The Massachusetts Division of Fisheries and Wildlife (MDFW) and the Natural Heritage and Endangered Species Program has prepared a Biomap2 for Northfield that shows Core Habitat (...”areas necessary to promote the long-term persistence of rare species, other Species of Conservation Concern, exemplary natural communities and intact ecosystems”) over much of the pipeline project area.

MDFW has also identified large areas along the route of the proposed pipeline as a Critical Natural Landscape (...”intact landscapes in Massachusetts that are better able to support ecological processes and disturbance regimes, and a wide array of species and habitats over long time frame.”). As the current route of the proposed pipeline passes through large areas of these two (2) resource areas the Town believes that an alternative route should be considered.

The Biomap2 is appended to this report.

**The Requirement:**

That there be a plan in place to protect these important natural resources.

**B. Invasive Plants**

**The concern:**

Clear-cutting for construction of the proposed pipeline will create an environment favorable to the growth of invasive plant species, as disruption of intact plant ecosystems creates opens favorable for their establishment. Construction vehicle traffic along the route of the proposed pipeline also creates a vehicle for introduction of invasive plants.

**The Requirement:**

That measures should be taken post-construction to prevent establishment of invasive plants.

That a long term plan be in place to monitor and control invasive plants.

**C. Mature Mixed Forests**

**The concern:**

Clear-cutting for construction of the proposed pipeline will result in the loss of many mature deciduous and coniferous trees.

**The Requirement:**

That measures will be taken to guarantee the protection of forest resources.

**D. Wildlife**

**The concern:**

A new or expanded clear-cut Right of Way (ROW) will isolate some wildlife and limit movement of other wildlife by fragmentation of intact forest resource areas.

**The Requirement:**

That a baseline study of all wildlife that lives in the area of the proposed pipeline be conducted to identify those species that will be negatively impacted by forest fragmentation.

That detailed plans are in place to mitigate the potential damage to intact forest resources.

**E. Sound and Wildlife**

**The concern:**

The expected burden of noise from the proposed compressor station will have a negative impact on wildlife.

**The Requirement:**

That measures be taken to minimize any noise from the proposed compressor station to the point that it will have no impact on wildlife outside a to-be-determined radius of the proposed compressor station.

**5.0 CULTURAL RESOURCES**

**A. Native American History**

**The concern:**

Northfield is rich in Native American history. The proposed pipeline route crosses numerous culturally significant Native American sites, and sites related to early American settlements in Northfield.

**The Requirement:**

That Kinder Morgan take steps to preserve the history and sanctity of these culturally significant lands.

That an archeological study be conducted along the entire route of the proposed pipeline, and that appropriate protection be given to all archeological sites and sites of Native American significance.

## **B. Swan and Sikes Homesteads**

The concern:

The route of the proposed pipeline passes through the Northfield Brush Mountain Conservation Area. The Swan Homestead and the Sikes homestead, historically significant sites, are located on this property.

The Requirement:

That these important historical sites be protected and public access to the site be maintained.

## **C. Northfield and Massachusetts Historical Commissions' Reviews**

**The concern:**

The Town is concerned that historical sites will be damaged by the construction of the proposed pipeline in Northfield.

**The Requirement:**

That both the Northfield and the Massachusetts Historical Commissions must be consulted, as there are numerous historical sites along the proposed pipeline route. Adequate protection for these historical sites must be provided.

That there be a full survey of the route of the proposed pipeline in Northfield to identify and protect all historic sites, and that the development of and response to the survey be coordinated with the Northfield Historical Commission.

## **6.0 LAND USE, RECREATION AND WILDLIFE**

### **A. The New England National Scenic Trail**

**The concern:**

The site of the proposed compressor station property will abut the New England National Scenic Trail, a two hundred (200) mile long trail that extends from Long Island Sound to the northern border of Massachusetts. The trail was designated a national scenic trail by the U.S. Congress in 2009. The trail is used by ten thousand (10,000) people per year. The construction disturbances and noise pollution from the proposed compressor station will significantly impact the environment and experience this trail is meant to foster.

**The Requirement:**

That there be no impact to the trail, trail users and the associated commerce that they bring to the town.

### **B. Conservation Priorities**

**The concern:**

In 2008, Northfield contracted with the Trust for Public Lands (TPL) to develop priorities for the protection of the historic and rural character of Northfield. The TPL study identified the eastern hillsides of Northfield, where the route of the proposed pipeline is planned, as the highest priorities to protect.

**The Requirement:**

That the proposed pipeline project must protect the character of these priority lands.

### **C. Protected and Conserved Lands**

The concern:

The route of the proposed pipeline is projected to pass through the Northfield Brush Mountain Conservation Area, the Northfield State Forest and other properties preserved and conserved by the Town of Northfield and protected under Article 97 of the Massachusetts Constitution. The taking of this land would be a direct violation of the rights of the Commonwealth of Massachusetts.

**The Requirement:**

That the Massachusetts Legislature shall determine if it is acceptable to take these properties for the

pipeline.

**The Requirement:**

That the proposed pipeline be rerouted to avoid crossing any land protected under Massachusetts General Law by a conservation restriction or an agricultural preservation restriction.

**D. Hunting**

**The concern:**

For generations, people have hunted in the forested land all along the route of the proposed pipeline. Hunting is an essential part of rural New England life. To lose access to this recreational resource would be a great loss to Northfield.

**The Requirement:**

That all land that is not already designated restricted access due to safety reasons will be available for passive and active recreation, including hunting where it is permitted by local and state ordinance.

**E. General recreational activities**

**The concern:**

Northfield has spent several years working on a plan to promote Northfield as an outdoor recreation area. This includes but is not limited to:

- The federally-designated New England National Scenic Trail (National Park Service);
- The Richardson-Zlogar Hikers' Cabin (Appalachian Mountain Club);
- Brush Mountain and Town Forest (Mount Grace Land Trust);
- Trail guides and brochures, regularly scheduled hikes (Open Space Committee and Northfield Trails Association); and
- Cycling and running events (NATABA, Northfield Environmental and Recreational Center).

These recreation areas are all in the proposed route of the pipeline. Access to these areas are subject to restricted access due to the proposed pipeline. Millions of dollars in partnerships with state and federal agencies and non-profits have been invested in the planning and development of these recreational resources. The Town has endorsed these plans, and spent countless hours developing and refining them. The proposed pipeline will jeopardize these plans and waste the resources invested in their development.

**The Requirement:**

That accommodations will be made to allow these activities to continue unhindered by the proposed pipeline.

**7.0 SOCIOECONOMICS**

**A. Destruction of Home Values**

**The concern:**

Proximity of residences to the proposed pipeline and proposed compressor station is expected to have a significant negative impact the appraised value of these homes even if there are no takings.

**The Requirement:**

That Kinder Morgan makes adequate provisions to fully compensate these property owners for their loss in value. This includes impacts not only to those whose land will be taken, but also to abutters and any other property regardless of distance from the pipeline that may be negatively impacted by the construction of the proposed pipeline and/or compressor station.

**B. Difficulties in Refinancing or Obtaining Mortgages**

**The concern:**

Those property owners in proximity to the route of the proposed pipeline and compressor station antici-

pate experiencing difficulties in obtaining or refinancing mortgages. One Northfield property owner has indicated she has not been able to refinance her house, even at this early stage, because of proximity to the route of the proposed pipeline and compressor.

**The Requirement:**

That measures be put in place to protect the investments of Northfield residents in their property and homes.

That Kinder Morgan ensures that mortgages and refinancing can be accomplished without regard to the proposed pipeline.

**C. Difficulties in Obtaining Homeowner’s Insurance**

**The concern:**

Property owners may experience difficulties obtaining full and adequate coverage from homeowner’s insurance policies because of unknown hazards posed by the proposed pipeline. One resident has indicated she has already faced this situation.

**The Requirement:**

That Kinder Morgan establish that a mechanism be established to ensure that residents can get insurance at a rate similar to their rate prior to the announcement of the coming of the proposed pipeline and/or compressor station.

**D. Damages to Town Infrastructure**

**The concern:**

The infrastructure of Northfield’s roadways is not designed for extensive heavy truck traffic. Two of the roads that the proposed pipeline parallels or crosses are unpaved gravel roads (Four Mile Brook Road and Old Wendell Road). Gulf Road is not designed to carry either the volume or the weight of heavy vehicles. Extensive truck traffic that will be hauling pipe and equipment during construction is expected to cause significant damage Northfield’s roads. This will create a significant burden to the Town’s budget.

**The Requirement:**

That a \$5 million bond be posted by Kinder Morgan or its contractor to provide for all services related to the restoration of any infrastructure damaged by the proposed pipeline and compressor station construction projects.

**E. Reduction in Equalized Valuation of Northfield Tax Base**

**The concern:**

Northfield expects the equalized valuation of all property in town to decrease because of a general reduction in property values due to the installation of the proposed pipeline.

Kinder Morgan has indicated the project will result in annual tax payments to the Town of Northfield to exceed \$3 million. However, to date Kinder Morgan has not explained how the figure was developed despite repeated inquiries. Because no other town that currently hosts a pipeline has received similar tax receipts, we question the accuracy of this estimate.

**The Requirement:**

That the overall equalized valuation of the town be evaluated and the tax rates of its citizens protected.

That a minimum tax rate and Payment In Lieu Of Taxes (PILOT) be set at a rate of \$3 million as Kinder Morgan has stated that this would be their expectation of the taxes paid to Northfield from this project.

**8.0 AIR QUALITY, NOISE AND VIBRATION**

**A. Noise Impacts**

**The concern:**

Northfield residents have been informed that the proposed high capacity compressor station will gener-

ate significant noise pollution throughout much of the town, including Main Street. This will ruin the quality of life in our town.

**The Requirement:**

That noise levels meet the Massachusetts Noise Control Regulation 310 CMR 7.10 standards.

**The Requirement:**

That the proposed compressor station not result in any increase in current ambient noise levels as they exist at the compressor station property line. This is also particularly important to the New England National Scenic Trail as it abuts the proposed compressor station property.

**The Requirement:**

That full consideration be given to use of lowest noise compressor engines, specifically electric motors and/or other lower noise producing motors or engines.

**The concern:**

We also question the impact of noise and vibration on wildlife in the vicinity of the proposed compressor station.

**The Requirement:**

That a study be done to establish the impact of noise and vibration to wildlife to protect species that currently are found in the habitat in the vicinity of the proposed compressor station.

That operations will not increase the volume of noise, emissions or vibration. Regular third-party monitoring is a requirement.

**The concern:**

We believe that average noise level is an insufficient measure of noise. Kinder Morgan shall control maximum noise level, and frequency of noise events, that raise the decibel level above a base level permissible volume.

**The Requirement:**

That controls be put in place to assure that these noise events are both infrequent and do not rise above a predetermined maximum appropriate level.

**B. General Air Quality Impacts**

**The concern:**

Northfield has been informed that ongoing operation of the proposed compressor station may require occasional venting, or blow-downs, of natural gas. The chemical composition of the vented gas is in dispute.

**The requirement:**

That Northfield receive clarification on the frequency and volume of this venting and the anticipated chemical composition of the vented gas.

That the Town receive Material Safety Data Sheets (MSDS) for all chemicals that will be transported within the pipeline and for all chemicals used at the proposed compressor station.

**The requirement:**

That measures are put in place to prevent degradation of local air quality are included as part of the project.

**The requirement:**

That any gas blow-downs to be contained and then added back into the flow at a future time.

**The requirement:**

That blow-downs do not in any way affect the air quality in Northfield.

**The requirement:**

That an ongoing monitoring plan be implemented for any potentially hazardous elements that might be released.

That this monitoring be continual throughout the life of the pipeline.

**C. Health Effect of Compressor Stations**

**The concern:**

Northfield has researched and acquired a great deal of information concerning the harmful health impacts to residents near existing compressor stations.

**The requirement:**

That a determination be made by a third party for all potential, possible health impacts, and that distances from the compressor proposed station where these impacts may occur.

**The requirement:**

That a plan is in place for ongoing monitoring of potential health issues along with a guarantee that there will be monitoring of potential negative health outcomes. Should negative health outcomes appear, the flow of gas will be stopped until such time as it is established that the negative outcomes are not related to the proposed pipeline, compressor station or the gases contained within, or that approved changes in the gas delivery system are made to prevent the proposed pipeline project from causing negative health outcomes. We need assurances that the protection of human life will trump the flow of gas.

**D. Construction Noise and Air Quality**

**The concern:**

Heavy equipment and truck traffic will impact air quality and noise pollution during construction of the proposed pipeline and compressor station.

**The requirement:**

That a mitigation plan is in place and implemented to limit any air quality impact or noise pollution.

**E. Light Pollution**

The concern:

It is anticipated that there will be numerous lights for security around the proposed compressor station which will contribute to light pollution along the ridgeline where it is to be located.

**The requirement:**

That a light pollution plan be developed and implemented, and any light pollution mitigated.

**9.0 CUMULATIVE IMPACT**

**A. Assurance of Proper Construction**

**The concern:**

The best assurance of the long-term safety of the proposed gas pipeline is proper construction.

**The requirement:**

That an independent third party perform a design review, construction monitoring and certification of construction at Kinder Morgan's expense.

**The concern:**

To date, Kinder Morgan has pursued a minimalist approach to public education of the project. Northfield has no reason not to expect that approach to continue through design and construction.

**The requirement:**

That Kinder Morgan be required to provide ongoing public education and response to all inquiries made

by public officials and private citizens, with a maximum response time of two business days to all inquiries.

## **B. Traffic Impacts**

### **The concern:**

The proposed pipeline will cross underneath several roads. The shallow depth of cover could result in traffic vibrations being transmitted to the pipe, possibly resulting in damage to pipe integrity.

### **The requirement:**

That the pipe be sleeved at all road crossings to mitigate this potential damage.

## **C. Ongoing Erosion Control**

### **The concern:**

Because of steep slopes in the project area, ongoing erosion control is a concern.

### **The requirement:**

That ongoing monitoring and erosion control measures are developed and implemented as issues are identified.

## **D. Vegetation Management**

### **The concern:**

As with any utility Right of Way (ROW), vegetation control is important.

### **The requirement:**

That non-chemical vegetation control be utilized where possible, and that necessary wetlands permits be obtained for implementing vegetation control.

## **E. Invasive Vegetation Control**

### **The concern:**

Invasive plants are a significant problem in cleared and/or disrupted areas in Northfield.

### **The requirement:**

That ongoing efforts to control invasive species be implemented to mitigate this problem and that a plan, acceptable to Northfield, be put in place.

## **F. Long Term Water Quality Monitoring and Reporting**

### **The concern:**

Long-term water quality can be compromised over time due to deterioration of the proposed pipeline or compressor station.

### **The requirement:**

That Kinder Morgan establish a long-term water quality monitoring and reporting program, and that Kinder Morgan be required to protect public and private water supplies from delayed impacts from construction or impacts from pipe leaks that result in reductions in water quality.

## **G. Long Term Air Quality Monitoring and Reporting**

### **The concern:**

Long-term air quality can be an issue as pipeline deterioration and compressor station emissions increase over time.

### **The requirement:**

That a monitoring and reporting plan should be implemented by Kinder Morgan to prevent health effects from gas venting or leakage. That monitoring must include average and peak measurements and standards. Provisions for immediate correction of any issues must be a part of the plan.

## **H. Cathodic Protection**

### **The concern:**

Corrosion of metal pipelines by electromagnetic fields has been well documented. Since the proposed pipeline is to be located adjacent to the electric transmission ROW, this is a significant threat.

### **The requirement:**

That Kinder Morgan ensure that the highest degree of cathodic protection is provided.

That the cathodic protection measures be checked frequently to ensure they operating at peak performance levels.

## **10.0 PUBLIC SAFETY**

### **A. Fire Protection and training**

#### **The concern:**

As a small town, Northfield does not have the equipment necessary to fight a fire resulting from pipeline failure.

#### **The requirement:**

That the equipment needed to fight such a fire as well as facilities to house that equipment shall be provided at Kinder Morgan's expense.

#### **The concern:**

The Northfield Fire Department is staffed by volunteers who will require extensive training to address the particular dangers posed by the proposed pipeline and compressor station. The Town's emergency responders' budget is limited by of the size of our tax base. It is impossible for the town to support the necessary purchases of equipment and provide the specialized training needed to prepare for a catastrophic event.

#### **The requirement:**

That Kinder Morgan provides funding for the necessary equipment and training to allow us to develop and maintain an adequate disaster response capability.

#### **The concern:**

Often, ROWs as defined before construction do not reflect the actual location of the pipeline (the actual ROW). This makes it dangerous for anyone digging nearby.

#### **The requirement:**

That actual ROWs are delineated on the ground post-construction.

### **B. Police Monitoring**

#### **The concern:**

Northfield has a three-officer police department that does not provide twenty-four hour coverage. We currently do not have the manpower to regularly patrol the pipeline.

#### **The requirement:**

That Kinder Morgan implement mitigating measures to adequately protect against terrorism or vandalism should be implemented.

#### **The concern:**

The proposed compressor station could be an open terrorist target. Kinder Morgan has provided mixed messages as to whether it will be manned or unmanned. This presents a safety problem as Northfield does not have the police staffing to adequately protect either the proposed compressor station or the proposed pipeline.

#### **The requirement:**

That there be a plan in place to ensure that the inhabitants of Northfield are protected from potential terrorist threats to the proposed pipeline and compressor station. Kinder Morgan must either install a security response team and equipment in Northfield, or provide funds to the Northfield Police Department to do so.

### **C. Regional Emergency Measures**

**The concern:**

A pipeline accident response will strain Northfield's emergency responder staff resources.

**The requirement:**

That a regional response plan with input from local responders and emergency planners should be prepared before construction begins.

That an ongoing review plan is developed.

That ongoing training is provided for the police department in Northfield as well as neighboring towns as they provide backup for our police in the event of a large scale incident.

That this be at Kinder Morgan's expense.

### **D. Evacuation Plans**

**The concern:**

In the event of a pipeline accident, evacuation plans should be in effect for nearby residents. This would be especially essential for Four Mile Brook Road, which the pipeline crosses twice and could isolate or trap residents between the two crossings.

**The requirement:**

That measures be put in place for residents that could be blocked in should an event happen on the section of the pipeline that is between their house and the rest of the Northfield.

**The concern:**

That public notification is difficult in an area with limited cell phone and high speed internet access.

**The requirement:**

That the evacuation plan includes methods for redundant communication.

### **E. Road Conditions**

**The concern:**

As stated earlier, the heavy truck traffic expected during construction will result in significant damage to town roads. Damage to town roads is a safety threat.

**The requirement:**

That a \$5 million bond be in place to protect our town roadways over the 8.7 mile length of the pipeline.

That the town will not have to bear the costs of repair of roads.

**The requirement:**

That a plan that will prevent damage from the roads wherever possible be in place prior to any construction work begins.

### **F. Best Protection Against Pipeline Accidents**

**The concern:**

The best protection against future pipeline accidents is proper design and construction.

**The requirement:**

That an independent third party review of all plans, design specifications, monitoring and certification of construction (as-built) be conducted for all phases of the proposed pipeline and compressor station

construction. To allow Kinder Morgan to self-monitor and certify construction constitutes a clear conflict of interest.

## **TOWN OF WARWICK, MASS. FERC TESTIMONY**

JULY 29, 2015 SCOPING SESSION - PF 14-22

Ted Cady, Chairman, Warwick Planning Board

My name is Ted Cady, I am the chair of the Town of Warwick Planning Board. The proposed pipeline will cross our town.

FERC COMMENDATION - FERC staff have done a good job of reviewing the mountains of information in a timely way are commended for this.

APPLICANT NOT ABLE TO DELIVER- EXTEND SCOPING PERIOD- Kinder Morgan has received approval from less than 50% of the landowners to cross their property. This makes surveying difficult, archaeological surveying impossible, wetland vegetation analysis and wetland delineation very difficult, and identification of rare and endangered species impossible. It is hard to evaluate their resource reports when much of the information is to be determined. The burden on them is to produce the information in a timely way. In this they have failed. Waiting until the last minute to submit data should not be used by an applicant as a way shortcut the process, speed up the process, or avoid review. Within 3 days of the Scoping Session in Greenfield Kinder Morgan has produced thousands of pages. It is unreasonable to expect a review before the Scoping Session by local concerned citizens. It would be very difficult for those concerned to seek and obtain professional review of particular sections within the current time frame for comment. Again, fairness requires an extension of time.

NORTHFIELD COMPRESSOR STATION NOISE ABATEMENT - Previously we requested the FERC require the compressor station in Northfield, MA to meet the Massachusetts noise abatement general law, which is based on ambient noise level. We still recommend this and suggest requiring the ambient noise level be determined in a timely way so that adequate design time is allowed to incorporate needed sound reduction into the plans for the compressor station.

**NORTHFIELD COMPRESSOR STATION LIGHTING** - Previously we requested that the “Dark Skies” that the area is noted for, and taken advantage of by groups and individuals for viewing celestial events, be honored by careful design of the lighting at the Compressor Station. Minimizing escaping light needs to be designed into the compressor station early on to minimize the burden on designers and contractors.

**ORGANIC CERTIFICATION**- What is the impact of the pipeline passing through organic farms fields?

**AGRICULTURAL FIELDS IMPACT** - When I dig in my fields the fertility of that area is reduced for some years afterward. Kinder Morgan has publicly stated they will restore fields. How do they propose to prevent a drop in field productivity? Based on my own fields, I suspect the problem comes in part from soil compaction, and in part from the most productive topsoil being mixed with less productive topsoil and subsoil. In our region the soils vary from rich bottom land soils in the Connecticut Valley to thinner, more sensitive soils at higher elevations. The impact of pipeline on the productivity of soils, by type of soil, needs to be addressed for the soil types on the farms the pipeline will cross and measures to lessen the impact of short term fertility loss stated.

**FREEZE THAW CYCLES IMPACT ON PIPE**- Freeze thaw cycles in our area have been known to heave pipe and cause it to leak. How will this be handled?

**INVERSION IMPACT** -Inversions (where cold air is trapped in the Conn. Valley or in hill town valleys are very common in our area in winter. What will be the impact of pumping station blow downs and other releases of natural gas from metering stations when there are inversions? Would such releases be dangerous or harmful during times of an inversion? If such emissions have a reasonable probability of being dangerous, how can the danger be minimized?

**ELECTRICAL GENERATION CO2 IMPACT** - Kinder Morgan representatives have stated that the pipeline will result in lower CO2 emissions than currently exist in Mass. That needs to be documented, because currently electrical supply in MA has quite a low profile.

**GLOBAL WARMING IMPACT** - Kinder Morgan is claiming that natural gas is “cleaner” regarding global warming emissions than other fuels. This claim is an important part of selling the project. Since Kinder Morgan has made the claim they should be willing to support it (and FERC should require it) by giving a complete analysis from drilling the well to final emission when it is burned, including natural gas blow downs at pump stations, metering stations and so on.

## **20150821-4049**

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission 888 First Street NE, Room 1A Washington, DC 20216

Re: Docket No. PF14-22, TGP Northeast Energy Direct - Precedent Agreements Dear Secretary Bose:

First, I'd like to reiterate too that I feel these scoping hearings are being conducted prematurely, especially in light of Kinder Morgan (KM) having only just released their second 6500 page resource report that still has over 10,000 To Be Determined (TBO) in it. My experience to date, as a directly impacted landowner on the proposed path, is that I have been continually either not, under or misinformed of projects' details, making it very hard to comment effectively this evening on the scope of the Environmental Impact Study (EIS). Please know that I have attended 5 of KM's open houses, 2 of their presentations and, I've read the first resource report and still don't have answers to questions that concern me.

In terms of the scope of this EIS, I'd like you to please conduct an objective study, meaning one not funded by the gas industry, using established reproducible scientific methods to determine the cumulative methane emissions that the entire US gas industry will produce over the next ten years and determine the impact of these emissions on global warming. To evaluate this properly, you'd have to first determine the amount of natural gas available for extraction in the shale regions and then how much of it is anticipated to be drilled over this ten year period. Clearly, one can assume that the extracted gas's inevitable destination will be in our atmosphere regardless of whether those emissions occur in Europe.

The reason I am requesting this research is because Scientist have determined that methane is 84 times more potent a greenhouse gas than carbon dioxide over a 20 year span (1). And according to the Union of Concerned Scientist who published the Climate Deception Dossiers, there has been “a coordinated campaign underwritten by the world’s major fossil fuel companies and their allies to spread climate misinformation and block climate action” (1). I’m also requesting that this study get peer reviewed and then published so we can see the data. And, until it’s available to us, I suggest a moratorium on all new FERC gas infrastructure permits.

While the moratorium is in effect, the gas industry should be required to do repairs to existing infrastructure so there no more gas is lost in transmission. According to the Environmental Defense Fund enough natural gas is lost each year to fuel 6 million homes. This is the equivalent annual emissions of 117 million cars or roughly half the cars in the United States (2).

It’s time for YOU to reveal the truth on this subject before we are all FERC’ing fracked. Thank you for this consideration.

2) Anna Geismar. July 2015. Methane Research: The 16 Study Series an unprecedented look at methane from the natural gas system fact sheet. Pages 1-4. [http://www.edf.org/sites/default/files/methane\\_studies\\_fact\\_sheet.pdf](http://www.edf.org/sites/default/files/methane_studies_fact_sheet.pdf)

## 20150821-4050

FERC Docket No.: PF14-22-000  
Project Name: Northeast Energy Direct Project Tennessee Gas Pipeline, LLC  
Company Name:

Statement of Richard G. Young

Good evening.

My name is Richard Young.

I come to this meeting as a private citizen, representing no one but myself.

My home address is 8902 Glenbrook Road, Fairfax Virginia.

I own a summer cottage in Northfield, Massachusetts.

I am a retired patent and trademark attorney. I have an engineering degree from Rensselaer and a law degree from Georgetown University.

My comments today focus on the campus of Northfield Mount Hermon School (“NMHtl) in the town of Gill.

The school was founded in Northfield in 1879. Today, it is a well-known coed boarding school) serving 650 students in grades 9 through 12.

NMH takes pride in its beautiful setting and its idyllic view of the river valley.

I am concerned that the compressor station proposed in Northfield will mar the view from the campus. This will be true during the daylight hours, but the intrusion will be even greater at night when, for security purposes, the compressor station will be highly illuminated as is customary in the industry.

Figure 1 is a photograph of the view from the school chapel. To demonstrate a worst case possibility, I have added to the photograph (1) an inset photograph of an 80,000 hp compressor station at a natural gas processing facility in Haven, Kansas, and (2) a red rectangle showing the location and approximate height of the Kansas compressor station, if it were to be built in Northfield.

Figure 2 is similar to Figure 1 except that it shows a smaller compressor station in Gallion, Alabama.

Figures 3 and 4 show that the compressor station site is directly on a line-of-sight from the chapel. They present satellite, topographic, and profile imagery from GoogleEarth and Topo USA.

If construction of the compressor station were to be approved, I urge that the following mitigation measures be utilized:

1. grading the site to lower the elevation of the compressor station,
2. constructing walls or providing other screening means,
3. orienting the buildings on the site to reduce the total surface area of the building walls that will face and be visible from the campus, and
4. minimizing nighttime illumination.

Respectfully submitted,

Richard G. Young

8902 Glenbrook Rd., Fairfax, VA 22031 (preferred postal address) 29 Cliff Rd., Northfield, MA 01360 (Rustic Ridge)

**20150821-4051**

### **Mount Grace Land Conservation Trust**

Protecting land and encouraging land stewardship in North Central Massachusetts

July 29, 2015

Federal Energy Regulatory Commission Public Hearing  
Greenfield, Massachusetts

FERC Docket #: PF-14-22-000

Testimony

Commissioners and Staff,

Thank you for the opportunity to comment.

My name is Leigh Youngblood. I am a Berkshire Gas customer and the executive director of Mount Grace Land Conservation Trust. Mount Grace owns land, and has facilitated numerous projects, directly affected by the N.E.D. pipeline.

I am here to address the high cost of impacts to public land, private conservation land, and property rights; and to ask whether the relative value of having this pipeline is so great that we should sacrifice the interconnected mosaic of conservation land strategically amassed through more than 100 years of effort, or whether the public benefits of the conservation land, left intact, are of greater value to Massachusetts and New England.

Massachusetts is comprised of just 5 million acres; our 6.5 million residents live on 1 million of those acres. About 1 million acres are protected. According to at least three independent analyses I , Massachusetts should dedicate one half of the remainder to wildlife habitat, forestry, and farms. In other words, we should not be sanctioning projects that undo past commitments when so much remains to be done to protect the cultural, ecologic, and economic integrity of our state.

As currently proposed, this single scheme would affect:

15 conserved farms, 5 State Forests, 5 State Wildlife Areas, 5 sections of National Scenic Trails, 9 conserved drinking supplies, 11 land trust lands, 18 municipal conservation areas, 5 sporting clubs, and the Silvio O. Conte National Fish & Wildlife Refuge.

**More than 110 conservation and recreation parcels would be impacted; 85 of these have Article 97 protection under the Massachusetts Constitution.**

These lands are public resources, established by voluntary contracts with landowners in many cases using dedicated federal, state, municipal, and charitable conservation funds. In one single project at least fifty charitable donations were made for the purpose of conserving the specific tract of land. The public trust and charitable public trusts so established extend both the harms from the pipeline and the legal duty to defend to those donors.

FERC Policy Statement (PL) 99-3-000 is clear when it states, “The strength of the benefit showing will need to be proportional to the applicant’s proposed exercise of eminent domain procedures.” And, “Vague assertions of public benefit will not be sufficient.”

A large percentage of the N.E.D. route in Massachusetts is proposed to cross public conservation land. Completing negotiations will require super-majority approval of both houses of our legislature pursuant to Article 97. This is unique to this state. Such approval is unlikely considering the overwhelming public opposition to this project in the numerous legislative districts it crosses.

It follows that a proportionately extraordinary showing of benefit would be required by FERC before granting Kinder Morgan federal eminent domain authority to be exercised against the Commonwealth of Massachusetts and its municipalities.

This pipeline proposal does not pass the cost: benefit showings test. I urge FERC to require, and carefully weigh, a full and complete accounting of the adverse impacts to public and private property rights.

FERC Scoping Meeting re: PF14-22-000

July, 28, 2015, Taconic High School, Pittsfield, MA

Comments of Jean Atwater-Williams, 182 Cold Spring Road, Sandisfield, MA

Illegal segmentation of NED and CT Expansion projects by Kinder Morgan’s Tennessee GasV~to.;

In the Delaware Riverkeeper Network v. FERC ruling in June 2014, the D.C. Circuit explained that an agency impermissibly segments NEPA review when “it divides connected, cumulative or similar federal actions into separate projects and thereby fails to address the true scope and impact of the activities that should be under consideration.” Delaware Riverkeeper Network v. FERC, 753 F.3d 1304 (D.C. Cir. 2014).

The court further explained that “Connected actions” include actions that are “interdependent parts of a larger action and depend on the larger action for their justification.” Id. § 150S.25(a)(1){iii}. To determine whether actions are interdependent, the court looked to the physical, functional and temporal connection between the segments.

Although Tennessee Gas insists that the CT Expansion and the NED projects are not physically connected, the evidence demonstrates otherwise. Tennessee Gas’ overbuild of the Connecticut Expansion project may well be in anticipation of the NED as both projects will serve several of the same customers. In addition, it appears that Tennessee Gas prematurely filed its application for the CT Expansion (docket CP-14-S29-000) - without the customary pre-filing - so that it can deny a temporal overlap between the projects.

Fast forward to the Northeast Energy Direct Project. The FERC has made it clear that they will conduct a thorough alternatives analysis of three potential routes identified by Kinder Morgan:

- 1) the now “preferred” route affecting Hancock, Lanesborough, Cheshire, Dalton, Hinsdale, Peru and Windsor;

2) further enlargement of the existing “200” line which would affect Richmond, Stockbridge, Lee, Tyngham, Monterey, Otis and Sandisfield; and

3) a Mass Turnpike alternative which would affect Richmond, Stockbridge, Lee, Becket and Otis.

Option 2 is the exact same corridor, impacted by the proposed CT Expansion. This is clear evidence that these two projects are indeed related and are being improperly segregated. It is therefore FERC’s duty under federal law to immediately deny

Docket No. PF14-22-000 July 28, 2015

189 North Street, Windsor, MA 01270, 413-684-3950. [slu\(ii\)AlpineSolar@leal.com](mailto:slu(ii)AlpineSolar@leal.com)

My name is Stuart Besnoff, [ I live at a zero net energy home in Windsor, Massachusetts where I operate a solar business and buy organic food from farms also in this town. The likely contamination of our food supply is one of the reasons the voters of Windsor passed a resolution against this type of project. The environmental impact statement (EIS) should study the impact on conventional and organic farms as well as family gardens in all towns with a proposed compressor station and along the entire route of the proposed pipeline.

Exhaust from a compressor station is a major concern in a town which now has very good air quality. The EIS should identify a soil, air, and water testing program to be conducted before any construction begins, to establish a quality baseline. The water testing should include public and private wells, plus surface and subsurface water.

Alternatives to providing the energy to operate the compressor stations should be considered in the EIS. Burning gas containing fracking contaminants is not good for the environment. The alternative of using renewable energy to operate all of the compressors should be studied. It is expected that a zero net energy facility using solar energy to operate all of the compressors will have the least impact on the environment.

Employment is important for my western Massachusetts neighbors skilled in various trades. Since there is now a shortage of people to install and maintain solar hot water equipment, I will be glad to help anyone here get started in a career which will help, not harm our planet. You can see me after this meeting, or look up Alpine Solar, in Windsor.

Resource reports provided by the developer have been incomplete or late.

These scoping meetings should be repeated when more project information is available, allowing at least 90 days to examine the completed report. Also, a scoping meeting should be conducted in each town designated for a proposed compressor station.

With the objective to avoid or lessen environmental impacts, it is clear that the alternatives which should be studied most extensively are conservation, efficiency, and renewable energy; instead of damaging the environment with new fossil fuel infrastructure.

#### **20150821-4056**

FERC Comment form:

July 25, 2014 - A report released as part of the U.S. EPA’s Office of Inspector General’s “products associated with climate change,” determined that “EPA has placed little focus and attention on reducing methane

emissions from pipelines in the natural gas distribution sector.” The report notes that in 2012, the EPA said methane leaks from pipelines “accounted for more than 13 million metric tons of carbon dioxide equivalent emissions,” are almost 100 percent methane, and are more than 10 percent of total methane emissions from natural gas systems. The report also noted that the EPA has not done a comprehensive analysis of the emissions factors it uses since a 1996 study that has a “high level of uncertainty,” and the agency does not have the partnerships in place to begin controlling methane leaks, such as with the Pipeline and Hazardous Materials Safety Administration.

PLEASE DENY THIS PROJECT THAT IMPACTS OUR COMMUNITY AND SIMILAR PROJECTS UNTIL MORE RESEARCH IS DONE .

There are four different points at which fracked gas is vented all the way along the pipeline. It is vented at the metering stations. It is vented at the valve stations. It is vented at the pigging stations and it is vented at the compressor stations. I would like to know how much methane gas and how much of the carcinogenic chemicals are vented at each of the four stations along the pipeline. I would like to know how far apart each of the stations are from each other along the whole route of the pipeline. I would like to know how many metering stations there are along the whole route of the pipeline. I would like to know how many valve stations there are along the whole route of the pipeline. I would like to know how many pigging stations there are along the whole route of the pipeline. I would like to know how many compressor stations there are along the whole route of the pipeline. I would like to know how the combination of the metering stations, the venting stations, the pigging stations and the compressor stations and all of their combined emissions affect the environment in terms of how much methane gas and carcinogenic chemicals will be spewed out into the air as a whole and fall upon all of our soils and go into all of our waterways. How will this affect our environment, our wildlife, our ability to grow healthy food in healthy soil, our ability to obtain clean drinking water, and our ability to breathe clean air? How is it going to affect all of our living conditions and our ability to attract tourism to this area in the Berkshires which is so well known for the beauty of its parks, its lakes, its forests and for its recreational facilities to enjoy nature? How is it going to affect all of the farmers who earn their living from growing and selling fresh Berkshire produce? Can we afford to have our quality of life destroyed and have all of what we have along the whole of the pipeline turned into a fracked gas waste dump where no one will want to live - where no one CAN actually live because the environment will be poisoned for centuries?

**20150821-4058**

To: FERC Northeast Energy Direct Docket #PF14-22

July 18, 2015 Taconic High School, Pittsfield Ma.

Submitted by: Jan Bradley 841 route 9 Windsor, Ma. 01270

Welcome to the Berkshires, the lungs of Massachusetts. My scoping request concerns compressor station emissions. I live in Windsor, and would be 3 miles from a proposed compressor.

David Carpenter is the Director of the Institute for Health and the Environment at the University at Albany. He has said that compressor stations are as equally polluting and harmful to the environment as fracking

wells, themselves.

Last year, the Madison County NY Board of Health conducted a study of compressor station emissions in Pennsylvania and Texas. They consistently measured high levels of benzene, toluene and over 20 more VOCs. These toxic, cancer causing chemicals are in the gas because of fracking. They are released into the air during planned emissions, fugitive emissions blowdowns and accidents. One study reported 2,126 fugitive emission points from a set of compressors. Radioactive elements such as radon 222 are also found in Marcellus gas and released into the air, Radon precipitates out as radioactive polonium and lead.

Anyone living in the vicinity of 3 miles from a compressor is at high risk for nose bleeds, rashes, headaches, dizziness, nausea. And Irregular heart beat. These symptoms have been detected even further away if down wind.

(The mere fact that this is common knowledge and allowed in America is your crime against humanity ... I don't care who pays your salary.)

These studies were done on compressor stations of 12,000-18,800 hp .. I can't even find data regarding a 41,000 hp compressor. it would be one of the largest in the country. We are a very humid climate, 8 inches of rain this last June, an average of over 50 per year. Air pollution comes to the ground with precipitation.

This is for you to scope: an assessment of our air quality before construction and a list of the chemicals and toxins that would be carried to this compressor. This must be made public information based on the Freedom of Information act,. Our observations say any runoff would go right to a nearby river, designated wild and scenic, where trout spawn naturally. Of course, the pollutants would be in the air and in all bodies of water but trout are an indicator species. Like canaries in the coal mine. If they weren't killed immediately; lesions on the body and spawning issues would lead to a rapid decline.

SO, We demand that your scope involve trout assessment. Additionally, we demand the enforcement of new technology and zero emissions from these stations. ZERO. IF Kinder Morgan thinks it can go from 18,000 hp to 41,000 then any safety methods used in earlier technology would no longer be valid or sufficient. NEW technology must be

required. We demand that the compressor station would be fully enclosed and that All gas released, (planned or fugitive) , must be captured and re~entered into the pipeline.

This country, with its institutions, belongs to the people who inhabit it. Whenever they shall grow weary of the existing government, they can exercise their constitutional right of amending it, or their revolutionary right to dismember or overthrow it." 1861 Abraham Lincoln

-----  
Letters to the editor

No pipeline movement without fact-finding

To the editor:

Massachusetts is mandated to meet the Global Warming Solutions Act, enacted Into law on Aug, 7, 2008, Approval of any application, or precedent agreement, requesting an Increase in gas capacity would ensure an increase in fossil fuels, which is In direct opposition to the requirements of the GWSA

The Department of Public Utilities must rule against the approval of any new applications, or precedent agreements, until all existing leaks in Massachusetts have been rectified and proven assurance received by DPU, The Global Warming Solutions Act demands nothing less, and it would be unconscionable on the part of DPU to not protect the public health, the public safety. and the public trust of our commonwealth residents, knowing full well that the GWSA is a response to the global climate crisis our planet is suffering,

Any company submitting new applications, or precedent agreements, for capacity needs to provide DPU with each and every efficiency and weatherization program offered its customers and the effects those programs have created In energy efficiency and the cumulative impact to reduce greenhouse gases.

I have no doubt that these applications and/or precedent agreements for more capacity are specifically geared to assist the proposed Kinder Morgan Tennessee Gas Pipeline project aka the Northeast Energy Direct(NED).

I further believe these applications are another method to obfuscate the real information the general public needs. Where are the justifications and proof that Berkshire Gas needs more capacity and its justification for imposing a moratorium on new and existing customers? Where are the justifications and proof, from its own poor energy record that every possible energy efficiency program has reached peak excellence to benefit its customers?

And where is the public information showing the effect of cleaning up the colossal leaks from Berkshire Gas's existing pipelines that are already present and/or repairing or replacing old and leaking pipes? This information is essential for informed public awareness and decision-making by DPU

It is crucial that Massachusetts residents understand the import of the ongoing claims by KMrrGP that there is a

need for more natural gas in the Northeast. I believe this is a blatant misinformation campaign. We cannot allow any precedents to be established now or in the near future that would inhibit the energy efficiency, pro-renewable energy gains and renewable and sustainable sources to solve this worldwide crisis.

No further applications and/or precedent agreements can be approved unless and until Massachusetts residents are made fully aware of what these applications are leading to and until residents know in a timely and thorough manner the entire scope of what these applications intend to accomplish - which is what I and others believe is the export of natural gas and greed,

DPU must ensure that thorough investigations of all applications are done - In this case that of Berkshire Gas, DPU must do its job and protect the residents of Massachusetts by denying Berkshire Gas any precedent agreement. Time is of the essence, It is now!

**20150821-4060**

My correspondence today concerns the proposed Kinder Morgan pipeline to run through Berkshire County Massachusetts. My home rests in a position similar to many along the route. Our house lies close enough to the pipeline that its mere existence will degrade our property values and in the worst case our lives will end in an inferno. From the end of my driveway where I now see Blue Herons in Cheshire lake I will someday have nothing but a memory that they used to like it best exactly where the hideous pipeline is. Yet, we live far enough away from the pipeline that we will receive no compensation. I urge you to take any and all action under your control to stop construction of this pipeline before any damage to lives and the environment can take place.

let's begin by examining if this project goes well. Expansion of the existing Spectra Energy pipeline will render the Kinder Morgan pipeline as unnecessary. The projected supply of gas serving as the source for the Kinder Morgan pipeline may reach depletion levels in only 10 or 20 years, while permanently scaring our area. No matter what, our personal usage of gas from this pipeline will remain at zero. It's interesting that we live in a spot that will never ever be offered natural gas or cable, yet people are trying to force an unwanted pipeline down our throats.

If the pipeline experiences failures, as it surely will, things go from bad to worse. And let's look at the history of these pipelines, there will absolutely be problems. Where, when and the severity of a breakdown may remain an issue, but the chances of a perfect record given past experiences stand near nil. Proponents of the pipeline tell me it's unlikely I'll be incinerated as the most recent technology will open valves and release gas to avoid a major explosion. Even using the shortest distances envisioned between safety points and the smaller: diameter being discussed; that still means a release into our air of over a million cubic feet of gas every time the system senses a problem. I will be happy if I can avoid incineration, but I certainly do not want a million cubic feet of chemically infused fracked gas released into the air I breathe on a regular basis.

Now let's explore a real disaster. The clean up faced by British Petroleum in the Gulf of Mexico may cost over \$50 billion. Based on a quick look at the Kinder Morgan Balance sheet, such an event would bankrupt them, and I have seen no evidence of any insurance or that insurance could cover a claim of this magnitude. One thing that stands out clearly when reviewing disaster history involves a very long list of Kinder Morgan pipeline failures, deaths, and criminal convictions.

In fact, Kinder Morgan stands convicted of criminally negligent homicide on multiple occasions. This proposed pipeline rates as analogous to the government issuing a machine gun to a serial killer and forcing us to accept them as a permanent guest in our home at our own expense.

As I stand facing an early death at the insistence of my government, let's consider that even the military draft lies as a thing of the past. Yet in this case, not only do they propose to put my life at risk, but do so for a cause that our community and our neighbors voted almost unanimously against.

The Fifth Amendment of the U.S. Constitution guarantees me the right to life liberty and property, yet the government proposes to certainly take my property and potentially take my life. Further constitutional language states property cannot be taken for public use without just compensation, yet that looks like exactly what they plan to do.

I find this pipeline unnecessary, repugnant, unconscionable and unconstitutional. I sincerely hope that you will do everything in your power to end this project before it destroys our property, way of life, natural resources and human lives.

Mory Brenner  
Lanesborough, MA

**20150821-4061**

We do not think that the Kinder-Morgan Pipeline will boost the economy!

Why do a pipeline?

Berkshire County seeks innovation to boost its economy. Berkshire Community College, MCLA, local high schools and business seeks to develop innovative approaches to science, technology, engineering, the arts and mathematics (STEAM).

There are many local ventures that reach out to develop renewable energy resources for solar, wind and water power. Developing renewable energy resources, specifically solar, creates about five or six man days of construction with probably one or two days additional days of supervision for each house. If efforts to develop local renewable energy such as solar would be encouraged for 50,000 individual dwellings then for one billion dollars, more than 500 jobs over a three year period could be produced locally. Then the 50,000 dwellings, each saving \$1,000.00 a year on power, could release fifty million dollars to the local economy for disposable income and innovation.

If we take 50,000 houses using solar power averaging 6000 KW hours per house per year that would equal 300 million kilowatt hours per year which would offset half the output of a plant using natural gas.

Natural gas is one way to get energy. Solar can provide a better price. Why do a pipeline? Energy from solar is local and renewable. The natural gas pipeline requires 20,000 horse power compression stations in Windsor and Stepentown to move the gas around. The electricity produced by roof top solar panels is consumed by that house to minimize this.

Why do a pipeline?

Let's plan to be proactive and squash any problems that Kinder-Morgan proposes. By using innovative technology with solar, wind and water Berkshire County could grow its local economy improve air quality and maintain its beautiful environment. KinderMorgan means leaking pipes, water contamination, problems with noise and pollution that lead to other health problems. Let's model and promote employment with clean, renewable energy to benefit the people of Berkshire County and Massachusetts rather than short term, short sighted Kinder-Morgan pipeline that is aimed off shore for parts unknown.

Let our voices be heard Tuesday, July 28 at 7PM at Taconic H.S.

Typed FERC Comment Form: Katherine Cioffi, 34 Helen Wood Lane, Averill Park, NY 12018

December 5, 2014 - A team of medical and scientific researchers, including from the Institute for Health and Environment at the State University of New York (SUNY) at Albany, reviewed the scientific evidence that both adult and early life - including prenatal- exposure to chemicals from fracking operations can result in adverse reproductive health and developmental effects. These include: endocrine-disrupting chemicals potentially increasing risk for reproductive problems, breast cancer, abnormal growth and developmental delays, and changes in immune function; benzene, toluene and xylene (BTX chemicals) increasing risk for impaired sperm quantity and quality in men and menstrual and fertility problems in women; and heavy metals increasing the risk of miscarriage and/or stillbirths. Potential exposures occur through both air and water. Based on their review, the authors concluded, "Taken together, there is an urgent need for the following: 1) biomonitoring of human, domestic and wild animals for these chemicals; and 2) systematic and comprehensive epidemiological studies to examine the potential for human harm." Lead author Susan Nagel said in an accompanying interview, "We desperately need biomonitoring data from these people. What are people actually exposed to? What are the blood levels of people living in these areas? What are the levels in the workers?"

PLEASE DENY THIS PROJECT UNTIL MORE RESEARCH CAN BE DONE.

## THE FACT THAT SAFETY STANDARDS IN RURAL AREAS IS DISCRIMINATORY

### 20150821-4063

THE FACT THAT SAFETY STANDARDS IN RURAL AREAS IS DISCRIMINATORY

### 20150821-4064

Typed FERC Comment form: Jeffrey Clark, 2561 NY Highway 43, Averill Park, NY 12018

April 16, 2013 - In a presentation on oil field light pollution for a conference on "Sustainable Environment and Energy: Searching for Synergies," Roland Dechesne of the Royal Astronomical Society of Canada described problems of "Light trespass," glare, and poorly-aimed fixtures in oil fields in Alberta. He described resulting "mass waterfowl mortality" linked to artificial illumination and other biochemical impacts of light pollution on wildlife, as well as the possibility of these effects on humans, including circadian disruption, melatonin suppression and possible resulting hormonally-linked diseases. Known to have ecological impacts, outdoor light pollution from drilling and fracking operations may also be linked to artificial light associated health effects documented in humans, including breast cancer.

The light pollution from this compressor station will pose these same risks for our community.

Say NO to this project.

### 20150821-4065

FERC Comment form: Stephen Clemus?,

The proposed lighting and the volume of noise associated with this project is an assault on our quality of life. It will cause migration of wildlife, sleep disturbances in residents, and a complete change to the rural character of our community. The bald eagles that nest in the area of the proposed compressor will be gone. We will no longer be able to view the star lit evening sky we now know,

The toxins released into the air will present problems for those with respiratory and likely other health related illness.

Our property values will be destroyed.

People come to rural areas for peace and quiet.

I AM OPPOSED AND ASK YOU TO DENY THIS PROJECT.

**20150821-4066**

Hand written FERC Comment form: Thomas Dahun, 4 Creekview Lane, Porter Corners, NY 12859, object-ing to different safety standards in rural areas.

**20150821-4067**

Typed FERC Comment form: Carolyn DeJoseph, 3 Hucklebery Drive, Castleton on Hudson, N&Y 12033  
Compressor stations are noisy. "Blow-downs" can last for two hours. The noise is comparable to a commer-cial jet taking oft. Blow-downs are needed if a gas pipeline is taken off-line for maintenance, in the event of emergencies, or to accommodate fluctuating demand. They often occur in the middle of the night.

THIS WILL HAVE AN IMPACT ON OUR CHILDREN, SLEEP, OUR WILD LIFE, OUR PEACE AND QUIET, OUR STRESS.

DENY THIS PROJECT.

**20150821-4068**

Typed FERC Comment form: Zachary DeJoseph, 3 Hucklebery Drive, Castleton on Hudson, N&Y 12033  
Compressor stations release huge amounts of toxins. These toxins include benzene, toluene, sulfuric oxide, and formaldehyde. Citizens within 1500 feet of compressor stations in PA, TX, LA and other states have suffered from nose bleeds, rashes, headaches, sore throats.

WHAT ELSE WILL THESE TOXINS DO TO OUR CHILDREN AND FAMILIES AND ANIMALS.

DENY THIS PROJECT.

Project docket number PF14-22-000 Name: Joan L. Devoe  
Street Address| Mailing Address: 14 South Main Street  
P.O. Box 941 Lanesborough, MA 01237  
Phone #: 413-443-6421  
Email Address:jld1251@verjzon.net

My Testimony:

Before giving my testimony. I would like to state the following for the record:

Given the incomplete nature of Kinder Morgan's Resource Reports and recent changes to the scope of the project. these scoping meetings are being conducted prematurely and failing to provide information that would benefit the NEPA process. Also, since almost no Scoping Meetings are being conducted in communi-ties that will bear the affects of the compressor stations and meter stations, these Scoping Meetings need to be repeated when more Information on the project is available and they need to Include Scoping Meetings in all towns that are slated to have compressor and meter stations.

Since I am a homeowner in Lanesborough, MA, a retired schoolteacher, and a cancer survivor who wants to live in a safe and healthy environment in a home that will maintain its value, you can Imagine how horri-fied I was to learn that my house is located near the Incineration Zone or Blast Area of the proposed Kinder Morgan natural gas pipeline. Also, this pipeline is slated to pass through our aquifer, conservation land, and pass under the Cheshire reservoir - thus threatening our health and safety.

Therefore, I request that FERC assign an independent third-party to conduct a scientific "No Action" Alter-native assessment to determine the impacts of not building the pipeline. This study would assess the current property values, public health, wildlife habitat, watersheds, vernal pools, aquifers, private wells, and the quality of the air, water, and soil all along the pipeline from Hancock to Dracut as well as in the areas where the compressor and meter stations are proposed. This will establish a baseline so that individual property owners, businesses, and towns will be able to receive adequate and fair compensation for any accidents, pol-

lution, health consequences, or any damages that may occur if the pipeline is built.

However, if the pipeline is built, there needs to be an ongoing scientific assessment by an Independent third-party that can monitor any changes in the infrastructure, public health, property values, conservation lands, private wells, aquifers, watersheds, vernal pools, wildlife habitat, and the quality of public drinking water, air, and soil all along the entire pipeline from Hancock to Dracut

Also, a detailed written emergency plan needs to be made available to every community in Massachusetts that is situated near this pipeline, plus there needs to be a plan for the annual training of all medical and emergency personnel that details how to respond to a pipeline explosion or any other pipeline-related health hazards that could occur. This includes an evacuation plan that provides detailed information on how residents will be supplied with food, water, shelter, medical care, and other basic necessities.

Also, there needs to be detailed legal documentation that specifies how communities, businesses, and residents will receive fair and adequate compensation for any negative impacts during the building of this pipeline and after the pipeline goes online in the all of the areas mentioned above.

It is important that there be shutoff valves every 2 miles not every 10 - 20 miles and that the pipe have a thicker lining then the one being proposed. It is also important that the pipeline be buried well below the frost line.

Since this proposed pipeline places communities in Berkshire County and all across this state in danger of undermining our property values, quality of life, health, safety, natural wildlife habitats, and the quality of our air, soil, and water, it is clear to me that no option is the best option.

Therefore, I request that FERC NOT grant Kinder Morgan permission to build this pipeline in Massachusetts but to instead look into the development of projects that expand clean, renewable energy in our state.

I am not a scientist, but I would like you to analyze what happens to the toxic gases released from the compressor station are blown over Burden Lake where they will cool over our water. I would also like to know who will be responsible if and when our drinking wells and lake water are contaminated.

I am opposed to this project.

December 5, 2014 - A team of medical and scientific researchers, including from the Institute for Health and Environment at the State University of New York (SUNY) at Albany, reviewed the scientific evidence that both adult and early life - including prenatal - exposure to chemicals from fracking operations can result in adverse reproductive health and developmental effects. These Include: endocrine-disrupting chemicals potentially increasing risk for reproductive problems, breast cancer, abnormal growth and developmental delays, and changes in immune function; benzene, toluene and xylene (BTX chemicals) increasing risk for impaired sperm quantity and quality in men and menstrual and fertility problems In women; and heavy metals increasing the risk of miscarriage and/or stillbirths. Potential exposures occur through both air and water. Based on their review, the authors concluded, “Taken together, there is an urgent need for the following: 1) biomonitoring of human, domestic and wild animals for these chemicals; and 2) systematic and comprehensive epidemiological studies to examine the potential for human harm.” Lead author Susan Nagel said in an accompanying interview, “We desperately need biomonitoring data from these people. What are people actually exposed to? What are the blood levels of people living in these areas? What are the levels in the workers?”

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission 888 First Street NE, Room IA Washington, DC 20216

Re: Docket No. PFI4-22, TGP Northeast Energy Direct - Scoping Comments for Pittsfield, MA

Dear Secretary Bose:

I'm Kathryn Eiseman, president of the Pipe Line Awareness Network for the Northeast and speaking on behalf of the organization.

It is critical that the Commission prevent the improper segmentation of the NED project and TOP's Connecticut Expansion project, and evaluate them as a single Northeast Expansion project. This issue was addressed in detail in a comment filed by the Massachusetts Pipeline Awareness Network on July 1 st, and I incorporate that comment by reference into our scoping comments.

Tonight I am commenting primarily on the need for the Commission's analysis to fully examine the socio-economic costs associated with the pipeline. This means not only the direct and immediate costs to municipalities, farms, businesses, communities and residents along the route, resulting from disruption by construction activities and damage to roads. This evaluation also requires a thorough analysis of the impacts that the proposed pipeline is already having, and would continue to have after construction, on communities along and near the route.

- Many of these communities are rural communities that have already been struggling to deal with declining populations, aging populations, and threatened or closing schools. In this context and others, the impacts of a new industrial corridor must be evaluated in terms of the community-wide effects. The impact on landowners' ability to sell their property must also be studied. The overall effect of the pipeline on appraised values of directly impacted properties must be evaluated, as well as the effect on property values within two miles of the route and any proposed infrastructure. Projections must be based on actual recent trends in property sales where similar infrastructure has been installed in socioeconomically comparable communities.
- Cumulative impacts on the demographics and the character of communities must be considered with respect to not just the immediate project, but the infrastructure and disruption that is proposed and likely to follow as a result of the project - including pipeline expansions, additional compressor stations, and gas-fired power plants.
- Impacts to the tourism and hospitality industries must also be evaluated.
- The employment impacts of nonpipeline alternatives versus pipeline alternatives should be studied in terms of not just the number of jobs created, but their duration and the percentage of the jobs that are provided to local residents.
- Also important to include in FERC's analysis is the longterm impact on gas prices, should the LNG exporter customers that TOP seeks materialize. Since some of the project's domestic customers are seeking twenty-year contracts, evaluation of ratepayer impacts over the first twenty years of operation should be evaluated under scenarios that include forecasts of LNG export and their impacts domestic gas prices.
- The EIS must also include a comprehensive ecosystem services analysis to evaluate, from a socioeconomic perspective, water quality, air quality, biological and other impacts described in other sections of the EIS.

- From a public benefit perspective, an economic analysis is meaningless without an equally thorough economic analysis of the alternatives. The Commission must evaluate, with an equal level of detail, the costs and benefits of the project and of the alternatives set forth in the EIS, including the no-action alternative, in order to determine which alternative is in the public interest.

Lastly, but importantly, before any of the analyses I've mentioned are undertaken, the Commission must squarely address the fundamental question of the purpose of the project and whether it serves a public need, or merely the interests of Kinder Morgan and its affiliates' and customers' stockholders.

Respectfully submitted,

Kathryn R. Eiseman, President

Pipe Line Awareness Network for the Northeast, Inc.

**20150821-4079**

Good evening.

My name is Richard Evans. I live at 7 Fern Hill in Great Barrington.

I thank you for the opportunity to speak at this time, and what I wish to speak about tonight is legacy; my

legacy and yours.

Yesterday when I told a friend where I was going what he had to say surprised me. He said , “Be realistic, your efforts will be useless because the FERC will approve the KM pipeline no matter what anyone says. Wow, I thought. Here I am. going with the belief that my voice, along with that of others, will matter. So I turned to my friend and said;

If I choose to believe that our voices do matter and that the people to whom I will be speaking, the members of FERC, will honor their mandate to act in the public interest and take seriously the many concerns and questions we have about this proposed pipeline.

And foremost is the question: Do we need this huge pipeline.? Has the case been made to spend billions of dollars to move billions of cubic feet of fracked gas from the shale fields of Pennsylvania to Atlantic ports in Canada? .. As we know KM is already engaged in tactical pull back on the size of the pipeline but the problem is the same, 36 inches or 30 inches.

If a case had been made for this pipeline why would our state attorney general, secretary of energy and several well informed citizen groups be calling for further study? Why would there be such honest disagreement about whether in fact we have experienced a real, or a manipulated, winter shortage of natural gas? And even if there were to be some energy shortage there are alternatives and the proposed pipeline capacity would far exceed what could be used, leading to the our belief that KM intends to move the fracked gas to Atlantic ports for overseas sales. And who will benefit from that? Not the people of our states. We will simply bear the costs and the risks.

And given the unenviable safety record of KM in its other operations across this country, well documented when you investigate,. the risks are considerable.

So the cost-risk/benefit analysis becomes clear; if the pipeline is built the corporation benefits and we bear the cost and risk .. And by we I mean all of us , for we will have here missed an opportunity to avoid yet another in a series of mistakes we have made in regard to our future. That future must not lie in new pipelines that will simply perpetuate the use of planet warming fossil fuels. We can't do that to our grand-children.

And that is what I meant when I said I wanted this evening to speak about legacy; mine and yours.

Thank you. Richard Evans,MD 7/28/15

I am strongly opposed to the NED project. Please consider the safety record of Kinder Morgan's projects. In Texas from 2003 to 2014, Kinder Morgan experienced 36 "significant incidents", resulting in fatalities or hospitalization, fires, explosions, or spills.

Throughout the U.S. since 2003, Kinder Morgan and its subsidiaries' pipelines have been responsible for at least 180 spills, evacuations, explosions, fires, and fatalities in 24 states.

I also do not believe there is a need for this project. Where is the gas going and who benefits. Not the residents near the compressor station who will experience health and safety hazards and diminished property values.

Deny this project!

**20150821-4084**

Hand written FERC Comment Form: Cathy Garcia, PO Box 86, Windsor, MA 01270, opposing

**20150821-4085**

John Garcia, PO Box 86, 376 High St Hill, Windsor, MA

Please study the potential risk for health problems to people and wildlife when a compressor station is engulfed in thick heavy fog and blizzards so that the blow off chemicals can't draw up to the sky and they stay low to the ground for days on end . This is typical weather for Windsor, MA.

Please research the effect on drinking water from all surrounding reservoirs (Cleveland, Wahconah, Ashmere, and all private wells in Windsor from the 15 or more chemicals that will be emitted from the compressor station exhaust stacks, especially associated with thick fog, blizzards, and rain.

Please research and measure how much chemical pollution from a compressor station accumulates in the different layers, of high volumes of winter snowfall, before melt off.

Please study the effect that chemicals from a compressor station will have on farm produce, livestock and individual gardens and will they be safe to eat.

7/27/15

**20150821-4086**

My name is Jenny Gitlitz. I live at 2 Pomeroy Ave. in Dalton, MA 01226.

I'll focus on 2 issues tonight: drinking water, and noise and light pollution.

1) The pipeline will traverse watersheds that Dalton and Pittsfield depend on for drinking water.

Please ask Kinder Morgan to disclose a full list of chemicals in pipeline gas, including:

- Common names (by CAS number), and alternate names.
- Concentrations in the gas at expected pressures.
- What plans exist to detect leaks?

In the event of contamination,

- What plans exist to provide residents with alternate drinking water?
- How will soils and water sources be restored?

How does Kinder Morgan plan to maintain pipeline integrity when it is only buried 3 feet underground, and when the frostline in our region can be 5 feet deep?

2) Noise and light pollution

Noise and light pollution from compressor stations are likely to be highly disruptive to people and wildlife.

Locally, the Notchview Reservation and the Moran Wildlife Management Area provide over 5,000 acres of wildlife habitat, and recreational areas to tens of thousands of visitors annually.

In terms of noise pollution, please ask Kinder Morgan to provide or identify:

- Exactly where the Windsor compressor station will be located.
- The exact levels of sound generated there throughout the day.
- When maximum sound levels will occur, and for how long?
- A detailed map of sound travel (in meters) and levels (in decibels).
- What types of wildlife will have to flee to less desirable habitats due to noise?
- What other impacts will noise have on wildlife?
- What economic impacts will loud noise have on the Notchview Reservation?

How many of the 10 to 15,000 annual visitors will be dissuaded from coming to ski or hike due to noise, and the loss of peace and quiet they value?

Windsor and the surrounding areas are one of the few truly dark skies left in Massachusetts. Dark skies are valued not only by astronomers, but by anyone who likes to look up at the night sky. They're also important for nocturnal animals. In terms of light pollution, please ask Kinder Morgan to identify:

- What size area will be illuminated by the Windsor compressor station?
- The exact levels of light that will be generated, in lumens.
- Please provide a detailed map showing light levels that will be visible directly and indirectly through glare-at a 1,000-foot radius, a 1-mile radius, etc., up through 20 miles.
- At what distance will light pollution no longer be visible?
- What types of wildlife will be forced to flee to less desirable habitats due to light pollution?
- What other impacts will such light levels have on area wildlife?
- What economic impact will light pollution have on western Massachusetts?

In closing:

- 1) Due to the large amount of missing information in the Resource Reports-over 10,000 TBDs at last count-please do not close the scoping comment period until 60 days after Kinder Morgan files new, complete Resource Reports.
- 2) I would ask FERC to allow the development of alternative sources of renewable energy-such as wind and solar built at residential, commercial, and industrial scales-to be studied before making a decision about the NED pipeline.

Thank you.

Typed FERC Comment Form: ??, 2 Second Dyke Rd, Averill Park, NY 12018

Uniform New York state mortgage agreement used by Fannie Mae and Freddie Mac requires that homeown-

ers not permit any hazardous materials to be used or located on their property. For those of us abutting this pipeline and compressor station, this could create problems for our mortgages and capacities to get loans.

This is only one of my concerns. What about home owners insurance? What will be covered and who is responsible if there is toxins in my water supply or an explosion.

I oppose this project.

**20150821-4097**

July 28, 2015

Project Docket number PF14-22 Susan Jacobs

565 Worthington Road, PO Box 68 Windsor, MA 01270-0068 rmspjl@verizon.net

Good evening. My name is Susan Jacobs; my address is 565 Worthington Road, Windsor, Massachusetts where our family has lived for 25 years. For seven of those years, we opened our home as a Bed & Breakfast, welcoming guests from around the US as well as Europe. Citing the quiet, peaceful surroundings, fresh air and ability to see the stars on clear nights, many came back repeatedly. This project, with a proposed compressor station barely 2 miles due west of our home will change all of that.

My concerns are many, but tonight I will focus on air and water quality.

The Sierra Club cites many concerns with the natural gas industry, including the numerous loopholes the industry exploits in order to ignore basic environmental and health protections. The Sierra Club goes on to list some of the many problems associated with inadequate safeguards in natural gas development, including:

- Harmful air emissions that pollute communities surrounding drilling operations, compressor stations and pipelines;
- Lack of environmental assessments, monitoring and regulatory enforcement to gauge damages to landscapes and wildlife.

I respectfully request that you determine the realistic amount of pollution that would be released from the compressor stations, and take steps to reduce the dangerous gases and chemicals in it to zero through the use of scrubbers, and any other technology that could be used to protect our clean air.

Like everyone else in Windsor and many of the surrounding rural communities, our home has a well. Much of our area of town also has wet, boggy areas, and is adjacent to brooks and streams feeding into the Westfield River. The VOCs contained in the emissions of the compressor station and other installations along the pipeline will not only be present in the air we breathe, but will fall to the ground to pollute our gardens, streams, and ultimately, our drinking water unless Kinder Morgan is forced to take all necessary steps to protect our resources.

During the construction process, where will Kinder Morgan access the large quantities of water they will need for hydrostatic testing? Will there be guaranties that that these sources of water will not compromise the local wells?

Please study how our pure water can be protected, not just mitigated when later studies show our wells, streams and rivers have become polluted.

Also, I respectfully request that the Resource Report submitted by Kinder Morgan be rejected until such time as they can provide complete information. Do not accept their submission if it contains even one "TBD" - To Be Determined!

Your job is to protect and represent the public. I ask that you do your job, and make the best decision for the public and deny KM a permit for this project.

**20150821-4098**

Typed FERC Comment Form: Lisa Johnas, 17 Lakeshore Dr, Averill Park, NY 12018

We have just completed a sewer project to protect our lake from the contamination from antiquated septic systems. We invest thousands in efforts to manage weeds.

Do not undo our hard work and endanger Burden Lake by placement of the pipeline and compression station within our community. The threats of emissions and leaks but our health, safety, and the enjoyment of our natural resource at risk. Will our children and grandchildren be able to use this lake when pipes begin to leak into ground water? Will the asthmatics in our community suffer more with the emissions? Will the inner city youth who enjoy Camp Adventure on our lake be at risk or frightened by blow downs? Where will the wild life be when exposed to the noise and light pollution? What stress with associated health conditions will we experience with the noise and light pollution?

DENY THIS PROJECT.

Typed FERC Comment Form: Alexandria Lambright, 2561 NY HWY 43, Averill Park, NY 12018

I believe FERC needs to do studies of the health risks for individuals living near compressor stations and pipelines before any more projects are approved.

Benzene, a naturally occurring component of crude oil and natural gas, is a known carcinogen. There are already documented studies of people near compressor stations having more respiratory illness, rashes, nose bleeds and a variety of other health problems. If you are approving these projects to provide what is questionably more affordable energy, maybe you should consider the cost of the resulting required health care.

**20150821-4106**

Typed FERC Comment Form: Alexandria Lambright, 2561 NY HWY 43, Averill Park, NY 12018

I oppose this pipeline and compressor for many health and safety reasons. I also feel it is outrageous that the safety standards for rural areas are lower than for urban areas. It indicates to me that the government has done a cost analysis and determined that there are fewer people in rural areas so the risk of loss doesn't necessitate the extra money required to be safer.

Yet, the government does not have any problem asking me to abide by the same tax tables.

If there is an explosion, have you considered our small community has only a volunteer fire department. Some of these volunteers may be incapacitated by the explosion. In any case, it is not adequate to deal with the scope of destruction a pipeline would cause.

I do not want this project. If you do approve it despite opposition, which is unfortunately your history, apply the same safety standards to ALL communities.

**20150821-4108**

Typed FERC Comment Form: Trisia? LaR? Vind?, 95 G? Pt Road, Averill Park, NY 12018

Please consider that our community already has had one lake destroyed by big business. Nassau Lake has PCPs from GE. Do not risk another natural resource that our community is able to enjoy for the sake of big business.

DENY THIS PROJECT .

Typed FERC Comment Form: Frank Maier, 77 Gundrum Point Rd, Averill Park, NY 12018

Kinder Morgan has demonstrated a disregard for the safety and caused significant harm to lives and property. Does FERC consider safety records when evaluating a project? Consider these examples:

In June 2012, in Garb County, Texas, a Kinder Morgan Natural Gas Pipeline or America 26' diameter pipeline failed at Compressor Station 154, Mile Post 52, 4 miles east of Lawton. The failure blowing a crater 30 foot diameter and burning 2 acres of agricultural land as well as two 500' gallon plastic tanks used to store liquid nitrogen plus two telephone poles and transformers. State Highway 162 was closed for several hours. The cause was a 50-foot-long longitudinal rupture in the pipe.

On December 26, 2012, in West Melbourne, Florida, a Kinder Morgan Florida Gas Transmission Company pipeline exploded in a pasture. The blast ejected a 20-foot section of 20' diameter pipe which landed about 16 feet from the rupture.

On May 8, 2013, a Kinder Morgan Texas pipeline compressor station near Crockett, Texas, had a

On June 18, 2013, in Louisiana, a Kinder Morgan Florida Gas Transmission Company 30' diameter pipeline ruptured and exploded before dawn, jolting residents out of their beds in a rural, wooded area of Washington Parish. No one was seriously hurt but 55 homes were evacuated. The blast knocked down trees in an area about 200 yards across and the fire burned. Within another 300 yards, "The ground would be the color of a complete, bare. The dirt would be just like it had been cooked in a kiln," and an 80-foot section of pipe was destroyed. The fire caused \$7,502,188 in property damage.

Would you select a doctor with a record like this? What criteria do these guys have to meet? Who monitors them? I don't want my family and home to be victims of their greed and irresponsibility.

This project does nothing for our community but pre-emptive hazards and disruption of our rural life. Who benefits from this gas? Where is it going?

**20150821-4112**

Typed FERC Comment Form: Frank Maier, 77 Gundrum Point Rd, Averill Park, NY 12018

I am opposed to this project. I am particularly concerned about emissions and air quality. In addition to the toxins released with blow downs I am concerned about oil leaks. I have read that oil is

circulated through compressors to provide cooling and prevent wear. The lube oil is pressurized and as a result there is a chance for leakage. Oil can spray into the atmosphere in an oil mist. It could produce toxic smoke or cause explosions. Gas transportation companies report many oil leaks a year in a compression station. This is an environmental hazard. The compressor station is located south of Burden Lake and I would like an analysis of how the prevailing winds could carry the emissions and oil spray clouds.

We work hard to protect and improve our water quality. We have a long range weed maintenance program and pay a great deal for the sewer project that was completed last year. We do not want our homes, families, and resources destroyed by poor air quality and contaminated water.

**20150821-4113**

Typed FERC Comment Form: Justine Malo, 1315 Burden Lake Rd, Averill Park, NY 12018

I am strongly opposed to the NED project. Please consider the safety record of Kinder Morgan's projects. In 2009, the Pipeline and Hazardous Materials Safety Administration (PHMSA) cited Kinder Morgan for violating safety standards regarding the distance between a natural gas pipeline and a "high consequence area"

such as a school or hospital; the pipeline was too close for safe operation in case of a leak. I realize the issue in this case was defining a school and hospital. I would argue that a lake that provides recreation to hundreds of residents, thousands of visitors, and a summer experience for inner-City residents of Rensselaer County is a “high consequence area”.

