risks increase when located so close to people. It is unacceptable to locate pipelines near schools, libraries, community centers, places of worship, and other locations where people congregate.

Ginger Vollmar Groton, MA 2014-11-10 There is no reason to allow this pipeline to go through miles of conservation land when existing rights-of-way can be used.

Steve Kalter Groton, MA 2014-11-10 We need to protect our environment -- especially from Corporate Greed!

Liam Spaeth Lincoln, MA 2014-11-10 Pipeline routing is poorly designed.

John Placais Boston, MA 2014-11-10 The cost outweighs the need

jared faugno athol, MA 2014-11-11 It affects my community.

Tyler M Hanson, MA 2014-11-14 There are energy alternatives that won't destroy the environment.

Richard Wheeler Concord, MA 2014-11-16 The appropriation of the land to insert the pipeline poses too many threats to the natural habitats and conditions. The pipeline is also a potential threat to neighbors. This is a replay of what is going on in middle of of the United States. We do not want this nor do we need it. Richard W. Wheeler

William Greene Concord, MA 2014-11-16 I'm signing because this pipeline is a 180 degree turn in the wrong direction for the people of Massachusetts and America. Profits over people is the name of the game for these greedy, money hungry Oligarchs

Mark Hanson Concord, MA 2014-11-17 We need renewable energy not natural gas exports!

ALAN BUDREAU Concord, MA 2014-11-17 We don't need another pipeline

mark gailus concord, MA 2014-11-17 We should not sacrifice our land and safety just to lower costs for a particular gas supplier. What is the safety of our homes and towns worth? Why invest precious land in a soon to be obsoleted energy source?

Bob Wallhagen Carlisle, MA 2014-11-18 We don't need more fossil fuels. It is imperative that we start cutting back NOW.

Frank McGovern Bedford, MA 2014-11-18 During the "polar vortex" New England suffered greatly from a shortage of natural gas - power plants went off line - and some actually burned jet fuel due to the shortage - natural gas is relatively cheap and plentiful , but there is a huge transportation constraint getting the fuel to New England - 67% of Connecticut's kWh are produced by nat gas . A pipeline would solve this constraint problem - now electric prices are doubling through out New England - consumers will see a doubling of rates due to limited transport - I own an electric company and have nearly 100,000 electric customers all "on wind" and started a solar company and drive an electric vehicle - but realistically for the next two decades natural gas is the best solution to support the energy needs of 12 million people in New England with solid steps towards solar and wind - ( note - people should buy wind electricity from Clearview Energy and others - approxi-

mately every time 1,000 homes switch to wind another windmill is built , but builtin places more optimal for wind like Texas and Nebraska etc the natural gas pipe line is critical in New England )

Ainsley Donaldson Melrose, MA 2014-11-18 I'm signing because I support renewable sources of energy, not the continued destruction of our natural environment.

melissa callahan somerville, MA 2014-11-18 I'm signing because my children and yours deserve a future not wholly distorted by the previous generations ignorance.

Karen Miller Somerville, MA 2014-11-18 I live in Massachusetts. It's environment has already been too compromised by development.

Erika Fox Cataumet, MA 2014-11-18 Increasing needs for energy must be met by renewable energy sources.

Lisa D Thompson Amherst, MA 2014-11-18 Invest the time, energy and natural resources in safe and clean RENEWABLE energy like solar and wind. This is destructive and time limited.

Jane O'Rourke Lexington, MA 2014-11-18 we have start paying attention to our environment

Freddie Estremera Fairhaven, MA 2014-11-18 This bothers me because it is the first order of business that these oil backed chosen politicians put on the table in congress. Putting this pipeline up will not affect U.S. oil prices and save us anything except put more dollars in these oil tycoons. I am surprised the American public is just standing by and being totally oblivious to this.

Lucie McCormick South Deerfield, MA 2014-11-18 A short term positive isn't worth the long term negative effect.

Stevie Converse Florence, MA 2014-11-18 I'm signing this petition for two reasons: I don't want a pipeline going through some of the most beautiful land in Massachusetts, which will devastate the land, hurt the wildlife and weaken communities. And I don't want to perpetuate non-renewable energy. I want Massachusetts to invest my tax dollars into renewable energy.

Lesa Spinazzola Worcester, MA 2014-11-18 No more dirty energy!

Laurie Wodin Upton, MA 2014-11-18 We are crazy to keep making fossil fuel infrastructure when we need alternative fuels to be developed instead. I certainly am opposed to paying for this pipeline. They are trying to make a new tax to pay for it, so the companies that own it only profit while we pay for it with our money and our health.

David Bryant Ipswich, MA 2014-11-18 Global Climate Change threatens to plunge our world into increasingly powerful storms, extended droughts, more frequent and wide spread tornadoes, as we extract more natural gas by fracking. While we should be converting our grid to renewable energy the crash in NG prices threaten to expand CO2 emissions to record levels. Are we sacrificing our children's future for cheap energy and threatening water quality of millions of people?

irene karayan newton, MA 2014-11-18 Clean energy is the only way to go to avoid devastation of our environment .Reducing our consumption by eliminating the excess lighting of buildings , excess heating and cooling of businesses and apartments buildings is our responsibility .

Elizabeth Wallace Hanson, MA 2014-11-18 I think it will spoil the environment.

Danielle thompson Lunenburg, MA 2014-11-18 I do not agree with the development of the pipeline

James Cayon Springfield, MA 2014-11-18 .....while I remain firmly against actions that profoundly impact in a negative way those who are least demographically capable of adjusting to them even IF sensitive to the environment, this project does NOT significantly benefit citizens of the Commonwealth given it is primarily for the purpose of supplying an INTERNATIONAL market; we do not need NOR want such a disruptive, damaging and potentially disastrous undertaking HOWEVER much Kinder Morgan continues to insist the right-of-way is least threatening to people (less so for OTHER life)!

Scott MacDonald Andover, MA 2014-11-18 This pipeline would be devastating for the communities that it would run through. In my town of Andover, it is planned to run right through our conservation land and water shed! We should not be further investing in fossilfuel infrastructure, especially when this pipeline will be carrying gas meant to export, not for Massachusetts communities. Lastly, this pipeline will be dangerous - it is a "high-pressure" pipeline, unlike the ones that have been built in the past. The existing "low-pressure" pipelines leak all the time, causing fires and extreme harm to the environment. Just imagine what could come of this! It's frightening that a company such as Kinder Morgan could be so selfish - endangering our communities, and the world's environment, for their sole benefit.

julie guido Hopedale, MA 2014-11-18 isn't there a way to do things without harming the environment and it'l wildlife.....

Helen Randolph Great Barrington, MA 2014-11-18 This pipeline would be the worst thing ever to happen to Berkshire County, and to the entire state of Massachusetts. Do not allow it.

carleen cordwell New Bedford, MA 2014-11-18 This is about big business, not community!

Marina Vrouvlianis Newton, MA 2014-11-18 save our beautiful state.... this pipeline is NOT necessary....

Kathleen Lique Salem, MA 2014-11-18 We need to support efforts to foster clean renewable energy and reduce our dependency on fossil fuel such as natural gas. The marketing idea that natural gas is "clean" is absurd if you know anything about fracking which is where most of it comes from these days. NO on this pipeline.

Kathryn Kogan Hingham, MA 2014-11-18 This pipeline moves us in the wrong direction.

Jodi MacDonald Andover, MA 2014-11-18 This is not the right solution to our energy needs.

Ann Hulsing Newton Highlands, MA 2014-11-18 The time has arrived to discontinue supporting & investing in fossil fuels.

Chris Powicki Brewster, MA 2014-11-18 Building out natural gas infrastructure runs counter to state law mandating drastic cuts in greenhouse gas emissions

Ann Van Dyke Leverett, MA 2014-11-18 Keep the pipeline out!

Selwyn Oskowitz Brookline, MA 2014-11-18 We must invest in alternate energy instead

derek brown e, MA 2014-11-18 i just saw the movie "interstellar"

Marian Kelner Greenfield, MA 2014-11-18 This pipeline is unnecessary and part of a paradigm that doesn't work. Berkshire Gas has reported there is enough natural gas for the present level of consumption. Let us not raise that level. In fact, let us lower consumption and leave the beautiful environment to the animals, plants, and humans who call this place home.

Jerry Vovcsko e. bridgewater, MA 2014-11-18 "greenfield" my ass...

Donald Allen Carlisle, MA 2014-11-18 I support this and other attempts to stop increased energy production because we waste huge amounts of energy in this country, because it is kept artificially cheap (e.g., drivers don't pay for the environmental costs of driving through proper taxation). I say make a major effort to reduce the waste before doing anything about increased supply.

Linda Breitman Westborough, MA 2014-11-18 We have the technology to shift our dependence on additional fossil fuels to clean energy. This project causes immediate destruction of the lands it travels through, and continued destruction of the planet in the future.

MJ Gosselin Rowley, MA 2014-11-18 No pipeline. It is unnecessary. We need to focus on renewables and stop raping our countryside. I live in Mass and will fight this to the end.

Kate Kenner Jamaica Plain, MA 2014-11-18 I live in MA and do not want this toxic plan to go through. We want clean energy here and a healthy environment,

Tanya Wheeler Westfield, MA 2014-11-18 I care about our environment and I support clean energy. This Pipeline does not meet the goals of providing clean energy to the citizens of Massachusetts.

Carl Osborne Natick, MA 2014-11-18 We need to focus on long term strategies that deliver renewable energy. More natural gas is a band-aid and short term solution to our immediate energy needs but one that sinks us into the deeper problem of climate change.

Matthew Carter Rowley, MA 2014-11-18 Think of the environment and people!

zelda gamson chilmark, MA 2014-11-18 Our beautiful land should not be used for this purpose. Let's use it for green energy!

Cheryl Lutzca Pepperell, MA 2014-11-18 This is devastating to our communities.

Peter Wildermuth Ashfield, MA 2014-11-18 This pipeline will permanently damage pristine landscapes and will contribute to global warming. There are better alternatives including renewable energy and energy efficiency.

Dawn Tesorero Roslindale, MA 2014-11-18 I sign this petition because our current pipelines are broken. We need repairs not new pipelines. We need to invest in a sustainable energy future, not one that kills humans and our environment.

Karen Sheaffer Shelburne Falls, MA 2014-11-18 I'm signing because I live in Massachusetts.

Maximilian Kreisky Lexington, MA 2014-11-18 I live in Massachusetts and I do not want our state to be poisoned by natural gas, nor do I want to support the use of it as a resource. I want a commitment to clean energy, not more malarkey.

rosemary gaskell winchendon, MA 2014-11-18 My town will have the pipeline going through it. Morgan Kinder did almost nothing to inform the town's people of this project and we had to scramble to build a protest group to fight back. It won't help and I firmly believe that they will go ahead anyway, and with the states governments approval. This pipe is cutting property in half and impacting the property values of residents. We are just an ordinary working class community and our homes are mostly our only financial assets. KM knows we don't have pockets deep enough to mount an effective legal battle.

Pamela Ross Haverhill, MA 2014-11-18 I support renewable energy before these impactful projects.

william hernandez Boston, MA 2014-11-18 We need independents from these gas and electric companies. I support wind and solar power.

Sage Freechild Shutesbury, MA 2014-11-18 Natural gas is not a "green" energy. In order to address climate change, we need to shift away from ALL fossil fuels and invest in renewable energy sources. I also oppose any energy project that will encourage more fracking because it is suicidal for us to keep destroying water supplies. And, by the way, the Koch brothers have too much money already, so we need to stop allowing them to influence energy policy to add to their greed accounts.

Connie Carter Oakham, MA 2014-11-18 We're never going to end our addiction to dirty energy if we keep expanding our use of it. Oil and natural gas companies are no better than drug dealers who want us all to stay hooked on their poison because it makes them money. Even though they are well aware it will eventually destroy us (and our home...the only one we have by the way). The devastation this will cause to the affected communities is sickening...all to stuff a companies pockets. How long will our government allow this kind of corporate greed at the expense of the people to continue? Did I mention sickening?

Gayle Simmons Dorchester, MA 2014-11-18 Any plam must blance the development of alternative energy sources with thoughtful environmental protection. I need to see the whole plan.

abigail higgins vineyard haven, MA 2014-11-18 am signing because am fed up with decisions that reinforce the status quo. want to reinforce innovation and sustainability.

Jessica Mcgeary Winthrop, MA 2014-11-18 Massachusetts agriculture is in a tough enough position without having to disrupt it for a pipeline that could ruin everything simply by its construction. This oil is dirty oil that won't help our market or our economy at all. This is not worth it, not even close.

Cynthia Ingelfinger Ipswich, MA 2014-11-18 This is not the direction we should be going with our energy sources. Clean, renewable energy solutions are possible. This pipeline is a step backward and will affect our quality of life and threaten our local natural resources. Just say no!

Lawrence J O'Brien Norwood, MA 2014-11-18 Advocate Renewable Energy

klaus kleinschmidt concord, MA 2014-11-18 Conservation of energy options are being ignored.

Rona Leventhal Northampton, MA 2014-11-18 We need to change imminent domain laws, too!!!!!! No govt should have a right to bully its residents!

Robin Dwyer Pepperell, MA 2014-11-18 I live in one of the pipeline towns, we have spent quite a bit of money to conserve land through out th town , we have loads of wildlife, this will impact them greatly. I do not want my town disturbed by this pipeline

Beth Ryan Falmouth, MA 2014-11-18 This Pipeline is going through my sister's backyard and I can see the devastation.

Ron Danklefs Boston, MA 2014-11-18 We need to kick the fossil fuel habit and go towards solar & wind power.

Patricia Colcord Hopedale, MA 2014-11-18 Pipeline a bad idea and I do not want it in any state, let alone my own.

Eleanor Perry Forestdale, MA 2014-11-18 We feel it is time to use renewable energy and not destroying the beautiful countryside with the laying of yet another pipeline!

jon higgins southwick, MA 2014-11-18 Northeast utilities will build a better pipeline on a pre existing right of way

geraldine zagarella brookline, MA 2014-11-18 This project is wrong for so many reasons.

Deborah Butler Framingham, MA 2014-11-18 Franking shale 2 make Natural GAS=Air Pollution, Degraded Water Quality in Rivers & Risks to Underground Drinking Water #NoFrackedGasInMA

Janet Street Northampton, MA 2014-11-18 I strongly oppose this and other natural gas pipelines because of the detrimental impact on the environment of Massachusetts. We want nonpolluting clean energy, not toxic petrochemicals, for our energy resources.

Anne Gyles Boxford, MA 2014-11-18 Gas will run out-the sun, wind and tide can power can go on forever!

Damian Adshead Auburn, MA 2014-11-18 WIND & SOLAR FARMS - ONLY!

Nancy Smith Brighton, MA 2014-11-18 Massachusetts will be a state providing leadership of sustainable energy for the future. Its not fair to have this pipeline project split her down the middle, injuring our environment and our communities.

Steven Picheny Great Barrington, MA 2014-11-18 This will further ruin our pristine environment for the sake of corporate profits. Run it along the Mass Turnpike!!!

Lisey Russell Royalston, MA 2014-11-18 No pipe line. Don't let the small towns in MA be used in this way.

Mary White Concord, MA 2014-11-18 Protecting our conservation land and wetlands which this pipeline is slated to go through is essential.

Jo-An Courtemanche North Hatfield, MA 2014-11-18 No I do not support this project in any way whatsoever

Ann Rosenkranz Vineyard Haven, MA 2014-11-18 It's all about reducing our carbon footprint and transitioning quickly to renewables NOW!!!!!!!!!!!!!! This is a non-negotiable imperative in order to preserve life on earth as we have known it.

Patricia Grimes Byfield, MA 2014-11-18 Lo

Carol Jussaume Fall River, MA 2014-11-18 Massachusetts needs to set an example just as it has by going green with wind energy and solar power.

james lagomarsino Hardwick, MA 2014-11-18 We have to go green NOW ! Every step we take to continue with fossil fuels is one less step forward for future generations.

Paula Vincent-Cowan Eastham, MA 2014-11-18 Because the preservation of our environment is much more important than money and greed.

K Gordon Mattapan, MA 2014-11-18 If we are to make any real progress in fighting climate change then we must reduce our dependence on

fossil fuels.

Chris K. Medford, MA 2014-11-18 Because I live here!

Mac Newman Grafton, VT 2014-11-18 not in my back yard, thank you very much Amanda Huggon- Mauretti

Brockton, MA 2014-11-18 This is NOT the way to address our energy needs! I do not support an increase of natural gas use when we are not utilizing the alternatives.

Judy Raphael Leverett, MA 2014-11-18 This pipeline should NOT be approved. The environment is at stake as well as people's livelihoods, and good health. Why should people in Mass. PAY a corporation to devastate the land? This gas is going to EUROPE! Mass. may get 23% of the gas. We can do more with SOLAR and WIND for energy, which has NO TOXIC SIDE EFFECTS. A leaky gas pipeline has DEVASTATING, damaging effects on the land and water. Look at places in PA and elsewhere where wells have been contaminated. People can light their water, coming from the tap, ON FIRE! NO PIPELINE FOR MASSACHUSETTS!

Edward Bayne West Tisbury, MA 2014-11-18 We need legislation supporting renewable energy.

Timothy Kane West Newbury,, MA 2014-11-18 It's a bunch of bullshit!

Donna Calvanese Longmeadow, MA 2014-11-18 Because I support renewable energy and protecting conservation land.

Nancy Ames ACTON, MA 2014-11-18 This is another case of a few rich oil companies profiting off the many of us . This looks like it will cause devastation and hardship to property owners and farms tearing up land of many people so a few can profit and what happens when there is a spill the oil companies will do everything they can to not tell the truth and minimize the disaster look at the way BP has acted and there area they have ruined it will never be the same . Oil companies lie pay people off , and have way to much power We the people should have a say in how our land is used and we should be told the truth just say no to the devastationline (pipeline) the billionaire line the lieline the dowhatwepleaseline

David J. LeBeau Sheffield, MA 2014-11-18 I live in one of the most beautiful parts of the USA which I have had the pleasure of serving. I refuse to allow our county and the nation to be degraded by a company and it's minions simply to increase their wealth in this shameful attack. Please join me and thousands of other citizens of the Berkshires to derail this dastardly attack on our beautiful home.

linda cohen west tisbury, MA 2014-11-18 I'm signing because I would like our energy efforts in Massachusetts to focus on alternative energies and supportive infrastructure .

JOHN MCDERMOTT Nantucket, MA 2014-11-18 Kinder Morgan is BAD NEWS. Period! <a href="http://www.familiesagaincancer.org/?id=163" rel="nofollow">http://www.familiesagaincancer.org/?id=163</a>

Nancy Pirman-Weiss CARLISLE, MA 2014-11-18 We already have a major pipeline running through my town (Carlisle) and yet a significant number of residences in the town don't even have access to natural gas!!! How much more can you be to passing off the risk and not providing benefit? Invest in greener resources.

kathleen ward salem, MA 2014-11-18 enough-!!!!

ilana corey Newton, MA 2014-11-18 Mass isn't home im not letting it get destroyed.

Wayne Maiewski Hatfield, MA 2014-11-18 Massachusetts will soon be "taking the pipe" if we don't end our dependence on non-renewable, carbon-based fuel sources altogether.

Scott Plantier Pittsfield, MA 2014-11-18 This pipeline is destined to drain the life out of every town it despoils -time to end the dirty energy cartels.

Amanda Hancock Dionne Newburyport, MA 2014-11-18 We need clean renewable energy solutions. Large Corporations have an abysmal track record for maintenance and repairs on these mammoth pipelines. I do not want this in my state or any other state. Please deny the Northeast Energy Direct Project. FERC docket no. PF14-22-000

Dave Roitman Florence, MA 2014-11-18 If our children and grandchildren are to be able to live healthy lives, we have to shift from relying on fossil fuels. Natural gas has "lifecycle" impacts (e.g. methane released from fracking; impacts on ground-water; etc.) that make natural gas a net negative source of energy. We NOW have the renewable technologies (starting with weatherization!) that can shift MA to a low demand scenario, making the pipeline unnecessary.

Paul Dobbs Roslindale, MA 2014-11-18 If we forced the gas companies to fix their leaking pipes, the saved gas would be more than enough to meet projected needs.

Maria Ritz Cambridge, MA 2014-11-18 We need to move away from a carbon based economy and invest more and more in renewable energy.

Cheryl Andreas Boston, MA 2014-11-18 The time is now to make the change to clean renewable energy!

Carolyn Lewenberg Boston, MA 2014-11-18 We don't need a pipeline! We need to develop renewable energy resources and consume less!

Mallory Colson Watertown, MA 2014-11-18 I care about the world

Karl Heinemann Acton, MA 2014-11-18 In my own amateur / dilettantish estimation, the supply of fracked natural gas that this pipeline will be meant to carry probably will run out after only 40 to 50 years. And I believe that any of our later efforts to restore the environmental wreckage left in the footprint of the pipeline's route will take a much longer period of time. And I have to wonder whether the costs of that restoration and recovery project would, in the long run, cost much more than whatever shortterm profits stand to me made by the supposed convenience of installing this pipeline to transport the fuel, rather than continuing to use more conventional methods of delivery.

valerie clark needham, MA 2014-11-18 It impacts my family members and the kids.

Erika Turner Ipswich, MA 2014-11-18 We must stop being lazy and taking the path of least resistance. The fossil based energy companies need to change their directions. Renewables. Period.

Daniel Miller Halifax, MA 2014-11-18 Massachusetts can do, does and has done better by its people of our Commonwealth. We need to continue to set the example on the cutting edge of technology, especially in the 21st Century, especially in renewable energy! Let's not go backwards.

tanis fletcher north falmouth, MA 2014-11-18 all fossil fuels are dangerous and therefore important in this issue.

Don & Valerie Bonzek Ludlow, MA 2014-11-18 We live in Massachusetts and don't need more to become more dependent on fossil fuels.

eline bakker Somerville, MA 2014-11-18 Clean energy technologies please

Robert S Hakkila Sr Morehead City, NC 2014-11-18 Save our country go solar stop pipe lines

Joann Fleming Ipswich, MA 2014-11-18 I believe renewable energy sources should be explored and promoted.

Gwen Hoffman Boston, MA 2014-11-18 I want our land and water protected. The pipeline will strip our lands, and the potential of destroying our water resources is far to great.

Anni Crofut Housatonic, MA 2014-11-18 The pipeline poses SERIOUS environmental threats and hazards. Those angling to make a profit will minimize these, but the evidence is clear that we should be investing energy funds into alternative energy rather than extraction, transportation and burning of carbon producing fuels. Listen to the communities, not the mammoth corporations with the dollars to influence.

Chris Stockman Plainfield, MA 2014-11-18 Christ stockman

Patrick Patterson Ipswich, MA 2014-11-18 This is not necessary, it will destroy the environment and contribute to global warming. It should not be done!

sayre sheldon natick, MA 2014-11-18 Fossil fuels have to be changed for renewable energy starting now--there is no more time to waste.

Craig Dillon Westford, MA 2014-11-18 Routing is not rationale.

Ronald Gore Medford, MA 2014-11-18 I believe we can find better ways to contribute to the energy issues at hand than running pipelines through our neighborhoods..conserving is the start,..renewable is the way!

Richard Vaillette Westminster, MA 2014-11-18 I'm signing because we need to develop safe and sustainable alternatives.

stephanie westenkatz Norton, MA 2014-11-18 I'm signing because I am afraid of the possible damage this pipeline can cause and we need to put our money into renewable energy.

Nancy Greene Lowell, MA 2014-11-18 This pipeline would run illegally through conservation land, and Massachusetts wants to be green, not only in our ecology, but in our energy sources. We've made great strides in solar and will soon have Cape Wind. My home is lit by hydroelectric power from the mighty Merrimack River. Fossil fuels are for dinosaurs, not for a progressive state like Massachusetts. Also, we suspect this pipeline is only being built so that fracked LNG can be shipped to Europe. It's not for the benefit of New England, only for the profit of Kinder Morgan. We would bear so much risk for little to no reward, and not the reward we're looking for, which is clean, renewable energy.

Lois Whitney Concord, MA 2014-11-18 The pipeline proposal seems to be being pushed thru without consulting the people of MASS.

Herb Kline Holyoke, MA 2014-11-18 It's the right thing to do

catherine hopkins Amherst, MA 2014-11-19 we must move towards regional sustainability, in food and energy-this pipeline is planned to go through beautiful, fragile environments and through people's farms and yards. No pipeline.

Pamela Frorer Newton, MA 2014-11-19 I'm signing this petition because I'm concerned with the effects of this pipeline on the limited natural environments left in MA. We need to focus on renewable energy instead.

Marcia Hutchinson Sherborn, MA 2014-11-19 These pipelines--all over-- are just for the .01% transnational corporations. They are for their bottom lines ONLY. And the environment and public safety be damned. We must put our collective feet down.

deb tobin marshfield, MA 2014-11-19 the money and effort would be better spent educating people about renewable energy solutions

Deborah Couture Gloucester, MA 2014-11-19 I think that natural gas is a hazardous source of energy. I would prefer to support clean, renewable energy solutions.

Jason Mejia Arlington, MA 2014-11-19 I will have to question whether or not I want to bring children into a dead world if the climate continues changing like it is.

Sarah Anderson Gardner, MA 2014-11-19 Short term profit for long term detriment will never be remembered as anything other than an atrocity.

Christina Rawley Falmouth, MA 2014-11-19 It is time to support life on Earth, transition to renewable energy sources and put an end to the plundering of the planet.