**20150821-4114**

Typed FERC Comment Form: Pamela Maier, 77 Gundrum Point Rd, Averill Park, NY 12018

I am opposed to this project. I have concerns about low frequency noise. I have read that this causes significant health problems if you are within an 5-8 mile radius of a compressor station. Children and animals are particularly sensitive. I am also concerned about toxic emissions. This compressor station is too close to homes and farms. OUF sensitive natural habitat will be destroyed. Deny this project.

February 13, 2014 - A major study in Science by Stanford University, Massachusetts Institute of Technology and the U.S. Department of Energy found that methane leaks negate any climate benefits of natural gas as a fuel for vehicles, and that the EPA is significantly underestimating methane in the atmosphere.<sup>325</sup> Lead author Adam R. Brandt told The New York Times, “Switching from diesel to natural gas, that’s not a good policy from a climate perspective.”<sup>326</sup> This study also concluded that the national methane leakage rate is likely between 3.6 and 7.2 percent of production.

PLEASE DENY THIS PROJECT THAT IMPACTS OUR COMMUNITY AND SIMILAR PROJECTS UNTIL MORE RESEARCH IS DONE.

August 5, 2014 - A Climate Central piece appearing in Scientific American outlined the natural gas-related factors that threaten any ability to achieve climate goals through President Obama’s proposed Clean Power Plan. “No one has any idea how much methane is leaking from our sprawling and growing natural gas system. This is a major problem, because without a precise understanding of the leak rate natural gas could actually make climate change worse.” Referring to an interactive Climate Central tool that runs various methane leakage scenarios, the article notes that, “... even with modest leak rates and a fairly aggressive transition, we could still end up with little or no climate benefits by 2030 after an enormous financial and political investment in natural gas.”

PLEASE DENY THIS PROJECT THAT IMPACTS OUR COMMUNITY AND SIMILAR PROJECTS UNTIL MORE RESEARCH IS DONE.

**20150821-4118**

Typed FERC Comment Form: Karen Milkiewicz, 44 Holly Hill Rd, Averill Park, NY 12018

We have just completed a sewer project to protect our lake from the contamination from antiquated septic systems. We invest thousands in efforts to manage weeds.

Do not undo our hard work and endanger Burden Lake by placement of the pipeline and compression station within our community. The threats of emissions and leaks put our health, safety, and the enjoyment of our natural resource at risk. Will our children and grandchildren be able to use this lake when pipes begin to leak

into ground water? Will the asthmatics in our community suffer more with the emissions? Will the inner city youth who enjoy Camp Adventure on our lake be at risk or frightened by blow downs? Where will the wild life be when exposed to the noise and light pollution ? What stress with associated health conditions will we experience with the noise and light pollution?

DENY THIS PROJECT .

Project Docket #PF14-22-000

Lyndon Moors

14 South Main St.

PO Box 941

Lanesboro MA01237 (413) 443-6421 Lyndon213@verizon.net

Thank you for the opportunity to speak with you today. My name is Lyndon Moors. I live at 14 South Main Street in Lanesboro, just half a mile from where the proposed pipeline is to cross Route 7. Lanesboro Massachusetts is celebrating our 250th anniversary this year. We celebrate our small-town, pre-Colonial-era heritage, our clean air and water, our natural resources, our green spaces, and our forests. The State Champion Elm sits outside my front door. Our town flag depicts the Constitution Oak, named for the legendary spot from which the signing of our Constitution was announced to Lanesboro residents in 1787. We value our recreational and agricultural lands. We set down our own roots, buying land, building homes, and educating our children.

I encourage you to fully consider the negative impacts this proposed pipeline will have on what we hold to be important.

- What is the risk to our aquifer, our town’s source of clean water, under which this pipeline would be run?
- What destruction would be brought upon Constitution Hill, perhaps our most historic location, but awaiting Kinder Morgan’s bulldozers?
- What impact will this project have on our private property values and insurability, and will its completion make our homes more difficult to sell?
- Is there a less destructive path for this pipeline, even though many analysts now claim that the project is excessive and unnecessary in its proposed scope?

I would also ask you to schedule additional opportunities such as this one, so that we may provide relevant testimony as Kinder Morgan’s plans continue to evolve. We know precious little about their plans for metering stations and compressor stations, and their potential impacts should also be considered in your deliberations.

Thank you very much.

**20150821-4121**

Typed FERC Comment Form: Cindy Nadel, 634 Hoags Corner Rd, Nassau, NY 12123

Natural gas is a bigger threat to the climate than previously supposed. Methane is not only a more potent greenhouse gas than formerly appreciated, real-world leakage rates are higher than predicted. Within the last five months, multiple teams of independent scientists have published data on fugitive emissions that, all together, call into question earlier presumed climate benefits from replacing coal with natural gas. Further, evidence increasingly suggests that the natural gas abundance brought by fracking is slowing the transition to renewable energy and is thus exacerbating, rather than mitigating, the climate change crisis, DENY THIS PROJECT.

TO: Federal Energy Regulatory Commission

FROM: Fred & Barbara Nuffer

SUBJECT: Northeast Energy Direct Pipeline - Docket # PF14-22-000

Water Issues at our Residence @ 171 Radley Road Averill Park, NY 12018

My wife and I are concerned about the proposed route of the Kinder-Morgan Northeast Energy Direct pipeline project. We have been notified that the NED may be constructed along the National Grid Right-of-Way (ROW) approximately 200 feet north of our home and may require Kinder-Morgan to take a ROW along our property laying just north of the National Grid ROW.

Our concerns relate to our two water sources on our property and the potential for the pipeline construction (side slope benching, trenching and blasting) to have a negative impact on these water sources:

1. Our domestic water supply comes from a low yield (less than 112 gallon/minute) artesian well. The well fills from the bottom to the top and overflows into a waste drain. The pressure or "head" on the water is influenced by the steep hill side which rises approximately 100 higher behind our house. The drilling of this well was very costly. We also have several expensive treatment systems in place to treat issues with bacteria levels and sulfur.
2. A supplemental water source for our household is a spring that dates from the construction of our house in the 1930's. It is used to water our extensive vegetable gardens, including a large greenhouse. This water source is essential due to the low flow issues from our well.

Construction of the NED pipeline is proposed along on the northern edge of the National Grid Right of Way (ROW). This ROW is located on a steep slope only several hundred feet behind our house. Approximately 50 to 75 feet upslope of the National Grid ROW is the crest of the hill. To the north of the crest the terrain is much flatter.

Placement of this pipeline a significant distance to the north side of the National Grid right of way may help to mitigate some of these potential water supply issues as well as requiring less terracing and less earth disturbance than construction on a side slope. We request that the pipeline route be placed 200 hundred yards to the north of the top of grade of the hill behind our house to provide a buffer zone around our well head recharge zone.

Also of concern is a grove of Spruce trees along the south of the National Grid ROW. These large mature trees would endanger our house if there is any disruption of the soil above them. Erosion and loosening of the roots would cause these 100 foot trees to fall down the slope onto our home.

**20150821-4123**

Typed FERC Comment Form: Rick Pfielsticker, 17 Campus View Dr, Loudonville, NY 12211

Please examine the impact of the Troy Sand and Gravel Company mining in the same area as the pipeline and compression station. If there is blasting will it increase the chances of pipes leaking and breaking.

DENY THIS PROJECT.

July 28, 2015

Pittsfield MA

PERC scoping Hearing:

My name is Stephen Philbrick, minister of the West Cummington Congregational Church. I live in Windsor, where a compressor station is planned. Our house is near the proposed pipeline route.

Before my scoping request I'd like to say that these hearings have lost relevance and lost our respect, because you allow them to continue this evening and tomorrow in Greenfield mere days after Kinder Morgan has filed a 6,000 page Resource Report. Studying the facts to make a wise decision takes time. You don't appear interested in doing this yourself and you are denying us the opportunity to do so.

One of your responsibilities is to oversee environmental matters related to natural gas projects, so before anyone is allowed to put a shovel in the soil of Windsor,

would you please analyze:

The geology all along the proposed route, with particular focus on: .” Blasting in the furore by quarries or for future road construction.

Any miscalculation of the charge based on ignorance of the local rock formations can result in ground-shaking damage .

- Frost heaves and steel quality, particularly for the lightest gauge which is what we will receive in Windsor, since our lives and environment are apparently worth less to you than those in other communities .

- Rust

- Ionization of the pipes by the high tension line .” Vulnerability to vandalism

- Vulnerability to terrorism, domestic or foreign, since we are so far from any watchful eye, even the screens in Houston.

In addition, I call upon you to fulfill your charge to study the siting of this pipeline in regard to the health and well being of New Englanders of every species.

Since another of your charges is to monitor and investigate energy markets, you should know that this pipeline is not necessary for a single thing in the world but Kinder Morgan's profits.

**20150821-4125**

July 21, 2014 - An independent assessment report by Scientists for Global Responsibility and the Chartered Institute of Environmental Health reviewed current evidence across a number of issues associated with shale gas extraction by hydraulic fracturing, including environmental and public health risks, drawing on academic research. Among the report's conclusions: there are major shortcomings in regulatory oversight regarding local environmental and public health risks; there is a large potential for UK shale gas exploitation to undermine national and international efforts to tackle climate change; the water-intensive nature of the fracking process which would cause water shortages in many areas; the complete lack of evidence behind claims that shale gas exploitation will bring down UK energy bills; and concerns that it will impact negatively on UK energy security. Despite claims to the contrary, the report noted that evidence of local environmental contamination from shale gas exploitation is well reported in the scientific literature. It emphasizes that, "[t]here are widespread concerns over the lack of evidence on tracking-related health impacts, and that there is a lack of substantive epidemiological study for populations exposed to shale gas extraction." 425

Typed FERC Comment Form: Ryan P?, 40 Morgan Road, East Greenbush, NY 12061 September 2, 2014 - Analyzing the level of greenhouse gas emissions attributable to electricity from natural-gas-fired power plants and coal-fired power plants, economist Chris Busch and physicist Eric Gimon conclude that, over short time frames and at high rates of leakage, natural gas offers little benefit compared to coal and could exacerbate global warming. Although Busch and Gimon acknowledge that natural gas offers some reductions in greenhouse gas emissions over longer time frames, they point out that such reductions are not large enough for natural gas to play an expanded role in efforts to manage emissions. They conclude that under the best of circumstances, natural gas-fired electric power offers a modest benefit toward abating climate change, while if poorly developed (i.e., with extensive methane leaks, estimated by these authors to be on the order of 4% or higher), or if used to displace energy efficiency or renewable energy, natural gas could seriously contribute to increased greenhouse gas emissions.

PLEASE DENY THIS PROJECT THAT IMPACTS OUR COMMUNITY AND SIMILAR PROJECTS UNTIL MORE RESEARCH IS DONE .

### **20150821-4128**

Cheryl Rose; Dalton, MA July 28, 2015 Docket PF14-22-000

Concerns regarding the scope of the environmental impact of the Northeast Energy Direct (NED) project On the FERC website, the Commission describes as “paramount” that all proceedings be open and fair to all participants. New Resource Reports from Kinder Morgan became available just a few days ago; and in them

many variables are “ToBeDetermined”. It is not fair to ask us to respond to over 6500 pages of incomplete information in just these few days.

- I request the FERC repeat the scoping hearings when more information is available, and hold hearings in towns slated for compressor stations.

As a resident of Dalton I am concerned about the effects of construction and operation of the proposed NED project on my drinking water quality, air quality, and safety -

The proposed route is perilously close to the drinking water supply which serves my town. I ask the FERC to require Kinder Morgan to provide:

- plans for baseline tests, and regular monitoring for and mitigation of impacts to Cleveland and Egypt Reservoirs.
- and a guarantee of safe drinking water delivered to our homes if construction or operation of the pipeline or pipeline accident contaminates or harms Cleveland or Egypt Reservoir irreparably in anyway.

Kinder Morgan should also provide:

- plans for baseline testing and continued monitoring of air quality near both the compressor station in Windsor and the Mainline Valve planned for Dalton
- and plans for response and remediation for increased air contamination with toxic chemicals contained in material to be transported through the pipe.

Finally, the FERC’s own mission statement is “to assist consumers in obtaining reliable, efficient and sustainable energy services at a reasonable cost”. I call on you to be true to your mission. The financial, health and environmental costs of this project, which will ultimately be borne by the consumers to which you refer, warrant a comprehensive study of our energy needs and the alternate ways they may be met. OUF Attorney General, Maura Healey, has engaged such a study.

- I ask the FERC to include the results of Attorney General Healey’s study in their determination of our need for this project.

The data on the negative effects of burning and transporting fracked methane, and the limited amount of methane available from Marcellus shale, continue to grow. In contrast, abundant clean energy resources are available; and the projects to deliver them are ready to be built at a faster rate than our government is supporting, under pressure from the fossil fuel industry.

The FERC has the power to impact our state energy policy for many years to come. Given what we know about energy, the environment and human health, I believe asking us to invest in this pipeline is wrong. The people of Massachusetts want to protect our health and the health of our environment; and we need our dollars to invest in true renewable and sustainable. and ultimately cheaper energy that will provide us long-term energy security.

- I call on the FERC commissioners to accept their responsibility with respect to impacts of their decision on climate change. This is not just about the immediate impacts of burying a pipe in the ground.

FERC statement 7/28/15 PF14-22-000.

I am Henry Rose, a resident of Dalton and a local physician. I have many health and safety concerns that I would like FERC to address.

First I need to reiterate that this scoping meeting is premature. These meetings should be held again and located in the communities slated for compressor stations.

Some 20% of existing gas is estimated to be lost from pipeline leaks, improving efficiency of energy use in homes and businesses has a long way to go, and green/renewable projects like solar and wind are certainly safer and more sustainable. The impact of these measures must be studied before moving further with a \$3.5 billion project that will be paid for by ratepayers, obligate the use of even more fossil fuel for years to come, and subvert the work to be done in green energy.

I request that the environmental impact statement not just assess the impact of construction. The gas in the TG pipeline is obtained by fracking, which employs numerous chemicals that are suspected or known carcinogens and endocrine disruptors. Pipelines are known to leak over time and the effects of these chemicals need to be looked at thoroughly, including the potential long term impact of ingesting or inhaling small amounts over many years, and especially the impact on children and pregnant women. The pipeline is planned to go near the Cleveland Reservoir, which supplies Dalton's and Pittsfield's drinking water. The potential impact on this reservoir and all other affected reservoirs need to be studied. In addition, when a pipeline is constructed, water is used to test its integrity. I would like to know where this water comes from and where it is discharged.

I also have concerns about compressor stations and pigging operations that release methane and the toxic fracking chemicals into the air as part of normal operations. The potential local and regional effects on air quality should also be determined.

Safety concerns about potential explosions and massive fires have not been sufficiently addressed. Such catastrophes have occurred and I request that FERC detail how a large fire or explosion would be dealt with in the Berkshires.

FERC has a mission to look at costs. I request that these costs include the health, safety, and economic costs of degrading the environment.

Much of the gas supplied by the pipeline is likely planned for export. The price of gas will reflect the global market price and gas prices will rise in the US. FERC's obligation is to this country.

Finally, I would like to say to my fellow citizens whose work is to repair and construct pipelines. I want you to have good paying union jobs with good benefits ... repairing our leaking infrastructure, stopping the waste that we already pay for with our gas bills, and reducing greenhouse emissions. I work for a hospital that is constantly upgrading to new technology-- they are not investing in electric typewriters or x-ray equipment from the 1970s. We have the ability to move forward with cleaner and more sustainable technology, and I hope you will help us.

I am strongly opposed to the NED project. Please consider the safety record of Kinder Morgan's projects. The Wall Street Journal asked, "Is Kinder Morgan Scrimping on its Pipelines?" after an investment analyst charged the company with stalling its pipelines of routine maintenance spending in order to return more cash to investors. I am a resident of Burden Lake and do not want this resource destroyed by this project.

**20150821-4132**

Typed FERC Comment Form: Kim SeEVERS, 348 Lakeshore Dr, Averill Park, NY 12018

I am strongly opposed to the NED project, Please consider the safety record of Kinder Morgan's projects, In 2011 r PH MSA cited Kinder Morgan for these safety violations:

- failing to maintain update maps showing pipeline locations.
- failing to test pipeline safety devices.
- failing to maintain proper firefighting equipment. jt failing ro inspect its pipelines as required, and

- failing to adequately monitor pipes' corrosion levels.

How many second chances does Kinder Morgan get!

### **20150821-4133**

Typed FERC Comment Form: Lois M. Siegel, 37 Aspen Rd, Latham, NY 12110

May 15, 2014 - A recent review of existing data on lifecycle emissions of methane from natural gas systems concluded that, as a strategy for addressing climate change, natural gas is a "bridge to nowhere." The review found that, over a 20-year time frame, natural gas is as bad as or worse than coal and oil as a driver of climate change. Referencing this review and other recent studies, Bloomberg Business News reported that the EPA has underestimated the impact of methane leakage resulting from the production transmission, and distribution of natural gas and is using outdated estimates of methane's potency compared to more recent estimates from the Intergovernmental Panel on Climate Change.

PLEASE DENY THIS PROJECT THAT IMPACTS OUR COMMUNITY AND SIMILAR PROJECTS UNTIL MORE RESEARCH IS DONE.

Testimony before FERC Hearing in Pittsfield, MA, July 28, 2015

The overwhelming evidence from all over the world-from the scientific community and all who have eyes to see-is that the struggle to protect us from climate change is failing. The evidence speaks for itself: vanishing snowpacks, rising sea levels, shifting seasons, record temperatures; wildfires, floods, droughts, heat waves, and storms. Everywhere one looks failure is writ large.

While fully aware of how little time is left to amend our failures, two sources challenge us to restore faith in a future, with us in it.

Until very recently the goal of nations was to limit warming to below 2 degrees centigrade. But now-according to a study published in the journal Nature Climate Action by researchers at the International Institute for Applied Systems Analysis (IIASA), the Potsdam Institute for Climate Impact Research (PIK), and others-it is critical that warming be kept below 1.5 degrees centigrade.

"The 1.5° degree goal," note the study'S authors, "leaves no space to further postpone global mitigation action and emission reductions ... Any imperfections - be it a further delay of meaningful policy action, or a failure to achieve negative emissions on a large scale - will make the 1.5°C goal unattainable during this century."!

Parenthetically, pipeline proponents claim the NED "fracked gas" is necessary as a transitional bridge to a clean power future. But, as expert testimony has pointed out, the need for the gas is poorly documented and also very likely redundant due to conservation and the growing installation of alternative energy sources in Massachusetts and throughout New England.

The second source is an interview with Dale Jamieson', a professor of environmental studies and philosophy at New York University and the author of "Reason in a Dark Time: Why the Struggle to Stop Climate Change Failed - and What it Means for Our Future. "

In the interview published in the NY Times Opinion Pages entitled "What Can We Do About Climate Change?", Jamieson affirms that the way forward is a bottom-up rather than a top-down process; that our

primary hope to address climate change is grounded in actions and organizing at the local and regional level.

In Jamieson's words, "International agreements matter but their importance is exaggerated. At the Rio Earth Summit in 1992 most northern environmentalists thought the solution to climate change would be an international agreement that would bind countries and force them to behave. But we don't live in a world in which such authority exists either external to nations or in their superegos. Most action on climate change will take place within regions, within countries, within communities, and in the hearts and minds of individuals. Once there has been enough change at these levels then effective agreements can be made. In a way the point is simple. When it comes to fundamental change law tends to follow politics and morality rather than leading them."

Jamison's words underscore the importance of WE THE PEOPLE - as agents in the FERC process and in stopping the pipeline, participating in actions in behalf of emissions reductions, and determining our future.

Typed FERC Comment Form: Melissa Spann, 43 Lakeshore Dr, Averill Park, NY 12018

I am strongly opposed to the NED project. Kinder Morgan has a history of a significant number of safety violations. Please check the records.

In Texas from 2003 to 2014, Kinder Morgan experienced 36 "significant incidents", resulting in fatalities or hospitalization, fires, explosions, or spills.

Throughout the U.S. since 2003, Kinder Morgan and its subsidiaries' pipelines have been responsible for at least 180 spills, evacuations, explosions, fires, and fatalities in 24 states.

On November 30, 2010, a 30" diameter Kinder Morgan I Tennessee Gas Pipeline failed in a semi-rural area between Highway 1 and State Road 3191 t two miles NW of Natc:hitoche!< Luuisiana. 1/4 mile NE of a count!'} dub, and 200' south of a residential subdivision. Louisiana state police evacuated 100 homes. Pipe cracked: 52.5 inches long & about 0.5 inches in maximum width. The failure site is near where TGP had a previous failure In 1965, with multiple fatalities That failure was attributed to stress corrosion cracklnq.]

In 2011, the Carteret, New Jersey, KMLT had a leak and fire during maintenance work on March 14, 2011. On April 4, 2013. the PHMSA Office of Pipeline Safety issued a Notice of Probable Violation, Proposed Civil Penalty and Proposed Compliance Order (NOPV) after an inspection.

In 2013, Kt'.IIT paid a penalty of \$63,100 and was required to complete pipeline integrity testing and other corrective measures by May 2015.

These are only an example of the violations and accidents I found. I DO NOT WANT OUR COMMUNITY TO BE ANOTHER STATISTIC RELATED TO A COMPANY THAT HAS SACRIFICED SAFETY FOR FINANCIAL GAIN.

August 5, 2014 - A Climate Central piece appearing in Scientific American outlined the natural gas-related factors that threaten any ability to achieve climate goals through President Obama's proposed Clean Power Plan. "No one has any idea how much methane is leaking from our sprawling and growing natural gas system. This is a major problem, because without a precise understanding of the leak rate natural gas could actually make climate change worse." Referring to an interactive Climate Central tool that runs various methane leakage scenarios, the article notes that, "... even with modest leak rates and a fairly aggressive transition, we could still end up with little or no climate benefits by 2030 after an enormous financial and political investment in natural gas."

PLEASE DENY THIS PROJECT THAT IMPACTS OUR COMMUNITY AND SIMILAR PROJECTS UNTIL MORE RESEARCH IS DONE.

**20150821-4138**

Typed FERC Comment Form: Rick Thorpe, 25 E?, Averill Park, NY 12018

I believe FERC needs to do studies of the health risks for individuals living near compressor stations and pipelines before any more projects are approved.

Benzene, a naturally occurring component of crude oil and natural gas, is a known carcinogen. There are already documented studies of people near compressor stations having more respiratory illness, rashes, nose bleeds and a variety of other health problems. If you are approving these projects to provide what is questionably more affordable energy, maybe you should consider the cost of the resulting required health care.

**20150821-4139**

Typed FERC Comment Form: ??, 2 Candlestick Lane, Averill Park, NY 12018

September 24, 2014 - According to a paper published by scientists from the University of California and Stanford University, "... without strong limits on [greenhouse gas] emissions or policies that explicitly encourage renewable electricity, abundant natural gas may actually slow the process of decarbonization, primarily by delaying deployment of renewable energy technologies. The study builds on previous research by examining natural gas in a range of supply curves, with a tested economic model, and across three different types and levels of climate policy. Researchers found that abundant natural gas, even with low rates of methane leakage, does little to reduce - and may increase - greenhouse gases. They conclude that, "... delaying deployment of renewable energy technologies, may actually exacerbate the climate change problem in the long term."

Where is the energy from this project going? Who is benefiting? CERTAINLY NOT OUR ENVIRONMENT!

**20150821-4140**

Typed FERC Comment Form: Dale Tobler, 2 Olive Tree Lane, Averill Park, NY 12018

A typical compressor (from FERC application for the Compressor Station in Reed, PA.) also emits 46.2 tons of nitrous oxide per year. An anesthetic for dental surgeries, nitrous oxide can cause numbness and mental impairment. It has a sickly sweet smell. Nitrous oxide and volatile organic compounds interact to produce ground level ozone. Ozone inhibits crop growth by up to 30%. HOW DOES FERC PROTECT US FROM THIS.

DENY THIS PROJECT.

More study is needed, including baseline measures of air quality, ongoing environmental monitoring, and health impact assessments.

THIS COMPRESSOR STATION IS FAR TOO CLOSE TO OUR COMMUNITY. THE COMPANY HAS A POOR SAFETY RECORD.

THE NEED HAS NOT BEEN DEMONSTRATED.

THE BENEFITS OF NATURAL GAS ARE QUESTIONED IN MANY STUDIES. THERE ARE LESS HARMFUL FORMS OF ENERGY THAT THE PRESIDENT HAS SUPPORTED.

SAFETY STANDARDS ARE NOT ACCEPTABLE.

PLEASE DENY THIS PROJECT.

**20150821-4142**

Typed FERC Comment form: Typed FERC Comment Form: Michael Riddle, 28 Lakeshore Dr, Averill Park, NY 12018

Compressor stations are noisy. "Blow-downs" can last for two hours. The noise is comparable to a commercial jet taking off. Blow-downs are needed if a gas pipeline is taken off-line for maintenance, in the event of emergencies, or to accommodate fluctuating demand. They often occur in the middle of the night.

THIS WILL HAVE AN IMPACT ON OUR CHILDREN, SLEEP, OUR WILD LIFE, OUR PEACE AND QUIET, OUR STRESS.

DENY THIS PROJECT.

**20150821-4143**

What a privilege to speak one's mind and now even moria when it concerns such a huge public health, safety, and well-being issue. } With non-polluting technologies such as solar, tidal, wind, wave energy, bio-mass, and geo-thermal power at our disposal, it is unconscionable that any corporation, state planning board, or federal agency would consider actually expanding fossil fuel use now that the hard effects of global warming caused by the industrial release of carbon into the atmosphere are clearly seen and has brought us all to the point of climate crisis.

The process of fracking for natural gas is irretrievably destructive to animals, the environment, and to public health. In farms and residential areas bordering frack wells in Pennsylvania, methane has backed up into people's water wells and plumbing systems to such an extent that their sink faucets can literally be set on fire --- creme broulee at the sink anyone? Toulouene, bezene, and other deadly chemicals are leaching into drinking water --- hmmm, how many of these substances can you feed your toddler?

When corporations crack massive layers of bedrock, blast water at astonishing pressures, strip mine for coal by tearing off whole mountaintops, clearcut massive acreages for timber, they have a word that they use to try to ignore the devastation to people, animals, and the environment that they leave in their wake; that word is "externalities." They literally seek to block out any thought of the destruction and pollution that their activities lead to so that the focus can be on their bottom-line profits. Here are some more "externalities" that those blinded by profit may not have considered. On Pennsylvania farms adjacent to frack wells calves have been born with no pupils or irises in their eyes; yes, just solid white marbles for eyes. Homes in Oklahoma near frack wells that have so much methane backed up into their plumbing and basements that people brace for an errant spark to set off a massive explosion in their own house; people cannot move away because there houses are now unsellable.

Pipelines as these can explode and anyone who balks at that idea simply has to remember the massive explosion in Edison, NJ a few years back when eyewitness accounts reported that people thought a nuclear bomb had been detonated, the sky was so lit up in orange and white. Fire crews became disoriented because the explosion ripped through multiple weak points along a two-mile stretch of the pipe; firemen had no idea where to respond first.

Please use common sense to protect our children, our grandchildren and ourselves: vote "No action" on this issue. Do not build any pipeline. Thank you.

**20150821-4144**

Typed FERC Comment Form: Dianna Vanderbogart, 20 Sheer Rd, Averill Park, NY 12018

Unsafe levels of radon and its decay products in natural gas produced from the Marcellus Shale, known to have particularly high radon content, may also contaminate pipelines and compressor stations, as well as pose risks to end-users when allowed to travel into homes.

WHAT WILL IT DO TO THE ENVIRONMENT AROUND OUR HOMES?

**20150821-4145**

July 28,2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission 888 First Street NE  
Washington, D.C. 20426

Re: Tennessee Gas Pipeline Company, LLC Docket No. PF14-22-000  
Northeast Energy Direct Project

Dear Secretary Bose:

My primary objections to the proposed pipeline involve safety.

First: the herbicides used to kill woody plants on utility right-of-ways are teratogenic; they cause birth defects. I Increasing the width of the current ROW will increase the amount of herbicide applied, which will increase birth defects in exposed human and wildlife populations. In this case, less would be better than ~.

Can TGP reduce our exposure, to reduce birth defects in future generations? Can they replace spraying crews with cutting crews? ,

A second safety problem is that a 30” diameter high-pressure gas transmission pipeline has a blast impact radius of more than 700 feet.’ How, then, can DOT allow a new pipeline less than 100 feet from occupied dwellings? DOT regulations must have been designed for the convenience of the pipeline industry; they do not have public safety in mind.

DOT’s pipeline setback distance needs to be increased to reflect the huge impact radius of today’s larger-diameter high-pressure pipelines’ leaks and explosions.

Can Tennessee Gas voluntarily increase the setback to the blast distance, for public safety?

Thank you.

daymountaindawn@verizon.net

1. The Northern long eared bat has been determined under the Endangered Species Act to be threatened. Section 4d of the act provides measures necessary for the conservation of the long eared bat and limit destruction of its habitat. Berkshire County is one of many counties that have infected bats with white nose syndrome and forest habitat disruption is considered a further threat. Please determine the environmental impact of the clearing of forest and trees for access roads, staging and pipeline construction and easement including the required 100 feet adjacent to existing utility corridors on the already compromised Northern long eared bat habitat.
2. Tourism is the main industry in Berkshire County and people come here for the pastoral scenery and the natural beauty. Indeed the unspoiled nature and beauty, outdoor recreation and wilderness are reasons many people choose to work and make a life here. Berkshire County is known for its many thriving small farms and many local farmers markets. To support local business, farmers, workers and residents we need to maintain the beautiful surroundings which are preserved by the mostly agricultural and residential zoning. We rely on preserving our natural landscape, our rural heritage and the beauty of this place. Please determine the impact of the NED pipeline on tourism, home values and the economy of Berkshire County.
3. When a home is built the foundation is built 4 feet under the ground level, when plumbing lines are placed they are required to be 4 feet under ground. We have long cold winters here and the frost line can easily go more than 4 feet in certain areas. Please study the impact of cold, frost heaves and potential for pipe disruption when the pipes are required to be buried no more than 3 feet under the ground and above existing frost lines.
4. Rural homes rely on wells and septic systems, please determine the potential contamination to these systems with construction and blasting.
5. I live in Peru like many hilltowns have a volunteer fire department, please determine the anticipated training, services and equipment necessary as first responders to answer the call to a pipeline emergency.

#### **20150821-4147**

Oral comments by Jane Winn Berkshire Environmental Action Team (BEAT) to the  
Federal Energy Regulatory Commission Scoping Meeting - Pittsfield, MA July 28, 2015

Kinder Morgan just released new Resource Reports thousands of pages long, and these Reports are STILL missing huge amounts of information. Without this information, we - the public - are at a huge disadvantage trying to come up with comments on the scope of what we would like to see in your Environmental Impact Statement. These scoping meetings are being conducted before Kinder Morgan has provided enough information on exact locations and sizes of facilities that would allow us to provide comments that would truly benefit the NEPA process. It is also clearly unfair that no Scoping Meetings are being conducted in Windsor or Northfield - communities whose character and environment would be heavily impacted by proposed compressor stations.

That said, tonight I would like to take my three minutes to focus on jobs.

We strongly support unions. Unions in the past helped to shrink income inequality and helped to counter corporate control of our democracy. We would like the unions to join with us in asking Local Distribution Companies - in our case Berkshire Gas - to start using well-trained union labor for fixing their most likely-to-explode gas leaks. Right now, Berkshire Gas is required to fix their most dangerous gas leaks over the next five years. We would like to know those jobs are going to highly trained union labor - right now, they are not. We will be pushing for ALL gas leaks in distribution lines to be fixed - consumers are paying for all that gas even though, at least in the Boston area, 2.7% of that gas is leaking into the atmosphere - wasting

consumers' money and contributing to climate change. Fixing these leaks could provide years of local, well-paying jobs.

We feel that this proposed pipeline threatens jobs - clean energy jobs - one of our fastest growing sectors in Massachusetts. At the end of 2014, clean energy employed 88,372 people according to the 2014 Massachusetts Clean Energy Industry Report. This is as many people as are working in the insurance industry here; an industry universally recognized as one of our leading industries.

The clean energy industry employs 2.4% of all Massachusetts workers. At the end of 2014, there were 5,985 clean energy businesses in our state. Clean energy jobs account for 2.5% of the Massachusetts gross state product. And these numbers are growing fast. The number of jobs in the industry grew by 10.5% from 2013 to 2014. This was the third year in a row of double-digit growth, resulting in a 47% increase over the past 4 years. Projections are for the clean energy industry to continue this double-digit growth.

We need the "no action" alternative for this proposed pipeline and to put our union friends to work immediately fixing the gas leaks in our state.

Thank you.

Sincerely,

Jane Winn, Executive Director

#### **20150821-4149**

FERC DOCKET # PF14-22

Here are comments from overwrought residents of Third Burden Lake. The largest lake in Rensselaer County where inner city children and veterans come for a summer experience. It has 100s of residents and thousands of visitors each summer. It is the home of a 50 year old thriving restaurant that claims customers from many different states and many miles away. And it will have the highest impact from the compressor station.

The comments ask you to include in your EIS these negative socioeconomic, health, environmental and cultural impacts:

1. Kinder Morgan's atrocious safety record including deaths that have happened in more that 36 "significant accidents" Their skimping on Pipes which are proven to leak. Not could leak, but will leak. Their failure to maintain, test, inspect and monitor their pipe's corrosion levels.
- 2 .. Research the leakage of methane, nitrous oxide and other toxins (that they do not have to disclose to us). The same toxins that come from fracking, also come from compressor stations. They cause prenatal problems, lower sperm count and fertility problems in women.
3. There are documented cases of people living near compressor stations developing respiratory illnesses and other health problems in their kidney, liver and brain.
4. The blowdowns and constant hum and vibrations and the health risks they incur
5. No emergency services to handle an accident
6. Mining in the same area as the pipeline
7. Benefits are little to non existent for residents and very large for foreign markets
8. Lights and constant humming will harm wildlife including bald eagles, blue herons, painted turtles, bears, many types of fish, alpacas, black angus beef farm and many others.
9. Explain why the safety standards are different between cities and rural places Why rural lives are expendable?

10. Study what happens when their mortgages and homeowner's insurance are called in and nullified due to harmful toxins on or near their property. Will Kinder Morgan be able replace these?
11. Will Kinder Morgan make up the difference of decreasing property values?
12. Pay for testing our water before and after the compressor station is built and continually monitor our water.
13. How will the fireworks and snowmobiling and quading in the area be affected.

Missing from my pile here are all the comments from the people that don't even know about this, or don't understand the harmful and even fatal impact it can have on our community and our world. Please include ways to notify ALL the residents in the towns affected. Maybe the US Mail could be used. Then it might not appear like the Gas companies and the Federal Government are trying to hide what you are doing to us.

Lastly, I am just asking you to think as you lay your heads on your pillows about what you are doing to people's lives. Their health, their financial position, their children, their animals, their mental state etc ... What will your decision do to your mental states knowing that you helped harm people by not denying this application. Is money worth people's lives? Please just go home and think about this as if it was in your backyard.

Thank you for your time,

Karen Zantay  
35 Blue Heron Dr. Averill Park, NY 12018

#### **20150821-5006**

Elizabeth Reilly, Nassau, NY.  
Elizabeth Reilly  
149 Clarks Chapel Road  
Nassau, NY 12123

In the resource report dated July 24, 2015, the impact on property values were addressed. They only addressed the impacts from the pipe and not the compressor stations. There is evidence that homes located next to an industrial complex sell for less than if they were located in a residential or rural setting. It also states if we feel our properties value has been impacted, then to seek a tax assessment reduction through our town. How will that help me when I have to sell and receive less than I paid for it. I just purchased my property in 2013, I currently have \$340,000 Invested in just the purchase, not including the improvements we have done since. I am located right next to the compressor station on Clarks Chapel Road in Nassau, NY. I have spoken with local real estate agents and appraisers. They all have stated if a home is located next to a source of noise or industrial complex then the values go down and sit on the market for a longer period of time. In the EIS please put a true picture as to how the value of resident's homes will be impacted. Perhaps Kinder Morgan should have to pay for us to have a pre-construction and post construction appraisal done on the values of our homes. The people appraised should include a minimum of all land abutters and 1/2 buffer zone properties.

Below is the July Resource report information on property values, below that is information on a town in New York that has had to get their property values reduced.

From July 2015 Resource Report

#### **5.6 PROPERTY VALUES**

It is not anticipated that the Project will negatively impact property values outside the proposed pipeline ROW. Landowners who believe that their property values have been negatively impacted may appeal to the local tax agency for reappraisal and potential reduction of taxes.

Allen, Williford & Seale, Inc. (2001) prepared a study for the Interstate Natural Gas Association of America ("INGAA") Foundation to determine the impact of natural gas pipelines on real estate. Four separate geo-

graphically diverse areas were selected for the case study: (1) a suburban area crossed by one natural gas pipeline; (2) a suburban area crossed by multiple natural gas and products pipelines; (3) a rural area crossed by one natural gas pipeline; and (4) a rural area crossed by multiple gas pipelines and one products pipeline. The results of the study revealed that there was no significant impact on property sales located along natural gas pipelines and that the pipeline size or the product carried did not impact the sale price. The study also revealed that there were no significant impacts on demand for properties within the geographically diverse areas and that the presence of a pipeline did not impede development of the surrounding properties. In addition, the existence of a pipeline had no significant impact on development decisions (e.g., lot size) and it did not impact specific property types more or less severely than other property types (Allen, Williford & Seale, Inc. 2001). Other studies have reached similar conclusions: PGP Valuation, Inc. (2008) for Palomar Gas Transmission Inc.; Ecowest (Fruits 2008) for the Oregon liquefied natural gas (“LNG”) Project; Diskin et al. (2011); and Hansen et al. (2006).

Real Facts for homes located next to Compressor stations and this is only 15,000 hp far less then the one that will be right next to the residents of Nassau NY.

#### FOR IMMEDIATE RELEASE: PROXIMITY OF COMPRESSOR STATION DEVALUES HOMES BY AS MUCH AS 50%

Fremont Center, NY — Homeowners living near the Millennium Pipeline Company’s 15,000 horsepower compressor station on Hungry Hill Road in Hancock, New York have seen the value of their homes decline by as much as 50 percent since the industrial facility was constructed in the midst of what used to be a quiet, rural community.

In May 2014 several Hungry Hill residents sought real estate tax relief citing the adverse impact of the compressor station on their property values. The Town of Hancock, denied the tax grievances, but Catskill Citizens for Safe Energy subsequently offered to fund homeowner appeals. On August 25, 2014, small claims hearings were held in the Hancock Town Hall. Two homeowners, a certified Real Estate Appraiser, and a representative of Catskill Citizens testified that the compressor station was responsible for heavy truck traffic, noxious odors, persistent low-level vibrations, and air contamination. The witnesses also asserted that the facility presented a safety threat and recounted how a Millennium employee suddenly knocked on the door of a house late one evening and urged the family to quickly evacuate their home. Finally, it was alleged that blasting during the construction of the compressor station had cracked the foundation of one house, which in turn led to an unsafe spike of radon levels. (Pre and post-construction radon tests conducted by Professional Home Inspection Service of Binghamton, New York showed that radon levels in the home jumped from 3 pCi/L to 6.1 pCi/L, which is above the EPA recommended action guideline of 4.0 pCi/L.)

In light of the evidence proffered, the Town of Hancock tax assessors agreed to decrease the assessed valuation and real estate taxes on two homes by 25 percent. The assessed valuation and taxes on a third home, the one that had been physically damaged, were cut by 50 percent. Hearing Officer John Creech, who presided over the settlement, was familiar with the compressor station and remarked, “I wouldn’t want to live next to it.” After the tax assessors agreed to the 50 percent tax cut he told the owners, “You have a good lawsuit here.”

#### **20150821-5009**

Richard Dumas, Walnut Creek, CA.

The NED project would comprise more than 418 miles of new and modified pipeline that would transport natural gas from the Marcellus Shale in Pennsylvania through New York, Connecticut, western Massachusetts, Southern New Hampshire, and finally to its terminus at a compressor station in Dracut, from which smaller lateral pipes would spiderweb throughout other parts of the state.

Please do not allow this project to proceed. It will be forced into the backyard of my friends and family members against their wishes destroying pristine countryside while putting them within a dangerous blast zone. You should not allow a for-profit energy company to get away with using tactics like “eminent do-

main” to pursue commercial plans that violent the wishes of residents, destroy home values and put human life at risk.

## **20150821-5010**

Timothy Somero, New Ipswich, NH.

From a socio-economic perspective, the forced transition from a rural, clean environment to an industrial scar over the pipeline route feels like a raping of awesome American natural resources.

So be it.

The current self-evident, caustic process is unbalanced so that a small number of Americans are burdened with a focused subsidy on infrastructure that has no benefit to the individuals.

It’s worse than taxation without representation, this is simply a thinly-veiled, focused TAX on America that lines the pockets of a private corporation.

For the sake of my comment today, so be it.

I wrote that to set context.

My concern today is that we Americans have scant remaining freedoms including the right to privacy in medical issues.

What process and protection does every affected American have to discuss medical concerns related to the pipeline project?

Where are our HIPPA rights?

What is our recourse when a before and after event occurs?

Look ahead and imagine:

1. Before the pipeline, our children were healthy.
2. After the pipeline, they are not.

When will each American have the right to discuss medical issues in a protected safe harbor?

## **20150821-5113**

### **Plainfield Conservation Commission**

Town Office

304 Main St.

Plainfield, MA 01070

August 21,2015

To: Kimberly D. Bose, Secretary Federal Energy Regulatory Commission

Subject: Comments on environmental Issues regarding the Northeast Energy Direct Project, Docket PF 14-22-000

We, the members of the Plainfield Conservation Commission, hereby request that FERC address the following issues in its preparation of an Environmental Impact Statement (EIS) regarding the “Northeast Energy Direct” project of the Tennessee Gas Pipeline, Inc. Submission of the following issues does not imply agreement with the current scheduling of scoping sessions in July and August, 2015. Given the incomplete nature of Kinder Morgan’s Resource Reports to date, we request that scheduling of scoping sessions be delayed until final, revised and complete editions of the reports have been issued and examined by all concerned. The following concerns presented by the Plainfield Conservation Commission apply not only to Plainfield, but to all towns through which the pipeline may pass and should be addressed relative to all such areas.

1. We request that impacts to habitat, wetlands, waterways, and protected open space should be avoided. Measures to avoid or mitigate impacts should be specified in detail for every aspect of construction and for each specific site along the route, including staging areas, temporary workspaces, temporary and perma-

ment access routes, temporary contractor yards, pipe yards, cathodic protection and grounding bed sites, and mainline valves. To construct an “in-kind mitigation wetland resource”, detailed assessments of each wetland resource area need to be conducted, taking into account the functions and values relative to topography, hydrology, vegetation and soils.

2. The numerous unspoiled streams whose headwaters originate in Plainfield are tributaries to the National Wild and Scenic Westfield River to the south. Therefore, we request that all of the wetlands, waterways vernal pools (certified and certifiable), floodplains and all jurisdictional areas under the Mass. Wetlands Protection Act within 200 ft. of the disturbed areas along the route be detailed in the EIS, including those missing from the March and July, 2015 Resource Reports, together with mitigation strategies as outlined in (1).

3. We request that NHESP “Priority Habitats of Rare Species”, NHESP “Estimated Habitats of Rare Species” and BIOMAP II “Core Habitats” and “Critical Natural Landscapes” be studied so as to avoid habitat fragmentation and all other impacts on the biota. In the case of unavoidable impacts, means of minimization by all possible measures should be specified in detail.

4. The project route passes through rough topography and ledge which will necessitate careful attention to downstream impacts of blasting and erosion on streams and wetlands. Therefore, we request that details of both pre- and post-construction erosion and sedimentation control procedures be described, including the restoration and post-construction monitoring for each specific site along the route.

5. Because Plainfield is relatively free of non-native invasive plants, we request that detailed procedures regarding the prevention of their introduction by construction equipment be included. Similar concerns apply to instances where soils may be trucked in for pipeline fill and bedding material.

6. In Plainfield, the large amounts of water used to pressure test segments of the pipeline would have to come from local surface waters. These withdrawals could have a serious impact. We request that the EIS include alternatives. If it becomes necessary to obtain water from another watershed and to discharge it into one of the town’s watersheds, a detailed methodology for the prevention of the introduction non-native aquatic species and damage caused by hydrostatic testing in wetlands near the ROW should be included.

7. The proposed compressor station to be located nearby in the town of Windsor will periodically release airborne hazardous and carcinogenic chemicals which may spread to streams in Plainfield through drift or entrainment in rain or snow. Therefore, we request that baseline studies of stream biota be conducted to establish the potential impact of each chemical.

8. The proposed “Class 1”, thin-walled pipes to be used through Plainfield are inadequate to provide the long-term protection needed to safeguard wetlands and vital ecological systems. The most robust pipes by regulation (i.e., “Class 4”) that provide optimal protection must be installed through wetland resource areas as defined in the Massachusetts Wetlands Protection Act.

Respectfully Submitted,

Judith Williams, Chairperson

Erik Burcroff

John Nelson Jr.

Alice M. Schertle

Edward Stockman, Wetlands Scientist

## **20150821-5138**

Dorothy Crawford, Fitzwilliam, NH.

Among our many concerns over the NED project is the blasting. We are interested in knowing more about the intended blasting zones. We are called the Granite State for a very good reason. How much bedrock is involved? On any given day when blasting is taking place, how many hours? How many days? What time do they stop and start? What are the decibel levels? What is the potential impact on wildlife? Needless to say the impact on us humans will be severe. Residents of our lovely little corner of NH moved here largely

for the quiet. How is the impact of extensive blasting on the human ear measured? Will we all be issued noise-cancellation headphones? What about our cats, dogs, horses, llamas etc? I can't imagine they will be able to tolerate the noise any better than we will.

#### **20150821-5146**

Kathleen Gauvin, New Ipswich, NH.

I am commenting to the lack of follow-up on your part to schedule Scoping meetings in New Ipswich, NH the site of the NED Pipeline project compressor station and Cheshire County in NH. We know that the Governor of NH along with the NH delegation to Washington, DC have written several times to FERC demanding that these scoping meetings take place so that everyone in New Hampshire will have the opportunity to speak to their concerns. I would think that this would be a minimal requirement. We do not expect that we will be "blown off"!

#### **20150821-5194**

Testimony for FERC Scoping Hearing in Pittsfield, Massachusetts on Tuesday, July 28th

Before giving my testimony, I would like to state for the record that I believe these scoping meetings to be premature because Kinder Morgan's Resource Reports are incomplete and because the scope of the project was recently changed. Hence, the hearings will fail to provide the information necessary to fulfill the mandate of the National Environmental Policy Act (NEPA). I would also like to state that I consider it unfair that no scoping meetings have been scheduled for the communities where compressor stations, among the largest ever proposed, are slated to be built. Scoping meetings need to be reprised when information on the project in its final form is available, and should include meetings in the towns closest to compressor stations.

First, full disclosure: I am a member of Pipeline Awareness Network. To some that makes me one of those who have been falsely dubbed "eco-terrorists," but unlike true terrorists, I and most of my neighbors and the majority of our elected officials who oppose the pipeline, constitute no danger. How could we when our only weapons are the questions we want answered? I confess to believing that building a huge new and patently unnecessary pipeline will inevitably damage our protected wildlife areas; degrade the natural beauty of our region which is our economic lifeblood; threaten our air and water with contamination; subject our neighbors along the pipeline route to an ever present danger of leaks and explosions; will, as we already know, involve the construction of huge compressor stations running 24 hours a day that will result in noise and light pollution, and the periodic venting of highly toxic chemicals into the air; and above all will derail our states commitment to goals for converting to renewable sources of energy under the Global Warming Solutions Act and will in fact, bequeath to our children instead of a brighter carbon-free future, an increase in our dependence on fossil fuels for many more decades and an acceleration of global climate change, despite the crisis level we are already experiencing and that demand immediate reduction in our carbon footprint.

Here are my questions and requests:

- As part of an economic analysis please examine the impact of a pipeline alternative involving energy conservation by local gas distribution companies and by their domestic and commercial customers. Please determine based on current estimates for the cost of the construction of NED and of its maintenance over the next twenty years, how much additional natural gas would be available if a fraction, say one-half for argument's sake, of the full amount were allocated for a mix of the following conservation measures: the repair of leaks in the existing supply lines; the weatherization of homes and businesses by upgrading insulation, replacing single with double-pane windows, replacing low-efficiency boilers with new high-efficiency ones, installing heat pumps and other measures commonly known to reduce energy needs; the institution of time-of-day pricing and smart metering systems and the like. In order to find out whether such an alternative expenditure might actually pay for itself, please determine how many jobs at locally prevailing wages over a twenty year period the alternative would generate and support as compared to the jobs generated and supported by the construction and maintenance of NED at whatever

pay-scale Kinder Morgan and its investors consider favorable to their annual profits and the value of their stock. Please determine the total dollar value of the economic contribution to the local economy, including the ripple effect, of the NED pipeline compared to the investment in conservation of one-half of the price tag of the pipeline.

- I further request that FERC examine the pipeline's community health impact in an analysis showing a) what is the baseline incidence of proven fossil-fuel related diseases and outcomes among the communities within 75-miles of the existing pipeline corridor with its current capacity and then b) extrapolating from the baseline using the Healthcare Energy Impact Calculator (EIC) show what the EIC estimates to be the increase in premature deaths, chronic bronchitis, asthma attacks, emergency room visits and other health measures by kilowatt hour per year of "brown" power once the pipeline becomes operable. The analysis should demonstrate the cumulative health impact of the additional "brown" power over the 30-year period following the introduction of the NED pipeline. I am also requesting that FERC determine how Kinder Morgan intends to avoid these negative health impacts; and if unable to do so, how it will minimize or mitigate negative health outcomes; how it will monitor public health in all the communities along the pipeline route, including those in the impact zone for the compressor stations, to determine the effectiveness of its mitigation activities, and how it will address the failure of its mitigation strategy. And I request that FERC determine how much Kinder Morgan plans to spend on these efforts on an annual basis over the 30-year period including and following the construction of NED.
- The Commonwealth, as you know, has created numerical goals under the Global Warming Solutions Act (GWSA) of 2008 for transitioning from fossil-fuels to renewable energy: a 25% reduction of Greenhouse Gas (GHG) emissions by 2020 and an 80% reduction by 2050. The emissions from GHG used in the generation of electricity constitute 1/5 of total emissions. I am requesting FERC to obtain an answer to the following question: if the NED pipeline and infrastructure is designed for decades of use as one must assume it is, since the huge expenditure to build it would not be justified otherwise, how much out of compliance will the Commonwealth be with its own law for reducing GHG emissions if NED is built; and how much closer to its legally sanctioned goals under GWSA will Massachusetts be if NED is not built?
- The venting of gas that is a normal part of the maintenance of the pipeline is a worrisome concern for people along the pipeline and those downwind of it. I request that FERC determine the identity of the chemical components of the toxic brew flowing through the pipeline and mixing in the air we breathe every time venting occurs. What is the volume of these releases on an annual basis. Which of them are known to cause harm, including increased incidence of cancers, birth defects, respiratory ailments, and endocrine disruption, and at what levels do they do so? What steps will the Kinder Morgan take to determine baseline health measures among the potentially affected population; how will it avoid the transmission of proven toxic chemicals into the air following venting; if unable to avoid transmission, how will it minimize and mitigate the impact; how will it monitor whether mitigation is successful; and if monitoring proves that mitigation is unsuccessful, how will it address that failure?

Respectfully submitted,

Comments on  
Tennessee Gas Pipeline Company's  
Northeast Energy Direct Project  
(Docket No. PF-14-000)

There are alternatives to the proposed action of providing a 30” pipeline to provide additional natural gas to the Northeast United States to provide the region with more usable energy. These alternatives include solar, hydroelectric, wind and storage of energy facilities. The need for this project needs to consider these alternatives. The report also needs to address the possibility of increasing the size and or pressure of the existing pipelines that service the area.

## 20150821-5219

Kristi Margaritis Bradshaw, Merrimack, NH.  
8/21/2015

Mr. Duff and Mr. Hartman:

I am a homeowner in the neighborhood of Whittier Place in Merrimack, NH. We are a bustling family neighborhood of 64 homes. The 1/4 mile stretch of the NED pipeline proposed to traverse our land and our neighbors land directly impacts 400+ human lives in a residentially zoned area.

As a neighborhood, we have attended KM “open houses”, scoping meetings, Merrimack TC Meetings, the 2 Amherst “alternate route meetings” -the list goes on and on. In addition to living our already busy lives, keeping up with what’s going on has become an unwelcomed additional full time job for many of us.

Along with thousands of other NH residents, we are opposed to the NED pipeline as a whole. As a neighborhood, we are also vehemently opposed to the placement of this pipeline as currently proposed. Once again, I repeat that this 1/4 mile stretch directly impacts 400+ human lives in a residentially zoned area. At our own expense, we have organized our opposition and retained representation as such. We have hired engineers to substantiate our opposition. These findings were included in a FERC submission dated 6/10/15 (Accession No.: 201506105257-Docket(s) No.: PF14-22-000 Filed By: Gallagher, Callahan & Gartrell, P.C. Signed By: Ari Pollack Filing Type: Supplemental/Additional Information -Filing Desc: Supplemental Information / Comment on Filing of Gallagher, Callahan & Gartrell, P.C. under PF14-22. Submission Date/Time: 6/10/2015 2:05:33 PM -Filed Date: 6/10/2015 2:05:33 PM)

We have heard multiple times and in multiple places that KM/TGP wants to work with ALL affected stakeholders during this pre-filing process including municipalities and private landowners. We’ve heard it so frequently that it has become (one of the many) KM/TGP mantras. Please, if you could then, help us understand the quandary we find ourselves in. Our attorney, has been communicating with Patty Quinn since July in an attempt to arrange a face to face meeting with one of you to discuss our concerns and provide input. We have been patient now for weeks and diligently checking in with Ms. Quinn. When a response was finally received from Ms. Quinn, the dates she offered were in mid to late September.

Could you please explain to us:

- 1- Why are we being pushed out months from our original request?
- 2- How a meeting in mid to late September could possibly provide KM/TGP time to truly evaluate less impactful route options when you plan to file with FERC in October?
- 3- How are we to possibly believe KM/TGP cares about working with affected stakeholders? Please help us to believe otherwise.

We look forward to a timely response to this communication and with confirmation of a meeting date in the very near future.

Regards,  
Kristi Bradshaw  
cc. Governor Hassan

FERC ecomment PF14-22

**20150821-5221**

Ruth E Stevens, Pepperell, MA.

Up until now I've relied on better educated and smarter individuals to speak up and/or write letters to you on this proposed Gas Pipeline going through. I don't understand why, "We the Common People", whom work hard to pay their taxes, that covers your salaries, paves our roads, take care of our neighbors have to suffer to help make those wealthiest individuals more money. It's all about the money. They don't care about our property, our health or the future for our children.

Pros and Cons for this pipeline.

Pros:

1. Exportation of Natural Gas to other countries.
2. As I mentioned above, more money for the CEO of Kinder Morgan and other companies and their associates.

Cons:

1. Environment. Protected Lands, Our drinking water, Fish, Wild Life, etc.
2. Safety: Gas pipelines leak. There can be leaks every so many feet.
3. Explosions. This is common place.
4. Our property being violated. We work hard to have a place we can call ours. Now, our government says "We the People" do not own anything and you can take it from us anytime you feel the need.
5. Health, have you investigated this? Do we breathe the methane gas that leaks out of the ground.
6. Fracking causes earthquakes. Pipes will and do break during these earthquakes.
7. The chemicals that are used for fracking are a health hazard.
8. Most of this gas will not benefit us. The electric grids will only use a fraction of it.
9. Solar panels going up everywhere. 3 houses on my block added solar within the last few weeks. Our town has gone solar. Hospitals in Boston are going solar. Our schools are going solar. We don't need the Gas.
10. In the near future gas will be a thing of the past.

We should be looking at the future using wind and solar. We need to protect our next generation and stop the polluting of this planet. We live on this planet earth and we must protect it.

RE: Info. Request

Tennessee Gas Pipeline Company, L.L.C.  
Northeast Energy Direct Project, FERC Docket No. PF14-22'  
Hartford and Fairfield Counties, Connecticut

Dear Lori Ferry,

This is in response to your 10-21-14 request for Farmington Valley Health District (FVHD) to review its records relative to the sensitive environmental areas within .25 miles of the proposed referenced project. I am only addressing items 3 & 5 in the list of sensitive environmental areas (i.e. surface waters that provide public drinking water supplies and any known existing or proposed public or private drinking water wells, reservoirs, or springs in or within 300' of the proposed alignment). Other federal, state or town agencies

and/or water companies must investigate the other 3 sensitive environmental areas. In addition, please note that with respect to this project, FVHD has authority only in the towns of Farmington, Avon, Simsbury & East Granby. Please contact officials in other towns that have affected areas. Unfortunately, the details on the map are so small it's difficult to discern exactly where the .25 mile buffer is located. I have attached some information gleaned from our files that appears to be within the .25 mile buffer zone. These included documents show several drinking water wells in the affected area within the town of East Granby. There may be some other properties on Miller Rd. & Stark Dr.

There are many affected properties in the towns of Farmington that appear to be within that .25 mile radius. All houses on the following streets in Farmington are supplied by private well water: Jefferson Crossing, Parish, John Steele, Northeast, Old Mountain & White

Oak. Properties within 300' appear to be on the following streets: Northeast Rd. & Old Mountain Rd. Also, some properties in Avon and Simsbury may be affected as well.

I did not include the property information for the towns of Farmington, Avon, Simsbury and some East Granby addresses because it became too onerous without a more detailed street map.

To the best of my knowledge there are no surface waters within the FVHD affected areas that provide public drinking water supplies in that outlined area. Again, the Ct.State Health Dept. and the Public Water Companies need to be contacted for this data.

I would STRONGLY recommend visiting our website at [www.fvhd.org](http://www.fvhd.org) for access to all available FVHD property files.

In any case please provide FVHD with a significantly larger scale map in order for us to accurately determine which properties are actually within the affected areas. Also, clarification is needed relative to 2 conflicting distances of interest (.25 miles and 300'). Please contact me if you have any questions or concerns.

Dianne Harding, R.S. Chief Sanitarian  
Farmington Valley Health District 95 River Rd. Suite C  
Canton, CT 06019

FVHD website- [www.fvhd.org](http://www.fvhd.org)

Mission: We strive to prevent disease outbreaks and conditions that give rise to poor health, promote health programs and policies that support good health, and protect members of our community from health threats both the everyday and the exceptional.

**20150824-0012**

**STATE OF NEW HAMPSHIRE  
OFFICE OF THE GOVERNOR**

MARGARET WOOD HASSAN  
Governor

August 14, 2015

Norman C. Bay, Chairman  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE:Docket No. PF14-22-000

Dear Chairman Bay:

I write to request that the Federal Energy Regulatory Commission (FERC) require Tennessee Gas Pipeline Company (the Company) to respond to the questions and concerns of New Hampshire residents related to the proposed Northeast Energy Direct (NED) Project, as well as to ask the commission staff to closely review

these concerns and consider potential alternative routes as they begin the Draft Environmental Impact Statement (DEIS) process.

Over the past few months, I have heard from many communities and individuals along the proposed route with a number of safety, environmental, economic, and health questions and concerns. To address these issues, I request that FERC, or the Company, as part of the DEIS process, provide detailed responses to the concerns and questions of New Hampshire residents, including the following:

~ The protection of drinking water is critically important to our state and our people. Many residents and municipalities have concerns about potential impacts on the region's water supplies, water quality, and water supply infrastructure from the development of natural gas transmission infrastructure. Has Tennessee Gas Pipeline Company compiled a complete inventory of potential impacts to water supplies and water quality from the proposed NED Project? If not, we request that FERC require such an inventory. What efforts will be undertaken to avoid or mitigate any potential impacts to water supplies and water quality? What, if any, short-term and long-term water quality monitoring will the Company conduct?

~ Many residents and municipalities, particularly those in New Ipswich and the surrounding towns, have concerns with potential air quality and emissions impacts from the proposed compressor station, as well as concerns about noise and the size of the proposed compressor station. What efforts will be undertaken to avoid or mitigate air quality impacts from the compressor station? How will Tennessee Gas Pipeline Company measure and control methane and other emissions from the compressor station? How will the Company measure any downwind air quality impacts? Are there alternatives to a 40,000 horsepower compressor station? To address noise concerns, we ask that the Company provide detailed information about noise impacts and mitigation related to the proposed compressor station.

~ Some of the towns along the proposed route are rural in nature and may have only limited emergency response resources. Will Tennessee Gas Pipeline Company work with communities to enhance emergency response capabilities? How will the Company monitor for potential safety issues?

~ There are many concerns that the project is not needed in our state, and that any regional benefits will not outweigh the impact on the communities along the proposed route. Does FERC's public need review consider where any unsubscribed capacity on the proposed line will be used? Does FERC's review consider any benefits that the project would have on system reliability and energy prices for all states in the region, including New Hampshire? It would be useful for stakeholders to understand the methodology that will be used to calculate these types of cost/benefit calculations in FERC's review of the project.

~ Many concerns have been raised that this natural gas will be exported to other nations. We ask that the Company provide a detailed response to these concerns, and to commit to using these supplies in New England.

~ The current proposal traverses primarily through communities where residents and businesses do not have access to natural gas. While we recognize the potential positive impact that increased natural gas supplies could have on energy prices across the region, we urge FERC to give serious consideration to alternatives that would place the pipeline closer to communities that will be directly served. In addition, we ask the Company to develop proposals that ensure that any impacted community will see energy benefits from a pipeline.

~ State agencies are currently reviewing the Company's Resource Reports and other filings and may have additional questions. It is my hope that you will require the Company to respond individually to state agency questions and concerns, as well as to questions and concerns from municipalities.

In addition to requiring the Company to address the questions above, I ask that FERC staff look closely at the proposed route and consider all potential viable alternatives. The siting of energy transmission projects must strike a balance between potential benefits in reduced energy costs and potential negative impacts. We must work to ensure that the potential negative impacts of the proposed NED Project do not disproportionately outweigh the benefits, particularly for the residents and communities that would bear the burden of hosting the project.

Thank you for your consideration.

With every good wish,

Margaret Wood Hssan  
Governor

Cc: Eric Tomasi, Federal Energy Regulatory Commission  
Allen Fore, Vice President, Public Affairs, Kinder Morgan

MEMORANDUM TO: Office of the Secretary

FROM: Paul Friedman, FERC staff

SUBJECT: Tennessee Gas Pipeline Company LLC, Northeast Energy Direct Project  
Docket No. PF14-22

DATE: August 21, 2015

Please place the attached document in the public files for the project proposed by Tennessee Gas Pipeline Company LLC (TGP) in Docket No. PF14-22-000:

~ Notes from a July 16, 2015 meeting between TGP, FERC staff, and representatives of various Indian tribes, held at the Foothills Performing Arts Center, Oneonta, New York.

The notes were taken by Cardno, the FERC's environmental contractor for the Northeast Energy Direct Project. The document is NOT confidential.

TENNESSEE GAS PIPELINE (TGP)

NORTHEAST ENERGY DIRECT (NED) PROJECT

FERC Docket No. PF 14-22

(Pennsylvania, New York, Connecticut, New Hampshire, Massachusetts)

MEETING WITH INDIAN TRIBES

AND THE FEDERAL ENERGY REGULATORY COMMISSION (FERC)

Thursday, July 16, 2015 (12 pm-4 pm)

Foothills Performing Arts Center

24 Market Street, Oneonta, NY 13820

Meeting Minutes

Attendees:

Eric Tomasi, FERC	Bryan Printup, Tuscarora Nation
Paul Friedman, FERC	Bonney Hartley, Stockbridge — Munsee
Oliver Pahl, Cardno	Doug Harris, Narragansett
Jennifer Ferris, Cardno	Muchquashim Heph, Narragansett
Jacquelyne Rocan, Kinder Morgan	Christine Abrams, Tonawanda Seneca Nation
Mike Letson, Kinder Morgan	David Weeden, Mashpee Wampanoag
Howdy McCracken, Kinder Morgan	Ramona Peters, Mashpee Wampanoag
Ed Gehres, Van Ness Feldman/Kinder Morgan	Jesse Bergevin, Oneida Nation
Perry Luu, Tennessee Gas	Eva Gibavic, Ceremonial Landscapes Research
Dell Gould, Louis Berger	
Rebecca Brodeur, Louis Berger	Attended by Phone:
Hope Luhman, Louis Berger	Mark Andrews, Wampanoag Tribe
Lynn Zakrzowski, Louis Berger	Elaine Thomas, Mohegan Tribe
Shaun Lynch, Louis Berger	

Meeting Summary:

12:00p.m. to 1:00p.m. - Lunch

1:00p.m. - Meeting opens

1:00to 1:20- Welcome, introductions, and safety briefing

1:20p.m. to 1:40p.m. — Mike Letson, Project Manager for Tennessee Gas Pipeline (TGP), gives Northeast Energy Direct (NED) Project Update

Discussion Points:

- ~ Second set of revised Resource Reports will be filed by TGP at the end of next week.
  - ~ The anticipated application filing date by TGP is October 2015.
  - ~ Surveys are still ongoing for wetlands, threatened and endangered species, and cultural resources.
  - ~ The pipe size for the portion of the proposed pipeline from Wright, New York to Dracut, Massachusetts (Market Path) is being reduced from 36 inch diameter to 30 inch diameter. Compressor stations that were previously proposed at 00,000 to 90,000 horsepower (hp) will be around 40,000 hp.
  - ~ Jacquelyn Rocu (Kinder Morgan) announced that there was a press release issued today regarding the change in pipe size. This change will be reflected in the forthcoming Resource Reports and the application.
- 1:40 p.m. to 1:50p.m. — FERC Project Manager Eric Tomasi gives project update and status of Pre-filing process.

Discussion Points:

- ~ The Notice of Intent (NOI) was issued by FERC on June 30, 2015.
  - ~ The scoping comment period ends on August 31, 2015.
  - ~ Compressor station location information was filed by TGP in June 2015.
  - ~ Eric requested that tribes send their concerns to him regarding the environment (e.g., cultural resources, plants, animals).
  - ~ Data requests will be submitted by FERC to the applicant for the revised Resource Reports and the application.
- 1:50p.m. to 2:30 p.m. — Dell Gould, Archaeologist from TGP contractor Louis Berger (LB), provides an update on the cultural resources studies.

Discussion Points:

- ~ The presentation slides will be sent to all meeting attendees.
- ~ Information was provided concerning cultural resource survey coverage to date, including parcel access mileage, survey corridor mileage, how many miles have been surveyed, and how many miles are left to survey.
- ~ Information regarding the status of project documentation for each state was discussed.
- ~ A list of tribal representatives who have received the required field training for the surveys was presented.
- ~ Training is open to all tribal representatives who would like to participate. Dell Gould (LB) requested that those interested should let LB know.
- ~ Doug Hams (Narragansett) requested that future presentations include information concerning findings so that more appropriate questions and feedback can be provided. He also requested information on the testing frequency.
- ~ Dell Gould (LB) stated that the number of sites found has been low and that isolated finds are the most common. The testing frequency varies from state to state and is also reflective of the probability model.
- ~ Doug Harris (Narragansett) asked what provisions were in place for tribes to look at areas and results of surveys that have already been conducted.
- ~ Hope Luhman (LB) stated that the tribal representatives will have full access to all final project documents

and that discussion can occur once the tribal representatives have reviewed them.

~ Mike Letson (TGP) stated that any immediate concerns with survey methods and site recordation should be brought up now so they can be addressed, and that areas would be revisited if needed.

~ LB will include preliminary results (Executive Summaries) in the weekly updates of survey details that are currently being provided to interested tribal representatives.

2:30 p.m. to 2:50 p.m. — Tribal representatives give update on tribal involvement

Discussion Points:

Bonney Hartley (Stockbridge- Munsee) stated that tribal participation in the field was hampered by insurance; however, now there is a waiver in place, which would facilitate tribal participation.

Mark Andrews (Wampanoag Tribe) is currently in the field conducting survey, which is progressing very well.

Bonney Hartley (Stockbridge —Munsee) and Mark Andrews (Wampanoag Tribe) are the only two tribal representatives that have been in the field; however, now that issues with insurance are resolved, access should be easier.

Stone landscapes are being recorded with a GPS unit and photographs, which will then be provided to tribes for input.

Doug Hams (Narragansett) feels that tribal concerns are not being met until there is an agreement between the tribes and FERC about tribal involvement for cultural surveys. He feels that without an agreement, the project is operating outside the Section 106 process and would like a redress of his grievance. A plan is needed that includes schedules and compensation. He states that in the AIM project, a letter was sent from FERC to the company advising them to enter into an agreement with tribes.

Ed Gehres (Van Ness Feldman/Kinder Morgan) noted that federal authorization may occur in the Section 106 process and that TGP/Kinder Morgan is struggling because they are not a consulting party.

Paul Friedman (FERC) stated that FERC is consulting under 36 CFR 800. FERC only does agreements in the event of adverse effects on a historic property, such as a Memorandum of Agreement. However, FERC could write a letter to TGP concerning tribal participation if a similar letter has been part of another docket, such as the AIM project.

Christine Abrams (Tonawanda Seneca Nation) noted she did not feel that the Tonawanda Seneca Nation needed an agreement.

Ramona Peters (Mashpee Wampanoag) does not agree with the predictive models and has been comparing them with their own models. Additional specific information would be good, particularly if there is potential to harvest plants within certain timeframes. Ramona will send the plant list to FERC.

Paul Friedman (FERC) mentioned that if a tribe becomes an intervenor on the project after the application is filed, then the tribe cannot participate in these meetings.

Jesse Bergevin (Oneida Nation) has been reviewing stone landscape pictures, which has been going well. Recommendation for a directive from the agency regarding identification standards and incorporation of the collective concerns of all the tribal nations so that all their issues can be addressed.

2:50 p.m. to 3:00p.m. -Dell Gould (LB) gives update on Near Future tribal participation.

Discussion Points:

Surveys are continuing in Pennsylvania, New York, and Connecticut. The New Hampshire SHPO has concurred with the Phase IA report. The permit for pedestrian survey has been submitted to the Massachusetts SHPO.

Weekly updates will be provided to tribes.

Information provided by Bonney Hartley (Stockbridge —Munsee) has been incorporated into the GIS layer that LB is using for predicting probability, the results of which may show that tribal input can help with

constructing predictive models.

TGP is working with adjacent right-of-way holders to find previously identified resources where the survey areas may have overlapped the NED survey corridor. Data gaps are being assessed for many resource areas (e.g., cultural, wetlands, threatened and endangered species), including where a portion of the survey area in Massachusetts overlaps with existing power lines.

3:30p.m. to 3:50 p.m. — Doug Harris (Narragansett) tribal representative, gives presentation on Ceremonial Stone Landscapes.

Discussion Points;

~ 36CFR800 provides the opportunity to identify and address impacts to ceremonial stone landscapes.

~ Approach should be to walk the site, identify those features that are ceremonial, map them, and then develop an avoidance plan. In developing plans, we should allow the landscape to speak for itself.

3:50p.m. to 4:15p.m. — Other topics or issues, closing questions or concerns, discussion of future meetings, closing prayer.

~ Mike Letson (TGP) asks tribal representatives to please provide suggestions for the weekly reports.

o Bonney Hartley (Stockbridge — Munsee) suggested the reports include a summary of any findings and a list of each state with the corresponding survey information.

~ Eric Tomasi (FERC) and Paul Friedman (FERC) clarify that other federal agencies should be working with the tribes through cooperation with FERC, who is the lead federal agency for the project.

~ Additional tribal meeting to be held at the end of August (possibly at the Mohegan Sun).

Paul Friedman (FERC) will send out an email with potential dates.

4:15p.m. - Meeting Close

July 21, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street NE, Room 1A

Washington, DC 20426

Re: PF14-22-000

Dear Secretary Bose:

I am writing to you regarding the proposed Northeast Energy Direct proposed natural gas pipeline and compressor station to be constructed in the town of Nassau near Burden Lake, New York. We are concerned with the possible environmental effects of the proposed construction of a 90,000 horsepower compressor station less than half a mile from Burden Lake.

Since 2007, the Adaptive Sports Foundation, which teaches sports to children and adults with disabilities, has been holding a three day retreat for our country's Wounded Warriors and their families at Camp Adventure on Burden Lake. This retreat includes waterskiing, wakeboarding, kayaking, canoeing, stand-up paddling, and tubing for wounded warriors and their families. Warriors bring their spouses and children with the goal of the event to be the inclusion of the disabled troops back into family activities. Our event on Burden Lake is part of our larger Warriors in Motion programming, which provides participating Wounded Warriors with a basic knowledge, and practice of wellness and the importance of lifelong healthful living. Warriors

engage through sports, outdoor activity, and recreation, and investigate how the physical self is tied to the emotional/psychological self, and how state-of-mind can affect the physical body. Our events at Burden Lake have a profound effect on the lives of our Wounded Warriors and their families.

Daryl Eddings, (Army 1<sup>st</sup> Sergeant, ret) states, ‘The Adaptive Watersports Festival on Burden Lake for Wounded Warriors gave me back a life I thought was lost after my injury. Not only was I able to realize I can still participate in outdoor activities, the event also taught our family how we can recreate together. The Burden Lake community gave my son opportunities I could not. Thank you and God Bless to all at Burden Lake!’

We are grateful to the Burden Lake community for their hospitality and support of this event. Local lake families provide volunteers, boats, and equipment for this event. We are also grateful that Burden Lake has been preserved so our nation’s heroes and their families find a relaxing, pristine environment to recreate and rediscover their family after all they have been through. The local Burden Lake Improvement Association through donations from the middle class lake residents has been extremely proactive in their quest to keep Burden Lake clean for current and future generations. Each year, the lake is treated for algae and they just completed a large community effort to bring sewers to the lake homes to ensure the lake remains free of man made pollution. The construction of the 90,000 square foot compressor station approximately a mile away threatens this beautiful and unspoiled environment. Invisible airborne particles released into the air through the various required “maintenance” actions of the compressor station have a high potential of affecting the ecosystem of Burden Lake and greatly affecting the health of the residents that live there.

We have a long history of serving our country’s wounded veterans on Burden Lake. Our retreat not only affects the lives of our Wounded Warriors and their families but the residents who participate as volunteers. We very much want to continue to do this for many years to come, however, the proposed compressor station threatens the health and future of the Burden Lake environment and therefore the future of our ability to continue to serve our Wounded Warriors and their families in this special but much needed way. We urge you to rethink the placement and/or the need of this compressor station.

Thank you for your time and consideration. Please do not hesitate to contact me if you need further information or have questions.

Sincerely,

Todd Mann  
Executive Director

Kimberly D. Bose

Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington D.C. 20426

Dear Secretary Bose:

I am writing to express my deep concern regarding the Northeast Energy Direct Project and the extension of the Kinder Morgan Tennessee Gas Pipeline. PF14-22-000. My concerns are largely regarding the environmental impact this project will have not only in Fitzwilliam but also the countryside of New York, the Hudson River, the Connecticut River as well as the many wetlands this project will traverse.

We live in a rural community rich in natural resources, wildlife and clean water. We live here not for the convenience certainly but to enjoy and appreciate the natural beauty that surrounds us. I have grave concerns about the change that will take place if this project is approved. Habitats are continually being destroyed. Fitzwilliam has actively tried to protect this with zoning laws and wetland ordinances as well as conservation land. Now we are left powerless at the mercy of a large corporation that will gain financially as we lose that which we hold dear...our properties, our surroundings and our quality of life.

I am retired, age 65. My home is the only home I own. I am home during the day. I enjoy the peace and quiet of our small town. I am worried about the noise pollution this project will cause. Our area does not have town water. We have an artesian well that relies on area aquifers. My water is drinking water quality and my hope is that it will stay that way. Blasting that will be required and disturbance of nearby wetlands are a threat to our aquifers.

Kinder Morgan may say that the land will heal and the wildlife and natural beauty will return. That may be true, however most likely not in my lifetime or that of my many elderly neighbors. Please consider the average middle class person. We will only be hurt by this project as 10% of the gas will be used in N.H. and certainly not by anyone in Fitzwilliam!

Sincerely,

Valerie Gill  
299 Upper Troy Rd.  
Fitzwilliam, NH 03447

## **20150824-0068**

Hand written FERC Comment form: Conner Kepcha, 20 Helenwood Lane, Averill Park, NH 12018, opposing.

Typed attachment:

Historically, this lake was man made in 1866 by Henry Burden. He made this lake so he could have enough water to supply his factories in Troy, NY. The lake has a historical marker that reads, "Enlarged by Wynantskill Imp. Assn. In 1866 the lake water turned the Burden Water Wheel which helped power the Industrial Revolution." This compressor station will wipe out the history of this lake. Not to mention all the other historical places such as Totem Lodge and it's now 18 hole golf course, the Boys and Girls Club known as Camp Adventure, and all the other Hotels and Casinos that once outlined Burden Lake. One historical place in particular will be greatly affected, and that is Kay's Pizza.

Kay's Pizza has been serving their famous pizza since 1958. Before Kay's, The Burden Lake House stood as a Hotel built in the mid 1800's. Today, Kay's Pizza has the number one pizza in the Capital Region and is visited by thousands of guests each summer. People come from all over the U.S. to try out Kay's famous pizza. This compressor station will deter people from eating and visiting this historical restaurant. The polluted air and water will make people shy away. Kay's business will plummet and eventually might cease to exist.

Myself and the residents of Burden Lake DO NOT want this compressor station. It has no benefit to us and will just cause pollution and noise. Not to mention cause fear in all of us if the station ever caught on fire.

The Burden Lake residents including myself have just installed sewer systems to help clean up Burden Lake. This sewer system project cost residents 3.5 million dollars. This money came from the New York Clean Water State Revolving Fund Program to help improve the water quality of Burden Lake. The names of Andrew M. Cuomo, governor, Matthew J. Ddscoll, EFC president and CEO, and Joseph J. Martens, DEC commissioner are on the sewer projects billboard located on Burden Lake Road. These people along with the fund program made it possible for us to have a cleaner lake and now this compressor station is being proposed a half mile away that is going to pollute Burden Lake even more! These sewers will now be pointless if this compressor station gets built and we will be paying \$1,200 a year for nothing. I am asking you to please stop this compressor station from being built. It is going to Bldg the natural beauty of this lake, the History, memories, and memories to be made by the current residents of Burden Lake.

Kiimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, Room 1A  
Washington, DC 20426

Dear Ms. Secretary,

My name is Josiah Barthelmess, I am 11 years old. I live across the street from the proposed compressor station in New Ipswich, NH.

Kinder Morgan's slogan is "we are good neighbors." Webster's Dictionary defines neighbor as a person who shows kindness or helpfulness toward his or her fellow humans. FERC how can a compressor station be my good neighbor? Do you think it's kind to emit toxins into the air I breathe? For the record, a good neighbor doesn't steal your stuff.

A good neighbor is someone you trust and respect. Good neighbors don't lie. Kinder Morgan says this is the only answer for New England. Yet we've heard right here, there are clearly better alternatives than this pipeline. FERC my question to you is can we start speaking TRUTH here? You have seen these last couple of days, that the residents of New Hampshire are not backing down. They are well versed, educated and far beyond thinking they will benefit from Kinder Morgan's lies. Hearing about taking the land of the people... all in the name of this "NEW ENGLAND ENERGY CRISIS". How can you even think of moving forward with this project?

This doesn't give my generation much hope in our government and the laws we the common people must abide by. How is it those with deep pockets can re-write the law? I asked my dad and mom to explain this to me and I didn't like their answer, that unfortunately this is the way the world works. Well that isn't good enough. What answer do you have for me? Aren't you a Federal organization, that will make sure Kinder Morgan follows the rules? Will you enforce them? What boggles my mind is why their rules are different than the rules we have to follow?

If this is what my federal government is like and what you stand for. I am moving to New Zealand. Please give me and my generation HOPE, that you are truly looking out for our best interest. And not that of a corporate giant, or the next corporate giant after that. You've already had a good look at me... RIGHT NOW... my generation is gathering in protest. The next generation IS being informed...;and I WILL make sure all will remember the decision that you will make in regards to this project. How do you want to be remembered?

I want to remember YOU.....as a good neighbor,,, someone I can trust and respect when this is all done. FERC at the end of the day, I want YOU to be able to hold your head high. I will.... because I fought for what was right. Don't let me down.

I promise... you will hear from me again... and the voices of the Kids of the Pipeline Resistance will continue to be heard.

Thank you for your time.

Josiah Barthelmess

Re: Tennessee Gas Pipeline Company, LLC. (“TGP”)

Docket No. PF14-22400: Proposed Northeast Energy Direct (“NED”)

I am writing to request that you take any and all measures available to stringently review and honestly evaluate the proposed Tennessee Gas/NED pipeline project. As a resident of Greenville, NH, a town affected by the proposed pipeline, I have grave concerns about this project, including:

~ The Public Utilities Commission’s paid consultant, Melissa Whitten, strongly stated that Kinder Morgan could not demonstrate the required need for this project. The only substantial contract in NH is with Liberty Utilities, a conveniently fabricated “customer” and a Kinder Morgan subsidiary. NH is currently a net exporter of electricity so the claimed need for extra natural gas to increase electricity production is spurious. No NEED.

~ New Hampshire would not be the recipient of any significant portion of the gas, and in fact, only about 4% of New Hampshire residents use natural gas. No BENEFIT.

~ Most of the gas is intended for export overseas or to Canada where gas prices are higher, providing huge financial benefit to Kinder Morgan. To accomplish this they will illegally use eminent domain to usurp NH homes and land. Then those affected will be asked to pay for this pipeline through higher utility rates.

~ Negative impacts would be severe on the safety, health and welfare of NH citizens, the ecosystem as well as the economy of the region. NH communities have a historic commitment to the environment and have actively worked to place significant portions of pristine wilderness into conservation trust. This pipeline would jeopardize many of these fragile watersheds and ecosystems as well as the water supplies of NH towns. Kinder Morgan sees “empty space” ripe for their picking and destruction. We see the natural beauty, wildlife and clean air and water that make NH unique and precious. Pipelines and compressor stations are exempt from Clean Air and Clean Water laws, allowing them to spew hazardous fumes into the air without regard for health consequences to people, farms, gardens, livestock and wildlife. This is unacceptable.

~ Existing pipelines owned by Portland Gas or Spectra could easily handle any projected needs for natural gas in the state without additional damage to property and ecosystems.

~ Kinder Morgan cannot guarantee the safety of their pipelines or compression stations and has a long history of safety “incidents,” poor honesty and transparency, failure to perform required maintenance procedures and slow response to emergencies. Their remote monitoring facility is capable of detecting pipeline leaks only after a leak of greater than 150,000 gallons. This in no way provides adequate monitoring for public safety. Local emergency services are not prepared for or able to handle a pipeline or compressor station emergency and the requirement to do so would place a severe financial burden on affected towns already struggling to balance budgets.

~ Current projections indicate that the Marcellus shale may only produce significant output for somewhere between 10 and 20 years, with some estimates as low as 8 years. Affected communities will then be left with an abandoned, toxic, obsolete pipeline still requiring tariff payments.

~ Investment of taxpayer dollars in non-renewable energy strategies and infrastructure which will be outdated within 20-25 years shows poor vision for future energy solutions for New Hampshire as well as globally. I respectfully ask that you rise to the charge of seeing that 'the common good' means we use restraint against an industry that wants to burn as much fossil fuel as it can, as fast as it can for their own private profit at the total expense of NH citizens. Neither NH nor the US will have time to create sustainable technologies if we continue to permit redundant pipelines like NED. The NED plan goes against the public interest. We ask you to refocus your mission and act as a good steward for the energy environment we face today and into the future by working to stop this pipeline project.

Thank you very much,  
Margaret Viglione

1889 S. Old Post Rd.  
Castleton, NY 12033

August 17, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room IA  
Washington, DC 20426

Dear Commission Members:

As the owner of property located at 1781 S. Old Post Rd, NY 12033 (Map/Block/Lot: 199.-4 -I), we are writing this letter in reference to Project docket number PF14-22-000 (Northeast Energy Direct Pipeline Project).

We are opposed to the pipeline project being proposed on the land of the Bulan Family Trust. In a rural area, such as ours, we know that pipeline safety standards are less stringent than in more densely populated areas. The fracked gas in this pipeline will need to travel at high pressure and this pressure will increase the likelihood of leaks, ruptures and/or explosions.

Pipeline leaks also pose a serious problem to the trust's land and environment. The proposed high pressure pipe line will be located over the Schodack Aquifer on the trust's property. We know that leaks can occur underground and be undetected. We also know that fracked natural gas uses chemicals that are harmful to humans.

Finally, the gas used in this pipeline is intended to be exported to the Canadian Maritimes. Putting the pipeline on the trust's property will not economically benefit us or members in our community. It will, however, lower the property value and bring considerable risk to people who live near the pipeline.

For all of these reasons, we oppose approval of the Northeast Energy Direct Pipeline.

David Bulan, Trustee                      Ida Bulan  
Benjamin D Bulan & Ida B Bulan Family Trust  
cc: Mr. Paul D Tonko, Member of Congress

RE: Docket No P14-22-000

Comments

Dear Ms Bose:

The following are our comments for submission to the Commission:

- New Hampshire is aptly known as the Granite State, which makes us justly concerned about the inevitable blasting required to bury the proposed Northeast Energy Direct. Our water well, along with hundreds of others, could be compromised when underground aquifers are disturbed.
- Another concern is devaluation of our property. Although we do not (at this time) about the proposed route, we are close enough to feel very vulnerable to decreased resale value on the property we have owned, maintained and paid taxes on for 49 years. We feel a much devalued sale price would be the only incentive for any possible property buyer to choose to be near a 30” natural gas pipeline.
- We feel there should be a restart of the scoping process. This would allow time to assess Kinder Morgan’s new and revised 6571 page Resource Report filed just days before and after the scoping meetings that were held locally.

Sincerely,

R. Brian and Peggy L. Morin

**20150824-0082**

Rev. Allen M. Humes  
 Post Office Box 23  
 Winchester, New Hampshire 03470

Kimberly D. Bose  
 Federal Energy Regulating Commission  
 888 First Street, NE  
 Washington, D.C.

Dear Members of FERC;

Though this letter comes from only one citizen, I am confident that it represents the thoughts of hundreds, if not thousands, of other citizens. I write in strong opposition to the proposed Northeast Energy Direct natural gas pipeline that Kinder Morgan/Tennessee Gas Pipeline proposes to build in New England, New York and Pennsylvania. This concerns Docket P F 14-22. My opposition is based upon several factors:

#1 The proposed pipeline will be an environmental disaster. As proposed, it will ravish many pristine rivers, streams, and forests. When will we stop destroying our precious natural resources at the expense of greed and profit? The pipeline cannot be built without enormous environmental costs to this generation and the beyond.

In our local area of Winchester, New Hampshire, the proposed route will devastate the natural beauty of Pulpit Falls, a pristine piece of land recently acquired by the Conservation Commission of the Town of Winchester. This is an ecological gem in the state of New Hampshire, if not the entire nation.

#2 The proposed natural gas pipeline moves in direct opposition to the Obama administration’s intent to rely less and less upon fossil fuels. We can be proud of the fact that our nation is relying more upon renewable sources of energy. There is no present or recognized need for additional fossil fuel energy in the northeast. The pipeline is a step in the wrong direction.

#3 The proposed pipeline opens the dangers of serious accidents. Is it worth the risk of the loss of life should an accident occur?

#4 These final reasons of opposition are personal since I am an abutter to the proposed route of the pipeline. It will pass about 15 feet of our home.

- a. I am concerned with how the pipeline will effect the value of my property. My home is a major part of the investment I have made for my future. As a retired person, I am relying upon the value of this home and its surrounding acreage for my future. Undoubtedly, the value of the home and land will be negatively impacted by the pipeline.

b. I am concerned with what the digging, and perhaps fracking, will do to my well. For years we have enjoyed fresh water from our well and it will be threatened by this disturbance to the land.

c. I do not want the land next door to be raped! The beautiful woodland supports the growth of trees, the abundance of wildlife, and the birds of the air. Do not take away their habitat. It was recently recognized as one of the most pristine animal corridors in the state.

Thank you for considering these sound reasons to deny Kinder Morgan permission to confiscate this land by eminent domain. I urge you to do all that is in your power to oppose the pipeline!

Sincerely,

Rev. Allen M. Humes

**20150824-0086**

August 11, 2015

Attention: Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission

Docket No. PF 14-22-000

I am Michelle Curtis-McMahon, and I live at 166 Clarks Chapel Road. I have lived at that home since July of 2000. It is the same home that my grandparents raised their three children in, a home that was passed down to my father. It is the family homestead. My grandfather was a master gardener; photos of his gardens were featured in Better Homes and Gardens on many occasions during his life. I am glad he is not here to see this nightmare that my family and the families of my neighbors are opposing.

On June 2, 2015 Kinder Morgan announced that the property directly abutting my home was a proposed site for a 90,000 horsepower natural gas compressor station; here we are starting the scoping process and now Kinder Morgan announces that they will be decreasing the size of this project. At this time all we know is that the pipeline itself will no longer be 36", it will be reduced to 30". The total capacity of this line will decrease from 2.2 billion cubic feet of natural gas per day to 1.3 billion cubic feet per day. What will the size of the compressor station be for this new project model... as of July 24, 2015 it was announced that the new compressor station would be 41,000 horsepower and still run on gas fueled turbines.

More importantly, if Kinder Morgan now proposes such a drastic drop in capacity for this line, is there a true need for nine new compressor stations and re-routing of the current pipeline? It would seem logical that updating the current infrastructure to make it more energy efficient and replacing lines that are 50 or more years old would be a more prudent track to take. Even with routine testing it is becoming more likely each day that seals and welds along this pipeline will fail. Kinder Morgan reported that the scaled back model is based on current firm subscription for service. It appears that Kinder Morgan's initial projections for contract expansion were unsuccessful during their open season recruitment. Upgrades and replaced lines would likely provided the same volume of product to be transported while decreasing pollution from existing lines.

Even at a reduced size and capacity this massive industrial complex will forever change the landscape of our peaceful rural residential neighborhood. The location of the proposed site is zoned rural residential and it is against town law to build and run this kind of infrastructure. Are we as residents to understand that town laws meant to protect our homes and property are useless in protecting our investments in the face of corporate expansion?

Despite claims from gas companies numerous studies have shown that this type of operation will cause pollution of our air, our water, our soil and even subject residents in the community to constant 24/7 noise. Dark country night would be disturbed by the glow of lights that will illuminate the complex. Methane, benzene, toluene, formaldehyde will be emitted from the site at levels that are high enough to cause damage to ground water and air. We all have wells that supply our drinking water to our homes. Our animals... dogs, cats, sheep, chickens, horses and cows will also be drinking this water. We worry what these pollutants will do to us, and the risk of this is simply unacceptable. NYS DEC banned the fracking of natural gas within

this state because continued exposure to these chemicals has been shown to cause cancer and many other health problems. Pipelines are largely unmitigated and loopholes exist that benefit the gas companies but not those who reside along the pipelines. Lengthy legal battles and improper use of eminent domain make it extremely difficult for residents to protect their investment in time, money and property.

There is an un-named stream that runs through my property and continues through the site where Tennessee Gas has expressed interest in building this compressor site. This stream is a tributary to a portion of the Valatie Kill in Rensselaer County, which has already been identified as a waterway of concern in regards to this project. The Valatie Kill is regularly tested by the EPA for pollutants due to its proximity the Dewey Loeffel Superfund site. The 16-acre unlined dump contains about 46,000 pounds of PCBs, solvents and other toxic chemicals that were illegally dumped from GE, the former Schenectady International and Bendix from 1952 to 1970, when the dump was closed by court order. It is located on Mead Road less than a mile from the proposed compressor station. The battle to clean this site has spanned decades and is still regularly tested to ensure that additional toxins do not continue to enter the ground water and the wells that supply drinking water to the homes of residents who live in this area. This stream will pass along the western edge of the new compressor site, and any pollutants that do settle in the land and water near it will be swept downstream.

Additionally, the town roads in the path of this pipeline are not rated for the industrial traffic necessary to build it. As stated in the Town of Nassau, REPORT ON THE POTENTIAL IMPACTS TO THE NATURAL RESOURCES FROM A PROPOSED NATURAL GAS Pipeline, May 12, 2015- "Compressor station components, including the compressor turbines and associated equipment, are over-sized facilities that will require large truck-trailers for component deliveries. Clarks Chapel Road is posted with 10 ton weight limits, due to significant limitations of bridges near Central Nassau Road and Slivko Road. Slivko Road is a single lane, dead-end dirt road with limiting grade and curving alignment. County Route 15 has extremely steep slopes to both the east and west that will limit accessibility to locations along the transmission line corridor from the roadway. These three roads represent the primary access routes to the proposed pipeline corridor location along the electric transmission line route in Nassau. Boyce Road in the Town of Schodack is the access point to the corridor to the western side of Nassau, and there is a pond completely crossing the electric transmission corridor that precludes access from the west. These limitations on accessibility should be identified as limiting the feasibility of developing a mainline compressor station within the identified compressor station study corridor in the Town of Nassau."

Residents walk these road ways with their families and pets. Clarks Chapel Road is part of a county wide bicycle touring route. Horseback riding is a familiar sight on this road. The introduction of up to a 10 acre industrial complex will detract from the peaceful, tranquil country setting that residents and visitors alike come to the town of Nassau for. The property itself is less than a mile away from picturesque Burden Lake that is known to be nesting site for federally protected Bald Eagles and is a popular summer haven for the communities of Averill Park, Nassau, Schodack and Stephentown. This particular portion of Nassau also known to be home for various other types of wild life including bears, owls, foxes, various types of woodpeckers, coyotes, moose and so much more. Bald Eagles have even been photographed on the proposed compressor station site.

My two year old son loves to play outdoors. He enjoys smelling the flowers, and feeding the horses grass. He spends as much time as he can playing in his pool and chasing the dogs around the yard. If you issue this certificate and this compressor station is built that will no longer be possible. Large Titan turbines will be running 24/7 to power this gas powered station, and the noise level will be comparable to a bulldozer idling in our back yard all day, all night. What will that kind of noise do to his developing ears? I worry about that, almost constantly these days.

What happens when a routine or an emergency blow down occur, and the noise level has jumps from a bulldozer to a jet engine... how am I to protect my son, myself or my animals? Fireworks over the Fourth of July week frightened my animals so much that I had to put them in the barn... there is little doubt in my mind that a blow down would cause them to harm themselves, perhaps even break free of their fenced in pasture to

try and escape the deafening noise coming from the station. Are there plans for blow down silencers like the ones that are used in residential areas for this compressor station... without them those residents that have farms would live in constant fear of a blow down and the resulting reactions of our cows and horses. Make no mistake- we are a rural residential neighborhood. There are over three hundred homes within two miles of this site... and six working farms (this does not count the smaller “hobby” type farms that are within this zone). These homes belong to families that never signed up for this kind of infrastructure to be in their own back yards. Imagine if you will a child taking riding lessons when a blow down occurs. Even the most well trained animal will panic, and the child (or even an adult) would be thrown from that horse, severely injured or killed because the animal has reverted to its basic instinct to flee when frightened. Emergencies occur and blow downs will not always be scheduled... is human life worth so little that this concern is of no consequence to the forward motion of this project and the gas that is supposed to move through our community to serve others? I fear you will find few who would agree that this is an acceptable reality.

I am curious as to why pipeline companies are allowed to choose between gas powered and electric powered compression? Emissions and noise are the main complaints from residents who currently live near compressor sites. As a nation, we are striving to reduce our carbon footprint by 2030. Though I understand that the gas is simply there and the initial cost is lower to install the gas run option, I can't help but wonder why the significantly quieter electric compressor station is not considered the preferred option. Electric compressor emissions are near zero in regards to hydrocarbons leaking into the atmosphere. Stations run by electricity can be outfitted with vapor recovery units and flare systems on the tanks are some of the main reason for the decrease in emissions. The units themselves remain pressurized during shut downs which would reduce start up time. This option may even result of in a smaller site footprint. The overall maintenance cost of one of these stations would be lower despite the initial upfront cost. The amount of product that will be saved will pay this back, so again, why place the environment and residents at risk?

What will be done to protect our homes and our lives? Communities in the path of this pipeline are full of people, families that worked their whole lives for the land and houses that they call home. These same people use their hard earned money at local businesses and are the heart of this American dream that our ancestors fought so hard for. We are being asked to accept all the risk- the half mile buffer zones where we may see all that hard work burned to ash should the unthinkable occur, the basic natural fear that may grip our pets and livestock during a blow down, the exposure to cancer causing pollutants in the air we breathe and the water we drink. The pipeline through Rensselaer County will run parallel to high tension power line which have been shown to increase to corrosion rate in pipelines, and at this time we understand that the lowest grade materials allowable by federal regulation will be used in the construction of this pipeline due to the “lower volume of affected population within proximity to the project.” Don't tell us that these risks are not real, we know they are.

It will be very difficult for our volunteer fire departments and ambulances to help us if the pipeline or compressor station fail. In the event of an emergency the following safety procedures would likely be in effect based on industry policies and procedures: ~ Contact the pipeline company ~ Secure the area ~ Evacuate as necessary ~ Stay upwind ~ Do not attempt to put out fire or operate valves ~ Attempt medical assistance if it is safe to do so ~ Establish command center for when pipeline company team arrives (as cited in: Northern Natural Gas Safety 4 Public Awareness General Guidance for Emergency Responders k Jim Hartman, TGP Right of Way Agent, select board meeting, Warwick, MA, May 13, 2014)

They are not equipped to handle the types of emergencies that are a risk of having facilities like this in our town. Manned by volunteers, it is not guaranteed that there will be crews available to respond especially during daytime hours, or that sufficient personnel will be available to effectively evacuate residents should that become necessary. Rensselaer County relies on mutual aid to ensure service to its residents, though in a emergency primarily volunteer area resources will be quickly overwhelmed.

Gas and oil companies across the country have shown little concern with these realities. Communities are not thriving where these pipelines and compressor stations are built. Homes have been devalued, homeowners insurance has been cancelled or rates are now too high for families to afford, life savings have been

washed away in the fight to protect home and hearth, all because they became the unknowing, unwilling neighbors of a natural gas compressor station. As these properties lose value a necessary shift in the tax base will have to occur, and residents that thought they had avoided the direct impact of this project will find it appearing in their yearly tax bill. The needs of people hundreds and even thousands of miles away are cited as the reason for the destruction of home and property. Yet Kinder Morgan and Tennessee Gas ask you to issue a Certificate of Public Convenience and Necessity in a massive, multiple state expansion of current pipeline infrastructure. Pollution in the form of noise and emissions and a massive industrial complex is not convenient to the public that calls this town home. Kinder Morgan has already had to scale down their project once because they were unable to secure new contracts for the natural gas they want to transport through our yards.

The nation is starting to move towards renewable energy sources. Geothermal, solar and wind energy is harnessed throughout this area, all you have to do is drive through our town to see it. We love our farms, our access to lakes and rivers and streams. We did not sign up for this; I did not sign up for this fifteen years ago when I chose to settle in the home that once belonged to my grandparents. These risks will be ours if this compressor station is built, risks that we are asking you now to save us from.

What will your agency tell us when this review is completely over? Will the land that we as the residents affected by this project still be ours? We have worked hard to make our homes strong, peaceful and free. The truth is that we hope you as an agency will see the value of the land where our homes are as more than a conduit for a corporation that has only its own needs in mind. Kinder Morgan continues to release proposals and updates that are incomplete. We are being asked to comment and offer suggestions to proposals that are full of TBD materials. This portion of the process is unfair to the residents in the path of this pipeline. The reality is that we as residents are set at a disadvantage from the start. Yet we are here, we are trying despite insurmountable odds.

We ask FERC to hear us and give us the same level of consideration that the gas companies are given. We hope the agency can see what will be lost in terms of open land, tourism, and communities who band together to protect what we have worked so very hard to have. The fate of our homes should not be in your hands, and yet here we are. What will your choice be, we have made ours. I, Michelle Curtis-McMahon oppose this pipeline and compressor station for myself, my family and all my neighbors. I sincerely hope that is enough to save my home that has been in my family for 68 years.

Sincerely,

Michelle Curtis-McMahon

Docket No. PF14-22-000

Date 8-16-2015

Kinder Morgan Pipe Line

Dear Kimberly D. Bose, Secret Federal Energy Regulatory Commission;

The Kinder Morgan Pipe proposal through NH is not good for NH residents and its' habitat. It comes across like the story of David and Goliath. How many no's does it take to stop a multi- billion dollar industry from putting a huge scar across the state of NH?

From what I can understand is that NH has the second highest electric rate in the country. But why is that. We have a nuclear power plant that should have provided a lower cost of electricity. We the people can do better than this. There are some of us out there who still believe in United We Stand. Solar Power and Wind Mills is increasingly on the rise. I like what New Zealand did with their ocean tides even though their tides are higher than ours. They generate electric power from it. Ocean tides are like freight trains. It just keeps on plowing through.

If anybody has just a little understanding of the beauty of what NH habitat has to offer, they would realize

that Kinder Morgan super power heads will break our state in the most destructive event ever recorded. The habitat will never recover even after seventy five years and our children's children will never experience the habitat like we have had experienced in our life time.

Therefore I ask that FERC deny the construction of this pipe line which will not be of any benefit to the people of NH.

Effected property owner

John F. Orthmann  
37 Comstock Drive  
Milford NH 03055

July 28, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission 888 First Street NE, Room 1A Washington, DC 20426

Subject: Northeast Energy Direct FERC Docket #: PF14-22.{}00

Proponent: Tennessee Gas Pipeline Company, L.L.C.

Tennessee Gas Line Pipeline Concerns

The Dalton Fire District (DFD) owns land in Dalton, Windsor, Hinsdale and Peru that is being affected by the Tennessee Gas Pipeline (TGP). To this date, the DFD is not aware of any surveys for environmental, biological, sensitive habitat or cultural resources completed or even begun. We would request that the Federal Energy Regulatory Commission (FERC) require a full "Environmental Impact Study" be performed for:

What will this do to our land quality?

Wildlife and vegetation?

Water quality?

We are the only Zone A watershed Impacted.

Flow of water to rivers and reservoirs in the entire Dalton water shed?

Timber sales and future timber sales?

The pipeline runs through our watershed and next to a public water supply well. There are three watersheds: the Egypt and Anthony in Dalton and the Windsor/Cleveland which starts in Hinsdale, running through Peru and Windsor. The Cleveland, Windsor, and Egypt reservoirs along with the Anthony Brook and Cady Brook Headwalls are the primary and emergency backup drinking water supplies, respectively, for Dalton. The Cleveland Reservoir and Cady Brook Headwall also serve the City of Pittsfield and the towns of Lanesboro, Lenox and Richmond. This affects tens of thousands of people and industries in our area. All of the reservoirs and filter plant are fed by streams and underground springs. Some of these streams cross the corridor in which the pipeline will be installed and the construction of the pipeline will directly impact these water sources.

We ask that you clearly identify the probable impact radius for potential explosions for the entire pipeline infrastructure, based on the proposed size and pressure of the pipeline. Document the High Consequence Areas (HCA) and the method used to determine them, including quantification used as the basis for each HCA. Identify all structures, public facilities, and areas commonly used by the public (trails, playfields, camping

and picnic areas, etc.) within the potential impact radius. Clearly identify the proposed distance between and which valves will be manually, remotely, or automatically operated in the case of a pipeline system failure.

We have compiled a list of questions and stated our concerns in this letter regarding the potential for unreasonable risk posed to human and environmental health. We respectfully ask FERC to have the TGP provide us with answers to our questions and our concerns. We need to feel comfortable with the unknown to protect the water supply for our town, the towns of Lanesboro, Lenox, Richmond and the City of Pittsfield, and our water shed wildlife and vegetation.

**In General:**

1. After the original pipeline is installed, can TGP tap into it at any point?
2. If there is a slow gas leak, how many cubic feet of gas will escape before a leak is detected?
3. What are the long term effects to the soil in the event of a spill or major break?
4. Would the precipitate from a break contain chemicals that could migrate into the reservoirs polluting the water?
5. How much fuel would be released given the type of valve and resulting time required to shut the valve off and the distance between valves in the case of a failure?
6. How will the pipeline on DFD land affect the property values?
7. If there is added value, how will the DFD be reimbursed for this?
8. How will the pipeline be marked so that snowmobilers and 4 wheelers will be made aware?
9. What is the maximum weight and speed that is safe to drive over the TGP pipeline?
10. What are the means to maintain access and function during severe winters, heavy winter snows, deep frost and spring mud seasons on our land?
11. The cost of any emergency response related to the construction, maintenance, or failure of the pipeline cannot be borne by the DFD. How will TGP ensure these costs are paid for?
12. We ask that FERC direct TGP to mitigate the adverse impacts on public health and safety by:
  - a. Require TGP to apply for and receive local permits for construction on local roads.
  - b. Minimize the use of open cut construction across public roadways.
  - c. Clearly identify any proposed locations where construction activities will potentially negatively impact emergency responses. Develop and implement a plan agreeable with the DFD.
  - d. Meet with the DFD fire and water personnel at least 2 weeks prior to commencement of any construction activity on our land to review plans and the construction schedule in order to coordinate responses and continue to meet every 2 weeks during the construction period.
13. Require TGP to enter into binding hold harmless agreements with the DFD which protects the DFD from damages resulting from pipeline construction activities.

**Compressor Station:**

Our reading materials provided suggest that water is removed at the compressor stations.

1. What are the disposal methods with the liquid waste extricated from the pipe?
2. What are the procedures used for the extrication?
3. How often does this procedure take place?
4. Do you notify the town, district or land owner when you perform the pigging operations?

**Water bodies construction crossings. drinking water impacts:**

The DFD needs reassurance that our drinking water will be protected. We specifically need diligent envi-

ronmental protection at the following locations in Dalton, Hinsdale, Peru and Windsor.

<u>Mile post #</u>	<u>Area Affected</u>
9.7-11.3	Anthony and Egypt Watershed, Surface Water Protection Areas, Zone C
9.8-10.4	Anthony Brook headwaters, Water Supply for Dalton
10.9-11.1	Egypt Brook Headwaters, Water Supply for Dalton
11.0-11.3	Close proximity to Egypt Reservoir
12.3	Wahconah Falls Well Head
13.0	Close proximity to Windsor Reservoir Watershed
13.5-13.6	Aqueduct that feeds water to Cleveland Reservoir from Cady Brook & the East Branch of the Housatonic River
13.5-14.2	Cleveland Reservoir Watershed within ~ mile of the Buffer Zone
15.0-15.1	Cady Brook Zone A Protection Area, Water Supply for Dalton & Pittsfield
14.3-16.7	Windsor Reservoir Watershed Protection Area, Zone C

1. What are the specific procedures you will use on DFD land, watershed, and water crossings? (i.e. reservoirs, streams)
2. How would you prevent contamination to our watershed and streams from trench dewatering?
3. How would you handle an oil or fuel spill from a construction vehicle?
4. What herbicides, if any, will be used and how will that directly affect the drinking water supplies?

Before the gas pipeline is placed into service, it is pressure tested with water. The migration of water along the pipeline in this testing phase may contain invasive or foreign water borne flora and fauna.

1. What prevention measures will be put into place to prevent drinking watersheds contamination from this?
2. Where does the water come from to perform the testing?
3. What chemical contaminants will be in the water to be discharged?
4. How is that water discharged?
5. Where is that water discharged?
6. How would you prevent contamination from ROW runoff before vegetation is established?
5. How would you remediate in the event of water supply contamination?
6. What are your restoration measures?
7. What is your post construction monitoring of re-vegetated areas?

The DFD would request that a truck washing station be implemented to prevent the introduction or spreading of invasive species and vegetation between work sites. We request that no blow off, compressor, meter or pig stations be allowed on District lands. Provide the DFD with funding to hire onsite Environmental Engineer and Construction Inspector, with DFDs approval of choice, to be on all work sites on DFD lands to ensure proper procedures are followed. The DFD would ask that testing is completed to establish baselines for water quality and existing flow rate in the Windsor, Egypt and

Cleveland Reservoirs, the headwalls on Anthony Brook and Cady Brook and the Wahconah Falls Well. The DFD would require that continued water quality monitoring be established to assess contaminants associated with the pipeline construction and operation every 6 months. Clearly layout the ongoing inspection protocols for the pipeline once in operation. Define the frequency of internal inspection for corrosion or the damage to the pipeline.

### **Blasting:**

Before blasting begins a permit must be issued by our fire chief to ensure Massachusetts General Laws are being followed. We prohibit the use of explosives containing per chlorate. The DFD will also prohibit storage of explosives on DFD lands. We also require that we be notified of the blasting days and times. Dur-

ing construction, analyze the impact of blasting necessary to remove rock. Determine the area of potential concern regarding rock throw and seismic impacts due to blasting activities. Determine the impact of construction activities, particularly on reservoir dams and the condition of the infrastructure given the age and condition of the water mains and aqueduct.

1. What are the specific blasting techniques used on district land?
2. What chemicals will TGP be using in the blasting on our land?
3. What land and water contamination prevention measures will be put into place?
4. How will TGP guarantee that blasting won't impact wells, the dam, streams and springs that feed the reservoirs - structurally or via underground movement? It is important to be aware that we have substantial frost here which moves the ground/ damage may not be immediately evident.
5. What are the safety and security measures for transporting and storage of construction explosives in Dalton?
6. Will security be provided during construction for the explosives and construction?

### **Fire Department:**

Initially, there are concerns for safety during the construction phase. The DFD needs access for all emergency vehicles on the construction sites. We would ask the TGP conduct a full assessment of the training, equipment and supplies needed for emergency response to incidents involving the Northeast Energy Direct (NED) Project, during construction or continued operations, as part of the NEPA process and that all impacted emergency responders have the capacity to respond appropriately to pipeline related incidents. The DFD is a volunteer fire department with both fire fighters and EMS personnel. Our average response times are 3 - 8 minutes depending on the location to the call from the fire station and the location of our volunteers when the call comes in. Our equipment inventory includes: 3 pumpers, 1 ambulance, and 2 old military vehicles converted for use on brush fires. The DFD respectfully requests no blow off, meter, compressor or pig stations are allowed on DFD lands.

1. The DFD does not have a safety vehicle to handle emergencies in this kind of project. We will need to acquire a safety vehicle to perform medical and fire rescues. Are there funds available from TGP for this?
2. All construction roads need to be properly maintained at all times. Is there security for this?
3. Where will the pipeline shutoff valves in and nearest to Dalton be located?
4. How will the shut off valves be marked?
5. Who can shut off the gas once a leak is found?
6. How long will it take for TGP operators to access and shut off these valves in our area?
7. What is the "Standard Operating Procedure" to shut off the gas in an emergency?
8. What response measures are to be taken?
9. What are the wildfire impacts from the clearing associated with the construction?
10. Provide the fire department with a list of hazardous materials which will be present during construction. Provide training to them on appropriate responses to incidents involving those hazardous materials; provide additional material or equipment necessary for the fire department to safely respond.

### **DFD Timber stands:**

The DFD would like one rotation of timber for regeneration and growth. We need access to our forest lands. We want an access road running parallel with the pipeline with marked crossing points every ~ mile. At the crossing points, the pipeline needs to be buried deeper or protected for heavy equipment.

1. How would the pipeline address access for forest cutting equipment on DFD lands?
2. How will the access points be marked?

3. Can the DFD limit the amount of land to be cleared?
4. How would the loss of future income be addressed?
5. What is the weight that the crossing will handle without damage to the pipe?

Due to the substantial concerns we have for the safety of our drinking water and surrounding watersheds, as well as for issues related to the pipeline crossing in the vicinity of Route 9 and populated areas of town, we have recommended an alternate route through Dalton, which will negate a majority of the concerns we have with the current pipeline route, and connect back to the route proposed for Windsor. It is as follows:

At coordinates 42 degrees 30' 45.94"N, 73 degrees 09' 14.61"W the pipeline will turn Northeast for 3.1 miles to coordinates 42 degrees 32' 19.48"N, n degrees 06' 17.93"W. At this point the pipeline will turn East for 3.1 miles to coordinates 42 degrees 32' 16.00"N, 73 degrees 02' 36.36"W and turn again heading Southeast for 3.32 miles to coordinates 42 degrees 29' 52.17"N, 73 degrees 00' 24.04"W. This will bring the alternate route back to the proposed pipeline in Windsor without the need to cross the watershed or Route 9, Wahconah Falls Brook and the headwaters of the Westfield River.

Again, this alternate route avoids our watershed, populated areas of town, 2 major road crossings, an Interim Wellhead Protection Area, Massachusetts Biomap 2 Critical Natural Landscape, Natural Heritage & Endangered Species Program Priority and Estimated Habitats, the Wahconah Falls Brook, farm land and privately owned timber lots. Furthermore, out of the 7.2 miles of proposed for Dalton's pipeline layout, at least 4.2 miles will have a direct impact on our watershed - all of which will be avoided with the alternate route, which is also entirely within State (and possible Federal) owned property with some privately owned land.

Respectfully,

James O. Driscoll, Chairman  
Board of Water Commissioners

Camillus B. Cachat, Jr.

Michael J. Kublick

15. Side Note there are two side roadways Into the Power Lines coming from Old Windsor Road. Roadways are Hinsdaie Road. Mile Maker 14.8. The other is Crane Road. Mile Maker 15.6. Both these roadways transverse thru the Windsor Reservoir Water Shed.

16. Side Note: There may be numerous Culverts that are Unknown on the entire Pipeline Route from Mile Maker 9.5 - 17.

Proposed Kinder-Morgan Pipeline Environmental Impacts Dalton Watershed

*{2 pages of maps not included here}*

## **20150824-0092**

Dear FERC,

I oppose the Tennesse Gas Pipeline Company's Northeast Energy Direct Project Docket NO.PF14-22-000 (Kinder Morgan Company)

I moved to New Hampshire 30 years ago from Massachusetts because I wanted to live in a country setting. I have it, my yard is all trees and grass and beyond the edge of my property in the rear is Beaver Brook a wetland.

I live right next to National Grid power lines. I have let my trees grow for 30 years to block the view of the power lines. This Gas Pipeline would chop down all my trees and maybe take my house by eminent domain. I am really scared to lose my home. I am 62 years old and was planning on dying in this house.

I know many other people in New Hampshire from meetings and get together that oppose this pipeline as much as I do.

I think you (ferc) should study this route thru New Hampshire and find an alternate route that does not go thru so much wetlands destroying the enviroment. Enclosed is a picture just beyond my back yard of Beaver Brook a nature wetland. I attended a Ferc meeting at the Radison Hotel in Nashua New Hampshire and heard of hundreds of wetlands that would be affected.

New Hampshire is famous for country settings. Lakes, ponds, rivers, streams, forests etc. This project would destroy thousands of trees and go under hundreds of wetlands.

I have constantly been told this pipeline would not help the New Hampshire and Massachusetts gas Quantity or lower prices. so why is this pipeline being built.

At the meetings I have attended I was told Ferc already approved some fatter pipelines. In fact Ferc approved the SPECTRA AIM Project in March which if built later this year and next would take care of all the recent demand. The need of the Kinder Morgan Tennessee Gas pipeline appears not to be a need for cheap gas for New Hampshire and Massachusetts but for Kinder Morgan to add more profitr for this billion dollar company by destroying the lives and land of thousands of dtizens of New Hampshire and Massachusetts like me.

Also I was told there are other pipelines in place which are not fully utilized. There are new pipelines under construction that will provide customers 3 billion cubic feet per day of Pennsylvania Gas. The REX pipeline and the Niagara Expansion.

Also National Grid is adding a major new construction In the spring of 2016 of new electric 315 hundred thousand volt electric power lines in the middle of the 2 existing power lines that are next to my yard and house. I have received notification offidally in writing of this project from National Grid Eversource.

Thus in summary please study this project Docket No. PF14-22-QOO and study if this pipeline is really needed. This project will destroy so much of what makes New Hampshire, New Hampshire.

Richard and Kathleen Kres  
9 Tina Ave  
Pelham, New Hampshire 03076

## **20150824-0093**

August 15, 2015

Ms. Kimberly D. Bose, Secretary  
The Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

RE: Docket Number PF14-22-000

Dear Ms. Bose:

As an abutter, I've been advised by some very learned people who apparently know a lot about this process that in order to give these comments the best chance of being taken seriously, I need to stick to facts and nothing but facts, while at the same time offering suggestions for ways to address these adverse environmental impacts. Why it's my responsibility to solve problems I didn't have a hand in creating and that I'm not being paid to solve is an absolute mystery to me, but since I happen to have a few recommended solutions anyway, I've included them.

Most of the environmental impacts detailed below are based upon my own site measurements, all made consistent with the Interstate Natural Gas Association of America guidelines specified in the attached drawing entitled "MAINLINE CONSTRUCTION PARALLEL TO POWER LINES RIGHT-OF-WAY". The drawing is numbered STD-INGAA-5 and is taken from a much larger document with which I'm sure you are familiar: "Building Interstate Natural Gas Transmission Pipelines: A Primer", available on the INGAA web site and carrying a publication date of January, 2013, with Kinder Morgan (KM) listed as a Key Contributor. While admittedly not a professional surveyor, I have taken and re-taken these measurements a total of four times now. They are accurate to +/- 3' and significantly more accurate than the CAD drawing of our home published without our prior knowledge by KM in its most recent Draft EIS.

### Issues

- If INGAA guidelines are adhered to, the currently proposed pipeline routing would place its centerline within twenty (20) feet of our home, not the forty-one feet indicated by KM in the most recently published Draft Environmental Impact Statement, Drawing MK-SEG\_I-RES-001.
- Adhering to the INGAA guidelines means that there simply isn't enough room between the electric transmission lines and our home to allow for placing the pipeline between our home and the current Eversource right-of-way without the permanent pipeline right-of-way encroaching on a portion of our house.
- Given the planned permanent right-of-way width of fifty feet as previously stated by Kinder Morgan representatives, adherence to the INGAA guidelines will mean not only a permanent right-of-way on our property, but a permanent right-of-way through a portion of our home.
- The loss in value to our property and home will most certainly approach 100% under this scenario as it will be impossible to sell the home and equally impossible for a prospective buyer foolish enough to try and purchase it to obtain insurance or financing with an easement running THROUGH the house. Who in their right mind would agree to be obligated under an easement to seek Kinder Morgan's approval to re-paint their kitchen or install a new garage door? It's beyond absurd.
- If INGAA guidelines are adhered to, excavation and blasting will occur within twenty feet of our home, subjecting the structure to potential damage caused by flying debris, concussive blast waves, heavy con-

struction equipment and construction personnel, and subjecting the occupants of the structure (our family) to physical and psychological stress and physical injury caused by such activity.

- If, on the other hand, INGAA guidelines are ignored, excavation and blasting will occur within forty-one feet of our home, subjecting the structure to potential damage caused by flying debris, concussive blast waves, heavy construction equipment and construction personnel, and subjecting the occupants of the structure (our family) to physical and psychological stress and physical injury caused by such activity. KM doesn't genuinely expect us to believe that an additional twenty-one feet would make any difference at all when they're detonating explosives or digging a 15' wide trench and laying pipe using equipment nearly as large as our house, do they? Do you?

#### Recommended Solutions

- Deny the project application with no chance of appeal. -or-
- Require the applicant to reroute the pipeline. -or-
- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

#### Issues

- The currently proposed pipeline routing would result in the only source of potable water on our property (a private well) lying within sixty (60) feet of the pipeline centerline.
- The currently proposed pipeline routing would result in excavation and blasting occurring within sixty (60) feet of the only source of potable water on our property.
- The currently proposed pipeline routing would also result in that private well lying within forty (40) feet of the permanent right-of-way.
- The currently proposed pipeline routing would also result in that private well lying 100% within the temporary construction right-of-way and work zone.
- These facts make it a virtual certainty that the only source of potable water available to supply our residence will be adversely and irreparably impacted by the currently proposed location of the pipeline including, but not limited to, line and casing integrity, turbidity, capacity, flow rate, and recovery rate.
- Due to setback requirements for the current septic tank, leach field, property lines, road way, and permanent right-of-way, securing approval for and successfully drilling a new well location would be virtually impossible. Further, a change to the entry point of the main water supply line into the house would be extremely difficult, and may in fact be impossible.
- A permanent lack of a potable water supply to our home due to pipeline approval and construction as currently proposed will render it uninhabitable, unsaleable, and largely worthless.

#### Recommended Solutions

- Deny the project application with no chance of appeal. -or-
- Require the applicant to reroute the pipeline. -or-
- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

#### Issues

- The currently proposed pipeline routing will result in the construction right-of-way encompassing 100% of the overhead lines providing electricity and other utilities to our home, making service interruptions during construction highly likely.
- A careful reading of the previously mentioned INGAA guidelines makes clear that utility service interruptions are a fairly standard occurrence in pipeline construction near residences, with contractors advised to attempt to give residents advance notice of construction related utility outages.
- Due to our rural location, during periods of utility outages we will be without heat, without potable

water and functional plumbing, without access to refrigerated foods, and without a way to prepare food.

#### Recommended Solutions

- Deny the project application with no chance of appeal. -or-
- Require the applicant to reroute the pipeline. -or-
- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

#### Issues

- The currently proposed pipeline routing will result in the temporary construction right-of-way encompassing a significant portion of the only ingress / egress route on the property (private driveway) with our access to our own home likely to be significantly and repeatedly compromised during construction and with substantial or total destruction of our paved driveway a virtual certainty.

#### Recommended Solutions

- Deny the project application with no chance of appeal. -or-
- Require the applicant to reroute the pipeline. -or-
- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

#### Issues

- The currently proposed pipeline routing will result in the removal of roughly 2/3 of all trees on our heavily wooded, 4-acre lot. That's literally hundreds of trees. As the trees are primarily evergreens, there is no actively growing ground cover under the tree canopy.
- Due to the significant slope of our property, this lack of vegetation makes certain the significant erosion of soil and flooding of our home as rainwater follows the course of this slope unimpeded by trees or ground cover.
- The currently proposed pipeline routing in such extremely close proximity to the house will necessitate the removal of 15-20 trees exceeding 50' in height and growing very, very close to the house. To date, KM has done absolutely nothing that causes me to believe they will exercise the level of care necessary to ensure no incidental damage to our home during the removal of these trees.

#### Recommended Solutions

- Deny the project application with no chance of appeal. -or-
- Require the applicant to reroute the pipeline. -or-
- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

In closing, I readily acknowledge the lack of creativity in my recommended solutions. However, as the issues related to the pipeline's proposed proximity to our home and to our sole source of potable water appear to be addressable only through denial of the application, the rerouting of the pipeline, or the outright purchase of our home, I didn't spend any time trying to figure out additional possible solutions for all of the other issues. Frankly, if the pipeline being located within twenty feet, or even forty-one feet, of our home, and within sixty feet of our well, isn't significant enough for KM and FERC to take steps to try and mitigate the health, welfare, and financial impacts on my family, I doubt any alternatives I could suggest would receive anything approaching serious consideration.

Subject:: Docket # PF 14r22-GOO Northeast Energy Direct Project

Dear Ms. Bose:

New Hampshire's state motto is "Live Free or Die". My husband and I want to live FREE from fear--the fear that Kinder Morgan's proposed natural gas pipeline (NED) would be approved. We are vehemently OPPOSED to this plan for so many reasons.

This is a project which is neither necessary nor beneficial to the residents of New Hampshire. Nor is the proposed route for the pipeline logical. Kinder Morgan wants to get gas from the middle of Pennsylvania through New York and finally into Massachusetts. If you follow a straight line on a map from Pennsylvania to Dracut Massachusetts, it doesn't go through New Hampshire! And a straight line is more logical and less expensive to construct.

It was stated in one of Kinder Morgan's open houses that there would be no takeoffs for distribution of gas to homes or businesses along the pipeline's run through New Hampshire. So why does Kinder Morgan insist that the project is needed here? The answer is simple there is no good reason for the pipeline to be built in New Hampshire.

Kinder Morgan argues that utility rates in New England are the highest in the nation and that the pipeline project would lower those costs. However, in KM's own March 2015 newsletter, they state there isn't enough natural gas pipeline currently to get the cheap gas from Pennsylvania to the market centers in the east. "That's causing consumers in places like Boston and New York to pay much higher natural gas prices than other locations in the country that have greater access to gas at the standard Henry Hub rate". If people want cheaper utility rates in Boston and New York, then put the pipeline in those states not New Hampshire! Eversource is the major supplier of energy in New Hampshire. Our rates in Londonderry are actually cheaper than this time last year. As a matter of fact, in Eversource's Aug. 2015 Customer Update, it stated that effective 07/01/15 customers who purchase their energy from Eversource have seen an average rate reduction of 7.5% on their bills monthly. This is due, in part, to lower than anticipated wholesale energy market prices over the winter months. So, obviously, New Hampshire doesn't need the natural gas pipeline to lower our utility rates.

Another reason for our opposition to the construction of the pipeline is the potential for damage to our environment. My husband and I have lived at 34 Severance Dr. in Londonderry for over 29 years, and we love the rural atmosphere of our part of town. There are small ponds nearby on Dan Hill and Elwood Roads, as well as wetlands further down on Severance. We have enjoyed the variety of wildlife we've seen over the years, and don't want any gas pipeline pollution destroying the local plants and animals. We've seen a young moose in our yard, watched wild turkeys walk single file across Severance Dr. onto our yard, and listened to the birds singing their songs. Geese have been known to nest near those small ponds, and turtles and frogs call those ponds home. In the spring, those ponds are the nurseries for the hatching frogs. One of the true signs that spring has arrived in New Hampshire is the sound of those "peepers" at night. Blue Herons and hawks fly overhead; deer and their fawns are also a common sight in the early morning. Weasels and owls are also residents of our neighborhood.

Everyone in our part of town has wells. We rely on well water for our everyday lives. We drink it, we use it for cooking our food, we bathe in it, and we wash our clothes in that well water. Despite what Kinder Mor-

gan says, there is danger to our environment should the pipeline project be approved. Over time, pipelines corrode, and the natural gas would seep into our ground water, our wells and the nearby ponds. Then what would we do, and what would happen to the wildlife? Are we expendable; would we be considered “collateral damage”?

I have read that the NED pipeline will age quickly due to its proposed co-location with Eversource’s high power transmission lines. This is caused by the electrical interference from the transmission lines which leads to increased corrosion. In a 2011 study conducted by the Maine Government Office of Energy Independence and Security titled “Issues Affecting Colocation of Energy Infrastructure” states that “the issue of electromagnetic field interference on buried pipelines has been known for 30 years”.

Another major fear is living in the “incineration zone”, which is more commonly known as the 800-1100 foot blast radius, should the pipeline explode. And, our home would be in the “incineration zone”. From the various reports we’ve read, Kinder Morgan doesn’t have the best record of maintenance or safety for their natural gas pipelines. The National Transportation Safety Board focused on just three accidents in the last five years which resulted in eight deaths, more than fifty injuries, and 41 homes destroyed. The Safety Board concluded that those incidents were due to inadequate inspections and oversight of those pipelines. There are many more incidents listed on Wikipedia’s Kinder Morgan page listing the damage CAused by explosions.

New Hampshire is known as the Granite State, and it’s been nicknamed that for a very good reason. Our ground is filled with rocks of all sizes--from small to boulders. Our winters are frigid and our summers hot. It’s been said that “frost heaves”. The wide range in temperatures brings those rocks to the surface of the land every year. That natural movement of the rocks could very well damage the pipeline by CAusing a rupture.

New Hampshire has also been experiencing an increase in earthquake tremors lately. There were two within a week of each other last month. They were centered somewhere south of Concord and measured somewhere in the 2.3 point range on the Richter Scale. We actually felt the aftermath of an earthquake last year while we were in our home.

My point is that phenomena such as natural rock movement and earthquakes can also cause damage to underground natural gas pipelines which would result in contamination of our water, air pollution, or much worse!

In addition to the pipeline, there are two compressor stations to be built in New Hampshire. There is major concern in those towns regarding the noise generated as well as air pollution and the potential for groundwater contamination, I read a newspaper article which stated that the emissions from those compressor stations don’t have to be disclosed, monitored, or managed. In addition, recent studies of populations near those compressor stations have shown an increase of health issues such as cancers, stillbirths, and recurring bloody noses.

To sum up our feelings, we don’t want our way of life disrupted; we don’t need the proposed natural gas pipeline in New Hampshire, nor do we want it here! There is absolutely NO BENEFIT whatsoever to the residents of New Hampshire. As a matter of fact, our town council in Londonderry voted unanimously to approve a resolution OPPOSING the construction of the pipeline in Londonderry. The resolution stated “The pipeline will create NO DIRECT BENEFIT to the residents of Londonderry, and the disruption to the residents of Londonderry caused by the construction of the new pipeline may outweigh the benefits to the Town and its residents”. The Northeast’ Energy Direct Project is NEITI-IER in the public convenience or necessity!

Re: Town of Richmond NH Opposes Proposed Reroute of the NED Pipeline through  
Richmond residential area, in place of original plan to go through vacant logging land  
Docket PF 14 - 22, Comment of Richmond NH Board of Selectmen

Dear Ms. Bose,

At a recent meeting of our Board of Selectmen of Richmond, NH, several residents of Richmond living on Scott Mountain Rd came to tell us that they had been visited by agents of Kinder Morgan and given a map with a proposed change to their original pipeline route. We attach a copy of this map showing the proposed reroute.

Kinder Morgan's original route through this section of Richmond went through unoccupied forestland. Kinder Morgan's proposed reroute now goes through and close to homes of Richmond residents. Two of the homes impacted by the reroute are very historic, one a well-documented pre-revolutionary house that has been authentically restored to its 18th century period by the owner who lives there, and the other the former home and studio of an early Richmond artist, the house dating to 1782. A third is the residence of a family with several young children. In addition, the proposed reroute follows Turnpike Road, itself quite historic as it was the first east-west road through Richmond (actually a turnpike whose toll gate site is located within the "incineration zone" of the proposed pipeline reroute) laid out in the 1730's.

In addition, this reroute moves the pipeline to within 400-800 feet of State Highway 119 for over one-half of a mile. Route 119 is the only main artery that connects Richmond with towns to the west (Winchester, Hinsdale and Brattleboro). In addition, Route 119 is a major route from Richmond to the nearest hospital in Keene. In the event of an accident along this proposed reroute, westerly traffic from the town of Richmond would be completely cut-off. [Note: the originally proposed pipeline route simply crossed Route 119 in one place before heading north into unoccupied forestland before joining the power lines. By following Turnpike and Scott Mountain Roads, the reroute now impacts the homes of the Richmond residents discussed earlier.)

One resident landowner on the newly proposed route asked the Kinder Morgan representative the reason for the proposed change, since it now would impact residences whereas before it did not. The Kinder Morgan representative said the new proposal avoids impacting "the walking trails on Scott Mtn: This makes no sense at all as the land is currently posted "no trespassing" and, in any event, is no more "public walking trails" than are the many old abandoned former logging roads that crisscross privately held forestland. Such trails are not maintained or publicized, nor do they have any signage.

Later, in a telephone conversation with the Chair of our Board, another Kinder Morgan representative gave another reason, stating that the new proposal was negotiated between Kinder Morgan and the landowner of the uninhabited land through which the pipeline originally had been proposed to traverse. This is extremely disturbing to hear - that a private land owner can negotiate with Kinder Morgan to reroute a pipeline through residences and emergency exit routes instead of unoccupied logging land.

All of the affected residents stated emphatically at our Board meeting that they do not want the pipeline to

be on or near their property

Can you please follow up with Kinder Morgan about this? Impacting homes and a major artery instead of unoccupied forestland makes no sense. This proposed reroute is clearly against the public interest.

In addition, we must add that despite Kinder Morgan's statements that they would be in steady advance communications with our town Board of Selectmen over their plans, they continue to fail to do so. After being informed directly by Kinder Morgan representatives, our residents came to their Board of Selectmen for verification. However the Select Board had been told absolutely nothing by Kinder Morgan.

The town of Richmond, at its March 2015 town meeting, voted overwhelmingly to oppose the NED pipeline, and that opposition continues with strength and vehemence. But proposals such as this new reroute throw gasoline on the flames.

Thank you for your attention,

Cc: Allen Fore, Kinder Morgan

From the Desk of Shannon M. Barnes Vice Chair, School Board

SAU 26

Merrimack, NH Shannon.barnes@merrimack.k12.nh.us

July 29, 2015

To tonight's FERC Delegation,

Attached please find the letter to FERC dated July 14, 2015 declaring the Merrimack School Board's position on this pipeline. The Merrimack School Board is unanimously opposed to any route that will place a pipeline within 1000 feet of any school facility.

Our school district's concerns lie greatly in the fact there are regular additional proposed routes. The Merrimack School District has facilities throughout town that could see an impact from both current and yet to be proposed redesigns offered up from other impacted communities in addition to Northeast Energy Direct.

The Merrimack School Board is committed to following this project and taking further positions on this pipeline as information becomes public. Consistent with our charge to our elected positions, we ask that you not consider any pipeline that could impact the safety of Merrimack's school children.

Sincerely,

Shannon M. Barnes

Vice Chair, Merrimack School Board, SAU 26

Re: Tennessee Gas Pipeline Company, LLC ["TGP"]

Docket No. PF14-22-000: Proposed Northeast Energy Direct ("NED")

Dear Ms. Bose:

The Merrimack School District (SAU #26) opposes, by unanimous vote of the School Board, any route that comes within 1,000 feet of a district school building. We hope that proposed route referenced below, and

future proposed routes, be removed from consideration to avoid impacts to a facility where our children and employees congregate,

On Tuesday, June 30, 2015, the Town of Amherst [NH] Pipeline Taskforce held a meeting with representatives of the Tennessee Gas Pipeline Company/Kinder Morgan. The purpose of the meeting was to discuss alternative options for the pipeline route through Amherst currently under analysis by Kinder Morgan. Please refer to the July 10, 2015 letter to you from Amherst Town Administrator, James O'Mara, Jr.

I call to your attention something that was not discussed at that meeting nor in its summarization; the Option 1 route proposed and discussed at that meeting, running along Continental Blvd in Merrimack, comes within 500 feet of Thorntons Ferry School, located at 134 Camp Sargent Rd, Merrimack, NH. Thorntons Ferry School is a K- 4 school in our district with a daily population of over 500 students and 85 staff members.

I respectfully ask that this letter and the accompanying documents be included as part of the public record.

Thank you for your consideration of this information.

Sincerely,

Christopher S. Ortega

Chairman, Merrimack School Board, SAU 26

My name is Josiah Barthelmess, I am 11 years old. I live directly across the street from the proposed Compressor Station, in New Ipswich.

You have heard this is not good for New Hampshire. The dangers of explosions and questions regarding Kinder Morgans Safety record. What we haven't heard from you .... is how much this will hurt our environment and those that live in New Hampshire.

Kinder Morgan is concerned about the health of 10 endangered ponies who will live a mile away from the station. What about the hundreds of kids who live within the 1/2 mile mark, don't our lives count to? Or the Temple Elementary School, only a few steps away. What about OUR health?

This nation .... fights to provide clean water to third world countries, how do you intend to protect my water? The same water I use to grow a vegetable garden in my

backyard. ... Or even bigger, the Greenville reservoir, seconds away?

MY generation, will be the generation who will pay greatly in this whole project. You think only on the now, and have forgotten the consequences this has in the future. Let me paint a picture for you.

I am but an 11 year old boy now, ... but one day I will be a man. A man belonging to the generation who will have to clean up the destruction and devastation this pipeline will leave in its wake.

We know what toxins comes out of your compressor station and what leaks from your pipes into the ground. We know you don't test emissions daily.

Our protected lands, our wetlands, and our health ... WILL BE effected .... much beyond repair.

Those younger than me, have no idea what you have already decided for them. I am old enough to under-

stand, what this pipeline brings with it.

I will not be naive ... I AM educated ...

and I am standing up NOW to protect my future.

Take a good look at me, I am just one face of the next generation ... I represent The Kidz of the Pipeline Resistance.

I promise ... you will see me again ... and OUR voices will be heard.

As you are aware we are here tonight because Massachusetts, which originally signed on to having the pipeline, decided last minute to change their mind. Massachusetts cited environmental concerns, hired lawyers, and KM moved it into Southern NH. If this practice is allowed, you are starting a dangerous president.

NH also has Environmental concerns. I would like to bring up one that is both environmental and safety related.

NH has had a history of earthquakes, in fact 260 that we know of. They have ranged from a 4.6 to a 6.0 magnitude. The NH Environmental Services states that earthquakes will continue to occur in NH with AT LEAST the same frequency and magnitude. It also could be a higher magnitude. It is documented that a 6.5 magnitude would produce an emergency that would most likely cause storage tanks, and gas lines to rupture. KM is planning on using a thinner pipe, except for a few exceptions, where they are willing to upgrade. In addition KM does not have a good safety record, and has been cited for it.

This proposed route through NH is not just under power lines, in fact it goes through housing sub divisions. In my case the pipeline cuts off the only exit on our dead end street, and goes through the parking lot of a school. On June 30 we made this information available to KM, however, there has been no response from them.

In addition the pipeline goes over one of the largest drinking water aquifers in NH. The pipeline will go on top of this aquifer in Amherst, NH

Massachusetts had years to look at this pipeline, they suddenly dumped it on NH by having the money to hire expensive lawyers, and sited environmental concerns. Our environmental concerns are as serious as Massachusetts.

In closing I hope you understand the "Pandora's Box" you are opening if you let a state after agreeing to a pipeline, change its mind and send it off to its neighbor.

In closing I am hoping FERC will do its job, stop the dumping of pipelines to other states because a state has second thoughts to an agreement it already made.

## 20150824-4003

Kenneth J Bury  
7 Patricia Lane  
Amherst, NH 03031  
Email: kenjburv@comcast.net  
Phone: 603-672-0687 (Home), 603-930-7163 (Cell)

I live on Patricia Lane in Amherst, NH and am an affected landowner. The pipeline is planned to be routed through the back of my property.

The detailed analysis done by the Amherst Town Pipeline Taskforce determined that New Hampshire does

not need additional natural gas especially for power generation. Massachusetts and other New England states need additional natural gas and as such should be the host for this planned monster. New Hampshire should not be taken advantage of, and used as a conduit for this pipeline, suffering all of the risks and problems with no gain.

That said the current planned route for the pipeline will cause negative environmental impact on many New Hampshire residents including me! One of the main reasons for purchasing our property was because there is a line of fully developed trees of from 30 to 40 foot blocking our view of the power line towers and lines. We now will lose this natural barrier and will continually be reminded of the fact that we not only border power lines but a 30" diameter natural gas pipeline.

We regularly use our yard for cook-outs and have fires in a backyard fireplace, Will we have to stop doing this for fear that there maybe a leak of odorless colorless gas being blown into the area ready to be ignited?

While we have experienced over the years, the electrical power lines may hum and generate static electricity we are safe from significant harm. There is no doubt that we will not be able to live in our current house, with as they say the low probability, but high impact, that a leak and fire can generate enough radiant heat to destroy any of the remaining trees as well as ours and neighbors houses. It could even kill or badly burn us, our kids and grandkids should they be visiting, and our also neighbors! The stress caused by this situation has ruined, and will continue to ruin the rest of my remaining retirement years. While I am not officially considered an endangered species I feel like one. Little consideration is being given to the safety and security (physical or emotionally) of us!

I do not want to move and most likely if I try to sell I will not be able to for another 5 to 8 years. Even then, I will most likely have to sell at a lower price than if there was no pipeline! As with many seniors my house is not only my shelter, but my financial security. I will now lose this financial security, and at my age have no chance to recover.

Faced with this dilemma we, including the town, have asked for Kinder Morgan to develop alternative routes that will minimize the impact on us and our neighborhood and others but have yet to get back acceptable alternatives. Kinder Morgan says some of the alternative routes it identified will be difficult to implement and maintain. To me that means, even though feasible, it will cost the company extra money to implement and maintain these alternatives. That means to me that the company is putting money before our safety and comfort!

As our representatives we ask you, FERC members, to stop or redirect this project in a way to minimize the impact on us residents not just the bats, turtles, aquifers', and wetlands! Thank you for your time.

7/29/2015

#### **20150824-4004**

FERC MEETING NASHUA NH 7/29/15 Docket No. PF14-22-000

Submitted by Dorothy Crawford

PO Box 127

Fitzwilliam NH 03447

We realize that FERC has never disapproved of a pipeline so we hope all of our efforts in opposing this ill-conceived project are not a total waste of our time and energy. We realize that Kinder-Morgan has a lot to gain but the residents along the proposed route have only to lose. Why FERC would approve such a project that is conceived to be primarily for export is deeply troubling to the residents and towns affected. Do we matter? Let's hope so!

We live on Rockwood Pond Rd just south of the proposed pipeline. However we have many objections and concerns about this project that go way beyond the fact that it will impact us so directly. They include:

1. There are 21,000 "TBOs" in the preliminary report. Clearly there should be many more studies con-

ducted to fill in that information. These studies need to be conducted by non..stake holders. Research that is funded by Kinder-Morgan and its entities is not believable or acceptable.

2. The impact to local habitats is of grave concern - we are talking animal and human. Habitat fragmentation, agricultural lands and soils, conservation lands and nature preserves, endangered and sensitive species, ground and surface water including aquifers, wells, reservoirs, rivers, lakes etc will all be impacted. The proposed route takes the pipeline through our neighbor Rhododendron State Park as well as just north of Rockwood Pond, our home, where it crosses Rockwood Brook and related aquifers. It is not only the construction of the pipeline that affects all of these habitats but the ongoing need to use pesticides and herbicides to keep the pathway clear.

3. The proposed route also takes the pipeline just north of the Troy MHIs Superfund site which the federal government spent countless millions to clean up and which the EPA continues to monitor. How will the blasting from the pipeline construction affect that containment zone? What would an explosion unleash?

4. The impact to our local economy is of utmost concern. We are a fairly rural area with a lot of history embedded in our small towns. In Fitzwilliam we celebrated our 250th birthday in 2012. There is a lot of pride in where we come from and preservinH the character of the area while not ignoring the fact that we live in the 21' century. The pipeline route and its proposed spurs would cut a gash across the region, a scar that would never heal. Our local economies are dependent on our natural setting and the visitors we attract, our organic farmers cannot be certified if toxins are being applied next door. Our neighbors stand to lose part or all of their homesteads - some of these properties have been in the same family for generations.

We can't help but ask the larger question: is natural gas from fracking a viable fuel taking us forward into the future? We think not.

The methane leaks from the fracking process that get into the atmosphere are 84 to 86 times more powerful than carbon dioxide over a 20-year span. As a bridge fuel it is not much better than coal.

The earthquakes Oklahoma has endured are just one of the hazards these pipelines pose. The proposed route of the NED project puts us in the "burn zone". I believe this means that in the event of an explosion, we will have time to vacate our home although our neighbors in the "incineration zone" will not.

Our town fire chief has already been to a training session. She told us that nre. departments are being asked to not begin putting out the fire until the authorities determine the source of the explosion. A sobering thought. Our son was living in Berkeley CA during the 2010 San Bruno explosion - 8 people killed, 38 homes destroyed. 200 firefighters fought that. In our rural counties, coming up with anywhere near that number of first responders is obviously impossible.

NH would be much better off reducing its energy costs by investing in efficiencies, much as the US Dept of Energy has done over the last decade resulting in a 30% savings. Greater subsidies for solar power and other renewables would contribute to reducing the need for fossil fuels in the long term.

Ratepayers are much more vulnerable to rate hikes and liability from a gas pipeline and have absolutely nothing to gain. Gas and oil prices are at an all time low. We realize that they won't stay there forever but this pipeline is not a viable answer for New England's energy future. Because this pipeline is designed to be primarily for export, what do we have to gain? Clearly nothing. We have only to lose and some would lose everything.