Brad Sandler Salem, MA 2014-11-19 Everyday it is more and more critical that a dedicated plan to implement 'renewable' energy alternatives be created. Any resources used to design, extract, build, expand, or transport greenhouse gas emitting fuels and other dangerous energy sources is delaying their demise. Building this pipeline only helps the existing fuel industry, not people.

Blossom Hoag Hingham, MA 2014-11-19 The money spent for this would be better spent on efficiency and renewables. We already have enough capacity without the pipeline if you do the math.

Jennifer Riley Wayland, MA 2014-11-19 Both the pipeline itself and the gas it will carry will seriously damage our future. We can break the addiction to fossil fuels!

Debra Plantier Richmond, MA 2014-11-19 This is important to stop because it is dangerous and goes through too many sensitive areas.

Sky Wild Bridgewater, MA 2014-11-19 The environment is under attack. We must protect our land, our nature, our conservation areas, our communities from poor planning and population pressures. I am against this invasive, anti-environmental pipeline.

Kathy Roberts Cambridge, MA 2014-11-19 The answer is supporting solar , wind and the internal heat of the earth energy sources rather than disrupting, devastating and polluting the land with a gas pipeline. Arsenic and tobacco are natural too---doesn't mean that they are good for you.

Sonia Demarta Lexington, MA 2014-11-19 I believe we have the technology and information we need to move away from fossil fuels. We need to look forward rather than using the old damaging technology from the past, for our children's sake.

Carol Haverly Lakeville, MA 2014-11-19 the emphasis now and going forward should be on renewable energies in order to save our environment. I am totally against this pipeline now and in the future. Wind, Power, Solar. Let's go, MA. Be first in the nation again! Save our state and help save our planet.

Jalalkhan Jalalkhan dorchester, MA 2014-11-19 I am totally opposed to this project.

Stanton Collins So. Lancaster, MA 2014-11-19 It's time to get out from under the dirty energy dictatorship, and get their money out of politics so that they can't basically bribe elected officials.

Tim Brainerd Natick, MA 2014-11-19 our two federal senators also doubt the need for this unneeded infrastructure...

Beth Girshman Danville, CA 2014-11-20 This proposed pipeline will not solve the energy needs of the Northeast - we need a true clean energy solution and this is far from that.

Carol Brunnschweiler Great Barrington, MA 2014-11-20 I'm signing because I want to protect our land and our natural resources.

Melanie Roth Smith Danvers, MA 2014-11-20 I am a proud citizen of the Commonwealth and a firm supporter of the environment. This pipeline only does damage to both!

geetha venkatesan India 2014-11-20 please do not disrupt people for few people's profits

Laurie Rothstein Cambridge, MA 2014-11-20 Invest in renewable and clean energy.

Katharine Overgaard Erving, MA 2014-11-20 I care about my home state.

diane peters Boise, ID 2014-11-20 I have family in New England. Don't want to mar the beauty of that part of the country!

Alexis Ladd Boxborough, MA 2014-11-20 This pipeline takes us in the completely wrong direction. It's expensive, benefits the oil industry, will negatively impact our local environment, and undermines efforts to shift to renewable energy sources.

Dorothy McIver Greenfield, MA 2014-11-20 We don't need this pipeline-it's all a ploy to dismantle the renewable energy efforts, conservation efforts, (the sane approach to climate change) by raising prices of our electricity in the NE and telling us we need this fracked gas, while much of it is destined to go overseas for a huge profit.

Ian Houghtaling Lee, MA 2014-11-20 The money spent on this ludicrous idea o f a pipeline, should be invested in statewide solar.

Brent McGlynn Chatham, MA 2014-11-20 I'm a massachusetts resident who cares about his earth and his state... We need to invest in our future and our children's future, not that of large corporations and Eco-killers.

Richard Heaney North Attleborough, MA 2014-11-20 I'm signing because, I live in Massachusetts. I dont want this.

David Spanagel Lancaster, MA 2014-11-20 I am interested in seeing our public officials protect their constituents against unnecessary environmental risk. I also understand that this project's promised economic benefits will enrich the corporations that are seeking its development, but not meet a demonstrated need of the energy consumers of Massachusetts. Why invest in infrastructure that supports an expansion of fossil fuel consumption precisely at a time when alternative energy sources are becoming increasingly available and economically viable? The pipeline

is an expensive step backward in the quest for clean, renewable energy, and its likeliest result will be to enhance out of state-owned energy companies' ease in transmitting North American fossil fuel supplies to European customers who will pay a premium price for them.

Margarete Couture Gill, MA 2014-11-20 This will have a negative effect on the environment .

Alyssa B Worcester, MA 2014-11-20 No pipelines! There are too many green energy options to look into, will people finally care when there is nothing left to destroy?

Alaina Paterson Nantucket, MA 2014-11-20 We need to stop placing short term economic security and growth before long term environmental health.

Michael de Lacy Beverly, MA 2014-11-20 I live in MA and tired of zero effort to curb reliance on fossil fuels.

SUZANNE Fenn Vineyard Haven, MA 2014-11-21 Its time to get serious about global warming and fossil fuels..our environment needs to be cherished not abused.

Neil Blanchard Maynard, MA 2014-11-21 We need to invest in renewable energy; not fossil fuel. Anthropogenic climate change is the single most important challenge that we face - or have ever faced.

Jeff Pietrini Beverly, MA 2014-11-21 I'm from mass. I'm for the environment. Against big cooperation

Paul Anderson West Boylston, MA 2014-11-21 This pipeline will go through many unspoiled places in northern Massachusetts. I do not want this pipeline in our area.

Gina Meduski Worcester, MA 2014-11-21 Even though I have no children, I am concerned for future generarions. Alternative clean energy is the solutiin.

Dallisson Silva Framingham, MA 2014-11-21 Keep green energy expanding

Geri Spanek Boston, MA 2014-11-21 This project will cause irreparable harm to the environment in Massachusetts and its residents.

Susan Wolk Williamstown, MA 2014-11-21 I abhor environmental damage

Laura Mendel Belmont, MA 2014-11-21 The number of permanent jobs created for the communities is almost nil, the monies generated by the sale of the gas will go the gas companies and shareholders, not the communities. We the people along the pipeline will not benefit. It will create hazardous conditions as the pipeline ages. This is a long term consideration. Please do not allow this pipeline to go through.

Fran Marrone Everett, MA 2014-11-21 Find a better way to get energy. why are still fighting this battle 40 years after the gas shortage of 1974. someone should have figured out of way to get cheap plentiful sustainable energy - stop blaming the average person

Joanna Ciampa winthrop, MA 2014-11-21 I'm tired Watching people destroy the planet there are other ways that are safer for all

Rena Mae Gagnon worcester, MA 2014-11-22 This is too great a risk to our water supply. Rather we should be looking for alternative forms of energy. In addition, this oil will be exported!

Kelly Cornell Taunton, MA 2014-11-22 We need to concentrate on renewable energy and protect the natural resources we have.

Christopher Jordan Grafton, MA 2014-11-22 Alternative energy, stop fossil fuels...Massachusetts is the leading state and model for the energy revolution, let's keep moving forward, not backwards

IRMA GENDREAU Worcester, MA 2014-11-23 Please save our dear planet earth and its people.

Isadora Coimbra Somerville, MA 2014-11-23 It affects not only the environment of my community but also of the world

Margaret Olson Lincoln, MA 2014-11-23 We do not need this. Increasing our dependence on fossil fuels is not helpful to the earth or to Massachusetts.

Carol Lovell Carmody Lincoln, MA 2014-11-23 I'm tired of sacrificing our environment - giving it away for free - to people who are exploiting it in the name of their profit.

Delia Watts Northampton, MA 2014-11-23 This is just wrong. Thank you.

Richard Goonan Groton, MA 2014-11-24 Kinder Morgan has no interest in preserving our conservation lands, our private property or our school property. They are only out to enrich the oil barons and intend to rape our lands.

Gregory Black Pepperell, MA 2014-11-24 Invest in renewables, not carbon pumping for out of state mega-corporations. The impact of this project on Pepperell will be devastating, destroying hard earned Conservation land and our local water sources. There are NO benefits accruing to this community, just immediate and forever ongoing costs and degradation of a lovely area, our home.

Eli Lennox San Diego, CA 2014-11-25 I grew up in Southern New Hampshire and Northern Massachusetts. A pipeline would destroy the environment and the quality of live enjoyed by the people who live and visit there. It's deplorable that corporate greed destroying that quality of life would even be considered- especially cutting through and destroying protected conservation land.

M. K. Dawson Groton, MA 2014-11-25 KM has a poor safety record & does not have to disclose all the chemicals used in this cracked gas. Should there be an explosion, we are exposing our local/regional First Responders to unknown toxins. Why create this potential risk in the first place when it has been proven not to be needed to meet our energy needs in Massachusetts?

Kenneth Seier Waltham, MA 2014-11-25 I am opposed to opening areas to environmental and property damage when existing infrastructure corridors exist. I am opposed to public underwriting of infrastructure that will be used for the profit of private companies. I am opposed to facilitating the monetization of natural resources that are extracted using processes that harm the people and the environment.

Steve Schnapp Medford, MA 2014-11-26 Massachusetts needs to reduce reliance on carbon-based energy and continue to move forward on renewables. Approving this pipeline is a step in the wrong direction.

Richard Stafursky Brattleboro, VT 2014-11-28 Don't destroy Massachusetts species' forests for something that will be obsolete this 21st century.

Faldora Faldor Somerville, MA 2014-11-30 I do not support any decision that is harmful for our community and isnt i the best interest of our communities.

j a west falmouth, MA 2014-12-10 I'm adding my name to this petition because we need clean, green renewable energy which is available to us without using fossil fuels.

Mary-Jean Miner Oak Bluffs, MA 2014-12-10 We need renewables much more. It is time to stop using fossil fuels.

Mas Kimball Oak Bluffs, MA 2014-12-10 We must fight the fossil fuel industry at every turn we can. Otherwise, it's game over for the planet.

Cosmo LaViola Savoy, MA 2014-12-17 In my opinion, our government should be spending time and money on renewable energy and sustainable alternatives, not non-renewable energy such as oil, natural gas, and multiple pipelines running across our country. This pipeline is a short term energy solution with many negative long term effects and really no long term value. It will bring pollution via compressor stations to some of the most pristine areas within the state of Massachusetts and beyond, including the Berkshires. It will run through the headwaters of the Westfield River Watershed. A watershed which is listed nationally as a wild and scenic river, for it's natural beauty, wildlife, and water quality. The Westfield River Watershed is the cleanest in the state of Massachusetts and has two out of its three branches certified as drinking water. In addition, this pipeline will place an 80,000 horsepower compressor station on a 50-100 acre plot of land in the heart of the Northern Berkshire woodlands, an area that contains literally thousands of acres of pristine wildlife preserves and habitats. But at least it will bring jobs to the area, right?!... Wrong. This station will likely not bring a single job to the area, as compressor stations are operated remotely. Compressor stations have been proven to pollute the air, the ground and water around them, and are lit up all night causing light pollution; furthermore, they are noisy and run 24/7. With the state of the global climate and the renewable alternatives and technology we now have, it is clear to me

that this pipeline has no place in Massachusetts nor our country.

Lisa Nowicki Firestone, CO 2014-12-17 I am originally from Berkshire county, most of my family still lives there and I visit whenever I can.

The land should not be ruined with an eyesore and threatened by a potential complication with this gas line.

Judy Eddy West Stockbridge, MA 2014-12-27 This pipeline is unnecessary! Energy efficiency measures alone will prevent the need for it. Join 350ma-Berkshires where we are fighting this pipeline and promoting clean energy!

Katherine Byrne Sharon, MA 2015-01-07 I'm concerned about the impact to the environment.

Michelle Bryan Colrain, MA 2015-01-08 because destruction of the earth is wrong and the idiots way of the world. It is time to smarten up and use clean renewable energy sources

Becky Wadrei Windsor, MA 2015-01-12 Why would anyone want to support a project from a crooked company like this... <http://westcoastnativenews.com/kinder-morgan-law-breaking-pollution-and-cover-ups/>

Sadie Koczela Windsor, MA 2015-01-12 I would rather see solar and wind power

Brian Wallace Windsor, MA 2015-01-13 I believe we should be spending our resources on building renewable energy infrastructure not dangerous and harmful fossil fuel pipelines.

Larissa Sobon Windsor, MA 2015-01-13 Because I don't want the possibility of a gas line in my backyard.

Steven Hamill Becket, MA 2015-01-13 this is just wrong. Why can't it follow mass pike?

Carina Alden Sandisfield, MA 2015-01-13 This is my home. Please don't ruin it.

Adam Larson Lee, MA 2015-01-14 For the children

Susan Sobon Windsor, MA 2015-01-14 Susan sobon

Jarred Mongeon Dalton, MA 2015-01-14 Im signing because this pumping station would disrupt the ballance in the quiet town of windsor. Its a fragile highland ecosystem similar to a Canadian boreal forest. The noise and poisonous run off created would be detrimental to the town and all the life near by. The well water of my family has great potential to be tainted by this facility on account of its building site is proposed to be very close to my families property.

Peter Sternerup Windsor, MA 2015-01-14 I see no reason for us to subsidize the cost of bringing this gas to Boston so I can be shipped abroad.

Cassandra Service Windsor, MA 2015-01-14 taxation without representation was one of the reasons that our founding fathers rose up against the oppression of the British overlords. Forcing us to pay a utility surcharge for a pipeline that will destroy our environment, compromise our health and our property values without bringing any benefit of cheaper heat or utilities to our town is essentially the same thing. Time to rise up in revolution!

Brie Lohnes Windsor, MA 2015-01-14 We need to look for alternatives. We cannot ruin our beautiful country and rural areas this way. We need to respect nature and our environment. Find a better way.

Cheryl Hopkins Colrain, MA 2015-01-14 We do not want Kinder Morgan's pipeline or any other pipeline! This is outrageous! The majority of people in Mass. do not want this! It will destroy environment, animals, birds & peoples' lives! Stop this now! Do what the people want! Don't cave in to special interest groups with big pockets. This will not benefit the people of Mass. !

Nancy Doolan Hinsdale, MA 2015-01-14 i don't want my town ruined

James Younis Reading, MA 2015-01-14 I love Sadie and will help her or anyone she knows who needs help in anyway even in a small gesture like this!!! Hope everything works out and love you and Richard!!

Hanna Sobon Windsor, MA 2015-01-15 This company is trying to put a pipeline right through my family's land and proposes building an awful compressor station in my town, destroying the peace and beauty of the Berkshire Hill Towns! I have lived there my whole life and would hate to see this happen to my beautiful home!

nikki dimitropolis Windsor, MA 2015-01-15 This is outrageous, keep the gas line out. Keep windsor beautiful

Erica Wetherell Lanesborough, MA 2015-01-15 Rural Massachusetts communities need to be protected.... I do NOT want this pipeline running through my town.

Ann-Marie Desautelle Washington, MA 2015-01-15 I live in the Berkshires and do not want this monstrosity destroying our beauty.

Monica Bliss Pittsfield, MA 2015-01-15 I am against the pipeline - everywhere - especially in the Berkshire!

Alfonsina Ramon Bristol, RI 2015-01-15 I'm signing because this is my home

Renee Poplaski Lanesborough, MA 2015-01-15 I'm signing because I don't want this pipeline in my community!

Mary Bilodeau Methuen, MA 2015-01-15 I feel this pipeline is bad for Massachusetts - the environmental impacts are plentiful and the benefit to citizens minimal. I do not want to support the fracking industry.

Audrey Huggon Westport, MA 2015-01-15 We need to take seriously the need to respect and rehabilitate our environment beginning on a local level, expanding to state and federal land( sea and air too). there are so many ways to support this movement. This is one of the easiest and fastest ways to help. Please Sign.

Lyndon Moors Lanesboro, MA 2015-01-16 This proposed pipeline will carry fracked gas, which is not safe, cheap, or needed. The construction of this pipeline will permanently scar the landscape of my town.

Jennifer Munoz North Adams, MA 2015-01-16 Investment should be in renewables, not in escalating efforts to find and deliver fossil fuels.

Gail Rice Wareham, MA 2015-01-18 I can see the damage that has been caused by this.

Rich Girard Somerville, MA 2015-01-20 I think that preserving nature and animal habitats matters to us and our future. despite the yahoos who think they can destroy things with impunity and it won't ever affect them.

Jennifer Markens Ashfield, MA 2015-01-22 This proposed project is overbuilt, deadly, and intended for export. Is the U.S. devolving into an extraction colony for the .01%? This is a massive abuse of public trust, public health, and credulity.

Patricia Lemon Warwick, MA 2015-01-22 It's lucky they will be shipping the gas to Europe, because we don't need it in Massachusetts.

Julia Blyth Sunbury, OH 2015-01-22 This pipeline would affect my community negatively.

Sylvia Snape Plainfield, MA 2015-01-22 This pipeline would create an indelible scar across Massachusetts that could not be reversed and which would cause great harm to the environment.

cathy kristofferson ashby, MA 2015-01-23 I am signing because we need to end the use of fossil fuels and promote the expansion of clean sustainable energy and energy efficiency. Pipelines for increased dependence on fracked gas, or for fracked gas exportation, are a bridge to climate catastrophe.

Rachel Kohn Amesbury, MA 2015-01-24 I value the land, water and air we depend on.

Lisa Donovan Pittsfield, MA 2015-01-29 I'm signing because this pipeline will destroy the untouched land of our beautiful state all in the name of progress.. There is no progress here only corporate greed.. When is enough enough!!

donna kingsley Lanesborough, MA 2015-01-29 "IF" this pipeline goes through it will be 4 house's away from me!!

Lisa Healey Pittsfield, MA 2015-01-29 I want to save our land and wild life and for so many more reasons.

Gina Frey Amherst, NH 2015-01-31 Do NOT build NED pipeline in New Hampshire. This gas pipeline does not support our state, environment,

property owners, or energy needs. It will negate millions of dollars spent in conservation, endanger our water supply, schools, rural quality of life, previously identified endangered species and our quality of life. It will decrease property values, and will create a financial and environmental burden for residents/ Gas companies are currently exempt from the Safe Drinking Water Act and do not have to disclose the chemicals in the pipeline; a pipeline leak could contaminate water sources with undisclosed chemicals. Gas will not benefit our energy prices and the pipeline will cross SIX counties, the Souhegan River, numerous wetland and preservation areas and construction blast will impact school zones and private water wells.

Patricia Wallace New Haven, CT 2015-02-02 I am a Quaker, and I am very concerned that this pipeline will harm the Woolman Hill Conference Center. I also believe that we need to focus on solar and wind energy infrastructure, not destructive infrastructure like this.

maria szmauz New Ipswich, NH 2015-02-04 It will destroy my land! NH does not need this

stephen philbrick Windsor, MA 2015-02-09 this project is all about extracting profit for a corporation at the expense of the lives of all the people. birds, animals and plants in its path: definitely not worth it!

Marsha Johnston Berlin, MA 2015-02-12 We are entitled to our personal property, clean water and air for our children and their children!

Sandra Nathan Stephentown, NY 2015-02-17 All of the health, safety and environmental reasons, as well as the injudicious decision to invest in dirty gas and because I live in the incineration zone

Julius Melbin Townsend, MA 2015-03-16 This project is unneeded and will have a devastating and lasting impact on communities, conservation lands, and the environment

Alice Arena Weymouth, MA 2015-03-23 We need to divest all money from dirty fossil fuel infrastructure and invest in green/renewable energy infrastructure.

Stephanie Engel Stephentown, NY 2015-03-24 The pipeline will be obsolete in the near future. What are Kinder Morgan's plans to remove the toxic pipeline then? Are they just going to leave it in the ground forever when fossil fuels are inevitably outdated and pipeline no longer used?

Elizabeth Whitcomb Northfield, MA 2015-03-28 This pipeline is not needed to meet our energy needs. Its true purpose is to give Kinder Morgan a quicker way to export natural gas to Canada. This past winter proved that we can more than meet our energy needs with the existing infrastructure.

Joe Graveline Northfield, MA 2015-04-01 This project will destroy many culturally and environmentally sensitive spaces and allow the continued use of fossil fuels for the next 50 years just do to the excuse of the cost of the investment. Please stop the taking of private land for corporate profits.

Joshua Paradise Brookline, MA 2015-04-01 We need more renewable energy and I don't want a gas pipeline running through clean rural areas.

Nolan Kitfield Northfield, MA 2015-04-09 I'm signing because I think we need a change: Please ban new infrastructure for fossil fuels and make a move toward a future of renewable energy.

Holly Lovelace Northfield, MA 2015-04-20 The compressor station would be 1/3 of a mile from my home and destroy my quality of life and property value.

Sebern Fisher Northampton, MA 2015-05-06 This pipeline is a natural disaster

Ellen Shaw-Smith Holyoke, MA 2015-05-06 I care about my community deeply. I do not want the destruction of a large and precious area of MA that includes the last of our open lands and many residential communities. . The structural change from the installation of the pipeline, the tremendous change in sound quality in the area, and the possibility of accident that would make the area largely uninhabitable is beyond anything we can be expected to accept for this beautiful and important area. Especially for an energy project that has no value to our area or the citizens in it. Profit for a far away company to export is not a reasonable or ethical exchange for the damage this would do to Western MA.

Blake Scyocurka Ludlow, MA 2015-05-06 This would destroy our environment only to further the greed of others.

Linda Kaye-Moses Dalton, MA 2015-05-06 1. We don't need more gas; 2. the dangers are all to real; 3. We don't want to pay the extra fees on our electricity bills; 4. the gas is going to be shipped overseas anyway; 5. NED and KM and TGP will not assume any liability for accidents (fires, explosions, leaks) in the pipeline and the individual towns will have to pay for clean-ups; 6. Any leaks will affect our reservoirs and aquifers!

Jeanne enis Woburn, MA 2015-05-21 We need to stop this prehistoric way of achieving energy, its deadly to the environment and humans

Joseph Lanza Winthrop, MA 2015-05-31 This is outrageous disturbing natural habitat and destroying the land. Why not invest in renewable energy and not one that is so environmentally destructive.

Seth Hansell Northfield, MA 2015-06-06 We do not want this project as close to our new house. It will lower the property value, not to mention ruin the peace and quiet where and part of the reason we purchased at the location we did in the first place.

marté augusto Northfield, MA 2015-06-16 I live in close proximity of the proposed compressor station in Northfield, Ma. I will have no property value or compensation for my home if this is built

bonnie Gage-Anderson Hudson, NH 2015-06-29 This is in my back yard in Hudson, NH

Kimberly Longey Plainfield, MA 2015-07-02 This pipeline is not necessary for NE energy needs, current or projected. Its proposed path crosses areas of critical environmental concern and would negatively impact the quality of life for many living beings. there are alternative solutions to the regions energy needs that can be delivered at far less negative impact and with much more sustainability.

Robert Dickerman Northfield, MA 2015-07-16 The pipeline would be used to transport gas destined almost entirely for export. Citizens may pay for construction costs through their electric bills. Costs to neighbors of 80,000 HP compressor stations might be very high, in terms of air pollution and associated illnesses, potential water pollution, audible noise and vibration, and light pollution.

Stephen Balazs Northfield, MA 2015-07-16 This pipeline is not needed if current leaks are addressed and fixed. It will be a catastrophe for the environment and a financial one for homeowners along the route.

Tammy Pelletier Northfield, MA 2015-07-16 This pipeline is expected to intersect some of the most beautiful and pristine Forrest in Northfield Ma. ,that many people have worked hard to preserve.it will go through conservation areas and have an eighty thousand H.p. Compressor station on a forested mountain. It will impact a beautiful small rural town with air ,noise , and ground pollution ,and ruin property values for hard working residents. It has no place in a long term energy solution in this area or any other,only negative impact for corporate profit.

Helen Adams Northfield, MA 2015-07-17 I live in one of the communities where a compressor station is proposed to be built. Ours is a beautiful, quiet community with rich history and a long tradition of attracting tourism. We would not have moved to this area if such a station had been present at the time or if we knew that it may be at any time in the near future. If my children did not have roots here and my husband did not have an established business that cannot be easily moved, I would strongly consider leaving the area if this project were to proceed.

Louis Anson Northfield, MA 2015-07-17 This will destroy many farmlands, Reduce property values and will provide no real benefit to the state. in addition to producing a hazard of large proportions to life in these communities. Also most of this gas will be sold overseas.

Cynthia Frado Amherst, MA 2015-07-17 As a concerned pastor from Northfield, I know how important environmental protection is to this community. This compressor station would be devastating on so many levels.

Melinda LaBelle Erving, MA 2015-07-17 I'm signing because I don't want the pipeline in my backyard.

Donna Dove Conway, MA 2015-07-18 I'm signing because I believe this would be hazardous to our environment, communities and personal

property.

Robin McKeon Northfield, MA 2015-07-18 I am against furthering our dependence on fossil fuel. I am against the usage of water to extract gas. We have a solar system on our house

Hattie Nestel Athol, MA 2015-07-18 I can't bear the destruction this pipeline would do. Besides we don't need it

Deborah Wagner BRookeville, MD 2015-07-18 There are no sacrifice zones. All places and beings have value. Walter and Susan Cudnohufsky Ashfield, MA 2015-07-18 This is an outrageous health, environment and climate destroying scam to enrich a few corporate criminals. It is time we say no as a society!

gay roberts northfield, MA 2015-07-18 I love this land and the environment it provides, and I don't want to see it obliterated. Amanda Nash Gloucester, United States Minor Outlying Islands

2015-07-18 There are just so many reasons to deny this pipeline. It is clearly not for the public good but simply for the corporations to make money on the backs of Massachusetts tax payers. Kender Morgan has a terrible safety and maintenance record. Western Massachusetts is a farming community where food is raised for regional and national consumption. So many other reasons...