I dearly hope someone at FERC is listening or at least reading these comments. Yes, the Supreme Court ruled that corporations are people too. But does that mean that Kinder-Morgan's interests outweigh the interests of the countless thousands who stand to lose their homes, their land, their livelihoods in some cases, and the character of their regions just to improve Kinder-Morgan's bottom line? We hope and pray not.

**20150824-4005**

Hon. Jennifer Daler, member **Temple Ad-Hoc Pipeline Advisory Committee**  
177 Colburn Rd, Temple NH  
FERC Docket # PF 14-22

To FERC:

The following are questions that I want answered before any permits are granted for Kinder Morgan's proposed NED-pipeline and compressor stations:

How will fugitive emissions be mitigated and how will they be reported when they occur?

How often will there be blowdowns? When and how will the public be informed of the date and time of blow downs?

What percentage of the matter emitted by the blowdowns will be radioactive?

According to the Southwest PA Environmental Project, studies show that the current protocols for assessing compliance with ambient air standards do not adequately determine the intensity, frequency or duration of actual human exposure to toxins. How will Kinder-Morgan address this.

Also, reference standards are based on discrete emissions, not on the cumulative impact- of many toxins together. Kinder Morgan needs to provide unbiased studies proving that there are no adverse health effects from this type of exposure.

Will Kinder-Morgan and FERC accept liability for adverse health effects on pregnant women and their fetuses/children due to the exposure to toxins?

Will Kinder-Morgan and FERC accept liability for the increased cost to the community in terms of special education and health needs caused by exposure to the toxic chemicals released by the compressor station?

I request that Kinder-Morgan provide the town of Temple with a longitudinal study on the health effects to children ages 5-12 exposed to compressor station of at least 40,000 horse power located within a two mile radius of a school.

Thank you.

Merrimack, NH 03054  
(megc@msn.com)

Re: Docket Number PF14-22-000

Dear FERC,

We would like to state our objections to the NED Pipeline coming through NH.

1) The gas isn't for us to use. There are less expensive ways for us to close any gaps in the power we can create now and what we need in the future. This gas is mostly for export. Let other countries ruin their environment instead of ruining ours so they can get gas delivered via cargo ship from Nova Scotia. If the Kinder-Morgan subsidiaries in Connecticut want some of the gas let them build the pipeline through Connecticut. Their partner in NH, Uberty, does not have approval to buy from NED, and it will not justify a 30 inch pipe even if they get it.

2) Kinder-Morgan is not being straight forward about the routes through our town. In the latest document dump in the e-library, made less than a week before this meeting, there are thousands of new pages to read. I do see the map through Merrimack, NH hasn't changed the route, despite the fact the next town upstream (Amherst, NH) worked a deal with Kinder-Morgan to change where the endpoint in their town is. Pipelines don't work with 2 mile gaps in them. Because of this, not everyone affected in Merri-

mack has been officially informed that they are in an ignition zone, their home insurance rates are going up and their property values are going down. I am sure they would have opinions the scoping meeting should include. One of these properties is the town elementary school. Just because there is more money in Amherst it is OK to put Merrimack's smallest children at risk? We would appreciate it that when the maps get updated someone addresses this safety and fairness issue at least, even if seeping for Merrimack is complete before the change.

3) We don't know where all the compressor stations will be located. We know the first couple but we also know more are added later and the initial ones always seem to expand. My brother lives near one in Windsor, NY that has caught fire twice and it sounds like he's being bombed when they vent the thing. It's never quiet. People move to the woods in NH for peace and quiet. Kinder-Morgan is just screwing with us because they don't want to deal with the rich green folks they would have had to disturb to go across the original route in northern Massachusetts. Just because there is less money living on this route, it doesn't mean we don't have the same values as Harvard or Carlisle, Massachusetts.

4) Kinder- Morgan is financially leveraged to the hilt. We can't trust them to do the proper maintenance or follow all safety procedures when money gets scarce. They are not motivated by safety in NH but by shareholders in the oil patch. Their Enron style management and documented safety issues do not promote confidence in their commitment to quality or the environment.

Regards,

#### 20150824-4007

My name is Susan Emerson, and I am the **New Hampshire State Representative for Cheshire District 11**, representing two of the communities on the path of this proposed pipeline.

Over the past several months I have followed this issue very closely, and I am here to give voice to the groundswell of opposition that has risen up in Fitzwilliam and Rindge, and in the other sixteen communities directly affected by Northeast Energy Direct. I am outraged that these FERC scoping sessions are being held only days after Kinder Morgan/Tennessee Gas Pipeline submitted their 6,571 page Draft Environmental Report, making it impossible to address, in any meaningful way, the depth, ~~breadth, or veracity~~ of the information contained in the report. It's also very important to note that the Draft Environmental Report, in its current form, still contains over 10,000 omissions, conveniently labeled as "To Be Determined".

While the Federal Energy Regulatory Commission's entire budget is underwritten by the Energy Industry it is tasked with regulating, that in no way means that the FERC's stated mission is to rubber-stamp every poorly conceived large-scale commercial energy project that comes before it. That brings us to Northeast Energy Direct.

My understanding is that the new preferred route through New Hampshire, which neatly avoids several wealthy communities in Massachusetts, is preferable because it is, for the most part, colocated along an existing energy corridor. Apparently-the FERC likes colocation. Well if this is colocation, then the FERC, and Kinder Morgan, have redefined the word. I will speak honestly about the social and economic impact of this kind of colocation along the path of overhead electrical transmission lines. Every single land owner along this route has already had to deal with the impacts of the current powerline corridor, including lowered property values, deforestation, the visual blight of powerline infrastructure, and the inability to use, in any meaningful way, significant portions of the land they own and pay taxes on. If the NED pipeline proposal becomes reality, everyone of these landowners are going to bear the burden again. The pipeline, which ~~in virtually all instances~~ will be located adjacent to, but not in the existing powerline right-of-way, will further reduce each land owner's property value. It will result in the deforestation of more of their land. It will make even more of the land that they own and pay taxes on unusable to them in any meaningful way. Kinder Morgan is asking that the specific group of people who have already been negatively impacted, to be the same group of people that will need to bear the brunt of the impact of a second intrusion on their property and their lives.

This is not the easy decision to lay a new pipeline adjacent to an existing pipeline. This is not colocation in any traditional meaning of the word. Kinder Morgan's plan to come back to the trough and take another bite out of a group of landowners that have already been bitten is simply unethical.

Separate from the issue of landowner impact is the overbuilt nature of this pipeline. For New England, Natural Gas is a bridge fuel, a short-term solution to a ~~vastly exaggerated~~ problem. For this much infrastructure to be put in place to address a dubious, short-term lack of supply, when weighed against the short-term and long-term environmental impacts that arrive part and parcel with the NED pipeline is folly, plain and simple.

I understand that the FERC is not concerned with market forces like demand.

I understand that Kinder-Morgan, conveniently positioned as a midstream supplier, is not concerned with the source nor the destination of the product passing through their infrastructure

I understand that the owners of the Natural Gas being transmitted are unconcerned with anything outside of the wall of the pipeline itself, other than the cost

being charged to them for the pipeline capacity that they use.

So the "scope" of these concerns, never ultimately look at the overall impact of the project. The scope, by design, is short-sighted, and near-sighted. And the route of the project itself is extremely poorly sited.

New Hampshire is, as others have said, New England's OPEC of electrical energy production and delivery. How strange that New Hampshire's reward for producing and exporting to Massachusetts much of the electricity they consume, is to be handed a pipeline that has to go out of its way to climb north into western New Hampshire, only to cross back over New Hampshire's southern border some 71 miles to the east in order to terminate in Dracut. Ultimately, the decision to build in New England an increasing number of Natural Gas power plants in the face of the known limits of New England's existing pipeline infrastructure is not New Hampshire's problem.

Which brings us to Anthony Buxton. Mr. Buxton, an industry lobbyist, came up with this idea of financing the pipeline by charging New England electrical ratepayers. Tom Welch, a Maine member of NESCOE got on board, and ultimately we have this scheme in place where the NED pipeline, a natural gas pipeline, is to be financed by electrical ratepayers, with apparently no assurance that the pipeline will ever carry any significant amount of Natural Gas for the production of electricity to be provided to New Hampshire's electrical users. And even if it were, well as I mentioned before, as an exporter of electricity, New Hampshire doesn't need Natural Gas delivered through new pipeline infrastructure. New Hampshire doesn't lie between in the Massachusetts corridor between Greenfield and Dracut. New Hampshire is not a county in Massachusetts.

I request scoping to be expanded to include an independent analysis, financed by Kinder Morgan, of the amount of electrical energy shortfall, by month, over the next decade, to include a cost benefit analysis of the pipeline vs. LNG importation, LNG storage facilities, renewable energy, conservation programs, and any other viable way to address any periodic shortfall. The cost-benefit analysis should include the short-term and long-term environmental impacts of each option, as well as the socio-economic impact on any affected landowners. as well as the socio-economic impacts of requiring ratepayers to finance the NED pipeline.

Thank you.

Majority Whip Richard "Dick" Hinch is in the audience and he supports what I'm saying

**20150824-4008**

April 7, 2015

To Whom It May Concern,

My name is James Ferreira and I live in the town of Merrimack New Hampshire. I am sending you this to request a scoping meeting be held in the town of Merrimack. Merrimack is the largest town that will be affected and impacted by the NED Project if approved in New Hampshire.

I am also asking you in this document to not approve the project. The proposed pipeline route is unacceptable for various reasons. Some of the following reasons should be considered before a determination is made on approval of the pipeline:

Horse Hill Nature Preserve (563 acre property with approximately 60 acres of wetlands) Merrimack River (is a protected river in New Hampshire) pipe line will cross at least in one location. Souhegan River (is a protected river in New Hampshire) pipe line will cross at least 2 possible 4 locations.

Merrimack Village Water District Water Works: the pipeline is set to go between the 2 main wells that serve as the main water source for the town and the majority of its residents.

Horse Hill Nature Preserve:

In April of 2002, the Town of Merrimack voted to purchase the property now known as the Horse Hill Nature Preserve. Due to its size, quantity of wetlands and impact on wildlife and water resources, this property was listed as the top priority for conservation in the 2002 Town of Merrimack Master Plan.

The 563+ acre property consists of gently rolling to fairly steep terrain and tow hills approximately 400' in elevation. The land consists primarily of mixed hardwood forest with trees between 20 and 60 years of age. The property includes a series of streams, ponds, swamps and numerous wetlands approximately 60 acres in total. The varied terrain, habitat and large areas of undisturbed open space have encouraged a wide variety of wildlife to thrive on the property.

The current proposed pipeline would run through almost the entire nature preserve disturbing its inhabitants, some of the animals include: Northern leopard Frog (*Rana pipiens*) use status is classified as Rare and uncommon, Blanding's Turtle (*Emydoidea blandingii*) also rare and uncommon, Spotted Turtle (*Clemmys guttata*) rare and uncommon, Wood Turtle (*Clemmys insculpta*) rare and uncommon, Eastern Box Turtle (*Terrapene c. Carolina*) rare and uncommon, Northern Black Racer (*Coluber c. constrictor*) rare, protected and uncommon, Great Blue Heron (*Ardea herodias*) rare, uncommon breeder, Cooper's Hawk (*Accipiter cooperii*) threatened, imperiled breeder, Red-Shouldered Hawk (*Buteo lineatus*) rare, uncommon and has special concern, the Bald Eagle (*Haliaeetus leucocephalus*) rare, and threatened.

I lived in Merrimack for a little over 2 years and own 7 acres of land which will be affected and impacted by the proposed pipeline. Over the two years we have seen flocks of turkey that come through my property on a daily basis, along with deer upwards of 20+ at a time, moose, black bear with 3 cubs, owls, hawks and rare woodpecker species to name a few. If the pipeline were to be approved I am sure this will disturb not only the species that frequent my property but the surrounding area along with Horse Hill Nature Preserve.

I have also done a lot of research on Kinder Morgan and I have to same I am truly stunned and alarmed about what I found out about them. Below are just a few bullet points to name a few of their incidents.

History of Significant Incidents-

In Texas alone from 2003 - 2014 Kinder Morgan had 36 "Significant Incidents" resulting in fatalities, hospitalizations, fires, explosions and spills.

Kinder Morgan has been further cited by the U.S Government in 24 incidents which led to five federal enforcement actions from 2006-2014.

Throughout the U.S. since 2003, Kinder Morgan and its subsidiaries' pipelines have been responsible for at least 180 spills, evacuations, explosions, fires, and fatalities in 24 states.

The company had 44 spills in 31 months, indicating "widespread failure to adequately detect and address the effects of outside force damage and corrosion," according to an order issued in August 2005 by the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration (PHMSA).

I have also found on several occasions that accidents and incidents occurred to them failing to properly mark pipelines.

The list goes on and on and the more research you do the more you uncover. It is really unsettling to think a company with this many violations could claim my land through eminent domain and place a gas pipeline in my backyard.

I greatly appreciate the time you spent reviewing my concerns and comments detailed in this document.

Sincerely;

James R Ferreira

7 Maryann Lane

Merrimack, NH 03054

---

### Kinder Morgan's History of Accidents

In Texas from 2003 to 2014, Kinder Morgan experienced 36 "significant incidents", resulting in fatalities or hospitalization, fires, explosions, or spills.U2J

Throughout the U.S. since 2003, Kinder Morgan and its subsidiaries' pipelines have been responsible for at least 180 spills, evacuations, explosions, fires, and fatalities in 24 states. Some notable examples (including spills in Canada):

- 2003

In August 2003, in Caddo County, Oklahoma, a Kinder Morgan Natural Gas Pipeline of America failed in a rural farming area about just east of the town of Stecker. A 26" diameter pipe exploded, throwing a 54-foot long section of pipe 30 feet from the ditch. The cause was environmental cracking along the length of the failed section parallel to the longitudinal weld searnY.IJ

- 2004

On April 27, 2004, an underground Kinder Morgan 14" pipeline ruptured at Suisun Marsh in Solano County, California, spilling over 120,000 gallons of diesel fuel directly into the marsh. The cause was pipe corrosion. The company failed to notify authorities about the spill for 18 hours, another safety violation for which it was later cited. Kinder Morgan was fined \$5.3 million for the spill, and agreed to enhance spill prevention, response and reporting practices. The company had 44 spills in 31 months, indicating "widespread failure to adequately detect and address the effects of outside force damage and corrosion," according to an order issued in August 2005 by the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration (PHMSA).UWJJ

On November 9,2004, a Kinder Morgan pipeline in Walnut Creek, California was struck by a backhoe, causing a gasoline spill that ignited in an explosive fireball that incinerated five workers and severely injured four others. CalOSHA (California Occupational Safety and Health Administration) cited Kinder Morgan for failure to accurately mark or map the pipeline location.l=' In 2005, the California Fire Marshal fined Kinder Morgan \$500,000 for its role in the "completely preventable" tragedy. Kinder Morgan agreed to upgrade pipeline inspection methods and improve corrosion controllI'"

- 2005

A Kinder Morgan Energy Partners petroleum products pipeline was found to be leaking gasoline into Summit Creek, near Truckee, California, on April I.About 300 gallons were spilled.l.WU!J

In May 2005, a Kinder Morgan Natural Gas Pipeline of America 30" diameter pipe exploded near Marshall, Texas, sending a giant fireball into the sky and hurling a 160-foot section of pipe onto the grounds of an electric power generating plant. Two people were hurt, 40 evacuated. The cause was stress corrosion cracking.P"

- 2006

On July 22, 2006, near Campbellsville, Kentucky, a Kinder Morgan Tennessee Gas Pipeline exploded. A 25-foot chunk of pipe blew out of the ground and landed 200 feet away, the pipe twisted and mangled, its external coating burned off. The 24” pipeline ruptured due to external corrosion more than two feet long at the bottom of a valley in an area of wet shale, known to cause corrosion on buried pipelines in this part of Kentucky.”

On November 11, 2006, a subcontractor on Kinder Morgan’s Rockies Express (REX) pipeline outside Cheyenne, Wyoming struck an existing pipeline, causing a rupture and explosion. Two months after this explosion, the Federal Energy Regulatory Commission threatened to shut the project down if REX didn’t improve its “poor compliance record” involving construction activity outside the approved work area. [i];J

On November 27, 2006, the Kinder Morgan Plantation Pipeline at Charlotte, North Carolina released about 4,000 gallons of gasoline from a Plantation Pipe Line Company block valve on a delivery line into a terminal owned by a third party company.

- 2007

On July 24, 2007, the Trans Mountain Pipeline, operated by Kinder Morgan Canada, released over 250,000 litres of crude oil (70,000 of which flowed into Burrard Inlet, requiring a C\$15- million cleanup) after a backhoe broke the improperly-marked line in Burnaby. lillill

- 2008

On September 23, 2008, a Kinder Morgan pipeline exploded and burned for more than ten hours at Pasadena, Texas. One person died; another was injured. l. l~l The cause of this “significant event” was corrosion. The Pasadena pipeline experienced at least 18 “significant incidents” 2004 to 2013.~

- 2009

In May 2009, near Palm City, Florida, a Kinder Morgan Florida Gas Transmission Company 18” diameter natural gas pipeline ruptured in a sparsely populated rural area of Martin Co. and “displaced” about 106 feet of buried pipe onto the right-of-way between Interstate 95 and the Florida Turnpike (SR-91). About 106 feet of pipe weighing about 5,000 pounds was blown out of the ground. The rupture was near a high school that was within the 366-foot potential impact radius (PIR). Injuries included two people in a car that ran off the road and a Sheriff’s deputy treated for inhaling gas.

On July 15, 2009, a pipeline accident at Sylva, Tennessee involved Boardwalk Pipeline Partners, Southern Natural Gas and Kinder Morgan in an explosion that killed one person and injured three ... ,

- 2010

On November 30, 2010, a 30” diameter Kinder Morgan I Tennessee Gas Pipeline failed in a semi-rural area between Highway 1 and State Road 3191, two miles NW of Natchitoches, Louisiana, 1/4 mile NE of a country club, and 200’ south of a residential subdivision. Louisiana state police evacuated 100 homes. Pipe cracked: 52.5 inches long & about 0.5 inches in maximum width. The failure site is near where TGP had a previous failure in 1965, with multiple fatalities. That failure was attributed to stress corrosion cracking.

- 2011

The Carteret, New Jersey, KML T had a leak and fire during maintenance work on March 14, 2011. On April 4, 2013, the PHMSA Office of Pipeline Safety issued a Notice of Probable Violation, Proposed Civil Penalty and Proposed Compliance Order (NOPV) after an inspection. In 2013, KMLT paid a penalty of \$63,100 and was required to complete pipeline integrity testing and other corrective measures by May 2015. [.4.’!]

On August 17, 2011, Kinder Morgan’s Natural Gas Pipeline Company of America had a flash fire and explosion south of Herscher, Illinois. Five employees went to the hospital. Kinder Morgan was cited for pipeline and workplace safety violations. P”

On November 16, 2011, near Glouster, Ohio, a weld failed on a Kinder Morgan Tennessee Gas Pipeline 36” diameter pipe; the leak exploded, leaving a blast crater 30 feet across and 15 feet deep. Three homes were destroyed by the fire. lIU The leak was caused by “displacement produced by a landslide and an inadequate

understanding by (TGP) of the influence of the geotechnical threats on the pipeline in this location. “i.IIJ A girth weld failed due to earth movement, inadequate design, materials or workmanship, exceeding operational limits & gaps in integrity management.v”

• 2012

In May 2012, at Arvin, California, a Kinder Morgan EI Paso Natural Gas pipeline’s relief valves and pipe supports failed, causing an explosion that damaged the Mojave facility and a surrounding cherry orchard, causing “the complete structural failure of the overpressure protection support system. “mJ

In June 2012, in Gray County, Texas, a Kinder Morgan Natural Gas Pipeline of America 26” diameter pipe failed at Compressor Station 154, Mile Post 52, 4 mi. east of Laketon. The gas ignited, blowing a crater 30 feet in diameter and burning 2 acres of agricultural land as well as two 500-gallon plastic tanks used to store liquid fertilizer plus two telephone poles and transformers. State Highway 152 was closed for several hours. The cause was a 50-foot-long longitudinal rupture in the pipe.m.J

On December 26, 2012, in West Melbourne, Florida, a Kinder Morgan Florida Gas Transmission Company pipeline exploded in a pastureP” The blast ejected a 20-foot section of20” diameter pipe which landed about 15 feet from the rupture.v”

• 2013

On May 8, 2013, a Kinder Morgan Tejas pipeline compressor station near Crockett, Texas, had a fire that caused \$7,502,188 in property damage. 1m

On June 18,2013, in Louisiana, a Kinder Morgan Florida Gas Transmission Company 30” diameter pipeline ruptured and exploded before dawn, jolting residents out of their beds in a rural, wooded area of Washington Parish. No one was seriously hurt but 55 homes were evacuated. The blast knocked down trees in an area about 200 yards across and the fire burned those within another 300 yards. “The ground around the crater is completely bare. The dirt around it is just like it had been cooked in a kiln,” and an 80-foot-section of pipe was destroyed.v”

• 2014

On June 26, 2014 near East Bernard, Texas, a gas pipeline next to the Kinder Morgan compressor plant blew out, destroying the road and setting a truck on fire at FM 1164 just south of Highway 59. Flames shot as high as 150 feet.W!!I

## 20150824-4009

Hand written FERC Comment form, Liz Fletcher, 288 Marcel Rd, Mason, NH 03048, outdated maps, corner cutting, financial stability, 5-year performance bonds for mitigation, insurance, decommissioning fund.

## 20150824-4010

Kimberly D. Bose, Secretary  
 Federal Energy Regulatory Commission  
 888 First St. NE, Room 1 A  
 Washington, D.C. 20426

Re: Docket Number (PF 14-22-000) Comment and Scoping Session FERC (July 29, 30, 2015)

I represent Richard I. and Leah R. Fressilli, owners of real estate in the Town of Temple, New Hampshire 03084. Our street address is at 404 Fish Road. Our mail is received at Post Office Box 10, Temple N.H. 03084. We have received letters from FERC and Kinder Morgan alleging our property or a portion thereof is in the project impact zone.

I wish to thank you for the opportunity to present concerns with the Kinder Morgan proposal, which I provide in the spirit of good faith. My approach is to remain objective through situations of this nature. I'm certain the Federal Energy Regulatory Commission adopts a similar approach in discharge of its duties.

We believe problems associated with Pipeline Proposal (PF 14-22-000), in general and the proposed location of the compressor station (41,000 to 80,000 horsepower), in particular are significant. I will recite them as briefly as possible for your convenience.

**1. Constitution of the United States of America, Article 1, section 1 states that, *All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and a House of Representatives.***

A. This doctrine of American administrative law evolves from the idea that Congress is able to delegate its

enumerated legislative powers to agencies, only when a set of clearly defined policy standards have been prescribed to guide agency policy decisions. Concerns arise in many interesting contexts imposing conflicts in the separation of power of Congressional and Executive branches of Government.

This implicates the substance of Article I, Section 1 (Congress Legislative Power), Article II, section I, (president Executive Power), Article II, section 2, clause 2, The President Appointments Clause), Fifth Amendment Procedural and Substantive Due Process, arguments of the United States Constitution. 1 The non delegable nature of this power is reaffirmed in a 2015 Supreme Court decision

Congress created Amtrak in 1970. Later Congress granted Amtrak and the Federal Railroad Administration (FRA) joint authority to issue (metrics and standards) that address the performance and scheduling of passenger railroad services.!

The Association of American Railroads filed suit to challenge their validity, alleging the metrics and standards have substantial, adverse effects upon its members' freight services..'

The grounds for the suit rest upon rights conferred by the Fifth Amendment Due Process Clause and the aforementioned Constitutional provisions regarding separation of powers.

The District Court rejected both The Department of Transportation and FRA claims, finding the standards and metrics invalid. It was unconstitutional for Congress to allow the private entity Amtrak, to exercise joint authority in the issuance of the standards and metrics. The District Court decided the case on Fifth Amendment Due Process Grounds and Separation of powers concerns .4 The Court of Appeals for the District of Columbia Circuit reversed as to the separation of powers claims in finding that, for purposes of this dispute, because Amtrak is a private corporation and cannot constitutionally be granted power under section 207 (a), 122 statute 4907.'

Having granted certiorari, 573 U. S. (2014), the Supreme Court held that, for purposes of determining the validity of the metrics and standards Amtrak is a governmental agency," Though Amtrak's actions were governmental, substantial questions respecting the lawfulness of the metrics and standards including questions implicating the Constitution's structural separation of powers and the Appointments Clause, U.S. Const. , Art. II, Section 2, Cl. 2 which may still remain in the case.( pp.11-12). Because these matters have not been passed on by the Court of Appeals this case is remanded. (721 F. 3d 666, vacated and remanded).

The above case and illustrates a most recent example which finds our constitutional legal framework turning toward the early doctrinal non-delegation safeguards which were instrumental in curbing initial Congressional attempts to delegate legislative power to accomplish rule making and policy making objectives long before the use of administrative agencies was expanded graphically.

In EPA vs EME Homer City Generation<sup>7</sup>, the Supreme Court upheld the Environmental Protection Agency's (EPA) recent interpretation of the Good Neighbor Provision of the Clean Air Act. The decision calls on states to reduce emitted pollutants preventing other down wind states from achieving minimum national air quality standards. In an opinion by Justice Ginsburg, writing for the majority, the Court held EPA had reasonably interpreted an ambiguous provision of the Clean Air Act. The EPA rule was a reasonable way to close the gap left open by Congress.

The Court found it highly unlikely that Congress might have "buried the power to allow cost considerations to weaken national ambient air quality standards in the language (requisite to protect the public health) and (adequate margin of safety), reasoning the cost factor was (both indirectly related to public health) and (so full of potential for canceling the conclusions drawn from direct health effects.) Cost, she concluded (would have been expressly mentioned had Congress meant it to be considered.)

The above cases appear to trace the outlines of a trend which appear to initiate an escalation in awareness of a need to develop some protections for health and safety of citizens at large from an arbitrary and unbridled assault upon highly sensitive, natural environmental resource areas. When the larger portion of the Massachusetts pipeline project was pulled from the construction list, I thought that this location was far more environmentally sensitive than any of those communities. I've been to most of them but one has to say,

“more power to them!” I wouldn’t wish what my family and I have gone through for the past few month on anyone. This has placed a severe strain on everyone in our family and everyone throughout the area that I’ve spoken with.

These decisions in addition to the recent Senate vote failing to muster the ability to further expedite the processes associated with siting interstate gas pipeline projects, failing short of the requisite number to over ride the Presidential veto and the February 15,2013 U.S. Government Accountability Office, Report to Congressional Committees, PIPELINE PERMITTING, Interstate and Intrastate Natural Gas Permitting Processes Include Multiple Steps, and Time Frames Vary.

Interesting to note is the variance processed between the report’s project time frames of different types for different states and the fact that FERC doesn’t track time frames, citing limited usefulness of such data. (Introduction, What GAO found). Several challenges referenced as management practices could generate an “efficient permitting process and obtaining public input”, were listed as 1. ensure a lead agency is coordinating Federallstatelocal intrastate pipeline projects, 2. ensure effective collaboration of numerous stakeholders involved in permitting processes, 3. provide planning tools to assist company routing to avoid sensitive areas, 4.offer industry the option to fund contractors or agency staff to expedite the permitting process, and 5. increase opportunities for public comments. (GAO Pipeline Permitting, introduction. What GAO found).

We were quite surprised to receive a letter from FERC and Kinder Morgan that we were in an impact range of the 80,000 horsepower compressor generator which is planned for construction in the Town of New Ipswich, which borders our town and a small portion of our property. Part of our surprise stemmed initially from the realization that we are situated in a Drinking Water Protection Area which would seem to preclude the siting of an instrumentality of such size and potential danger anywhere within this region. This part of the Monadnock Region is an environmental wonder and it is somewhat difficult to comprehend the logic of such an initiative in contrast to the existence we have come to know here.

The 2015 Amtrak case which highlighted the unconstitutional delegation of some form of government power to a market participant in the railroad industry may offer some assistance when coupled with the EPA vs EME Homer City Generation, 2014 Supreme Court Case, which spoke to the issue of ambiguity in one of the provisions of the clean air act. The FERC private pipeline contractors are virtually unsupervised agents of the government, employed through loosely capitalized limited liability corporations while engaged in activities capable of imposing huge amounts of risk upon sensitive natural resources and infrastructure. Cloaking these agents with eminent domain power artificially escalates their governmental posture, yet it is illusory.

Homer City Generation works to escalate the health and safety concerns which may potentially arise from activities which impose a significant threat to environmental quality. The importance of environmental quality as a means of safeguarding public health and safety is of primary concern when activity is conducted which imposes the risk of endangering the environment.

This is graphically contrasted with the mechanism which enables FERC to place the public at large in harm’s way, through the construction of pipeline activities performed by private, corporate agents, with the power of eminent domain. For example, analyze the rationale for placing pipeline of thinner, inferior quality in highly sensitive environmental zones based solely on the population. Logic dictates the sensitivity of the environment should dictate the tools and construction techniques employed, when in actuality the opposite is the case.

Rather than focusing upon the sensitivity of the environmental concerns for water, air and protection of these and other resources, FERC imposes a relaxed pipeline material standard for the construction which is based solely on population. I don’t recall an assessment formula associating appropriate costs as a means to control expenditures on these projects. This seems ambiguous.

A pipeline is not an acceptable use in Temple and New Ipswich. I have provided some documents from attending hearings of the Planning and Zoning Office, Zoning Board of Appeals and in New Ipswich. The scope of the hearings should offer insight into how well our two towns police steep slopes and setbacks to

wetlands in this rural zone in the State of New Hampshire.

This tradition isn't going to disappear, not without an administrative process or two.

These will undoubtedly take place above and beyond the traditional boundaries of FERC's pre-emptive barriers.

The pages that follow contain the sections of the United States Constitution and the New Hampshire Constitution which have been implicated by the pre-emptive status FERC has been delegated to attribute to itself by Congress. You will note the frequency and repetition accorded through the New Hampshire Articles associated with protections similar to those extended to residents of this state by the guarantees within the federal Bill of Rights.

U.S. Constitution Article IV Section 1, Each State shall give full faith and credit to the public acts and records of the other States.

*Full Faith and Credit shall be given in each State to the public Acts, Records, and judicial Proceedings of every other State. And the Congress may by general Laws prescribe the Manner in which such Acts, Records and Proceedings shall be proved, and the Effect thereof.*

The Kinder Morgan, Northeast Energy Direct, Tennessee Gas Pipeline proposal denies the purpose and effect of Article IV, Section 1 through the total disregard of the state's inherent land use authority as exercised through the zoning initiative of its local government subdivisions. The Towns of Temple and New Ipswich have each adopted extensive Zoning Ordinances, Subdivision Ordinances and Comprehensive Master Plans. These powers have been exercised to enable these two similar geographic communities, with modest distinctions in character to coexist with reasonable short and long term expectations for the future, while safeguarding natural resources and quality of life.

The turmoil of 14-22-000 has been imposed upon property owners haphazardly in what appears to have been an arbitrary and capricious fashion. More to the point the actions to date represent a severe intrusion into the area of New Hampshire's most fundamental constitutional safeguards and intrinsic regions of State Sovereignty. This has been accomplished through an apparent reckless disregard of the following constitutional provisions.

## 2. United States Constitution, Fourth Amendment

*The right of the people to be secure in their persons, houses, papers and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized*

While the process continues our homes have no resale potential and therefore have been partially seized. The security of the house itself has been violated. The substance of the Fourth Amendment has been viewed in various ways, often fashioned to judicial specification to accomplish effective exercise of the police power. The results were traditionally directed toward avoiding the tiresome task of obtaining a search warrant while loosely alleging to conform (more or less), to the law governing search and seizure.

Through this proposal the applicant and F.E.R.C., a federal government agency have imposed a process wherein concerned citizens scramble about to meetings, hearings and a full gamut of political social interaction. As a result many residents have been compelled to spend inordinate time and anxiety to save something bought, maintained, sweated and earnestly paid and sacrificed for.

The home was once stood for what American life was all about. This was a custom or tradition many of us had learned and understood from watching our parents.

Home ownership served as the cornerstone of our hopes and aspirations. It was, indeed the essence of the American Dream. The practice of siting gas and oil pipelines in environmentally sensitive rural areas and drinking water supply areas may be considered "just" and "fair" to some people but I don't consider it to be appropriate. I certainly don't intend to sit around and watch it happen.

This discussion ironically implicates the appropriate language held through:

3. Article IV, Section 3, Regulations concerning property subsection 2.

*The Congress shall have Power to dispose of and make all needful Rules and Regulations respecting Territory or other Property belonging to the United States, and nothing in this Constitution shall be so construed as the Prejudice any Claims of the United States, or of any particular State.*

Under the above Congress is supposed to make “needful rules” respecting the Territory or other Property belonging to the United States. This should never be construed so as to prejudice “Claims to the property of any other particular State, “ for example any of New Hampshire’s authority such as it may exercise through eminent domain, zoning or its subdivision powers.

4. U.S. Constitution’s Article III., Section 2 Jurisdiction of Federal Courts

*The judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their Authority, -to all Cases affecting Ambassadors, other public Ministers and Consuls. =to all Cases of admiralty and maritime Jurisdiction-« to Controversies to which the United States shall be a Party, -to Controversies between two or more States; -between a State and Citizens of another State, -between Citizens of different States, -between Citizens of the same State claiming Lands under Grants of different States, and between a State, or the Citizens thereof, and foreign States, Citizens or subjects.*

*In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the supreme Court shall have original Jurisdiction.*

In all the other Cases before mentioned, the supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make.

Since what point in time has one become unable to seek redress concerning a Federal Question through the original jurisdiction of the District Court? I have been deprived of one of the most cherished assets known to the civilized world, deprived to a significant extent. The marketability of the title to my home has been impaired.

I’ve read, FERC has approved 95% of these oil pipeline proposals. Challenges to these approvals are reportedly difficult to sustain once a decision has been made. Those of us who have been injured by the loss of property don’t really care which one of the parties, FERC or FRAC, was responsible for confiscating our property without substantive or procedural due process of law. The scoping sessions as proposed do not present a forum through which the requirements of procedural due process can be satisfied. This is obvious from the number of aggrieved communities with significant interests involved simultaneously in attendance at each hearing. There is simply no time to discuss the individual concerns of each locality through this venue.

5. U.S. Constitution, 5th Amendment, Trials for crimes; just compensation for private property taken for public use

*No person shall be held to answer for a capital or otherwise infamous crime, unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service in time of war or public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law .. nor shall private property be taken for public use, without just compensation.*

The fourteenth Amendment was necessary to apply the fifth Amendment to the states. 6. U.S. Constitution 14th Amendment; Privileges of Citizens

This amendment was proposed on June 13, 1866, and ratified on July 9, 1868:

*Section 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the state wherein they reside. No state shall make or enforce any law*

*which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty, or property, without due process of law “ nor deny to any person within its jurisdiction the equal protection of the laws.*

## B. Issues under the New Hampshire State Constitution

### 1. Article 1. Equality of men; Origin and object of government.

*All men are born equally free and independent; therefore, all government of right originates from the people, is founded in consent, and instituted for the general good*

The idea that any government of right which has originated from the people's consent, has been instituted for the general good promotes an image drastically different from the one proposed through PERC's review process by Northeast Energy Direct. I attest to that as a landowner within proximity to the proposed project. I'm reasonably certain anyone immediately affected by the effort is similarly unenthused with the approach. The drilling, storage, subsequent transport, and compression of this fossil fuel and its volatile chemical contaminants through New Hampshire flies in the face of State efforts to decrease the scope of the carbon footprint and statewide efforts to help preserve the viability of the planet.

The fact that the project is proposed to be advanced through commandeering control over state authorized local land use policies and public safety concerns while inducing landowners to concede fundamental rights is outrageous. The proposed project trespasses upon state and federal notions of constitutional justice and displaces much of the bedrock upon which our system of cooperative federalism has been based.

2. Article 2. Natural Rights. *All men have certain natural, essential, and inherent rights among which are, the enjoying and defending life and liberty; acquiring, possessing, and protecting, property, and, in a word, of seeking and obtaining happiness. Equality of rights under the law shall not be denied or abridged by this state on account of race, creed, color, sex or national origin.*

3. Article 3. Society, its Organization and Purposes. *When men enter into a state of society, they surrender up some of their natural rights to that society, in order to ensure the protection of others; and, without such an equivalent, the surrender is void*

Reference is made to essential rights discussed as inherent in regard to enjoying and defending life and liberty. The methodology is through “acquiring, possessing, protecting and defending property.” In the face of this experience with (Docket #14-22-000) I can begin to understand the rationale for the emphasis upon defense characterized as necessary to safeguard the interests of freedom. This situation with the pipeline has yanked the liberty I had hoped for from my grasp.

My time is now spent trying to retain something I believed belonged to me and now it has been jeopardized through no fault of my own. My error stems from following the prescription for happiness advanced by the state.

4. Article 7. State Sovereignty. *The people of this state have the sole and exclusive right of governing themselves as a free, sovereign, and independent state; and do, and forever hereafter shall, exercise and enjoy every power, jurisdiction, and right, pertaining thereto, which is not, or may not hereafter be, by them expressly delegated to the United States of America in congress assembled*

5. Article 7. State Sovereignty. *Articulates the right of independence and self government forever after to people of this state, “to exercise and enjoy, which is not or may not hereafter be expressly delegated to the United States in congress assembled” A strangely phrased expression indeed which seems to offer no guaranty of some continued alliance within this union.*

6. Article 8. Accountability of Magistrates and Officers; *Public's Right to Know. All power residing originally in, and being derived from, the people, all the magistrates and officers of government are their substitutes and agents, and at all times accountable to them. Government, therefore, should be open, accessible, accountable and responsive. To that end, the public's right of access to government proceedings and records shall not be unreasonably restricted*

7. Article 10. Right of Revolution. *Government being instituted for the common benefit, protection, and secu-*

*... rity. of the whole community, and not for the private interest or emolument of anyone man, family or class of men; therefore, whenever the ends of government are perverted, and public liberty manifestly endangered. and all other means of redress are ineffectual. the people may, and of right out to reform the old, or establish a new government. The doctrine of nonresistance against arbitrary power, and oppression, is absurd, slavish. and destructive of the good and happiness of mankind*

The final clause of Article 10. ***“The doctrine of nonresistance against arbitrary power, and oppression, is absurd, slavish, and destructive of the good and happiness of mankind”***

8. Article 12. *Protection and taxation reciprocal. Every member of the community has the right to be protected by it, in the enjoyment of his life, liberty or property; he is therefore bound 1b his share in the expense of such protection. and to yield his personal service when necessary. But no part of a man’s property shall be taken from him. without his own consent. or that of the representative body of the people. Nor are the inhabitants of this state controllable by any other laws. to which they or their representative body. has given their consent.*

9. Article 14. *Legal Remedies to be free, complete and prompt. Every subject of this state is entitled to a certain remedy, by having recourse to the laws. for all injuries he may receive in his person, property or character; to obtain right and justice freely; without being obliged to purchase it.’ completely. and without any denial; promptly and without delay. conformably to the laws,*

Respectfully submitted,

Richard J. Fressilli

## **20150824-4011**

My particular request to FERC is regarding maps, that FERC require Kinder Morgan to promptly provide digital vector map layers of the proposed pipeline route and any other unique information at their disposal, so that citizens opposed to the pipeline can create their own layered maps with which to make timely counterarguments to Kinder Morgan’s proposals. Operating with the maps in Kinder Morgan’s reports, which are essentially just pictures of maps, we cannot quickly determine the exact latitude and longitude of inflection points on the pipeline, precise locations of compressor stations and other ancillary equipment, river crossings, etc. Vector maps are mathematical constructs that can be used to do thought experiments and calculate statistics that could help us do this work. Combining these vector layers with other, publicly available, vector and raster layers, we can do our own analysis. The layers could be in the form of shapefiles or spreadsheets of latitudes and longitudes.

Like virtually all of my neighbors in Greenville, New Ipswich and Mason, I oppose the construction of the NED pipeline because it is unnecessary and because constructing and operating it destroys the values of the place we have chosen to live. The land, water and air that would be forever degraded by this project contains unique treasures that we want to pass on to our descendants.

Along with many of my neighbors, I also oppose it because it is a means of prolonging the burning of fossil fuels instead of switching to renewables. Others have shown that there is no likely increased demand by consumers in our towns and in most of our state for natural gas for home heating. Others have also dem-

onstrated that, to the extent that natural gas is a convenient stopgap for electric generation during the short peak periods, the increased demand during those periods cannot justify the capital expense of building this pipeline and upgrading the existing pipeline routes into New England in comparison to the cost of injecting LNG into the system at appropriate times. Others have shown that the most likely purpose for this pipeline is to export gas as LNG to Europe and Asia via Canada. The purpose is to find a market for the Marcellus shale gas produced via destructive fracking processes, in the parts of the world where the offered price for gas is highest, and this export has no direct benefits to the people of New Hampshire and New England.

## 20150824-4012

Good Evening I am Maryann Harper. I am speaking tonight on behalf of the Town of Rindge.

Rindge New Hampshire which is approaching its 250th Anniversary is home to the Cathedral of the Pines, an inspirational -all faiths - outdoor place of worship as well as Franklin Pierce University which bears the name of our only NH President. It is home to over 6,000 residents and over 1000 University students.

Rindge is also the location of the highest number of wetlands and water bodies in all of Cheshire County, several large wildlife corridors, and two large parcels permanently protected by the Monadnock Conservancy. All of these are in the path of the proposed NED pipeline.

New England lags the rest of the country in economic recovery. Rindge, like many of the rural towns along the proposed route, would not be characterized as wealthy. This could be the final blow to many fragile existences. I am asking FERC to hire an independent third party consultant to study this entire project in a socio-economic context. The creation of a new industrial corridor will remove the buffer of trees between homes and the current utility corridor. What this project is collocating with - is many, many neighborhoods. This will have an immediate effect on the marketability of properties and in fact already has. This represents a financial catastrophe to aging homeowners trying to downsize, retire or move to health care facilities. I am asking FERC to study and report on the cumulative effect this project has on those who would like to sell their properties in the next 5 years. In addition to the effect on property value, please include the health impacts, both physical and psychological, that accompany the stress of having your well planned future derailed.

Additionally I am requesting that FERC include this information as part of a report on the "fino pipeline" alternative as required under NEPA.

The greatest predictor of future actions is past performance. To date Kinder Morgan operating as Tennessee Gas has shown us great disrespect. They pushed for Open Houses during the worst part of our winter, they have sent surveyors in to our towns where nearly everyone has denied access yet we come home from work, to our properties that are legally posted No Trespassing, to find survey markers and ribbons on our land. Kinder Morgan has identified 73 properties in Rindge as affected, yet we count nearly double that number. I do not believe this is unique to Rindge. I am requesting that FERC look into this matter along the entire proposed route.

The Constitution of the United States begins with three powerful words "We the People" - a principle our country was founded upon. Yet "We the People" have no true voice in this decision. All that has been offered so far is lip service from a Company that is using the Natural Gas Act as a license to steal our land and has an insider relationship with the only NH Utility signed up for a contract on NED. "We the People" say NO. "We the People" say We've had ENOUGH "We the People" say DO NOT take New Hampshire's citizens for granted.

Thank You!

**TOWN OF MERRIMACK, NH**

Town Of Merrimack  
6 Baboosic Lake Rd. Merrimack, NH 03054  
July 29, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission 888 First Street, N.E.  
Washington, DC 20426

Written Testimony for FERC Scoping Meeting

Good Evening. I am Nancy Harrington, the Chair of the Merrimack Town Council and speak on behalf of the entire Council for these proceedings. Merrimack is unique among NH municipalities impacted by the NED Project in that the Town has a vibrant business community with a deep interest in reducing energy costs in addition to being a community with a profound interest in protecting natural resources and the environment as is evidenced by the large acreage of conservation areas in Merrimack and the number of entities stepping forward with concerns regarding the impacts of the NED Project. Merrimack has engaged in this process early on in order to ensure protection of its resources and community.

Merrimack would also like to take this opportunity to express its disappointment that the Commission did not heed the suggestion we and many other interested parties made regarding delaying these scoping meetings until a period after the Applicant's submission of the next round of resource reports. This next round of resource reports was filed on July 24, 2015 and included thousands of pages of new information regarding the Proposed and alternative routes and associated impacts. It is appalling to the Town that we have not been afforded sufficient time to review these filings in order to comment on them at these scoping meetings. Holding these scoping meetings less than a week after such a significant filing is a gross denial of due process. We request that the Commission hold an additional round of scoping meetings once interested parties, like the Town, have had ninety days to review this latest round of resource reports.

Despite this objection to the process, Merrimack is extremely concerned that (as Merrimack indicated to FERC numerous times in Docket PF14-22) there are numerous extremely sensitive receptors impacted by the Proposed Route through our Town. Written testimony will be provided with more specific information and Tim Tenhave, Chair of the Merrimack Conservation Commission will follow me with additional environmental data.

In brief, the Proposed Route through the Town of Merrimack, NH has significant and unacceptable impacts to:

1. Two Town owned conservation parcels- Gilmore Hill Memorial Forest and Horse Hill Nature Preserve
  - a The Horse Hill Nature Preserve contains ponds and streams providing important habitat for several endangered/threatened species
2. At least multiple wetland areas including Naticook Brook and the Merrimack River- the lower portion of which is a NH Designated Protected River
3. Merrimack's highest yield aquifer (which is also a Wellhead Protection Area and Aquifer Conservation District) is located near the Proposed Route along with two water supply wells which together provide more than half of the water service to the Town.
4. The Proposed Route crosses Town water supply lines in at least 10 locations
5. The Proposed Route crosses municipal and private sewer lines in at least 4 locations
6. The Proposed Route impacts numerous private residences some of which rely upon private wells and

septic systems

Merrimack also understands from the July 24 resource reports that Amherst and the Applicant have discussed and are proposing several alternative routes through Town. Of these routes, one was discussed in a July 10, 2015 letter from the Town of Amherst, NH filed in this FERC docket (“Amherst Alternative”). Merrimack has also learned from its independent public water supply company (MVD) that between July 1 and July 21 the MVD and the Applicant actively discussed significant modifications to the Amherst Alternative. It is unclear based on our current level of review of the resource reports whether the MVD discussions impacted the Amherst Alternative or are incorporated in another of the proposed alternative routes through Amherst. The lack of transparency in these discussions and the timing of the filing of the new resource reports are inherently detrimental to Merrimack’s ability to participate in this FERC process in a meaningful way. Additional relevant and important concerns regarding these alternative routes will be provided in writing.

The following are only some of the unacceptable impacts as a result of the “Amherst Alternative”:

1. It is immediately adjacent to an active rail line for approximately two miles of its route through Town;
2. It passes through the Town’s most sensitive wellhead area where one wellhead has some existing contamination and three more are under construction and where the Town is actively planning a new water treatment plant
3. It travels directly up Continental Boulevard (an extremely heavily travelled roadway)
4. It passes immediately adjacent to an elementary school and
5. It goes through the Pennichuck Water Works properties which provide and protect water for Merrimack and other NH municipalities including Nashua

As required by the Commission’s jurisdictional authority we ask that the Commission look carefully at the many existing non-NED Project alternatives such as the Northern Pass Project, Portland Natural Gas and Spectra. There is much evidence supporting the conclusion that these projects are sufficient to meet New England’s energy needs on their own and that they are far ahead of the NED Project in construction time line. These other energy projects will avoid the devastating environmental effects of the NED pipeline as they truly co-locate with other existing pipelines.

We are not aware that any of these issues have been addressed to date in any reports filed by the Applicant. Of course, given that less than a week has passed since the filing of the major modifications to the resource reports, it may be that some of these issues are addressed giving rise to the second tier of issues which Merrimack has not yet focused upon. The Proposed Route and the Amherst Alternative have significant impacts to the Merrimack resources and we look forward to a process in which those issues may be addressed in a more complete and transparent manner.

Sincerely,

The Merrimack Town Council

Nancy M. Harrington, Chairperson

-----  
Verbal Testimony at FERC Scoping Meeting - July 29, 2015 - Nashua, New Hampshire

**Nancy M. Harrington, Merrimack Town Council Chair**

Good Evening .. my name is Nancy Harrington and the Chair of the Merrimack Town Council and am here on behalf of the entire Council for these proceedings. The Town of Merrimack has engaged in this examination process early on in order to ensure protection for our resources and community. As a result we have provided multiple documents to Docket PFti2 for consideration. Although I will provide written testimony, I would like to highlight three issues of concern during this verbal testimony.

**1. FERC’s rushing to the scoping meetings when the KM resource reports were about to be filed has made the process less transparent and disadvantaged interested parties like Merrimack.**

This next round of resource reports was filed on July 24, 2015 and included thousands of pages of new information regarding the Proposed and alternative routes and associated impacts. It is appalling to the Town that we have not been afforded sufficient time to review these filings in order to comment on them at these scoping meetings. Holding these scoping meetings less than a week after such a significant filing is a gross denial of due process. We request that the Commission hold an additional round of scoping meetings once interested parties, like Merrimack have had ninety days to review this latest round of resource reports.

**2. There is no information in the record documenting why this project is necessary as compared to approved projects that address the energy issue**

As required by the Commission's jurisdictional authority we ask that the Commission look carefully at the many existing non-NED Project alternatives such as the Northern Pass Project, Portland Natural Gas and Spectra. There is much evidence supporting the conclusion that these projects are sufficient to meet New England's energy needs on their own and that they are far ahead of the NED Project in construction timeline. These other energy projects will avoid the devastating environmental effects of the NED pipeline as they truly co-locate with other existing pipelines.

**3. The limited information we had in the old resource reports made clear that the Proposed Route has dramatic impacts in Merrimack**

We are not aware that any of these issues have been addressed to date in any reports filed by the Applicant. Of course, given that less than a week has passed since the filing of the major modifications to the resource reports, it may be that some of these issues are addressed giving rise to the second tier of issues which Merrimack has not yet focused upon. The Proposed Route and the Amherst Alternative have significant impacts to the Merrimack resources and we look forward to a process in which those issues may be addressed in a more complete and transparent manner.

Diane Hewitt, Resident of Groton, MA

Comments for FERC Scoping Meeting, July, 2015

Good evening. My name is Diane Hewitt and I am a resident of Groton, MA whose property is included in the Northeast Energy Direct's original pipeline route. My son and his wife recently moved to a home in New Ipswich, NH, less than 2 miles from the largest compressor stations proposed on the new, preferred route.

let me begin by saying how disappointed our family is that these seeping meetings are even proceeding. FERC has steadfastly refused to heed the urgent requests of our legislators, congressional delegation, state wide environmental groups, municipalities and thousands of citizens to postpone these comment sessions for at least 60 days after the release of the amended Resource Reports. You have provided us with less than a week to digest and understand documents that span over 6,000 pages and are still riddled with over 10,000 pieces of incomplete information. This is a travesty.

In my comments this evening, I would like to ask how FERC intends to conduct an analysis of the air quality impacts and greenhouse gas emissions related to both the construction and operation of the pipeline. We know that KM proposal is expected to have significant impact on air quality and a complete and comprehensive assessment of the cumulative impacts on air quality, including all the related facilities, such as Compressor Stations, Metering and Venting Stations will be required.

Specifically, I am requesting that you study and document the following information:

1. Research the local, state, and federal air quality standards that must be compiled with and the monitoring requirements and ongoing testing protocols to determine compliance during both the construction and operation of the pipeline
2. Provide a detailed description of the air quality modeling that will be conducted and provide maps of the areas that will be impacted from the emissions from the pipeline, compressor stations, metering and venting stations. This should include pre and post pipeline studies which are conducted under different

meteorological conditions. Please review and incorporate into your work the study by the Southwest PA Environmental Health Project on the health impacts of compressor stations (2/24/2015).

3. Identify all of the hazardous pollutants that will be emitted and the air quality monitoring and testing that is proposed to be completed on daily, weekly, or a more frequent basis at the compressor, venting, and metering stations during the operation of the facility to protect our health and safety. Study and devise a reporting structure and rapid response system on these emissions so that local, state, and federal officials are aware and can respond appropriately to changing/unhealthy conditions.

4. Conduct an analysis of the greenhouse gas emissions expected to be generated by the construction and operation of the KM pipeline. Quantify the impacts of the project on the state's Climate Change initiatives and Greenhouse Gas reduction goals.

Thank you for your time and consideration.

---

Re: Docket No. PF-1 ... 22, Tennessee Gas Pipeline Co., Northeast Energy Direct Proposal

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

Re: Docket No. PF-1 ... 22, Tennessee Gas Pipeline Co., Northeast Energy Direct Proposal

Dear Ms Bose:

I currently serve as the **Chairman of the New Ipswich Zoning Board of Adjustment (ZBA)**, an elected member of the New Ipswich Budget Committee and serve as Chairman of the New Ipswich Pipeline Task Force. However, today I am writing as a private citizens, concemed about the Impact the proposed NED pipeline will have on my drinking water.

But let me start by saying, that given the incomplete nature of Kinder Morgan's Resource Reports and recent changes to the scope of the project. I believe these scoping meetings are being conducted prematurely and. therefore, failing to provide information that would benefit the NEPA process.

New Ipswich has no public drinking water. We are all on private wells. My well draws water from a Stratified Drift Aquifer, one of three the pipeline will segment in New Ipswich.

According to NH DES, our groundwater resides within bedrock fractures and between particles of soil, sediment. and loose rock that lie on top of bedrock. The upper boundary of an underground area that is com-

pletely filled with water. the “water table.” is typically 10 to 20 feet below the land surface.

Our groundwater quality is influenced by the bedrock and overburden material it moves through and can be greatly influenced by land use. Our stratified drift aquifers are typically high-yielding. The nature of New Hampshire aquifers differs significantly from many other parts of the country where aquifers are more uniform and much deeper. Unlike these places, the amount of water that can be stored in New Hampshire as groundwater is limited naturally by the state’s climate and geology.

Radon and arsenic, in particular, are naturally occurring and concentrations can increase due to the disturbance caused by the pipeline’s construction.

Because of these facts, the quality of pipe used in this project should be evaluated due to potential leaks contaminating our aquifers as these impacts to our aquifers are permanent if contaminated.

Please identify all wells that draw water from these three stratified drift aquifers in New Ipswich.

Please test these wells prior to construction and then quarterly after construction for flow impacts and also for contaminants, both naturally occurring and those leaking from the pipeline.

Asking us to identify what needs to be avoided, mitigated, minimized or compensated without the adequate resources or time to do so can only assure that the Town of New Ipswich will suffer irreparable harm from this project.

Sincerely,

Wendy Juchnevics-Freeman

July 29, 2015

Concerns regarding the proposed NED Pipeline

I have numerous concerns regarding this proposed pipeline which include; given the other proposed increases in sources of natural gas in the northeast (such as the Spectra/Northeast Utilities Pipeline proposal, is there even enough demand to justify such a huge disruption to our land. I also have many concerns about the safety record of such pipelines and the ability of our relatively small emergency response teams to protect property and lives if an incident were to happen.

I have not been able to ascertain if this meeting is solely to address environmental issues regarding the project or a broader field of concerns. Given that, I will concentrate my remarks on the environmental issues but want to make very clear that there are a number of other issues of concern before reaching a decision on whether to proceed with this project or not.

I have lived in Merrimack for several decades. I chose to live here for the quality of life this area supports. This project would seriously degrade that quality of life. The rural character would be irreversibly altered. Property values would decline. Our environment would be negatively impacted. If this pipeline were critically necessary, maybe I could accept such changes, but NH exports approximately half its’ natural gas to other states. Looking at a more regional view, occasional short term supply shortages can be mediated by the much smaller other proposed increases in gas supply as well as storage of LNG as a buffer.

The proposal puts at risk our wellhead protection area, two conservation areas which we have spent time and money to preserve (Horsehill Nature Preserve and Gillmore Hill Memorial Forest). There is a reasonable chance that the pipeline may disrupt both ground and surface water flow. Areas currently used for recreation will be jeopardized. The pipeline will pass under both Naticook Brook and the Merrimack River. Hazardous materials are by definition needed in the construction process and may impact the surrounding land. Blasting certainly could impact the nearby homes as well as the integrity of the underground ledge.

The idea of adding a tariff to our electric bills to help pay for this project simply adds insult to injury. We already pay some of the highest electric rates in the country and to increase those rates to pay for a pipeline we don’t really need is absurd.

Recently, I have heard that there is a new proposal to alter the route in response to concerns voiced by other towns. This new route would place the pipeline in close proximity to Thornton's Ferry Elementary School. That is a risk that is totally unacceptable.

No one can guarantee that there will never be an incident jeopardizing the health and safety of our residents. It is also almost guaranteed that there will be some level of leakage over time from the pipeline. Putting our lives at risk and permanently altering our environment is simply not worth it for a project of questionable value.

Thank you for your time and I sincerely hope you will heed the pleas of our community and not approve this pipeline for this location.

Carol J. Lang

Merrimack NH 03054

## **20150824-4018**

Tennessee Gas Pipeline, I. L. C. Docket No. PF14-22-000 Northeast Energy Direct Project Fitchburg Lateral Line

**Louise M. Lavoie, Selectman, Town of Mason** NH 35 Brookline Road  
Mason, NH 03048  
603-878-2960  
Imlavoie@myfairpoint.net

First I would like it entered into the record that the NH Towns and effected landowners were not afforded sufficient time to review and fully understand the Kinder Morgan Resource reports posted on the FERC webpage on Thursday 7-24-2015. Please note, these documents contain several thousand pages, FERCs website traffic has been overloaded resulting in limited access to the documents and most importantly 3 business days is inadequate to comprehensively review the documents, underscore changes, locate and digest the many many unknown and TBD details that still exist with this project. I strongly urge FERC to slow down this process and allow due process to all those impacted by this project.

I am requesting Public Safety be studied with the intent of providing the towns a clear line of sight on emergency planning, preparedness and costs.

To put things in context.

- Mason is a small town with a limited tax base with total operating expenses of \$1.6M.
- The annual budget for our volunteer fire department is \$65,000.
- Town of Mason and surrounding towns with volunteer departments rely on availability of volunteers and mutual aid of nearby towns. The majority of our small towns run on volunteer efforts and have limited budgets.
- In Mason for example, there is limited access to water, there are no pressurized hydrants, tanker shuttles are required to provide water supply to active scenes.
- There is limited accessibility to the proposed pipeline routes, especially back country land locked areas.

The Town of Mason is requesting a public safety plan for all NH towns along the proposed route. - The public safety plan must address but not be limited to key points of concern.

- What is the emergency notification process for municipalities and the public?
- What is KM and its affiliates plan to respond to emergency situations (minutes, hours, days)?
- What are the evacuation plans for elderly, disabled, children as well as homeowners potentially blocked in on dead end roads, cut-de-sacs, etc in the event of a pipeline emergency
- Who is responsible for providing resources, training and equipment to deal with pipeline emergencies?

- In event of a pipeline emergency where does KM and its affiliate's responsibility begin and end?

Where does the Town of Mason pick up?

- In the event of a pipeline emergency who shoulders the cost of services incurred by the Town of Mason? Are Kinder Morgan and its affiliates responsible?

- Who is responsible to fund training and equipment necessary to respond to a pipeline emergency? .

What is the plan to access back wood land locked areas during a pipeline emergency?

How do we ensure the confidence of the public that there has been adequate planning and consideration given to public safety?

The issues I raise deserve thorough, thoughtful study and consideration. Small towns simply can not afford to take on the burden and responsibility for this project.

## 20150824-4019

1. There is nothing in the Draft Environmental Report - Resource Report 10- Alternatives from Tennessee Gas Pipeline that allows the conclusion that the environment of Northern Massachusetts is more sensitive than the environment of Southern New Hampshire. Further - the prime table absolutely needs to be quantified.

2. The great New England energy crisis goes to the generation and use of electricity. Natural gas is a wonderful way to generate electricity.

3. Massachusetts has been shutting down coal and oil fired electricity generating plants without replacement for many years now. At the beginning of the shutdown cycle in about the year 2000, Massachusetts generated close to enough electricity to meet its needs. Today that number is closer to 50%, and Massachusetts imports electricity from anywhere that it can find it including New Hampshire, Connecticut, and Canada. If it weren't for these three entities, Massachusetts would go dark.

4. New Hampshire generates more than twice the electricity it uses. That extra electricity all goes to Massachusetts.

5. Massachusetts uses about ten times the amount of natural gas that New Hampshire uses. 10 Times!!]

So, the environmental differences between Northern Massachusetts and Southern New Hampshire are pretty equal, New Hampshire uses 10 times less gas than Massachusetts, and as a good neighbor, New Hampshire exports fully half of the electricity it produces to Massachusetts. For these reasons it is unconscionable to even consider putting the pipeline in New Hampshire when it really and truly belongs in Massachusetts - where it is needed - put it there.

6. For process - on the "do nothing" part of the environmental report electricity projects absolutely must be included - as natural gas equivalents. I will provide this information to the FERC in support their Environmental Impact Statement preparation.

Speaking of Northern Pass - all of that electricity will flow to Boston Massachusetts. ISO New England has issued the permits to make it so. Build out of some of the support structure has already begun in the Merrimack Valley. Deerfield, Scobie Pond, Twerksbury MA, Wakefield MA and then to Boston MA. Northern Pass has nothing to do with bringing hydro-power to New Hampshire - only thru New Hampshire.

7. On FERC Process. For the FERC - New Hampshire should be provided more time!

8. Many of our politicians are supporters of Northern Pass, this pipeline project and even industrial scale wind turbine complexes. None of these projects bring any value to the state of New Hampshire and in fact they are all short-or long term disruptive and/or bad for our largest industry ... Tourism including seasonal homes. What are the Politicians thinking? I don't know but it is not New Hampshire first - it's more like New Hampshire second, third, or "who cares".

9. To stop the outlandish bills that are coming our way in 2017 and beyond do not allow the Coal Fired Brayton Point Plant in Massachusetts to close, install a second Distrigas LNG terminal in Everett Mass that

is just for the Mystic Power Station. Leave the one that is there just for other local consumption. This should help a great deal- these generators are HUGE!

10. AND - Don't even think about brownouts and blackouts in New Hampshire because there isn't enough electricity - New Hampshire has plenty of electricity ....

11. OBFUSCATION-

Hiding // Not in one sentence Regionl NH OR New England NH // If your reading 27 words and it only take 3, buyer beware!

SINCERELY - Thank you all for your time ..... PatL

LeBelMarketing.com

Tuesday, July 28, 2015

Most Honorable Members of FERC

Dear Members of FERC,

I am writing to let you know that I strongly oppose the proposed Kinder Morgan pipeline in southern New Hampshire.

This pipeline will destroy property, displace families, impact people's health in serious ways due to high levels of air and noise pollution, and put many people including children at significant risk. Kinder Morgan has a poor safety record, and there is an explosion at one of their facilities across the US nearly every day. Allowing the pipeline, and specifically the compression station in Temple, would be reckless.

The proposed pipeline will also dramatically decrease the property values in Temple and surrounding areas while increasing our taxes. People will chose to leave the area, and other trained people who could enhance our area will chose not to move here. Soon the entire Monadnock region, long known as a tourist destination as well as an area for the arts, will dry up.

One of the wonderful aspects of New Hampshire is its natural beauty, which is why our level of tourism is so high. Allowing the Kinder Morgan pipeline to destroy a large of the southern region, while the compression station ruins our air, would be disastrous to our economy and well as to the citizens of the state.

Many people have been 'tricked' into believing that the pipeline will decrease our energy costs. The proposed pipeline will do nothing to decrease our costs since none of the energy will be available to those in the area, with most of the gas exported. The fact that management at many businesses in the state think this pipeline will decrease their operational costs is irrational.

The entire premise for the pipeline is to make those in Kinder Morgan's management, and its investors, richer. They have no regard for the thousands of people who will be affected. A pipeline here would be devastating.

I have attached a short article about the recent Temple Historical Society's Barn Tour.

It reflects what is so special about the Monadnock region, Temple in particular in this instance, and how the inhabitants here are dedicated to maintaining a quality of life that is hard to find in other parts of the state and country. Our love of nature and life in a rural area, and our 'love' of celebrating ways of the past are evident in everything we do here every week of the year.

To allow a pipeline to change our landscape and our lives forever would be immoral.

I appreciate your time and consideration in reading this letter, and I truly hope that you will represent the

people of the state of New Hampshire in your decision.

Respectfully yours,

Lilliane LeBel

## **20150824-4021**

Melanie Levesque

2 McDaniels Dr. Brookline, NH 03033

My name is Melanie Levesque. I live at 2 McDaniel's Dr. in Brookline, NH. We are concerned about the impact of the pipeline on property values for those co located with the planned pipeline. You may refer to them as pipeline abutters.

We request that Kinder Morgan be required to provide tangible, substantiated data regarding the impact of similarly sized gas pipelines on local property values. An assessment of the potential impact on property values in each town along the pipeline should be clearly detailed.

My second comment involves electricity rates. One of the alleged benefits of NED is reduced electricity rates. We have trouble understanding how a pipeline that does not serve existing power generation plants will aid in reducing electricity rates. In other words. the gas from the pipelines will be used for heating not electricity.

To assist in quantifying the benefits of NED, we request that Kinder Morgan and its partners be required to:

- a. #1 -Provide the results of a study that evaluates the cost/benefit analysis of this specifically proposed pipeline for electricity prices in NH (similar to a recently completed study in Maine). This study should also consider the potential cost impact of the project on ratepayers.
- b. #2 - Provide quantifiable figures on the predicted reduction in electricity prices as a result of the pipeline and over what period of time

Such an analysis can then be weighed against the significant personal and environmental impact of this project.

In addition as a former state legislator I am deeply concerned about the role of the Federal Energy Regulation Commission. It seems that an Agency titled as such should not only be to approve pipelines but to heavily consider the impact on our environment, our communities, our conservation lands, our energy needs, and promoting a responsible 21st century energy strategy\_ One that promotes renewable, sustainable, efficient and necessary energy projects. This is not such a project.

## **20150824-4022**

### **“Need” for Natural Gas in New England**

Until the winter of 2013/2014 there had never been any shortage of natural gas or electricity in New England in the winter. New Englanders know winter is coming. and prepare for it in a number of different ways. Some winters are worse than others, but we're ready for the worst, and flexible about how we deal with it.

So why did things come so close to disaster in 2013/2014? The single biggest difference was that “Independent System Operator-New England” (ISO-NE) the “not for profit corporation” tasked with managing the New England electrical power grid) decided we needed a “Winter Reliability Program”. After the winter, ISO-NE patted themselves on the back for keeping the polar vortex from freezing New England. They implemented a centrally controlled solution to a nonexistent problem. In doing so, they broke the market mechanisms that had been working for many decades, and created the kind of shortages and problems they

were claiming to solve.

The “Winter Reliability Program” involved ISO-NE contracting for demand electricity from no more than 200 oil fired and dual (gas/oil) fuel generators. {1 & 3} They refused to contract for winter electricity with gas only generators using LNG. That meant that natural gas only generators were very likely to be idle some part of the coming winter. ISO-NE spent \$66 million of ratepayer’s money to pay for the oil for the oil/dual fired generators. Why would electrical generators turn down “free oil” when the alternative would be buying natural gas with their own money, especially when ISO-NE would refuse to buy electricity generated using natural gas from LNG?

Both before and after, but not during, the winter of 2013/2014 Liquid Natural Gas (LNG) imports were a significant part of the fuel used for electricity and heating in New England. In 2009/2010 LNG imports were around 51 billion cubic feet, 2010/2011 around 54 Bcf, 2011/2012 around 48 Bcf, 2012/2013 (mild winter) around 21 Bcf, 2013/2014 {severe winter with “Winter Reliability Program”} 18 Bcf, 2014/2015 around 24 Bcf to Everett LNG terminal and additional LNG through other terminals. Looking at the facts, it would appear that the “Winter Reliability Program” was really a “Winter Unreliability Program”.

In September 2013 FERC approved the 2013/2014 “Winter Reliability Program” without LNG, accepting ISO-NE’s false assertion that there wasn’t time to include LNG in the program. ISO-NE says in their filing agreed to by FERC on September 16, 2013: “Under the Winter Reliability Program, ISO-NE will solicit bids only from oil-fired generators, dual-fuel generators, and demand response resources. ISO-NE contends that it could not create a fuel-neutral program for this winter due to the short time frame and the requirement to minimize market distortions, but states that it intends for future winter programs to be fuel neutral.” (2) You’ll note the “minimize market distortions”. As we all know in 2013/2014 energy markets from wood pellets to oil to natural gas were all distorted far beyond what has ever occurred before or since. One can certainly speculate that removing a large part of the natural gas supply which before and since has come to New England in the form of LNG would likely result in energy market distortions.

The assertion that there wasn’t time is belied by comments from LNG suppliers and Conservation Law Foundation proposing a workable inclusion of LNG in the mix for 2013/2014. That proposal was ‘pooh poohed’ by FERC in Part C of the same ISO-NE filing (3). Neither FERC nor ISO-NE addressed the substance of the LNG proposal.

In the (2013/2014) “Winter Reliability Program” “ISO-NE will solicit bids only from oil-fired generators, dual-fuel generators, and demand response resources.” (4) What they’re saying is that ISO-NE would NOT solicit or accept bids from natural gas fueled generators. The result was that natural gas fueled generation was ‘frozen out’ of the market in 2013/2014. Those generators sat idle while ISO-NE’s preferred generators ran using oil bought by ISO-NE using rate-payers’ \$66 million. (Your “System Benefits” charge at work.) ISO-NE’s conclusion from this was that there wasn’t enough pipeline gas capacity in New England.

In the same filing, ISO-NE says: “ISO-NE asserts that a fuel-neutral program design, or one that includes liquefied natural gas (LNG), is preferable to a more limited program design but would conflict with ISO-NE’s goal to minimize market distortions. ISO-NE states that compensating natural gas resources for incremental natural gas could reduce opportunity costs, and thus wholesale electric prices, at times of high natural gas demand, thereby sending the wrong signal during times of natural gas scarcity. ISO-NE also states that, due to the complexity of the natural gas supply chain, a natural gas solution would pose a risk of unintended consequences. For example, ISO-NE contends that providing incentives for additional LNG supply would reduce natural gas released from other sources or displace use of pipeline natural gas when it is economic.” (5) ISO-NE says their goal was to “minimize market distortions”. That’s a real whopper. How could anyone expect the market NOT to be distorted by ISO-NE’s market manipulation?

In the last sentence, they say: “ISO-NE contends that providing incentives for additional LNG supply would reduce natural gas released from other sources or displace use of pipeline natural gas when it is economic.” In other words readily available LNG would be used instead of pipeline gas when LNG is cheaper. That would be good for consumers, but would require pipeline companies to compete on price with LNG.

In the next to last sentence, ISO-NE says: “ ... due to the complexity of the natural gas supply chain, a natural gas solution would pose a risk of unintended consequences.” This implies that there were intended consequences. Given everything else in the filing, and the fact that ISO-NE came up with the “need” for a “Winter Reliability Program” seemingly out of thin air, the only conclusion I can make is that the ‘intended consequences’ were to have us here tonight listening to more lies from Kinder Morgan.

Under 717 C of the Natural Gas Act (6), manipulation of natural gas markets is illegal. In this case, rather than preventing or prosecuting market manipulation by ISO-NE FERC was complicit in that manipulation by approving a plan that manipulated all energy markets in New England from natural gas to electricity to wood pellets.

It’s likely ISO-NE will say they weren’t a natural gas market manipulator because they didn’t actually trade in natural gas. However, as an “entity” manipulating the natural gas market (by their own statements) they are a “person” (7) as defined by the Natural Gas act.

The facts make it very clear that there is no need for additional pipeline capacity to New England. The artificially created shortage of natural gas, electricity, and other forms of energy in 2013/2014 was a result of market manipulation by ISO-NE with the complicity and approval of FERC. In winters before and since, there was no shortage of fuel or generating capacity because the market was allowed to operate without manipulation, and energy needs were satisfied. I will encourage Department of Energy’s Inspector General to look for coordination and communication between ISO-NE and pipeline companies. It is difficult to believe that this fiasco was solely the result of ISO-NE’s incompetence.