Jason Ellis Bernardston, MA 2015-07-18 This pipeline is planned to run primarily in an electrical right-of-way adjacent to or under high-tension lines, and I cannot imagine that this is actually safe. I grew up near high-tension lines and you could literally hear the hum, buzz, and pop of the electricity flowing through those lines. Imagine a leak in a high pressure natural gas pipeline. Imagine the resulting explosion when the natural gas contacts the raw electricity in the high-tension line above. It would devastate this regions electrical supply in an instant.

Peter curtis Ashfield, MA 2015-07-18 It is clear to me that this proposed pipeline is not needed in MA. It is a project for the personal profit benefit of a few at the expense of the many. FERC knows this as we all know now.

karen sullivan ashfield, MA 2015-07-18 I believe that alternative energy is the way to go. Fix existing gas pipelines and stop ruining our beloved Mother Earth for greed. To take land eminent domain for private profit is wrong!

Virginia Ansbergs Plainfield, MA 2015-07-18 This is a move in the wrong direction. We need alternative sources of energy which do not so very negatively impact the people and environment in our beautiful state. The vast majority of people who would be affected by having this pipeline in our communities are resoundingly against it. It is the right and responsible and moral thing to reject this unnecessary and dangerous pipeline project! Say NO to Kinder Morgan who does NOT have the interests of the people of Massachusetts in mind!!! Thank you for doing the right and wise thing.

john hann Winchester, NH 2015-07-18 use of eminent domain to take private land for the benefit of corporations shipping gas internationally is wrong

Maureen Spaulding Easthampton, MA 2015-07-18 I am opposed to this project. It is an invasion of our privacy.

Ellen Barfield Baltimore, MD 2015-07-18 We gotta outgrow destructive poorly regulated fossil fuel extraction, transport, and burning. Green energy is ready, cheaper in many places and is where the jobs of the future are. GO GREEN NOW!!

Emily Howard Plainfield, MA 2015-07-18 I live adjacent to the proposed pipeline route. We need more renewable energy, not to be sending gas to other countries.

Walter Jaworski Northfield, MA 2015-07-18 I am opposed to the unnecessary pipeline which is primarily being built to export LNG and profit corporations at the expense of ordinary citizens.

Jean Wagener Northfield, MA 2015-07-18 Concerns regarding environmental toxins Lack of need for this pipeline through MA

Helen Johnson Northfield, MA 2015-07-18 This project will decimate property values and destroy the scenic quality of our towns (visual beauty and the quiet). It will add to climate change - the worst environmental disaster humanity has ever caused or experienced - by contributing to the burning of fossil fuels. Saying that gas contributes less than oil to climate change is like saying that stabbing someone is less bad than shooting them. It doesn't make stabbing a good idea. What we need is investment in renewable energy, and an overall shift to a new environmental and economic paradigm. This pipeline is part of the old paradigm, WHICH WILL COLLAPSE IN THIS CENTURY; the question is how much we will allow it to destroy as it goes down.

Grayce McCreary South Portland, ME 2015-07-18 I don't want the pipeline to destroy our beautiful New England.

Leatra Harper Senecaville, OH 2015-07-18 We must avoid catastrophic climate change. No new huge pipelines are needed - stop the corporate profiteering!

Clifford Phillips Northfield, MA 2015-07-18 This dirty fuel source is not a "bridge fuel" but a methane-producing threat to life on the planet. This pipeline will directly impact my family's health and well-being and will be an uncompensated loss to the value of our property in Northfield, MA. The Commonwealth of Massachusetts and its people have committed to reducing greenhouse gas emissions while increasing renewable energy use. This project, by corporate fiat and with the aid of the FERC, will deny Massachusetts this right by forcing a larger role for toxic natural gas in our energy market, while providing gas producers with an export terminal to boost their profits and stock price. This project conflates public need with corporate growth aspirations at the expense of the well-being and safety of the public and future generations.

David Greenberg Colrain, MA 2015-07-18 This is the last thing we need in Mass., a state committed to leaving fossil fuels where they belong... underground.

Lucia Sturup Belchertown, MA 2015-07-18 You will destroy all that is pure and beautiful with your filthy pipeline

Margaret Anderson Granby, MA 2015-07-18 I am outraged!

Steven Tower Northfield, MA 2015-07-18 This pipeline is a Trojan Horse -- a seeming gift on the outside, but teeming with horror on this inside in SO many ways!

budinich Budinich Northfield, MA 2015-07-18 I fear corporate injustice , stop the MONEY line

Michael Suter Shutesbury, MA 2015-07-18 This pipe line is unnecessary and will contaminate the drinking water of citizens of Massachusetts. The gas is for export and we must invest in appropriately sited renewable energy and NO MORE FOSSIL FUELS.

terrance McKeon Northfield, MA 2015-07-18 Reliance on fossil fuels has to stop we all need to conserve and make sacrifices towards solar, wind, hydro Kinder Morgan plans on exporting the large majority of the gas, so trying to justifying the need other than profits is suspect. Billions of cubic pounds of gas are lost with current pipes and compressor stations, how about conservation efforts? Volatile gases from blow offs and leaks, would settle in the valley as inversion of air is common in northfield. Our property values would plummet fracking wastes precious water, and is not good for the earth. Based on their history with other compressor stations, Kinder morgan will not pay the community a reasonable payment in lieu of taxes ...noise, light, vibration, ruining conservation land...these reasons are only the tip of the iceberg

Rev. Dr. Terence Ellen Pikesville, MD 2015-07-18 It is way past time for FERC to actually start acting in the public's interest, not just that of petro companies. We simply cannot burn all the gas assumed by these new pipelines and stay anywhere near two degree Celsius rise by the end of the century. You are killing our planet, destroying our public health, and putting us all at risk for the sake of profits to a wealthy few. This is morally and fiscally (in terms of the economic costs of the consequences) intolerable.

Deborah Andrew shelburne falls, MA 2015-07-18 I am a signatory to this petition for a number of excellent reasons. 1. Hydrofracking, banned in some places, should be banned in the U.S. The thousands to millions of gallons of pure water per well (depending upon depth) is contami-

nated with chemicals, forever unusable, contaminating the soil and aquifer as well as nearby wells. (2) the release of methane throughout the process. Methane has a far greater negative impact and exacerbates the number and harm caused by extreme weather events (drought, floods, hurricanes, tornadoes, etc). (3) causes increases in earthquakes. The overall damage to the environment, life as we know it, our food supply, our water supply, our homes, our communities, our health ... all are affected. This and other pipelines are designed to carry hydrofracked gas. They are colluding in the destruction of our environment and lives. They must be stopped.

Benita Campbell Burgettstown, PA 2015-07-18 This monstrous, dangerous infrastructure for fracking is proof that there is no intention for this to be a bridge fuel, and the extractors will drill and frack anywhere and everywhere they can.

Maud Geng Plainfield, MA 2015-07-19 Maud geng  
 caleb kissing Bernardston, MA 2015-07-19 we need to cut down on our use, not put in more infrastructure so we can gluttonize more carbon.

Cody Sisson Northfield, MA 2015-07-19 This is proposed to go through my lower field withing a few hundred feet of my house and business!!

Emily Koester Northfield, MA 2015-07-19 all fossil fuels must stay in the ground if we are to survive

Sharon Raymer Northfield, MA 2015-07-19 The pipeline is going right through one of my favorite places

Sarah Doyle Turners Falls, MA 2015-07-19 I don't believe that the pipeline is actually needed, except to make money for a few people, and I don't trust Kinder Morgan. It isn't only a pipeline, but a huge station in Northfield that will be noisy, intrusive, and a source of pollution. Rather than tearing up the landscape for short-term gain for a few people, we should be investing in renewables and continuing to cut down on usage to find better sources of energy. NO to the pipeline!

JEANNE DOWD Greenfield, MA 2015-07-19 this is a terrible long term answer for meeting our country's current and future energy goals. It is against all natural conservation goals for the environment, wildlife as well as contrary to young people's interest in pursuing renewable energy careers and saving the earth for future generations. Shame on you!

A Morris Leverett, MA 2015-07-19 corporations do not care the PUBLIC interest and the natural resources that belong to the Indigenous peoples who were here before the colonists (ie: rapists)

Judy Wolter Northfield, MA 2015-07-20 It's the right thing to do. It is nonviolent to sign this, while the pipeline is violent.

Susan Flores Plainfield, MA 2015-07-20 This will destroy the character of our small town!!

Andra Rose Amherst, MA 2015-07-21 I want our energy dollars to be spent on renewable infrastructure, not fossil fuels. Gas is not a bridge fuel and NED will not reduce energy costs in the short run. In the long run we'll have to abandon the pipeline before it's paid for itself. The reason is that we are legally bound to meet the GWSA emission targets and burning natural gas for over 50% of our energy needs is in direct conflict.

Anna Fessenden Ashfield, MA 2015-07-21 The time has come to dismantle Corporate Rule. We, the People will never allow the destruction of our land, communities and homes for profit. We will never surrender to becoming a "host community"!

Robert English Ellendale, MN 2015-07-21 This pipeline proposal is a living nightmare that has already produced financial ruin for many homeowners. It's sort of like getting hit by lightning or a meteor. In light of Global Warming, the notion of FERC assessing environmental impact is a joke.

Jane Shaney Ashfield, MA 2015-07-24 "A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it ends otherwise." Aldo Leopold A pipeline provides no integrity, stability, or beauty for a biotic community. It is wrong.

Edward Cahill Shelburne Falls, MA 2015-07-24 This pipeline goes through pristine land, it must be stopped. Route it through already despoiled land, I might get behind it.

Mary Boyle West Roxbury, MA 2015-08-03 I'm signing because a new pipeline is planned for my neighborhood next to an actively blasting quarry!

Terrence O'Reilly Dracut, MA 2015-08-04 There is no need for this and the plan for this is too close to densely populated areas affecting peoples property, water and agriculture.

Deidra McMorro Dracut, MA 2015-08-04 I do not want this pipeline!

Caroline Yunta Peabody, MA 2015-08-09 The Pipeline presents an ongoing danger to my community and others; should there be a discharge of natural gas into any part of the Pipeline's length our homes would be peril of obliteration through explosion and fire.

Cynthia Lawton-Singer Conway, MA 2015-08-10 I want a world in the future that can support life! I love the world. Building more fossil fuel infrastructure is like investing in buggy whips after the automobile was invented. This technology MUST be retired ASAP. We are at tipping points for life on the planet.

Susan Landon Tewksbury, MA 2015-08-11 This project results in permanent and irreparable damage to the environment, loss of personal property rights (including my own) and safety issues. A high pressure pipeline is not the answer when Massachusetts can do more with sustainable energy sources and getting existing pipelines to patch their leaks.

Meghan Stanley Maynard, MA 2015-08-12 Massachusetts wants clean energy now!

Dawn Hammond Holliston, MA 2015-08-14 We need very rapid transition away from fossil fuels to renewable sources of energy, in order to keep climate change to a manageable level. Building a new gas pipeline is inconsistent with this imperative.

Cassandra Nawrocki Ashfield, MA 2015-08-23 From all I have read, this pipline seems unnecessary and environmentally detrimental. Our state and nation should be concentrating efforts on renewable sources of energy and conservation

Roy Pincus Lynnfield, MA 2015-08-23 This pipeline would be devastating to the residents of Massachusetts and extremely harmful to the town I live in, Lynnfield, MA. It would run right through my property, making it almost worthless as no one would want to live in a home with this pipeline running just feet from it, in addition to the fact that it would run right through the water source for my town, threatening contamination and that destroy our water system. Please do not let this pipeline happen.

Amy Feinberg Lynnfield, MA 2015-08-24 I have children and want this no where near them!

Kathleen Gauvin New Ipswich, NH 2015-08-28 This pipeline is only being built to make a huge profit to KM/Tennessee Gas at the risk of our safety! GREED, GREED, GREED! Let's change it around to ENVIRONMENT, ENVIRONMENT, ENVIRONMENT!

Julie Orfirer Ashfield, MA 2015-08-30 It puts my community and home at risk for no benefit. There are better, safer ways of producing energy that didn't threaten people's lives, investments, and a world-time of evolution and beauty in our protected lands.

*{end of 20150831-5179}*

**20150831-5183**

Thomas Malloy, Averill Park, NY.  
 PF14-22

To whom it may concern:

We the people of Averill Park vehemently oppose Kinder Morgan's pipeline/compressor station proposal. For sixty-seven years I have lived in this beautiful town, made many friends and raised a wonderful family. I, as well as my ancestors, and all of Averill Park dwellers have worked very hard to build the foundation of Averill Park. We have made this town a safe, clean, inviting, beautiful place to raise our families. If the pipeline is approved will our town be safe? Will our town be clean? Will our town be inviting? Will our town be beautiful?

I request research and answers on the following:

- the effects of the compressor station/pipeline and blasting will have on water wells
- the effects this will have on the habitat in Nassau/Averill Park/Stephentown area (we are all connected)
- the toxin levels released from the compressor station and how this will affect the public health
- the toxin levels released into the ground soils and how it will affect vegetation (there are many farms in the area)
- the effect this will have on Burden Lake, which is in close proximity to the proposed compressor site. It would be of great disappointment if we could no longer swim or fish in this beautiful lake due to toxins. We can't enjoy Nassau Lake thanks to the Dewey Loeffel dump and the PCB's that polluted the lake. Will Burden Lake become another useless lake filled with toxins?
- the effects this will have on the Dewey Loeffel Superfund site.
- the effects this will have on our taxes, I am sure there is some cost to the tax payers
- the effects this will have on our EMT's and Firefighters. Will they be mandated to attend special training so they would be educated on how to respond to a pipeline explosion
- who will operate the compressor station?
- the effects this will have on our roadways
- research Kinder Morgan's incident rate and safety protocol
- why is this needed, especially when our leaders are focusing on renewable energy?
- how much of the gas will be exported?
- what are the benefits?
- How much will home owner's insurance go up?
- How much will our home depreciate?

The people of Averill Park, Nassau and Stephentown are living the American dream please do not turn it into an American nightmare. I ask you to please consider denying Kinder Morgan's proposed pipeline project. This pipeline/compressor station will ruin the quality of life in our small upstate community. Would you want your family to live in close proximity where fracked gas is being transported? Would you want your daughter and grandchildren living in an incineration zone? Would you want to breathe air filled with Methane, Radium and Formaldehyde? Would you want to drink water filled with cancer causing carcinogens? Would you want your homes in your neighborhood to devalue? Please stop Kinder Morgan from ruining our beautiful community.

Thank you for your help with this matter.

Respectfully,

Tom Malloy

**20150831-5187**

Laurie Carter, Averill Park, NY.

PF14-22

To whom it may concern:

We the people are speaking out against Kinder Morgan's proposed pipeline project and urge you to deny their application.

As a lifelong resident of Averill Park, NY I am genuinely concerned of the effects the compressor station and the pipeline will have on my family and friends, as well as our community. My family has lived in this area for nearly a century. We love this area for its serene, quiet, beautiful neighborhoods filled with trees, lakes and an abundance of wildlife- deer, bears, owls, red tailed hawks, snapping turtles, wild turkeys, butterflies, bees, woodpeckers, and an assortment of beautiful birds, including the beloved Bald Eagle. The eagles nest on beautiful burden lake, which is located within the half mile buffer zone of the proposed compressor station. In addition to the wildlife, there are an abundance of humans who live in this area including many children. The proposed location is less than a mile and a half away from a registered daycare where my two children attended, as well as my sisters five kids. We chose that daycare because of its outstanding reputation, affordability and close proximity to our homes. However, if a compressor station was right around the corner I am afraid we would have had to choose another daycare - hence, negatively impacting small businesses in our community. Do you think it is fair to take away business from our community so we can fill the pockets of greedy billionaires?

In addition to the impact it will have on small businesses, it will negatively impact our emergency responders. We do not have enough responders to handle a catastrophic event such as a pipeline explosion. What happens if all of our responders are at an explosion when another accident, fire, heart attack..etc. occurs? Who will help those in need? We simply do not have the means to tackle an event such as a pipeline explosion. Once again, do you think it's fair to put so many people at risk just to fill the pockets of greedy companies such as Kinder Morgan?

The pipeline and the compressor station are putting unnecessary risk to my family, my friends, our first responders and our community with absolutely nothing to gain. Will there be any benefits to us? What is Kinder Morgan's incident rate? Has anyone other than Kinder Morgan looked into how many incidents occur each day, month or year? How often will the pipeline be evaluated for cracks or leaks? Gas pumps have to be inspected, will the pipeline have to be inspected on a regular basis?

I ask you to please consider denying Kinder Morgan's proposed pipeline project. This pipeline/compressor station will ruin the quality of life in our small upstate community. Would you want your family to live in close proximity where fracked gas is being transported? Would you want to endanger your family knowing that the pipe could explode at any time? Would you want to breathe air filled with Methane, Radium and Formaldehyde? Would you want to drink water filled with cancer causing carcinogens? Would you want your homes in your neighborhood to devalue? Please stop Kinder Morgan from ruining our beautiful community.

Thank you for your help with this matter.

Respectfully,

Laurie Carter  
26 Ravers Way  
Averill Park, NY 12018

#### **20150831-5188**

Gloria D Chaput, Mason, NH.

I am writing today because of my concerns about the NED pipeline that is proposed to run through my town of Mason NH and many other small rural towns in southern New Hampshire. I do not claim to know or understand all the complexities involved in managing our nations need/demand for energy. And I would like to believe that FERC is doing its utmost to fulfill its duties in understanding the energy market and regulating companies that have a vested interest in maintaining and expanding the infrastructure to meet the energy needs that this nation has been able to consistently rely upon for so many years.

I am very concerned about the safety, the financial repercussions and overall quality of life that will impact-

ed the US citizens in the path of this NED pipeline. And for what? What does the sacrifice of these citizens achieve? Is it truly for the good of this nation? Would you allow a “for profit” company to install a pipeline in your town, your back yard, or on conservation land you have spent a lifetime to protect? And if you would, what would you expect in return for your sacrifice?

I believe that your agency can help this nation achieve its goal of reduced reliance on fossil fuels by denying applications for new transmission lines that transport natural gas or oil. In addition, if you increase pressure on companies with existing transmission lines to maintain and repair their existing lines, we may be able to promote more incentive for these companies to invest in infrastructure to support renewable resources of energy. I am not so naive to believe that this alone will get us to our desired destination but I do believe that a long journey starts with small steps towards the desired destination.

I would like to request that you decline the request to Tennessee Gas Pipeline Co. a subsidiary of Kinder Morgan or any other company that wants to install yet another natural gas pipeline through our region.

Thank you for your time and consideration.

Sincerely,

Mrs. Gloria Chaput

Re: Docket #PF 14-22-000

Francille Egbert

50 Maple Trail

Sand Lake, NY 12153

Federal Energy Regulatory Commission

Kimberly D. Bose, Secretary

Washington, D.C.

Commissioners:

I write to express my opposition to the proposed Kinder Morgan/Tennessee Gas Northeast Energy Direct Project.

I do not think that Kinder Morgan/Tennessee Gas has a safe history of environmental health in its industrial settings.

The towns, Schodack, Nassau, and Stephentown, and the Rensselaer County legislature, have passed resolutions expressing the people’s will against the construction of this pipeline.

The proposed pipeline compressor plant located in Nassau, NY will burn gas contaminated with hydrofracking chemicals. Gas contaminants released by compressor stations include volatile organic compounds such as methane, benzene, methylbenzenes, ethylbenzene, xylene, pentane, hexane, toluene, 1, 3-butadiene, aliphatic hydrocarbons. These are known human carcinogens. Compressor stations also release formaldehyde, hydrogen sulfide, and radon, which are carcinogens and can cause cancer and other health disorders, and respiratory and nervous system diseases. The compressor plant will operate 24/7 and its noise will reverberate for miles through the Burden Lake basin and the surrounding hills and hollows. I think you would agree that this is not an appropriate plant for a residential area and would not want something like this near your home.

The proposed pipeline will cut through, destroy, reduce and degrade parts of the Rensselaer Plateau, which is a unique and irreplaceable natural area, and a reservoir of natural diversity. The Rensselaer Plateau is the 5th largest contiguous forest in New York State. The plateau forest is being conserved through a number of federal grants, nonprofit organizations, state parks and nonprofit groups. It has been deemed valuable enough to receive highly competitive federal funds.

As Commissioners, I understand your job is to assess the balance of energy needs against the value of natural resources in the same area. As our dwindling natural resources take on an added value for all citizens I know you will take these concerns seriously.

For more information:

[www.rensselaerplateau.org](http://www.rensselaerplateau.org)

Sincerely

Francille Egbert

Susan M. Ceccacci, Jefferson, MA.

August 30, 2015

Federal Energy Regulatory Commission

RE: Northeast Energy Direct Project

To Whom It May Concern:

I am the owner of a piece of land that will be affected by the construction of the proposed Tennessee Gas Pipeline. I acquired my land, 149 acres off Route 10 in the town of Winchester, New Hampshire, in 1983 for recreational use. It is forested land crossed by a right of way, old logging paths, and beaver ponds.

During my ownership this piece of land has been open to the public. Students of a nearby preparatory school in Northfield, Massachusetts, take advantage of it for walks. In 2014 I joined a Forest Management Plan with the State of New Hampshire for the purpose of good management and also to maintain and enhance the natural beauty of the land. The presence of a gas pipeline adjacent to a power line that crosses our property will be detrimental for the following reasons:

- The useable acreage of the property will be severely reduced along the pipeline:
- The noise of a pumping station will be poorly tolerated by the wildlife present in the area (deer, turkeys, ruffed grouse, ducks, geese, beavers, and occasional bears)
- The pipeline in one area will run very close to a beaver pond with possible damage to aquatic life.
- The aesthetic value of the land, with the majority of the forest not harvested for the last 30 years, will suffer.
- The timber value of the land will be markedly diminished. We were unable to obtain a clear cut answer to the question on whether heavy logging equipment will be allowed to cross the pipeline if we decide to harvest timber.
- I will defer to the opinion of geologists whether or not the pipeline will possibly result in pollution of underground water.

The real economic advantage of a new pipeline for the New Hampshire has been questioned by some. Will it really lower the cost of energy or will it just benefit the Tennessee Gas Pipeline Company by exporting the gas to foreign countries?

Though I recognize that gas is less polluting than coal, if indeed the pipeline is intended to decrease the cost of gas, and therefore to increase its consumption in New Hampshire and other states, that will represent a slap in the face to our president's proposal to achieve a 30% carbon dioxide cut by the year 2030.

Sincerely,

Susan McDaniel Ceccacci

360 Causeway Street, Jefferson, Massachusetts 01522 email: [sceccacci@aol.com](mailto:sceccacci@aol.com)

**20150831-5211**

Timothy Camann, Unadilla, NY.

I am concerned about the cumulative impacts of this proposal with other approved pipelines and other proposed pipelines. The increased natural gas infrastructure will promote increased natural gas development, consumption, and emissions. This will lead to even greater amounts of greenhouse gases in the atmosphere and oceans and will exacerbate global warming and ocean acidification.

I am concerned about the loss of forested wetlands on my property, as well other portions of the proposed route. I am concerned about the loss of upland forest on my property and the rest of the route.

**20150831-5219**

Re: P14-22-000

Comments:

As a citizen of Montague, MA, I wish to express my profound concern over the Tennessee Gas Pipeline Company's proposal to construct a new pipeline through the Pioneer Valley region of Western Massachusetts. It is my understanding that the proposed pipeline would be routed under the Connecticut River as well as through truly lovely and pristine woodlands, agricultural areas, sites of historic interest, and sites sacred to indigenous peoples. The Company has not provided sufficient assurance that it can do so without harm. I have read that the proposed compression plant, to be sited in the town of Northfield, would generate extreme noise pollution – in an area where the loudest sounds at night are crickets, an area that people choose intentionally to settle and live quietly and in peace.

It's hard for me to understand why this pipeline is in the national interest at this time. I have read that the gas to be piped is not to be used in the U.S. Presumably the profits from its sale would benefit the TGPC and its shareholders; and while there is nothing inherently wrong with benefitting from one's investments, it is not advisable to go forward when to do so would entail harm, and possibly grievous harm, to a group of stakeholders. The stakeholders, in this case, are the people and natural resources of this region, including students of the Five Colleges and numerous fine boarding schools. The presence of these educational resources, which draw students from across the globe, including the students of leaders of government and industry, guarantees that any accident would be an immediate focus of global media attention. And harm would be grievous were there to be an accident, or a terrorist act perpetrated, involving the pipeline.

Under the circumstances, I would advocate strengthening the existing pipeline as a compromise measure.

Thank you.

Cynthia Goheen  
7 Whitney Way  
Montague, MA 01351

**20150831-5225**

Kristen Campbell, New Ipswich, NH.

What kind of coatings are they going to use on the pipeline to prevent leaks and corrosion? I believe a special coating is needed to be around power lines. Not all coatings are created equal and we already know the gas company plans on cheaping out on materials in NH.

**20150831-5232**

Kristen Campbell, New Ipswich, NH.

This pipeline should not be allowed to be built because it will never be removed once it is placed. When it is no longer in use it will be left to rot in the ground and continue to seep pollution for a long time to come. That is disgusting!

## 20150831-5233

Daniel Cournoyer, Temple, NH.

Dear Kimberly and members of FERC: PLEASE don not allow construction of a natural gas pipeline near my home in southern New Hampshire. There is no need of natural gas here. Considering the danger of leaks and explosions this proposed NED pipeline is not welcome anywhere near Temple, NH. This area is beautiful, and many peaceful homes and businesses will be adversely affected by a nearby pipeline, including our local Elementary School and a Convent. As mentioned, there is very little demand for natural gas here in southern New Hampshire, and any pipeline, compression station and related infrastructure is unwanted. Perhaps a natural gas electricity generating plant could be appropriate, closer to the source of the gas. Thank you for your consideration.