I don’t ask anyone to take my word for anything. Everything here is verifiable fact. Most of it is from FERC’s and ISO-NE’s websites and other publicly available sources. Whether it may disappear from those sources is anyone’s guess. I’ve sent copies of this to our federal legislators, the IRS, the Inspector General of DOE and the press.

Subject: Docket iPF14-22: Scoping Meeting Comment - Resource Report 10

Dear Ms. Bose,

I am writing to draw your attention to the incomplete nature of the Kinder Morgan Resource Report 10. In particular, section 10.1.1 which deals with evaluating the potential of energy efficiency as an alternative, in whole or in part, to meet demand for natural gas does not include any rationale, analysis or references to expert studies.

This is especially concerning when we look at the timing and cause of pipeline constraints.

Since the Issue of natural gas shortage occurs during the winter months and are related to IIS consumption for heating homes and businesses, why would Uberty Utilities be decreasing Investment In energy efficiency projects for 2015 and 2016 at this critical juncture? The following graph from ISQ-NE 2015 Regional Electricity Outlook shows natural gas consumption for heating versus electricity generation for the months November to March:

*{graph omitted}*

The people of New England deserve a detailed analysis of an energy efficiency initiative aimed at reducing the residential heating load before considering doubling the amount of natural gas flowing into New England to address a problem that occurs 4 months out of the year.

Such a program would deliver immediate benefit to current residential gas consumers and would protect electric and gas ratepayers from the risks of stranded costs related to an overbuild of fossil fuel Infrastructure.

The response to the entire Alternatives subsection of Resource Report 10, but especially 10.1.1, by Kinder Morgan should include a study similar to the Synapse Study conducted for Massachusetts and published in January 2015, but should be expanded to include the entire ISO-NE region.

While there were many problems with the Synapse study, it provides a nice framework for presenting scenarios comparing the cost/benefit of energy efficiency investments versus increased pipeline capacity.

Although FERC does not establish specific goals for energy efficiency, applicants presenting proposals are required to consider relevant Federal, State and Regional policy goals and design to those standards. My comments concern New Hampshire, but each of the participating ISO-NE states has similar rules.

According to testimony given by the Northeast Energy Efficiency Partnership (NEEP) in IR 15-072, Energy Efficiency is the most cost effective energy investment as shown in the chart on the following page.

In New Hampshire, RSA 378:7 grants the Commission authority to fix just and reasonable rates. In determining whether rates are just and reasonable, the Commission must balance the customer's interest in paying no higher rates than are required against the investors' interest in receiving a reasonable return on their investment." Within this balancing test, a justification for the pursuit of all cost effective energy efficiency resources is evident. Maximizing value for both ratepayers and investors requires the utility commission to plan for acquisition of the least cost resources, and as demonstrated below, energy efficiency is the resource that provides the most value for ratepayers and utility investors.

*{graph omitted}*

In analyzing the effectiveness of the current energy efficiency statistics for natural gas customers in New Hampshire, please ask Kinder Morgan to take into consideration how much of the historical energy efficiency investments were expended on converting oil, electric or other fossil fuel heating systems to natural gas versus assisting current customers to reduce consumption. Please also ask the efficiency programs to specify what percentage of energy efficiency dollars were invested in weatherizing buildings versus rebates on equipment.

Unlike the Synapse study, please ask Kinder Morgan to only present scenarios which achieve climate goals as specified in the State Energy Strategy. If those goals cannot be met with pipeline Infrastructure, please ask Kinder Morgan to specify mitigation through carbon capture/sequestration projects which should be included in the financing of the project.

Thank you very much for the opportunity to comment on a matter of great concern to the people of New England.

Sincerely,

Patricia A. Martin  
17 Farrar Road  
Rindge, NH 03461

**20150824-4025**

To: FERC Scoping Hearing Committee From: Julia Steed Mawson

Re: Public Testimony - NED project, Nashua Radisson Date: July 29, 2015

My name is Julia Steed Mawson, I am a biologist and extension educator emeritus with the University of New Hampshire. I live at 17 South Shore Dr. Pelham NH and I oppose this pipeline.

Research produced through the Community Profiles Program produced by UNH Cooperative Extension for Pelham and nearly every other NH town involved in them, carry the statement in some form regarding “maintaining the rural character of NH”. This is echoed in Pelham’s Master Plan and in the recent report developed by the Nashua Regional Planning Commission. The question becomes, how do we maintain our natural resources and the vital, and critical rural character and the rural treasures to the west of us and not become another industrialized region like middle New Jersey in the future?

In 1973 as a student working on an NSF grant to study the Lowell Canals as a community resource, I had to be fully immunized to work on the Merrimack River. Millions of dollars and hours of people’s time later, the water is now suitable for recreation. When the mills and cities were built over a hundred years ago, no one considered these unintended consequences. Understandable in some ways, since our science was not developed. In the 2015 report Beaver Brook Flood Study for Pelham produced by VHB on the flooding events that now challenge Pelham, it states that due to rapid growth, and changes in climate events, modifications to the floodplain have had unintended consequences “ ” “. Not so excusable since the science of hard surfaces and its relationship to runoff and flooding has been known for over 30 years.

Now we are faced with building a high-pressure pipeline of great scope and magnitude that can have long term and potentially devastating impacts on our natural, social and cultural resources of NH, activities that can impact the “orderly development of this region”. Not thoroughly studying the unintended consequences of this project concerning maintaining the vital resources and way of life that we have in southern N H would be INEXCUSABLE given that: there are at least 17 other NE energy projects currently proposed, thousands of leaking gas capture incidences that need to be mitigated and great financial pressure to make the Marcellus Shale Fields profitable.

I ask therefore that you study the long term, 75 to 150 year impacts of this project by developing a research strategy that incorporates the evaluation of multiple stressors on the interrelated human. energy and ecosystem services of the southern NH/northern MA region through integrated laboratory, field and social science approaches. Further, given the growing understanding of climate change, I request that these studies include the projected impact of methane as a greenhouse gas, generated by loss of gas by pipe leakage in current systems in New England, blowdowns. venting and other events where methane and related gases are released at along pipes or compressor stations.

While this research takes time and effort, something that this rushed, NED project does not seem to allow, our collective wisdom should prevail so that in the long run we will hopefully prevent ourselves from furthering environmental injustices on populations that we view as sacrificial and that we will know that the best effort was made to do what is right.

Project Docket PF14-22

Joseph McGuire

339 Nutting Hill Rd, Mason, NH 03048

NuttingHill@Gmail.com

My name is Joe McGuire - I live in the town of Mason, NH and I am a stakeholder.

The NED pipeline is planned to cut over 55,400,000 square feet of forest. As it traverses through our New England farmland, there are many individual examples of *Acer Saccharum*, also known as Sugar Maples, as well as sugarbushes that will be affected by this project. A sugarbush is any group of sugar maples that are planted in close proximity to each other for the purpose of harvesting maple sap, the raw ingredient used in the manufacture of maple syrup and related products.

Maple syrup is a prime agricultural product of the state of New Hampshire. As FERC develops the Environmental Impact Statement for the NED pipeline please identify how you will consider the following attributes associated with the removal of either an entire sugarbush, or a portion of a sugarbush for the entire pipeline route.

Since the economic vitality of any sugarbush is based on the closeness of trees to each other, in order to facilitate economically more feasible sap harvesting and continuity of operations, please be sure to personally examine, on foot, the impact to each and every sugarbush on the NED pipeline route. Removing the middle of a sugarbush for example can more than double the operational cost of running the remaining two, isolated pieces of a sugarbush as the harvesting process will need to be duplicated for each section. In many cases it will not be feasible for these costs to be borne by the operator and chances are that the entire sugarbush will cease production.

Please be sure to conduct these studies with the landowner and sugaring operator present, as well as a state employed forester, and a representative of the New Hampshire Maple Sugar Producers Association.

Please also identify the process by which Kinder Morgan will replant the sugar maples for each and every instance where sugar maples will be cut. In order to have the a successful replanting, young trees must be harvested and transplanted from the same sugarbush that they are going to be replanted in. The transplanting process takes one full year or the transplanting process will be a failure.

Please also identify how the economic impacts for every sugar maple cut will be handled to provide just compensation for the sugarbush operator. Any trees replanted will not yield marketable crop for at least 40 years. After that the sugar maple trees have a lifespan of up to an additional 360 years, providing agricultural products for many generations to come.

In addition please identify how Kinder Morgan will maintain the easements without the use of chemical herbicides which potentially will render entire crops unusable by humans. In addition please identify for the entire pipeline route how you will prevent either non-native species of trees or non-sugar maples from replacing the sugar maples that are cut.

In addition tourism, especially during the fall foliage season, is a much needed and valuable industry in our state. The sugar maple, which is a representative species in new England is known for its bright fall colors. Removing large swaths of these trees will detrimentally affect any tourist related business in operation now or planned for the future that relies on this spectacular fall beauty. Please identify each and every example, through personal, physical inspection and review, of any instance where the removal of sugar maples has a negative impact to a related tourist or potential tourist business.

**20150824-4028**

### **FERC - Restart Scoping**

On March 13th of this year, Kinder Morgan released the first draft of its Resource Reports for the NED project. These early draft reports were very incomplete and contained more than 21,000 uses of TBD - To Be Determined. These TBDs indicated where necessary data was missing from the reports.

Because these draft reports were so incomplete, they were all but unusable for serious analysis of the NED environmental impacts. Kinder Morgan promised to release updated Resource Reports in June.

FERC went ahead and scheduled the initial Scoping meetings to start on July 14th. This scheduling was very tight for those needing time to examine the updated reports ahead of the Scoping meetings.

Worried about this tight schedule and about the possibility that Kinder Morgan might not deliver the revised reports as promised in June, dozens of individuals, towns, environmental organizations and elected officials filed comments asking that FERC please not let the Scoping meetings proceed until after Kinder Morgan had released the updated Resource Reports and the public had had time to read and analyze them.

It is worth noting here just how massive a set of documents these updated reports are. There are thirteen resource reports, sixteen appendices and four companion documents. These total nearly 7,000 pages. This is not light reading.

What was FERC's response to the many requests they had received to delay the scheduling of Scoping meetings until a usable set of Resource Reports was available? **Absolutely Nothing** - they simply ignored these many requests and refused to delay the scheduled Scoping meetings.

And - what was FERC's response when Kinder Morgan did in fact miss the promised June release date and the updated reports did not become available until last Friday, July 24? Again **Absolutely Nothing** - FERC simply went ahead with the Scoping meetings as scheduled. The Pennsylvania and New York Scoping meetings took place before the updated Resource Reports were made available.

And FERC's schedule provides very little preparation time for attendees of this week's five Scoping meetings in Massachusetts and New Hampshire.

Simply stated, FERC has failed the public. Participants at the earlier Scoping meetings only had the unusable draft Resource Reports and even those attending later Scoping meetings will be afforded precious little time to read, analyze and prepare comments based upon the updated reports.

I add my voice to the many others calling upon FERC to restart the Scoping process for this pipeline proposal. FERC must provide those who would be so seriously impacted by this pipeline with the necessary time to read and digest these crucial reports. Surely FERC must want to receive the most complete and accurate Scoping feedback that a properly informed public can supply - and a restart of Scoping would allow that.

Thank you.

Nick Miller Groton, MA

#### **20150824-4030**

The Merrimack Village District is responsible for providing potable water to over 25,000 residents in the Town of Merrimack, New Hampshire. All of our water resources are derived exclusively from groundwater that is pumped from a series of high-yielding wells sited in three stratified drift aquifers. On an annual basis, we provide approximately 800,000,000 gallons of clean, potable water to our customers. The proposed route of the NED gas pipeline crosses through the center of one of the principal aquifers that supplies a critical portion of the groundwater supplied by the District.

The MVD has invested a substantial amount of financial resources in developing groundwater sources that are of very high quality. A loss of a production well would have devastating consequences and cost the rate payers millions of dollars to relocate. The loss of an aquifer would be catastrophic with immeasurable financial consequences and the inability to provide a reliable source of water to the residents and businesses of Merrimack.

The MVD believes that the installation of a gas pipeline through these 'sensitive groundwater recharge areas' that ultimately provide a safe and reliable Drinking Water to the greater Merrimack community seriously puts at risk the investments that we have made in these valuable water supply assets. Therefore we oppose allowing the installation and construction of high pressure gas lines within any of our designated Wellhead Protection Areas.

Ron Miner, Jr.

Superintendent  
Merrimack Village District

Federal Energy Regulatory Commission  
Secretary of the Commission  
888 First Street, N.E.  
Washington, DC 20426

RE: Mailing List for Tennessee Gas Pipeline Company, LLC (NED Project) Docket Number: PF 14-22

Dear Secretary,

The Merrimack Village District (MVD) is responsible for providing potable water to over 25,000 residents in the Town of Merrimack, New Hampshire. All of our water resources are derived exclusively from groundwater that is pumped from a series of high-yielding wells sited in three stratified drift aquifers. On an annual basis, we provide approximately 800,000,000 gallons of clean, potable water to our customers.

Tennessee Gas Pipeline Company, LLC is in the pre-filing process of siting a pipeline route (identified as the NED Project) through the Town of Merrimack. One of the proposed routes of the NED gas pipeline crosses through the center of one of the principal aquifers that supplies half of our groundwater through two high-yielding wells. Loss of the use of such critical production wells would have devastating consequences and cost the rate payers millions of dollars to relocate one or both of the wells. The loss, however, of an aquifer would be catastrophic with the immeasurable financial consequences and the inability to provide a reliable source of water to the residents and businesses in the Town of Merrimack.

Based on the research and findings from the MVD's geologist Emery & Garrett Groundwater Investigations (letter attached) we strongly oppose the siting of the pipeline within the Wellhead Protection Area and we intend to actively participate in the FERC pipeline siting and review process. We respectfully request that you add the Merrimack Village District to the mailing list for the above referenced docket.

Best regards,  
Ronald Miner, Jr.  
Superintendent

Fax (603) 279-8717

February 18, 2015

Mr. Ron Miner  
Merrimack Village District  
2 Greens Pond Road  
P.O. Box 1949  
Merrimack, NH 03054

Dear Ron,

Pursuant to your request, this letter serves to provide you with our (Emery & Garrett Groundwater Investigations, LLC's [EGGI's]) professional opinion as it relates to potential impacts that might occur as a result of installing a proposed gas pipeline in Merrimack. The natural gas pipeline route that is proposed by the Tennessee Gas Pipeline Company would run directly through the middle of the Wellhead Protection Areas (WHPA) for the Merrimack Village District (MVD) Production Wells located in the Naticook Brook Aquifer. This letter summarizes our key concerns associated with that proposed pipeline route.

### **Background**

The Merrimack Village District is responsible for providing potable water to over 25,000 residents in the Town of Merrimack, New Hampshire. All of the water resources are derived exclusively from groundwater that is pumped from a series of high-yielding wells sited in three stratified drift aquifers. On an annual basis, the MVD provides approximately 800,000,000 gallons of clean, potable water to its customers.

Glacial sand and gravel deposits that filled an over-deepened bedrock trough that formed along the Silver Lake Fault Zone comprise the highly productive Naticook Brook Aquifer. Two of the most productive MVD wells (production Wells MVD-2 and MVD-3) are located in this Aquifer. Together, these two Wells have a combined sustainable yield of 1,900 gpm, which accounts for 50% of the MVD's total water capacity (Figure 1).

The Naticook Brook Aquifer is an invaluable natural resource within the Town of Merrimack that provides an irreplaceable source of clean groundwater for potable use. As you know, EGGI has conducted extensive hydrogeologic investigations throughout the Town of Merrimack and have concluded that no other aquifers, capable of yielding the quantity and quality of groundwater that are produced from these existing Production Wells, are available within the MVD Service area. *The Naticook Brook Aquifer deserves the highest level of protection; loss of such a critical resource would have devastating consequences on the MVD's ability to provide a reliable source of water to the residents and businesses in the Town of Merrimack.*

### **Gas Pipeline Concerns**

#### **Potential Blasting and Construction Activity Within the Wellhead Protection Area (WHPA)**

Portions of the proposed gas pipeline route (that are planned to be within the WHPA for Wells MVD-2 and MVD-3) crosses areas where bedrock is at or near the ground surface; therefore, blasting would likely be necessary to install the gas pipeline. Groundwater quality concerns with any blasting project are associated with the introduction of blasting chemicals (or their combustion by-products) into the environment. These blasting chemicals can enter the groundwater system and ultimately create adverse impacts to the underlying bedrock aquifer, adjacent sand and gravel aquifer, wells, and/or springs. Examples of blasting agents (and their byproducts) that are of concern include nitrate, volatile organic compounds (VOCs), perchlorate, and petroleum hydrocarbons.

Installation of a high pressure gas pipeline also involves significant construction activities including land clearing, major trenching and excavating, and tasks associated with the assembly of the pipeline and associated infrastructure. Construction activities pose numerous potential threats to the utilization of large community water supply wells. These threats include the following:

- Frequent handling and storage of petroleum products that can lead to uncontrolled releases into the environment that result in the contamination of underlying groundwater supplies;
- Earth disturbance and excavations that can change (or concentrate) storm water flow in new ways and, as a result, subsequently impair surface water' or groundwater quality.

#### **Operation of the Pipeline**

Although the normal operation of a natural gas pipeline typically presents limited risk to groundwater quality, there are certain events or occurrences that can pose a significant threat to groundwater resources. Catastrophic pipeline failures are low frequency, high-impact events that have devastating consequences in

terms of structural damage and personal injury\_ A catastrophic leak, explosion, or fire can lead to groundwater contamination (and water utility service disruption) due to runoff from fire suppression efforts and/or the mass injection of natural gas into the subsurface.

Furthermore, if this proposed pipeline is also licensed to carry liquid hydrocarbons (gasoline, crude oil, diesel, or other liquid hydrocarbons), there is serious concern that a release of one (or more) of these products could result in a significant impact to groundwater quality that renders the groundwater unfit for potable consumption for decades.

### **Loss of Future Groundwater Development Opportunities / Restricted Water System Expansion**

The gas pipeline could limit future well development. If the MVD decided to redevelop a Well at the former MVD-] site (or elsewhere on MVD or Town-owned property), the pipeline would be located just over 400 feet away, limiting the District's ability to drill additional Production Wells on their property. Although we do not see any reason to develop a well here, unforeseen events (such as contamination that puts MVO-2 or MVD-3 offline) might prompt the need for redevelopment of the old MVD #1 Production Well site. Additionally, it is not a simple matter to cross gas transmission lines with new utilities; there are often strict requirements that impose additional costs on the MVD if and when a new water line must cross the gas pipeline.

### **Conclusions and Recommendations**

If a catastrophic event were to occur that adversely impaired any of the MVD Wells, the cost to replace that Well would likely be in the \$2-3 million range ... and that is only if a replacement water supply could be found. It is our view (based upon our previous investigations) that developing new sources of groundwater supply capable of meeting the current New Hampshire Department of Environmental Services (NHDES) standards for Large Groundwater Withdrawals, will be difficult or impossible to accomplish. Therefore, protecting these sources of public water from adverse impacts should remain the highest priority for the Town of Merrimack and the MVD. **In our professional opinion, the MVD should oppose the siting of the natural gas pipeline through the Naticook Brook Aquifer to protect the availability of water resources for current and future residents of the Town of Merrimack.**

I hope you find the information contained herein responsive to your needs. If you have any questions, please do not hesitate to contact me.

Best regards,

Jeffrey M. Marts, P.G.

Project Manager/Geologist

1 The Naticook Brook Aquifer is directly connected to surface water bodies, including Greens Pond and Naticook Brook, which both provide necessary recharge to the underlying aquifer.

### **20150824-4031**

404 Jarmany Hill Road

Sharon, NH 03458

July 29, 2015

To: FERC Hearing on Kinder-Morgan Pipeline Proposed for New Hampshire Statement to Commission from Ted and Susan O'Brien, Sharon, Address Above

My husband and I are journalists of longstanding in New England. He holds the New England Television Academy Silver Circle Award, the highest recognition in the television media community.

We are unequivocally opposed to the gas pipeline proposed by Kinder-Morgan Corporation, and on these grounds:

---Eminent Domain: the seizing of private land for corporate profit is a fabricated abuse of the legal concept of eminent domain, which was enacted only for projects that address a public good. Numerous town gov-

ernments along the proposed pipeline have provided your commission with full proof that this pipeline will benefit no one in New Hampshire. Our town Planning Board, of which my husband is a member along with membership in the Select Board, has informed you that Sharon will seek relief from Constitutional law if you approve this pipeline.

---Environmental Disaster: please see the attached, very current article from the Boston GLOBE regarding the large and increasing number of explosions from pipelines. Your approval of this pipeline will place 822 families directly on the pipeline, an elementary school full of children, and others near the pipeline, in extreme and extraordinary danger.

-- Wildlife: although this is never a concern of corporations who propose these devastating acts, of course our wildlife, which we have carefully safeguarded and valued in numerous conservation easements and protections, will of course be decimated.

---Pollution: you are fully aware of numerous and longstanding reports of pollution of air, water and ground that will occur from this pipeline, including pollution of private wells, the only water source in many areas here.

Business--For example, a Vietnam veteran on the proposed route will have his ski trail business damaged. The ripple effect can impact all businesses in our area.

We have worked all our lives to be able to live in this area. Our fathers fought bitter and highly dangerous battles in World War II so we could have this quality of life. They did not do so on behalf of a land, water, air and ground battle by a completely unethical corporation.

All of this for a pipeline that is necessary and important only to one entity: the Kinder-Morgan corporation. We ask you to insure that this disastrous pipeline project be eliminated from New England.

Ted O'Brien

Susan K. O'Brien

## **20150824-4032**

Ogonowski  
110 Pelham Rd  
Dracut, MA 01826

Thank you

I am Jim Ogonowski of Dracut mass.

I am a 30 year veteran of the united states military. And I am a farmer.

My family been farming in Dracut for 112 years.

Based on what I can surmise. Our farm is the single most impacted parcel of land along the entire proposed routing.

I am here to tell you ... our farm is not for sale

Our farm is not free for the taking.

we have a proud farming tradition and we are known for preserving open space.

Two parcels of our family farmland is preserved as open space. With the assistance of the late senator Kennedy in memory of my late brother John himself a veteran, a farmer and the pilot of AA flight 11 who was murdered by terrorists on sept 11 2001.

my late brothers farm of over 100 acres is also preserved as open space.

The one parcel we have not preserved was purchased in 1948 when my dad a member of the greatest gen-

eration returned from ww2 from the ARMY AIR CORP.s it hasn't been preserved because as dad would say, "we own it, who ~o we have to preserve if from"?

I am here to tell you who. KINDER MORGAN.

Our farm is the most impacted parcel of land in the entire northeast.

Let me repeat that, our farm is the most impacted parcel of land in the entire northeast.

Not only do we get over 2500 feet of 30 inch pipeline we also get over 5000 feet of pipelines for two laterals one going to Lynnfield and one going to Haverhill. Our one farm is proposed to have 7500 feet of pipelines. crossing fields, waterways, and clear cutting 100 year old forest land. I've been told that would be over 10 acres

Not only do we get pipes we also would be neighbors to a massive compressor station.

Take a look at the entire routing, as it proceeds from west to east. When it arrives in Dracut it bends 90 degrees to the west across farmland to place a compressor station in a residential area. Dracut is the first town on the mass/ nh border. This pipeline makes no sense at all.. it borders on insanity .

The people of New England are well educated and deserve better than this proposal.

Don't let a texas company profit from new England landowners when they ship gas overseas.

my job, representing my family, is to protect the farm and we will pursue all of our legal rights to do so.

J am a 30 yr military veteran in need of your assistance.

I ask you to protect us and preserve our property, reject this pipeline

### **20150824-4033**

THANK YOU FOR THE OPPORTUNITY TO ADDRESS YOUR COMMITTEE REGARDING THE POTENTIAL PIPELINE PROPOSAL THAT IS BEFORE YOU FOR APPROVAL FROM KINDER MORGAN.

MY NAME IS DIANNE PAQUETTE AND I AM A 54 YEAR RESIDENT OF SALEM NH.

MY HOME IS NOT DIRECTLY EFFECTED BY THE PIPELINE PATHWAY HOWEVER I AM HERE TO REPRESENT THOSE SALEM NH RESIDENTS WHO ARE AFFECTED AND DEVASTATED BY THE PROSPECT OF THIS PIPELINE PATH BEING PLACED IN OUR TOWN.

MY CLOSE FRIENDS AND NEIGHBORS MANY HERE TONITE WILL BE DIRECTLY IMPACTED BY THE DECISIONS THIS COMMITTEE MAKES WITH REGARD TO THE KM PIPELINE. I HEARD A PHRASE -rr TAKES A VI LLAG E" WELL I AM TELLING YOU THE VILLAGE IS HERE. WHEN ONE VILLAGER IS AFFECTED, WE ALL ARE AFFECTED. I AM HERE TO SPEAK FOR THE VILLAGE OF SALEM NH.

KM KNOWS THAT THIS PIPELINE PROJECT IS NOT THE BEST PLAN OR THE SAFEST PLAN OR THE MOST BENEFICIAL PLAN FOR THE RESIDENTS IN THE PATHWAY, KM DOES KNOW THIS PLAN IS THE CHEAPEST MOST ECONOMICAL COST WISE PLAN AND THE PLAN THAT WILL GARNER THE MOST REVENUE FOR KM. KM ONLY CONCERN IS PROFITABILITY AND REVENUE AND THEY INTEND TO PURSUE THIS PLAN IRREGARDLESS OF THE COLLATERAL DAMAGE IT WILL CAUSE TO THOUSANDS SOME OF THE HOMES AND NEIGHBORHOODS AND WOODLANDS BEING DESTROYED AS COLLATERAL DAMAGE ARE OWNED BY THE RESIDENTS HERE TONITE.

WHEN YOU PURCHASE A HOME, YOU PUT YOUR LIFE INTO IT LITTERALLY, FIGURATIVELY AND FINANCIALLY, IT IS OUR LARGEST LIFETIME PURCHASE AND OUR LARGEST ASSET.

BUT WHEN YOU PURCHASE A HOME YOU ALSO INVEST YOUR PEACE OF MIND IN THAT PROPERTY, IT IS YOUR SANCUARY A RESPITE AND ESCAPE FROM LIFE.

WHEN THAT PLACE YOU KEEP YOUR PEACE OF MIND IS THREATENED, THIS CREATES AN IMBALANCE IN YOUR PEACE AND THE FOLKS HERE TONITE IN FRONT OF YOU FEEL THAT IMBALANCE AND HAVE BEEN LIVING WITH THAT IMBALANCE IN THEIR LIVES FOR SEVERAL MONTHS SINCE BEING TOLD THEY ARE IN THE PATH OF THE PIPELINE.

THAT IMBALANCE HAS BEEN CREATED BY KINDER MORGAN'S PLAN TO PLACE PIPELINES INTO THE VERY

SANCUARY OF THESE RESIDENTS, INTERFERING WITH THEIR PEACE OF MIND AND THEIR RESPITE.

THESE ARE HARD WORKING TAX PAYING HOMEOWNERS WHO FEEL VIOLATED AND FEEL AS THEY HAVE BEEN GIVEN ABSOLUTELY NO INPUT INTO WHAT IS ABOUT TO HAPPEN TO THEM AND THEIR HOMES AND THAT IS OUTRAGEOUS! THESE INPUT MEETING WITH FERC NEED TO BE MORE THAN INPUT THEY NEED TO BE THE VOICE OF THE VICTIMS OF THIS KM PLAN, FERC HAS HEARD ENOUGH FROM KM THEY NOW NEED TO HEAR FROM THE COLLATERAL DAMAGE OF THIS PLAN, THE HOMEOWNERS IN THE PATH.

SOME OF THE PEOPLE HERE TONITE ARE FRANKLY AT THEIR WITS END WITH THE WORRY OF WHAT IS PROPOSED TO HAPPEN TO THEIR PROPERTIES AND THE NATURAL WILDERNESS THEY ARE SURROUNDED BY.

THEY ARE WORRIED THAT THEY ARE SIMPLY A CONDUIT FOR THE PROJECT A PASS THRU AND THEY ARE NOT RECEIVING THE DIRECT BENEFIT OF THE GAS BEING PIPED THROUGH THEIR PROPERTIES AND TOWNS.

THEY ARE WORRIED ABOUT THE CONSTRUCTION AND DESTRUCTION OF THEIR PROPERTIES AS THE PIPELINE IS CONSTRUCTED ON, AROUND AND IN SOME CASES RIGHT THROUGH THEIR PROPERTIES.

THEY ARE WORRIED ABOUT THEIR CHILDREN IN HARMS WAY DURING CONSTRUCTION NEAR THEIR PROPERTIES.

THEY ARE WORRIED ABOUT ACCESS TO THEIR HOMES AND NEIGHBORHOODS.

THEY ARE WORRIED ABOUT HAVING TO MOVE SHEDS/GARAGES/POOLS/GARDENS OR HAVING PIPELINES IN THE CENTER OF THEIR PROPERTIES OR WITHIN 100 FEET OF THEIR HOMES.

THEY ARE WORRIED ABOUT BEING IN THE 1000 FOOT ZONE CALLED THE "INCINERATION ZONE" WHERE PROPERTIES AND PEOPLE ARE DESTROYED ALMOST INSTANTLY SHOULD THERE BE A PIPELINE LEAK OR EXPLOSION. HUNDREDS OF THESE HOMES ARE IN THIS ZONE.

THEY ARE WORRIED ABOUT LIVING NEAR A COMPRESSOR STATION WHERE LIGHTS SHINE ALL DAY AND NIGHT AND LOUD PIGGING SOUNDS FROM THE PIPES ARE CONSTANT AND THE AREA SURROUNDING THE STATION AND THEIR PROPERTIES HAS A CONSTANT GAS SMELL THAT PERMEATES THEIR HOMES. HUNDREDS OF THESE HOMES ARE NEXT TO PROPOSED COMPRESSOR STATIONS.

SO YOU SEE ITS CLEAR THAT FERC CANNOT APPROVE THIS PROJECT, THE PEACE OF MIND OF THOUSANDS OF HOMEOWNERS WILL BE DESTROYED FOREVER. KM HAS KNOWN FROM THE START THAT THIS PROJECT IS NOT THE MOST ECONOMICAL PROJECT FOR NH OR MA AND THEY HAVE KNOWN FROM THE START THAT IT IS NOT THE LEAST INVASIVE PLAN FOR NH AND MA.

THE ONLY THING THAT KM IS CONCERNED WITH IS PLACING A PIPELINE IN NH AND MA THAT IS COST EFFECTIVE FOR KM WHILE DELIVERING GAS AND GENERATING REVENUE FOR KM. AS LONG AS THE PIPELINE IS COST EFFECTIVE FOR KM IRREGARDLESS OF THE COLLATERAL DAMAGE IT CREATES AND THE PEACE OF MIND IT DISTURBS, THEN KM WILL HAVE INCREASED PROFITS AND THAT IS THE ONLY GOAL KM SEEKS.

FERC MUST NOT APPROVE THIS PIPELINE PROJECT, IT DOES NOT DIRECTLY DELIVER GAS TO THESE TOWNS AFFECTED, IT DOES HOWEVER DISRUPT NEIGHBORHOODS, DESTROY WOODLANDS, DESTROY FARMS, FIELDS AND WETLANDS, DISRUPT HABITATS AND AS I STATED EARLIER, THIS PIPELINE PROJECTS DISRUPTS THE PEACE OF MIND OF THOUSANDS, I RESPECTIVELY REQUEST THAT FERC DENY THE KM PIPELINE PROJECT APPLICATION AND GIVE THESE PEOPLE HERE TONITE AND THE THOUSAND OTHERS WHO ARE THREATENED THEIR PEACE OF MIND BACK FOREVER. A GRATEFUL VILLAGE AWAITS YOUR DECISION, I KNOW YOU WILL MAKE THE BEST DECISION FOR THE HOMEOWNERS OF NH AND MA. PLEASE DENY THE APPLICATION FOR THE KM PIPELINE INTO MASS AND NH.

THANK YOU,

**20150824-4034**

Hand written FERC Comment form: Julia K. Parkhurst, 11 Apollo Rd, Londonderry, NH 03053, opposing.

Statement of Thomas S. Popik

20 Lee St., Nashua, NH 03064

Hello, my name is Thomas Popik and I am resident of Nashua, New Hampshire.

I wish to speak in favor of the Northeast Energy Direct Pipeline. While I am chairman of the Foundation for Resilient Societies, a non-profit group that advocates for greater electric grid reliability at the state and federal level, tonight I am representing only myself as a private citizen.

Among regions of the United States, New England is arguably at highest risk of large scale grid outage and resulting societal impact. States within New England are at elevated risk of grid blackouts caused by the combination of dependence on long distance electricity transmission, lack of pipeline capacity and local storage for natural gas-fired generation plants, accelerated phase-out of five New England coal-fired plants, above-average exposure to solar storms, and vulnerability to physical, cyber, and electromagnetic pulse attack.

New England's significant complement of nuclear power plants cannot be used during conditions of grid instability, because safety standards prohibit operation without concurrent off-site electricity supply.

The high population density of southern New England will exacerbate societal impacts during conditions of long-term outage.

Because New England has overlapping grid reliability and security issues, because the region narrowly avoided blackouts in the winters of 2013 and 2014, and because every winter brings potential rolling blackouts due to inadequate gas pipeline capacity, there should be greater receptivity among politicians, appointed officials, and the public for proactive measures, including building this natural gas pipeline.

Uncertain natural gas transmission and delivery makes grid restoration difficult because about half of New England generation is dependent on natural gas. During grid restoration, the New England nuclear plants at Seabrook, NH, Plymouth, MA and Waterford, CT will be shut down. All of these factors combine to make long-term blackout for New England more likely.

The New England electric grid consists of generation and transmission within a control area managed by ISO-New England. Like Silicon Valley and San Francisco, New England is a vulnerable "electricity peninsula" dependent on power imports. New England has ten interconnections on eastern border, supplemented by one interconnection to New Brunswick (see graphic below).

**{graphic omitted}**

Graphic Source: ISO New England

New England is dependent on imported electricity and natural gas used for electricity generation, with about two-thirds of electricity demand supplied by these sources (see graphic below). Dependence on imported energy has been growing over time. For electricity imports, New England is principally dependent on Hydro Quebec. Hydro Quebec has the longest electricity transmission system in North America. These "built" features, along with enhanced and demonstrated vulnerability to solar storms make New England inherently vulnerable to natural and man-made disruption.

New England Depends on Energy for Electricity from Outside the Region

**{graphic omitted}**

Graphic Source: U.S. Energy Information Administration, from ISO New England

The natural gas pipelines for New England are long and narrow at the ends, as the below graphic shows.

New England Is at the Narrow Ends of Long Natural Gas Corridors

**{graphic omitted}**

Graphic Source: Principal Interstate Natural Gas Flow Summary, 2012; U.S. EIA

Much of the New England natural gas pipeline capacity is used for home heating in the winter. Gas utilities supplying residential customers have "firm contracts" for supplies, while electric utilities obtain cheaper gas through the "day ahead" market. During cold snaps, generation plants using natural gas for fuel may not

secure sufficient gas to operate. On two occasions in the winter of 2013, New England nearly had rolling blackouts due to constrained gas pipeline capacity.

More local natural gas storage may contribute to a future solution. However, the geology of New England prevents underground natural gas storage in rock formations, as a result, liquefied natural gas storage (LNG) is the only storage option. GDF Suez operates a large LNG facility in Everett, Massachusetts with a direct connection to a 1.5 gigawatt generation facility.

New England's reliance on electricity transmission over long distances and imported natural gas for generation reduces its resilience to a wide range of blackout-initiating events and therefore this pipeline is essential for increased electric grid reliability.

Statement of  
David Rushton  
12 Autumn Street  
Windham, NH. 03087  
Before FERC Scoping Hearing  
July 29, 2015  
Nashua, NH

Docket No: PF14-22-000

My name is David Rushton. I live in Windham, New Hampshire. Thank you for this opportunity to speak publically about a project I oppose. My property is in close proximity to the planned pipeline. I live close enough so that it will be significantly devalued and more importantly I will live with the constant fear associated with being in the "area of high consequence" should there be art problem with the pipeline. Direct ~ abutters and those in my situation are being asked to shoulder the expense and stress for this project, while a private company reaps the benefits. Realistically, any short-term benefits to this region will be far exceeded by sacrifices a relative few will make. In the longer term, temporary construction jobs will quickly go away, depreciating pipeline assets will eat away at promised town revenue, safety issues will grow as the pipeline ages, the inevitable exportation of gas delivered by this pipeline will lead to large market price increases negating potential financial gains, and our collective dependence on non-renewable energy sources will continue unabated. All the while our environment will continue to suffer in ways you are all well aware off. You should be sure to hold Kinder/Morgan accountable.

During this pre-filing period, Kinder-Morgan! Tennessee Pipeline is obligated to:

1. Communicate with stakeholders.
2. Identify areas of concern.
3. Attempt to resolve those issues.

It seems to me that they have forgot that last step. To a certain extent, the first two requirements are being addressed. It is your duty to require that they work on the last one and make an honest attempt to resolve known issues. Unfortunately, as I see it, most issues cannot be resolved, and in true governmental methodology it will by necessary to brush those under the rug. You should at least require that they work on those issues, which could potentially be resolved.

One resolvable issue bothers me more than some.

Why has Kinder/Morgan not negotiated with the power companies to truly co-locate this pipeline within the power line easements. Specially, the section from Londonderry to Dracut contains a very wide right-of-way, more than capable of including both the pipeline and the power lines should they be willing to negotiate and consolidate lines. Can you require that they at least attempt to do so? If not, why not?

Thank you for your time, I will await your response.

## 20150824-4037

NORTHEAST DIRECT PF14-22

Stephanie Scherr Fitzwilliam, New Hampshire

Those of us OPPOSING THE KINDER MORGAN NED PIPELINE want you to HALT THE SCOPING HEARINGS and RESTART THE PROCESS giving land owners the FULL 60 days they are allowed. The thousands of “to be determined” labels in Kinder Morgan’s latest report is unacceptable. Routes have been changed leaving no time for land owners to understand what is happening to them as Kinder Morgan’s people swoop in on them like vultures trying to negotiate deals. These calculating moves on the part of Kinder Morgan do not go unnoticed, nor without response.

When Kinder Morgan uploaded their latest draft of the Environmental Report on Friday afternoon, leaving just days to sort through the enormous document before scoping, land owners called FERC. Their calls were met with incredibly rude, disrespectful, condescending responses. This reinforces that you support pipeline projects at any and all cost with no regard for those that will be impacted and whether they WANT or NEED your services.

The following comments were made by FERC employees Sarah McKinley & Marcia Lurensky at the land-owner helpline:

- Sarah told one caller, “Compressor stations are just big chemical plants.

There is no pollution. I don’t know what you’re worried about. I have worked on gas pipelines for FERC for over 30 years and never heard the term blowdown. You have been sold a bill of goods. You need to get off YouTube!” Then she hung up. This was the second person at FERC to tell her blowdowns do not exist.

- Sarah told another caller, “You and your folks can take as long as you want to process and digest this information. You do not need it for scoping. Your FERC comments sent in to us are the same as testifying at scoping. Kinder Morgan pushed your buttons and there’s no need for your buttons to be pushed.”

- A caller who spoke to Marcia stated, “Not one of my questions have been answered. She’s beating around the bush. She wouldn’t stop talking until I told her that it was my turn to talk now. She tried to tell me that there would be no tariffs on our electric bill, that the noise wouldn’t be THAT interruptive, and that any information that I may get from protest groups is biased.”

- Marcia told another caller that she talks to Kinder Morgan on the phone.

They’re wonderful people. They don’t want to hurt anyone. She said that she’d be at working til 7:00 tonight “donating her time to FERC” talking to people to make them feel better. She was told she should not be so upset.

Believe me, this kind of response doesn’t make anyone feel better.

The FERC game is rigged to promote old, outdated, filthy energy technology. Seal the leaks in existing pipelines and send Kinder Morgan back to Texas! We value clean air, clean water, wildlife, scenic vistas, outdoor recreation, state parks, conservation lands, historic homes and small town culture. The injustice of shoving this pipeline through rural communities does not sit well with us. RURAL LIVES MATTER!

We have clean energy solutions already in use, exploding in popularity. The energy field labor force already possesses the skills to transition to safer, healthier, clean energy jobs with bright futures. I call upon Governor Hassan and all of our state representatives to have the VISION to boldly move New Hampshire forward, promoting choices that will proudly put New Hampshire in the lead.

## 20150824-4038

Environmental Concerns July 29, 2015

Michelle Scott, 632 Sand Pit Road, Mason, NH 03048

miscott39@gmail.com 603 878-1680

**Aquifer in Mason, NH** that serves the town. When blasting through the granite which exists throughout

this community, how will you avoid damaging the main water supply of Mason. GOing only SO ft from the pipeline is not likely to take care of the wells that can be disturbed by blasting. What measures will be taken to determine well failure that is caused by the blasting. There are house lots in Mason which remain unbuilt on because it turns out they are on an impenetrable ledge of granite.

**Brooks and streams which are part of the Nashua River Watershed.** How will you maintain the flow, the trout population, and restore the vegetation around the pipeline. There are at least 5 streams (not rivers) that are crossed by the proposed pipeline route in just the town of Mason. How will you keep from not only polluting the brooks/streams, but altering their flow.

**Air Pollution.** How much gas escapes when the pigging stations are use? Exactly what is in the off-gas? What plans do you have to measure the air quality before the pipeline is in place, to compare it to monitoring air quality after the line is actively moving gas? How will you reduce/minimize the pollutants in the fracked gas that are leaked at pigging stations and at the compression stations.

**Deforestation and air pollution.** Since Mason and the other 17 towns are heavily forested, how will KM mitigate the air pollution increase that will result when a 70 mile 150 ft swath is cut thru southern NH? That is about 55,440,000 sq ft of forest, and at least 18 million average sized trees. The carbon storage of this many trees will affect the overall air quality of NH. Due to the westerly winds, we already receive pollution from the Midwest, and some refer to southern NH as the "Tailpipe of the Nation." We need these trees for air purification. Colocation with power lines is a myth, since the main corridor which is free of trees must be enlarged by 100 to 150 feet since a 36 inch pipeline cannot safely be located directly in the path of high tension wires.

## 20150824-4039

Docket No: PF14-22-000

FERC Scoping Meeting July 29, 2015

Homer Shannon, 15 Autumn Street, Windham NH

I built my home in 1983 and have lived in it since. When I purchased the land for my home, it came with a power line easement. The easement occupies about 30% of my total land. For the most part, the power line has been a good neighbor: it has never had any barking dogs, there have never been any shouting residents and best of all, I know that it cannot be rezoned for a 24-hour gas station.

Imagine my surprise when in January of this year I learned that Kinder Morgan was plotting to take about 20% of my non-easement land for a natural gas pipeline and its associated right of way. I was informed that this would be in the best interest of all citizens as the route would use "existing power corridors".

I'm not certain what a "power corridor" is. No one has ever used this term in reference to the power lines that go across my property before. My land is not zoned as a "power corridor". I do not consider my property to be a "power corridor" - it is simply my yard.

What would the impacts of this project be to me and my property?

The strip of rand in question is on the west side of my usable land. The strip is heavily forested with mature oak, maple and pine trees, 50 to 80 feet in height. This strip of forest buffers my house and landscaped yard from the power line. This is more than an esthetic feature. In the winter, the trees protect my property from the cold winds that blowout of the northwest. In the summer, it provides shade that cools my home and adjacent yard from the long, hot, afternoon sun.

The Kinder Morgan NED proposal, as presently drawn in the alignment sheets, would require that most or all of this treed buffer would need to be cleared. There is not sufficient room between the new easement and my home to grow a new buffer - even if I had thirty years to wait for it to grow. Furthermore, my land with the power line easement is not at the same level as the usable portion of my land. The usable portion of land, including the treed buffer, is about 10 to 15 feet higher than land of the power line right of way. How will the pipeline be raid so that a significant portion of my yard is not carved away to allow its installation?

This pipeline will devalue my property in many ways:

- The placement of a second easement (of any sort) will cause a devaluation of my property,
- The loss of usable land will devalue my property.
- The presence of a 30", potentially explosive, pipeline on my land will devalue my property.
- The loss of the power line, treed buffer will devalue my property.
- Re-grading my usable land will devalue my property.

I estimate that these losses will cost me \$50,000 or more in the market value of my home. I will incur the burdens of the planning for this project, I will have legal cost relative to negotiating with Kinder Morgan and granting an easement, I will have to endure the construction of this project, and I will have a permanent degradation of "lithe use and pleasure" of my land due to the esthetic changes caused by the pipeline.

How much will Kinder Morgan pay me for these losses? How much for the taking of my land? How much for the inconvenience that this entire project represents? How much for aesthetic damages to my property? How much for the new risks associated with living right next to this pipeline? I do not know. I have been to several "Open Houses", but all Kinder Morgan says is that, "You will be paid in full for your land and paid for any additional damages". What these are and how much I am to be paid is not discussed f

I ask you (FERC), if you approve this application, will you protect my rights to the full value of my land? Will you assure me due compensation for all of my losses? You have the authority to approve or deny Kinder Morgan's application, but that authority comes with a responsibility to assure me and all of the right-of-way owners in the path of this project that we will be fully and fairly compensated. I am demanding that you demonstrate that you will uphold your responsibilities in this regard. Tell me how you will protect my interests.

#### **20150824-4040**

Hand written FERC Comment form: Ed Silva, 43 Auburn St, Lowell, MA 01852, opposing

#### **20150824-4041**

Hand written FERC Comment form: Susan Silverman, 67 East Lake Rd, Fitzwilliam, NH 03447, **requesting CD of latest Resource Report filing from NED**

#### **20150824-4042**

Scoping letter to FERC

My name is Terry Silverman and I live at 67 East Lake Road, Fitzwilliam, NH.

I am the **Planning board chairman for the town of Fitzwilliam** a 30-year member of the board and an active **member of the NH Municipal Pipeline Coalition**. I am concerned with the NED proposed project and its effects on the area and the Town of Fitzwilliam.

The proposed route of the NED pipeline suggests that construction, maintenance and the pipeline itself will affect wetlands. NH RSA 674:17 states that the specific intent is to protect wetlands values such as:

- Ground water quality and quantity
- Surface water quality and quantity
- Storm water runoff quality and quantity
- Flood control, erosion and sediment control
- Wild flora and fauna
- Recreational aesthetics

The following should be considered:

- Will the project result in the conversion of wetlands from one type to another, and how can this be avoided or minimized?
- How much wetlands will be permanently lost? Can this be mitigated?
- Even if temporary disturbance is “mitigated” or “minimized” how will soil compaction from construction affect the wetlands function?
- How will the pH change in soil due to the rotation of removed and replaced earth? How will this change affect wetland and water quality?
- How will the destruction of vernal pools be avoided since many of these, though important for the health of the watershed and wetlands, are not mapped?
- How will the partitioning of wetlands and surface water affect the effectiveness of wetland function and wildlife?
- What are the detrimental effects on wildlife during and post construction due to the loss of native vegetation and plant diversity?

FERC- Wetland and waterbody construction and mitigation procedures only require 80% native vegetation and 50% plant diversity differential from preconstruction levels. (1994 FERC procedures).

- The study done by Robert G. Bailey of U.S. Forest Service for FERC studied 960 sites suggest that [problem wetlands greater than 20% surface rock or open waters, shallow bedrock soils or those dominated by annual plant species] had a low mitigation success rate ;35% from preconstruction levels. The Adirondack New England mixed forest eco-region along with the proliferation of granite that defines N.H. makes these wetlands common. The success of mitigation is not high. How would this be more successfully mitigated?
- What will be the affect of the additional non-permeable surfaces in construction sites, additional work areas, and access roads (temporary and permanent)? How will this be mitigated?

I urge you to follow the Statement of Policy issued (9/15/1999) in which the Commission’s goal is to consider:

1. The enhancement of competitive transportation alternatives,
2. The possibility of overbuilding infrastructures,
3. The avoidance of unnecessary disruption of the environment
4. The unneeded exercise of eminent domain.

While I have discussed only concerns of wetlands it seems clear that the continuation of the NED pipeline does not reflect these goals and I urge that this project be rejected.

Thank you for your consideration. Terry Silverman

## 20150824-4043

Comments of Stephen Spaulding, 32 Fletcher Lane, Hollis, NH

The following questions pertain to the Northeast Energy Direct (NED) pipeline proposed by Kinder Morgan and Tennessee Gas Pipeline (KM/TGP).

**Energy policy:** Expansion of our natural gas infrastructure has serious implications for the overall approach to meeting our energy needs.

Do you support implementation of policies designed to promote development and use of clean, sustainable energy technologies?

Do you support implementation of policies designed to promote conservation and greater efficiency in energy usage?

Do you believe that policy should favor non-polluting and renewable energy technologies over fossil-

fuel-based technologies?

Do you consider natural gas a sustainable energy source, given that the supply is finite? Do you consider natural gas a clean energy source, after taking into account its full environmental impact at all stages from extraction to combustion?

Given the scale of the NED project, its environmental and aesthetic impact, and the need to grant powers of eminent domain for the taking of private and public land, do you feel that the project should be allowed to proceed only if it is clearly demonstrated to be the best way to address the region's energy needs?

Do you believe that the NED project has been clearly demonstrated to be the best way to address the region's energy needs?

**Climate science:** Global temperatures are rising, with many results that are already observable and many others predicted by scientific modeling.

Do you accept the near-unanimous judgment of the scientific community that climate change is occurring, is caused by human activities, and is an imminent, serious threat to the wellbeing of human beings and other species?

Do you agree with the scientific consensus that moving away from reliance on fossil fuels is essential if we are to avoid the worst impacts of climate change?

Methane, the principal component of natural gas, is known to be an extremely potent greenhouse gas (many times more so than carbon dioxide). Do you support increased government regulation of methane emissions?

Leaks from natural gas infrastructure introduce large quantities of methane into the atmosphere (69 billion cubic feet in 2011—more than 30 times the daily capacity of the proposed NED pipeline—according to figures provided by gas distribution companies). Do you support requiring the owners and operators of existing pipeline infrastructure to repair these leaks?

**Energy prices:** Elected officials, regulators, KM/TGP, and various utility companies state that the NED project is needed in order to lower energy prices in New England.

Many project opponents believe that much of the gas would be destined for the export market, where prices are several times higher than domestic prices, and that New England consumers would see little benefit. Do you believe that a guarantee of reduced electric rates for energy consumers in New England, many of whom are unlikely in the foreseeable future to have the option of using natural gas for heating and cooking, should be a prerequisite for approval of the NED project?

Do you believe that alternative approaches, such as conservation, grid modernization, and increased exploitation of renewable sources, offer the promise of lowering energy prices?

If the NED pipeline were to fulfill the stated objective of lowering energy prices for New Hampshire consumers, do you believe this outcome would impede development of clean, sustainable energy technologies and encourage increased consumption of natural gas?

Even if the NED project is approved and completed without delay, it will bring no gas to New England until late 2018. In many parts of the United States and the world, energy from renewable sources is already cost-competitive with natural gas. Do you believe that advances in other technologies during the interim might make natural gas relatively less advantageous from a cost standpoint?

If the price of fossil fuels reflected the true costs of the environmental damage they cause, do you believe such fuels would remain economically competitive?

Throughout the world, demands are mounting for action on halting climate change and on curbing the extraction, transmission, and consumption of fossil fuels. Do you think that this political opposition will result in delays and increased costs (ultimately to be borne by consumers) in construction of natural gas infrastructure?

Are you confident that the economic benefits promised by the project's advocates outweigh the environmental, social, and opportunity costs of completing it?

**Fracking:** Support for expanding the natural gas infrastructure strongly implies support for increased hydraulic fracturing, or fracking, as the means of extracting the fuel. The fracking process injects as many as 600 chemicals into the ground, including numerous known carcinogens and other toxins. It also consumes between one and eight million gallons of water per well.

Many studies suggest that in the vicinity of fracking sites, water and soil are contaminated, seismic activity increases, and residents suffer elevated rates of cancer and other diseases. Do you believe that fracking poses a threat to public health?

Fracking companies are exempt from the provisions of the Safe Drinking Water Act, and in many cases are not required to disclose the chemicals that they are using. Do you think fracking is adequately regulated?

Do you support the right of states, counties, and municipalities to ban fracking within their borders?

If industry scientists were to discover commercially viable shale deposits in New England, would you support allowing fracking to proceed in those locations?

#### 20150824-4044

1.) My name is \_\_\_\_\_ and I live at \_\_\_\_\_ in Brookline, NH. In Brookline, a total of 15 parcels will be impacted by the pipeline, including six parcels that have been purchased by the Town's Conservation Commission at a cost of over \$571,000 and totaling over 163 acres. The Town of Brookline has engaged qualified experts to assess the potential impacts of the pipeline project. We ask that the record reflect such resources have been retained. As the results of these studies are finalized, we reserve the right to utilize them in requests to Kinder Morgan, its affiliates as well as FERC, NHSEC and other agencies.

2.) Secondly, I wish to advise FERC that at Brookline's annual town meeting on March 11, 2015, voters overwhelmingly passed several warrant articles related to the proposed pipeline.

The following were passed:

- #1 ~ Shall the Town of Brookline vote to oppose approval of the Northeast Energy Direct Project because the proposal is inconsistent with the Town's goal of protecting and preserving aquifers, drinking water including community and private wells, wetlands, streams, and other bodies of water. In addition, the proposal to extract water to use in drilling or other operations, whether from a body of water or well, is inconsistent with the Town's goal to protect such waters.
- #2 - Shall the Town of Brookline vote to oppose approval of the Northeast Energy Direct Project because the proposal is inconsistent with the basic tenet of individual property rights whereas if approved, Tennessee Gas Pipeline Company, LLC shall have the power to force private property owners to give up rights under Eminent Domain proceedings in order to create a new corridor for the installation of the pipeline project.
- #3 - Shall we impose a moratorium on any interstate gas pipeline projects within the Town of Brookline? The moratorium became effective immediately upon the vote and included, but was not be limited to, land acquisition, surveying, tree removal, or any physical alteration of any land within the Town of Brookline intended for pipeline construction or development.
- A fourth article appropriated funds to assist the Town in opposing the pipeline project.

#### 20150824-4045

Statement of  
Paul Sullivan  
3 Autumn Street

Windham, NH. 03087  
Before FERC Scoping Hearing  
July 29, 2015 Nashua, NH.  
Docket No: PF14~22~000

My name is Paul Sullivan; I am an abutter to the proposal at 3 Autumn St, Windham NH. Segment J. Mile Post 34.80

I appreciate the opportunity to offer testimony this evening.

In December of 2000, an executive of Tennessee Gas testified before the NH Public Utilities Commission and stated, ... “there are few, if any human endeavors, which can be undertaken without some impact to the environment” 1

While I vehemently oppose this proposal, and find explanations and analyses riddled with double speak, misrepresentations and outright lies .. I do agree with TGP on this point, there will be impact to the environment An environmental impact, that will leave a permanent scar on the face of this state.

I wish to direct my remarks to the neighborhood in West Windham and the environmental damage this proposal will have.

I would like to raise two issues during this hearing.

The first pertains to the lack of documentation on Wetland & Watershed areas.

It should be noted that this neighborhood is included in the Stratified Drift Aquifer! and also part of the Upper Beaver Brook Merrimac River Watershed3

Referencing the Tennessee Gas maps of 1/12/154 at mile marker 34.8 an ‘unnamed stream’ links a series of ponds and drains into Beaver Brook at mile marker 34.9. No ‘wetlands’ are delineated on the TGP map. But a simple review of town tax maps shows a Wetland & Watershed Protection District (WWPD)S along the western edge of Autumn St including most of lot 19-B~919o

Construction in the WWPD would violate town ordnances written for the protection of private wells and natural habitat

The potential risks include:

- Contamination from pipeline construction, including compounds used for field-coating welds before installation of pipe
- Potential contamination of the watershed from herbicide use
- Disturbance of soil in the ROW, staging areas and temporary construction access points will seriously increase the risk of invasive plant species

The nature of the watershed, which includes glacially, deposited sand and gravel are highly susceptible to contamination. ‘Wells located in an unconfined aquifer are considered to have a high vulnerability to potential contamination due to the absence of hydro geologic barriers (i.e. clay) that can prevent contamination migration into the aquifer from the surface.’?

The second issue pertains to the aesthetics of the environmental damage.

When this neighborhood was developed 35 years ago, the power line ROW had already been established. The builder preserved the natural buffer of trees to the ROW as the development took shape. Now comes TGP, who will remove the natural buffer and opening a vista comparable to a lunar landscape ... no trees, no brush no buffer, just an unimpeded view of the electric ROW.

It’s not just the abutter effected by this, but residents across the street, who once had a view of majestic trees will now have unimpeded views of the power lines and towers.

While these two issues have direct impact on the neighborhood, one fact needs to highlight this testimony. As of this date, Tennessee Gas cannot

point to a spot on the ground and tell my neighbors ... this is where the pipe will be placed!

Segment J uses construction technique ROW-CONFIG\_OS and \_06B, which could cause a clearing of either 45' or 85' from the centerline of the pipe. This is bad enough, but the fact is, we don't even know where the pipe will actually be placed to start with.

In its Environmental Construction Plan for NH, Tennessee Gas is ... "proposing that the pipeline will be installed generally five feet outside the exiting power line easement boundary,"? But a few paragraphs later the proposal comes with a loophole .... "adjustments may result in the centerline of the pipeline to be located with in an existing power line easement, less than five feet from the existing power line boundary, or further than five feet from the existing power line boundary"<sup>10</sup> In other words, we are giving Tennessee Gas the option, to put it wherever its wants.

Members of FERC, you are asking us to offer specific environmental comments about this pipeline, yet you do not hold the Tennessee Gas responsible to offer a specific route. You are asking for comments on a moving target

I have serious reservations as to validity of the scoping hearing since the true route has not been established and the release of the draft EIS was only days ago.

I have spoken of the impact this will have in my neighborhood in the town of Windham. But my mind reels with the fact this will be repeated in hundreds of towns along the route.

To my fellow residents this should be a wake up call as to the power a private corporation can wield again citizens.

To our elected officials, take note ... this is what happens when an agency & rules are streamlined to work against the very citizens and environment it was designed to protect

Washington. DC 10426

RE: Tennessee Gas Pipeline Company. L.L.c.: Federal Energy Regulatory Commission ("Commission")

Docket No. PF 14-22-000

Dear Secretary Bose,

The Conservation Commission for the Town of Merrimack New Hampshire: a properly established Conservation Commission in accordance with New Hampshire State Law RSA 36-A. appreciates the opportunity to submit these scoping comments in conjunction with the pre-filing phase of the Tennessee Gas Pipeline Company's (TOP) proposed Northeast Energy Direct pipeline ("NED Project"), Docket No. PF14-22.

The Conservation Commission already commented (accepted March 18, 2015 - 20150318-5072) on the need and appropriateness of placing a pipeline as proposed in our managed and owned conservation properties so I will not duplicate those comments at this time.

These comments today are in response to the guidance provided by your Commission in the June 30, 2015 Notice of Intent to Prepare an EIS for the planned NED project. Given the limited time to speak, my comments will highlight our concerns but will not be all-inclusive of our concerns. The Conservation Commission will be filing a more complete submittal in the near future.

I will now comment on each of the environmental impact headings:

### **Geology and Soils**

New Hampshire is known as "Granite State" and that is for good reason. Granite is very prevalent and found in all areas of our State. It lies on the surface and under the surface in most locations within our Town. There are significant granite formations within the proposed pipeline route. Those formations are not only picturesque but also contribute greatly to the hydrology of these properties. They form the underground channels and holding areas for the aquifers that provide more than 80% of the water needs of our community.

With this prevalence comes the burden of removal when a buried pipeline is being constructed. Typical methods are blasting, pulverizing, and digging. Each of these processes creates the opportunity for unintended consequences on the land, soils, water resources, vegetation, and wildlife nearby. The Town of Merrimack has developed ordinances to guide contractors during this type of activity. The Conservation Commission requests you stipulate TOP follows our ordinances and processes even if they appear more burdensome than State or Federal rules and regulations. The Town has local experience and has developed these ordinances to balance the

environmental and health needs of our community with the needs of the business community. Our local experience and knowledge should not be underestimated and if nothing else, any other resident or commercial entity would be required to do the same. We are asking no more of TGP than we would require of any other business.

### **Water Resources and Wetlands**

As commented previously, Merrimack is nearly completely dependent on subsurface ground water through both private and large municipal wells. As this is a resource that cannot be easily replaced, protection of our underground water resources needs to be of the utmost concern. The Conservation Commission requests you stipulate to TOP that it must map, sample, and monitor all wells within the construction area and outside that area to a minimum distance of 1000 feet to be able to know if their activities have had a negative impact to these water resources. The sampling and monitoring should address both water quality and water quantity with baseline measurements done before activity starts. The results of the testing and subsequent monitoring should be independently confirmed and provided to the landowner of record.

Our conservation and other open space properties (both private and public) have ponds, streams, brooks, rivers, jurisdictional wetlands, and numerous vernal pools. The most elusive of these are the vernal pools. Vernal pools by nature appear and disappear every year. They provide life to some of the smallest wildlife in our Town. That wildlife then provides life to other species, including State rare and threatened species. Proper mapping of these vernal pools before construction is essential to assure the overall health of our properties and its inhabitants. This mapping should be done in different seasons leading up to construction to ensure all vernal pools are identified and cataloged. Once mapped, avoidance is the next request. Something often not considered is the avoidance of the trails, pathways, and connecting channels for these pools. If the connections are disturbed or blocked by the construction or the placement of a pipeline, the ef-

fectiveness and health of the vernal pools and wildlife dependent on them is of great concern. Vernal pools therefore cannot be viewed on an individual basis but must be considered, avoided, or properly mitigated when viewed as part of a larger ecosystem. The Conservation Commission requests that you stipulate TGP follows the New Hampshire Method (<http://nhmethod.org>) and all applicable State Laws and Merrimack ordinances when mapping all types of wetlands and makes that information fully available to the impacted landowners. Providing this information prior to construction will allow affected landowners to refute irregularities and educate both TGP and regulatory agencies associated with the project. This will help ensure potential wetland and vernal pool impacts are not missed in the process.

The proposed pipeline will have temporary and permanent wetland impacts within Merrimack and across the State. State Law (RSA 48:2-A) provides guidance on how these impacts should be mitigated and it is referred to as compensatory mitigation (<http://des.nh.gov/organization/divisions/wetlands/WILNO>). One aspect of that mitigation is a payment in-lieu of doing physical protection or mitigation activities. This payment opportunity should be viewed as a last resort. The Conservation Commission requests that you stipulate TGP must act in good faith and make every reasonable effort to provide physical compensation in each community where wetland impacts are made. The use of a payment should only be a last resort whose determination is solely allowed to proceed if the New Hampshire Department of Environmental Services has determined no mitigation project is possible in an impacted community.

### **Vegetation and Wildlife**

Merrimack's open space and conservation areas impacted by this pipeline are teeming with life of all types including plant, insect, amphibian, reptile, rodent, mammal, and human. We have professionally documented cases of NH rare and threatened species within the TOP study area for the proposed pipeline. This includes both plant and animal species. Some of this information has been found more recently and we are working with NH Fish and Game and NH Natural Heritage Bureau to have them be formally documented. Given these occurrences and their vicinity to the pipeline project, the Conservation Commission requests you stipulate TGP must do on-the-ground studies for rare and threatened species of both plants and wildlife and require them to avoid those areas where they are found and the general habitat areas where they live. Some of these species are mobile. They move and live in different habitat depending on the time of year, mating season, and for hibernation. Avoidance of these areas is crucial for their ongoing survival. This is one key reason why the Town of Merrimack has spent literally millions of dollars to preserve these open space areas.

The proposed pipeline project is intended to run adjacent to existing high voltage power lines. These power line corridors require vegetation maintenance which is likely similar to a natural gas pipeline. Eversource is our local power line company and they use mechanical methods to control vegetation along the route in our Town. They have been doing this work when the ground is frozen during what are normally the winter months. Doing this activity during the winter ensures most animal species are in hibernation or have migrated and are not likely directly harmed by the activity. They also avoid certain plant life if it has been identified as needing protection. The Conservation Commission requests that you stipulate TGP must only do mechanical vegetation control and that those activities only happen once the ground is frozen during the months of December through February. Also, that TGP work with each landowner to ensure rare or threatened species identified anytime during pipeline construction or operation are protected from any form of vegetation control.

### **Cultural Resources**

The Town of Merrimack was chartered before our great country came into being. It has a long history dating back to the 1600s. The proposed pipeline will inevitably cross or come into close contact with these historical treasures in our Town. Some of those treasures will be directly impacted if the proposed primary route is taken. This includes an historic roadway used by our Founding Fathers and original settlers who helped to incorporate, build, and farm our community. Those homesteads, foundations, and roadways are pre-

cious to OUF Town and are currently protected by the Conservation and Heritage Commissions in our Town along with many private citizens. The Conservation Commission requests that YOU stipulate TGP maps all these treasures, avoids them once mapped and where avoidance is not possible, that best management practices for historical preservation be performed to ensure artifacts are not lost, removed from our Town, and not damaged. When an historical item is encountered anywhere along the construction route, we request you require the Town to be immediately notified and appropriate action be taken to preserve the item. We further request that historical artifacts found on properties that TGP may purchase as part of this project be offered free of charge to the prior property owners or the Town of Merrimack if those owners do not wish to have them.

### **Land Use, Recreation, and Visual Resources**

Many members of our Town and the surrounding communities utilize our conservation and open space areas. They are a treasure and are held in high regard. The Town of Merrimack has designated millions of dollars over the years to purchase and maintain these properties. We actively manage our parcels and have committees whose sole purpose is to manage them for all their intended uses. Wildlife, rock formations, flora and fauna only add to the visual appeal of our properties. Our open spaces have multi-use trails, fields, and support outdoor water recreation. Hunting, trapping and fishing is also deeply revered and an important part of our community as well as a way to control certain animal species. A pipeline coming into our community will impact our way of life. The Conservation Commission requests that FERC reviews each of these activities, assesses the impact to them, and stipulates that TOP work with the Town and each landowner to minimize an interruption the pipeline may make as well as ensures that pipeline infrastructure is not located so as to impede these activities in our open spaces and conservation areas. Infrastructure items beyond the actual pipeline (metering stations, pig related items, blow off valves, etc.) often entail support roadways and other items. They should be specifically sited out of these open spaces and conservation areas to avoid interruption to the users and inhabitants and ensure the safety of the infrastructure.

### **Socioeconomics**

This is not an area where a Conservation Commission as defined by State Law would be active in. But it is something we do consider when making decisions. We feel our conservation properties and our oversight of water/aquifer projects within our Town certainly have a socioeconomic impact. We endeavor to ensure our properties add to the quality of life for our residents and businesses. Disruptions of these open spaces, visual interruptions, and the safety fears of people as they relate to a pipeline cannot be minimized. The Conservation Commission recognizes that State and Federal regulations may dictate certain signage, painting and marking schemes, etc. The Conservation Commission requests that you stipulate that TGP further: adheres to our local ordinances for these things when they do not conflict with these other regulations. When local regulations add further precision, local ordinances should be adhered to and not be ignored because they add cost of any form or time.

### **Air Quality and Noise**

Air quality is a deep concern for the Conservation Commission. Blow-offs, venting, and other activities that allow gas to leave the transmission pipeline are both a fact of life and an area of concern. The gas that will flow through this pipeline is known as a green house gas and will likely contain many other gases that are part of how the gas is extracted from its initial source. Some are known to disturb and affect humans. Not to be missed is their impact on plant and animal species as well as when or if this gas becomes part of our wetlands or aquifers. The Conservation Commission realizes there are Federal regulations that dictate and mandate how air quality is measured and impacts should be mitigated. We do request that YOU stipulate TGP does not place potential gas emitters (valves, stations, outlets, etc.) within wetlands, near existing trails or commonly used areas by humans, or where if they were ignited could cause a significant loss of our forests and open spaces. It should not be lost on your Commission that our Town has only a limited public safety capability and a pipeline of this proposed size can cause significant damage before safety mechanisms

react.

### **Cumulative Impacts**

The proposed pipeline is primarily being sited to run adjacent to the existing Eversource power lines. The power lines have already left a visual scar on our communities. Adding an adjacent scar on the landscape, will have a significant visual impact and will directly interfere with usability of both private and public property. Eversource likely has a long planned capital power line improvement plan. We are seeing evidence of this in one of our neighboring communities as Eversource is upgrading its own infrastructure. The Conservation Commission requests that FERC contact Eversource and review those long-term plans. We further request that where those plans may potentially be in conflict with or along the same proposed route of the pipeline (and within the pipeline's intended operational life) that you consider those impacts when making your siting adjustment requests. Balancing these conflicts must be considered a part of your charter as you go through your approval process.

### **Public Safety**

The Conservation Commission is very concerned about pipeline and public safety during both the construction and operational phases of this project. Terrorism, natural disasters, weather, seismic changes, negligence, and ignorance can all lead to a public safety incident. The Conservation Commission requests that you stipulate TOP must not only work with local safety officials but that it must bear the cost of planning and implementation for any relocation of current public or private use trails that may be impacted by the pipeline project or be of a safety concern by TGP or Merrimack public safety officials.

In conclusion, the Commission has contracted with a professional ecological company to assist us in understanding two of our potentially impacted properties. We have allocated over \$30,000 for this study with the results due by early fall. Unfortunately this may leave us with no time to further clarify our scoping comments to your Commission before your current scoping deadline.

The speed at which this NED pipeline process is moving makes it very difficult for our community to be adequately prepared and do adequate research. It is not that we have delayed our activities or are using this as an excuse. We have been very proactive and engaged our contractor within one month of the New Hampshire alternative route becoming the primary proposed route. The simple fact is that our properties are large (-600 acres). The different seasons of the year provide both challenges to performing a study and provide for new or not previously seen species of all kinds to be found, identified, and studied. Proper science following best management practices has a time aspect that cannot simply be ignored.

Given these concerns and our sincere desire to be an active stakeholder in the project, we request your Commission extends the scoping period by 60 days so we can provide you even better guidance and further that your Commission holds a scoping meeting and site visit within the Town of Merrimack to allow specific input on any impacted parcels as they relate to the NED project

Sincerely,

The Merrimack Conservation Commission

Timothy Tenhave

ttenhave@merrimacknh.gov

As authorized by the Conservation Commission on July 20, 2015.

### **20150824-4047**

Scoping questions

1) Since water quality and supply is a key issue in New Hampshire due to its topography and weather extremes it is of interest to residents what safeguards are taken during use and during construction. Kinder Morgans routing process seems to have been centered around inflaming landowner sentiment since they played connect the dot with water sensitive areas as well as Schools, homes, and public areas. What mea-

asures is FERC prepared to take to ensure water quality is treated properly within these constraints?

2) In Litchfield alone there are a number of notable water resources that we want on the record. The project crosses the Merrimack River at entry, runs near the Nesenkeag Brook that feeds the Merrimack. Nearby are the Pennichuck wells that feed into the Litchfield, Hudson and Nashua water supplies. There are several ponds nearby as well, within reach of interaction from the proposed course. These are Darrah Pond, Half Moon Pond, Perch Pond and Common Pond. Since the topography of the area involves runoff events during the year this could well involve Chase Brook as well. Within the area of the path there are several private wells in use that would well be impacted by blasting and the use of heavy equipment. What enforcement resources does FERC have to employ to safeguard these resources once the permits have been issued and how are affected residents going to access them?

3) Since the proposed route seems to have been chosen to inflame public sentiment, a connect the dot path across water supplies and near schools, parks, and residential density, what measures is FERC prepared to take if the State ofNH Site Evaluation Committee deems this project not expedient to approve?