Daniel Cournoyer

## 20150831-5236

Bob Dickerman, Northfield, MA.

Bob Dickerman FERC NED EIS Scoping comments

Rev. B August 31, 2015

The following comments relate to the project in general, and the Northfield installation in particular.

### Air Quality

It has been estimated that the proposed 80,000 HP NED compressor station will burn approximately 1000 tons of natural gas per day, and that it will emit almost twice that mass per day in combustion products, mainly contaminated carbon dioxide and water vapor. It is the contamination in these combustion products that is the greatest concern.

Please consider the following tactics and concerns regarding air quality:

- Please verify estimates that the compressor station would burn approximately 1000 tons of natural gas per day when operated at 80,000 HP, and that the mass flow of combustion products would total approximately twice that.
- Please estimate the number of pounds per day of harmful chemicals that would be emitted in the turbine combustion products during normal operation, including:
  - a. carbon dioxide (greenhouse gas)
  - b. carbon monoxide
  - c. NOx
  - d. endocrine disruptors
  - e. benzene (a bone-marrow cancer causing agent) and other VOCs
  - f. any other cancer-causing or otherwise harmful agents
- Please estimate the number of pounds per day of harmful chemicals that would be emitted through leakage of raw gas and blowdowns of raw gas during normal operation, including, but not limited to, those chemicals listed above.
- Please do a wind pattern study to assess the likely path of the combustion product plume.
- Please require the gas extractors to disclose the chemicals used in fracking, which are presently secret.
- Please estimate the short-term and long-term human health impacts of all of the emissions from the compressor plant, including respiratory disease, endocrine disruption issues, and cancer.

### Noise Pollution

The proposed NED compressor station comprises large rotary machines that would generate significant noise. This noise might be broadband, narrowband, low frequency, ultrasonic, or infrasonic, and might be

accompanied by vibration. Changing compressor and/or turbine characteristics in frequency, size, or number could impact the amount of noise the equipment makes. Noise and vibration might need to be mitigated by the use of insulation and dampening materials, or proscribed combinations of equipment running, etc. to reduce noise impact on neighbors.

The Massachusetts Department of Environmental Protection recognizes noise pollution: “Noise is a public health concern that falls within the scope of Massachusetts Department of Environmental Protection (MassDEP) authority as a form of regulated air pollution (M.G.L. Chapter 111, Sections 142A-M provide statutory authority for MassDEPs Air Pollution Control Regulations, 310 CMR 7.00)” (<http://www.mass.gov/dep/air/laws/noisepol.htm>, accessed 1/31/13)

A further concern is there is a bat mentioned elsewhere in Northfield’s comments whose presence near the site may need to be evaluated by doing surveys of airborne ultrasound.

Please consider the following tactics and concerns regarding noise pollution:

- Please make a before and after noise level study, and estimation of cost to mitigate noise to original levels, including the following:
  - § determine baseline noise levels over octave or half-octave bands for the proposed compressor station site, and taking samples of average sound levels over 1-minute intervals throughout the day.
  - § make audio recordings concurrently with the noise level measurements at the test sites so that the nature of the sounds during testing may be later analyzed, and make these recordings available to the public
  - § estimate how much the proposed “standard” design would increase the noise level in each band and over 1-minute time intervals
  - § estimate the cost of reducing the in-service noise levels to near those of the original site

If a study such as this is omitted, and it is determined after construction and start-up that the NED compressor station noise level is unacceptable, the cost of mitigation at that point may be much higher than if the site is characterized and effective noise mitigation is implemented from the outset.

- A concern is that post-startup noise levels, especially those averaged over short periods of time, such as a minute, may be much higher than those at the original site, due to blowdown and other intermittent events.
- Another concern is that post-startup noise levels due to turbine and compressor machines may be narrowband signals, whose power is concentrated at discrete frequencies related to the rotational frequency of the machines, and which may cause a much higher impact on residents and wildlife than would a broader-band noise.
- Insure that noise meets levels set in the EPA’s Noise Control Act of 1972.
- Consult with the Sound Seal company, of Agawam, MA to minimize audible noise (see [www.soundseal.com](http://www.soundseal.com)). This company has had great success in noise mitigation at gas compressor stations.
- Ensure that compressor plant complies with FERC’s rule at 18CFR 380.12(k)(4)(v)(B) to insure that there is no perceptible increase in vibration from the plant .
- Make airborne ultrasound surveys to, in particular, characterize local bat populations.
- MassDEP testing standards may be useful.

## **20150831-5237**

Bob Dickerman, Northfield, MA.

Bob Dickerman FERC NED EIS Scoping comments

Rev. B August 31, 2015

The following comments relate to the project in general, and the Northfield installation in particular.

Light Pollution

Northfield hosts the annual Connecticut River Valley Astronomers’ Conjunction, which is an astronomers’

convention with night sky viewing sessions. One of the Conjunction's leaders has expressed concerns that lighting at the compressor station might be disastrous, not only to the Conjunction, local wildlife, and human health. Properly shielded lighting would mitigate these impacts and conserve energy.

Please consider the following tactics regarding light pollution:

- Design lighting according to International Dark Sky Association's (IDA) guidelines (see <http://www.darksky.org/nightskyconservation>)
- Specify lighting fixtures that are certified with the International Dark Sky Association's (IDA) Fixture Seal of Approval (FSA) (see <http://www.darksky.org/outdoorlighting-29>)

### Safety

The proposed pipeline is slated to share a right-of-way with high-voltage, high-power electrical transmission lines in many stretches. These electrical transmission lines may both pose a safety threat to, and be threatened by, the NED pipeline and compressor station.

Another concern is that the magnitude of any catastrophic event at the compressor station will likely be proportional to the distance between the compressor station and the nearest upstream (and, to a lesser extent, downstream) automatic shutoff valve.

Lightning safety is also a concern at the proposed compressor site, which is elevated and subject to frequent summer thunder and lightning storms.

A factor that may affect both lightning safety and the possible harmful effect of proximate electrical transmission lines is the high electrical resistivity of the local "soil". Many of the locales in which the project is slated to be built have very rocky ground, or may be solid rock, which may produce an extremely challenging environment for designers of electrical grounding.

Some of the following concerns, as well as others, were introduced in Power Technology, October 2004, "Electrical Risks in Transmission Line - Pipeline Shared Rights of Way", by Jose R. Daconti.

Please investigate the following safety concerns:

- Please contact Eversource to inquire whether Eversource's #381 line, carrying 345 KV between Northfield and Vernon, should be re-located, fortified, dismantled, or otherwise decommissioned for the reasons that:

§ In the event of a tower collapse or line break, the #381 line might provide hazardous and destructive levels of conducted current and voltage to compressor station components, as well as a source of ignition energy to any methane vapors that might be present?

§ Part of the #381 line would likely be destroyed in a catastrophic compressor station event, interrupting electrical transmission by that line, and possibly disrupting the electrical grid?

- It has been estimated that, if automatic shutoff valves are 10 miles upstream, in a catastrophic event, 37,000,000 cf of gas, equivalent to approximately 60 tanker trucks of LNG, could be released. Please verify this estimate, and evaluate the costs and benefits of placing automatic shutoff valves relatively close (e.g., 1/2 mile) to the compressor station, particularly in the upstream direction, to limit the fuel available in a catastrophic event.
- Please make surveys of electrical ground resistances in rocky areas in the vicinity of the proposed compressor station site be made so that lightning protection and electrical grounding may be appropriately designed. Consider extending these surveys to elevated segments of the pipeline itself.
- Please make meteorological studies of the intensity and frequency of lightning strikes in the specific vicinity of the proposed compressor station site (which is an elevated area), as well as near any proposed elevated runs of the pipeline itself.
- Surge arrestors with status monitors should be placed across any electrically insulating joints in the pipeline to prevent arcs in the event of electrical transmission line or lightning stimulus

- Surge arrestors with status monitors should be placed across any electrically insulating joints in the pipeline to damage to cathodic protection rectifiers in the event of electrical transmission line or lightning stimulus
- Please estimate, and recommend mitigation for, any corrosion effects due to the proximity of the pipeline to local electrical transmission lines and conductive or inductive coupling between the two.
- Can a warning system (to prompt evacuation in the event of a large leak or fire, for instance) be provided to residents in the high-impact zone?
- Can a multi-level (status, alarm, communication with compressor station operators) monitor, alarm, and communication system be provided to Northfield fire officials, police officials, and other municipal officials?
- Can the same multi-level monitor, alarm, and communication system be provided to Shelburne Control, our local dispatcher?
- Should a large fire break be permanently maintained around the compressor facility to limit the likelihood of wildfires in a catastrophic event?

### **20150831-5239**

Kristen Campbell, New Ipswich, NH.

My husband and I moved to New Ipswich to be surrounded by natural beauty and the sounds of nature. A giant pipeline and compressor station have no place here. The noise, vibrations, pollution and stadium lighting will destroy all the reasons we came to this town. There is not enough public need to justify ruining our community. Most of this gas is for export overseas.

### **20150831-5240**

Bob Dickerman, Northfield, MA.

Bob Dickerman FERC NED EIS Scoping comments

Rev. B August 31, 2015

The following comments relate to the project in general, and the Northfield installation in particular.

Alternatives

There is evidence that, if built, the majority of gas carried by the NED pipeline will be delivered to export terminals, where it will be converted to LNG and exported to maximize profits for extractors and pipeline operators. Consequently, domestic LNG prices may increase, due to the selling of LNG into a wider world market, to customers willing to pay higher prices. Furthermore, U.S. citizens may be harmed by the consequential depletion of domestic energy resources. The export of domestic energy resources is clearly at odds with U.S. energy independence goals; the export of crude oil, for instance, has been largely banned in the U.S. since 1973.

Peak demand for natural gas in some areas of the Northeast is near the present limits of peak supply, but it is not necessary to build a 2.2 bcf/day pipeline to address these limits. The maximum total peak demand in the entire Northeast in 2014 was only 3.3 bcf/day.

Peak demand limiting may be, and has been, addressed in many ways. For a local example, in the recent precedent agreement hearing for Berkshire Gas ( a nearby LDC), local lawyer Rudy Perkins described how the Berkshire Gas's Whately, MA LNG peaking facility was designed and permitted in 1999 for five 70,000 gallon LNG tanks and associated gasification equipment; two tanks were to be initially installed, and the remainder installed over the next decade, as peak demand rose. However, the remaining three tanks were never installed, and, to this day, only the first two tanks are being used. Jennifer Boucher of Berkshire gas was quoted in The Recorder on June 27, 2015 as saying that expanding their peaking facility would provide "only" an additional 5000 Dth/day; however, this could supply approximately 10,000 new homes, or more, with natural gas. This squarely contradicts Berkshire Gas's weekly newspaper ads' assertion that the NED pipeline is the only solution to the peak demand limit problem, and raises serious legal questions about their

3-year moratorium on new residential customers.

Please evaluate the costs and benefits, as well as the (comparatively shorter) construction schedules, of the following conventional alternatives to the NED pipeline:

- In Western Massachusetts, the build-out of Berkshire Gas's existing Whately peaking facility, as was originally planned and permitted by the Massachusetts State Energy Board in 1999.
- In Eastern Massachusetts, officials at LNG companies such as Distrigas have publicly stated that they could easily address peak demands at a much lesser cost to consumers than for the NED pipeline. Competing proposals from the following entities should be solicited and evaluated:
  - the Distrigas facility in Everett, MA,
  - the Northeast Gateway facility offshore Cape Ann, MA, and
  - the Neptune facility offshore Cape Ann, MA
- The expanded use of peaking facilities in general, including stationary peaking facilities, that liquefy gas from the pipeline network during periods of reduced demand, and gasify the LNG and re-introduce the gas to the network during periods of peak demand. Inland stationary peaking plants have the advantage that they require no additional local tanker truck or railway transportation of LNG.
- In addition, FERC should consider the ability of aggressive conservation, adoption of solar and wind energy, and pipeline leak-fixing to help address peak demands.

Furthermore, please address the following concerns:

- Isn't it a mathematical certainty that the majority of the gas carried by the pipeline - perhaps as much as 2.0 bcf/day initially - would necessarily be exported or used to reduce flow in existing lines, as it is impossible for net gas demand in the region to be increased by anywhere near 2.2 bcf/day anytime in the foreseeable future?
- Does exporting of substantial domestic energy resources truly serve the national interest, at a time when China and Russia are aggressively seeking out and securing energy resources all over the globe?
- In what way does such exporting serve the public convenience and necessity?

#### **20150831-5242**

Kristen Campbell, New Ipswich, NH.

Firefly populations are on the decline. They are an important part of the ecosystem. The stadium lighting on compressor stations will negatively impact the fireflies ability to communicate with each other and find mates.

#### **20150831-5250**

Kristen Campbell, New Ipswich, NH.

Please don't let this pipeline through. We need to keep our conservation land for its purpose. If the pipeline and all its compressor stations are allowed to be built, there will be more conflict between people and wildlife as the wildlife are pushed away from their refuge.

RE: Docket no. PF14-22, Northeast Energy Direct project. Tennessee Gas pipeline Company, L.L.C.

Dear Secretary Bose and FERC Commissioners,

This is a submission of scientific, medical and media findings demonstrating inconvenient and serious health problems with known links to fracked gas air pollutants. Further, I reference submission 20150831-5156 under FERC Docket PF14-22, demonstrating that liquefied natural gas resources make pipeline expansion in the New England region unnecessary. It provides conclusive proof that the Northeast Energy Direct project is not necessary.

I submit a compilation of 62 citations extracted from the Compendium of Scientific, Medical, and Media Findings Demonstrating Risks and Harms of Fracking (the Compendium), cited as: Concerned Health Professionals of New York. (2014, December 11). Compendium of scientific, medical, and media findings demonstrating risks and harms of fracking (unconventional gas and oil extraction) (2nd ed.). <http://concernedhealthyny.org/compendium/>.

The citations extracted are submitted in table format under the following three headings:

1) Air pollution, 2) Public health effects measured directly and 3) Medical and scientific calls for more study and more transparency. In this compilation, the fifty two citations about air pollution include twenty eight citations published in 2014; the six citations about public health effects measured directly include two published in 2014; and the citations about calls for more study and more transparency include four published in 2014. My purpose is to document the growing evidence that the build out of fracked gas infrastructure shows high levels of pollutants, striking declines in air quality and an increase of health problems with known links to air pollution.

In the Commission's Certificate Policy Statement (Certification of New Interstate Natural Gas Pipeline Facilities , 88 FERC ¶ 61,227 (1999), clarified, 90 FERC ¶ 61,128, further clarified, 92 FERC ¶ 61,094 (2000)), it is stated that in considering new pipeline facilities "the Commission balances the public benefits against the potential adverse consequences. The Commission's goal is to give appropriate consideration to the enhancement of competitive transportation alternatives, the possibility of overbuilding, subsidization by existing customers, the applicant's responsibility for unsubscribed capacity, the avoidance of unnecessary disruptions of the environment, and the unneeded exercise of eminent domain in evaluating new storage and pipeline construction."

I urge the FERC Commissioners to adopt the "no build" option when considering the Northeast Energy Direct application because the project does not qualify as a public convenience or necessity.

Sincerely,  
Linda Reik

**20150831-5267**

Erika Ladd, Conway, MA.  
RE: Docket No. PF14-22-000

I am writing to request that you, the FERC panel, consider denying a permit for construction of TGP's Northeast energy direct project here in Franklin County.

This pipeline is a bad idea for our land, our air, for future generations to come and for our way of life that we have chosen here in Western Massachusetts.

We live here because we like the quiet, rural nature of our towns and roads. We love the darkness at night. We live in a little corner of the world where we are proud of our local farms, our protected lands that we have safeguarded with our tax dollars and other contributions. We try to be protective of the land, water and air, and have great respect for nature and for each other and our planet.

This pipeline is a bad idea for us, our state, for the USA and for the planet as a whole. It is a giant step backwards into the dirty fossil fuel, methane and pollutant producing industries that we must move beyond to have any sustainable future on this planet.

It is beyond my comprehension that this private project could even be a consideration by a panel that is supposed to look out for our interests. The cost to us personally, our way of life and to the planet is immeasurable – and all this harm would be done so that the big dirty oil players can get a lot richer?

Please think of the future and say no to Kinder Morgan and their greedy partners. Think clean energy – not more poisons!!!

Thank you, Erika Ladd

## **20150831-5270**

Kenneth & Diane Stokem, Castleton on Hudson, NY.

Our family and community oppose the Northeast Direct (NED) pipeline.

The NED PIPELINE is NOT NEEDED — This NED pipeline is being touted as filling in a “shortfall” in fuel needed for electricity generation. The proposed gas for the main pipeline far exceeds the stated need of 0.7 billion cubic feet per day for regional electrical generation—a need projected to occur only 10-27 peak-demand days per year. The “shortfall” in energy has occurred only during very cold snaps when more of the current gas supply is used for heating instead of electricity. This occasional “shortfall” could be cut by 1/3 by simply fixing the leaks in the current gas infrastructure. The remaining 2/3 could easily be made up by expanding current energy efficiency programs, conservation and renewable energies.

The gas transported by the NED is INTENDED FOR EXPORT — The excess capacity of the pipeline would likely be used for export, as the terminus in Dracut, MA can be connected to the Canadian Maritimes. This would be an inappropriate use of the public’s money and land as the project would be a private for-profit venture. This means we would see minimal, if any, benefit as towns, a state, a region, or a nation.

The NED pipeline will not ultimately bring about CHEAPER PRICES for gas and electricity -- When the pipeline is used for export gas, then the stated reason for having the pipeline, to prevent rising prices for electricity with cheap domestic gas generation, would be suddenly impacted by market prices for gas that customers in Europe and emerging economies like India and China would be willing to pay. The gas companies could see huge profits, but ratepayers would see no offset for the likely increase in our rates due to supply and demand factors.

GAS is NOT CLEAN (as advertised) — While natural gas produces less carbon than coal or oil when burned, the methane that leaks in drilling, flaring, transmission, and distribution is a far more potent greenhouse gas than carbon dioxide and negates any gains over burning other fossil fuels.

NO BENEFIT in our homes — This pipeline would not bring fuel directly to homes for heating and cooking in our community and New York state. This is a transmission line, not a distribution or service line. It would transport natural gas to facilities that can accept high-pressure natural gas such as distribution facilities, power plants and export facilities. None of this gas will be used in NY.

Negative ENVIRONMENTAL IMPACT — This project would deliver fracked gas from Pennsylvania. The impact to the areas where the gas is being extracted and to our climate would be devastating. We shouldn’t be using tariffs on our electric rates and the power of eminent domain to develop a resource that is damaging to our environment and creates profits for few while socializing its short and long term costs.

The NED will create negative IMPACTS ON WATER, AIR AND SOIL— This pipeline creates concerns about construction impact and pipeline leakage on our air, soil, residential wells, surrounding watershed, local ponds, streams and rivers. Water quality could be affected during and after construction. Blasting could disturb sediment, causing it to flow to the home rather than resting safely at the bottom of the well. Water tables can also crack or shift during blasting, rerouting the water away from a well. Fracking involves blasting water contaminated with more than 600 dangerous chemicals, many of which will find their way into the gas. Gas companies are exempt from the Safe Drinking Water Act and Clean Air Act and do not have to disclose the chemicals in the water nor transported via the NED pipeline. But studies have shown that many of these chemicals have serious health effects. A pipeline leak would contaminate water, air and soil with undisclosed harmful chemicals.

The NED jeopardizes CONSERVATION LAND — The original proposed route (and some alternate proposed routes) would require breaking conservation easements—a terrible precedent to set for private projects. While large tracts of conservation land may be inviting to pipeline companies, the permanent scarring for that purpose would not be in the public’s best interest. The precedent of taking conservation land threatens future donations of private land for conservation.

The NED will have negative HEALTH and SAFETY RISKS — There are serious concerns about the safety record of gas pipelines in general and Kinder Morgan in particular. Gas leaks threaten sensitive aquifers, soil, and plant life. Explosions involving pipelines of this size and pressure actually occur and are catastrophic, with the fire being fed by many miles of fuel between shut-off stations, leading to prolonged, extremely high-temperature burn. Our communities’ emergency response facilities are not equipped to deal with such occurrences.

The NED will be a FINANCIAL BURDEN for LANDOWNERS — The payment for the easement on private land would be a one-time deal and is not much money when weighed against the loss of property value. The presence of gas pipelines has historically had a negative impact on property values, and in some cases homes are no longer eligible for a mortgage and can be hit with increased insurance premiums.

The NED should not use EMINENT DOMAIN — If the Federal Energy Regulatory Commission (FERC)-the agency which permits pipeline- determines that there is a public need for the pipeline, this could lead to granting the pipeline company access to the private and public land under eminent domain—enabling private corporations to make substantial profits through the use of our precious private property. Eminent Domain should not be used for private gain. Especially when the profit making for the private entity will ultimately lead to costs that will be socialized and born by the United States, communities and citizens who are seeing little profit or gain and even negative losses and costs from the company’s profit making gain.

EXPANDED FOSSIL FUEL INFRASTRUCTURE is a step backward — Building a permanent infrastructure for this fossil fuel could ensure its use far into the future. This unneeded project represents a step backward in technology and several steps backward from important national and state and international goals to address our climate crisis. Let’s plan for renewable energies and not add more fossil fuel infrastructure including the NED pipeline.

The NED is a bad idea. It is the wrong direction for securing the energy future for the Northeast and just the opposite of what is needed to reduce greenhouse gases from accelerating climate change and the damage and catastrophe that climate change will bring to the US and the world.

## **20150831-5273**

Kristen Campbell, New Ipswich, NH.

The northeast is actually more at risk for earthquakes than originally thought. What happens to a gas pipeline when there is an earthquake?

**20150831-5276**

Kristen Campbell, New Ipswich, NH.

If there is a known rise in still births among people living near compressor station emissions one can also predict a rise in birth defects that cause permanent disabilities for the same population. What would you like to say to women of child bearing age that live within the two miles of a compressor station that would suffer the most? "good luck?" This is an issue that can not ever be mitigated by the gas company. Is there really that much need in this area to justify this? No! Most of this gas is headed overseas! Stop this pipeline!

**20150831-5282**

Kenneth Stokem, Castleton on Hudson, NY.

No Scoping Session was held in Albany County, the county in NY State with the largest population through which the NED pipeline will pass through.

I request that a scoping session be offered in Albany County NY in or near the Town of Glenmont, NY.

The Scoping for NYS cannot possibly be completed until better effort is made to solicit, allow and provide for comment by Albany County residents. Albany County residents should not be required to travel substantial distances to scoping meetings in other counties.

It is not fair that no scoping meeting was provided to Albany County.

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, D.C. 20426

**RE: Scope of environmental impact statement for the Northeast Energy Direct Project, Docket No. PF14-22-000**

Dear Ms. Bose:

In response to the Notice of Intent to Prepare an Environmental Impact Statement for Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, published in the Federal Register on July 8, 2015. 80 FR 39095, I offer these comments.

On July 24, 2015, Tennessee Gas Pipeline, LLC (Applicant) filed a letter documenting changes to the project, along with revised Resource Reports 1-13 that reflect project changes and respond to hundreds of comments made by the Federal Energy Regulatory Commission (FERC) and other federal and state agencies on the original Resource Reports. Project changes and the revised Resource Reports were made available to the public 27 days into the 60-day scoping period and after six of the thirteen public scoping meetings had been held. In the public interest, I strongly urge the FERC to re-start the scoping period and to require that additional hearings be held in the communities where hearings were held before the new project information and revised Resource Reports were filed, to allow for meaningful public participation in the required Environmental Impact Statement (EIS) scoping process, thereby mitigating public frustration in the public participation component of the National Environmental Policy Act process and limiting input on specific issues and concerns that may arise from the project changes and revised Resource Reports.

The proposed pipeline is planned to cross my property at 365 Beldingville Road in Ashfield, Massachusetts. With the creation of new right of way, access roads, and staging area, I anticipate that approximately 15 to 20 acres of my property will be deforested. On July 29, 2015, I testified before the FERC hearing in Green-

Office of the Senate leader, Boston, MA 02133

Representative Robert A. Deleo Massachusetts State House - Room 356

Office of the Speaker, Boston, MA 02133

Office of the Speaker, Boston, MA 02133

---

Kinder Morgan NED Project  
FERC Environmental Impact Scoping Hearing  
Testimony of Mark BURton  
July 29, 2015

My name is Mark Burton and I live in Ashfield, Massachusetts, I am a fly fisherman and I speak on behalf of the Greater Boston Chapter of Trout Unlimited, of which I am a member. The chapter has over 1,100 members, many of whom spend days and vacations fly fishing the great trout streams we have to offer in this part of the state.

My concern tonight is the certain adverse impact the NED project will have on our local ecology, specifically the impact on our cold water resources and the habitat of the Eastern Brook Trout.

One hundred years ago, much of New England, and certainly all of the Berkshire region and Pioneer Valley, had healthy brook trout streams. Today, after decades of land development, brook trout have entirely disappeared from 7% of their historical habitat, have been greatly reduced in another 28%, and reproducing populations are unknown in another 42%. (b.1.iQ;LLyyY!'Y:t.. rn ass ·gQti\_~lli\!ggl c i ~5L4fi:J.Qf~fi2Ll:~i Id I ife~pla n t~LftihL!,r,Q\_ld!:in:rp rrD\_ '!llQll. h tm I)

According to the Eastern Brook Trout Joint Venture Report on the status and threats to the species, analysis reveals that in only 5% of historical habitat does a fully sustaining brook trout population exist, and a reduced but sustaining level in 9% of historical habitat. (.b.1tP\_jl~stel!Jbrooktr()u.!,QrgL) Virtually all of these intact populations reside in the western part of the state where the NED project will be located.