4) Since a number of the properties to be impacted by this proposed path will be marginally habitable afterwards what is FERC prepared to do to referee the process? Wren Street in Litchfield will have severe impacts and a number of these properties will probably be market desertions as a result. Despite the assurances and the platitudes spread around during the process the end result will be a large number of properties that no one will want to own, left to lenders and the town to assume the debt and liability loads from. Since the gas act seems to lend protections to the builders does FERC intend to be a liable interest.

5) Given that the Merrimack and most of the other rivers in the area that this impacts were reclaimed from extreme pollution during the 50s, 60s, 70s and 80s and are now clean enough to be a recreational resource how does FERC intend to protect this public resource from the pollution inherent in the gas infrastructure framework?

6) This is the first of what was to have been three scoping meetings in the Granite State, the third is still not scheduled. The governor and the state congressional delegation had requested that FERC schedule meetings in accordance with the demand from impacted communities. Since we were blindsided by this and the recent release of the resource report that is almost unusable because of all ofit's blank space and "to be determined" entries we want to know the time and date for the third meeting. Is that available at this point?

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE Room 1 A  
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C. , Docket No. PFI4-22-000 Northeast energy Direct Project

Dear Commission Members,

The intent of this letter is to confirm, on record, that I oppose the above referenced project. I live in a dwelling within a rural residential neighborhood which is located at 17 Autumn Street Windham, NH ( Windham NH Tax Lot 19-B-906 ).

The construction of this proposed pipeline and the tree clearing for the pipeline easement would cause devastating economic impacts to properties located within our neighborhood. Eight properties located on Autumn Street are directly impacted and an additional fourteen properties on Autumn and Winter Street are indirectly impacted. My definition of direct impact is that these properties will have the pipeline or tree cut

easement on their property. Indirectly impacted properties, even though the pipeline or easement is not on their property, will absorb disadvantage economic effects of the pipeline construction.

The directly impact properties are faced with the following:

- 1) The devaluation of their property. Depending on the intrusion on the property forensic insurance companies estimate it to be as high as 35% of the property value.
- 2) Potentially go through the seizure of their property by eminent domain.

This would be a blatant abuse of the eminent domain process for private company profits.

The indirectly impacted properties are faced with the following:

- 1) The devaluation of their property. Due to the devaluation of abutting properties.

Forensic insurance companies estimate it to be as high as 15% of the property value.

Please see the enclosed Plan entitled "Overview Plan, Prior & Post Construction"

If you have any questions or comments please don't hesitate to call or contact me

Sincerely,

Anita E. Trudel

888 First Street, NE  
Room 1 A  
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C. , Docket No. PFI4-22-000 Northeast energy Direct Project

Dear Commission Members,

The intent of this letter is to confirm, on record, that I oppose the above referenced project. I live in a dwelling within a rural residential neighborhood which is located at

17 Autumn Street Windham, NH ( Windham NH Tax Lot 19-8-906 ). The proposed pipeline and easement is designed to clear cut a fifty-five foot (55') existing treed buffer which currently exists and is located between my dwelling and an existing three hundred and fifty foot (350') wide clear cut utility easement. The present utility easement consists of three rows of high tension steel towers in which one extends to the height of eighty feet (80'). Eversource, the utility company which has the 350' wide easement, has released plans to relocate within the easement an existing row of towers and add another row which include 80 to 90 foot tall steel towers ..

The existing fifty-five foot (55') treed buffer performs many uses.

- 1) It is a visual buffer to the existing 350 foot wide treeless easement corridor.
- 2) It is a visual buffer to the eighty foot (80') high steel electrical towers.
- 3) The buffer protects my dwelling from high force winds which blow through the existing treeless easement corridor.
- 4) The buffer plays a crucial part of the desirable rural characteristics and value of my property.

Please see the enclosed Plan entitled "Lot 19-8-906 Prior & Post Construction"

If you have any questions or comments please don't hesitate to call or contact me

**20150824-4050**

NORTHEAST ENERGY DIRECT PROJECT

Docket No. PF14-22-000

Public Scoping Meeting

Wed., 07/29/2015

Nashua NH

Thank you for the opportunity to address you this evening.

I am in opposition to THE NORTHEAST ENERGY DIRECT PROJECT as it passes through the town of Merrimack.

My specific concern is the impact upon the Water supply for the Town of Merrimack. The propped route crosses through the center of one of the principal aquifers from which the MVD ( the producer of water for the town) draws water. There are two production wells in the area of the crossing. Protection of this aquifer is provided by the town's Aquifer Protection overlay District. The contributing zone for the two wells is a registered Wellhead Protection Area with the State of New Hampshire. I must state my strongest opposition to the construction of the proposed pipeline in this area.

To lose such a critical resource would have dire consequences on the capability to provide water to the residents and businesses in the Town of Merrimack. Another aquifer to the southwest (Witches Brook Aquifer) is also interdicted by the proposed 'pipeline. Together these aquifers contain 83% of MVD capacity. Based on numerous searches it would be very unlikely that production wells of equal yields could be found in the involved servic area.

Also of concern are construction activities. Blasting, excavation, and storage of such products necessary for such an undertaking invite contamination. Stormwater runoff changes can also impact surface/groundwater quality.

Fuurther, although infrequent, catastrophic pipeline failures are most always accompanied by structural damage and personal injury. A reasonable person, municipal entity or dare I say a Regulatory Commission would not place even such a small risk in so sensitive an area.

Finally the cost of replacing production wells, if it were possible to do so, would be prohibitive. (estimated to be 2-3 Million dollars each.)

As a Resident of the Town of Merrimack and a Rate payer of the MVD I mast strongly urge the Commission (FERC) to find the project not of public convenience and necessity.

Lon S. Woods  
2 Arbor St.  
Merrimack NH 03054

**20150824-4051**

July 29, 2015

Dear Commission Members,

Thank you for travelling here and taking the time to hear our concerns about this proposed Kinder Morgaof-fennessee Gas Pipeline Project.

My name is Caroline Zuk, a Team Leader of the Dracut Pipeline Awareness Group.

I reside at 100 Old Parker Road, Dracut, Massachusetts 01826. I am a graduate of Wentworth Institute of Technology and have worked as a test engineer, project engineer, and regulatory engineer.

I presently own and operate Saja farm in Dracut, MA, a family owned farm, now under the watchful eye of the US Dept. of Agriculture's Agricultural Preservation Restriction program. We grow food. We feed people. Many communities across New England are doing the same. We recognize farm land to be a national food resource and we don't want it tainted.

Emissions, airborne toxic contaminants, undue noise levels, increase in utility easements, loss in property values, tariffs, displacement of wildlife habitats, waterways, and risk of catastrophic events weigh heavily on our minds. Most of us still don't have a clear picture of what Kinder Morgan is proposing as information keeps changing. That doesn't sit well •..

To better understand our concerns, we invite regulators to put on your hiking shoes and come take a closer look. Visit our populated areas, citizens, local farmers, and places slated to be ravaged by what is perceived to be an "industrial invasion".

We have an existing aging gas pipeline infrastructure in Dracut in need of attention.

When will the noise and odors from the metering station be resolved? Why aren't we funding renewable energy solutions instead? Are we really examining the long term cumulative effect on our communities and our environment? ••• I don't think so.

We don't need this. Dracut doesn't need this. We are not designed for this. Tell Kinder Morgan goodbye.

Caroline Zuk  
100 Old Parker Rd  
Dracut, MA 01826

## 20150824-4052

FERC Scoping Session 30 July, 2015

Milford Town Hall

Dear Mr. Tomasi,

My name is Michael Barrett and I live at 24 Twillingate Road, in Temple, New Hampshire. The Town of Temple abuts the proposed location of the compressor station. I am a member of the **Town of Temple's Ad Hoc Pipeline Committee.** I have read the Draft Environmental Report and I am greatly concerned. The Report is incomplete, insufficient in scope, and is not sufficiently protective of the health, safety, and welfare of the public and the environment.

The Report states clearly that the public safety is ensured based upon "empirical information." The overly simplistic use of empirical data does not include the unique features of our environment. The Report also states "the greatest hazard of a natural gas transmission line is a pipeline rupture that results in a fire or explosion." Yet the report does not consider that New Hampshire is the second most densely forested state in the continental U.S. and that Temple is a heavily forested community. Incidentally, there are currently five out-of-control fires in the United States. The report does not mention that Temple has an all-volunteer fire department and it does not address the Town's ability to contain and limit the growth of a fire-related incident during periods of dry weather.

The report does not refer to the existing Emergency Plan of the Town, or any other towns along the pipeline. It ignores the fact that the Temple policemen are the first to respond to Town hazards. The report does not indicate the times when none, one, or two policeman are on duty. The Report does not acknowledge the location of the Temple police station being situated two towns south of Temple, in the Town of Greenville. This detail is unique to Temple. The Report does not address the possibility that the police travelling from

Greenville to Temple in response to a reported pipeline or compressor station hazard need to access the one or two roads that may be impassable in the event of a fire or rupture. Both roads are adjacent to the compressor station. Thus, a hazard may at times prevent the Temple police from beginning the evacuation of the citizens to minimize the loss of life.

These concerns that) have stated are not unprecedented and they are well documented. Although not one NTSB Pipeline Accident Briefing is referred to in the Report, I refer you to the May 2009 briefing entitled “Rupture of Florida Gas Transmission Pipeline and release of Natural Gas”. This report describes the closure of a highway due to a pipeline rupture. It further describes the evacuation of a local school to prevent injury. In this case there were three injuries including a first responder, a sheriff. The Tennessee Gas Pipeline Report does not indicate that the Town’s only school is located about two thousand feet from the proposed pipeline and compressor station. It does not address the means by which the school can transport the children to a safe zone. In Temple, the school busses do not remain at the school during school hours and are often in use during school hours. The current school evacuation plan has the children crossing Route 45 and being secured within a barn, a wooden barn. An alternate plan will be needed.

The Report does not consider the fact that the school is also the only emergency shelter in the Town of Temple. This emergency shelter has provided housing for residents during past and recent declared emergencies. This emergency shelter’s ventilation system requires the use of outdoor ambient air which is subject to any emissions received from the proposed site of the compressor station.

The report also fails to address compressor station hazards that occur during declared emergencies. It does not mention the twelve-day emergency that began on December 11 th, 2008. The Governor signed the Emergency Declaration on December 13th as the residents of Temple were beginning to occupy the emergency shelter. These residents had nowhere else to go; Entry and egress to and from the Town was prevented by the massive amount of fallen trees and power lines lay on the ground and crossing almost every road and street. Although this disaster lasted over a week the adjacent Towns were not able to provide mutual aid because they too were in distress. Finally and thankfully, the NH National Guard arrived and ensured the public safety. I still remember the day when they arrived at my house in a Humvee to check on my family’s welfare. At that time only large all-wheel-drive vehicles could safely navigate through the Town.

The Report failed to consider all other types of natural disasters that have been declared in Temple. Some claim the worst natural disaster was 1993 snow storm. It has been called the storm of the century by some. This storm was huge and affected 26 states as well as most of eastern Canada. The storm came with cold Arctic air, heavy snow and hurricane force winds. The storm left 10 million people without power, 310 people lost their lives and the storm cost \$6.6 billion in damages. I had to transport my wife to the hospital for surgery and was unable to leave the hospital for three days due to impassable roads.

Other notable disasters include the 1940 New Hampshire earthquake, for example. On December 20, 1940, New Hampshire had a 5.5 magnitude earthquake with the epicenter being in Ossipee. The effects of the earthquake were felt in Montreal and Quebec, Canada as well as Maine, New Jersey, New York, Pennsylvania, Delaware, Massachusetts, Vermont and Rhode Island. Damages from the storm included broken pipes, furniture and walls as well as several damaged chimneys and water wells.

Clearly the Tennessee Report admits the use of “empirical information.” This type of information does not well address our environment and the many potential hazards associated the proposed pipeline and compressor station locations. The Tennessee Report claims compliance with the Pipeline and Hazardous Materials Safety Administration (“PHMSA”) 49, CFR Part 192. I conclude they are grossly misrepresenting the situation, and as proposed, significantly violate many requirements including “the availability of personnel, equipment, tools, and materials, as needed at the scene of an emergency, and the “making safe any actual or potential hazard to life.” Without a hazard analysis the Report’s claim remain unsubstantiated.

As a degreed engineer with experience in the drafting of safety and hazard analyses I am also greatly concerned the Tennessee draft Report seems to ignore the lessons learned within documented NTSB reports. It also does not consider a local and occupied religious facility, called Our Lady of Hope. As someone that

has raked the leaves there in the fall, I can personally attest to the potential for the rapid growth of fire when the dry leaves and on the ground. This facility is located just across the street from the proposed compressor station and the pipeline is located under or next to their land. Why is this facility not considered in the federally-mandated risk assessment? I am going to add them in my prayers.

In addition to inadequately assessing the public safety, the Tennessee Draft Environmental Report does not even mention the precious raptors and eagles that also make Temple unique. Ignored entirely is the extremely important migration route for raptors. Temple is part of and contiguous to one of the few pathways for the twice-yearly migration of raptors which is federally recognized. Thousands are recorded each year on Pack Monadnock as they begin their flight south (toward the compressor station) in the fall, and often times over ten thousand are reported and counted. The site is one of approximately 169 consistently reporting North American watch sites, all of which enter their daily observations into a database administered by the Hawk Migration Association of North America (HMANA). Audubon employs a naturalist to record raptor migrations in Temple during the period from August to November each year, supported by volunteers who, in 2012 “logged 600 observation hours over 55 days”. The proposed location for the compressor station in New Ipswich is on the lead line of this very special migration. What assessments have been made for the compressor station’s heat plumes, drafts, blow-downs, noise and light? None are mentioned in the Environmental Draft Report.

I respectfully request that FERC requires Tennessee Gas Pipeline Company, LLC to pay for and provide an updated Environmental Report with:

1. A comprehensive hazard analysis report written by an independent Professional Engineer with significant expertise to identify all potential hazards to the local environment resulting from the proposed compressor station. The analysis is to include the probability of occurrence and the severity of hazards assuming multiple scenarios.
2. A comprehensive analysis written by a Professional Engineer or PhD with significant expertise to address all potential’ hazards to the local bird species, including all recorded migratory birds, resulting from the proposed location of the compressor station. The analysis is to include the probability of occurrence and the severity of hazard assuming multiple compressor station hazard scenarios.

Respectfully Submitted,

Statement of Dr. Martin J. Barry PE, CIH, CSP at FERC Scoping Hearing, Milford, NH

Good evening -I am Doctor Martin Barry with the **Troy Conservation Commission**.

I am a professional engineer in New Hampshire, a certified industrial hygienist with a PhD in biomedical engineering and extensive experience in Risk Assessment.

I am concerned for those near the so-called “Incineration Zone” and the potentially devastating consequences ... the potential loss of life and severe environmental damage ... that could come from a pipeline leak and accident.

Now, I recognize that statistically, the chance of a major catastrophe, with a brand new properly installed pipeline, is extremely remote.

But, considering Kinder Morgan’s history of pipeline safety violations’, I am concerned that

- (1) The pipeline will Not be properly designed
- (2) That the pipeline will Not be properly installed ... and most critically
- (3) That the pipeline will be neglected and poorly maintained

I am concerned about the risks that our children and grandchildren will inherit from a deteriorated, poorly maintained pipeline ... thirty, fifty or one-hundred years from now.

So I ask FERC ... When doing your risk assessments ... when predicting the number of hypothetical deaths that this pipeline will bring to our communities ...

Run your risk scenarios

- 1) Assuming improper design
- 2) Assuming poor construction
- 3) Assuming inadequate seismic bracing
- 4) Assuming Kinder Morgan will poorly maintain the pipeline
- 5) Assuming excessive pipe corrosion over time
- 6) Assuming Significant erosion of pipe underlayment materials

And specifically calculate the risks ... the number of estimated deaths ... that our children should expect to occur not just during the first decade of operation, but also during the fifth decade, ninth decade and tenth of operation. Thank you

Martin J. Barry, PhD, PE, CIH, CSP

Member: Troy Conservation Commission

## **20150824-4054**

My name is Josiah Barthelmess, I am 11 years old. I live across the street from the proposed compressor station in New Ipswich, NH.

I told you, you would see me again.

Kinder Morgan's slogan is "we are good neighbors." Webster's Dictionary defines neighbor as a person who shows kindness or helpfulness toward his or her fellow humans.

FERC how can a compressor station be my good neighbor? Do you think it's kind to emit toxins into the air I breath? For the record .... a good neighbor doesn't steal your stuff.

A good neighbor is someone you trust and respect. Good neighbors don't Lie. Kinder Morgan says this is the only answer for New England. Yet we've heard right hear, there are clearly better alternatives than this pipeline. FERC my question to you is can we start speaking TRUTH here? You have seen these last couple of days, that the residents of New Hampshire are not backing down. They are well versed, educated and far beyond thinking they will benefit from Kinder Morgan's lies.

Hearing about taking the land of the people .... all in the name this "NEW ENGLAND ENERGY CRISIS". How can you even think of moving forward with this project?

This doesn't give my generation much hope in our government and the laws we the common people must abide by.

How is it those with deep pockets can re-write the law? I asked my dad and mom to explain this to me and I didn't like their answer ... that unfortunately this is the way the world works. Well that isn't good enough. What answer do you have for me? Aren't you a Federal organization, that will make sure Kinder Morgan follows the rules? Will you enforce them? What boggles my mind is why their rules are different than the rules we have to follow?

If this is what my federal government is like and what you stand for. I am moving to New Zealand. Please give me and my generation HOPE ..... that you are truly looking out for our best interest. And not that of a

corporate giant .... or the next corporate giant.

You've already had a good look at me ... Outside this building RIGHT NOW .... my generation is gathering in protest. The next generation IS being inforned ... and I WILL make sure all will remember the decision that you will make in regards to this project. How do you want to be remembered?

I want to remember yOU ..... as a good neighbor.”, someone I can trust and respect when this is all done. FERC at the end of the day, I want YOU to be able to hold your head high. I will. ... because I fought for what was right. Don't let me down.

I promise ... you will see me again ... and the voices of the Kidz of the Pipeline Resistance will continue to be heard.

Thank you for your time.

**20150824-4055**

### **Wetlands and Vernal Pools**

Hi, my name is Sebastian Barthelmess and I live in New Ipswich, NH just feet from the proposed 10 acre compressor station.

**Given the incomplete nature of Kinder Morgan's Resource Reports and recent changes to the scope of the project, these scoping meetings are being conducted prematurely and, therefore, are failing to provide information that would benefit the NEPA process (National Environmental Protection Act).**

Fresh, clean, water is our single most valuable resource for sustaining life - NOT gas, oil, or coal. New Ipswich has no public drinking water, we are all on private wells.

My fellow neighbors and I are seriously concerned the pipeline will impact wetlands.

Our wetlands are of great importance for flood control, water filtration, water storage and recharge for both groundwater and surface water.

Vernal pools are among our most valuable wetlands and the pipeline will impact several wetlands, including vernal pools.

All vernal pools along the pipeline route should be identified and avoided.

Vernal pools within 300 yards of pipeline work areas, staging areas, and other construction areas associated with pipeline construction should be identified.

Wetlands are essential for a wide variety of plants and animals. They provide birds, mammals, reptiles, amphibians, fish, insects and plants with food, water and shelter - including animal breeding or nest habitats. Approximately 66 percent of New Hampshire's species of greatest conservation concern are wetland or surface water dependent.

Alteration of Terrain Best Practices (as outlined by the NH dept. of Environmental Services) should be used to AVOID indirect impacts to wetlands.

The quality and thickness of pipe needs to be increased to prevent leakage and water contamination along the entire route involving wetlands.

We require you use NO HERBICIDES during construction or maintenance along the pipeline and compressor station properties. Besides wetlands impact, this also affects organic farming, and honeybees on our property and in the greater New Ipswich area.

This is a "high consequence area",

**I would also like to address Light Pollution from the proposed compressor station in New Ipswich.**

We are identified as having a rural sky and are regarded as a truly dark site.

To protect that we require that ALL lighting (interior and exterior) follow energy efficient shielded LED form factors for the proposed compressor site and adjacent buildings AND that only minimal exterior safety lighting is permitted and only with required motion sensors.

The official clear sky chart result of 4.5 (beautiful night sky) is for the nearest light pollution reading on MeetingHouse Hill several towns away. An accurate reading at the proposed compressor site needs to be taken now, and then maintained post-production.

**Asking us to identify what needs to be “avoided, mitigated, minimized, or compensated” without the adequate resources or time to do so can only assure that the Town of New Ipswich will suffer irreparable harm from this project**

**20150824-4056**

To KM,

The environmental impact of this project itself is too great for us to let this happen. Taking any trees and woodlands will affect the local wildlife. The possibility of polluting our natural wetlands, and more important, our residents underground drinking water is a great hazard.

Sound and noise pollution is something no small, rural town should have. I’m currently deployed and living on a small military base that is run by generators. I can assure you that it is not pleasant. But here, it’s required to maintain quality of life and provide security to defend our troops, our nation and partner nations. A large compressor station surely has no reason being in our town. The ground vibration alone would be enough to force wildlife from the area and cause issues with the natural ecosystem.

The negative economic impact it would create will drastically and unfairly reduce property values. Home owners’ insurance rates would climb for anyone within range of the incineration zone. Some residents will end up leaving the area to escape the negative effects of this project. With less residents, there will be less tax money coming in to support our town. This could lead to a hike in our property taxes.

You can say what you want to try and deceive the people of our community into thinking that this pipeline and compressor station is a great idea for us and that we will benefit from it. Keep patronizing us, telling us what you think we want to hear. I, for one, can see through your BS and I’m sure most others can as well. There is no benefit at all for anyone except KM. Any amount of money you spend for testing and research is just a waste. There is no good reason for us to allow you to bring your pipeline and compressor station through this community. Ask yourself if you would let this happen if you lived here.

I’ve been defending people against bullying my whole life. I’ve been defending our great country and our allies from being bullied by its enemies for 12 years. What makes you think I won’t defend my town from being bullied by you?

Sincerely,

Sgt. Joseph Belanger  
B Btry 3/197 FAR  
31 Appleton Rd.

**20150824-4057**

Regional Need - Mark

My name is Mark Bender and I live at 20 Grater Road, Amherst, NH.

I am the **Town Administrator in Milford, NH**. I am also a member of the 15 Town **NH Municipal Pipeline Coalition**.

On July 16,2015 Kinder Morgan announced that the Northeast Energy Direct (NED) project’s market path segment would be reduced from a 36” diameter and 2.2Bcf/d pipeline to a 30” diameter and 1.3Bcf/d pipeline. In the announcement they state that NED “will serve the commitments we have received from New England local gas distribution companies (IDCs) and commitments we expect to receive from other IDCs and electric distribution companies (EDCs) to provide domestic, low cost and environmentally cleaner natural gas for New England’s residential and industrial consumers, and to meet New England’s existing and antiCipated gasfired electricity generation demand.” While the diameter reduction is welcome news, the

troubling part of the announcement is that at this late stage KM is announcing commitments they expect to receive.

We understand that:

- o The electric grid is shared regionally in New England.
- o New Hampshire has 63 operating power plants including Seabrook nuclear plant.
- o New Hampshire is a net exporter of electricity to the region.
- o NED provides very little benefit to New Hampshire for the enormous impact.
- o 71 mile “greenfield” project entering New Hampshire from Massachusetts only to return to Massachusetts.
- o liberty Utilities, the only IDC signed onto NED from NH, reduced their commitment from 115,000 Dth/d to 100,000 Dth/d and only 50% of that commitment represents incremental capacity or growth. The incremental/growth volume represents less than 4% of the reduced 30” diameter pipeline capacity.
- o No EDCs from NH have made a commitment to NED.

We request that FERC require that Kinder Morgan:

- 1.} Detail the commitments from all LDCs and EDCs.
- 2.} Ensure a full analysis of need by Identifying replacement gas currently delivered to customers on existing pipelines and real Incremental/growth gas for each LDC and EDC.
- 3.} Quantify expected commitments from LDCs and EDCs and explain to FERC why these should be Included in the project evaluation.
- 4.) Quantify amount of gas delivered by KM/TGP to EDCs in New England for the past five years.
- 5.} Require Liberty Utilities to detail plans for their NED commitment to show communities that will be served and when.
- 6.} Compare competing pipeline plans to NED that are known by FERC to determine least and best cost solutions and to prevent a gross overbuild of infrastructure.
- 7.) Quantify the amount of gas lost in current transmission and distribution pipelines in New England.

## **20150824-4058**

Good evening, and thank you for being here tonight. Based on my knowledge of how the federal government works, you are employed by us, the people of the United States of America, and tonight, you are here to hear us, the people of Southern NH. I’ll refrain from the emotional rhetoric, as I know that while it is important to us, it is not necessarily germane to your decision making process. I’m sure you are aware that one of the proposed compressor stations is a 1/2 mile from the Temple Elementary School, and I’m sure you know our volunteer fire departments are ill-equipped to handle even a small “accident”. I know you will take into consideration the quality of life we enjoy here - the fresh air, the clean water, the solitude, the peace and the conservation land we so diligently put aside for future generations to enjoy. I know you will consider all of this, because you represent us, the people. This is not the least expensive place to live, and not the easiest, but it is ours, and we love it.

I am far from the most knowledgeable person on this subject, and have relied on the efforts and dedication of others to gather information, and I have tried to look at both sides of this issue. Based on my understanding, there is a perceived “need” for energy in this region, and that the term “energy crisis” has been bandied about as justification for this pipeline proposal. One does not have to dig too deeply to find out that this is a fabricated need by those who will benefit financially from it, and not an actual one. One also doesn’t need to look too hard to find out that the vast majority of the natural gas this pipeline will move will not be used in New England. The one company that has “signed up” to utilize a very marginal amount of the gas is - wait for it - affiliated with Kinder Morgan. I guess if you can’t legitimately find a need, if you have enough

money you can create one.

I'm not sure what Kinder Morgan expected to find here, but we are not the semi educated back woods hicks they might have expected. We are country folk, for sure, because we choose to be. I could say thank you to Kinder Morgan, for this issue has united and galvanized a large population that might otherwise not have come together. I think they have underestimated how fiercely we love this place we live, and how fervently we will fight to protect it. We live here for a reason, and if anything, this proposal has given us great reason to pursue alternative and renewable energy resources, to reduce our energy consumption, to buy more energy efficient products. We, as a nation, should be moving in this direction, not increasing our reliance on fossil fuels. I believe it is your job to facilitate that process.

I challenge you to give us a year. To let us show you through nothing but our concerted efforts that we can in fact reduce our energy consumption, that we can pursue other options, that we can live comfortably without having our homes and communities pillaged and plundered by deceitful and greedy corporations. I will leave you tonight with a quote by Margaret Mead - "never doubt that a small group of thoughtful committed citizens can make a difference, indeed, it's the only thing that ever has". You, my friends, have run into a group of very committed citizens, and as our state motto suggests, we will indeed, live pipeline free, or die trying. All of us here and especially the children of the Temple Elementary School, thank you for your thoughtful and rational consideration as you deny this proposal.

Amy Cabana

## 20150824-4059

FERC comments -

- Liberty Utilities, one of the subsidiaries of Kinder Morgan's partner in this endeavor, has already stated that it will build a lateral pipeline from NED through Cheshire County to Keene. This is segmentation of the project, and against FERC's mandates.
- In every FERC filing regarding NED, TGP has stated that it reserves the right to change the route, size of the pipe, number of ancillary facilities and pressure of the gas as it sees fit. The thousands of "BD"s in TGP's latest filing are an insult to the residents that live along the proposed route of this massive industrial infrastructure. The project AS A WHOLE should be evaluated, not bits and pieces. The devil IS in the details.
- ISO-NE has already admitted that existing New England pipelines are currently running at 20 to 80% below 2008 levels. 20 to 80% BELOW. Adjusted prices are lower now than they were at that time. ISO-NE also stated that to decrease prices further would "send the wrong signal" to consumers about the relative scarcity of this resource.
- Energy industry experts are already questioning whether Marcellus holds enough supply to recover the costs associated with building this pipeline. An un-needed, un-wanted pipeline will be laid to pump fracked gas for how long? What would the pipeline be used for then? And would residents have any input on that process and decision?
- The true energy crisis in New England is that instead of diversifying its energy portfolio with truly renewable solar, wind and hydro-electric power, New England is doubling down on non-renewable fossil fuels which damage communities and the environment at EVERY point of extraction, storage and distribution. As the FERC you have an enormous responsibility. You hold the gavel for the energy of the future in your hands. Your decisions affect numerous individuals, families, businesses, and communities. Today I task you with a new responsibility, one no group is owning, but has become our burden to bear. I

task you with including the negative impacts pipelines and compressor stations have on SOCIety, and the communities situated around them, because our futures rely on it. By Identifying how to approve a project such as NED primary based on the least amount of impact to the environment is not only performing half of your due-diligence it's simply a job left undone.

Every action in our world is balance by an equal and opposite reaction. We are required to live with those reactions. It's time for change, change that doesn't continually feed a consumption nation, but that instead responsibly assists in suppl.jS1,alanced supply of truly renewable energy.

Thank you,

Brandon Cardinal

Re: Scope meeting Held in Milford NH Docket # PF14-22

Nick Darchik  
320 Melendy Rd.  
Milford NH 03055  
603-672-9769

This project will create a non recoverable impact on the environment. With a 150 foot clear cut work area in the proposed 72 miles of New Hampshire being impacted, 1,309 acres of pristine land will no longer remain usable. This is the pipeline route only! Add in the additional proposed 57 acres for each pump station (Possibly 2) this now removes 1,423 acres from the total area of New Hampshire and the globe. This equates to 2.22 sq. miles gone!

This loss does not appear to be that great of an impact, However If the original route in Massachusetts is used, The total miles of pipeline will be reduced (This IS THE MOST direct route) and an additional reduction in the land loss in the state and total impact on the environment and the globe! The original route needs to be re addressed to minimize any and all impacts to the environment.

	Square acres	1,309 acres % loss of ea.
New Hampshire	5,984,000	= .021875 0/0
Massachusetts	6,754,560	= .019379 %
Texas	172,044,800	= .000760 %
Earth	37,000,000,000	= .000003537 %

The larger the land area the less the impact on that area only, the impact globally remains the same.

We NEED to keep what we have for real estate since NO ONE can go out and buy more!

## 20150824-4061

7/23/2015

To the Officials of FERC:

I have grave concerns regarding the proposed Kinder Morgan pipeline project to be constucted in the Monadnock area. If allowed to move forward this project will forever change the affected communities and disrupt the environment. My concerns are as follows:

### **Public Health and Safety and Environmental Hazards:**

What safeguards will be in place to protect the residents and the children who attend the Temple Elementary School (which will be approx 0.5 miles away from the compressor station in the "Burn" zone)? If there is

ever an accident at the compressor station the students, staff and residents will be in grave danger and our volunteer Fire Dept will be inadequate to the task of dealing with such an incident. The Compressor Station is automated and by the time an issue is noted and residents notified it could be too late to evacuate the students, staff and residents in the affected zone. Kinder Morgan does not have the best safety record regarding their compressor stations and an incident could result in loss of life and property.

There are concerns regarding toxins released into the air periodically during normal operations that could impact the entire area. What filtering systems will be in place to prevent air pollution? Of note: Noise pollution could also hinder effective learning at the school as well as negatively impact nearby residents.

Another important issue is potential pollution of the aquifers that supply water to all of the town of Temple's wells as well as the Public Water Supply for the Town of Greenville. (There is no feasible way to bring in "city supplied water" from a safe source if this occurs).

Additionally potential ground contaminants would negatively impact farming in the area (some of which is certified Organic). This will adversely affect the local businesses, causing many farms to close down operations.

**Negative Impact on Property values:** living in a rural area, we pay significant property taxes to cover the costs of running the Town. If this project moves forward, it will negatively impact property values causing hardship on the residents of the affected Towns. Our tax rates will rise even as our property values plummet. Homes will be difficult to sell and residents will take large losses in their investments. The pipeline will also negatively impact land which was placed in Conservation for protection.

The proposed Compressor Station is too large to be built in the middle of these rural mountain communities. This should be built in an industrial zone away from populated communities which would lessen negative impact on property values as well as increasing safety for the residents.

Lastly, this project is not going to benefit the families in the affected areas or even the New England area. The majority of the energy produced will be sent off shore where it will increase the profits of Kinder Morgan at the expense of the residents of all the affected towns along the proposed route. I sincerely hope that you will consider the negative impact this project will have on the Monadnock area and address these grave concerns regarding the KM Pipeline project in NH.

Sincerely, Jean Darnell  
89 Kulgren Rd  
Temple NH 03084  
nhfiddler@hotmail.com

## 20150824-4062

My name is Lisa Derby Oden and I live in New Ipswich, NH.

Given the incomplete nature of Kinder Morgan's Resource Reports and recent changes to the scope of the project, these scoping meetings are being conducted prematurely and, therefore, failing to provide information that would benefit the NEPA process. And more importantly, given that NEED has NOT been demonstrated, I'm unsure why we are here at all.

Though my concerns are many, I am going to talk about pets and farm animals. They will be affected by the pipeline construction noise and vibrations, as well as compressor station construction and operation.

I own dogs, cats and horses and they are a large part of my life. Indeed, one of the reasons that I live in a pristine, quiet, healthy, rural environment is so that I may have all these animals. I am not alone in this! Subjecting our pets and farm animals to ongoing construction noise as well as compressor station noise, vibration and emissions is just not okay from an emotional OR financial point of view.

Pet and farm animal owners invest a large amount annually into their care and well-being. At town hall this spring I was told that there are 1000 licensed dogs in New Ipswich. That does not take into account the other pets of all kinds or farm animals in New Ipswich and across the NED project, and we don't really know

what that count is.

Animal health issues related to construction and compressor station operation will result in increased veterinary bills, as well as premature loss of the animals. Similarly, health impacts to farm animals represent loss in production and subsequently directly impact the livelihood of those with production farm animals.

At the very least, FERC and Kinder Morgan need to provide us with the following:

- Determine pets and farm animals owned across the NED project
- Investigate cost to relocate pets and farm animals during construction phase and offer relocation to those requesting it
- Conduct meteorological studies to evaluate weather patterns year-round and impact areas of the toxins that are air born
- Identify chemicals used in fracking process that are emitted during compressor station operation, as well as animal health-related problems associated with them
- Calculate economic loss to local businesses that supply pet food and treats, vitamins, veterinary services, animal sitting and kennel boarding, groomer and grooming aids, toys, and other pet and animal supplies when animals are lost as a result of construction and compressor station emissions
- Identify resources and availability to evacuate pets and farm animals in an emergency
- Provide ongoing animal health monitoring during construction and when pipeline and compressor station are operational
- Pay ongoing increased veterinary bills and production loss costs
- A plan and adequate funding for ALL those humans, pets and farms animals, impacted by the construction and operation of NED to BE MADE WHOLE, not just mitigated
- Other items, studies, and resources that are TBD

Asking us to identify what needs to be “avoided, mitigated, minimized or compensated” without the adequate resources or time to do so can only assure that the Town of New Ipswich will suffer irreparable harm from this project.

### **20150824-4063**

Good Evening, my name is Brian Dillon and I live in Amherst,

This is currently the view from my home into the proposed pipeline path. My home abuts the land where the proposed route will begin to deviate to avoid Souhegan HS and Middle School.~ is also where a water line to Milford is buried as well. This picture is what I am trying to prevent happening to this land.

Part of Kinder Morgan’s pitch to New Hampshire has been that we will now have a less costly source of energy to use. This is a false premise. Currently, many towns do not have the existing pipeline infrastructure that would be needed to get this gas into our homes. Several of us looked into getting natural gas hooked up to our homes because there is an existing natural gas line along Boston Post Road. It would cost us around \$150 per linear foot to run the pipe to our homes. My home is roughly 425 feet from the line. That does not even consider the cost to purchase and have installed a new furnace that would burn natural gas. Kinder Morgan is not offering one cent towards the infrastructure in the towns impacted by their pipeline needed to get the gas to our homes nor are they offering anything to the homeowners.

The threat of this project has already caused my property value to decrease. Once built, the value will decrease even more. Like many people, my home value is a part of my retirement plans. It is going to take a very long time for my property value to recover if at all. Additionally, I asked my insurance agent what it will mean for my homeowners insurance if this pipeline is built and I will now be living in an incineration zone. Initially nothing, but that does not mean it would stay that way. The real problem could occur when I go to sell it. That is when the home would be evaluated and now that the home is in an incineration zone, the cost of homeowners insurance could make it too costly for a new owner. ~I am already in a flood plain and

have seen my yearly flood insurance premiums dramatically increase, especially after Super StormSandy. I can barely dig a hole without jumping through a lot of hoops.

How in the world is the same government that forces me to buy flood insurance is allowing a flood plain to be ripped to shreds and all vegetation around the pipeline be killed off? At some point after this pipeline is built, it may be better financially for me to simply send my house keys to Kinder Morgan and walk away. This pipeline could destroy everything I have worked for in terms of property value and lifestyle.

Shame on Governor Hassan, our two Senators and our Congressmen here in New Hampshire. While opposition to this pipeline is abundant, ALL of them have stayed on the sideline and the most any of them will say is that we need more time to study this. In the words of Teddy Roosevelt ... BULL FEATHERS! We do not need more study time. We need this pipeline sent back to Massachusetts where it is needed. The Federal Government wants this and Kinder Morgan wants this. Use land owned by the Government ... bury this line down the middle of 495 to Dracut! There is not a need for this in New Hampshire as we are already a net energy exporter and our electricity rates are being reduced.

Finally, this whole process and the threat of friends and neighbors property being taken by eminent domain has really soured me and has got me thinking about running for Congress. Someone needs to fight for us here. Many towns, livelihoods and qualities of life are about to be steamrolled by an over-reaching Federal Government and a company built by the alumni of Enron, (remember them?), in order to put in a pipeline that will ultimately export natural gas, under the guise that natural gas is needed in New Hampshire.

Thank you.

Re: Tennessee Gas Pipeline Company, LLC Docket No. PF14-22-000

Northeast Energy Direct Project

COMMENT FOR SCOPING MEETING

I am Susan L. Durling, a resident of New Hampshire, and proud to say that my family has lived in New Hampshire for more than 400 years. I therefore claim standing to oppose the issuance of a Federal Energy Regulatory Commission (FERC) permit for the Kinder Morgan/Tennessee Gas Pipeline Company, L.L.C., and its Northeast Energy Direct Project.

Prior to my questions for this meeting, I am compelled to respectfully request that scoping meetings be postponed until everyone has had an adequate amount of time to examine and respond to the gigabytes of data Kinder Morgan/Tennessee Gas Pipeline posted to FERC's website on Friday, July 24, 2015.

The Town of Winchester has the longest segment of greenfields, areas far from power lines; and residents must drive substantial distances to attend these meetings.

My questions for you are:

- Will Kinder Morgan/TOP provide a list of citizens of affected towns with whom it has contracted for services, and the fees paid to them?
- If unable to identify because of privacy issues, how will the number of persons and financial or material compensation by town be made known?

- What will be done to avoid impact to Winchester's natural wonders of Pulpit Rock and Pulpit Falls?
- The pipeline enters Winchester through conservation land deeded to the town with the caveat that these areas be protected. We want these areas avoided. What will you do to protect them?
- Most homeowners rely on wells for their water supply, (municipal or private). Given the rocky nature of The Granite State, blasting will no doubt be required to complete construction. Please look into how the company plans to avoid contamination, damage, and changes in water levels.
- Will KMJTOP preserve stone walls, historic foundations, and dam and mill sites within the project's Area of Potential Effect (APE)?
- Will KMffOP perform archeological surveys to determine pre-historic and historic significant areas within the project's APE?
- I have seen no reference to performance of a determination of properties eligible for listing on the National Register of Historic Places within the project's APE has been done. Does the company have a plan for this? What is that plan?
- I have seen no reference to Native American traditional cultural places within the project's APE. Does the company have a plan for dealing with the unanticipated discovery of prehistoric sites, historic properties or human remains? What is that plan?
- Please contact Elizabeth H. Muzzey, the Director of the Division of Historical Resources and New Hampshire's State Historic Preservation Officer, as she has not yet been contacted by Kinder Morgan.

Respectfully,

Susan L. Durling

Comments on NED Pipeline Construction Proposed Project (Docket PFI4-22-000)

Given the great technological advances of this century in Solar, Wind, Geothermal, ground source heating and cooling, tidal power, biomass as well as weatherization and energy efficient construction, I request that your commission evaluate whether these technologies might more appropriately and more economically

meet any need we have for energy and be a less expensive and longer term option for our future needs.

We have south facing roofs, we have well digging skills for geothermal, we have coastline, we have open spaces for solar fields. We also have colleges and technical schools that can train our young people to install and maintain the modern systems. Indeed, we have, I have read, in the town ofEpson a high school training students in solar technology; all ofEpson's town buildings are powered primarily by solar. The sun, wind, earth and water will always be with us.

Please study the capacity of these alternate systems for power production in New England in the near and medium term and whether our power needs might be met more economically and with less disruption than by this gas pipeline.

Ms. Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE: Northeast Energy Direct Project, Docket N. PF-14-22-000

Dear Ms. Bose:

Thank you for the opportunity to comment on the proposed Northeast Energy Direct Project (NED). As you know, the Forest Society is New Hampshire's oldest and largest land trust. We hold more than 750 conservation easements permanently protecting more than 120,000 acres of privately owned land statewide. In addition, we own more than 53,500 acres of forested lands in 180 separate reservations in 101 New Hampshire municipalities. Three of our forest reservation parcels are located in the route of the NED: the 55 acre Heald Tract parcels in Greenville and Mason, and the 45 acre Bockes Forest in Hudson. As such, we are in the process of assessing the potential negative impacts the project may have on them and their natural resources, and will be providing a full report upon completion of this study.

Because the 71 mile proposed route in New Hampshire will cross significant land and water resources as well as wildlife habitats, SPNHF requests FERC undertake a thorough and transparent review of the impact the entire NED Project will have on natural resources on the ground. As you determine whether it provides a public benefit, we believe FERC must equally weigh the project's adverse effects, especially over the long-term. These natural resources provide benefits to public drinking water supplies, agricultural and forest soils, public recreation including hunting and fishing and the forest products industries. It is therefore incumbent for the agency to take this approach during its review.

Specifically, we would urge the agency to develop alternate proposals that will avoid and minimize impacts to protected conservation lands and other sensitive natural areas. As you recall, the Nature Conservancy asked FERC to give special consideration in the EIS of how to avoid, minimize impacts to, or offset impacts to critical habitats. We strongly support TNC's request and would expect to see information in the Draft EIS that addresses the following categories: large, intact forest patches; floodplains, wetland and vernal pool

complexes, seeps, bogs, and fens; fragile habitats; rare species habitats, both freshwater and terrestrial; migratory bird habitat. As you develop these alternate proposals, we would also ask FERC to consider options that use existing transportation rights of way.

The Natural Gas Act grants private natural gas companies that have received a FERC certificate of public convenience and necessity the power of condemnation. This authority is a powerful tool and provides those companies a significant regulatory advantage over landowners. Therefore, FERC must exercise extreme diligence and restraint before granting such power. We would ask FERC to set a high a review threshold for determining if the NED Project will provide a substantial benefit to the people of New Hampshire before granting the power of condemnation.

In closing, if you determine this project is necessary, we would also ask you to require the developer to avoid impacts the most ecologically significant natural resources and minimize impacts on other important environmental areas. Thank you for your consideration of these comments. We look forward to your response.

Sincerely,

Matt Leahy, Public Policy Manager

Re: Tennessee Gas Pipeline Company, LLC, Docket No. PFI4-22-000

My name is Elizabeth Freeman. I live at 410 Ashby Road, New Ipswich, NH. I wish to address the issue of potential noise created by the proposed compressor station. I am the Vice Chairman of the New Ipswich Planning Board, but today I speak as a private citizen.

Several years ago, the Planning Board wrote an ordinance governing the construction and operation of commercial wind farms. In the process of writing that ordinance the Board researched numerous issues, including the impact of industrial and commercial noise on a quiet rural community. The Board consulted with acoustical engineers with many years of experience in community noise control. Our consultants referred us to the cautionary warnings for quiet environments published by the US Environmental Protection Agency' and the World Health Organization' .

While I did not, by any means, become an expert on community noise as a result of helping to write this ordinance, I did gain an understanding of certain issues. First, that New Ipswich is a quiet area with no industrial or commercial noise sources, which establishes us as a "Quiet Rural Community." The existing Background Noise Levels in New Ipswich are less than 30 dBA and 20 dBA at night without natural sounds. Second, that if the noise levels generated by a commercial or industrial use are not designed to operate quietly, there WILL be a serious, negative impact on the health and welfare of residents of the community. And third, that industrial and commercial noise level limits for a "Quiet Rural Community" need to be significantly lower than those for an urban setting.

My concern is that the noise standards used by FERC, while appropriate for an urban setting, are NOT appropriate for a "Quiet Rural Community" and ignore the cautions found in Appendix D of the aforementioned EPA document. While more expensive, it is possible to build a compressor station with noise levels lower than FERC's standard of 45 dBA leq night time.' Additional expenses for doing this can be better controlled if an acoustical engineer takes charge of the entire acoustic footprint," There are noise-control material providers that specialize in the design of very quiet compressor stations.

In order to preserve the quiet rural environment of New Ipswich and to provide protection from excessive noise levels that cause adverse impacts to public health, welfare, and well-being, I request that Kinder Morgan be required to meet a noise level standard for the compressor station that is less than 38 dBA leq night-time at the boundary of residential properties.

Thank you.

Hand written FERC Comment form: Denise Hannessy, 77 Elan Street, Apt 4, Milford, NH 03055, opposing

**20150824-4071**

My Name Is Craig Herlihy I'm from Wilton, NH.

I moved here with my wife 8 years ago and I love my town and I love this state. When we moved here we were looking for a place that was beautiful, a safe place to raise our children and a place to invest in a home that will hopefully increase in value. I do believe we've found that here. But, all of these things are in jeopardy with this proposed pipeline.

The beauty of nature preserves in our area as well as the back yards of average citizens are at stake. We are here in the hopes that all our voices combined will stop the grinding machine of Kinder Morgan from misusing Eminent Domain in their selfishly motivated intentions.

The pipeline would also be a soft terror target and a daily hazard to those who live and work around it.

Furthermore, it would lower property values because No-one wants to live in a danger zone.

Lastly, no clear benefit has been outlined for the citizens of this community!

I am strongly opposed to this disastrous proposal.

The answer to the question of whether this pipeline should be put through NH is a resounding No!

**20150824-4072**

Hand written letter, 2 pages, Trey Hiatt(?), many questions, opposing.

**20150824-4073**

**TESTIMONY OF COMMISSIONER CAROL H. HOLDEN CITIZEN OF AMHERST, NH  
HILLSBOROUGH COUNTY COMMISSIONER - DISTRICT 3 - 23 OF 29 TOWNS**

I WANT TO POINT OUT SEVERAL CONCERNS ABOUT THE PIPELINE RAISED BY MY CONSTITUENTS.

THE PLAN, SITE AND ROUTE OF THE PIPELINES WAS TO BE DONE IN WAYS TO REDUCE ENVIRONMENTAL AND COMMUNITY IMPACTS. PONEMAH BOG WILDLIFE SANCTUARY, RHODORA DRIVE WHICH IS SLATED TO REQUIRE BLASTING TO INSTALL THE PIPELINE. LET'S HOPE THE SANCTUARY CAN BE SAVED!!

THE SANCTUARY FEATURES A THREE ACRE POND SURROUNDED BY A FLOATING SPHAGNUM MAT, ALL ENCIRCLED BY OAK AND PITCH PINE WOODS. THE BOG IS IN A KETTLE HOLE CREATED BY THE RETREAT OF GLACIERS. CLASSIC BOG PLANTS SUCH AS LEATHER-LEAF, BOG LAUREL AND TAMARACK GROW HERE. VISIT IN MAY TO SEE A SPECTACULAR DISPLAY OF RHODORA. YOU CAN ALSO FIND INSECT EATING PLANTS, PITCHER PLANTS, SUNDEWS AND BLADDERWORTS. A TRAIL, BOARDWALK, AND A VIEWING PLATFORM AL-

LOW YOU TO GET A CLOSE VIEW OF THE LIFE OF THE BOG.

1. ACCORDING TO AN AMHERST TASK FORCE THE PIPELINE WAS NOT TO BE SITED ON A DEAD END STREET FOR SAFETY REASONS. IS THE PIPELINE GOING TO BE REROUTED IN ALL STREETS THAT DEAD END?

2. FOR THE SAME REASON AND THE ABILITY TO HAVE TWO MEANS OF EXIT, THE PIPELINE WAS NOT TO BE SITUATED NEAR A SCHOOL. THE AMHERST CHRISTIAN CHURCH SCHOOL IS AT THE END OF PATRICIA LANE. THE CAPACITY OF THE SCHOOL IS APPROXIMATELY 100 STUDENTS. THE PIPELINE GOES THROUGH THE PARKING LOT OF THE SCHOOL.

3. CONSIDERATION FOR ABUTTORS LIVING NEAR A TRANSMISSION SITE WAS TO BE GIVEN. SENIOR CITIZENS MIGHT WANT TO SELL THEIR HOMES IN 3- 5 YEARS AND WOULD NOT BE ABLE TO GET FULL MARKET VALUE FOR THEIR PROPERTY. THEY WOULD NOT BE ABLE TO WAIT 10-15 YEARS FOR THE PIPELINE TO HAVE A SAFETY RECORD TO SELL THE PROPERTY AT FULL VALUE.

WHO IS GOING TO BE RESPONSIBLE FOR THEIR LOSSES?

4. FIREFIGHTERS IN ALL COMMUNITIES IN THE PATH OF THE PIPELINE NEED TO BE TRAINED TO KNOW WHAT THEIR ROLE WOULD BE IN AN EMERGENCY.

5. FINDING PIPELINE EASEMENTS - TO GET DETAILED INFORMATION ABOUT A SPECIFIC PARCEL, YOU SHOULD CONTACT THE HILLSBOROUGH COUNTY REGISTER OF DEEDS AND PROVIDE THEM WITH THE PARCEL NUMBER OF THE PROPERTY YOU WISH TO LEARN MORE ABOUT. THE REGISTER OF DEEDS CAN ALSO HELP YOU LOCATE A DEED AND DETERMINE IF THE PIPELINE COMPANY HOLDS AN EASEMENT ON IT.

6. PLEASE MAKE SURE IF YOU HAVE A UTILITY EASEMENT WHICH ONE IS ON YOUR DEED. A PIPELINE EASEMENT MIGHT NOT BE ON YOUR DEED.

TY

I REPRESENT THE FOLLOWING TOWNS: Amherst, Brookline, Greenville, Hollis, Lyndeborough, Mason, Milford, New Ipswich, Temple, Wilton and Windsor. IN THE PATH OF THE PIPELINE AND I HOPE CONSIDERATION OF THESE CONCERNS AND THOSE OF THE WHO WILL TESTIFY BEFORE YOU THIS EVENING.

THANK YOU.

329 Mast Road  
Goffstown, NH 03045  
Phone: (603) 627-5602 Fax: (603) 627-5603

Board of Commissioners

The administration of Hillsborough County Government is vested in the three member Board of Commissioners, elected every two years from the three county districts:

Toni Pappas

District #1 - Bedford, Manchester and New Boston,

Sandra Ziehm

District #2 - Hudson, Nashua, Pelham and Litchfield ..

Carol H. Holden

District #3 - Amherst, Antrim, Bennington, Brookline, Deering, Frankestown, Goffstown, Greenfield,

Greenville, Hancock, Hillsborough, Hollis, Lyndeborough, Mason, Merrimack, Milford, Mont Vernon, New Ipswich, Peterborough, Sharon, Temple, Weare, Wilton and Windsor.

The Board of Commissioners duties are mandated by NH Statute RSA 28 and Includes the custody and care of all property and real estate belonging to the County.

They are responsible for the governing, administration and overall supervision of the department of corrections, nursing home, public assistance, human resources and departments not under the statutory control of other elected officials. The Commissioners also have budget review over all county departments.

July 29, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission 888 First Street NE, Room 1A Washington, DC 20426

RE: Docket PF14-22-000, Nashua Scoping Meeting Comment

Dear Secretary Bose,

On behalf of the 60 members of the **Friends of Horse Hill Nature Preserve**, I respectfully request that the FERC ensure that all potential Impacts of the proposed Northeast Energy Direct (NED) pipeline route be thoroughly evaluated. Environmental Impacts to be studied and documented In the EIS Include:

- Impacts to wildlife during the construction and maintenance of the pipeline, including specific reference to all lifecycle stages, such as mating and gestation areas and migration requirements. All terrestrial and aquatic plant and animal life must be identified and included In the studies.
- Impacts to wetlands during the construction and maintenance of the pipeline. All wetlands, including vernal pools, ponds, streams, uplands surrounding wetlands, and so on, must be Identified and Included in the studies.
- Impact of temperature on the pipeline. Please ensure that the EIS includes detailed information specific to New Hampshire, such as extremes of temperature, expected maximum depth of frost, Impact of frost heaves on the pipeline, case studies of pipelines in a similar topography and climate, and so on. (Note that the existing TGP pipeline in New Hampshire may not present the same challenges and may not be a good candidate for comparison.)
- Specific information on the use of non-mechanical means of vegetation control (e.g., chemical defoliants and herbicides), Including responsibility for monitoring for chemical use and corrective action that will be taken If agreements with property owners are not adhered to.
- Documentation of all methodologies, testing equipment, qualifications of evaluators, evaluation dates, and a comprehensive report of all results from all studies.

In addition, Merrimack has some unique concerns. Our town has been Identified as the site of a proposed metering station and we are concerned about leaks. In a written response to questions from the Town of Merrimack, kinder Morgan said:

*“All compressor and meter station(s) along the pipeline routes are monitored from the 24-hour control center ... If a leak is detected that does not represent a safety concern and is classified as a non-hazardous leak an appropriate repair plan would be developed. An example of a non-hazardous leak that would not require a system shut down could be a valve packing that can be tightened to stop the leak.”*

Given that Kinder Morgan states that leaks may happen and may be allowed to continue while a repair plan is developed, and given that the proposed site is very near the Merrimack River, we are requesting that the air and water surrounding the proposed metering station be evaluated before, during and after construction and during the operational life of the station, in a minimum of 1000' radius around the station site. The results of preconstruction tests, and a specific plan for ongoing monitoring and notification, must be included in the EIS.

The currently proposed route bisects the Horse Hill Nature Preserve (HHNP) and the Gilmore Hill Memorial Forest, and these present unique issues that must be addressed in the EIS, including:

- Impacts on trail maintenance. The proposed pipeline route crosses our trail system in several locations. In response to the town's questions, Kinder Morgan stated that any trail improvements or construction activities would have to be submitted to them for approval, and that they would have to be on site whenever a piece of equipment is used. Clearly, this will cause a great deal of difficulty for trail maintenance and is unacceptable. Please provide a specific plan addressing these concerns.
- Impacts to specific user groups. For example, hunting is currently allowed on HHNP. Will that be a problem for KM/TGP? Please elaborate, being specific about notification, monitoring, policing, and so on.
- Impacts of erosion on the protective soils above the pipeline. Use of the trails by hikers, bikers, horses, and ATVs causes severe erosion in certain areas, particularly in the pipeline corridor. Please provide specific details describing monitoring, policing, and specific corrective action that will be taken to address erosion issues. Note that closing the trail is not an acceptable corrective action.
- Impacts on public support for conservation land donations and purchases following the granting of a right-of-way to a natural gas transmission pipeline. The taxpayers of Merrimack voted to spend over \$4 million dollars of their hard-earned money to purchase HHNP in 2002, and they continue to contribute to its ongoing maintenance. If the federal government can grant the right to a corporation to cut through the delicate ecosystem of this Nature Preserve, will voters be as inclined to fund future purchases in the name of conservation? Please document a minimum of ten situations in which the FERC has approved an application in similar situations and the changes in voter behavior following installation of the pipeline.

Permitting the taking of private property by a corporate entity is a serious use of federal power, and the FERC is obligated to ensure that there is a societal benefit commensurate to the exercise of this power. Please provide details describing the societal benefit by:

- Documenting all existing pipeline capacity that could service the same need as the NED proposal. Include a thorough evaluation of potential use of the spare capacity available on the Maritimes line and proposals by Portland Natural Gas to provide more gas to the region.
- Documenting the injection of liquefied natural gas into the New England pipeline network over the last five years, including specific amounts and dates of injection. Evaluate whether the markets have been working properly in this regard and, if not, how that might have impacted New England's available gas supplies.
- Documenting the projected impact of the approved AIM and/or Expansion projects, and the proposed Access Northeast and other proposed projects, on New England's natural gas supply.
- Documenting the impact of expanding the Concord Lateral. Such expansions have been an appropriate response to increased natural gas demand in the past.

Finally, please provide a detailed description of how this pipeline proposal supports the goals set forth in the

*New Hampshire 10-Year State Energy Strategy*, prepared by the New Hampshire Office of Energy and Planning, published In September 2014 and endorsed by Governor Hassan.

Thank you.

Sincerely,

Debra Huffman Merrimack, NH

#### **20150824-4078**

I am Timothy Jones. My wife and I are part of a 265 year tradition offarming in New Ipswich. We have chosen organic farming in the belief that, while slower and less profitable than farms using chemicals, it contributes more to human health and improves our local community. We chose New Ipswich because of its open space and respect for nature. In fact, we were struck by the fact that the Town's Master Plan starts out by citing the importance of 'a country environment free of pollution from water, air, noise and light' and 'characterized by farmlands and woodlands'.

We feel that the Town's Vision is very much in jeopardy at this time.

But first, about organic farming and why it is so slow but effective

##### I. Soil

- avoid all chemical pesticides and herbicides
- add natural amendments
- promote natural microbial activity via microbes, fungi, and earthworms
- use coyver crops to add nutrients naturally and break up soil compaction
- till cover crops into the soil to act as 'green manure'
- rotate and diversify our crops
- and we must have abundant clean air and water

##### II. Livestock (in our case pigs, chickens and sheep)

- rotational grazing for animal health and well being
- rotational grazing: to spread livestock manure naturally
- rotational grazing: to disrupt and improve the soil
- rotational grazing: to grow optimum pasture grass .
- animal stress directly affects meat quality, so we minimize environmental stress, including noise
- and we must have abundant clean air & water and minimum noise

##### III. Vegetables and fruit

- soil fertility directly affects weed control
- water quality and mineral balance affect taste
- soil fertility directly affects plant growth and flavor
- and ample clean water and air are essential

After all this work and preparation, if our soil and air become contaminated, it takes 3 years of work to

regain an organic designation. You simply cannot hasten the organic process. Organic farm margins are too slim to weather that kind of disaster.

Some observations:

1. First, it seems that our community is being penalized for its focus on a healthy, open environment. What easier place to park a massive construction project than where there is low population density, even if that was why so many people chose to live here.
2. And second, my wife and I are unable to sort out what tips the scale so that much of what our region holds dear is forfeited to a large corporation, chasing a huge profit, paying lip service to helping NH energy needs all while exporting the product to foreign markets?

## 20150824-4079

FERC Scoping Session

Milford July 30, 2015

My name is John Kieley.

I, and the colleagues you have or will be hearing from shortly, **represent the Town of Temple**. While Temple is not directly on the pipeline route, the proposed pipeline and New Ipswich compressor station would be immediately south of our town line.

This proposed project would have dramatic impacts on the quality of life in our town including the air we breath, the water we drink, our rural tranquility and even our ability to educate our children.

Even in such an important area as air pollution, the Resources Report filed by Kinder Morgan last week still has it as a "TBD" item. We feel that it is inappropriate to schedule scoping sessions when the report we are supposed to be commenting on is still incomplete. We request that additional scoping sessions be scheduled in each of the towns affected by the project a minimum of 60 days following the issuance of a complete Resources Report.

In addition to providing complete impact information on air, water, light, vibration and noise pollution as well as safety concerns and the diminishment in property values that my colleagues have or will comment on. the Town of Temple requests that research be conducted on the impact of this project, including the compressor station. on:

1. FLYWAY. The largest and most important flyway in the northeast is along the Temple Mt ridgeline and is a migration route for more than 10,000 raptors annually including bald and golden eagles. This flyway has been the subject of annual research by NH Audubon for many years/The site of the proposed compressor station is in the flight path of these raptors and their use of the flyway would be directly impacted by the noise, light, air and thermal pollution emanating from that facility. Research should be conducted to assure that the compressor station could not interfere with this migration.
2. LUKAS COMMUNITY. The Lukas Community provides the required tranquil environment for twenty developmentally disabled adults many of whom have lived there for decades. The facility is in close proximity to the compressor station so residents would be particularly affected by the noise and air pollution emanating from that facility. Research should be conducted to assure that the quality of life for these residents is not diminished by the compressor station.
3. ELEMENTARY SCHOOL (1). Our elementary school is roughly one-quarter mile from the proposed compressor station site. Air pollutants from compressor stations are known to have significant negative effects on human behavior and health thus placing our children at riskf Research should be conducted to assure that our children could not be negatively affected by the pipeline or compressor station.
4. ELEMENTARY SCHOOL (2). The Town uses the elementary school as our emergency shelter. During the 2008 ice storm that facility kept our residents warm, showered and fed for two weeks. Research

should be conducted on the appropriateness of continuing to designate that facility as our emergency shelter and what the costs would be to build an alternative.

5. BROWNFIELD. The proposal is to build the compressor station on an EPA brownfield site. A study should be conducted to assure that lead and other identified toxins on the site could not leach into private wells, the Greenville reservoir and the Temple/New Ipswich aquifer all of which are in close proximity to the site.

#### **20150824-4080**

FERC Scoping Session Milford July 30, 2015

My Name is Constance Kieley. I am a resident of Temple and represent the Town.

Kinder Morgan has repeatedly stated that the proposed pipeline and compressor station will not effect property values of nearby residences and, therefore, no compensation is due to those property owners.

We are already seeing that properties for sale along the pipeline, particularly those in close proximity to the proposed compressor station, are being shunned by those seeking to buy properties locally.

We ask that Kinder Morgan commission a study by independent experts to determine what the reduction in property values actually is. Such a study should be based on actual historical data from similar communities with similar pipeline and compressor station infrastructure.

I refer you to a 2014 Fremont Center, NY study by a certified real estate appraiser that determine that homes close to a compressor station were reduced in value by 25% to 50%. Please note that the Fremont compressor station is approximately one third the size of the proposed New Ipswich station. That appraiser's rationale included safety hazards substantiated by a middle of the night evacuation, air pollution and noxious odors, persistent vibration and noise, damage from construction and increased truck traffic.

We further request that the study include the impact of pipelines/compressor stations on the tax rates in affected communities. Our analysis of the Town of Temple shows that the pipeline/compressor station will reduce the value of up to 100 houses in close proximity. This then causes dramatic increases in taxes to the other property owners in Temple to cover the loss of value and taxes from houses near the pipeline/compressor station. Similarly, property owners in the other eight ConVal towns will experience an increase in their taxes as the costs of the consolidated school is shifted to those communities.

Constance Kieley  
37 Holt Lane  
Temple, NH 03084

#### **20150824-4081**

July 28, 2015 Written submission to FERC Scaping Session at Milford, NH scheduled for Thursday, July 30,2015

Jacob E. Krashan, Sr. of 20 Nutting Hill Road, Greenville, NH previously from Cromwell, Ct, 147 Berlin Road. In the 1950s Algonquin Gas who is the parent company to Kinder Morgan, installed a 36" pipeline and with the installation it destroyed a private pond on our property, in CT and the surrounding area.

We were not allowed to use the land that they had a right of way to (gas line) and they sent an airplane over twice a day to monitor the gas line. Then during the 1980s they came through and put another 36" gasoline adjacent to that one.

My question are:

If they put one gas line through now, will they put another one in another 20-30 years?

Are they going to have vents on each side of the road at each road crossing?

How will this gasoline be monitored?

How wide of a buffer zone will be required? And how much of the required buffer zone will be totally defo-

liated?

At the Compressor Station, are you going to maintain a fully staffed Fire Department, at all times? This is a must as other small businesses have to maintain other fire apparatus.

Jacob E. Krashan  
20 Nutting Hill Road  
Greenville, NH 03048

Federal Energy Regulatory Commission  
Project Docket No: PF 14-22  
Comments by Albert C. Lefebvre  
695 Old New Ipswich Rd  
Rindge NH 03461  
(603) 899-2208  
Email: vohoal@hotmail.com

My name is Albert Lefebvre and I live in Rindge NH which is along the path of the pipeline. I am a member of the Rindge Conservation Commission. As a Commission member, I request that the Federal Energy Regulatory Commission schedule new scoping sessions after we and other Conservation Commissions have had the opportunity to review and respond to the over 6500 page Resource Report prepared by Kinder-Morgan with, I might add, many items still to be decided. Those items must be completed and distributed to every affected community, Conservation Commission and other town boards in order to understand the full ramifications of the pipeline and what Kinder-Morgan has studied or is planning to study or has not properly studied. How can we as everyday citizens attempt to properly respond to this incomplete Kinder-Morgan report? It is, to say the least, unprofessional, unethical, condescending and without merit to us and you the Federal Energy Regulatory Commission.

Kinder-Morgan is a multi-billion dollar corporation with vast and varied resources at its disposal that it can draw upon and pay for. It is associated with and can draw upon the whole world-wide energy structure for assistance. Kinder-Morgan's financial resources are like a huge Goliath compared with those of the small towns along the proposed route. It seems to the people that Kinder-Morgan and the Federal Energy Regulatory Commission are using and taking advantage of the people by its actions in this regard. These small towns have significantly fewer financial and human resources to address the monumental issues confronting them with this pipeline. How can these small towns develop responsible responses in such a short period of time? How can you, a regulatory commission, allow this to happen? How is it that our government, its leaders, legislative bodies and the various arms of the government not concern itself with this issue?

The Federal Energy Regulatory Commission will certainly be looked upon negatively in NH and elsewhere if it cannot agree to an extension until all reports are completed and the towns and their people have sufficient time to respond and then to allow the Commission to ethically weigh the issues of the people of this region.

Thank you for your attention to this matter and I look forward to a response.

**20150824-4084**

John Leoutsacos  
79 Mountain View Drive  
Temple, NH 03084

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426 !

Docket # PF14-22-000

My name is John Leoutsacos. I live in Temple, NH.

I'm going to begin and end my comments echoing my friends in New Ipswich, because YOU NEED to hear US and so far it appears you Aren't listening.

First of all, given the incomplete nature of Kinder Morgan's resource reports and recent changes to the scope of the project, these scoping meetings are being conducted prematurely, and therefore, fail to provide information that would benefit the NEPA process.

I have several serious concerns regarding the water sources for hydrostatic testing.

There is a definite need to identify the water sources to be used for hydrostatic testing during construction.

As typical hydrostatic testing utilizes millions of gallons of water, will these sources be replenished and if so, how?

Is monitoring of "used" hydrostatic testing water for toxins required? If this water is found to be contaminated,

who is this information reported to?

how is this water purified or disposed of?

An extremely high number of New Hampshire residents rely on private wells as their sole water supply. Being that Gas companies are currently exempt from the Safe Drinking Water Act and do not have to disclose the chemicals in the pipeline; a pipeline leak could contaminate water sources with undisclosed chemicals. In addition to potential damage caused during the construction process, these wells may be negatively impacted by contamination from ground and surface waters.

Asking affected towns to identify what needs to be "avoided, mitigated, minimized or compensated" without the adequate resources or time to do so can only assure that the State of New Hampshire will suffer irreparable harm from this project.

NED FERC Scoping Meeting Milford NH, July 30th, 2015

Re: In support of Kinder Morgan Northeast Energy Direct Energy Project Dear Ms or Mr:

My name is Thomas F. Hersey. I am the Business Manager of laborers Local 976 located in Portsmouth, NH. I am here today on behalf of myself and my Local's members to speak in support of Kinder Morgan's Northeast Energy Direct Pipeline project.

This project will bring a much needed reliable energy source and jobs to the State. The Union Laborers who will build the pipeline are skilled and well trained. Union Laborers have access to training and safety certifications at our Hopkinton Training facility specifically designed for the construction of transmission and distribution pipelines.

As NH residents, they will take great pride in their work, going the extra mile to make sure this project will be built safe, on time and on budget with respect for the environment.

Kinder Morgan and specifically Tennessee Gas Pipeline is, and always has been, a responsible pipeline

owner and good neighbor. The Pipeline will be built along an existing utility corridor to ensure the environmental impact will be minimal.

This project will not only create jobs during its construction but will have a positive, exponential effect on job growth in NH. The inexpensive, safe, reliable, clean, energy the pipeline will provide will allow existing industries to lower their energy costs and expand. It will also attract new industries creating new job opportunities for NH's citizens.

I urge the FERC to approve and support this project.

Respectfully submitted

Thomas F. Hersey  
Business Manager laborers Local 976

## 20150824-4086

My Name is Laura Lynch and I am from Temple NH and I am here representing anyone suffering with lung problems such as COPD, Asthma, Bronchitis, Emphysema and many many more.

Gas pipelines involve a mix of chemicals, including known carcinogens and radioactive gases such as Formaldehyde, Benzene, Methane and Radon. (Radon - an odorless gas - is considered the second largest contributor to lung cancer in the United States, after smoking, by the EPA). Natural Gas mining and consumption have been associated with severe public health and environmental degradation, due to these chemicals, in dozens of communities across the United States, the majority of which are rural/farm locations.

The VOC formaldehyde is also considered a Hazardous Air Pollutant (HAP) by the US EPA (EPA). It is one of the emissions chemicals that the natural gas development industry is required to report, for instance to the PA OEP. According to these reports, compressor stations are the highest UNGO source for formaldehyde.

For the year 2012, emissions of formaldehyde from compressor stations in Pennsylvania ranged from 0.0 TPY to 22.5 TPY. 51

A recent study of air emissions in the Barnett shale region of Texas found concentrations of formaldehyde at sites with large compressor stations.

Some of these concentrations were greater than the Texas Commission on Environmental Quality's health protective levels. Formaldehyde was one of 101 chemicals found in association with methane in this study. The research showed that aromatics in particular were associated with compressor stations.

Air exposures to formaldehyde target the lungs and mucous membranes and in the short-term can cause asthma-like symptoms, coughing, wheezing, and shortness of breath. The EPA classifies it as a probable human carcinogen.

The World Health Organization classifies it as carcinogenic to humans.

It has also been associated with childhood asthma. The California Office of Environmental Health Hazard Assessment (OEHHA) has "identified formaldehyde as a Toxic Air Contaminant and gives it an inhalation Reference Exposure level (REL) of 55 µg/m<sup>3</sup> for acute exposures and 9 µg/m<sup>3</sup> for both 8-hour and chronic exposures.

The acute REL is 74 ppb based on irritation of asthmatics. It has also been linked with adverse pregnancy outcomes and reproductive and developmental toxicity. More recent investigations on formaldehyde near compressor stations are focused on the chemical reaction between methane and sunlight.

While it is well known that stationary compressor station engines emit formaldehyde, it is less well known that formaldehyde may also be formed at these sites through this chemical reaction. While the research is ongoing, it suggests that health hazards associated with formaldehyde may be greater than previously thought. Because reported health symptoms near compressor stations, such as respiratory impacts and shortness of breath, can be caused by exposure to formaldehyde, targeted monitoring of this chemical at these sites would and should be recommended.

Re: Northeast Energy Direct Project Docket HPF14-22

Dear Ms. Bose,

I am writing to register my opposition to the Northeast Energy Direct Project (NED) as currently proposed by Tennessee Gas Pipeline Company, L.L.C. Division of Kinder Morgan, and to urge the Federal Regulatory Energy Commission to deny permits for the project to proceed.

Even though it is generally accepted that New England needs more energy, the NED pipeline would deliver far more natural gas than the region needs or could use. Other projects already approved can meet New England's current and projected shortfall and are much less disruptive than NED. One can only conclude that the natural gas supplied by NED will be sold for export with little or no gas supplied to or needed in New England. If this project is allowed to proceed the result will be the taking of more private property by eminent domain for corporate profit. The landowners are left with unusable land that they still own and pay taxes on, receiving a onetime token payment to host the pipeline and live with the consequences while Kinder Morgan generates a cash stream for themselves year after year.

Please reject the NED project.

Thank you for your consideration.

Sincerely,

Linda Maki

## 20150824-4090

I'm Pat Martin

I live in Rindge, NH

And I'm the **Chairman of the Rindge Energy Commission**

Does NH NEED NED? NOI We know that NH already has more energy than we need, and we export almost half to the rest of New England.

We now know that last winter's high electric rates were not due to scarcity, but timing! In spite of a colder winter than the previous one, wholesale prices fell 60% by Jan. without any new pipelines. For months now, we've had the lowest demand for electricity in 12 years ... and electricity wholesale prices are lower than they've been in 16 years ... without a single new pipeline and with the retirement of 4 major power plants! As the president of the NE Power Generators Assoc. said, "the 'energy crisis' was overblown!"

But for any winter peaks, we're already covered by Distrigas LNG, NEPOOL's proposal and the Winter Reliability Program. Portland Natural Gas Transport System will also be available soon and wouldn't foist a destructive and expensive construction process on rate payers. AIM and TGP/CT pipelines are already approved by FERC. They would all be less of a burden for rate payers than NED and not harm southern NH's economy, travel industry, real estate markets and communities.

Please show us how adding more fracked gas to the line-up of projects already in queue for NE will NOT create an imbalance in our supply when we're already using gas for 50% of generation. Adding more natural gas to our generation actually REDUCES diversity. Please explain to us why NH's State Energy Strategy should abandon the price protections and security offered by supply diversity.

Prove to us why we'd be better off with Kinder Morgan's 5 measly permanent jobs, rather than thousands of good permanent local jobs from energy efficiency work and installing renewables.

Kinder Morgan keeps telling us that prices will go down if NED's approved. Show us the error in the EIA calculations that predict prices for gas will rise due to exports. Explain to us when most of NED's fuel hits its destinations in Asia and Europe where they pay 4 times as much how it won't force gas prices to rise here at home.

Explain to us why the Industrial Energy Consumers of America who are fighting the exportation of gas should stop worrying about their manufacturing and transportation costs rising. And explain to us why thoughtful applications of alternatives won't be a smarter choice than squandering our US fuel resources for higher profits abroad and depleting our resources at home that future generation may need.

**Madison County, New York Department of Health  
Comments to the Federal Energy Regulatory Committee  
Concerning Docket No. CP14-497-000, Dominion Transmission, Inc.**

Prepared for Madison County Department of Health  
by

September 30, 2014

## Executive Summary

The following comments are addressed to the Federal Energy Regulatory Commission in response to the permit application (Docket No. CP14-497-000) filed June 2, 2014, by Dominion Transmission, Inc. of Richmond, Virginia. The Madison County Department of Health has concerns that impacts to public health have not been adequately addressed in this permit, specifically in regard to the Sheds compressor station in Madison County. The National Environmental Policy Act requires that FERC take into account potential environmental impacts and that FERC address public concerns in its permit review. The Madison County Department of Health's concerns are based in part on the report from the United States Environmental Protection Agency (USEPA) Inspector General that documents a lack of emissions data from oil and gas facilities which, in turn, casts doubt on the accuracy of projected air quality impacts. This brings into question the appropriateness of using the National Ambient Air Quality Standards to establish health safety risk near the Sheds compressor station. There are also documented correlations between health impacts and residential proximity to unconventional natural gas development facilities, including compressor stations.

Section II of these comments reviews what is known from the literature about compressor station emissions. Information specific to compressors is very limited. The types of chemicals that have been identified include VOCs, carbonyls and aldehydes, HAPs, aromatics and particulate matter. In particular, there is a lack of information on the intensity, frequency and duration of emission peaks that occur during blowdowns and large venting episodes that are a normal part of compressor operations. Slowdowns, on average, release 15 Md of gas into the atmosphere. Fugitive emissions and accidents are also of concern. One study from Fort Worth, Texas reported 2,126 fugitive emission points from a set of compressor stations. Radioactive chemicals are present in natural gas pipelines and can be released into the atmosphere, though little is yet known about exposure profiles for communities near compressor stations.

Section III reviews known health risks from known chemicals emitted, while acknowledging that there are data gaps in both chemicals emitted and potential health effects. Health risks from VOCs in the short term include eye and respiratory tract irritation, headaches, dizziness, visual disorders, fatigue, loss of coordination, allergic skin reaction, nausea, and memory impairment. Effects from long-term exposure include loss of coordination and damage to the liver, kidney, and central nervous system as well as elevated risk of cancer. Health effects from particulate matter affect both the respiratory and cardiovascular systems. Inhalation of PM<sub>2.5</sub> can cause decreased lung function, aggravate asthma symptoms, cause nonfatal heart attacks and high blood pressure. Diesel emissions from truck traffic (primarily during construction of the compressor) can irritate the eyes, nose, throat and lungs, and can cause coughs, headaches, lightheadedness and nausea. Short-term exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. Long-term exposure can cause increased risk of lung cancer. Chemical exposure to vulnerable populations is a particular concern. The problem of chemical mixtures and how these might affect health needs further research.

Health effects associated with compressor stations are summarized in section IV. This set of research relies primarily on self-reported data from public health surveys. The symptoms identified are associated with health impacts on respiratory, neurological and cardiovascular body systems. These health effects correlate with the impacts associated with many of the chemicals emitted from compressor stations.

Madison County residents have reported numerous concerns to FERC and to the MCDOH (Section V). Primary concerns are for health safety and food/crop safety. Concerns about the safety record of compressors and pipelines, impact on community character and home values, emergency response preparedness, air quality and other environmental impacts were also raised.

Recommendations for framing and scoping public health issues (Section VI) includes information on relevant health data sources. Methods for assessing environmental health determinants include baseline data collection on air emissions, soil, and water quality.

Data gaps and other challenges to the implementation of a public health analysis are identified in section VII. These are: a lack of previous health studies that address compressor stations; limited data on chemical constituents of compressor air emissions including intensity, frequency and duration; the problem of poorly identified chemical mixtures and potential health effects; unidentified related emissions from metering stations and pipelines; the lack of data on potential radioactive chemical emissions; Inadequate assessment of the effect of local weather patterns on dispersal of air pollutants (air dispersion modeling); and very limited information on the exposure pathway of air pollutants entering soil and food crops, and the potential for human health impacts.

Recommendations are also provided in the event that the permit is granted, as follows:

- Perform a baseline health study to establish population health status before the compressor station is built.
- Require best practices to ensure that effective emissions control measures are kept up to date.
- Establish an alert system for blowdowns or other large emissions and/or noise events.
- Put Emergency Plans in place.
- Institute a monitoring strategy at the Sheds compressor station and surrounding locations.
- Institute a health registry.

### Threatened and Endangered Species

Hello, My name is Alec Mayer, and I am a resident of New Ipswich.

Given the incomplete nature of Kinder Morgan's Resource Reports, coupled with the recent changes to the scope of the proposed project, these scoping meetings are being conducted prematurely and, therefore, are failing to provide information that would benefit the NEPA process.

The Southern New Hampshire region contains multiple endangered, threatened, and protected species of animals, insects, and plants. These flora and fauna include, but are not limited to, Blanding's Turtles, Marbled Salamanders, Golden Eagles, Spotted Turtles, Wood Turtles, Blue Spotted Salamanders, Wood Frogs, Lady's Slippers, and Bearberry. Several of these species have been identified by residents that are located within what is called "The Incineration Zone". Unfortunately, with the limited time we have been given, and the lack of resources and properly trained participants, there are bound to be many more that have gone unnoticed.

If the proposed pipeline and compressor station are allowed to be built, the result will include some deforestation, which then leads into a population boom of invasive species. A weakened ecosystem is then left open for more disease and insect destruction. We already face the onslaught of Emerald Ash Borer, Hemlock Woolly Adelgid, and the Asian Longhorn Beetle nearly on our door. Combine all of that with the potential and unknown impact this proposed project will have on the local honey bees and other pollinator populations.

- Who is going to implement an IPM program for invasive controls?
- What damages will be done to the microclimates and ecosystems within the region?
- Where are the case studies on the impact to an already threatened region?
- How will the emissions from the compressor station impact migratory paths and breeding grounds?
- When will our lands be safe?

Asking us to identify what needs to be "avoided, mitigated, minimized, or compensated" without the adequate resources or time to do so, only assures that the Town of New Ipswich, and the Southern New Hampshire region, suffers irreparable harm from this project.

20150824-4093

I'm Kat McGhee, I live in Hollis and **was the chair of the town's Impact Study Taskforce** the year before many of the towns in this room heard about NED. I was asked to join the **Nashua Regional Planning commission** by my town, and I serve on that group still, reviewing the issue of Demand.

In the time I have been involved with Senate hearings in Concord, and Public Utility filings and hearings in MA and NH, and interactions with FERC, it has become abundantly clear that the system at the state and federal level, is strongly weighted toward industry.

I say this because each agency hides behind a segmented responsibility, giving you cover to ignore the big picture. The only picture you do consider beyond the business as usual permitting is the economics. But, ignoring the total picture of our energy and environmental decisions is also a bad long term economic decision - that is being swept under the rug - to aid the current gas-boom. We don't need regulation to help pipeline companies. We need regulation to maintain a balance between commerce and the common good.

The NED pipeline would not be found to be in the public's interest if we factored in the context of 21st century greenhouse gas emissions levels; we could also argue it is not in the public good to throw good money after bad, investing ratepayer dollars in a new unsustainable energy infrastructure - but then vision is not

your department right?

Now it may very well be that you don't want to hear these words. It may very well be that you do not believe these very real issues are among your very specific charge - which is: to facilitate the permitting process. Since your charge compliments the industry that pays your salaries, it is designed to make opposing projects, very difficult. So from the outside looking in, there is a lot wrong with this picture.

So here is our proposal: Why don't you update your mission for the times in which we live?

Why don't you recognize that having access to sufficient gas to bridge our clean energy strategy is a far cry from permitting every 'reasonable' project - when the industry seems to be so good at making them all appear to meet your burden of proof. We ask that you recognize that the cumulative effect of permitting NED, on top of the existing infrastructure projects that will bring ample new gas to the region, is going to change the landscape of our energy markets to the detriment of clean energy alternatives and goals; NED will bring a negative effect to fuel rates when market dominance forces prices up.

The issue seems to be that the state uses a microscope to approve straightforward precedent agreements and the FERC facilitates permitting as long as basic environmental rules are upheld. And what we need from you, in 2015, is a lot more acknowledgement that these decisions have consequences that can no longer be kicked down the road. Under these conditions, conditions defined by the petroleum industry, the public good has no ability to be served.

It is up to the FERC to reinvent itself for this century, when the fossil fuel industry is exploiting its last gasp to the fullest, at the expense of future generations. You have to say no to projects that mean excess capacity is being harvested and burned. I taught my children the difference between want and need. Its time you taught the gas industry the same.

We ask that you rise to the integrity of public servants who can see that the common good means we use restraint against an industry that wants to burn as much fossil fuel as it can, as fast as it can. We will not have the time to create generative, sustainable technologies if we acquiesce that excess pipelines like NED are needed. The NED plan goes against the public interest. We ask you to reform your charge for the environment we face today, and deny this permit.

**NRPC  
NASHUA REGIONAL PLANNING COMMISSION**

July 30, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

RE: Project Docket Number: PF14-22-000

REQUEST TO EXTEND COMMENT PERIOD through October 23, 2015

Dear Ms. Bose:

The proposed Northeast Energy Direct (NED) project will directly impact eight of the 13 member municipalities served by the Nashua Regional Planning Commission (NRPC) including Mason, Brookline, Milford, Amherst, Merrimack, Iitchfield, Hudson and Pelham New Hampshire. For the NRPC region and Southern New Hampshire as a whole, the NED proposal represents a significant expansion of gas pipeline infrastructure through relatively rural and undisturbed landscape, including significant environmental resources and residential areas.

On July 24, 2015, Kinder Morgan/Tennessee Gas submitted updated draft Environmental Resource Reports to the FERC docket. It is critically important for NRPC and its member communities to review and under-

stand these documents so that they may provide valuable input to the FERC pre-filing process. NRPC's Commissioners will convene on September 16, 2015 to revisit issues relative to the NED, and they need adequate time to synthesize all available information. For these reasons, I ask that the previously established comment period be extended through October 23, 2015 to allow more time for review of this information in order to more fully assess potential impacts associated with NED. Further, additional scoping meetings should be held to allow the public more opportunity to address the additional information.

An effective and transparent environmental process must allow all parties adequate time to review the significant volume of information which has been filed, some of which was made available only days ago. NRPC echoes the collective position of the Southwest Region Planning Commission that a comment deadline of August 31, 2015 does not represent sufficient time for agencies like NRPC and the communities we serve to provide thoughtful and detailed comment. NRPC respectfully requests that the public comment be extended to close of business on Friday, October 23, 2015.

Thank you for the opportunity to provide input.

Tim Roache  
Executive Director

**New Ipswich, NH  
NED Pipeline and Compressor  
Station Concerns  
New Ipswich Board of Selectmen  
30 July 2015**

*{slides used in 30 July 2015 meeting}*

-----  
**Outline of Concerns**

- Private Wells
- Public Health and Safety
- Noise, Air and Light Pollution
- Socioeconomics
- Land Use, Recreation and Aesthetics
- Threatened and Endangered Species
- Extend Scoping Period

**Consider the NO ACTION ALTERNATIVE - NED is Not Needed**

-----  
**Private Wells**

- No public drinking water
- Aquifers
  - Three Stratified Drift Aquifers will be segmented by pipeline
  - Unknown number of Bedrock Aquifers
  - Water table is typically 10 to 20 ft below land surface
- NO BLASTING I
  - Consider alternatives such as drilling and cutting
- Identify wells drawing water from impacted aquifers
  - Hydrogeological study
  - Test wells for flow and contaminants

## **Groundwater is Life Blood of New Ipswich**

---

### **Private Wells, continued**

- Identify dug wells which may be impacted by compressor station emissions
  - Test wells prior to construction
  - Test wells quarterly for contaminants
- Quality of Pipe increased to prevent leakage / water contamination
- Alternation of terrain Best Practices
- NO HERBICIDES!

## **Groundwater is Life Blood of New Ipswich**

---

### **Public Health and Safety**

- Emergency Management
  - All volunteer
  - Emergency Response Plan
- Fire Department
  - All volunteer / mutual aid
  - Wildfire fighting capabilities limited due to water sources
  - Compressor station design?
  - Training? Special Protective Gear?
- Police Department
  - No 24x7 coverage / rely on mutual aid
  - Compressor station security ~.

### **Who Lives in New Hampshire? .. We Do!**

---

### **Public Health and Safety, continued**

- Department of Public Works
  - Roads are not suitable for heavy equipment / truck traffic
  - Bonds should be in place well before work begins
- Automatic Shut-off Values
  - Road structure / conditions
  - Terrain
  - Weather
- Steep Terrain
  - AVOID grades greater than 15%
  - Erosion, pipe cleaning (PIGS)
- Quality of Pipe increased to prevent accidents

### **New Ipswich Lives Matter!**

---

### **Noise, Air and Light Pollution**

- Quiet Rural Community
  - Currently less than 30 dBA and 20 dBA at night
  - Need to reduce FERC standards by 10 dBA
- Rural sky / typical truly dark site
- Air Pollution
  - Build compressor station to control emissions - PREVENTION
  - Use NAAQS Standards as MAXIMUM
  - Test for emissions

- Test dug wells for contamination
- Health monitoring program -

**Public Health and Safety is our First Priority!**

-----  
**SocioEconomic**

- New Ipswich is economically diverse
- Few businesses
- Mostly bedroom community (91% residential)
- Tourism limited
- Reduced property values / abatements anticipated .
- Need to study and identify impacts
- AVOID disproportionate impact on low income ..

**Greater Property Taxes will Change Socioeconomic Character**

-----  
**Land Use, Recreation and Aesthetics**

- Windblown Cross Country Ski Area
  - Land use, recreation and economic impacts
- Wapack Trail
  - Pipeline proposed to cross trail 3 times - UNACCEPTABLE!
- Conservation Easements . '
  - Preserve land, no clearcutting ... except for pipeline? '
    - Need to AVOID!
- Native American / Religious sites need to be AVOIDED ~ II
- Deforestation impact needs to be studied •

-----  
**Threatened and Endangered Species**

- Endangered
  - Blanding's Turtle
  - Identify habitat and AVOID May through August
  - Marbled Salamander
  - Golden Eagle
- Threatened
  - Spotted Turtle
  - Northern long-eared bat
- Species of Special Concern
  - Northern Leopard frog
  - Blue spotted salamander
  - Wood turtle
  - Smooth green snake

**Study, Monitor, Protect**

-----  
**Extend Scoping Period Beyond 31 Aug**

- Kinder Morgan Resource Report - March 2015 FIVE MONTHS
  - Over 21,000 TBDs
  - Compressor Station location TBD
  - Some Affected landowners along Existing Right-of-Way have not been notified
- Compressor Station in New Ipswich -June 2015 LESS THAN THREE MONTHS
  - Some Affected landowners have not been notified

- Scoping Meetings Announced - 30 June 2015 TWO MONTHS
- Kinder Morgan Final Resource Reports - 24 July 2015 ONE MONTH
- Need time to study and identify impacts - objective & non-stakeholder funded
- Some studies can only be done in Spring / Summer 2016

### **Environmental Issues Important? Why Rush?**

**20150824-4099**

TDD Access: 1-800-735-2964

July 30, 2015

Dear FERC representative,

Thank you for the opportunity to speak to you this evening. My name is Gary Daniels. I am a member of the Milford Board of Selectman, and I also serve as the State Senator for New Hampshire District 11, a district whose population exceeds 50,000, and which is comprised of the towns of Amherst, Merrimack, Milford and Wilton. It's in this Senate capacity that I testify, as three of the four towns I represent, Amherst, Merrimack and Milford, are impacted by the proposed Northeast Energy Direct pipeline project.

While each of these three towns assembled task forces to study this project, vetting various aspects, proposals, and concerns, and ultimately all opposing it, I chose to focus primarily in the areas of community need and community benefit. Over the past six months I met with Kinder Morgan and Liberty Utilities numerous times, both formally and informally. In addition I attended briefings involving ISO New England and the New Hampshire Public Utilities Commission.

With the loss of fossil fuel generating stations, natural gas and wind power dominate the new resource proposals in the ISO queue, with natural gas at 63%. I do believe southern New Hampshire and the towns I represent need an alternate source of energy, but I am not convinced it is necessary to construct the Northeast Energy Direct pipeline to achieve this result. There are other transporters and other routes that may fulfill the need without disturbing 71 miles of southern New Hampshire terrain, and impacting numerous residential properties.

While I do believe there is a need, the real problem comes when I ask how this project is going to benefit my communities. From the beginning Kinder Morgan has stated that it is just the transporter of the gas and therefore the pipeline alone offers no benefit to a community without a distributor. That's where Liberty Utilities comes in. Liberty Utilities currently distributes gas in this area from Kinder Morgan's Dracut, Massachusetts to Concord, New Hampshire lateral.

I met with Liberty Utilities representatives numerous times, inquiring each time how the NED pipeline was going to benefit my communities. Beyond the potential that the existing 5301 natural gas customers in my district may see lower prices because the gas would come from the Marcellus shale instead of the Gulf of Mexico, I have been told directly that Liberty Utilities cannot guarantee there would be any benefit to the towns of Amherst, Merrimack and Milford. No guarantee, yet some of my constituents face the prospect that their property could be taken by eminent domain. I do not find it an unreasonable request that Liberty Utilities disclose where they intend to extend their customer base so that those in my communities will know whether or not there will be any benefit derived from this project, or if those communities are just being used as a pass-through, with no public benefit left behind.

I understand that issues of eminent domain need to be addressed now in the process, as it's too late to try to address this issue after a certificate has been granted. My understanding of "eminent domain" has always been that it is only supposed to be used in instances where land is taken for public use or purpose, that is,

for the public good. I have already stated that the pipeline, by itself, serves no public good. Liberties Utilities has been and will continue to be the gate keeper to any benefit offered to the communities. What we are being asked to do now is support a pipeline, which, by itself, offers no community benefits, while the entity that holds the key as to whether or not there are any benefits, stands on the sideline in deafening silence. This is not right.

To my point, if Liberty Utilities plans to expand their customer base in the more densely populated communities of Nashua, Manchester or Concord, for instance, there are more direct paths for a pipeline to follow than cutting across 17 southern New Hampshire communities who would experience no benefit.

I respectfully ask that FERC issue a stay of order until such time that (1) all questions asked by the community task forces are answered, (2) Liberty Utilities has made available to the public a detailed plan for expansion that identifies the towns in which expansion will take place, and (3) upon identification of Liberty Utilities expansion area, reassess routes to that expansion area on environmental and personal property impact criteria.

I, again, thank you for your time and respectfully ask that you take these comments under active advisement.

Respectfully submitted,

Senator Gary Daniels District 11  
(603) 860-4482

#### **20150824-4100**

Concerns with the Kinder Morgan Pipeline

1. the pipeline is going thru 70 miles of NH, without any planned access for NH except for Liberty Utilities, which has limited distribution.
2. Liberty Utilities Director of Government and Community Relations - NH Michael Licata and Chico DaFonte, Vice President, Energy Procurement explained to me that Liberty Utilities can not expand into an area unless it is economical. And that expanding into Milford NH and many adjoining towns do not offer economical expansion
3. If any of this gas was going to benefit any of the towns it is going thru, I might have a different opinion. To the best of my knowledge the biggest user for the gas will be residents of Mass, with the bulk of the gas to be potentially exported at a significant profit for KM. Mass resident said "not in my back yard". To take any of my NH neighbors property by eminent domain for the benefit of a private company can not be legal.
4. It has been stated that the pipeline will lower the energy cost of NH residents by 40%. The only benefit I could see for me would be my electric bill. There is no way I could endorse cutting my \$120/mo electric bill by 40% at the sacrifice of my neighbors house, having a potential time bomb a mile from my house, scarring the face of our wonderful NH landscape with a pipeline. You really need to re think what NH residents value.
5. Show me that this pipeline will benefit NH if you approve the continued development. Do NOT rubber stamp this proposal. We don't need it, we don't want it.

July 30, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission (FERC) 888 First Street, NE, Room 1A

Washington, DC 20426

RE: Tennessee Gas Pipeline Company, L.L.c.

Docket No.4-22-000: Proposed Northeast Energy Direct (NED)

Dear Ms. Bose:

The town in which we have chosen to raise our family, Temple, New Hampshire is a small rural-residential town located immediately north of New Ipswich and west of Peterborough. While not a host to a portion of the proposed pipeline, it would run less than 1/2 mile from our southern border. And the proposed New Ipswich compressor station would be only 1/2 mile from our elementary school and only emergency shelter. After reviewing information relating to the NED pipeline project, we, our Planning Board, and our Selectboard have very serious concerns about the effect of this project on our town and on the many other towns through which it will pass and impact. All that have looked into this project find it to be of absolutely no redeeming value to any of these towns (or the states through which it passes) and consider it to be the most egregious challenge to the continuing health and prosperity of our family, town and region we have ever faced.

**Please study whether natural gas is as “clean” an energy source as many claim.** Proponents purport that the NED pipeline will bring more “clean” energy to the region. Is natural gas clean? If all of the pollution and disruption of the environment and people’s lives are ignored then natural gas is cleaner than oil or coal, but it is still a fossil fuel that emits carbon dioxide when burned. And, it is far from “clean” energy if one considers the extraction, transportation (compression), and so on. Moreover, unlike oil and coal, natural gas is a very potent (25-30 times more potent than carbon dioxide) greenhouse gas. So, even before it is used/burned, gas releases from leaks, compressors, and other “normal” operations of the pipeline will be contributing to climate change and global warming. What are the effects of the contaminants contained in the mix? How will thinnest pipe proposed for our “low-density” region interact with the freeze-thaw, corrosive soils, hydrology, and even seismic activity here (creating more leaks which will go unfixed)? Will blasting this trench affect our wells and aquifers? How much would it cost to replace this pristine water and restore this resource? How long does this lightweight material last under our conditions? How will this pipeline affect our water (wells, wetlands, etc.), air we all breathe, and our environment (during and after construction)?

**Please study if there is a need for such a pipeline and any portion of the gas it would deliver:** Proponents purport that the NED pipeline will reduce the overall cost of energy (gas and electric rates). However, New Hampshire is already an exporter of energy. Those regions of the state having sufficient population to support the distribution of natural gas already have established distribution systems and sufficient gas for their needs now and into the future. Because of the low population density, it is not economically feasible for those elsewhere in the state to support the infrastructure required for natural gas distribution (to cities). If you find a need for gas during peak times (of electrical generation), can that need be filled in other ways?

**Will this pipeline violate your policy of NO ratepayer funding?** The proposal that this pipeline be funded in part by a tariff on electricity proposed by the New England Committee of Electricity (NESCOE), a “non-governmental organization”, clearly attempts to shift some of the burden of costs of construction to the backs of the citizens of New Hampshire. This is clearly contrary to FERC’s September 15, 1999 policy statement (Docket No. PL99-3-000) that pipeline expansions are not to be subsidized by existing customers. {NESCOE proposes that electric rates in six states be taxed to demonstrate to the federal government the need for the project to be subsidized by current users to justify the exercise of eminent domain.}

**How will the noise and disruption of the pipeline and compressor stations be mitigated?** We moved here for peace and tranquility - NOT to live in an industrial zone! For Temple, and for many other towns, conditions will only get worse after construction is complete and the pipeline is in operation. The noise from the operation of 41,000 HP compressors - like the one proposed for New Ipswich - will be a significant and highly disturbing factor to the peace and tranquility of both residents and wildlife of this region. These stations have been described as the equivalent of two or three diesel locomotive engines! How will Kinder-Morgan mitigate this sound pollution? How will the disturbance to wildlife and their habitats from all these pollution sources be remedied? For instance, “blow-downs” (gas releases from compressors) will also have

a devastating effect on the migration of birds and raptors, who utilize the “lead-line” of the Wapack Range for navigation during the annual migrations.

**Please study how this pipeline will affect the historic Wapack trail and what measures will be taken to ensure its uninterrupted use and enjoyment. •• And its effects on tourism to our (once) beautiful state.** The Wapack trail is over 75 years old and extends from Mount Watatic in Massachusetts to North Pack Monadnock in New Hampshire. My family has greatly enjoyed hiking, snowshoeing and skiing this wonderful trail. What will be done to ensure the historic integrity of this and many other historic sites in our region? Can alternative routes be found? Does the pipeline need to cross it 3 times?

**By any measure, the proposed project will seriously reduce our quality of life and the value of our home and that of many, many others. What will Kinder-Morgan do to restore this? What measures must they take to restore our “Quality of Life” and that of others in the affected states? How much will this cost?**

I will close with a statement from the Town of Sharon that we whole-heartedly support (although not wishing this travesty and devastation on anyone):

“In our opinion the proposed NED project’s original route through Massachusetts was a much better attempt to assign the burdens caused by the project to the residents of the state that would receive the majority of benefits. The decision to reroute the pipeline through New Hampshire potentially represents an unconstitutional taking from residents of New Hampshire for the benefit of residents of another state. Should FERC permit such an abuse of power, we will strongly support the seeking of redress that the U.S. Constitution provides related to takings, equal protection. and states’ rights. We assert that it is FERC’s responsibility to advise NED that it must file an application that more accurately matches the burdens imposed with the potential benefits to be received.” **What can be done to ensure that those that bear the benefits of such a project bear the costs as well? ... and those that don’t are released from its burdens and devastation?**

Respectfully,

Gary Nielsen & Connie Rinaldo

## 20150824-4102

Scoping Meeting Testimony

July 30,2015

Milford, NH...

I would like to express my grave concern regarding the negative environmental effects caused by the noise generated at and in the vicinity of compression stations.

**Compression Station Noise:** Noise levels associated with natural gas compressors vary with the size of the compressor and distance from the compressor; and change with shifts in wind direction and intensity. For these reasons accurate assessment of decibel levels is challenging. According to the Powder River Basin Resource Council in Wyoming, “Depending on the wind direction, the roar of a field compressor can be heard three to four miles from the site. Near the compressor stations, people need to shout to make themselves heard over the sound of the engines.” And this is under normal operation. Noise levels during blowdowns have been measured as high as 120 decibels(dbA). Industry standards require that noise levels in the vicinity of compression stations be no higher than 55 dbA. However the reasoning for setting the standard at that level is problematic.

**Evaluating Noise:** Noise levels vary during operation, so evaluating an “average” level of noise does not accurately document the noise emitted on an ongoing basis every day. And levels of noise during blow-downs far exceed the standard. Additionally, decibel level alone does not capture the potential negative effects of noise. Infrasound, sometimes referred to as low-frequency sound, is sound that is lower in frequency than 20 Hz (hertz) per second, the “normal” limit of human hearing. Low frequency sound is commonly emitted by gas compression stations. Samuel Matteson, professor of physics at the University of North

Texas and a specialist in acoustics, has stated that low-frequency sound transmits easily through the soil and can travel great distances. It is extremely difficult to protect oneself from low frequency sound as buildings are not designed to insulate from it and it is easily transmitted from the ground by sound waves originating underground or near the surface. Given these factors, the utilization of a maximum standard of 55 dbA is a flawed mechanism of measure and does not take into account the quality of noise emissions.

**Negative Effects of Noise:** There is a large body of research documenting negative health effects from high decibel noise as well as low frequency noise.

**High Decibel Noise Effects:** A European study conducted by Deepak Prasher of University College, London concluded a chronic nighttime exposure of 50 dbA was the noise threshold for at which there was a higher risk for cardiovascular problems. Prasher states “Many people become habituated to noise over time. The biological effects are imperceptible, so that even as you become accustomed to the noise, adverse physiological changes are nevertheless taking place, with potentially serious consequences to human health.”

Physician Louis Hagler, who coauthored a review on noise pollution in the March 2007 Southern Medical Journal concluded “Noise pollution contributes not only to cardiovascular disease, but also to hearing loss, sleep disruption, social handicaps, diminished productivity, impaired teaching and learning, absenteeism, increased drug use, and accidents. The public health repercussions of increasing noise pollution for future generations could be immense.”

In 1999 The World Health Organization published a report called “Guidelines for Community Noise” to standardize risk assessment and management of noise dangers ... Researchers found that “acute noise exposures [can lead] to temporary changes such as increased blood pressure, increased heart rate, [artery] constriction, hypertension, and ischemic heart disease.”

The Environmental Protection Agency website provides research articles outlining the dangers of acute noise, including high blood pressure, coronary disease, migraine headaches, and low-birth weight newborns. A number of studies of noise effects on children conclude that noise-exposed children have difficulties in concentrating in comparison with children from quieter schools. Children exposed to chronic environmental noise have been found to have poorer auditory discrimination and speech perception as well as poorer memory requiring high processing demands. Finally, chronically exposed children tend to have poorer reading ability and school performance on national standardized tests. I do not need to remind you that the proposed location of the New Ipswich compressor station is within 7 mile of the Temple Elementary School.

The World Health Organization has stated that “Noise is an underestimated threat that can cause a number of short and long-term health problems, such as sleep disturbance, cardiovascular effects, poorer work and school performance, hearing impairment. Their recommendations state that exposure over the following levels pose a danger: Indoor noise level at night: less than 30 dbA; outside levels less than 40 dbA; in classroom settings less than 35 dbA to allow good teaching and learning conditions.

While these findings are of significant concern and certainly substantiate justification for FERC to require noise dbA levels that align with WHO guidelines, of equal or greater concern are Low Frequency Sounds that are emitted by compression stations during normal operation

**Low Frequency Noise Effects:** Infrasound, sometimes referred to as low-frequency noise (LFN), is sound that is lower in frequency than 20 Hz (hertz) or cycles per second, the “normal” limit of human hearing. Psychologist Richard Wiseman of the University of Hertfordshire conducted an experiment with young adults which concluded that the presence of the low frequency tone resulted in a significant number (22%) of respondents reporting anxiety, uneasiness, extreme sorrow, nervous feelings of revulsion or fear, chills down the spine, and feelings of pressure on the chest, all this despite the fact that the sound cannot be heard. “There is no doubt that some humans exposed to infrasound experience abnormal ear, CNS. and resonance induced symptoms that are real and stressful.”

The World Health Organization advises that “Health effects due to low-frequency components in noise are estimated to be more severe than for community noises in general...The evidence on low-frequency noise is

sufficiently strong to warrant immediate concern.”

The effects of infrasound or low frequency noise are of particular concern because of its pervasiveness due to numerous sources, efficient propagation, and reduced efficiency of many structures (dwellings, walls, and hearing protection) to mitigate low frequency noise compared with other noise. Unlike higher frequency noise issues, LFN is very difficult to suppress. Closing doors and windows in an attempt to diminish the effects sometimes makes it worse because of the propagation characteristics and the low-pass filtering effect of structures. Individuals often become irrational and anxious as attempts to control LFN fail, serving only to increase the individual’s awareness of the noise, accelerating its negative effects.

**Recommendation:** Given the complexity of the impact of noise emissions associated with the compression station, I challenge FERC to require Kinder Morgan to mitigate all outdoor noise emissions in excess of 40 dbA to align with World Health Organization Guidelines. Additionally I challenge FERC to require Kinder Morgan to engage in an exhaustive study of LFN emissions and to submit a formal plan for mitigation of those emissions.

Submitted by:

Jean Nigro  
Temple, NH

**20150824-4104**

Date: 7-30-2015

To: Milford town officials,  
Members of the Federal Energy Regulatory Commission

I am presenting my objection to the NED pipeline based on 3 concerns:

Please look into ...

1. The extent of the land needed, required for the installation and maintenance of the pipeline.
2. The effect of this on the animals and vegetation on and adjacent to the pipeline.
3. The near and long term impact on the residents in terms of quality of life, usage of property and property values.

Please determine ...

The extent of the land needed is undefined since the requirement is for a 150 wide footprint that is 71 miles long. Kinder Morgan has claimed that wherever possible the required land will be within or adjacent to current electrical grid distribution right of ways. Being adjacent may still require the need for more land in a manner that appears to be by right of way with all of its negative impact to all the abutters that are within or near the footprint.

Please study ...

The restoration of vegetation as presented by Kinder Morgan is poorly undefined. The relatively shallow depth of the pipeline will impose restrictions on the type of vegetation that will be allowed to grow and will have long term needs for control of growth through methods that can be harmful to humans and wildlife.

Please look into ...

The installation of this pipeline will require many instances of blasting through granite with dynamite. The consequences of this blasting are a complete unknown. The noise and shock waves from these explosions will be immediately felt by residents near the pipeline route. It is unknown what other effects will result. Will the blasting release radon and/or arsenic into our homes and wells? Will it disrupt our septic systems and leach fields requiring expensive repair or replacement? No one can answer these questions and we won't know until afterward when it will be too late.

Please determine ...

The impact on residents affected by the pipeline is unknown cannot be measured by monetary means alone. The people that have chosen to live in towns like Milford have an affinity with the environment such as, the wildlife, trees and other vegetation. This pipeline would be a scar across the state that no amount of taxes can erase. There is the promise of how the pipeline will result in reduced fuel costs. In reality, this pipeline has but one purpose and this does not include the residents of the state of New Hampshire.

I have dedicated much of my time to serving the local community in various activities that include scouting, the Arrowhead District and food pantries. My family and I have relished the life style and close connection with the land that is offered by being a resident of Milford.

In Nashua last night scope meeting. I was among the seven hundred concern citizens. The part that concerned us is that FERC commissioners that make the final decision were not there or even now. So the written concerns from all that choose to, their voices isn't heard. It comes across that the energy is going to boil down into a one page summary and our concerns will be dismissed.

## **20150824-4105**

Noise Impacts. Federal guidelines establish a maximum day-night average noise level for compressor stations of 55 dB at the closest noise-sensitive area. Hopefully the New Ipswich compressor stations will comply with this nominal statutory requirement. However, averages can be misleading. Peak noise levels are a more relevant and important metric because the loudest noises at compressor stations occur sporadically such as during blow downs, not continually.

Peak noise levels of 100 dB have been measured in the vicinity of compressor stations. For comparison, the nominal requirement of 55 dB is roughly equivalent to the sound produced by a modern dishwasher. In contrast, 100 dB is about as loud as a jackhammer.

Noise alone is sufficient to cause health problems including hearing impairment, cardiovascular and other physiological effects, mental health effects, and sleep disturbance. Compressor stations operate 24 hours a day. Nighttime sleep disruption during blow downs is likely. Inadequate sleep is proven to cause many

health problems. Chronic sleep loss has serious consequences for health, performance, and safety.

KM's own measurements found that the selected noise sensitive areas near the compressor station site have estimated nighttime sound levels from 41 to 44 dB. A nighttime noise caused by blowdown of 100 dB would be jarring indeed (being perceived as roughly 90 times louder than the background noise) and is easily loud enough to disturb sleep in most people.

Also of concern is the low-frequency noise produced by compressor stations. Low-frequency noise (below 100 Hz) has been linked to numerous psychological, emotional, and physiological complaints. Low-frequency noise can be worse than noise at higher frequencies. It doesn't need to be considered "loud" to cause annoyance and irritation. Low-frequency noise is found to be more difficult to ignore than higher frequency noise.

Wildlife will also be adversely affected by loud noise. Laboratory experiments show reactions in some animals similar to those of humans after prolonged exposure to loud noise. Other studies show that anthropogenic noise can interfere with vocalization and communication in some species, leading one author to conclude that "The inability of creatures to successfully communicate or otherwise employ their auditory senses is detrimental to the long-term survival of these displaced creatures and the overall biological integrity of the environment. "

What are the studies on health effects due to noise from large, 41,000 HP compressor stations? Are there studies that focus on low frequency effects as well as peak noise (blowdown noise) ? What are the noise effects on echo locating bats? What are the studies on the effects of compressor station noise on local wildlife?

Sean Radcliffe, Temple, NH

Kelly Collins from Greenville described the risks to the Greenville water supply due to the compressor station in New Ipswich, I will connect the dots for you,

The proposed site of the New Ipswich compressor station is on the SKAT land property; at the corner of New Ipswich, Temple and Greenville. The SKAT land is between Rt 45 and old Temple Road, uphill from either road. The land is a big, steep hill of granite, If they need the compressor station on level ground, it could mean a lot more blasting on the SKAT land, Residents with bedrock wells are at higher risk due to additional blasting for compressor station area,

More sensitive are those that are dependent on surface water, The KM maps show 1 small wetland on the map for the compressor station but that map doesn't show the large hydric soil area it will be sitting on, A few hundred feet from the compressor station site is a pond that is wet 12 months of the year. That pond is part of a series of larger ponds which is one of 3 main tributaries to the town of Greenville reservoir, There are nearby farms that irrigate from surface ponds. The area is in part of the Souhegan River watershed. Residents surrounding the SKAT land have dug wells, Our dug wells have extremely clean water because the land around us is extremely clean, The SKAT land is uphill from us, Every time there is a heavy rain or snow melt, water runs from the direction of SKAT land through our land, towards the tributaries of to the Greenville reservoir behind our houses, Any contaminating substances from the compressor station will percolate down-hill like a funnel and the local residents will be drinking and eating them.

Yesterday Kathleen Gauvin pointed out that heavy molecule substances such as radon, polonium and other radioactive isotopes could get into soil and groundwater, Those substances are heavy and will drop quickly in the adjacent lands and waters during blowdowns.

We are not paranoid, There are recent reports of people near frack wells and compressor stations that have poorer health than the average, Stop these projects until the harmful health effects are understood and the

public can be kept safe,

How many 41000 HP frack gas compressor stations are sited on hydric soil that are up hill from stratified drift aquifers and ponds less than 1000 feet away?

Are there studies looking for contamination to surface water and dug wells that are checking for seasonal effects? Is contamination greater in spring thaw due to contamination being trapped in the snow? Is the contamination greater in drier fall season when the stratified drift aquifers have naturally lower water levels and contamination could be concentrated,

Are there studies looking at health effects which are 5 years old, 10 years old? The contamination may take time to migrate off the hill,

Re: Tennessee Gas Pipeline Northeast Expansion Project - Scoping Comments

Dear Kimberly D. Bose,

We are writing to express our concern with and opposition to the proposed Tennessee Gas Pipeline North-east Expansion project (Docket PFI4-22-000).

After being residents of Tewksbury for 23 years, we are finding it difficult to digest that there is a proposed gas pipeline that would be cutting through our property. Our family will be directly affected by its potential consequences including the risk of gas leak-related explosion and contamination, as well as a decline in property values and an increase in insurance costs. We have a swimming pool (which would have to be removed) and a French Drain piping system which is connected to three houses. If the French Drain piping system is disrupted/broken it would cause water to back-up into our basements, damaging our heating & air conditioning equipment and personal belongings. Our property is also part of an eco-system with rare species that would be forced out of their habitats, which will be destroyed.

Also, according to a Town of Tewksbury Zoning Map (February 2015), our property is on a Groundwater Protection District. The purpose of this Groundwater Protection District is to:

- a. Promote the health, safety, and general welfare of the community by ensuring an adequate quality and quantity of drinking water for the residents, institutions, and businesses of the Town of Tewksbury
- b. Preserve and protect existing and potential sources of drinking water supplies
- c. Conserve the natural resources of the town
- d. Prevent temporary and permanent contamination of the environment.

The effort to meet Massachusetts' ongoing energy needs should not adversely impact residents' quality of life, nor come at the expense of open space benefitting the public good. The proposed pipeline merely perpetuates reliance on non-renewable resources for short-term gain while ignoring the long-term benefits of renewable solutions that are safer, less invasive and potentially less costly.

Massachusetts has a strong track record promoting renewable energy and energy efficiency programs. I urge you to fully prioritize further investment in and deployment of these solutions, and to take any actions as are necessary to disallow the Tennessee Pipeline Expansion project.

Sincerely,

David & Connie Roy

Scoping Milford NH

7.30.2015

My name is Terry Silverman, **Chair of Planning Board, Town of Fitzwilliam**. Our town is a member of the NH Municipal Pipeline Coalition.

The problem many towns face in dealing with the FERC process regarding the NED project is illustrated by the Town of Fitzwilliam. Our current Masterplan, created under NH RSA 674: 1 by the Fitzwilliam Planning Board, was revised in 2012. It was also revised in previous years: 1981, 1995, and 2004. The Masterplan's vision statement "charges us to act as stewards of our natural resources. The town must balance issues of energy, conservation, protection of natural resources and economic development that maintains our rural character and sustains a viable community."

Fitzwilliam Conservation Commission's Open Space Plan's table of important resources ranks the following resources on a scale of 1-7:

1. water, 6.85
2. clean air 6.82
3. protection of wildlife habitat, 6.51
4. protection of wetlands, 6.43
5. peace and quiet from natural areas, 6.35
6. scenic qualities, 6.29
7. land and water for recreation, 6.28
8. historic features, 5.99

These values would be undermined by the construction, maintenance and infrastructure associated with the NED pipeline project.

Chapter 110 of the Land Use Code of the Town of Fitzwilliam governs Blasting. This would not be followed if the project goes forward due to preemption. Chapter 113 of our Code is our Groundwater Protection Overlay District. This would not protect the town if the project goes

forward. Chapter 137 covers our Rural Character, including our Night Skies Ordinance. This would not protect the town if the project goes forward.

The Town of Fitzwilliam was incorporated 253 years ago, and having lawfully adopted by vote the highest

and best zoning practices, we are unprotected from the affects of this project due to federal preemption. We are a rural community with some of the cleanest air and water in the world, and we strive to protect it.

I urge you to reject the NED pipeline project.

### **SOUHEGAN WATERSHED ASSOCIATION & SOUHEGAN RIVER LOCAL ADVISORY COMMITTEE**

website: [www.souheganriver.org](http://www.souheganriver.org) e-mail: [georgemay@comcast.net](mailto:georgemay@comcast.net)

TO: FERC EIS SCOPING SESSION 7/30/2015, Milford, NH

#### **THE SOUHEGAN RIVER IS SPECIAL AND DESERVES SPECIAL PROTECTION**

- The Souhegan River has two citizens group looking to improve and protect the river for now and into the future - the Souhegan Watershed Association and the Souhegan River Local Advisory Committee.
- SWA sponsors canoe/kayaking trips on the river all summer long.
- SWA has about 30 volunteers that collect river samples every two weeks during the summer to measure the water quality for the health of the river and for the health of swimmers.
- We sponsor cleanups along the river all season long.
- The Souhegan River is a protected NH river since designation in 2000; there is a local advisory committee to advise DES and corridor towns on protecting the river.
- Several years ago the Souhegan was chosen by the state legislature for a pilot project to study and protect instream flow for this and as a model for the other protected rivers in the state. This project is still in process with a final report to be submitted by DES shortly.
- The Souhegan was (and still is) one of the most important rivers in the recently halted Merrimack Watershed Salmon Restoration program run by USF&WS. The SWA (Souhegan Watershed Association) still continues to place classroom-raised salmon fry into the Souhegan in Milford in the springtime as part of our Adopt a Salmon Family program in local schools.
- We still hope for wild salmon to return to our river.
- The Merrimack Village Dam at the mouth of the Souhegan was removed a few years ago to allow fish to move upstream.
- A several year study was done to consider removal of the two unused dams in the center of Milford and recommended removal. The BOS voted not to remove them at this time but it is clear that will happen in the future.
- A huge amount of time, effort, and money has gone into gathering data and protecting and improving the river in recent years. This pipeline proposal is seen as a setback.

THEREFORE, WE RECOMMEND;

THE FOLLOWING ARE IN ORDER OF PREFERENCE TO PROTECT THE SOUHEGAN WATERSHED ENVIRONMENT:

#### **1. ALTERNATE ROUTES**

Clearly the least invasive environmental solution is for the pipeline to be removed from the Souhegan Watershed completely.

- KM has pipeline easements across northern MA that would do the job.

That means there is a better, less environmentally upsetting solution for this proposed route. That there are concerns for that route are more than mimicked here - and this would be an upset to a still pristine area.

- NH depends on tourism that could be affected. Our recreational programs will be upset.

- Just as people in this watershed are becoming more concerned about studying and protecting their area, this would be a bad signal to send. Most of the river crossings have been signed and many of the towns are putting signs on their brook crossings.
- That 75% of the affected landowners (including municipalities) have not given KM access to their property to survey (misguided or not) shows how deeply the mood is against the proposed route.

## 2. IF THE ROUTE CONTINUES THROUGH NH

We ask that the route through Amherst and Merrimack be changed. Once the route of the powerline reaches Rte 101A, it crosses the highway and Ponemah Bog and continues on through floodplains (that do flood) to Souhegan High School. After a short way it crosses the Horse Hill Nature Preserve in Merrimack. Both of these sections are a problem and should be avoided if possible.

- There is another utility, the railroad line running along Rte 101A. If the pipe ran along this corridor and then alongside Continental Blvd in South Merrimack, it would avoid not only the two problem areas but also it would avoid crossing the Merrimack Village District, something the MVD strongly objects to.
- A modified route should be thoroughly studied and a better way found.

## 3. IF THE PRESENT ROUTE IS CONSIDERED A. Ponemah Bog should be bypassed

There is no safe way to cross the bog and still preserve it. There is no way to mitigate for the loss of this property. This is an public area visited and walked by people interested in its unusual nature, butterflies, birds, and insects that exist there.

B. We ask that the route be changed to follow the powerline through the Souhegan High School property. The proposed route specifies a convoluted route that crosses the river four times in a short zig zag around the schools.

- “Oh, no. Don’t put it closer to the high school!” Well, if it’s not safe enough to go past the high school, it’s not safe enough to go anywhere - not within 25’ of a residence. And I’ve been told by their engineer that it is safe enough to cross the ball fields.
- We don’t want it to disturb the river.
- Digging up the ball fields (and perhaps improving them) is preferable to disturbing still undisturbed land and damaging the image of the river.
- The proposed route crosses the Amherst Canoeport and would bury the pipe in an area that may erode or move around in the future.
- This should require serious study before attempted - we’d like to protect the river as a natural resource forever.
- Serious mitigation should accompany this plan. Boating, swimming, fishing will be disturbed.

## C. BROOKS, TRIBUTARIES, WETLANDS

The proposed route crosses several wetlands in the Souhegan Watershed. This will change natural areas now enjoyed by hikers, dog walkers, and others.

- We ask that KM improve the area for people expected to traverse the area depending on how urban or natural each is now - picniC area, benches, and mitigating funds to improve hiking trails in other spots to replace this loss. Each crossing should be looked at and proposals made and scoped before construction.

## D. GREENVILLE RIVER CROSSING

This will be a difficult crossing in a steep, sensitive area. Utmost care must be used to prevent damage to the river and to the area surrounding the river. This crossing merits concern. Under Alternate 1, this problem disappears.

**STATE OF NEW HAMPSHIRE  
Executive Council**

DAVID K WHEELER  
EXECUTIVE COUNCILOR  
DISTRICT FIVE

STATE HOUSE ROOM 207  
107 NORTH MAIN STREET  
CONCORD, NH 03301  
WWW.NH.GOV/COUNCIL  
(603) 271-3632

July 30, 2015

To whom it may concern:

Every town save one, effected by the proposed pipeline project, is in my district. I will summarize comments that I have received from some of 300,000 people I represent. Please hear them and listen when they detail their testimony tonight.

Every public works project has an environmental impact. Every other eminent domain project also has a substantial NH benefit. This Export pipeline does not benefit granite-staters, especially those who live in Export pipeline affected towns.

This project will steal over 1,500 acres of land from NH home owners. They will be required to give up their land, their forest, their crops, their privacy, their property values, their clean pristine well water, and the list goes on and on .

Air quality and water quality will be effected far beyond the 1,500 acres of the proposed taking, 10 to 20 fold or more.

Part of my duties as an Executive Councilor, is to appoint and serve on Highway commissions.

If this 71 mile taking were for a highway it would NEVER pass environmental protection muster. In fact the proposed circumferential highway project thru Hudson and Nashua was shut down. Why then should this project be allowed in the exact same towns?

A highway would NEVER, I mean NEVER, be built with the kind of citizen opposition that was in Nashua last night and here again tonight.

Will you listen, or will you recommend this project be forced upon us?

The only responsible environmental finding/recommendation for this project should be NO BUILD!

Respectfully submitted,

Councilor David K Wheeler  
Council district 5  
Milford, NH

Comments of the Town of Salem, NH

RE: Tennessee Gas Pipeline Company, L.L.C. (“TOP”)

Docket No. PF14-22-000: Proposed Northeast Energy Direct (“NED”)

Dear Ms. Bose:

The Town of Salem, NH was notified in 2014 by Kinder Morgan (KM) that KM was planning to construct a third natural gas line that would be located within the existing right-of-way where two existing gas lines are located where possible. KM indicated that there would be locations where installing the third gas line next to the existing two would not be feasible and would require the taking of additional property.

More recently in 2015, KM indicated they had changed their original route through the Commonwealth of Massachusetts to a new route that passes partially through Massachusetts and partially (-71 miles) through the State of New Hampshire, before returning to Massachusetts to terminate at the gas Hub in Dracut, Massachusetts. This new route includes approximately two (2) miles through the Town of Salem, NH as part of the Haverhill Lateral. KM also determined that they would replace the one existing lines and replace them with a new 20” gas line.

As the duly elected Board of Selectmen responsible for directing the municipal government of the Town of Salem in line with the wishes of its residents, we have strong reservations with the NED project as proposed. Specifically, it is the judgment of the Selectmen that the proposed route through Salem is poorly chosen with numerous adverse effects on our community and must be changed if this pipeline is to pass through the Town at all. The reasons for this judgment are set out below.

### **I. Character of the Town**

The possibility of expanding the current right-of-way for the proposed natural gas pipeline through conservation property, over important natural resources, through existing residential neighborhoods, and far outside the borders of our Town’s existing industrial/commercial-zoned areas, conflicts with our most recent Master Plan, and with the desires of a majority of its residents.

The current pipeline route as proposed by the Tennessee Gas Pipeline Company and Kinder Morgan would:

1. Disturb and permanently diminish the quality of life in existing residential neighborhoods because of significant construction through neighborhoods that, because of permanent clear-cutting and pipeline maintenance, and because of the potential of the seizure of privately owned residential land through eminent domain.
2. Unnecessarily risk to wetlands surrounding one of the Town’s most precious surface waterway -Worlds End Pond, which is a pristine piece of the Town’s conservation property.

It is worth noting that New Hampshire is the second most heavily forested state in the United States (behind Maine). The people of Salem, as in many other New Hampshire communities, live here in part because the heavily forested environment is integral to the character of the town. The extensive tree cutting required by pipeline construction is therefore particularly disruptive especially in the residential areas-and degrades the NH flavor of semi-rural character we seek to preserve.

While the Town of Salem is not opposed to new commercial and industrial development in order to broaden the community’s tax base, it should not be done at the expense of our natural resources, conservation properties and existing residential neighborhoods. Please see enclosed Exhibit A for an overview of the proposed line location.

### **II. Worlds End Pond:**

Worlds End Pond is a one hundred thirty (130) acre body of water which flows southwest and joins the Spicket River. Its bottom is covered with a very deep layer of decaying vegetable matter.

Around World's End Pond are three parcels that the Rockingham Planning Commission rated a high priority for the Town to purchase to preserve for conservation. That recommendation is based on the soils and wildlife on the property. The properties have been identified as prime wetlands. Please refer to Exhibit B & C for maps of the area surrounding World End Pond.

### **III. Public Safety Concerns:**

The Town of Salem shares all of the concerns other impacted communities have regarding a high pressure gas transmission pipeline passing through the community. These concerns are made more acute by the proposed route's passage through residential neighborhoods. In particular, we are concerned with its proposed bisecting of neighborhoods including Bounty Court, Hunters Run, and Theresa Avenue. Residents of these neighborhoods are concerned with potential safety risks related both to pipeline construction and with the potential for a pipeline incident that could isolate and trap residents and/or restrict access to them by emergency vehicle and services.

It is difficult to see how the concerns of these residents could be addressed with the currently proposed pipeline route.

We will defer our more general concerns with public safety, e.g. training and equipment for first responders, communications between Salem first responders and KM concerning potential incidents, incident response, etc., to a later date.

### **IV. Conclusion:**

The Town of Salem, through its Board of Selectmen, strongly opposes the currently proposed route through the Town of Salem, NH for the NED pipeline. With the possibility of needing to impact property outside of the existing natural gas ROW, the proposed route is disruptive to the character of the town and the quality of life for its residents, threatens unacceptable harm to ecologically sensitive areas, and represents apparently irresolvable safety concerns for at least some residents on or near the proposed route. Based on the lack of any specific information provided to the Town by KM during their planning process, it does not appear that KM has explored alternative routes that would be less disruptive and have a lesser impact on the environment.

The Salem Board of Selectmen is strongly in favor of increasing our energy supply in both availability and pricing to benefit more businesses in coming to the town and region, but believes that the Kinder Morgan project is too excessive for the Town of Salem and the region. When Kinder Morgan is ready to rethink its selection of a route through the Town of Salem, the Board of Selectmen would ask that Kinder Morgan engage the Town early in the planning process. The currently proposed, unsuitable route has generated much concern and uncertainty among the residents of Salem. It would be preferable to engage early with the representatives of the Town and present a much more detailed project, rather than put together another, unsuitable route and set off additional concerns and uncertainty among Salem residents.

Thank you for considering the concerns of Salem, New Hampshire.

Sincerely,

James S. Keller, Chair

Patrick M. Hargreaves, Vice Chair

Everett P. McBride, Jr., Secretary

Stephen F. Campbell, Selectman

Michael J. Lyons, Selectman

**20150824-4119**

756 Brookline Road

Mason, NH 03048

30 July 2015

RE: Docket PF14-22

Thank you for coming here to listen our concerns about the proposed Kinder Morgan pipeline. Our environment is very important to us here in NH. It provides more than ambiance. It is our life support This is important stuff.

So Kinder Morgan produced a nearly 7000-page report on the environment, which they released on July 24th so that we'd have plenty of time to review it before these scoping sessions.

It seems that in their report there are a lot of TBDs, most of which are in one field of one table. Discounting those still leaves nearly 3000 TBDs.

When I was in school, if I submitted a report with 3000 TBDs, I know what kind of grade I'd receive.

I think Kinder Morgan deserves A FAILING GRADE on this report.

And speaking of schools, the people in the town of Temple, NH, are concerned that their school will be one-half mile +/- from one of Kinder Morgan's compressor stations.

Now RICHARD WHEATLEY, a spokesman for Kinder Morgan, said in an interview reported in the June 10,2015 issue of THE RECORDER (published in Greenfield, Massachusetts):

“Compressor stations do not ‘exhaust’ or ‘release’ methane gas during normal operations.”

My understanding is that it's not all that unusual for a compressor station to emit methane. Guess those stations are not operating “normally?”

During a phone conversation with SARAH MCKINLEY, an outreach specialist for FERC, stated:

“Compressor stations are just big chemical plants. There is no pollution. I don't know what you are worried about. I have worked gas pipelines for over 30 years and never heard the term ‘blowdown.’ You have been sold a bill of goods. You need to get off YouTube.”

I think some people at Kinder Morgan and FERC need to do their HOMEWORK! Conversations like that undermine the credibility of those organizations. They do a severe disservice to the concerned citizen.

The following statements were extracted from that same report in Greenfield's THE RECORDER:

- During ventings known as blow-downs” large quantities of methane are released to the atmosphere.
- Compressor stations also leak methane via valves and gaskets that weaken and leak from corrosion and thermal stress.
- Compressor stations release huge amounts of toxins. These toxins include benzene, toluene, sulfuric oxide, and formaldehyde.
- Citizens near compressor stations in PA, TX, LA and other states have suffered from nose bleeds, rashes, headaches, sore throats, dizziness, and nausea
- “Blow-downs” can last for two hours .... Blow-downs are needed if a gas pipeline is taken offline for maintenance in the event of emergencies, or to accommodate fluctuating demand.”

Furthermore, nature and the environment do not recognize our state or town boundaries. I insist that FERC DO THE MATH to determine the cumulative effect of the 20-some pipelines under expansion or construction in the region, and the consequences the use of the pipelines' contents will have on our environment. Since MONEY is the only language portions of our society seem to understand, FERC should DO THE MATH to determine the true cost of this project - the cost to the homeowner whose property happens to be above a natural gas deposit, the cost to someone whose property is in the way of a pipeline, or the cost to our environment. And consider as well the benefits of clean sustainable energy alternatives.

Thank you,

Douglas Whitbeck

20150824-4120

Dr. Susan R. Williams  
PO Box 244, 242 Old Country Road, New Ipswich, NH 03071  
Docket # PF14-22

To the Federal Energy Regulatory Commission Scoping Meeting, 30 July 2015

Milford Town Hall, 6:30 pm

I am Dr. Susan R. Williams, Professor Emeritus of History at Fitchburg State University. I have lived in New Ipswich for twenty-six years and have served the town in many ways, including as a member and then chair of the New Ipswich ZBA. I am currently **president of the New Ipswich Historical Society** and, as such, **am requesting consulting party status** for that organization during the project area survey. This pipeline violates our Zoning Ordinance--which protects steep slopes and wetlands; it jeopardizes our drinking water and air quality by threatening our wells and surface waters, and the proposed compressor station threatens our rural sense of security by making us a potential threat to terrorists.

My focus tonight, however, is the impact on Cultural Resources in New Ipswich. I have reviewed "Resource Report 4: Cultural Resources," included in the current version of the 6571-page Draft Environmental Report submitted by Tennessee Gas last week. The report states that "Field surveys are ongoing" for the New Hampshire portion of the pipeline. Strangely, the document lists NO resources in New Ipswich. I assume that the Section 106 review, conducted in concert with the Advisory Council on Historic Preservation, will remedy this omission. There are important cultural resources in New Ipswich that are at risk if this project is approved. Let me offer a brief list:

- **Native American resources:** the Abenaki presence is evident throughout this region, including New Ipswich, where (among other things) there is a known burial ground-in the path of the pipeline.
- **Architectural resources:** the New Ipswich Center Village Historic District has been included in the National Register of Historic Places since 1992. This district includes some 144 buildings, structures, and sites, all of which are 1.5-2 miles from the proposed compressor station. The District's proximity to the compressor station raises issues about sensitive resources outside of the one-mile barrier, when exposed to air, noise, light pollution, and blasting. I urge FERC to take this into consideration. What will be done to protect these sensitive historical resources from environmental damage caused by the compressor station and pipeline construction?
- **Religious Commemorative Site:** The town is also the site of a highly significant religious commemorative site, dating from the 1840s and in continuous use from that time as a focus of traditional association with the group's historic identity. This particular site lies in the direct path of the pipeline.
- **Historic landscape resources:** New Ipswich has other important cultural landscapes in the pipeline's path, including remnants of old mills, stonewalls, colonial roads, and agricultural sites with rich historical integrity dating back to the early settlement period. Several of these agricultural sites also offer significant evidence about the history of Finnish settlement in New Ipswich, dating from the late 19th century. Finnish-Americans remain the strongest and most cohesive ethnic group in New Ipswich today. It is important to preserve and protect evidence of their contributions to the history of the town.

I urge you to carefully consider the impact of the NED Pipeline on these resources as you make your determination about the Tennessee Gas application. Mitigation is not an option where cultural landscapes and structures or traditional cultural properties are concerned. Once they are disturbed, they are lost forever, along with their power to reinforce local, regional, and national identity.

Respectfully submitted,

Dr. Susan Williams  
Emeritus Professor of History and President, New Ipswich Historical Society

**20150824-4121**

Federal Energy Regulatory Commission Scoping Meeting

Thursday, July 30, 2015

Milford Town Hall

One Union Square

Milford, New Hampshire 03055

My name is Tim Winship and I live on Cutter Rd. in Temple, New Hampshire about a mile north of the compressor station proposed for New Ipswich. I've been operating a vegetable and berry farm using organic methods for the last 29 years. I'm asking FERC to require that Kinder Morgan and Tennessee Gas be required to pay for soil tests on our farm prior to the construction of the compressor station to establish a baseline presence or absence of certain pollutants known to be emitted by compressor stations, and to then have soil tests done on an annual basis to monitor these same pollutants. In the event that our soils are found to be accumulating toxins that are traceable to the compressor station then I ask that Kinder Morgan and Tennessee Gas be required to devise a way to prevent further accumulation and compensate us for any income that may be lost as a result of such accumulation. I also ask that if the pollution of our soil renders it unfit for growing safe food then Kinder Morgan and Tennessee Gas be required to purchase our farm at its fair market value prior to the existence of the compressor station. If our farm is healthy before the existence of the compressor station and unhealthy as a result of the construction and operation of the compressor station the party responsible for destroying a business and a way of life must bear the financial cost

In addition, I suspect that the executives at Kinder Morgan and Tennessee Gas have little or no conception of how much we care about this region and the places we call home. They are profoundly mistaken if they think that they can take our property, tear through our forests, wetlands, and waterways, and pollute our air for the sake of profiting from a completely unneeded pipeline. We are not in the least fooled by their false propaganda about the alleged need for this. Better alternatives exist to serve New England's energy requirements. If commonsense prevails, and it must and it will, Kinder Morgan and Tennessee Gas will never lay so much as a single section of pipe in New Hampshire for this project.

Thank you.

Tim Winship

New Field Farm

258 Cutter Rd.

Temple, NH 03084

**20150824-5009**

M.linehan, Pittsfield, MA.

I am in full support of this project. It is well known that MA & all of New England is at the very end of the gas pipeline. Our energy costs are the highest in the U.S. and as coal departs more gas will be consumed for electricity. We are at a huge competitive disadvantage with these costs. The pipeline will follow an already established energy route 90% or so. Aging pipelines already in place will begin failing. They are 40+ years old and leaks are common. This new line may well help in a lot of replacement. Strange no one insists the old pipeline be dug up and most all folks agree energy costs here are too high. Renewables are a big piece of our future. Sadly Not fully able to handle our needs for quite some time. I cannot wait for that. In fact my family & I need to work, eat and live in the City of Pittsfield. I insist you make sure the pipeline company does this project responsibly and at the highest standard and mitigates as many concerns that folks have as possible. Lets not forget this is in the company's economic favor as well. Economic & standard of living logic dictates the need. A responsible well run project is a win..win for us all.

Thank You.

M.L.

## 20150824-5012

Emily Norton, West Townsend, MA.

History is filled with examples of perceived needs resulting in shortsighted decisions that caused more harm than good.

According to FERC, “need” is determined by very limited criteria, primarily the number of contracts a pipeline company is able to negotiate. Once FERC concludes a need for a pipeline, it approves the pipeline construction despite the fact that the pipeline will forsake other critical needs.

I ask you to use wiser criteria to determine “need”.

- We need a clean, safe drinking water supply.
- We need a habitable climate that will continue to support earth’s ecosystems and agriculture for our food supply.
- We need freedom from our addiction to fossil fuels.

These are true needs, necessary for the survival of human civilization. We can not survive without a habitable climate, an adequate food supply and clean water.

Whether you like it or not, the decisions that you of FERC make to approve more and more fossil fuel infrastructure are also decisions that you make to endanger our water and food supply and exacerbate climate change. If you approve this pipeline proposal, your decision will threaten the survival of our children and grandchildren.

- We need FERC to acknowledge the gravity of the decision you will make.
- We need FERC to admit that its definition of “need” is outdated and short-sighted at best and dangerous at worst.
- We need FERC to update its definition of “need”.
- We need FERC to remember you are human beings first and cogs of a dysfunctional system second.
- We need FERC to find the courage to say “no” to a project that is wrong for the people.
- I can’t believe that I need to ask you, people of FERC, to value human survival needs above the profits of a pipeline company.

Yes, we need energy. But we need to DECREASE our use of fossil fuels while we INCREASE the use of green, renewable energy sources.

We need FERC to be a part of the solution, not part of the problem.

West Townsend, MA

## 20150824-5013

Emily Norton, West Townsend, MA.

There’s a story about the early aviators who tried to design the first flying machines. Many of them copied the way birds flap their wings. They fashioned their machines like bicycles so they could pedal faster and make their flying machines’ wings work harder. Those brave aeronauts pedaled off cliffs, launching themselves into midair. They were the first people to feel the thrill of flying. The only problem was that their designs did not follow the laws of physics. In reality those aeronauts were falling to their deaths. As they watched the ground come closer and closer, they pedaled faster and faster. Pedaling faster didn’t work because they were not obeying the natural laws that would allow them to remain aloft.

The FERC fiasco reminds me of those early aviators. Just as those daredevils found their brief power of flight exhilarating, so the FERC decision-makers enjoy tremendous power to permit fossil fuel infrastructure through every nook and cranny of our nation. Just as those early aeronauts made their decisions contrary to the laws of physics, so the FERC decision-makers have ignored the laws of sustainability and the approach-

ing climate catastrophe. Just as the first pilots pedaled furiously as the ground got closer, so FERC decision-makers are rubber-stamping pipeline projects as fast as they can.

However, that's where the similarity in stories ends. Those first pilots who drove off cliffs plunged to their deaths. The only people at risk were the aviators themselves. FERC pilots have billions of passengers whose survival depends on the decisions FERC makes. The FERC pilots refuse to make decisions that could move us towards sustainability. The FERC pilots, like the early aeronauts, are just pedaling faster, carrying themselves and the rest of the human population to their demise.

Not your job? Just doing what FERC guidelines state? Sorry. That excuse just doesn't work anymore. We know what must be done to halt climate change. We know we need to decrease our use of fossil fuels. We know the laws of sustainability. The decision-makers of FERC are obligated to follow those laws. Indeed, every human being is obligated to do so.

FERC decision-makers, we have just experienced the hottest year ever. Do not pedal faster. Do not head us towards a crash. Our survival is in your hands.

SCOPING REQUEST: Please consider this project's lack of sustainability in your determination whether to approve it or not. How can a project that is not sustainable ever be considered to be of "public convenience and necessity"?

Emily Norton  
West Townsend, MA

Shaun Bennett. Ph.D., Philadelphia, PA.

Dear Secretary Bose:

August 21, 2015

The plan to construct a gas pipeline through Richmond, NH is flawed. It has not been widely presented and few of the land owners along its wide corridor have been notified of the proposal, possibly to limit the criticism it deserves. I am one of those un-notified land owners, with property along the shore of Sandy Lake and along Bullock and Lang Roads in Richmond (Map 405, lots 20, 22 and 25).

Sandy Lake is a rare, valuable, vulnerable water body. It is pristine because its watershed is undisturbed save for Sandy Pond Rd. and a transmission line that is the proposed pipeline's path. The Lake's shoreline is undeveloped, with almost no buildings, and no year-round residences. Undisturbed water bodies are very uncommon in Southern New Hampshire. This is a precious natural resource.

The Lake is unusually deep, 15 meters (50 feet), providing a large hypolimnion region and a longer "residence time" for water (and any contaminants) than in the typically shallower lakes of the region which "flush" more rapidly. The Lake's fauna includes fish, water birds (e.g., kingfishers and great blue herons, ducks, geese), raptors (e.g., osprey) and nighthawks, reptiles (turtles and snakes), amphibia (breeding green frogs, bull frogs, american toads, spring peepers, and the densest population of eastern spotted newts ever reported in the scientific literature, as well as red backed salamanders and two lined salamanders). Mammals include occasional beavers and otters, and a substantial bat population (a threatened group that could be adversely affected). Historically the brooks of Sandy Lake had an annual run of alewives that reproduce upstream of the proposed pipeline. The run's status is uncertain, at best it is endangered and disturbances in the watershed and streams could cause its extinction.

Trucks will damage roads on the western shoreline and along the northern shore. Pipeline construction will require many large, heavy vehicles over a long period with consequent degradation as these few roads provide the only access to long stretches pipeline route. Repairs will introduce sediments and noxious chemical agents from repair vehicles and from the needed new pavement. Assignment of the repairs' cost is an additional issue.

Most of Sandy Lake's watershed is to the north. There is virtually no runoff coming from the east or west. The southern watershed limit is a hundred meters or so from the shoreline with this zone constituting less

than 10 percent of the watershed and contributing a correspondingly small proportion of water.

In other words, nearly all water entering the Lake comes from the area impacted by the pipeline. Actions affecting water quality in this zone have a maximum effect on the quality of Sandy Lake and its ecosystem. The wide margins of the corridor insure that it will affect nearly all of the watershed.

The most obvious impacts, forest clearing and excavation of soil and bedrock leading to erosion are damaging. More devastating will be herbicidal control of vegetation. Construction and maintenance of a pipeline corridor using chemical vegetation control will be disastrous to Sandy Lake, regardless of the toxicity of the chemical agents used.

The most common herbicide uses glyphosate, determined by the World Health Organization's International Agency for Research on Cancer to be a likely human carcinogen. The children's summer camp, Wiyaka, has used the Lake for swimming, boating, and, in the past, even drinking water. Introduction of a harmful chemical would be irresponsible in the extreme.

Herbicides are, by definition, toxic. They kill plants. (Some herbicides may be less toxic to humans.) Sandy Lake is comprised of an ecosystem based on plants at its most basic trophic level. Any herbicide that enters the Lake will inevitably have a deleterious effect on plant life. The prolonged residence time of water (and substances in it such as herbicides) in Sandy Lake insures maximum negative effect.

There is a more insidious effect of herbicide use in a watershed: Research conducted in the Hubbard Brook Experimental Forest in northern New Hampshire under the US Forest Service and collaborating universities including the University of New Hampshire, Dartmouth, Cornell, Yale and others over 6 decades shows the essential role of living plants in retaining plant nutrients within terrestrial ecosystems like the Sandy Lake watershed. Research led by Professors Gene Likens and F. Herbert Bormann and including contributions from dozens of others show that when a forested ecosystem is cut and prevented from re-growing through the use of herbicides, enormous amounts of nutrient materials are dissolved in rain water and lost from the ecosystem in runoff. The runoff water may appear normal, but the dissolved content may exceed acceptable levels for potable water.