Clearly there is much at stake here for the habitat of brook trout, and what we ask of FERC tonight is that you include in the scope of the EIS a full review of the impact on trout habitat and the necessary mitigation and remediation measures that undoubtedly will be required to be taken in order to minimize and hopefully negate adverse impact of the project.

Short of postponing this review process so that we have time to review the draft resource report, we respectfully request FERC to include the following in the scope of the EIS:

- A full evaluation of the direct, indirect and cumulative impacts of the proposed pipeline on native and wild trout populations and their watersheds. This would include the impact which deforestation of thousands of acres will have on water temperature in the affected watersheds (i.e., Hoosic, Housatonic, Westfield, Deerfield, Millers, and Connecticut Watersheds) at the level of first order tributaries through to the large rivers.
- A comprehensive analysis of alternative pipeline routes and construction methods that avoid or minimize impacts to native and wild trout populations and their watersheds, including smaller rights-of ways (e.g. 50 foot rather than 75 foot and 150 foot rights of way which is possible using alternative construction methods) must be conducted as part of the EIS process.
- At least 15 different direct negative effects from sedimentation have been demonstrated to impact trout and salmon, ranging from stress, altered behavior, reductions in growth and direct mortality. There must be an assessment of quality turbidity impact and efforts to mitigate the potential for erosion and sedimentation impacts from construction of the proposed pipeline on trout streams, water quality and aquatic life.
- Stream restoration/mitigation plans must be prepared for each stream crossing and use the best avail-

able science to ensure that streams are restored to their original condition and long-term impacts avoided.

- Type of crossing method for each proposed stream crossing should be determined on a site-by-site basis, based upon field conditions rather than just a desktop analysis. The wet crossing method should not be used for any crossings on native and wild trout streams. If dry crossing method is specified, then the type of dry crossing method should be identified as each type of dry crossing has unique impacts that must be identified in the EIS so that appropriate mitigation measures can be included in the EIS.
- Sufficient information about stream characteristics should be collected at each proposed stream crossing. Such analysis should include, at a minimum: proximity to the nearest confluence up and downstream; stream discharge, channel gradient, channel sinuosity, stream substrate, cross-sectional surveys, channel debris; sediment storage, and stream order; information about bed and bank stability, scour depth and depth of pools; and a scour depth analysis to determine the potential for vertical or lateral adjustment of each stream.
- Stream crossing installations must be able to handle certain percentage of the 1a-year, 50-year or 100a-year base flow, based upon site specific conditions at each stream crossing. This is the only way to limit potential flooding impacts. A critical shear stress analysis for all sites with any definable risk of bed scour, to ensure that the stream bed remains stable under flow conditions associated with 100a-year storm events and that the pipeline company is using the best engineering practices to assure that stability.
- Geotechnical feasibility studies to determine if horizontal directional drilling, Direct Pipe™ or other conventional bore methods are appropriate and feasible must be conducted for each stream crossing.
- The depth that the pipe is buried beneath the stream must be determined on a site-by-site basis, based upon the potential for vertical or lateral adjustment of the stream.
- Kinder Morgan should be required to observe the setback requirements for vegetation cutting promulgated by the Massachusetts Rivers Act.

While this construction project is clearly adverse to trout habitat and will contribute to its long term degradation and potential extirpation of wild and native trout populations, your diligence in ensuring that its effects are mitigated, remediated, or eliminated is of critical importance.

Thank you for hearing my testimony.

Re: Docket No. PF14-22-000: Proposed NED Pipeline.

Dear Secretary Bose:

Last year we moved to NH after purchasing land so that my husband could build a home for us. We have woods and wetlands that are full of life. In one year we have seen, black bear, porcupine, wild turkeys, coyote, a fox, reptiles, a moose, birds, bats, butterflies, insects, amphibians, deer, and a countless amount of salamanders. There are Plants, flowers, mushrooms, fungi, monotropa uniflora, lady slipper's, and trees, of all varieties.

There is so much to nature's presence that I am constantly looking up information online and in books because this is like nothing I've ever seen before. There could be endangered species or plants that we have but as there is so much to see and because it has only been a year, I don't know yet. The forests of NH are breathtakingly beautiful. Majestic!

There is a reservoir extremely close to us that feeds into a stream that runs along besides us. We live a couple of miles away from the proposed pipeline. In August of 2015 we put in our water well.

I read that we would not know what harm is being done to our water and that the information does not have to be released. The sentence I read, on [nhpipelineawareness.org](http://nhpipelineawareness.org) "Gas companies are exempt from the Safe Drinking Water Act and do not have to disclose the chemicals in the pipeline."

How could I, in good conscience allow my small children to drink, or bathe in the water when I will not know how our water supply will be affected? This is asking NH and all affected by this proposed pipeline to risk their health so that a corporation can make more money. Our lives matter. We will not benefit from this Gas in anyway but we would reap the negative aspects.

As a mom and human being I know that this is not right. I oppose the pipeline. I do not want my family or anyone else's family or our animals in harm's way. I would like to see Solar and Wind Power for a cleaner energy source in our future and NOT a toxic and problematic pipeline harming our families and the environment.

Thank you,

**20150831-5307**

Kathleen O'Connor Ives, Boston, MA.

August 31, 2015

State Senator Kathleen O'Connor Ives

State House, Room 215

24 Beacon Street, Boston, MA 01233

Federal Energy Regulatory Commission

888 First Street, NE

Washington, DC 20426

I submit my comments on the proposed Kinder Morgan Northeast Energy Direct project to detail why I strongly urge the Commissioners charged with making a recommendation on this project to make a no action determination. The proposed Haverhill Lateral is projected to run through the City of Methuen, whose citizens I represent in the State Senate. Residents have communicated to me and my office their serious concerns surrounding this project. It is important that I relay to you that I have no record of any resident in my district communicating support for this project. I have not encountered a single municipal or state elected official without serious concerns about the proposal. It should also be noted that the Methuen City Council unanimously passed a resolution opposing the pipeline expansion project. The residents and businesses of the City of Methuen are only guaranteed the burden of having this high-pressure pipeline pass through their community. There are no guaranteed reductions in energy costs--only guaranteed costs related to public safety and emergency response placed on the city and reduced property values absorbed by residents.

The only way to assuredly mitigate environmental impact is to recommend no action on this project because no measures are possible to sufficiently reduce the safety threat and disturbance of protected open space and active farmland. I cannot comprehend how efforts at the federal, state and local level, to preserve valuable conservation lands, and invest in improved water quality for recreation and consumption, as well the state's

local farming economy can all be set aside for the unsubstantiated claims of energy needs and proposals from an individual for-profit energy company. Why should private citizens as well as the public at-large make available valuable easements along private and public property for a for-profit energy company, when there is no proven need for such infringements?

Kinder Morgan's proposal should not be approved because the company has not secured the requisite purchaser contracts for natural gas from this pipeline. As FERC is aware, there are other gas pipeline expansion projects presently advancing in the region. The public deserves a comprehensive, regional assessment verifying Kinder Morgan claims of the need for the pipeline, as well as its speculative contracts for this gas. Kinder Morgan took the very notable step of scaling back its pipeline proposal in western Massachusetts on account of weaker than anticipated interest in contracts for its gas. As such, close scrutiny of Kinder Morgan's entire proposal is merited to verify the need for any expansion as proposed by this company.

Also, Kinder Morgan plans to conduct horizontal drilling directly under and across the Merrimack River. Please be aware that the Merrimack River is a critical drinking water supply for many communities in the Merrimack Valley, including the City of Methuen.

I urge you to apply your responsibility to the public and respect the will of the residents in my district who do not support the approval of this project under any circumstances. Thank you for your consideration of my comments.

Sincerely,

Kathleen O'Connor Ives  
State Senator  
First Essex District

(603) 899-2208

Email: yohoal@hotmail.com

August 31, 2015

I am writing to express my concerns with the proposed Kinder-Morgan/Tennessee Gas Pipeline (KM/TGP) that is planned to cross southern New Hampshire and my town, Rindge.

As you already know from other submitted documents and data that you have received, the proposed pipeline is not needed. NH does not have and will not have a natural gas shortage. KM/TGP is supporting television advertisements that erroneously scares the public into thinking that there is a gas shortage that will affect fuel availability. These ads also erroneously scares the public into thinking that without gas electricity costs will rise while failing to mention that our costs will rise to pay for any new pipeline. The FERC needs to monitor these advertisements and call KM/TGP to task for their scare tactics. FERC needs to properly advise the public of correct information.

On another issue, the EPA of August 18, 2015 announced that it was submitting new standards for both methane and volatile organic compounds. Methane is greenhouse gas and is one of the country's largest emitter of methane. These gases endanger both the public health and public welfare of current and future generations. Since 1990, natural gas systems (such as the KM/TGP pipeline) were cited as being the single largest contributor of US man-made methane emissions (per EPA Regulatory Impact Analysis. This was supported in part by industry information released under the Greenhouse Gas Reporting Program.)

Since methane gas emission is such a major problem for the environment and the public, why should the KM/TGP pipeline go forward? The pipeline is not needed and will cause serious environmental issues. Why build this pipeline when its emissions will raise the level of methane gas emissions? This pipeline will only add to gas to the pipeline when the country's goal is to reduce these types of emissions; building it only adds to the problem. The pipeline flies in the face of basic common sense.

I ask that FERC reject this proposed pipeline.

Thank you for your attention to this matter.

### **20150831-5323**

Rina Petit, Litchfield, NH.

This is a massive project crossing several states and the public has a lot of information to process on this pipeline but first of all, it's insufficient information and too short of a timeline to review everything. Plus there are other much smaller pipeline projects that look like they will be sufficient to meet New England's natural gas needs for the foreseeable future. How about FERC integrating all of the smaller New England pipeline projects together JUST FOR AN ANALYSIS to confirm that? Also, how about FERC taking a long hard look at ISO New England and its \$1,500,000 CEO along with its overpaid and overstaffed staff? FIX THE PROBLEMS don't just look at NED in isolation.

### **20150831-5326**

David Bennett, Deerfield, MA.

I am writing to express my extreme concern regarding the proposed Northeast Energy Direct (NED) Pipeline Project currently being reviewed for approval by the Federal Energy Regulatory Commission (FERC). The pipeline being proposed will potentially cut through my property. I am deeply concerned regarding the adverse effects that this pipeline could have on my property and the greater surrounding community as a whole.

My property is terraced and on a steep hillside, and is already prone to erosion. From my understanding the Tennessee Gas is seeking to put the NED through a portion of my land that is densely wooded. This wooded area of my property is crucial in protecting my property from erosion from water and wind. If the pipeline were to cut through my property we would be forced to maintain the area with low growing grasses that would do little to keep the property from further eroding.

Across the street from my property is a wetland which is bordered by preserved farmland. This wetland, which the pipeline would cut through, protects my property and the property of others from flooding from the Deerfield River. As recently as August 2011 hurricane Irene resulted in extreme flooding in my area and much of the Northeast. My property on the hillside became an island, as water rose above the road in front of my home, trapping us there. However, we sustained no damage to our property, which is owed to the fact that the wetland in front absorbed a large portion of the flood waters. I am very concerned about the potential destruction of this wetland by the proposed pipeline.

As I explained above, the Deerfield River is nearby and the pipeline is proposed to cut across it. In addition, the eastern portion of my town, Deerfield, MA, is bordered by the Connecticut River and is also slated to be crossed by the pipeline. These rivers are valuable resources to my community and the state for recreation and commerce. There are numerous hydroelectric dams along the Deerfield River operating to produce valuable, renewable hydroelectric power. This goes for the Connecticut River as well. The Connecticut River has only recently been cleaned up from years of environmental degradation and now could face a new onslaught of pollution if this pipeline were to fail underneath it.

There seems to be no legislation that protects my rights as a landowner. The pipeline running through my property would devalue it and there is nothing that mandates that this company provide me compensation for the devaluation. The magnificent views that are afforded from my property would be ruined in part by the destruction of the forested area bordering that this pipeline would destroy. The easement from this pipe-

line would lower the value of my home as a portion of the property would become unusable. And despite the devaluation to the property we would still be responsible for the taxes on the property. This pipeline cutting through my land would put my family in danger of any accidents to the pipeline that could occur. And these accidents do happen... January 2015, Brandon, MS a pipeline explosion burned six acres of land and created a large crater; April 2015 Borger, TX a

Kinder Morgan gas pipeline exploded leading to the evacuation of nearby homes; August 2015 Falfurrias, TX another Kinder Morgan pipeline ruptured; March, 2014 Plymouth, WA a pipeline operated by Williams Companies exploded leading to the evacuation of 1,000 residents; February 2013 Knifly, KY a Columbia Gulf Transmission pipeline exploded detonating two homes.... this list could go on and on. Not only is my town not prepared to respond to the type of disaster that a pipeline explosion could cause, but the presence of a pipeline on my property could render it un-insurable.

I am deeply concerned that there has not been time for a thorough, independent review of the need for this pipeline. I strongly encourage FERC to delay their review process until the study currently being undertaken by my Massachusetts State Atty. General Maura Healey can be completed. I also encourage FERC to review the current studies available—the report commissioned by GDF Suez and

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street, NE

Room 1A

Washington, DC 20426

Re: Docket No. PF 14-22-000 - Tennessee Gas Pipeline Company, L. L. C., “Northeast Energy Direct Project”

Dear Secretary Bose,

On behalf of the Ipswich River Watershed Association, I am writing to comment on the Tennessee Gas Pipeline Company’s (TSGP) Northeast Energy Direct (NED) Project (FERC docket PF14-22-000) per your June 30, 2015 Environmental Impact Statement Scoping (EIS) Notice. The Ipswich River Watershed Association is a member-supported 501(c)3 not for profit organization. Founded in 1977, our mission is to preserve and protect the Ipswich River watershed for people and nature. A significant portion of the proposed Lynnfield and Peabody laterals portion of the project will traverse the watershed and as such, we are extremely concerned about the proposed project’s impact on the river and watershed.

The Ipswich River is the source of drinking water for 350,000 people and businesses and is literally the lifeblood of our region. Additionally, the watershed is home to significant environmental resources including conservation lands, wetlands, interior forests, water supply protection lands, and rare species. The proposed project will traverse the watershed for over 11 miles, cross the river and dozens of tributaries, travel for over 2 miles through wetlands, be constructed through dozens of vernal pools, travel directly along the riverbank for 2 miles, will be constructed through contaminated areas, will disturb underground hydrology, will clear virgin land for a proposed meter station and will require a 100 foot construction and 50 foot permanently cleared swath through critical habitats and interior forest totaling 120 acres. Due to this level of activity in the Ipswich River Watershed, we feel there is simply no way to adequately mitigate this level of environmental impact. As such, our Board of Directors voted unanimously to oppose this project. Moreover, since there are several less impactful alternatives to the proposed “greenfield” route and there is no demonstrated

need for this section of the pipeline, we feel the EIS should emphasize and fully analyze the “no-build” alternative.

Should the proposed project review go forward, we request that the following environmental impacts be included in the scope of the EIS:

Alternatives Analysis. There are two primary categories of alternatives, the no build alternative and alternative routing. While other commenters will question the demand for new gas supplies overall, I would like to focus my comments on the redundancy issue. As you may know, a virtually identical natural gas pipeline was recently installed by Spectra Energy between Dracut and Danvers. The debarkation and terminus points are almost identical to the proposed pipeline. The route essentially parallels the proposed pipeline. This large, 30” high pressure serves the exact same customer base as the proposed NED lateral and is significantly underutilized. Because the proposed NED lateral does not provide for any local connections and essentially duplicates this existing, nearly new underutilized pipeline, there can be no justification for building a second pipeline through this region.

Should the need for a second pipeline be established, we request that routing alternatives be fully explored. As summarized above and detailed below, the proposed route of the Lynnfield/Peabody lateral traverses some of the most environmentally sensitive resources along its entire route. It is clear that the project proponents strategically chose the “greenfield” route over developed areas to avoid potential conflicts with already developed areas. Due to the critical nature of the environmental resources that would be disturbed by the greenfield route, and the existence of less disruptive routes, including existing utility corridors, the EIS must include a detailed alternative routing analysis to avoid these sensitive areas as further detailed below.

Water Supply Protection Areas. The proposed pipeline route traverses several state and municipally-designated public waters supply protection zones serving hundreds of thousands of people. Construction and long term maintenance impacts of these activities on the water supply infrastructure and protective zones must be fully evaluated and alternatives pursued at all costs. Clean and reliable public water supply is society’s most important need and no impact on these critical and sensitive areas should be acceptable given other alternatives. The use of herbicides for the maintenance of the pipeline right of way must be strictly prohibited within these areas.

Wetlands and Waterways. Wetlands and waterways are critical for flood protection, water quality, wildlife habitat and recreation. The proposed route poses an unacceptable level of disturbance to these critical areas. Alternatives to the more than 2 miles of wetlands, dozens of vernal pools and river/stream crossings that will be traversed by the proposed route must be evaluated. In addition, many wetland areas and all vernal pools are supported and maintained by site-specific subsurface soil and groundwater conditions. Pipeline construction will disturb and could dramatically alter these unique conditions which are responsible for maintaining the hydrologic conditions for these wetlands. These conditions must be specifically analyzed for each wetland and stream crossing area and adequately mitigated to maintain pre-construction hydraulic conditions.

In addition to the wetland areas, the proposed route will disturb more than 131 acres of land within 100 feet of wetlands (known as the buffer zone under Massachusetts law) within the watershed. Wetlands buffer zones are critically important to the protection of wetlands themselves and construction and long term maintenance of the right of way needs to mitigate these impacts.

Herbicide applications should be prohibited throughout the wetlands and buffer zones. Because of the critical importance of wetland resource areas, Massachusetts and each individual community along its route within the Ipswich River Watershed have enacted strong wetlands protection laws and regulations. The EIS must require that any proposed construction be evaluated based on these laws and conditioned and mitigated based on these local rules.

Conservation Areas. The Ipswich River is fortunate to have a large percentage of its watershed protected

by conservation lands. These lands include public water supply protection areas, state forests & parks, town conservation lands, non-governmental conservation areas and private conservation restrictions. Many of these lands are “permanently” protected by Article 97 of the state constitution. The proposed project is clearly designed to target these lands (to avoid developed areas) and its route is largely determined by the location of these lands. A large percentage of the 120 acres that will be disturbed by the project in the watershed are on these lands. Undeveloped, protected land is critical for protecting the water quality and quantity in the watershed (surface and groundwater). The EIS should analyze the cumulative impact on these lands and require alternatives in less sensitive areas.

Riverbank The pipeline is proposed to be built for more than 2 miles immediately on the riverbank and tributaries and will disturb more than 50 acres of land in the 200 foot Riverfront Area which is protected by the Massachusetts Rivers Protection Act. The EIS must require that the proponents evaluate the impact of construction and the permanent right of way against the Rivers Protection Act and mitigate according to its provisions. Because the Act prohibits most forms of new construction within 100 feet of a river or perennial stream, alternatives to construction in these sensitive areas should be mandated.

The Ipswich River and its tributaries support one of the few viable coldwater fisheries in Eastern Massachusetts. This habitat is maintained primarily due to the shading provided by tree cover. The proposed construction and maintenance of the pipeline right of way will require that these lands be kept clear of tree cover. Because of the amount of the proposed route within the Riverfront area to the river and its tributaries, the cumulative impact of construction and permanent right of way maintenance on the cold water habitat must be fully evaluated and mitigated.

Wildlife habitat The Ipswich River Watershed supports some of the largest and most intact wildlife habitats in Eastern Massachusetts because of the high percentage of protected conservation lands. As such, the watershed supports a tremendous diversity and abundance of wildlife including rare and exemplary natural communities. The EIS must evaluate the impact on these resources and the proposed route should be modified to avoid these areas. The proposed route will create a permanently cleared swath through interior forest habitats which will have a detrimental effect on interior forest species. In addition, pipeline corridors act as gateways for the spread of invasive species which will have a major negative impact on native flora and fauna. The EIS must evaluate the cumulative impact on interior-dependent species as well as the impact on encouraging the spread of invasive species into natural areas. Since it may not be feasible to mitigate these impacts, the proposed route should avoid interior forest habitats altogether.

Underground hydrology The Ipswich River watershed tends to contain relatively small and shallow aquifers. Both the public water supplies and wildlife habitats supported by the river are significantly influenced by these aquifers. The installation of underground pipelines can have major detrimental effects on these shallow aquifers including functioning as a conduit to move ground water and infiltrating storm water along these routes. The impact of the proposed pipeline on these unique aquifers needs to be evaluated and the back filling plan needs to include fill conditions to prevent intra and inter aquifer impacts. Additionally, several areas along the proposed route in the upper watershed traverse former dump areas and otherwise contaminated areas. The EIS must take into account the impact of construction on these areas and a contingency plan must be in place should construction encounter contamination along the route.

Recreational values. Due to its proximity to large numbers of people and its relatively well-conserved landscape, the Ipswich River Watershed is one of the region’s leading recreational resources. Recreational values such as boating, fishing, hiking, biking, hunting, cross-county skiing, shellfishing, birding, photography and other forms of passive recreation are paramount. An 11-mile 100 foot construction and a 50 foot wide permanently cleared swath will have significant detrimental impacts to these resources. The EIS needs to take these values into account and alternatives identified.

On behalf of the Ipswich River Watershed Association, thank you for considering these comments.

Sincerely,

Wayne Castonguay  
Executive Director

Submitted via eComment at [www.ferc.gov](http://www.ferc.gov)

Re: Comments on EIS Scoping Process for Northeast Energy Direct Project, Docket No. PF14-22-000

To Whom It May Concern:

On behalf of the Chesapeake Bay Foundation, Inc. (CBF) and over 200,000 of our members, please accept the following comments on the scoping process for the Federal Energy Regulatory Commission's (FERC) preparation of an Environmental Impact Statement (EIS) for Tennessee Gas Pipeline Company, LLC's (TGP) Northeast Energy Direct (NED) Project, Docket No. PF14-22-000.

CBF is a 501(c)(3) organization with its headquarters in Annapolis, Maryland and offices in Harrisburg, Pennsylvania; Richmond, Virginia; Norfolk, Virginia; Easton, Maryland; and the District of Columbia. CBF is the largest conservation organization dedicated solely to protecting the Chesapeake Bay and its many tributaries throughout the 64,000-square-mile watershed.

Since 2010, CBF has worked tirelessly to support the implementation of the Chesapeake Bay Clean Water Blueprint. The Blueprint consists of pollution limits for nitrogen, phosphorous, and sediment established by the United States Environmental Protection Agency (EPA) in the Chesapeake Bay Total Maximum Daily Load (TMDL),<sup>1</sup> and the corresponding State-created Watershed Implementation Plans (WIPs)<sup>2</sup> that detail pollution reduction activities to achieve these limits. Roughly two-thirds of the Commonwealth of Pennsylvania and a large percentage of the southern tier of New York drain to the Chesapeake Bay. CBF urges FERC to consider how the NED Project—and existing and planned natural gas development in the region cumulatively—will impact Bay States' ability to achieve TMDL pollution reduction goals for nitrogen, phosphorous, and sediment.

The proposed NED Project route traverses roughly 135 miles within the Chesapeake Bay watershed and lies entirely within the Chesapeake Bay airshed.<sup>3</sup> In addition to the natural gas pipeline, the Project includes eight new compressor stations, 16 new meter stations, modifications to existing compressor and meter stations along the route, and construction of other associated facilities.<sup>4</sup> In Pennsylvania and New York alone, at least 4,698 acres of land will be affected during construction and 1,115 acres will be permanently affected during operation of the pipeline.<sup>5</sup>

A variety of environmental impacts are associated with unconventional natural gas development.<sup>6</sup> Many of these impacts, individually and cumulatively, may pose risks to the health of the Chesapeake Bay and its many tributaries.

Construction of natural gas pipelines and infrastructure increases forest loss and erosion. Loss of forest land negatively effects the watershed by removing the valuable filtering processes performed when forests filter and slow runoff and absorb harmful nitrogen oxides from the air. In addition, the NED Project area is located where there are erodible, steep slopes and farmland. Disturbance of forested mountain sides and certain agricultural lands during construction, along with the impacts of soil compaction and deforestation post-construction, can reasonably be expected to alter site conditions so as to cause or contribute to increased rill and gully erosion, decreased infiltration of precipitation, increases in peak rate and volume of stormwater

discharge, and downstream water quality degradation.

The Project location is an area that supports a number of Pennsylvania's most pristine and ecologically sensitive streams. The Pennsylvania Department of Environmental Protection classifies these streams as high quality ("HQ") and exceptional value ("EV") based on specific water quality criteria. Similarly, streams containing naturally reproducing wild trout populations are foremost indicators of exceptional water quality, and as such are found only in the Commonwealth's most pristine and ecologically sensitive waters. The area proposed for this pipeline project holds a number of Pennsylvania's designated Class A Wild Trout Streams. Although New York and Pennsylvania State erosion and sediment regulations and best management practices (BMPs) attempt to minimize negative environmental impacts resulting from construction and maintenance of pipelines, such regulation is not designed to achieve a no-net increase in pollutant loads. Increased pollutant loads to local rivers and streams, and ultimately the Bay, may impact the States' ability to meet their requirements under the Chesapeake Bay Clean Water Blueprint. The FERC's EIS must address whether site-specific erosion and sediment control plans are necessary to supplement TGP's statespecific erosion and sediment control plans.

The NED Project and the FERC-Certified Constitution Pipeline<sup>7</sup> follow an almost identical route from Susquehanna County, Pennsylvania to Schoharie County, New York. The consecutive construction of these pipeline projects will increase the length of construction time and the impact to local waterbodies and land-owners. In addition, the FERC acknowledged that "[t]he permanent impacts of these projects, for example, loss of forested lands, could result in significant cumulative impacts."<sup>8</sup> The FERC's EIS must thoroughly address these cumulative impacts and determine whether even the most stringent conditions and mitigation requirements can ensure no-net increase in sediment, nitrogen, and phosphorous pollutant loads to the Bay watershed or airshed.

Natural gas pipelines are part of a larger trend of natural gas development in the Marcellus Shale formation. A 2010 study by The Nature Conservancy (TNC), for example, projects between 34,000 and 83,000 acres of forest will be cleared in Pennsylvania during the next fifteen years for natural gas well pads.<sup>9</sup> Various water quality impacts and air pollution from trucks, wells, compressor stations, and pipelines have been widely documented in areas with active shale oil and gas development around the country, including development of the Marcellus Shale formation in the Susquehanna River basin. Most recently, the New York State Department of Health acknowledged that the "significant uncertainties about the kinds of adverse health outcomes that may be associated with" high volume hydraulic fracturing (HVHF) and recommended that New York State ban HVHF until sufficient evidence ensures that the risks can be "adequately managed."<sup>10</sup>

Given the diversity and magnitude of the potential impacts of the proposed NED Project, the projected intensification of unconventional natural gas extraction activities within the Bay watershed, along with the recognition that state permitting requirements do not fully mitigate environmental impacts, the Chesapeake Bay Foundation reasserts the need for a Programmatic Environmental Impact Statement (PEIS) on the impact of unconventional natural gas extraction in the Marcellus Shale region on the Chesapeake Bay watershed.

CBF originally made this request regarding Marcellus Shale basin activities in an April 2011 petition to the Council on Environmental Quality (CEQ) and to all federal agencies involved in unconventional natural gas drilling activities, including the FERC.<sup>11</sup> CBF called on CEQ to undertake a cumulative impacts analysis to determine the effects that drilling and natural gas activities in the Marcellus Shale region have on human health and the environment. Additionally, we petitioned CEQ to promulgate any necessary guidance and regulations based upon the findings in the PEIS and to comply with the mandates of Executive Orders 13508, 11514, 11991, and 13352. CBF has also submitted comments on a number of individual natural gas development projects within the watershed, including the Constitution Pipeline.

CBF respectfully asks the FERC to complete an Environmental Impact Statement that addresses the complete scope of potential impacts to air, water quality, forest, ecosystems, forest land, national park land, wildlife habitat, and ecosystems as a result of the NED Project. The FERC's EIS should include both indi-

vidual and cumulative impact, particularly the cumulative impacts associated with the Constitution Pipeline. CBF also requests that the FERC conduct a robust analysis of project alternatives that fully accounts for the potential of renewable energy sources and strategies to reduce overall demand (i.e., energy efficiency). Indeed, a study commissioned by New England states found “that new infrastructure could be avoided entirely if energy efficiency, renewable heating, and distributed renewables keep gas demand low.”<sup>12</sup> FERC should only issue a Certificate for Public Convenience and Necessity to the NED Project if it finds that the natural gas proposed to be delivered is so necessary as to outweigh the significant environmental and private property impacts—a finding that must be clearly addressed in the EIS.<sup>13</sup>

Thank you for the opportunity to provide comments.

Sincerely,

Harry Campbell, Pennsylvania Executive Director  
Chesapeake Bay Foundation

## 20150831-5343

Russell Bennett, Averill Park, NY.

On August 18, 2015 the EPA proposed what it described as a “suite of common sense requirements to ...re-

duce air pollution that harms public health”. Among these requirements was a set of provisions addressing natural gas compressor stations. The proposed requirements encouraged use of dry seal compressors; replacement of rod packing systems in reciprocating compressors every 26,000 hours of operation or every 36 months or capturing rod packing emissions in a closed vent system; and, most importantly, using optical gas imaging equipment to monitor leaks (which must be repaired within 15 days).

I would submit that the proposed requirements are indeed common sense and should be imposed as a mitigation measure by FERC for the NED pipeline. Mitigation of some of the air quality effects of the newly proposed compressor stations could potentially be achieved by requiring the applicant to put these new procedures in place for ALL its existing compressors prior to construction of any new pipeline i.e., offset new emissions by reducing existing unnecessary emissions in the applicant’s current operations.

## 20150831-5351

Susan Phillips, Windsor, MA.  
To the Commissioners, FERC

Re: Northeast Energy Direct LNG Pipeline proposal, Kinder Morgan and Tennessee Gas & Pipeline

I’m filing these comments as a resident of Windsor, MA, proposed location for one of the compressor stations proposed for this project.

Like most Windsor residents, I believe this project poses a serious risk to the quality of life and the economic viability of our town, which counts as its primary assets its scenic and wild landscape, rural and agricultural character, abundant wildlife, artisan community members, and easy access to the cultural resources of Berkshire County and surrounding areas.

I am also frustrated with this comment process, as many of the most important details surrounding the environmental and other impacts of this proposal are still missing from Kinder Morgan’s filing with the Commission. These details will not be provided until my opportunity to comment upon them has passed, which seems contrary to the principles of the comment process itself.

Some of the most egregious examples of information that Kinder Morgan has not yet provided:

“Air emission estimates for the compressor stations for all criteria pollutants, speciated hazardous air pollutants, and greenhouse gasses.”

“Fugitive methane emissions from aboveground facilities.”

“Ambient noise, acoustical analysis, construction noise impact, compressor station noise mitigation requirements.”

Wetland and waterbody surveys...potential impacts to groundwater of compressor stations...avoidance and mitigation measures around wellheads and protected areas...location of contractor yards...possible construction of communication towers...All “TBP”.

It’s hard to comment intelligently in the absence of information. Still, some points can be made: Kinder Morgan has not provided a serious and substantive economic analysis of the costs and benefits of this project to the affected areas and to the region generally. “More cheaper energy good” is as far as they seem to go in their thinking. There is no documentation of any commitment from Kinder Morgan to sell the LNG to pipeline-affected communities, there is no commitment from Berkshire Gas to lift its moratorium on gas hookups (which tactic, by the way, when employed by a heavily regulated quasi-monopoly in the utility sector is either the next best thing to blackmail or an admission of incredible levels of incompetence in managing their supply chain in a responsible fashion).

Massachusetts residents and communities have taken to renewable – particularly solar -- power enthusiastically, and will continue to add capacity as long as the regulator framework continues to support it.

Unlike the sun, energy coming from the Marcellus Shale is of uncertain quantity and recoverability. As the environmental downsides become better known – water pollution, earthquakes, methane – the costs associ-

ated with recovering the resource will undoubtedly go up. There are 17 major pipeline proposals percolating in the Marcellus, which looks like a bit of a landrush/bubble rather than a well-designed roll out of needed infrastructure.

As you consider Kinder Morgan's proposal, please keep in mind the profound, irreversible impact it will on Windsor and other communities along the pipeline's path.

## 20150831-5352

David R Musser, Colonie, NY.

Building new natural gas pipelines, which will inevitably encourage further production and consumption of natural gas, is the wrong direction for New York State and the northeast region to be going in. Because of the threat of global warming we should be moving away from fossil fuel infrastructure and consumption; we should instead be encouraging the development of renewable energy (solar, wind, hydro) that is crucial to both economic and environmental well-being.

Permitting the development of the Northeast Energy Direct Pipeline would be abdication of FERC's regulatory responsibility: aside from contributing to climate change, (1) it is unnecessary, given the overabundance of natural gas supplies as reflected in its low market price; (2) it appears not even to be a sound fiscal investment by Kinder Morgan Energy, and the company's future losses could become burdens not only to its shareholders but to tax payers; (3) numerous studies have shown that far more jobs are created by the same dollar investment in renewable energy infrastructure.

These are effects that may take place over several years and even decades, but the pipeline will also bring immediate harm to the environment and to quality of life of those living along the pipeline route - especially those near compressor stations, which are large industrial installations property owners could not have anticipated.

### United States Department of the Interior

#### NATIONAL PARK SERVICE

Northeast Region

United States Custom House

200 Chestnut Street

Philadelphia, PA 19106

August 31, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426  
[www.ferc.gov](http://www.ferc.gov)

**Subject: FERC Docket PF14-22-000 – Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project (Tennessee Gas Pipeline Company, L.L.C.); in Pennsylvania, New York, Massachusetts, New Hampshire and Connecticut; NPS (ER 15/0370)**

Dear Secretary Bose,

The National Park Service (NPS) is pleased to provide comments on the Notice of Intent (NOI) to prepare an Environmental Impact Statement (EIS) for the Northeast Energy Direct Project (NED). NED would involve the construction and operation of natural gas facilities by Tennessee Gas Pipeline Company, L.L.C. (TGP), in Pennsylvania, New York, Massachusetts, New Hampshire and Connecticut. The NED Project would consist of the construction and operation of approximately 412 miles of new natural gas transmission pipeline and associated facilities, including modifications at existing compressor and meter stations, and

construction of nine new compressor stations, fourteen new meter stations, and various appurtenant facilities. These facilities would be capable of providing 2.2 billion cubic feet per day of capacity to transport natural gas to markets in the northeastern United States and Canada. The pipeline includes supply path and market path components. NED also includes construction of nine pipeline laterals, loops or delivery lines in Massachusetts, Connecticut and New Hampshire to provide natural gas to local markets. These comments submitted by NPS address all components of the proposed project.

### **I. Potential Direct Impacts**

The NPS has concerns regarding potential impacts to rivers designated, or legally designated for study, under the Wild and Scenic Rivers Act (WSRA): 1) the Westfield River, a designated Wild and Scenic River, in Massachusetts; 2) the Lower Farmington River, a WSRA study river, in Connecticut; and 3) two segments of the Nashua River, the Squannacook and the Nissitissit, WSRA study rivers, in Massachusetts and New Hampshire. In addition, a number of rivers proposed for crossing by the NED pipeline are on the Nationwide Rivers Inventory (NRI). NPS, and all federal agencies, have responsibilities under the NRI. More information on these requirements is provided below.

NPS is also concerned about potential impacts to the Deerfield Village National Historic Landmark (NHL) District, and the Captain John Smith Chesapeake National Historic Trail. NPS has responsibilities for protection of these resources which are detailed below.

Overall, NPS administers or has program responsibilities for a number of units and program lands in this area of the East. Those located within 5 miles of either side of the proposed pipeline are listed below. Additional information is provided for those units and program lands within 2.5 miles of each side of the pipeline. We understand that the final route has not quite been set yet. We are pleased to see that so few units and program lands would be directly impacted by the current pipeline route. NPS thanks TGP, in particular, for their efforts to find a suitable crossing of the Appalachian National Scenic Trail, as we detail below.

### **Wild and Scenic Rivers**

The Wild and Scenic Rivers Act (Public Law 90-542) states, in Section 1(b) of the Act, Congressional policy for America's rivers,

*“It is hereby declared to be the policy of the United States that certain selected rivers of the Nation which, with their immediate environments, possess outstandingly remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural, or other similar values, shall be preserved in free-flowing condition, and that they and their immediate environments shall be protected for the benefit and enjoyment of present and future generations.”*

Section 7(a) of the WSRA specifies that, “no department or agency of the United States shall assist by loan, grant, license, or otherwise in the construction of any water resources project that would have a direct and adverse effect on the values for which such river was established, as determined by the Secretary charged with its administration” (in this case, the Secretary of the Interior, through the NPS). NPS looks forward to consultation with FERC in order to make our required determinations.

The Westfield River is a Wild and Scenic River located in western Massachusetts. It is unclear from the shapefiles if the proposal is to cross the river in the electric transmission corridor right-of-way (ROW), to expand the ROW to include the pipeline, or to build a new ROW adjacent to the existing ROW for the NED project. See Figure 1 below. Regardless, there would be potential new impacts to the river. NPS would prefer underground crossings using horizontal directional drilling (HDD), jack and bore, or other such techniques, but will take up this topic during required consultation.

*{areal photo omitted}*

Figure 1: The Proposed NED Pipeline Crossing of the Westfield Wild and Scenic River in Massachusetts.

## Interim Protection of Study Rivers

The NED Project also proposes to cross a number of WSRA Study Rivers. Resource values contributing to the potential designation of such congressionally authorized study segments are afforded statutory protection under the Wild and Scenic Rivers Act. Section 7(b) of the WSRA says,

*“...and, no department or agency of the United States shall assist by loan, grant license or otherwise in the construction of any water resources project that would have a direct and adverse effect on the values for which such river might be designated, as determined by the Secretary responsible for its study or approval”*

(and)

*“Nothing in the foregoing sentence, however, shall preclude licensing of, or assistance to, developments below or above a potential wild, scenic or recreational river area or on any stream tributary thereto which will not invade the area or diminish the scenic, recreational, and fish and wildlife values present in the potential wild, scenic or recreational river area...”*

The Lower Farmington River, in Connecticut, was designated for study by Public Law PL109-370. See Figure 2 below.

*{map omitted}*

Figure 2: The Proposed NED Pipeline Crossing of the Lower Farmington River in Connecticut.

The Nashua River and its tributaries, the Squannacook and Nissitissit Rivers, and their tributaries were designated for study by Public Law PL113-291. See Figures 3, 4, and 5 below.

*{map omitted}*

Figure 3: The Proposed Fitchburg Lateral - NED Pipeline Crossing of the Squannacook River and its tributaries, Walker Brook, Locke Brook, Willard Brook and Pearl Hill Brook in Massachusetts.

*{map omitted}*

Figure 4: The Proposed Fitchburg Lateral - NED Pipeline Crossing of the Nissitissit River and its tributary, Gould Mill Brook in New Hampshire.

*{map omitted}*

Figure 5: The Proposed Fitchburg Lateral - NED Pipeline Crossing of Spaulding Brook and Mitchell Brook, which are tributaries of the Nissitissit River in New Hampshire.

## Nationwide Rivers Inventory

The Nationwide Rivers Inventory (NRI) is a listing of rivers that have been considered under the criteria of the National Wild and Scenic Rivers Act (P.L. 90-542, as amended). Included on the list are rivers and river segments that meet the minimum criteria for further study and/or potential designation and inclusion in the National Wild and Scenic Rivers System.

The Council on Environmental Quality (CEQ) provides guidance to federal agencies with permitting and/or granting authority for projects on or near rivers listed on the NRI. In accordance with a 1979 Presidential Directive, all agencies must “take care to avoid or mitigate adverse effects” to rivers identified in the Nationwide Rivers Inventory.

NPS is available to assist other federal agencies in carrying out this process; however, it is the role of the federal permitting agency (not the National Park Service) to ensure that effects to NRI rivers are avoided or mitigated. Adverse impacts are defined as actions which could diminish the free-flowing, water quality, undeveloped characteristics, or the outstandingly remarkable values of a river listed in the NRI. Such activities could jeopardize the river segment’s ability to meet the eligibility and classification criteria for inclusion in the National Wild and Scenic River System.

If a proposal, including one or more alternatives, could have an adverse effect on a river or river segment listed in the NRI, the CEQ guidelines require that an environmental assessment or, if the effects are sig-

nificant, an environmental impact statement must be prepared. Further, all federal agencies are required to consult with the National Park Service prior to taking actions which could effectively foreclose wild, scenic or recreational classification or designation entirely for rivers or river segments listed in the inventory. All federal agencies are obligated by the President's directive to "... take care to avoid or mitigate adverse effects on the rivers identified in the Nationwide Inventory..."

The main steps in reviewing potential impacts to NRI-listed rivers are to:

- 1) Determine whether the proposed action could affect an NRI river.
- 2) Determine whether the proposed action could have an adverse effect on the natural, cultural, and recreational values of the NRI segment.
- 3) Determine whether the proposed action could foreclose options to classify any portion of the NRI segment as wild, scenic, or recreation river areas.
- 4) Incorporate mitigation/avoidance measures in the proposed action to the maximum extent feasible within the agency's authority.

NPS has identified the following NRI listed rivers as potentially impacted by the NED Project via the following river crossings.

- Deerfield River: one crossing in Massachusetts (see Figure 6 below)
- Souhegan River: four crossings in Massachusetts (see Figure 7 below)
- Susquehanna River: one crossing in Pennsylvania (see Figure 8 below)

NPS looks forward to consultation and is ready to assist FERC in carrying out the required processes.

*{map omitted}*

Figure 6: The Proposed NED Pipeline Crossing of the Deerfield River in Massachusetts.

*{map omitted}*

Figure 7: The Proposed NED Pipeline Crossing of the Souhegan River in Massachusetts.

*{map omitted}*

Figure 8: The Proposed NED Pipeline Crossing of the Susquehanna River in Pennsylvania.

### **National Historic Landmarks (NHLs)**

The NPS manages the NHL program on behalf of the Secretary of the Interior and has responsibilities under the National Historic Preservation Act (NHPA) Section 106 and Section 110(f) to review and comment on projects affecting NHLs. The proposed pipeline appears to cross through one NHL.

#### **Old Deerfield Village Historic District NHL**

It appears from the route shapefiles provided that the NED pipeline would directly impact the Old Deerfield Village Historic District NHL. See Figure 9 below. We hereby request to be a consulting party under Section 106 of the National Historic Preservation Act (NHPA), and look forward to participating in this important process.

*{map omitted}*

Figure 9: Old Deerfield Village Historic District NHL (NRIS #660007741) and the Proposed NED Pipeline

Old Deerfield Village Historic District NHL is managed primarily by two non-NPS entities whose contact information appears below. We recommend that FERC work directly with them during your planning process and consider any potential impacts to archaeological resources, while keeping NPS involved as a consulting party.

#### **Deerfield Village Significance**

When first settled in the 1660s, Deerfield was an extreme northern outpost of English America. Indian raids virtually destroyed the settlement on several occasions, but it was rebuilt each time, and by the 1750s Deer-

field had become the center of a thriving wheat industry and an important market town. Many of its colonial buildings have been preserved and are open to the public in one of America's most impressively restored and best-interpreted historic communities.

### **Boundary Justification**

Old Deerfield Village possesses an unusual degree of integrity in that its historic buildings and street plan are relatively unaltered and the original settlers' farming and grazing tracts in the North and South Meadows remain in active agricultural use. To maintain that integrity the entire complex of village and meadows is included in the national historic landmark boundary.

### **Historic Deerfield, Inc.**

Under the auspices of Historic Deerfield, Inc., a publicly supported organization established in 1952, Deerfield Village has become one of the most effective community restorations in America.

Historic Deerfield Inc. is an outdoor history museum that focuses on the history and culture of the Connecticut River Valley and early New England. It has a dual mission of educating the public about the lifestyles of the diverse people who lived here long ago and of preserving antique buildings and collections of regional furniture, silver, textiles, and other decorative arts. First settled in 1669, Deerfield is one of the few towns settled by English colonists along the eastern seaboard that retains its original scale and town plan. Visitors are offered guided and self-guided tours of 12 antique houses ranging in age from 1730 to 1850. Eleven of these houses are on their original sites.

The organization interprets more than 300 years of stories that reflect the rich and diverse social, cultural and economic history of Deerfield and the region. The Pocumtucks, English, French, enslaved and free Africans, as well as later immigrant groups such as the Polish, frame the stories Historic Deerfield tells.

Philip Zea, President  
Historic Deerfield  
PO Box 321  
84B Old Main Street  
Deerfield, MA 01342  
413-774-5581

### **Pocumtuck Valley Memorial Association**

The mission of Deerfield's Pocumtuck Valley Memorial Association, reflecting the history of New England as well as that of the nation, is focused on preserving and communicating the multi-cultural history of the Connecticut and Deerfield River Valleys, with emphasis on "old Hampshire County", and present day Franklin, Hampshire, and Hampden Counties.

Contact:

Tim Neumann, Executive Director  
TNeumann@deerfield.history.museum  
Pocumtuck Valley Memorial Association (main office)  
P.O. Box 428  
10 Memorial Street  
Deerfield, MA 01342-0428  
413-774-7476 x 10  
pvmaoffice@deerfield.history.museum

There are additional NHLs located within five miles of the current proposed pipeline route. Information on each of these is detailed below under Route Changes.

### **National Trails**

#### **The Captain John Smith Chesapeake National Historic Trail**

The Captain John Smith Chesapeake National Historic Trail is managed by the NPS Chesapeake Bay Office (NPS CHBA). The pipeline is proposed to cross the Smith Trail north of the town of Wyalusing, Pennsylvania and runs parallel to the Smith Trail in New York. See Figures 10 (PA) and Figure 11 (NY) below.

NPS requests that the Environmental Impact Statement (EIS) consider the potential impacts from construction and operation of the proposed project to the resources of the Captain John Smith Chesapeake National Historic Trail. Trail resources include, but are not limited to: evocative landscapes, indigenous cultural landscapes, historic American Indian town sites, significant American Indian archeological sites, landscape features and cultural sites of significance to modern American Indian tribes, visitor experience, viewshed impacts and public access sites.

Specifically, the Feasibility Study for a Potential Susquehanna Connector Trail for the Captain John Smith Chesapeake National Historic Trail notes the Wyalusing area was linked to the North and West Branch confluence area by significant native trails. “Bradford County, PA and Tioga County, NY, along the Upper Susquehanna show a significant complex of sites associated with the Susquehannock Indians and with 16th century accounts of the area as a center of native habitation along the Susquehanna River.” (Feasibility study, p. 64). The map below indicates Indian villages that have been documented by various sources. See Figure 12 below. This area also provides landscapes such as those viewed from Wyalusing Rocks Scenic Overlook that are important to the Smith Trail and modern American Indian tribes. NPS can provide additional information to FERC and the applicant regarding specifics of these trail resources upon request.

The NPS, Captain John Smith Chesapeake National Historic Trail representative and lead contact is Charles Hunt, Superintendent at Charles\_hunt@nps.gov or 410-260-2471.

Figure 12: The Captain John Smith Chesapeake National Historic Trail, Past Settlement, and the Proposed NED Pipeline.

### **The Appalachian National Scenic Trail**

The Appalachian National Scenic Trail (Trail) is a 2,189-mile footpath that traverses through the scenic, wooded, pastoral, wild, and culturally resonant lands of the Appalachian Mountains across fourteen of the eastern United States, from Katahdin in Maine to Springer Mountain in northern Georgia. Conceived in 1921 and completed in 1937, the Trail was built and is still maintained by volunteers, giving rise to its nickname, “the people’s trail” and is enjoyed by an estimated 2 to 3 million people each year. The Trail was designated as the first National Scenic Trail by the National Trails System Act of 1968 and it is arguably the most famous hiking path in the world. The Trail offers opportunities for viewing spectacular scenery and opportunities for a variety of recreational activities, and lies within a day’s drive of two-thirds of the American population. Furthermore, the Trail is eligible for listing in the National Register of Historic Places (NRHP), and the NPS has prepared documentation to formally list it on the NRHP.

As FERC is aware, Title 30 of the United States Code (U.S.C.) Section 185, Rights of Way for Pipelines through Federal Lands, specifically excludes units of the national park system and many other specifically protected federal properties from the Secretarial authority to issue rights-of-ways for petroleum product pipelines and associated facilities. This exclusion applies to lands “administratively transferred” to other federal and state agencies. The authorities for the National Park System to issue rights-of-way permits, Title 16 U.S.C. Sections 5 and 79, also do not include petroleum product pipelines as a utility to which a right-of-way permit may be issued.

NPS is pleased that TGP is proposing to utilize a crossing of the Trail in an existing transmission corridor right-of-way on non-NPS lands. See Figure 13 below. While there will still be some impacts, this location is the best scenario for a crossing of the Trail. Resource Report 8, filed with FERC, mentions the need to coordinate with NPS to further avoid, minimize or mitigate impacts. We look forward to such coordination directly with the Trail office. NPS also highly recommends coordination with our management partner, the Appalachian Trail Conservancy, (<http://www.appalachiantrail.org/>) if such coordination is not already taking place.

*{map omitted}*

Figure 13: The Proposed NED Pipeline Crossing of the Appalachian National Scenic Trail.

The NPS, Appalachian National Scenic Trail representative and lead contact is Wendy Janssen, Superintendent, at [Wendy\\_Janssen@nps.gov](mailto:Wendy_Janssen@nps.gov) or (304) 535-6279.

## **II. Route Changes**

The NPS understands that project planning at this stage does not reflect the final pipeline route as landowner agreements are finalized and alternatives are developed. There are a number of NPS units and program lands within five miles of the proposed pipeline route. Should the route change, these units and program lands may be impacted. For those lands within 2.5 miles of the current route we provide more detailed information. For those program lands 2.5 – 5 miles from the current route we provide a list. NPS requests to be kept apprised of any further route or overall project changes, and can provide contact information and additional assistance should it be needed.

### **National Parks**

#### **Lowell National Historical Park**

America's self-image is founded in part on the nation's rapid rise to industrial preeminence by World War I. While there is no single birthplace of industry, Lowell's planned textile mill city, in scale, technological innovation, and development of an urban working class, marked the beginning of the industrial transformation of America. Visitors can see today the working components of this early manufacturing center---the dam and nearly six miles of canals that harnessed the energy of the Merrimack River; the mills where the cloth was produced; a boardinghouse representing the dozens of like buildings that housed the workers; the churches where they practiced their faiths; the ethnic neighborhoods. These are the roots of American industry and of American working people.

Lowell National Historical Park is also a National Historic Landmark, and is located within 5 miles (but more than 2.5 miles) from the proposed NED pipeline.

Contact:

Lowell National Historical Park  
67 Kirk Street  
Lowell, MA 01852  
(978) 275-1700

### **National Historic Landmarks (NHLs)**

As stated above, the NPS manages the NHL program on behalf of the Secretary of the Interior and has responsibilities under the NHPA Section 106 and Section 110(f) to review and comment on projects affecting NHLs. We do not anticipate any impacts from the proposed pipeline to the landmarks listed below given the current proposed route. NPS requests to be kept informed should the route change, or any alternatives or pipeline infrastructure or construction components move closer to these locations. Each of these sites is privately managed. NPS can provide contact information for these managers should this information not be readily available to FERC.

There are no NHLs in Pennsylvania or New Hampshire within five miles of the current pipeline route. There

are no NHLs within 2.5 miles of the NED route in New York.

#### **New York NHLs 2.5 - 5 Miles of the NED Route**

- Delanson Historic District (NRIS #84003181)
- Fort Crailo (NRIS #66000563)

#### **Massachusetts NHLs within 2.5 Miles of the NED Route**

##### **Derby Summerhouse**

The Derby Summer House (sometimes called the McIntire Tea house) was designed by Samuel McIntire for Elias Haskett Derby of Salem in 1793 and was constructed by McIntire in July 1794. The Derby Summer House is unique. There is no other extant building like it in the United States today. Aside from its rarity, the Summer House is important because it represents American Federal architecture at its finest. The Federal style was based on the work of the Scottish architect Robert Adam who studied private homes in ancient Rome, especially at Pompeii and Herculaneum<sup>2</sup>. See Figure 14 below.

Contact: Danvers Historical Society: <http://danvershistory.org/>

*{map omitted}*

Figure 14: Derby Summerhouse NHL (NRIS#68000020) and the Proposed NED Pipeline

#### **Massachusetts NHLs 2.5 - 5 Miles of the NED Route**

- Crane and Company Old Stone Mill Rag Room (NRIS #83004376)
- Lowell Locks and Canals Historic District (NRIS #76001972)
- William Cullen Bryant Homestead (NRIS#66000136)

#### **Connecticut NHLs within 2.5 Miles of the NED Route**

##### **Hill-Stead**

The Hill-Stead Museum is a Colonial Revival house and art museum set on a large estate at 35 Mountain Road in Farmington, Connecticut, USA. It is best known for its French Impressionist masterpieces, architecture, and stately grounds. The property was designated a National Historic Landmark as a nationally significant example of Colonial Revival architecture; built in 1901 to designs that were the result of a unique collaboration between Theodate Pope Riddle, one of the United States' first female architects, and the renowned firm of McKim, Mead & White. The house was built for Riddle's father, Alfred Atmore Pope, and the art collection it houses was collected by Pope and Riddle. See Figure 15 below.

##### **Edward W. Morley House**

The Edward W. Morley House is a historic house and National Historic Landmark at 26 Westland Avenue in West Hartford, Connecticut. It is notable as the home of the scientist Edward W. Morley (1838-1923) from 1906 to 1923. Morley is famous for his collaboration with Albert A. Michelson on the Michelson-Morley experiment and for his work on the atomic weights of hydrogen and oxygen. See Figure 16 below.

No Contact: Private Residence

##### **Noah Webster Birthplace**

The Noah Webster House is a historic house museum located at 227 South Main Street, West Hartford, Con-

necticut. It was the home of American lexicographer Noah Webster (1758-1853), and was declared a National Historic Landmark in 1962.

In 1758 the house was the birthplace of Noah Webster. His father mortgaged the farm, including this farmhouse, for Noah to attend Yale College. Webster returned to the house after graduation, and was engaged as a teacher at local schools. His interest in lexicography prompted a series of publications, beginning with a spelling book in 1783 and culminating in the publication in 1828 of his Dictionary of the American Language, which sold millions of copies during his lifetime, and laid down basic principles for dictionaries and spelling books that are still used today. See Figure 16 below.

### **Austin F. Williams Carriage House and House**

The Austin F. Williams Carriagehouse and House is a historic house at 127 Main Street in Farmington, Connecticut. Built in the mid-19th century, the property was designated a National Historic Landmark for the role it played in the celebrated case of the Amistad Africans, and as a “station” on the Underground Railroad.

Austin Williams (1805–1885) and his wife Jennet Cowles Williams were abolitionists. Their property first became important in the Amistad case, when the Mende men who had participated in the revolt on the slave ship La Amistad were released from prison in 1841. Williams purchased this property and erected a dormitory building in which the Mende men could stay while awaiting arrangements for their return to Africa. Williams was friends with Lewis Tappan who was assisting the Africans. The structure that was built is now part of the carriage house. The men did agricultural work during this period. In 1842, the Williams’s built their Greek revival house. The cellar of the carriage house served as a hiding place for escaping slaves as a part of the Underground Railroad. See Figure 16 below.

No Contact: Private Residence

### **Stanley-Whitman House**

The Stanley-Whitman House is a historic house museum at 37 High Street in Farmington, Connecticut. Built c. 1720, it is one of the oldest houses in Farmington. A well-preserved saltbox with post-medieval construction features, it was designated a National Historic Landmark in 1960.

The Stanley-Whitman House is the fourth-oldest existent structure and the oldest eighteenth-century structure in modern day Farmington. A centrally located chimney made of field and sand stone divides the house into two symmetrical halves. The original c. 1720 house had four rooms and a third-story attic space. Family members lived, worked, and entertained in the Parlor and Kitchen on the ground floor and the Parlor Chamber and Kitchen Chamber on the second floor. When second owner Solomon Whitman added a lean-to onto the existing room-over-room 3-storey building in the mid-eighteenth century, he expanded his family’s living space and extended the roof line to create the classic saltbox silhouette for which Stanley-Whitman House is famous. The house was constructed in the framed overhang style, in which the second story extends 18 inches (460 mm) over the first story. Four drop pendants, carved directly from wooden beams in the framework of the house, ornament the overhang; two of these are still original while the other two are reproductions. See Figure 16 below.

### **First Church of Christ**

The First Church of Christ, Congregational is a historic church at 75 Main Street in Farmington, Connecticut. Built in 1771, this Greek Revival church was designated a National Historic Landmark in 1975 for its role in sheltering the Amistad Africans before their return to Africa.

The First Church of Christ in Farmington was founded in 1652. Roger Newton, the first pastor, was the son-in-law of Hartford founder Thomas Hooker, and was succeeded by Hooker's son, Samuel. Among First Church's pastors was Noah Porter, who began America's first foreign missionary society in the parlor of his home. He was also the father of Sarah Porter, founder of Miss Porter's School, and Noah Porter, Jr., president of Yale University.

The present church, the third, originally known as the Meeting House, was built in 1771, designed by Judah Woodruff. The slender steeple on top of the bell tower can be seen for miles. The church is cited as an "excellent example of its architectural style and period."

The church began the first "Sabbath School" in the 1700s for the local Tunxis Indians, to teach them Christianity. It was a hub of the Underground Railroad, and became involved in the celebrated case of the African slaves who revolted on the Spanish vessel La Amistad. When the Africans who had participated in the revolt were released in 1841, they came to Farmington, and stayed with Austin Williams before their return to Africa. While staying in Farmington, they attended this church. The Amistad case was important for the abolitionist cause and significant in the history of slavery in the United States. See Figure 16 below.

### **National Natural Landmarks**

The National Natural Landmarks (NNL) Program recognizes and encourages the conservation of sites that contain outstanding examples of our country's natural history. It is the only natural areas program of national scope that recognizes the best examples of biological and geological features in both public and private ownership. Sites are designated by the Secretary of the Interior, with landowner concurrence. To-date, nearly 600 sites have received the NNL designation. The National Park Service administers the program, reports on the condition of the NNLs, acts as an advocate for the protection of designated sites, and raises public awareness of our Nation's natural heritage.

Two sites, the Lynnfield Marsh NNL and the Rhododendron Natural Area NNL, are within 2.5 miles of the proposed pipeline and could potentially be impacted should the route change. While NPS has an administrative and advocacy role for the NNL program, we are not the land manager for the Marsh or the Natural Area. More information is provided below.

### **Lynnfield Marsh NNL, Essex County, Massachusetts**

Lynnfield Marsh NNL is an inland, fresh-water marsh, dominated by cattail and bisected by the Saugus River. The marsh provides habitat for numerous and rare bird species and affords much opportunity and value for public appreciation. The NNL is privately and municipally owned and located in the towns of Lynnfield and Wakefield, MA. The Conservation Commission officers from each of the two towns are the local contacts for Lynnfield Marsh NNL. See Figure 17 below.

### **Rhododendron Natural Area NNL, Fitzwilliam, NH**

Rhododendron Natural Area is considered the largest, thriving stand of rhododendron in central and southern New England. The site is located at the northern limit of this species' range, where rhododendron is rare and localized. The Natural Landmark is a 16-acre grove of Rhododendron Maximum, which is the focal point of Rhododendron State Park. See Figure 18 below.

Figure 18: Rhododendron Natural Area NNL and the Proposed NED Pipeline

There are additional NNL sites located within 5 miles, but more than 2.5 miles away from proposed pipeline. They are:

- Hawley Bog, Hawley, MA
- Mount Monadnock, Jaffrey & Dublin, NH
- Mclean Game Refuge Natural Areas, Granby, CT

There are no NNLs within 5 miles of the proposed route in Pennsylvania and New York. Please contact NPS should more information be needed.

### **National Heritage Areas and Corridors**

National Heritage Areas (NHAs) and National Heritage Corridors (NHCs) are places where natural, cultural, historic and recreational resources combine to form a cohesive, nationally distinctive landscape arising from patterns of human activity shaped by geography. NHAs and NHCs may be managed by a State or local agency, a commission, or a private nonprofit corporation. The National Park Service provides technical and financial assistance for a limited time (usually 10-15 years) following designation. We encourage Tennessee

Gas Pipeline to contact the NHA or NHC manager for their input. A list of all National Heritage Areas and Corridors, as well as contact information can be found at <http://www.cr.nps.gov/heritageareas/CNTC/INDEX.HTM>.

The current NED pipeline route passes through the following NHAs and NHCs:

- Erie Canalway NHC
- Hudson River Valley NHA
- Upper Housatonic Valley NHA
- Freedom's Way NHA
- Essex NHA

Each is shown in relation to the NED route. See Figures 19 and 20 below.

### **Erie Canalway NHC**

The U.S. Congress recognized the Erie Canal's significance to our nation by establishing the Erie Canalway National Heritage Corridor in 2000. The Corridor spans 524 miles across the full expanse of upstate New York. It includes the Erie, Cayuga-Seneca, Oswego, and Champlain Canals and their historic alignments. The Corridor encompasses 4,834 square miles in 23 counties and is home to 2.7 million people.

Upstate New York's largest population centers-- Buffalo, Rochester, Syracuse, and the state capital Albany—all grew up along the canal and are within the Canalway Corridor today

Erie\_canal@nps.gov

### **Hudson River Valley NHA**

Congress designated the Hudson River Valley National Heritage Area in Title IX of Public Law 104-333 (1996), as amended by Section 324 of Public Law 105-83 (1997). The purpose of the Hudson River Valley National Heritage Area Act of 1996 is to:

- Recognize the importance of the history and the resources of the Hudson River Valley to the nation.
- Assist the State of New York and the communities of the Hudson River Valley in preserving, protecting, and interpreting these resources for the benefit of the nation.
- Authorize federal financial and technical assistance to serve these purposes.

In its 1996 review of regional resources and history, the National Park Service declared the Hudson River Valley "the landscape that defined America." Its political importance was demonstrated early in the nation's history when the river played a critical role in the Revolutionary War. For George Washington, the Hudson Highlands were the key to stopping the British advance. With possession of the valley, the British could have separated the southern and northern colonies, potentially changing the course of American history.

Almost a century later, the valley was an important destination along the Underground Railroad, offering hope for slaves as they sought freedom in the north. In 1860, in one of the fiercest moments in the anti-slavery movement, Harriet Tubman incited a riot in Troy to protect the escaped slave Charles Nalle.

The many streams and waterfalls of the tributaries of the Hudson River powered early sawmills and gristmills. The river was the site of the first successful steamboat innovations, beginning with Robert Fulton's Clermont (1807). The Hudson's largest tributary, the Mohawk River, formed the spine for the Erie Canal (opened in 1825), connecting New York City to the west. Beginning in the mid-19th century, the railroads

dominated transportation in the valley. The Erie Canal and the railroads made New York into the Empire State.

The Hudson's influence extended from commerce to culture. The river and its landscapes inspired the first American school of art in the 19th century, the Hudson River Painters.

### **Upper Housatonic Valley NHA**

The Upper Housatonic Valley National Heritage Area's operational goal is to provide a management framework to foster a close working relationship with all levels of government, the private sector, and the local communities in the upper Housatonic Valley region to conserve the region's heritage while continuing to pursue compatible economic opportunities.

The heritage area is the watershed of the upper Housatonic River, extending 60 miles from Kent, CT, to Lanesboro, MA. The heritage area footprint was originally proposed to comprise 848 square miles, including eight towns in Connecticut and eighteen in Massachusetts. Three more communities were later included (Becket & Hinsdale, MA and Colebrook, CT), adding 116 square miles for a new total of 964 square miles. The Berkshire (MA) and Litchfield Hills (CT) that surround the watershed have helped shape a distinct regional culture and have provided natural borders for the heritage area.

info@HousatonicHeritage.org

### **Freedom's Way NHA**

Encompassing 45 communities in North Central Massachusetts and Southern New Hampshire, Freedom's Way National Heritage Area (FWNHA) was established by Congress in 2009 to foster a close working relationship between local and regional partners, governmental agencies and the private sector to preserve the special historic identity of the region.

Roughly triangular in shape, Freedom's Way National Heritage Area is a large landscape encompassing 994 square miles (636,160 acres) in area and extending almost 55 miles from metropolitan Boston to its north-west boundary. While its central core is predominately rural in character, the heritage area includes urban and suburban communities with a pattern of land use that becomes predominately less dense as one travels from east to west.

Reflective of its scale, Freedom's Way National Heritage Area is home to a richly textured mosaic of historic, natural and cultural features and sites that reveal the region's story and its role in the shaping of an American identity. Shaped by rivers and their associated valleys and wetlands, Freedom's Way is a landscape of subtle beauty that has inspired consecutive generations of writers, philosophers, visionaries and

experimenters.

mail@freedomsway.org

**Essex NHA**

In 1996, the United States Congress recognized the national significance of the historic 500 square mile region north of Boston, Massachusetts, by establishing the Essex National Heritage Area. The Area is home to:

- 9,968 historic structures listed on the National Register of Historic Places
- 400 historic farms
- 86 significant museums
- 26 important National Historic Landmarks,
- 9 scenic State Parks
- 2 notable National Park units
- 1 large National Wildlife Refuge

Collectively, these resources define a remarkable region where the present economy and quality of life are intertwined with its heritage.

---

1 NRIS numbers refer to the specific National Register listing for each property

2 From the Danvers Historical Society description.

Dakota Zantay, Averill Park, NY.

After the PA and NY scoping meetings for the NED Pipeline, and 4 days before the NH and MA scoping meetings, Kinder Morgan dropped a brand new 6,571 page set of Resource Reports for a different size project, making comments from PA and NY irrelevant and leaving no one time to evaluate them. This renders the current scoping period null and void. Please issue a new notice of intent, schedule new scoping meetings, and allow a new full 60-day comment period. Please don't disregard the comments that were made before just because new Resource Reports were released.

I live on Burden Lake in Averill Park, NY. I am more than concerned about the effects of the 40,000 (scalable to 90,000) hp compressor station, slated to be built on Clark's Chapel Road in Nassau, NY. This compressor station would be less than 3,000 feet away from Burden Lake, a beautiful NY State treasure. I have spent my life on this lake, and have always used it as a place to escape and find peace. It is home to American bald eagles, this country's national bird and symbol of freedom. I find it disturbing that we are going to ruin a place of refuge for not only them, but also all the other species, including humans, who thrive on this lake. Those of us lucky enough to live on or near the lake, consider the birds, fish, Peregrine falcons, turtles, and landscape, our friends.

I implore you to further research the health effects that will take place if this pipeline and compressor station come to fruition. Not only will people's lives be medically ruined due to the emission of toxic gases, but the mental effects will be horrible as well. The noise and light pollution alone will disrupt circadian rhythm. This will cause obesity, depression, and mental instability. Sitting out on the lake at night will be a thing of the past. Who will want to listen to the equivalent of a freight train constantly passing? The bright lights of a football stadium will impede stargazing. The nature tranquility of the lake will cease to exist. Even more importantly, the emission of toxic gasses such as radon, formaldehyde, and benzene, will cause fatal health risks to children, wildlife, and the rural and beautiful landscape of the Capital District. NY's capital will be destroyed. People will suffer from a long list of health effects, including but not limited to, respiratory ailments, cancers, and kidney disorders. I implore you to look at Kinder Morgan and TN Gas Pipeline's safety record before giving approval to this project. In 2011, PHMSA cited Kinder Morgan for these safety violations:

- Failing to maintain/update maps showing pipeline locations,
- Failing to test pipeline safety devices
- Failing to maintain proper firefighting equipment,
- Failing to inspect its pipelines as required, and
- Failing to adequately monitor pipes' corrosion levels.

How can Kinder Morgan be sure that ground water and air will not be contaminated? If it is, what is their plan for cleaning it up? How is it that we already know the horrible water and air effects pipelines and compression stations have in places such as Pennsylvania, yet you continue to let this happen? How can the public, and FERC, trust a company who has this type of track record? It is not a question of if the pipeline or compressor station will leak or have an accident, it is when.

The pipeline being placed on Logan's Fault Line could trigger not only an earthquake, but also a leak that would affect Kinderhook Creek, contaminating the vicinity and Albany, Rensselaer, Columbia, and Greene counties. The Environmental Impact Statement should include how these habitats, creeks, and fault lines, will be avoided by the pipeline and compressor stations. This compressor station would lie extremely close to the Dewey Loeffel Landfill Site, which is a superfund site. Residents living near Dewey Loeffel have reported contaminated groundwater directly resulting from the superfund site. Dewey Loeffel Landfill has rendered Nassau Lake unfit for swimming. If Burden Lake should become contaminated, two lakes in the same town will be toxic.

Members of the Federal Energy Regulatory Commission, I ask that you take a true and extensive look at all the impacts this pipeline and compressor station will have before approving this project. I ask that you do

an all inclusive cost benefit analysis of this pipeline and compressor stations. I ask that you take the time to study potential impacts to wildlife, economics, and rural character. I ask that an archeological dig is done before this project goes forward of the former Totem Lodge site. This site should be a historical site, as it was once home to a beautiful resort and casino, and has prehistoric remains there. Totem Lodge represents the heritage of Burden Lake and Rensselaer County. It's very character and DNA.

Is this project going to truly serve the public good? Please extend the scoping comment period since Kinder Morgan's new Resource Reports have been filed. I implore you to reconsider this site as a potential location for a compressor station and pipeline, and to consider a "no action" alternative. You will be devastating this area in terms of not only tourism and commerce, but many families and generations who have personal history in the area, adding to the area's natural rich national history. My family will no longer be present in the Capital District. This will upheave many lives, at least the ones lucky enough to be able to sell their homes in time, which will be deemed unlivable if this pipeline and compressor station comes to light. How can Cuomo ban fracking in the state of NY but allow the transportation and infrastructure to still pass through his state? If fracking is dangerous enough to ban, then why are we not taking steps to further ban it? If there is so much opposition, and obvious detrimental effects, how could FERC possibly approve this? Please think of the people and the environment with your decision.

**20150831-5370**

Martha Klein, Norfolk, CT.

Dear Secretary Bose,

I am writing in reference to Docket number PF14-22, Kinder Morgan's Northeast Energy Direct (NED) project. Please consider the following issues in the environmental impact statement.

First, NED will vastly increase the amount of methane being released into the environment. Pipelines leak at a rate of nearly 3%, a rate reported by scientists in peer reviewed journals. Other emissions of methane into the environment are intentional, such as venting, which occurs at compressor stations and other pipeline facilities, such as pigging stations. Methane gas, commonly called "natural" gas, is known to be 100 times worse than carbon dioxide at causing climate disruption over 10 to 20 years. As a result, increased use and transport of methane gas will be equally or more destructive to the climate compared to coal or oil. Earlier this month, the EPA called for reductions in methane emissions of up to 45% over the next 10 years. NED will make these reductions impossible, and will continue to cause worsening climate change. FERC should require that the NED project not destroy our climate with methane emissions.

Second, FERC must insure that the populace in Connecticut and the region are not at risk from exploding pipelines. According to data from the Pipeline and Hazardous Materials Safety Administration, US Department of Transportation, on average, hazardous fuels in the US leak at a rate of 200 barrels PER DAY. These spills have grown in severity and occurrence, due largely to the flammable and corrosive fuels being carried in pipelines. Shale gas is such a fuel; fracking has allowed previously unrecoverable fuels to be obtained and transported, and these fuels are more dangerous than traditionally drilled fossil fuels. Exploding pipelines with releases of flammable gas, and the attending toxic chemicals, including NORMS that occur in fracked gas, will have negative impacts on the public's health. Pipeline incidents since 1986 have caused thousands of injuries, hundreds of deaths, and cost billions of dollars in damages. It is FERC's duty to insure that these potential deaths and injuries from exploding pipelines don't happen.

Third, FERC must insure that the NED construction and operation will not have a detrimental effect on the drinking water for residents of the Hartford area. The Hartford Metropolitan District has already written to FERC about its concerns that the NED project poses potential contamination hazards to the drinking water for consumers served by the Metropolitan District.

Fourth, FERC should measure the environmental harm from Kinder Morgan's two projects which are on the identical pipeline route. FERC must admit that these two projects, CT Expansion and NED, have cumula-

tive environmental damages, although FERC chose for the benefit of industry, to allow Kinder Morgan to apply for these two connected projects separately. FERC has been found guilty of illegal segmentation in the recent past, and should consider that in its future environmental studies.

Finally, consider that the environmental and climate destruction that NED creates is unnecessary. The extra power that this bloated project will carry is not needed in this region, and in Connecticut, electric distribution companies are scrambling to find new gas customers to justify all the extra methane coming into our state. With efficiencies like sealing pipelines, and with the continued rapid rate of new solar and wind power installation, no new pipelines are needed.

Sincerely,

Martha Klein  
Norfolk, CT

NY's clean water advocate

August 31, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

Re: Docket No. PF14-22-000: Notice Of Intent To Prepare An Environmental Impact Statement For The Planned Northeast Energy Direct Project, Request For Comments On Environmental Issues, And Notice Of Public Scoping Meetings

Dear Secretary Bose,

Thank you for accepting and considering comments on the above referenced scoping notice. While Tennessee Gas Pipeline Company's Northeast Energy Direct Project will cross hundreds of miles - and presumably a great many rivers, streams and wetlands - Riverkeeper's mission is to protect the environmental, recreational and commercial integrity of the Hudson River and its tributaries, and safeguard the drinking water of nine million New York City and Hudson Valley residents. Consequently, while our comments may be more generally applicable, these scoping comments apply to how the Pipeline, if constructed, would cross the Hudson River.

Riverkeeper is a member-supported watchdog organization dedicated to defending the Hudson River and its tributaries and protecting the drinking water supply of nine million New York City and Hudson Valley residents. The Hudson River is a globally significant estuarine ecosystem that is home to hundreds of plant, animal and fish species, including endangered Atlantic and shortnose sturgeon.' Riverkeeper litigates, advocates, and educates the public on environmental issues affecting the Hudson River, including gas extraction and related infrastructure.

FERC must scope the Draft Environmental Impact Statement so as to comprehensively assess any reasonably foreseeable impacts from the construction and operation of the Northeast Direct Pipeline. FERC must fully assess pipeline route alternatives and mitigation measures to address unavoidable impacts. The Impact Statement must include a detailed description of what types of land will be disturbed, how much and for how long, as well as mitigation measures to minimize or offset such impacts. Unless Tennessee Gas carefully analyzes these impacts, and the pluses and minuses of various realistic alternatives, it will not do everything necessary to reduce or eliminate impacts on the human environment.

While Tennessee Gas will presumably use Horizontal Directional Drilling to cross the River and therefore avoid disturbance to the river bottom sediment and biota, it is critical that FERC carefully assess the potential impacts to shoreline areas that will be disturbed in order to drill and place the pipeline under the Hud-

son. The Impact Statement should assess all potential impacts and available mitigation measures that could be utilized to offset land and river impacts that may result at any potential crossing locations. The Scoping Document lacks specific information about where and how the applicant proposes to cross the Hudson River. If the Applicant does not submit more specific information on the preferred route before completing the draft Impact Statement, FERC should supplement the draft Impact Statement with more detailed information when it becomes available.

The Impact Statement must assess the impacts of accidents or spills that could occur during the drilling process, including to those involving drilling fluids such as bentonite clay. The Applicant must minimize the risk that drilling fluids could spill, releasing bentonite clay or other drilling fluids into the Hudson or other stream crossings to the maximum extent practicable. The Impact Statement should assess whether real-time monitoring Horizontal Directional Drilling operation and water quality in the vicinity of the drilling would ensure that any loss of drilling fluid into the environment would be quickly discovered and stopped. The Impact Statement should analyze how discharged drilling fluids could impact wetlands, streams and the Hudson River over multiple timeframes, and fully describe what remediation and cleanup methods would be necessary to remediate such spills.

The Impact Statement should include the same type of assessment for all Horizontal Directional Drilling stream crossings - not just the Hudson River crossing.

In areas where trenchless crossing using Horizontal Directional Drilling is infeasible, the Impact Statement should include an assessment of the impacts of an open trench crossing. These could include impacts on water quality, stream flow, benthic habitat, and disturbance of benthic, invertebrate and fish species in the disturbed area of the stream. In areas where open trench crossings are contemplated, either in the preferred or alternative routes, the Impact Statement should include a detailed discussion of best management practices required to minimize impacts, including monitoring water quality during construction and ensuring that the streambed is restored to its original, pre-construction condition after the crossing is complete. Temporary stream diversions that utilize gravel or other hard substrate to ensure stream flow must be fully replaced or remediated to eliminate any permanent alteration of streambeds.

### **Storm water Runoff**

The Impact Statement must evaluate both impacts from increased stormwater runoff due to construction activities and long-term changes in surface drainage patterns.

When construction activities remove vegetation and expose soils, forest canopies no longer intercept stormwater and root systems no longer hold soils in place. Stormwater runoff from construction sites may carry pollutants - such as debris, oil and other contaminants from equipment, and any herbicides used for vegetation clearing or ROW maintenance - from the project site to downstream wetlands, streams, and other waterbodies. Construction site runoff can also erode exposed soils and transport sediment to receiving waters. Long-term changes in hydrology and surface drainage patterns may also result from construction activities, particularly in areas, such as steep slopes, where changes in ground cover and topography can increase stormwater runoff, reduce the ability of natural systems to filter pollutants, and permanently alter drainage patterns.

The evaluation of stormwater impacts must include a Stormwater Pollution Prevention Plan, prepared in accordance with New York State Department of Environmental Conservation requirements. Tennessee Gas should submit a Stormwater Pollution Prevention Plan as early in the environmental review process as possible to allow for thorough review and comment. A Stormwater Pollution Prevention Plan is an important tool for mitigating any adverse impacts from stormwater runoff, and is necessary to fully understand the project's potential for significant impacts on water resources. The Impact Statement should also include a description of how construction will be phased to coordinate with control measures contained in the Stormwater Pollution Prevention Plan.

### **Wetlands and Buffer Areas**

According to the Environmental Protection Agency, “Wetlands are part of the foundation of our nation’s water resources and are vital to the health of waterways and communities that are downstream. Wetlands feed downstream waters, trap floodwaters, recharge groundwater supplies, remove pollution, and provide fish and wildlife habitat. Wetlands are also economic drivers because of their key role in fishing, hunting, agriculture and recreation.” Given how important wetlands are to the human environment, FERC must assure that Tennessee Gas treats wetlands with as much care and provide as much protection as it does to major river crossings.

The Impact Statement must comprehensively evaluate likely impacts to wetlands and the associated 100-foot buffer areas as part of its consideration of impacts to water resources. The Impact Statement should exhaustively delineate all federal, state, and locally regulated wetlands and buffers; completely analyze wetland functions; and evaluate Horizontal Directional Drilling or other trenchless methods for each wetland crossing proposed.

Wetlands perform a number of important functions, including serving as water storage resources that absorb and retain flood and storm waters to reduce erosion and prevent downstream flooding. This storage capacity allows for the recharge of surface waters, ground waters, and aquifers that may feed local drinking water supplies.

Any analysis of wetlands impacts must include impacts to associated 100-foot buffer areas. Wetland buffers are important transitional areas that intercept stormwater from upland habitat before it reaches wetlands or other aquatic habitat. Wetland buffers reduce thermal impacts, increase nutrient uptake, allow stormwater infiltration, reduce erosion, and restore and maintain the chemical, physical, and biological integrity of water resources. Damage to wetland buffer areas can significantly impair and degrade wetland functions.

In order to identify and evaluate all likely impacts to wetlands and buffer areas, the Impact Statement must completely delineate all wetlands and 100-foot buffer areas potentially impacted by the project. It should include those wetlands and buffer areas regulated at the federal, state, and local level.

In New York, many municipalities have local wetland ordinances that provide for protection of wetlands and buffer areas. The Impact Statement should carefully analyze the project’s effect on wetland functions and mitigation plans on all wetlands and buffer areas. The Impact Statement should evaluate the hydrology, vegetation, fish, wildlife and soils present. The Impact Statement should also include a comprehensive wetland mitigation plan.’

Finally, the Impact Statement must evaluate trench less crossing methods for each wetland crossing. The Statement should analyze alternate routes that might avoid the specific wetland crossing, the feasibility of using trenchless methods, and the environmental impacts likely to result from the use of trenchless versus trench crossing methods for each specific crossing proposed. The Statement should analyze any additional temporary workspace necessary outside the existing ROW, discuss the impacts likely to result from any clearing or other disturbance outside the ROW, and balance these impacts against the likely impacts of using trench-crossing methods. Trenchless crossing should be utilized under the buffer area as well as within the wetland itself, and all workspace should remain outside the 100-foot wetland buffer area.

### **Hydrostatic Testing**

The Impact Statement must evaluate in detail the amount of water to be used, methods and rates of withdrawal, planned use of any additives, and specific withdrawal and discharge locations for all water to be used to hydrostatically test the pipeline prior to service. Depending on project specifics, hydrostatic testing can consume millions of gallons of water.”

Tennessee Gas must provide specific, detailed information on how it plans to use water for hydrostatic testing. It should disclose the amount of water it plans to use, its methods and its rates of withdrawal. If Tennessee plans to withdraw water from surface waters, the Impact Statement must evaluate likely impacts to fish and other organisms. If it plans to draw water from municipal sources, the Impact Statement must assess potential adverse impacts on local supplies. The Applicant must also be required to state whether it plans to

use additives, and, if so, detail the adverse environmental impacts likely to result from the discharge of additivelaced testing water.

It is also important for the Impact Statement to identify exactly where water will be withdrawn and where it will be discharged. Simply listing a waterbody or general area is not sufficient, as different waterbody sections may be more or less sensitive than others, or may support ecosystems or uses that are incompatible with large-scale water withdrawals. The identification of specific discharge locations is also critical, particularly if testing water is to be discharged into surface waters from which it was not withdrawn, and/or has been contaminated with harmful additives.

### **Cumulative Impacts**

Pursuant to the National Environmental Policy Act, 42 U.S.c. §§ 4231 et. seq., an Impact Statement must include an evaluation of cumulative impacts,” defined as:

“[T]he impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.”

40 C.F.R. § 1508.7.

As such, the cumulative impacts analysis in the Impact Statement must identify and assess the project’s environmental impacts as a whole, including pipeline take up and relay, new pipeline installation, upgrade of existing compressor stations, upgrade of existing and construction of new metering and regulating stations, and system operation once construction is complete. Importantly, the Impact Statement must come to terms with the recent determination that current tests and models may vastly underestimate methane leaks. The Impact Statement should include cumulative impacts within all categories of likely environmental impacts identified in the Impact Statement.

The Impact Statement must also identify and evaluate the incremental effects of the project in combination with “other past, present, and reasonably foreseeable future actions.” This evaluation must include more than a mere recitation of neighboring actions; it must evaluate how these projects work together to affect the human environment.

Tennessee Gas and FERC must realize and understand that just because this projects and others may comply with all applicable regulations does not mean these projects - alone or togetherpose no significant or incrementally significant impact. The incremental effects of other actions in combination with the AIM Project must be fully identified and assessed in the Impact Statement.

Finally, the Impact Statement should include a consideration of the impacts associated with increased industrial gas extraction activities that will be facilitated by the AIM Project, which will considerably expand natural gas delivery capacity - and therefore increase demand for gas extraction - in the Northeast region.

Thank you for the opportunity to comment on these important issues.

Sincerely,

Chris Len Director

Emily Chetkowski, New Ipswich, NH.

To once again emphasize the seriousness of locating a 40,000hp fracked gas compressor near Villi Poni Farm, Newfoundland Pony Preserve, in New Ipswich, NH, I am including a link to a televised Documentary in which our ponies and myself appear because it covers an event in which I figured prominently. This Documentary, called "Where Once They Mattered, Saving the Newfoundland Pony" is the true story of a coast to coast herd rescue of 20 critically endangered Newfoundland Ponies. The documentary says it all and is receiving wide acclaim. The risk our herd's existence by plunking down a toxin spewing abomination anywhere near the sanctuary is simply unconscionable! The risk of our very rare native species ponies to illness, sterilization, infertility and death is great and proven. We also harbor one very rare bloodline here, almost completely.

In the event of an emergency, it is simply impossible to evacuate an entire herd quickly.

As you will see in this documentary, moving a herd takes months of planning and much money, even as urgent as that rescue situation was. I know all too well, as you will see from watching it; that effort became the main focus of my every waking moment for almost a year.

You will also see how important the Newfoundland Pony is to very many people across this continent and beyond. Genetic material is NOT recoverable. Once it is lost, it is lost forever. Kinder Morgan could very well be the straw that breaks the pony's back. Kinder Morgan's negligence could very well cause it's utter extinction.

I would like to also mention the damage that we would suffer to our charity, our mission, and our financial ruination the negative impact of such an environmental monster being located here would have.

We can't stay, yet we can't leave.

This project is nothing short of negligent genocide, in the truest sense of the word.

### **20150831-5393**

Elizabeth Bennett, Deerfield, MA.

Docket Number PF14-22-000, Northeast Energy Direct Project

Federal Energy Regulatory Commission

888 First Street, NE

Washington, DC 20426

Dear Federal Energy Regulatory Commission:

I am writing to express my extreme concern regarding the proposed Northeast Energy Direct (NED) pipeline project currently being reviewed for approval by the Federal Energy Regulatory Commission (FERC) for the applicant, Tennessee Gas Pipeline Company, LLC (TGP). The pipeline being proposed will potentially cut through my property. I am deeply concerned regarding the adverse effects that this pipeline could have on my property and the greater surrounding community as a whole.

My property is terraced and on a steep hillside, and is already prone to erosion. From my understanding the TGP is seeking to put the NED through a portion of my land that is densely wooded. This wooded area of my property is crucial in protecting my property from erosion from water and wind. If the pipeline were to cut through my property we would be forced to maintain the area with low growing grasses that would do little to keep the property from further eroding.

Across the street from my property is a wetland which is bordered by preserved farmland. This wetland, which the pipeline would cut through, protects my property and the property of others from flooding from the Deerfield River. As recently as August 2011 hurricane Irene resulted in extreme flooding in my area and much of the northeast. My property on the hillside became an island, as water rose above the road in front of my home, trapping us there. However, we sustained no damage to our property, which is owed to the fact that the wetland in front absorbed a large portion of the flood waters. I am very concerned about the potential destruction of this wetland by the proposed pipeline.

As I explained above, the Deerfield River is nearby and the pipeline is proposed to cut across it. In addition, the eastern portion of my town, Deerfield, MA, is bordered by the Connecticut River and is also slated to be crossed by the pipeline. These rivers are valuable resources to my community and the state for recreation and commerce. There are numerous hydroelectric dams along the Deerfield River operating to produce valuable, renewable hydroelectric power. This goes for the Connecticut River as well. The Connecticut River has only recently been cleaned up from years of environmental degradation and now could face a new onslaught of pollution if this pipeline were to fail underneath it.

There seems to be no legislation that protects my rights as a landowner. The pipeline running through my property would devalue it and there is nothing that mandates that this company provide me compensation for the devaluation. The magnificent views that are afforded from my property would be ruined in part by the destruction of the forested area bordering that this pipeline would destroy. The easement from this pipeline would lower the value of my home as a portion of the property would become unusable. And despite the devaluation to the property we would still be responsible for the taxes on the property.

The NED cutting through my land would put my family in danger of any accidents to the pipeline that could occur. These accidents do happen... January 2015, Brandon, MS a pipeline explosion burned six acres of land and created a large crater; April 2015 Borger, TX a Kinder Morgan gas pipeline exploded leading to the evacuation of nearby homes; August 2015 Falfurrias, TX another Kinder Morgan pipeline ruptured; March, 2014 Plymouth, WA a pipeline operated by Williams Companies exploded leading to the evacuation of 1,000 residents; February 2013 Knifly, KY a Columbia Gulf Transmission pipeline exploded, destroying two homes.... this list could go on and on. Not only is my town not prepared to respond to the type of disaster that a pipeline explosion could cause, but the presence of a pipeline on my property could render it uninsurable.

I am deeply concerned that there has not been time for a thorough, independent review of the need for this pipeline. I strongly encourage the FERC to delay their review process until the study currently being undertaken by Massachusetts State Atty. General Maura Healey can be completed.

Thank you for taking the time to review my correspondence, and for recently sending your officials to my community to take public comments in person. Please consider my concerns, the concerns of others in my community, and the concerns of the energy and environmental experts that have been working to get this country on the right track towards renewable, clean energy sources when making your decision whether to

approve the NED project.

Sincerely,

Elizabeth and David Bennett

**20150831-5397**

Loren Brown, Nassau, NY.

Dear Council of FERC,

One more Docket PF14-22-000 e-comment in the time remaining.

My research has taught me that the profitable gas to be fracked is estimated to last until around 2020. The trend has been towards overestimating well productivity, which invites shareholder optimism, creating economic bubbles, which, when they burst because of inaccurate estimates of profitability, leave shareholders to swallow the loss.

Fracking is among the most expensive, most environmentally dangerous, and most ephemeral, non-sustainable sources of energy. Wells cost millions to establish, and once the well's ground zero is quickly depleted, the outlying gas is extracted in exponentially decreasing amounts, requiring the drilling of more expensive wells.

It seems to be a high stakes game in investing millions upon millions in infrastructure, both wells and pipelines, for quickly diminishing returns.

So, we are really talking about how to manage a timeline, a short and dramatic one affecting many people's lives and the biological well-being of many ecosystems.

In the mean time, we have every incentive, and possible momentum, to transition to green renewable energy. A very dynamic time indeed.

So, the Kinder Morgan NED Pipeline is slated to begin construction in 2018, only two years before fracking's natural and profitable anticipated end. Perhaps by that time, many more unforgivable pipeline accidents would have occurred, making for such a powerful public outcry that any governor/government agency with veto power in such matters would be obliged to use this power to stop construction of the pipeline, which would discredit agencies who failed to do so earlier in this timeline.

In short, approval of this or any other pipeline through NYS is simply inadvisable in lieu of economic, environmental, and rights to self-governance considerations. This will become so apparent, that opposition to said approval will result in yet more time delays and costs to the Kinder Morgan, and everyone's energy will be spilled in fighting rather than redirected towards a future of innovative new energy technologies, which may arrive just soon enough, or when it is already too late.

My pet theory is that there should be federal legislation to empower those companies bound by the inertia of such industries as fracking to transition to new green technologies. These industrial giants are really our best and quickest means of getting on board with green energy technologies, and could be the best motivated, if our federal government would assist in both the motivation and the transition with the necessary assistance and mandates. Just makes all the sense in the world to me, but is probably out of your purview.

Thank you once again for considering these points in your decision.

Sincerely yours,

Loren Brown

151 New Rd

Nassau, NY 12123

Docket PF14-22-000

Lynnette Shanahan, Nassau, NY.

I am writing to you about docket #PF 14-22 concerning the gas pipeline and compressor station.

My name is Lynnette Shanahan and I live in Nassau, NY, at 1236 Nassau Averill Park Road, Nassau, NY 12123. I bought my house just a year and a half ago. Had I known that there was the possibility of a pipeline and compressor station going near this house, I never would have considered buying this house or any other house in the area.

What I thought I was buying was a place I could live for many years because it is in a rural community which is where I want to live. The reason I prefer to live in a rural area is because of less pollution, air and water, noise and light, and for more green space. I have since learned that a large company, Kinder Morgan, wants to take this away from me, my two small children, and the others who live along this pipeline and the compressor station. My house is directly across the street from the location of the proposed compressor station.

I have learned that fracking not only pulls natural gas out of the Earth, but other chemicals with it; carbon monoxide, nitrogen oxide, volatile organic compounds, benzene, toluene, xylene, and formaldehyde; all are dangerous to animal life. The compressor stations need to be vented on a regular basis and will release these dangerous compounds into the air. Pipelines have been known to leak, which also releases these compounds into the air. What starts out in the air, ends up in the ground water. There are several lakes in close proximity to the pipeline and the compressor station. All of these dangerous compounds will end up in the lakes and in our groundwater. We already have strong scientific evidence to support global warming and its detriment to the Earth. Allowing this pipeline will increase global warming and contribute to the worldwide problems that are already occurring.

Building the pipeline and the compressor station requires ground to be cleared. The blasting that will be used to clear some of the land will contaminate the groundwater. The clean, fresh well water that I and my neighbors enjoy will be unfit for drinking. Sure, we can get our groundwater tested, mine is great right now. But, testing the water after a pipeline and compressor station is built is a reactive measure that will only let us know that we have been drinking contaminated water. We can stop drinking the water, but we can't undo the damage already done during time we drank the contaminated water.

The compressor station will be very loud. The quiet of the country that I enjoy so much, will be gone forever. I will hear the loud noise of the compressor station 24 hours a day, 7 days a week, never to stop. When the compressor station is vented, it will sound like a 747 airplane is driving through my house. Humans need silence. I suffer from migraine headaches which are brought on by stress. When I have a migraine, the only thing that allows me to work through the pain, is to be in a quiet and dark place. When my home is not quiet, what am I supposed to do?

The compressor station will be lighted 24 hours a day, 7 days a week, never to stop. I will no longer be able to see the stars at night; my sleep will be disturbed, because of the light pollution. Humans also need darkness so that their body stays on cycle. People who live in urban areas have a higher rate of sleep problems due in part to light pollution.

This pollution will go on day after day, year after year, unless there is an explosion. Then I will not have to be concerned with the pollution, because I will be dead. A 90,000 horsepower compression station, pumping fracked gas through a 30 in pipe – any explosion, will be tragic for any living creature around.

I learned that the safety standards are less in rural areas. Kinder Morgan is allowed to use the thinnest pipe in rural areas because the population density is not high. I guess rural human lives are not as valued as urban or suburban human lives. I have a hard time explaining that one to my children.

We are learning as I write this about the detrimental effects gas pipelines and compressor stations have on animal life. Recent studies show that people living within a two mile radius of a compressor station are 50% more likely to develop heart disease, respiratory disease, and cancer. I take great care to lead a healthy

lifestyle; I eat only organic food, I use natural cleaning products, I exercise, I sleep well. I do not want a big company, who's only interest is to make money, to sabotage the healthy lifestyle I have worked hard to attain. What about the children who live so close? They are even more susceptible to the negative effects of this pollution.

I think that we are losing sight of the delicate balance between what our Earth offers and the lives that depend on this Earth to survive. We are taking too much and the animal and plant lives are the ones that suffer the consequences. Yes, death is inevitable. However, I don't want mine sped up so that Kinder Morgan can make a bunch of money.

Here is my common sense reason for knowing that the pipeline is a very bad idea. If we have to go through all of this to get gas out of the earth, and we know that most will be exported, why is it that we are not saving it for ourselves? If something happens, and our country needs a power source, why are we giving it away now? We should, as a nation, conserve what we have, rather than extract every little bit so we can just ship it off to another country and let a big company make money at the expense of the lives it is going to ruin.

Please take my concerns into consideration. We are on a downward spiral and someone needs to make everyone slow down so that the effects of this can truly be studied and considered.

#### **20150831-5408**

Norman R Rathbun, SR, Hancock, MA.

I am a land owner along proposed route of this gasoline. My family and I are very opposed to have pipeline cross through our property. For many reasons! Damage to land, environment, animals all things that would be destroyed or displaced due to this process proposed to happen across many states. With many of those effected unable to even receive this service. In addition I burn firewood for heat and wood have to cross pipeline in several places to access my own wood on my own land. Not to mention The safety issues in proximity to pipeline and also my house are of great concern. Premiums for insurances are bound to rise. And this will be detrimental to the value of my property and many, many of my neighbors and friends. And again I say with all risks of health and well being to our land and families taken by Us The landowners against our rights, with no benefits whatsoever for this service or anything pertaining to it to our local area.

Norman R Rathbun Sr.

#### **20150831-5411**

Gail LaGoy, Montague, MA.

Comments 1 of 2:

1. Provide corrected maps, and add all additional/available map layers to identify:

- a. Chapter 61 Forestry land
- b. Agricultural land
- c. Conservation lands of any type
- d. Rare and Endangered Priority and Estimated Habitat
- e. All bodies of water, including but not limited to: seasonal streams, streams, brooks, rivers, ponds, lakes, ocean, other.
- f. Watershed areas for all bodies of water, including: seasonal streams, streams, brooks, rivers, ponds, lakes, ocean, other.
- g. Water supply drinking areas – public and private supplies.
- h. Wells
- i. Springs
- j. Interim wellhead areas – public and private supplies

- k. Flood Zones, including 100 year floodplain areas – public and private
  - l. Areas considered to be “bald knobs” with shallow depth soil.
  - m. Soil types
  - n. Other map layers not listed above.
2. Identify all areas with one or more potentials impacts, and assess the environmental, cultural, structural, and financial impacts in the aggregate:
- a. Including, but not limited to:
  - b. Forestry and Agricultural
  - c. Rare and Endangered Priority and Estimated Habitat
  - d. Vernal pools
  - e. Water Supply districts
  - f. Historical and cultural interest
  - g. Planned Open Space
  - h. Tourism areas – including scenic vistas and overlooks
  - i. Conservation land of any type
  - j. Interim wellheads
  - k. Flood Zones
  - l. Watershed
  - m. Wells
  - n. Springs
  - o. Bald knobs with shallow depth soil
  - p. Driveways and roadways – public and private
  - q. Other potential impacts not listed above.
3. Assess the financial impacts:
- a. Loss of tax reduction due to loss on conservation classifications
  - b. Loss of landowner, business, or public entity income (current and future potential, over expected life of owners and heirs) related to:
    - i. Tourism
    - ii. Real Estate Sales, resales, and rentals
    - iii. Forestry and Wood Products
    - iv. Agricultural
    - v. Quarry
    - vi. Metals and Minerals
    - vii. Sand and Gravel
    - viii. Soils
    - ix. Water sources
    - x. Other not listed above
  - c. Loss of or pollution of soils
  - d. Additional costs to landowner, business, or public entity due to limitations presented by pipeline and related structures
  - e. Loss of real and personal property value
  - f. Loss of tax basis to cities, towns, counties, states, other public entities
  - g. Loss of clean energy sector jobs

- h. Damage to buildings, other structures
  - i. Damage to forestry and agricultural land
  - j. Damage to personal property
  - k. Other financial impacts not listed above.
4. Impact of groundwater flow alteration to:
- a. Forestry and Agricultural land
  - b. Conservation land of any type
  - c. Watershed areas for all bodies of water, including: seasonal streams, streams, brooks, rivers, ponds, lakes, other.
  - d. Water supply drinking areas – public and private supplies.
  - e. Interim wellhead areas – public and private supplies
  - f. Flood Zones, including 100 year floodplain areas.
  - g. Wetlands crossings – public and private
  - h. Drainage controls – public and private
  - i. Retention Ponds – public and private
  - j. Reservoirs – public and private
  - k. Swales – public and private
  - l. Driveways, paths, roadways – public and private
  - m. Buildings and other Structures – public and private
  - n. Soils
  - o. Wells
  - p. Springs
5. Impact of air flow and wind pattern alterations to:
- a. Forestry and Agricultural land
  - b. Conservation land of any type
  - c. Driveways, paths, roadways – public and private
  - d. Buildings and other Structures – public and private
  - e. Soils
6. Identification and mapping of all vernal pools in all areas of proposed project:
- a. Impact to vernal pools from proposed project.
  - b. Impact to vernal pool reliant species – animals and plants.
7. Identification and mapping of all habitat and range areas, of all species of animal and plants that are:
- a. Migratory species - all
  - b. Federal Endangered, Threatened, or Species of Concern
  - c. Massachusetts Endangered, Threatened, or Species of Concern
  - d. New Hampshire Threatened, or Species of Concern
  - e. New York Endangered, Threatened, or Species of Concern
8. Impact to all habitat and range areas, of all of all species of animal and plants that are:
- a. Migratory species - all
  - b. Federal Endangered, Threatened, or Species of Concern

- c. Massachusetts Endangered, Threatened, or Species of Concern
  - d. New Hampshire Threatened, or Species of Concern
  - e. New York Endangered, Threatened, or Species of Concern
9. Impact of fragmentation of habitat for:
- a. Migratory species - all
  - b. Federal Endangered, Threatened, or Species of Concern
  - c. Massachusetts Endangered, Threatened, or Species of Concern
  - d. New Hampshire Threatened, or Species of Concern
  - e. New York Endangered, Threatened, or Species of Concern
10. Geological studies should be required to identify potential impacts and alterations to:
- a. Underground water flows
  - b. Aquifers
  - c. Fault lines
  - d. Radon containing rock
  - e. Springs
  - f. Wells
11. Geological studies should be required to identify all areas where blasting will be required.
12. Impact of blasting to:
- a. Underground water flows
  - b. Aquifers
  - c. Fault lines
  - d. Ground water flow
  - e. Radon release into underground water supplies – public and private
  - f. Radon release into structures – public and private
  - g. Radon release into air
  - h. Soil loss
  - i. Soil pollution
  - j. Springs
  - k. Wells
13. Air quality impacts:
- a. Identification of ALL chemicals in the transported gas itself, along with MSDS and health impact information for each chemical
  - b. Identification of ALL chemicals used in the transportation and compression of the gas, along with MSDS and health impact information for each chemical
  - c. Identification of ALL chemicals used in the maintenance of the pipeline, compressors, and other related equipment, along with MSDS and health impact information for each chemical