Plant nutrients that sustain terrestrial ecosystems' growth can be thought of as fertilizers. Large amounts entering an aquatic ecosystem will fertilize it as well. Increased growth of aquatic plants including undesirable and noxious species result. Organisms at higher trophic levels -- plankton, invertebrates and fish -- will be adversely affected by the disruption of the plants on which they depend. The biomass will eventually die and may overwhelm the ecosystem's capacity to decompose it aerobically, resulting in foul anaerobic decomposition. Aquatic organisms that normally obtain oxygen from water can no longer do so and they die as well. Note that this chain of events is unrelated to which herbicide is used and how expertly it is applied.

Could this happen in Sandy Lake? Initially vegetation on the transmission line that is the pipeline's path through the watershed was controlled by herbicide. This caused growths of a previously absent vascular plant known as bladderwort or *Utricularia* in the Lake. The plants grew in large mats at the water surface (up to several square meters in area and half a meter thick). They were unpleasant and potentially dangerous to swimmers who could become entangled. After a few years during which this plant growth increased, the maintenance of the transmission line was changed to mechanical vegetation control and the *Utricularia* disappeared.

To summarize, Sandy Lake is a rare and threatened habitat: a deep, undeveloped, pristine aquatic ecosystem. The Lake supports wildlife populations including threatened organisms as well as public recreation and a children's summer camp. The planned pipeline will pass through the watershed that is critical to Sandy Lake's health and will inevitably have an adverse impact on the Lake. Herbicidal control of vegetation will dramatically exacerbate the harm done by the pipeline regardless of the type of herbicide and the care with which it is applied.

It can only be concluded that routing the pipeline through the Sandy Lake watershed is the result of ignorance and/or a lack of concern.

Shaun Bennett, Ph.D.

**20150824-5017**

Harry Collins, Averill Park, NY.

I am concerned about the NED Gas Pipeline because I live within one mile of the proposed Nassau compressor station. I know of the environmental and health effects of such a project and ask that FERC deny this proposal.

**20150824-5018**

David PILL, Pittsfield, MA.

RE: PF14-22-000

Kinder Morgan Pipeline through Berkshire County Mass.

Thank you for allowing this comment.

IO am OK with the pipeline. I am NOT good with it – just OK. I realize that there is some amount of disruption involved, but if we did not allow things to be built based on their disruption, we would not have railroads, highways, airports, water systems, sewers, etc.

That many of the people on the pipeline route within Berkshire County are not on the route – the truth is that that it is designed to be away from populated areas, so that is by design – obvious.

But we all use the by-products of that gas. We use electricity, we work in places heated with that gas (about 85% of the county's population IS served by Berkshire Gas – so these folks DO shop, work, get medical care, etc. from it).

We have closed down VT Yankee, Mt Tom, Salem Power and other power stations throughout the region. Demand continues to rise – that electricity will NOT be all generated by solar or wind. In fact, try to put up a turbine, and you will see similar mobilization in this region. I would love to see more of both – but my neighbors do not want this pipeline today as they tell you about the future of renewables, and tomorrow – they will fight any project generated by the renewables.

I watched the meeting held at Taconic High School in Pittsfield. I could not attend due to family commitments. Many of the people commenting either moved here from large cities or now are mad that the house they built on a green field may be near some attribute of this pipeline. Lock the doors, they are here – no one else can come. Well, it does not work that way. What if all the states along the Mississippi said no East-West railroads? What would this country be?

Dicken Crane – nice guy, but his family just sold their multi-billion dollar company to venture capitalists who have been parceling it off piece by piece after reducing employment 50%. His Dad cared about the community – he, his siblings, and his cousins are just mad that the currency paper they produced is going to benefit others. If they could have made a buck on this pipeline – you'd have heard not a peep. His compost business will be sharing space with a pipe yard, big deal. The cows will still graze next door.

In fact, that is the crux of this:

1. The pipeline will be well underground (Cheshire Lake by the way is man-made, and under today's laws, would still be a swamp). So once the pipeline is complete, there will be a nice open wildlife corridor for those moose to traverse. Also to snowshoe, and for other wildlife. New England a century ago had no trees. The 700 acre property my family farmed in Becket had no trees in 1930, and today is nothing but woodlands – and no farming.
2. I have googled, searched, and otherwise looked – but could not find one shred of scientific study showing that the fracking chemicals actually wind up in the gas. Yes, they wind up in the ground if not handled correctly, and have polluted wells – but not a ton. The real answer to fracking is to regulate, and inspect the

process and require bonds, absolute liability, etc. to ensure the chemicals are properly handled. Better leak detection in the pipeline, smaller releases – or recycling the gas into another storage facility near vents for re-injection in to the pipe may be wise as well.

There have not been issues in this area except 40 years ago. I have made plenty of mistakes in the previous 40 years and would like the opportunity to move beyond them, learn from them and be held to account on them. But to say no – you cannot do X because in 1970 something bad happened without accounting for better materials, practices, and other technological advances is asinine.

I do not love this project, barely like it – but I do support it and believe the histrionics of a billionaire farmer, a lawyer who is unhappy that the already degraded property he lives on (he borders the abandoned and heavily polluted US Gypsum site in Cheshire) isn't in line for a big pay day. You see, one problem of small towns – is that you can talk, but after a while, if folks know you – they figure out your motives.

My motive is to ensure that we are not left behind economically. We are at the end of every system – and we need the resources to compete. If this gas gets sold to the highest bidder in Europe, I will work hard to shut that operation down. But in the meantime, it needs to feed homes, power plants, and businesses here in New England.

Thank you for reading,  
Respectfully Submitted,  
David Pill  
Pittsfield, Massachusetts

#### **20150824-5024**

Melissa, Richmond, NH.

To Whom this may concern,

I am a concerned NH resident of pipeline project for many reasons, too many to list. If you should like for me to spell them out, please contact me and I will send pages of literature or speak on the recollection of my studied knowledge of this project. When I considered how I would like to present my thoughts and reasons against the invasion of the pipeline in NH territory, I first decided I could compose a list of pros and cons for NH residents. However I could not find or list a pro. All I can summarize are cons. Therefore I do not feel there need to further defend our wishes to not allow this pipeline in the state of NH and hope the appropriate parties involved can come to the same conclusion. If the state of MA and so forth should feel the need to keep this project alive, that's your business, your soil, your residents. I gather they feel as we do and did not want this on their soil. Again, no pros for us, no pipeline for them. Pretty simple, huh?

Thank you for your attention to this matter,

Melissa Frye  
603-762-2067

#### **20150824-5026**

Matthew Goldsmith, Boston, MA.

I am writing to you to request a delay in the decision timeline for the Northeast Energy Direct Project.

MA Attorney General Maura Healey has initiated a study of the long term energy needs of the Commonwealth and surrounding New England states set to be completed in October. However, the FERC approval process is underway and residents are being rushed through information sessions and public comment periods before the results of this study are even available for them to review. Because the stakes are so high, I request a moratorium to allow for a genuine, transparent and scientific investigation of all alternatives to this pipeline. There is much data indicating that through increasing installation of solar energy, energy-efficient improvements, repairing of costly leaking gas pipes and LNG storage, this pipeline would be unnecessary. In addition, I would request you to initiate an investigation into the health and safety issues related to gas

pipelines and compressor stations that have already been documented elsewhere in the U.S. I also point to the recent article below where the previous chairperson of the MA Department of Public Utilities indicates that the pipeline is not needed: <http://www.recorder.com/home/18260496-95/former-dpu-chair-says-pipeline-not-needed>

It is against the best interests of all MA and New England residents not to give this process the thorough and investigative process it deserves before making a decision to irreparably impact our region and our citizens. I urge you to take action to delay this pipeline approval until all alternatives can be thoroughly and transparently vetted.

Sincerely,

Matthew Goldsmith  
111 Atlantic Ave Apt 405  
Boston, MA 02110

#### **20150824-5041**

Joseph L Belanger Jr, New Ipswich, NH.

I WOULD LIKE TO EXPRESS MY OPPOSITION TO THIS PROJECT FOR REASONS OF THE UNNECESSARY IMPACT IT WILL HAVE ON MY FAMILY, NEIGHBORHOOD, TOWN, STATE, AND COUNTRY. MY FAMILY LIVES WITHIN 1/2 MILE OF THE MID STATION #4, ALSO WITHIN 1/4 MILE OF THE LINE IF INSTALLED. I AM 62 YRS. MY WIFE OF 42 YRS. + HAVE LIVED WITHIN 1 MILE RADIUS OUR ENTIRE LIVES. IF THIS UNNECESSARY PROJECT GO THROUGH AND THERE IS AN ACCIDENT (KINDER/MORGAN NOT THE BEST SAFETY RECORD) MY FAMILY COULD BE DESTROYED PHYSICALLY, AND FINANCIALLY. I ASK YOU HONESTLY WOULD YOU LIKE SOMETHING AS UNNECESSARY AS THIS GOING THROUGH YOUR NEIGHBORHOOD AND THREATENING YOUR FAMILY I THINK NOT. THERE IS NO GAIN FOR THE PEOPLE OF N.H., NEW ENGLAND, OR THE UNITED STATES. THE GAS IS GOING TO CANADA TO BE EXPORTED TO FOREIGN COUNTRIES FOR PROFIT OF KINDER/MORGAN. 70% TO CANADA TO AVOID EXPORT TAXES (NAFTA

) AND HOW IS THIS GOOD FOR OUR COUNTRY? YOU HEARD THE TERM NEED NOT GREED THIS IS TOTAL GREED FOR KINDER MORGAN WE THE PEOPLE HAVE NOTHING TO GAIN. I HOPE YOU LOOK INTO YOUR HEART WHEN YOU MAKE YOUR DECISION FOR THIS UNNECESSARY PROJECT AND REMEMBER THAT YOU HAVE TO LIVE WITH IT THE REST OF YOUR LIFE IF ONE PERSON, CHILD, RESCUE WORKER GETS INJURED OR DIES FROM THE DECISION YOU MADE FOR A PROJECT AS UNNECESSARY AS THIS. NOTICE I KEEP USING THE WORD UNNECESSARY. WE DO NOT WANT THIS PROJECT IN OUR NEIGHBORHOOD, TOWN, STATE OR COUNTRY. RESPECTFULLY. JOSEPH L BELANGER Jr.

#### **20150824-5047**

William Buckley, Dracut, MA.

We are William & Nancy Buckley from East Dracut Massachusetts, and are writing to you in reference to the Northeast Energy Direct Project pipeline project.

We purchased our house in Dracut over 30 years ago. Our area of Dracut is a quiet, beautiful location. Our house is located within a 1/2 mile radius of the proposed compressor station, which puts us in the "INCINERATION" zone. It is also very close to where the pipeline route will destroy many of our neighbors' backyards. How can you allow such a station to be built so close to residential and commercial properties? In addition, it appears that one of our Fire Stations on Jones Avenue is within this "INCINERATION" zone, and our only Police Station is right on the edge. They are first responders! What happens in the event of a catastrophic event?

Living next to a risk as great as this so that a large corporation can profit is unacceptable. No matter what

Kinder Morgan says about its' safety measures, it is still an unacceptable risk. Technical failures, natural disasters, or acts of terrorism are all uncontrollable causes of events that could cause a pipeline or compressor station explosion killing hundreds.

We are deeply concerned about the effects on our health, safety and property value.

In addition to the destruction it would cause in our neighborhood, the pipeline would cut through pristine lands, including at least 15 miles of conservation trust lands. We are opposed to any project that undermines the great legacy of conservation that the majority of Massachusetts residents hold dear. Many experts are saying that this gas is not needed in this area, and will probably be used for export to foreign buyers. The town of Dracut will receive no direct benefit from this pipeline project.

We are both retiring in 2015, and hope to live out our retirement years in the same beautiful location we have enjoyed for the last 30 years.

Please withdraw all support for this project, and do anything within your power to ensure that this pipeline is not built!

Thank you for your attention to this issue.

#### **20150824-5048**

JOSEPH L BELANGER JR., NEW IPSWICH, NH.

I WOULD TO EXPRESS MY OPPOSITION TO THIS DOCKET. MY CONCERN IS THE EFFECT IT WILL HAVE ON THE WILD ANIMALS AND VEGETATION. WE LIVE WITHIN 1/2 MILE OF THE PROPOSED MID STATION 4. WE (MY WIFE OF 42 YRS AND OUR FAMILY) HAVE LIVED HERE THE PAST 32 YRS. WE HAVE BEARS,MOOSE,WILD TURKEYS, AT ONE TIME 27 DEER GRAZING IN OUR FROUNT YARD,BIRDS WAKE US IN THE MORNING AND WE LOVE IT. ALSO THERE IS A MIGRATING PATH OF SOME 12000+ FALCONS AND THIS STATION IS RIGHT IN THERE PATH WHAT WILL THEY DO ? REROUTE NOT THAT EASY ASK THE NATIONAL AUDUBON SOCIETY. I FEEL SORRY FOR YOU IF HAVE NO EXPERIENCED THIS WOUNDER OF NATURE. IF THIS UNNECESSARY PROJECT GETS APPROVED WE WILL MOST LIKELY NOT SEE ANY OF THESE ANIMALS AGAIN BECAUSE OF THE NOISY, LIGHTS, AND AIR POLUTION. THE FOOD THEY EAT AND WATER THEY DRINK MAY BE POLUTIED, WILL BE POLUTIED BY THIS STATION. THIS SAME POLUTION WILL EFFECT ME AND MY FAMILY WE DO NOT NEED UNNECESSARY HEALTH PROBLEMS CAUSED FROM A UNNECESSARY PROJECT LIKE THIS. WITH 70% OF THE GAS GOING TO CANADA TO AVOID TAXES (NAFTA)TO SHIP TO FORGIN COUNTRIES FOR CORP. GAIN AND LITTLE OR NO GAIN TO ME,NEW IPSWICH,NEW HAMPSHIRE,NEW ENGLAND,OR THE UNITED STATES, HOW CAN THIS BE IN THE BEST INTREST OF THE COUNTRY YOU REPRESENT. REMEMBER YOU MAKE THIS DESISSION YOU HAVE TO LIVE WITH WHAT EVER HAPPENS FOREVER. \$\$\$\$\$\$KINDER/MORGAN\$\$\$\$\$\$

#### **20150824-5052**

Stella M Walling, Rindge, NH.

Please look for alternative route and advise in detail of alternative routes found. If not found, please advise in detail why alternative routes not found.

Please determine exactly who the final end user will be of this gas product. If in the U.S, how much and to which states, if outside the U.S, how much and where?

The resource reports published to date are most incomplete. Please offer complete reports without any "TBD"'s or "unknowns". If not, please advise why this is not important.

Please provide a report of all contaminated wells in the U.S. caused by gas pipelines over the past 5 year.

Please advise how long this pipeline will be in service and for what purpose.

Please advise what surface rights landowners whose land will be taken will have.

How will it be explained that any land appraisal is supportive and reliable? How are the appraisal costs calculated and by whom?

Please explain in detail how the construction of this pipeline falls into the current plan by The United Nations Framework Convention for Climate Change to reduce fossil fuels (agreed to by 195 countries including the US).

Please advise what alternatives to fossil fuels have been considered, if any. If not, why not?

Please explain in detail what resources homeowners will have should land taken not be brought back to pre-construction standards.

Please explain in detail who will pay for safety and health management oversight for the duration of the pipeline.

Further comments sent via hard copy in triplicate as required.

Thank you, Stella Walling

August 23, 2015

**20150824-5053**

Nancy Steeves, Pepperell, MA.

From the beginning my family and I have been opposed to the Northeast Pipeline. Natural gas pipeline is not the way of the future but clearly a step back. The New England states consumed a total of 889 billion cubic feet of natural gas in 2013. The data of the U.S. Energy Info. Admin. also shows that New England's natural gas inflow capacity is currently 1,709 billion cubic feet. So why despite a natural gas inflow capacity that is nearly twice the region's annual demand, does ISO New England persist to claim that we must expand our gas pipeline infrastructure to keep electricity prices down and avoid the threat of rolling blackouts? In the winter the prices are always higher for gas relative to market practice than pipeline constraints.

The short of it is the pipeline is unnecessary and would be a hardship on towns and private property owners who live here to be close to nature - undisturbed.

**20150824-5055**

JOSEPH L BELANGER Jr., NEW IPSWICH, NH.

I WOULD LIKE TO EXPRESS MY OPPOSITION TO THIS DOCKET. MY FAMILY (WIFE OF 42 YRS. 3 DAUGHTERS & I) LIVE WITHIN 1/2 MILE OF THE PROPOSED MID STATION 4, AND WITHIN 1/4 MILE OF THE LINE ITSELF IF APPROVED. WE HAVE FRESH WATER FROM A WELL THAT SUPPLIES US WITH DRINKING WATER BETTER THAN BOTTLE WATER, AND HAVE FOR 22 YEARS. IF THIS PROJECT GETS APPROVED WE WILL LOSE THAT LUXURY AND ALSO THE WHOLE TOWN OF GREENVILLE FOR THEIR RESERVOIR GETS ALL ITS WATER FROM BROOKS AND SPRINGS FROM THE AREA WITHIN 1/2 MILE OF MID STATION #4. ALSO ALL OUR NEIGHBORS, YOU SEE WE DO NOT HAVE CITY WATER SUPPLY WE ALL RELY ON OUR OWN WELLS, SOME AS SHALLOW AS 25 FEET DEEP SOME 200+ FEET DEEP. THIS TYPE OF UNNECESSARY PROJECT CAN AND WILL DISTURB OUR WATER SUPPLIES, THEN WHAT DO WE DO? THIS PROJECT IS UNNECESSARY IT HAS NOTHING TO GIVE TO THE PEOPLE OF NEW IPSWICH, NEW HAMPSHIRE, OR THE UNITED STATES, ONLY KINDER/MORGAN \$\$\$\$\$\$. WITH 70%+ OF THE GAS GOING TO CANADA TO AVOID EXPORT TAX (NAFTA) THE ONLY ONE GAINING FROM THIS IS KINDER/MORGAN \$\$\$\$\$\$. PLEASE DO YOUR JOB AND LOOK OUT FOR US THE PEOPLE YOU REPRESENT NOT BIG CORPORATE. WE NEED YOU. RESPECTFULLY.

**20150824-5056**

Cassandra, Ashfield, MA.

I vote NO to the proposed Kinder Morgan pipeline across Massachusetts. The state and nation as a whole

should focus efforts and resources on renewable energies and conservation efforts, which I understand have been far from exhausted. NO. No pipeline.

**20150824-5060**

JOSEPH L BELANGER JR., NEW IPSWICH, NH.

I WOULD LIKE TO EXPRESS MY CONCERN ON THIS UNNECESSARY DOCKET. MY FAMILY AND I LIVE WITHIN THE 1/2 MILE OF MID STATION #4. THE UNHEALTHY AIR THAT WILL BE LET INTO THE AIR ME AND MY FAMILY WILL BREATHE, MY NEIGHBORS, THE WILDLIFE, AND VEGETATION THAT WE ALL RELY ON WILL BE GONE. OUR AIR SMELLS LIKE FLOWERS AND NATURAL HEALTHY SMELLS. OUR AIR DOES NOT SMELL OF CHEMICALS, HOW DO I KNOW I LIVE HERE WITH THE ANIMALS THAT LIKE FRESH AIR, THEY WILL BE THE FIRST TO LEAVE. THE UNKNOWN CHEMICALS THE MID STATION #4 WILL PUT IN THE AIR IS ONLY KNOWN BY KINDER/MORGAN AND IS CONFIDENTIAL. I WOULD HATE TO FIND OUT A FAMILY MEMBER OR FRIEND BECAME SICK BECAUSE OF THIS UNNECESSARY PROJECT. UNNECESSARY 70%+ WILL BE DEL. TO CANADA TO BE EXPORTED TO FOREIGN COUNTRIES, NOT FOR OUR GOOD. WHY CANADA TO AVOID EXPORT TAXES (NAFTA) AND KINDER/MORGAN CAN MAKE MORE PROFIT. HOPEFULLY WHEN YOU AND THE OTHER FERC REPRESENTATIVES MAKE YOUR DECISION ON THIS PROJECT YOU WILL THINK OF THE FATHERS, MOTHERS, SONS, DAUGHTERS, THAT WILL BE BREATHING THIS AIR YOU APPROVED OF, FOR YOU ALONE WILL HAVE TO LIVE WITH THIS IF SOMEONE DOES GET SICK, BECAUSE IT IS UNNECESSARY. RESPECTFULLY.

**20150824-5066**

JOSEPH L BELANGER JR, NEW IPSWICH, NH.

I WOULD LIKE TO EXPRESS MY OPPOSITION TO THIS UNNECESSARY DOCKET. ON NOISE. MY FAMILY AND I LIVE WITHIN 1/2 MILE OF THE PROPOSED MID STATION #4. WE LIKE QUITE AND IT IS FOR THE MOST PART. WE HEAR WHAT WE WANT TO HEAR, OUR FAMILY CONVERSATION, BIRDS SINGING, WE HAVE A 300 FT. DRIVEWAY AND WE CAN TELL IF SOMEONE PULLS IN. WE CAN HEAR EMERGENCY FIRE ALARMS FROM THREE TOWNS (WE HAVE VOLUNTEER FIRE DEPARTMENTS AND THAT IS IMPORTANT). WE DO NOT HEAR THE CONSTANT SOUND OF ANYTHING LIKE THE SOUNDS THE THREE TURBINES & COMPRESSORS AT THE MID STATION #4 IF APPROVED. IT WILL SCARE WILDLIFE AWAY, WE LIKE WILDLIFE. I GUESS WE JUST LIKE QUITE DON'T YOU. IF YOU APPROVE THIS UNNECESSARY PROJECT WE WILL LOSE THAT. BUT KINDER/MORGAN WILL GAIN LOTS OF PROFIT AT OUR EXPENSE. THEY ARE PUTTING A UNNECESSARY PIPELINE THROUGH SOUTHERN NEW HAMPSHIRE TO PIPE GAS 70%+ TO CANADA TO AVOID EXPORT TAXES (NAFTA) SOO THEY CAN MAKE MORE PROFIT, AND WE PAY FOR THE PROJECT THROUGH HIGHER ELECTRIC TARIFFS. THIS PROJECT IS NOT OF ANY VALUE TO THE PEOPLE OR THE UNITED STATES, ONLY KINDER/MORGAN. RESPECTFULLY.

**20150824-5068**

JOSEPH L BELANGER JR, NEW IPSWICH, NH.

I WOULD LIKE TO EXPRESS MY OPPOSITION TO THIS UNNECESSARY DOCKET. ON LIGHTING. MY FAMILY AND I LIVE WITHIN 1/2 MILE OF THE PROPOSED MID STATION #4. AT NIGHT WE CAN SIT ON OUR DECK AND WE CAN SEE STARS YOU CANT BELIEVE, IF THIS UNNECESSARY PROJECT IS APPROVED WE WILL NO LONGER BE ABLE TO SEE THE STARS AT ALL. YOU SEE IT HAS TO BE DARK TO SEE STARS. I LIKE IT DARK TO SLEEP. WE DON'T NEED SHADES IN OUR WINDOWS TO SLEEP AT NIGHT IT'S DARK. THIS PROJECT IS ONLY GOOD FOR KINDER/MORGAN AND THEIR PROFITS, THEY SLEEP GOOD AT NIGHT AS LONG THEY MAKE MORE MONEY AT OTHER PEOPLES EXPENSE. THAT'S RIGHT 70%+ OF THE GAS GOES TO CANADA

TO AVOID EXPORT TAXES (NAFTA) AND SHIP TO FOREIGN COUNTRIES FOR LARGER PROFITS. PLEASE SEE THIS IS NOT GOOD FOR THE UNITED STATES WHEN MAKING YOUR DECISION ON THIS UNNECESSARY PROJECT. RESPECTFULLY.

**20150824-5071**

JOSEPH L BELANGER JR, NEW IPSWICH, NH.

I WOULD LIKE TO EXPRESS MY OPPOSITION TO THIS UNNECESSARY DOCKET. COST BURDEN. IF THIS UNNECESSARY PROJECT IS APPROVED THE COST BURDEN IT COULD HAVE ON MY FAMILY COULD PUT US INTO BANKRUPTCY. SEE WE LIVE WITHIN 1/2 MILE OF THE PROPOSED MID STATION #4 AND WITHIN 1/4 MILE OF THE PIPELINE IT SELF, OUR PROPERTY WOULD BE ALMOST WORTHLESS IF NOT, WOULD BUY IT??? ALSO NEW ELECTRIC TARRIFFS WOULD PUT ON OUR ELECTRIC BILLS TO MAKE US PAY FOR THE PIPELINE OVER YEARS, AND KINDER/MORGAN MAKES MORE PROFIT\$\$\$\$. WE GET NOTHING. EVEN THE GAS 70%+ GOES TO CANADA (NAFTA) NO TAX TO BE SHIPPED TO FORGIN COUNTRIES FOR MORE PROFIT FOR KINDER/MORGAN\$\$\$. WHERE DO WE GAIN ? WE DONT!!! LETS TALK FIRE OUR TOWNS HAVE VOLINTEER FIRE DEPARTMENTS WE GET AID FROM NEIGHBORING TOWNS TO FIGHT A HOUSE FIRE (NO TOWN WATER--NO FIRE HYDRANTS)WHAT WOULD THE TOWN DO IF A FIRE EVER HAPPENED(KINDER/MORGAN NOT THE BEST RECORD). WE NEED MORE EQUIPMENT-MORE TAXES ANOTHER BURDEN. PLEASE ASK YOURSELF WHO IS THIS REAL- LY GOING TO HELP NOT ME AND YOU ONLY KINDER/MORGAN. RESPECTFULLY.

**20150824-5073**

Lisa M Zimmerman, Nassau, NY.

FERC Environmental impact statement

In regards to the proposed Northeast Energy direct pipeline Docket # PF 14-22-000

Comments presented by:

Dr. Lisa Dietrich Zimmerman DVM

80 Rice Road

Nassau, NY 12123

I am a practicing veterinarian duly licensed by the state of NY to practice veterinary medicine. I took a Hippocratic Oath to uphold the statement to protect both the health and welfare of the animals and people they serve. In that oath, we are required to prevent and relieve animal suffering, conserve animal resources, promote public health and advance medical knowledge. This also requires me to protect the health, safety and welfare in regards to the environment of those animals. I have major concerns regarding the NED project that proposes to put a gas pipeline and compressor station close to homes, farms and water supply to ~ 20,000 people and their animals in my towns of Schodack, Nassau and Stephentown, NY.

1. Environmental concerns:

a. Effects on the Schodack Aquifer, a large aquifer extending across Northern Columbia and southern Rensselaer counties. This is a direct quote from the USGS by Richard Reynolds in his US Geological Survey Report # 97-639 from 1999 of the Schodack aquifer which the NED is proposed to cross:

“This development, coupled with the generally high permeability of these deposits and a typically shallow depth to the water table, makes these aquifers vulnerable to contamination from point sources such as landfills, rock –salt stockpiles, hydrocarbon- fuel storage, and other industrial facilities with a potential for contaminant leakage. ...

b. There must be continual monitoring both before, during and after the construction and operation of the pipeline and compressor station of chemicals that could potentially contaminate the very water we are drinking. These chemicals have been cited in a report by the Madison county board of health in regards to the

Sheds compressor station. This monitoring should be performed at least monthly to determine the potential contamination of the aquifer before people ingest chemicals in their drinking water and continued for the life of the pipeline or until it has been established with certainty that the pipeline and compressor stations with not leak or emit any chemicals into the surrounding atmosphere over a course of at least 10 years. After this time, the chemical testing should be at least quarterly. If chemicals are detected in significant levels, the compressor station and pipeline must be shut down until EPA has done an environmental review, the contamination eliminated and the facility deemed safe for surrounding residents.

c. Gas pipelines have the potential to leak. Radioactive radon has been found in the fracked gas. The construction process also has the potential to lead to increased radon in houses of homeowners living within several thousand feet of the proposed pipeline due to drilling through shale deposits. Free monitoring and remediation of excess radon should be given to all landowners within 1 mile of the constructed pipeline.

d. At no time, shall ANY natural gas storage be allowed in the Schodack and Nassau Aquifers since this will directly contaminate wells in these areas.

I ask you to take all these health concerns seriously to protect the health and welfare of people and animals living in Rensselaer county.

Sincerely, Dr. Lisa Dietrich Zimmerman

## 20150824-5075

Lisa M Zimmerman, Nassau, NY.

Dear FERC,

I am continuing my statement in regards to the environmental effects of the NED pipeline and compressor station in Rensselaer county.

RE: Docket # PF14-22-000.

I have serious concerns in regards to the proposed compressor station on Clark's Chapel Road.

- a. Compressor Stations that have been previously studied have been shown emit large amounts of toxic chemicals mixed in with the methane extracted by the fracking process.
- b. These chemicals include and are listed on the MSDS as required by OSHA in any business as being carcinogenic or toxic in nature.

Formaldehyde- grade III health effects- cancer, organ damage and even death.

Toluene- grade II health effects- neuro toxin and toxic to bone marrow, blood and internal organs.

Benzene – grade II health effects- carcinogenic, neurotoxin

See MSDS sheets of these chemicals that can be labeled as carcinogens and have neurological, hepatic and renal effects.

c. If this compressor station is approved, there must be continual monthly monitoring by KM/TGP before and after construction of areas within a mile around the compressor station to detect these dangerous chemicals in the soil and water of surrounding landowners. This same concern has been adopted by the NYS medical association and NYSVMS- veterinary medical society.

d. These chemicals must be identified and withheld to the same safety standards that OSHA requires for any business operating within the state of NY. We must use hoods and safety equipment – goggles, gloves and protective clothing to handle formaldehyde and toluene in our business. Why should Kinder Morgan get a pass exposing residents to these known toxins?

Noise, light and air quality effects

1. The area surrounding the compressor station will be directly impacted by the industrial sized compressor station.

a. FERC allows noise to be 55 Dcb at the nearest house or business according to their “An Interstate Natural Gas Facility on My Land? What do I need to know” booklet. This is unacceptable to

neighboring homeowners. It must be no higher than 40 dcb at the nearest homes.

b. There is considerable light emitted at night by the compressor station that could affect local insect populations, migratory birds and bats. This needs to be studied to mitigate the effects on the surrounding area for both human and animals. Bald eagles have been sighted on the proposed compressor station property and Rice road. Eagle, bat and migratory bird habitats need to be studied to see if there are nesting sites, caves or feeding grounds in the area. 24 hour stadium lighting and loud noise must not be allowed so that insects and bats will not be affected.

c. The compressor station may also be a potential source of terrorism for bombing or sabotage of the large generators causing a massive explosion. There must be more protection around the compressor and metering stations and these should be manned and guarded 24/7/365.

d. Solutions should include:

- moving the compressor station to another less populated area- this cannot be within a mile of 20 homes or less.
- sizing down with a total cap of no more than 10,000 HP gas turbines
- requiring a large sound proof 50 foot high barrier around the compressor station,
- requiring all lighting to be no more than 10 feet off the ground and on motion sensors as to not allow continual lighting
- Providing 24 hour armed guards to a locked facility around the compressor station.

Kinder Morgan promises jobs so guards could be some of the fulltime jobs to protect metering and compressor stations not just temporary construction jobs.

#### Public Safety Concerns

1. The proposed NED pipeline will parallel 2 other older natural gas pipelines from Wright to Lape road in Schodack. It is known that age of pipelines can affect the integrity of the pipe due to age related corrosion. The pipelines located in Schodack were built in the 50's and the other in the 70's. If there ever was an explosion of one of these pipelines, the other 2 may be impacted. This could potentially create an explosion and firebomb of exponential proportions. Many people live in this area could be seriously injured or killed. We had a very long, cold winter here in 2015 where the frost line exceeded 4 feet. A large pipeline exploded in Minnesota due to frost heaves on May 26, 2014.

2. Potential solutions:

- a. Stop the NED pipeline construction- this should be a number one solution.
- b. Move the proposed pipeline out of Albany and Rensselaer counties- second best solution since these areas are too populated for this huge pipeline and compressor station.
- c. Require Kinder Morgan and Tennessee gas pipeline companies to replace the existing pipelines with new pipes from Wright to Lape Road.
- d. Decrease the pressure of the NED from 1460 psi to 740 psi and the diameter from 36" to 30" to make an explosion less dangerous.
- e. Require the pipeline to be buried at least 4 feet below the ground not 3 feet like it is proposed.

Sincerely, Dr. Lisa Dietrich Zimmerman

**20150824-5077**

Lisa M Zimmerman, Nassau, NY.

Dear FERC,

These are my final comments in regards to the scoping process and concerns I have in regards to the NED pipeline proposal PF14-22-000.

Socioeconomic Concerns

## Proving the Public Convenience and Necessity

It is well known that the production of Marcellus shale fracked natural gas far exceeds the capacity for use in the northeast. There is enormous pressure from both the natural gas industry and Wall Street investment firms who financed the gas companies who extract fracked NG to export this gas out of the United States. European, South American and Asian prices can exceed US prices by 2-3 times our current natural gas prices. This LNG exportation also has the potential to use a limited resource that is produced in the US for foreign investment to some countries of which are not our free trade allies. Kinder Morgan wants to transport up to 2.2 billion cubic feet/ day of natural gas through the NED when new England capacity is ~ .6 billion cubic feet per day . There are multiple LNG export stations proposed for the east coast including those in Goldsboro, NS by Peridae Energy and in New Brunswick, Canada. There are also applications to reverse the current flow of gas from Canada to New England to supply these proposed export stations. How will the domestic natural gas prices be affected if supply diminishes over time? If the gas is used for export will we become dependent on the Middle East again for fossil fuels? Will this decrease the move to renewable energy seen to be the way of the future for power generation? Will the greater northeast be even more deficient in natural gas than it is already in the winter months? Will New England and New York state unfairly be required to fund this construction through taxes on our electric rates? All these economic effects must be studied before the NED is approved. The NED will benefit a large 131 billion \$ company, Kinder Morgan and not the state of New York and certainly not Rensselaer county. We get no gas supplied to our county from this pipeline. It is wrong to take our land by eminent domain to line the pockets of a large private corporation.

I asked you to deny the Certificate of Public Convenience and Necessity. If the project moves forward then please do not close the scoping comment period until 60 days after Kinder Morgan files new complete resource reports. We need more time to review this and our legislators and senators agree.

If the NED project is not denied, then require Kinder Morgan to pay for the decreased value of homes adjacent to or within a mile of the pipeline and 2 miles of the compressor station (at least 30% of our current home and land values). We should not have to bear the financial burden of a company that wants to make billions of dollars from taking our land without just compensation.

Thank you,

Dr. Lisa Dietrich Zimmerman

### **20150824-5079**

JOSEPH L BELANGER JR, NEW IPSWICH, NH.

I WOULD LIKE TO EXPRESS MY OPPOSITION TO THIS UNNECESSARY DOCKET. EMINENT DOMAIN. MY UNDERSTANDING OF EMINENT DOMAIN IS TAKING OF LAND FOR PUBLIC USE AND BEST INTEREST. NOT FOR CORPORATE USE AND PROFIT. IF YOU CAN EXPLAIN HOW THIS UNNECESSARY PROJECT IS NOT FOR CORPORATE USE & PROFIT WHEN 70%+ OF THE GAS IS GOING TO FOREIGN COUNTRIES. THE REASON FOR THIS ROUTE AND NOT A MORE DIRECT ROUTE TO A CLOSER AND MORE DIRECT DISTRIBUTION PORT IS TO AVOID PAYING EXPORT TAXES HERE IN THE UNITED STATES. GOING TO CANADA THEY (KINDER/MORGAN) WILL AVOID PAYING EXPORT TAXES (NAFTA) THEREFORE MAKING MORE CORPORATE PROFIT AND HOW IS THIS PUBLIC USE??? I DON'T KNOW ANY AMERICAN WHO WOULD NOT GIVE AND HAVE GIVEN MORE THAN THEIR LAND FOR THE GOOD OF THEIR FELLOW MAN AND COUNTRY, NOT FOR CORPORATE PROFIT. IF THIS WAS FOR THE GOOD OF FELLOW MAN AND COUNTRY EVERYONE WOULD BE GLAD TO GIVE UP THEIR LAND JUST ASK THEM, DON'T TAKE IT FOR CORPORATE GAIN. ASK YOURSELF IS THIS FOR PUBLIC USE??? RESPECTFULLY.

**20150824-5081**

JOSEPH L BELANGER JR, NEW IPSWICH, NH.

I WOULD LIKE TO EXPRESS MY OPPOSITION TO THIS UNNECESSARY DOCKET. PROVEN NOT NECESSARY. MY FAMILY AND I LIVE 1/2 MILE FROM THE PROPOSED MID STATION #4 AND 1/4 MILE FROM THE PIPELINE IF APPROVED. IT HAS NOT BEEN PROVEN THIS PROJECT IS NECESSARY FOR THE GOOD OF THE PEOPLE OF NEW HAMPSHIRE,OR THE UNITED STATES, IF MORE THAN 70% OF THE GAS IS GOING TO BE EXPORTED TO FOREIGN COUNTRIES. HOW IS THAT NECESSARY FOR THE PEOPLE OF THE UNITED STATES??? THE ONLY PEOPLE THIS PROJECT IS NECESSARY FOR IS KINDER/MORGAN. FERC-FEDERAL ENERGY REGULATOR COMMISSION, NOT FORIGN ENERGY REGULATOR COMMISSION. PLEASE ASK YOURSELF IS THIS REALLY NECESSARY FOR THE PEOPLE OF THE UNITED STATES, ARE THERE OTHER WAYS TO ACHIEVE THE SAME GOALS. THERE ARE PEOPLE AND LIVES COUNTING ON YOUR DISSCISSION,NOT MONEY. RESPECTFULLY.

**20150824-5084**

Jason L Caetano, New Ipswich, NH.

I am opposed to having the natural gas pipeline and Compressor Station in New Ipswich because:

- 1.) I could be required to pay additional tariffs on my electric bill
- 2.) The presence of the pipeline and compressor station would have severe negative impact on my property value
- 3.) My taxes are likely to increase
- 4.) I would be responsible to pay for quarterly tests of my well
- 5.) Pipeline explosions DO happen.
- 6.) Tens of thousands of tons of cancer-causing toxins

Thank you,

Jason

**20150824-5101**

**Chesterfield Conservation Commission Position in Opposition to the NED (Pipeline) Project**

Energy company Kinder Morgan has proposed running a natural gas pipeline through roughly 20 towns in southern New Hampshire, entering Winchester from Massachusetts and re-entering Massachusetts from Pelham. This proposal is known formally as the North Energy Direct (NED) Project. The conservation commissions in many of these towns have formally expressed their opposition. The conservation commission in neighboring Winchester, a pipeline town, has prepared a statement opposing the pipeline, which will be sent to the Federal Energy Resources Commission (FERC), the final permitting body. Winchester's statement is attached. The Chesterfield Conservation Commission wishes to go on record as supporting their position.

We agree with their statement that a 36" underground pipe and resulting cleared right-of-way, with the necessary construction and maintenance disruption, will cause significant damage to forests, wetlands and important wildlife habitat along the route. The Winchester Conservation Commission has identified specific environmental damage from the project, and we would like to raise two further objections.

**This project will bring little benefit to our state related to energy needs.**

In fact, not only is this gas going to pass through New Hampshire and go back into Massachusetts to a terminal in Dracut, but as recently as 2012 New Hampshire produced enough electricity that half was exported (Source: US Energy Information Agency as reported in the Keene Sentinel, Feb. 19, 2015, page A8.) There is clearly no impending electricity shortage in New Hampshire, particularly since the largest producer of electricity in New Hampshire, the Seabrook Nuclear Power Plant, is currently licensed until 2030.

In fact, Kinder Morgan, on their Home Page, has expressed a willingness to export this power: "... (5 proposed LNG export projects in northern Maine and Atlantic Canada) ... could find capacity on the NED Project useful to serve their LNG export facilities." (Source: Kinder Morgan Home Page, NED Project.)

**There are alternatives being considered which would meet energy needs in the region.**

Until late 2014 this pipeline was planned to go directly through Massachusetts from the Connecticut River to Dracut. It was only political opposition from Massachusetts communities which led Kinder Morgan to propose the southern New Hampshire route. It had nothing to do with energy needs in New Hampshire, nor is it the less costly method of increasing regional electricity supply.

In addition to Kinder Morgan's own all-Massachusetts alternative for NED, just mentioned, there is also a proposed pipeline project called Access Northeast which would carry natural gas directly to the Boston area for conversion to electricity. National Grid and Eversource Energy, representing 70% of the customers in the region, including New Hampshire, have signed on to this project, and the major electricity importer in the region is Massachusetts. A recent additional project to bring electricity into New Hampshire is the so-called Northern Pass, which would deliver Quebec hydropower on lines over new and existing power line corridors.

The environmental concerns identified by the Winchester Conservation Commission, together with these two issues above, make it difficult to justify the NED (pipeline) Project as currently proposed. The Chesterfield Conservation Commission joins the Winchester Conservation Commission in being opposed to this project being located in New Hampshire

**20150824-5107**

**FERC Fiddles While Kinder Morgan's Pants Are On Fire**

At a recent scoping meeting hosted by FERC, I asked Mr. Eric Tomasi, FERC's NED project manager, if he had any response to the multitude of lies told to the public by Kinder Morgan. Mr. Tomasi asked that I file any comments regarding Kinder Morgan's misbehavior with FERC so that they are documented. I replied that I had already done so many times.

Mr. Tomasi, the list below provides you with just some of the comments that I have filed with FERC beginning in October of last year. All of these comments include examples of Kinder Morgan's deceit, misdirection and outright lies.

***1. Why Kinder Morgan Isn't More Forthcoming***

<http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=13657158>

***2. Kinder Morgan Continues to Torture the Truth***

<http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=13733951>

***3. The Damage Caused By Kinder Morgan's Deliberate Misinformation***

<http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=13789971>

***4. How FERC Has Failed the Public on the Northeast Energy Direct (NED) Project***

<http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=13941948>

***5. Fix FERC First, Chapter 3: FERC Allows The Public To Be Misled***

<http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=13820763>

And if FERC is interested in locating filings from other commenters who also complain about Kinder Morgan's lies and misinformation, I suggest the following: Make use of your own eLibrary search capability in the NED docket using search terms such as "**deceptive**", "**mislead**" and "**misinform**". These three searches will all return multiple comments on Kinder Morgan's deceit.

In a recent FERC filing titled "**Open House**" meetings - perverted from "**obligation to inform**" into

**“opportunity to sell”** (<https://elibrary.ferc.gov/IDMWS/common/opennat.asp?fileID=13960811>), another commenter has searched your eLibrary using the search term “Open House” and has located 36 separate comments that report Kinder Morgan’s attempts to mislead the public.

Mr. Tomasi, the information that you requested has long been available in FERC’s own repository. But the public is simply not at all sure that you read this information; or that having read it, that you believe it; or that believing it, that you have the slightest inclination to put a stop to it and to remediate the damage that these lies have caused to the public.

Kinder Morgan does not want there to be an informed public. An informed public asks hard questions and doesn’t accept vague, misleading answers. Kinder Morgan much prefers a more complacent, ill-informed public. If FERC is unwilling or unable to control the misinformation that this pipeline company spreads or to apply some type of sanction to it, why would Kinder Morgan not continue to lie to the public? Their pants are on fire, but they don’t even seem to notice.

How about it, FERC? Do you have any control over the orgy of misinformation that Kinder Morgan supplies? And do you have any intention of remediating the damage that it has already done to the public? Or are we as completely on our own in trying to defend ourselves against Kinder Morgan as we appear to be?

Nick Miller Groton, MA

## **20150824-5110**

Filer: Susan Wyatt

Docket(s): PF14-22-000

Lead Applicant: Tennessee Gas Pipeline Company, L.L.C.

Filing Type: Procedural Motion

Description: Information submitted request for protective restriction for Conservation area of Sprague Brook Wildlife for TGPL the Northeast Direct Pipeline on 8/24/15

Docket No. PF14-22-000

Thank you for the opportunity to comment on the proposed Northeast Energy Direct Project (NED). These evaluations are in response to the Richmond/Winchester wetlands and town water supply re-routing reports for the NED project, and include analyses about project impacts as well as specific information and analyses that we request be included in the Environmental Impact Statement for the project.

Silvio O. Conte US Fishing and Wildlife Refuge has proposed Sprague Brook US Fish and Wildlife Refuge; as a natural habitat for native fish spawning and wetlands preservation. Residences of Richmond and Winchester NH respectfully requests that FERC take into consideration the environmental impact of NED on the ecology of this critical area. The proposed NED pipeline route will disturb the environmental balance of the proposed (8,434 acre) Sprague Brook Refuse land and water resource. Proposed Sprague Brook US Fish and Wildlife Refuse lays along the border of Richmond and Winchester NH this critical habitat is within the Quabbin to Cardigan core area and supporting landscape. This area is identified as ecologically significant by TNC (The Nature Conservancy) for it’s high ranking floodplain forests, marsh and shrub wetlands and peat-lands supporting: mammals, endangered bird species both migrating/song birds and Terns, Rails, Heron, Bittern and rare freshwater aquatic life. The US Fish and Wildlife have been for the past 7 years or more, reintroducing Atlantic Salmon into Sprague and Roaring Brooks area and native trout.

Besides avoidance of critical habitat and the rare species and valuable ecosystems found within it; Sprague Brook is a source of the drinking water supply for Winchester NH, which overlays this productive aquifer. This critical habitats provide public benefits that go well beyond providing habitat for wildlife species these include: protection of drinking water supplies, forest soils, and recreation including hunting and fishing and the backbone of the tourism/recreation and forest products industries in Richmond and Winchester NH. A growing body of studies demonstrate the economic value of public investment in lands and the ecosystems provides proven community enrichments. We respectfully request that FERC include in the scope process

consideration for Sprague Brook this critical habitat in evaluating the proposed pipeline route.

**20150824-5117**

Angela Leak, Mason, NH.  
Dear Committee Member,

I am writing to you in opposition to the proposed NED natural gas pipeline project. As a citizen of Southern New Hampshire, this project offers no benefit, other than to Kinder Morgan. I understand myself and my neighbors to be in a Davis vs. Goliath situation, but I feel compelled to voice my objection nonetheless.

The NED pipeline project is unnecessary. Any additional energy needs could be managed by expansion and upgrading of existing infrastructure.

The NED pipeline project does not benefit New Hampshire. There is no chance my town will receive any of the natural gas that will be flowing underground. The vast majority will be exported to European markets thus ultimately driving up the price of the energy here in New England. Even parts of the state that have the infrastructure to take advantage of the gas will end up paying more for it than they are at present.

Job creation will be almost entirely temporary. Once the pipeline is built, the job is done. As of now, the survey trucks I see driving through my area have Texas plates – so much for local job creation.

The NED pipeline project is harmful. Wetlands, aquifers that supply our wells and protected habitats will be jeopardized by drilling and blasting, even before millions of gallons of gas starts flowing, and inevitably leaking into the environment. Kinder Morgan's safety record is abysmal and they are not planning to bury the pipe beneath the frost line. It is only a matter of time before a leak or explosion causes irreparable damage.

The NED pipeline is a violation of our rights as citizens. Overwhelming opposition to the project has been the theme throughout every affected town along its proposed route. The specter of eminent domain hangs over all of our heads as we still don't know the exact route the project will take. No private company should be allowed to take our land without our consent and without any benefit to the landowner.

Please consider not only my opinion, but the opinion of the literally THOUSANDS of letters you have received from people opposing this project before you make a decision to approve the NED project. New Hampshire does not want or need this pipeline. I sincerely hope you will come to the same conclusion.

**20150824-5118**

August 24, 2015

David & Connie Roy 36 Dunvegan Road Tewksbury, MA 01876

Re: Tennessee Gas Pipeline Northeast Expansion Project - Scoping Comments

Dear Kimberly D. Bose,

We are writing to express our concern with and opposition to the proposed Tennessee Gas Pipeline Northeast Expansion project (Docket PFI4-22-000).

After being residents of Tewksbury for 23 years, we are finding it difficult to digest that there is a proposed gas pipeline that would be cutting through our property. Our family will be directly affected by its potential consequences including the risk of gas leak-related explosion and contamination, as well as a decline in property values and an increase in insurance costs. We have a swimming pool (which would have to be removed) and a French Drain piping system which is connected to three houses. If the French Drain piping system is disrupted/broken it would cause water to back-up into our basements, damaging our heating & air conditioning equipment and personal belongings. Our property is also part of an eco-system with rare species that would be forced out of their habitats, which will be destroyed.

Also, according to a Town of Tewksbury Zoning Map (February 2015), our property is on a Groundwater Protection District. The purpose of this Groundwater Protection District is to:

- a. Promote the health, safety, and general welfare of the community by ensuring an adequate quality and quantity of drinking water for the residents, institutions, and businesses of the Town of Tewksbury
- b. Preserve and protect existing and potential sources of drinking water supplies
- c. Conserve the natural resources of the town
- d. Prevent temporary and permanent contamination of the environment.

The effort to meet Massachusetts' ongoing energy needs should not adversely impact residents' quality of life, nor come at the expense of open space benefitting the public good. The proposed pipeline merely perpetuates reliance on non-renewable resources for short-term gain while ignoring the long-term benefits of renewable solutions that are safer, less invasive and potentially less costly.

Massachusetts has a strong track record promoting renewable energy and energy efficiency programs. I urge you to fully prioritize further investment in and deployment of these solutions, and to take any actions as are necessary to disallow the Tennessee Pipeline Expansion project.

Sincerely,

David & Connie Roy

## **20150824-5127**

Emily Norton, West Townsend, MA.

Tragedy of the Commons? Tragedy of Private Property?

In 1968 Garrett Hardin, professor of human ecology at the University of California, Santa Barbara, authored "The Tragedy of the Commons" which was published in the journal *Science* (Hardin, G. 1968. The tragedy of the commons. *Science*, 162:1243-1248). In the essay Hardin argued that human nature dooms us to destroy the resources we hold in common. His reasoning went something like this. Imagine life in New England in the 1800's. Each family has a herd of cows. The town common is a place where people bring their animals to graze. Each family naturally wants to maximize its benefit from the common. By adding another cow to the common, the family that owns that cow reaps all the benefits of grazing on the common. Any damage done to the common as a result of that added cow must be shared by all families. So, for that one family the benefits outweigh the costs. For all the other families there are just added costs. The problem, though, is that ALL families act on that same reasoning. Every family adds a cow to the common. Then every family adds another cow and another. In a very short period of time the common gets over-grazed and destroyed. Then all families lose. The same reasoning applies to dumping wastes into a common.

According to Hardin, the only way to prevent that tragedy of destroying the commons is through laws. Hardin said that prohibiting certain actions could easily be legislated. But Hardin was very concerned about regulation of non-prohibited actions. He actually predicted the issues we have with FERC today. In his essay Hardin said "The result is administrative law, which is rightly feared for an ancient reason – Quis custodiet ipsos custodes? – Who shall watch the watchers themselves? [...] Bureau administrators, trying to evaluate the morality of acts in the total system, are singularly liable to corruption, producing a government by men, not laws. [...] The great challenge facing us now is to invent the corrective feedbacks that are needed to keep custodians honest. We must find ways to legitimate the needed authority of both the custodians and the corrective feedbacks."

How does Hardin's essay relate to NED and FERC?

1. Kinder Morgan wants to reap monetary benefits by building its pipeline through the "common", but it is not stopping there. The proposed project would not only harm public lands, shared water supplies, and the air. The project would also invade private properties, stealing the American dream from hundreds of citizens. Kinder Morgan reaps all the benefits. We pay all the costs – contaminated wells, noise and light pollution at compressor stations, loss of safety. We literally are asked to pay the monetary costs of building the pipeline through a tariff on our electric bills. In addition, all people will suffer the consequences of the

increased use of fossil fuels that result from the building of yet another pipeline. We will all suffer from the exacerbation of climate change. That is the tragedy.

2. According to Hardin, the only way to avert that tragedy is through government regulation. FERC, the “custodian” responsible for regulating fossil fuel infrastructure, is increasingly criticized for being in the pockets of the gas industry.

Was Garrett Hardin correct? Can we prevent this tragedy of the commons? Are the custodians of administrative law honest or have they become corrupted?

Re: Scoping Notice; Tennessee Gas Pipeline Company, L.L.C.,  
Docket No. PF14-22-000 Northeast Energy Direct Project

**Introduction.** These comments are submitted on behalf of the **Nassau-Burden Lake Citizens Against the NED Pipeline and Compressor Station** for purposes of scoping in relation to the proposed Northeast Direct Pipeline. Our comments relate to Rensselaer County, in particular Schodack, Burden Lake, Nassau and the Rensselaer Plateau.

To its credit, FERC’s May 15, 2015 letter to Kinder-Morgan requested a considerable amount of important information. Despite a July 24, 2015 submission by the applicant of more than 6500 pages of resource reports, much of that information remains outstanding. The missing information is essential to a full understanding of the implications of the pipeline. It is our firm belief, therefore, that scoping should stay open for at least two more months. Beyond this, it should stay open for a reasonable period of time after the applicant completes the blanks in its resource reports. It is impossible to identify all the environmental issues that should be explored in a project this large, particularly when it has had a major route change, so many new pages of resource report and so many items left to be determined.

Before addressing purely local concerns, we would briefly take issue with the fundamental underlying premise purporting to justify the pipeline; i.e. that there is a capacity problem negatively affecting the New England states. While high demand days have caused price spikes and have led power producers to resort to alternatives such as briefly increasing their use of coal, oil and LNG, adequate electric generation has never been in doubt. As to price spikes, these occurred at the same time in Pennsylvania, the source of the natural gas that purportedly would spare us this problem, strongly suggesting that lack of pipeline capacity was not the problem. In truth, increasing our reliance on a single energy source will produce the very price volatility sought to be avoided.

More importantly, full utilization of existing pipeline capacity is inconsistent with New England’s existing and proposed greenhouse gas ‘budgets’. Exporting additional fossil fuels will simply add to the world’s climate woes. This has been recognized in President Obama’s recent tightening of EPA’s emission regulations, which will accommodate a large transition from coal power directly to renewables like wind and solar, skipping over natural gas altogether. The argument that more natural gas is necessary to balance intermittent solar and wind is a false one. With New England currently using natural gas for 41% of its energy, that balance has already been achieved. Simply put, additional use of natural gas will necessarily place the New England states in violation of federal and state limits on emissions long before any benefit is seen for the large additional cost on ratepayers. The EIS should address how New England will meet its emissions budgets if it uses the additional natural gas being provided.

**Pipe and Compressor Downsizing.** Late in the scoping period, the applicant announced a downsizing of its pipe from 36 inches to 30 inches and its compressor station at Nassau from 90,000hp to 41,000hp. However, in its letter of July 24, 2015 to FERC stating the intention to reduce the size, Tennessee Gas Pipeline said, “Tennessee will continue to evaluate the needs of the market and reserves the right to amend the Project scope and construction schedule as needed to most effectively meet the demand needs of the market com-

mitments supporting the Project.” Accordingly, there is no assurance that the pipe will ultimately be downsized. Such a reservation of rights leaves the public with no knowledge of the ultimate size of the project, whether smaller or larger. We do not believe that it is possible to properly evaluate the environmental impact of the proposal when as fundamental a factor is left unstated. Our comments will relate to the pipe and compressor station as initially proposed.

**Hudson River and estuary crossing.** The Hudson River is a Superfund site for two hundred miles from Fort Edward south to NYC. The crossing at Coeyman’s Landing and Schodack is just 20 miles south of the Troy dam, where General Electric has performed an expensive dredging and cleanup operation of PCB deposits in the sediments to prevent their further downstream migration. The river is over 1100 feet wide at the proposed crossing point at Papscanee Island, which lies between the Hudson and an estuary marsh. The island is 1600 feet wide at that point. On the east side of the route would cross the estuary marsh at the mouth of the Moordener Kill creek. The estuary marsh is a significant feeding area for the protected Atlantic Sturgeon.

The EIS should establish whether Kinder-Morgan’s (KM) river crossing method will disturb and resuspend PCB deposits at the crossing site. FERC should study the effect on downstream communities such as Rhinebeck and the City of Poughkeepsie which use the Hudson River for drinking water. Additionally, the Town of Bethlehem uses wells adjacent to the Hudson at its Clapper Road treatment facility, in very close proximity to the proposed pipeline crossing. The Hudson is an estuary river which changes its direction of flow four times per day. The danger to the public water supply requires a hard look.

KM has indicated that it generally attempts to use dry stream crossing methods. If Horizontal Direct Drilling (HDD) will be used, the EIS should explain how KM will address inadvertent return of drilling material or fluid seepage and its potential to disturb PCB-laden sediment layers. How will they protect the drinking water, benthic invertebrates, aquatic plants and fish-spawning habitat in the river and estuary marsh?

Mr. Andrew Kahnle testified at the FERC scoping hearing in Castleton on July 14, 2015 regarding the effect of the river crossing on the Hudson and its fisheries. Mr. Kahnle is a retired fishery scientist with over thirty years experience in management of the Hudson River fisheries. He stated that the reach of river containing the proposed pipeline crossing is used as a spawning and nursery area by the shortnose sturgeon, American shad, striped bass and as a feeding area for Atlantic Sturgeon. Both the shortnosed sturgeon and Atlantic sturgeon are Federally listed endangered species. The marsh and stream complex to the east of the river is an important spawning and nursery area for many Hudson River fishes. This tidal complex has been designated as a significant fish and wildlife habitat by the New York State Department of State. This formal designation means that activities such as pipeline construction requires special scrutiny to avoid environmental damage. The applicant’s environmental reports are silent on construction techniques for crossing the river. If excavation and backfilling are used, construction should not occur at times of the year when the area is used for fish migration, spawning, rearing of young or feeding. Turbidity must be controlled with turbidity curtains or settling.

The bottom sediments of the Hudson and its tidal marshes contain many contaminants. Before excavation, the applicant must test sediments across the entire width of the proposed trench. If contaminants are detected, contaminant and contaminated sediments must be contained during construction.

The river and marsh bottoms also support a rich variety of natural invertebrates, which are important food for fishes. Construction will disturb or eliminate these organisms and this loss will impact fish especially the endangered short-nosed sturgeon. Finally, the NED Pipeline is just one of several pipeline and power cables being proposed for the Hudson River. Given the importance of the Hudson to endangered short-nosed sturgeon and Atlantic sturgeon, FERC should ask the National Marine Fishery Service for a biological opinion evaluating the cumulative impacts of all of the proposed projects for these endangered fish species.

**Papscanee Island.** The proposed pipeline follows an existing pipeline right-of-way where it exits on the east shore of the Hudson River and crosses Papscanee Island. The home of the Staats family is on the property and they have been asked to sell another 75 feet. The home, which dates to 1696, has been in the same

family for 11 generations. It is one of the oldest continually occupied residences in the State. The Federal Highway Administration has identified Papscanee Island as “a historic property eligible for listing in the National Register of Historic Places as an historic district for its association with events of significance to the broad patterns of upper Hudson Valley history, particularly with regard to the Mohican people, and containing sites important to history and prehistory. The land was once the central site of the Mohican tribe and continues to be of considerable cultural significance to the tribe, as it is their ancestral home.” There is a very significant archaeological site on the island called Goldkrest, where pre-European longhouse remains have been found. It is our understanding that the Tribal Historic Preservation Officer of the Stockbridge-Munsee Community Band of Mohican Indians has been contacted for the required consultation under Section 106 of the National Historic Preservation Act.

Although a significant portion of the island is protected by the Open Space Institute and the Staats family, the scenic and historical integrity of much of Papscanee Island has been lost. It has been partially covered in dredge spoil to make way for a deep water channel in the Hudson River. It is in fact no longer an island but is attached to the shore on the north end. The east shore of the island is hemmed in by a railroad right-of-way. The northern tip of the island in the neighborhood beyond the Goldkrest site is industrial. Now the NED would take another 75 feet from the remaining intact portion of the island. Each incursion seems to beget the next. The cumulative effect must be evaluated. The EIS should consider avoiding the island altogether, rather than let it die a death of a thousand cuts.

#### **Nassau compressor station (Market Path Mid Station 1).**

We note that on May 15, 2015, FERC notified the applicant of a number of items that were required for its resource reports. Many – if not most – of those items remain outstanding. Among these was the requirement that the applicant specify the location and details for new compressor stations including plot plans identifying the proposed units, buildings, piping and other equipment. Instead the applicant provided bare compliance with no level of detail. We do not know anything about the height, layout, lighting, security features, fencing or visibility of the proposed structure.

The proposed 90,000hp compressor station is just 2800 feet from the southern tip of Burden Lake in an area that is otherwise extremely quiet. Portions of the lake are within the half-mile buffer from the compressor. Once sound reaches the lake, there is no topographical barrier to attenuate the noise or prevent its travel over the water. Residents of Burden Lake report that on calm winter nights they can easily hear low frequency noise from Amtrak trains from the tracks 12 miles to the west.

The extremely loud sounds produced by blow downs will be carried far further than in other locations, particularly since the prevailing winds are from the south and run directly toward the lake. As pointed out in NYSDEC’s SGEIS on the Oil, Gas and Solution Mining Regulatory Program in New York State, even a six decibel increase in sound pressure can be annoying against existing rural background levels of only thirty decibels. (See Final SGEIS, May 2015, Vol. 1, page 6-301.) FERC should study the effect on the sound impact of the topography, prevailing winds and quiet background.

Tennessee Gas Pipeline discussed existing noise levels at the proposed Nassau compressor station in its Resource Report Vol. I, RR9, p. 9-39. It found daytime sound levels of 49 decibels and nighttime levels of 43.8 decibels, with an ambient level of 51.2 decibels. These levels are far higher than readings taken by a member of the Town of Nassau Natural Resources Committee, which found levels of 26 to 30 decibels. On the day that measurements were taken by Tennessee, the present owner of the land on which the station would be located was operating a drill rig and the owner of the nearest NSA was operating a tractor. Testing was at the side of the road. The noise levels therefore were not indicative of typical levels. They were artificially high. The applicant should be required to retest at night, at a more appropriate time of the year and not at roadside.

The most important feature of compressor stations that FERC needs to consider in much more than its customary depth is the reasonably foreseeable significant adverse health impacts of gas pipeline infrastructure(detailed below).

The American Medical Association adopted Resolution 519 at its June, 2015 annual meeting in Chicago. Plainly unsatisfied with current regulatory agency health impact assessment protocols, the AMA determined to support legislation requiring FERC, among other agencies, to conduct comprehensive health impact assessments in keeping with formal protocols of the public health profession.

The attached Memorandum by Dr. David O. Carpenter, State University of New York School of Public Health, presents several key examples of the way in which FERC health impact assessment protocols fall far short of professional standards. We are formally requesting that FERC supplement its review of compressor station impacts by seeking the assistance of the U.S. Dept. of Health and Human Services.

Excessive exposure to low frequency noise (LFN) can cause a systemic pathology known as vibroacoustic disease (VAD). VAD has been observed in several populations exposed to environmental LFN such as those produced by compressor stations. In both human and animal models, LFN exposure causes thickening of cardiovascular structures. Depression, increased irritability and aggressiveness, a tendency for isolation and decreased cognitive skills are all part of the clinical picture of VAD. LFN is a demonstrated genotoxic agent. The occurrence of malignancies among LFN-exposed humans, and of metaplastic and displastic appearances in LFN-exposed animals, clearly corroborates the mutagenic outcome of LFN exposure. (Noise Health. 2004 Apr-Jun;6(23):3-20). FERC should consider noise control measures to eliminate exposure to the high volume noise as well as LFN that travels easily over water as well as locate the compressor far from populated, rural areas.

The sound from the compressor station could be mitigated by employing a number of smaller stations with electric motors instead of natural gas engines, installing silencers and mufflers, erecting sound containment structures, moving the facility to a less sensitive location, or, preferably eliminating it altogether. The EIS should study the feasibility of the alternative of electric compressors.

The Clean Air Act, which was last amended in 1990, requires EPA to set National Ambient Air Quality Standards (40 CFR part 50) for pollutants considered harmful to public health and the environment.

The Clean Air Act identifies two types of national ambient air quality standards. Primary standards provide public health protection, including protecting the health of “sensitive” populations such as asthmatics, children, and the elderly. Secondary standards provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

The construction and operation of the proposed projects will result in result in significant emissions of various air pollutants, including NO<sub>x</sub>, VOCs, carbon monoxide, particulate matter, sulfur dioxide, and GHGs, particularly methane. These pollutants affect air quality—and therefore human health—in a variety of ways. NO<sub>x</sub> is a precursor of both ozone and fine particulate matter (“PM<sub>2.5</sub>”). VOCs are also an ozone precursor. Fine particulate matter is linked to increased heart attacks, aggravated asthma and decreased lung function, and for people with heart or lung diseases, premature death. Ozone exposure can lead to coughing, chest pain, and throat irritation. It also worsens bronchitis, emphysema, and asthma, and can reduce lung function. The EPA has listed Rensselaer County as a nonattainment area for ozone pollution. [http://www.epa.gov/oaqps001/greenbk/anayo\\_ny.html](http://www.epa.gov/oaqps001/greenbk/anayo_ny.html)

The most common hazardous air pollutants associated with natural gas development are n-hexane and the “BTEX compounds” benzene, toluene, ethylbenzene, and xylenes. Benzene is a known human carcinogen, and formaldehyde, which is also emitted from natural gas operations, is a probable human carcinogen. Methane is a potent GHG, which the Intergovernmental Panel on Climate Change (“IPCC”) estimates to have 34 times the global warming potential (“GWP”) of carbon dioxide (“CO<sub>2</sub>”) over a 100-year period.

The estimated emissions from construction may exceed the tons-per-year threshold for major sources for multiple of the pollutants emitted, including NO<sub>x</sub>, VOCs, CO, and PM. If it is determined during analysis that the project exceeds the limits for attainment status for VOCs and NO<sub>x</sub>’s, additional air pollution measures must be taken to meet or exceed the general conformity requirements. Moreover, the Draft EIS must include the potential health effects to workers and members of the community who live nearby and who may be at risk of exposure to harmful air pollutants.

When unfavorable meteorological conditions exist, both wet and dry pollutants from the compressor station are going to fall-out into Burden Lake with a potential for adverse impacts on water quality and the aquatic habitat in Burden Lake. FERC should undertake all necessary meteorological and air quality modeling studies to determine potential impacts and must identify how they will require Kinder-Morgan to take appropriate steps to prevent negative water quality and aquatic habitat impacts from occurring in Burden Lake and the Valatie Kill and the surrounding watersheds.

The cleaning operations for pipelines remove hazardous components from the unrefined natural gas. The resulting waste should not be stored onsite, but should be removed immediately.

Aside from hosting a nesting population of bald eagles, golden eagles and numerous osprey, Burden Lake is a regular stopover for migratory waterfowl in the spring and fall. These include large numbers of Canada geese, bufflehead ducks, mergansers, loons, wild swans, and mallards, etc. FERC should study the impact of the compressor station on resident and migratory birds.

In addition to exposure to pollutants while swimming in the lake, many residents use lake water for cooking, bathing and showering. Experimental studies have demonstrated that VOCs can be efficiently transferred from water to air, especially in showers where the water is heated and there is a large water air interface. VOCs released to the air can equilibrate with the air in the bathroom and eventually with the rest of the house. (Agency for Toxic Substances and Disease Registry, 4770 Buford Hwy NE, Atlanta, GA 30341; Public Health Assessment Guidance Manual (2005 Update); Appendix G: Calculating Exposure Doses).

Burden Lake hosts a children's summer camp operated by the Rensselaer Boys and Girls Club. For the last nine years, it has hosted Wounded Warriors events for recreation and recovery of severely disabled veterans. It is inconceivable that we would subject these veterans, many of whom may be suffering from post-traumatic stress syndrome or traumatic brain injury, to constant, sudden and extreme noises or to force them to find another host site after forging a strong community connection here for so many years in an ideal site.

The rates of asthma in children exposed to toxic emissions have been demonstrated in the literature. Given the number of children attending Camp Adventure and Camp Schodack, both in close proximity to the proposed compressor site, the EIS should address the impact on these children, the associated cost of medical treatments for asthma attacks, and the long range health impacts of steroidal treatment of asthma. Mitigation would include air quality testing conducted by the NYSDOH before any construction, during construction, and during normal operations as well as blow downs. All mitigation methods to contain emissions should be required.

Dr. Carpenter has described the process by which methane gas reacts with sunlight to produce formaldehyde. This is a carcinogen. It causes nose bleeds, particularly in children. Given the number of children using the area for recreational purposes, the EIS should address the impact to them of exposure to this toxin. Nitrous oxide and VOCs produce ground level ozone that has been estimated to reduce crop growth by 30%. The EIS should study the economic and environmental impact of this on the farms in this community.

In addition to the health matters raised above, the EIS should address the work of Susan Nagel at the Institute for Health and Environment at SUNY and examine the risk of exposure to VOCs from the compressor station and the impact on reproductive health, endocrine system, breast cancer, developmental delays, changes in immune function, impaired sperm quantity and quality, fertility problems, and miscarriages. (Estrogen and Androgen Receptor Activities of Hydraulic Fracturing Chemicals and Surface and Ground Water in a Drilling-Dense Region, Christopher D. Kassotis, Donald E. Tillitt, J. Wade Davis, Annette M. Hormann, and Susan C. Nagel, *Endocrinology* 2014 155:3, 897-907.) The EIS should address the impact of emissions on asthmatics and people with respiratory illness during the construction and operation phases of the project. The EIS should consider the higher background levels of radon in Rensselaer County and the impact of potential contamination at compressor stations handling gas from Marcellus Shale, known to have a particularly high radon content. Creation of a "public health registry" related to exposures and health effects. Biomonitoring for VOCs should be provided for humans and domestic and wild animals (Recommended by the Institute for Health and Environment at the State University of New York at Albany, Susan

Nagel, December 5, 2014)

The EIS should address the need for a statewide network of reporting exposures and health effects in residents around the compressor station before construction and after operation. Our region is served by volunteer fire, rescue and ambulance service. The nearest burn units are in Westchester County and Syracuse. Risks of the sort presented by a compressor station in industry are normally served by professionals. The EIS should address how emergency services would be provided. As was done with the Constitution Pipeline, the applicant should be required to install Class 2 design pipe in all Class 1 locations, install the pipeline deeper than required for Class 1 locations with a minimum depth of 36 inches in normal soils and 24 inches in consolidated rock, inspection of 100 percent of mainline pipeline welds, hydrostatic testing of the entire pipeline at a level suitable for Class 3 locations, and spacing of mainline valves (MLVs) at closer intervals to meet Class 2 requirements in all areas.

Pipeline compressor stations typically employ stadium type lighting for security purposes, despite the fact that these stations are generally hidden from view by the topography and are unattended. Lighting of the sort contemplated would pollute the night sky, preventing any view of the stars from Burden Lake and unnecessarily interfering with activities of night animals such as bats and owls.

As pointed out in the report of the Nassau's Natural Resource Committee:

“There are very few full-time outdoor lights that are operated in the community surrounding the compressor station study corridor within Nassau. There is one street light (with a notably dim bulb), located at the intersection of Clarks Chapel Road and Center Nassau Road. There are two “farm-light” fixtures in the area, one attached to a residence on Clarks Chapel Road east of County Route 15, and one on a barn on Slivko Road near Clarks Chapel Road. Otherwise, the area is lighted only intermittently by household lighting, and by passing cars which are infrequent during night-time hours. The area can be characterized as experiencing dark-sky conditions, with stars and planets readily observable on average nights with skies clear of clouds. Astronomical conditions are readily observed and appreciated in the community. Obtrusive lighting is rare, and dark conditions are encouraged by the community as reported by the Town of Nassau Comprehensive Plan (pg. 634).”

The EIS should consider the impact of 24-hour lighting on the circadian rhythm of individuals exposed to the light pollution. Exposure to light at night can disrupt circadian clock mechanisms causing sleep disturbances. Studies have demonstrated that disruptions in circadian clock mechanisms are associated with weight gain in humans. (The Effects of Light at Night on Circadian Clocks and Metabolism; Laura K. Fonken and Randy J. Nelson) The global increase in the prevalence of obesity and metabolic disorders coincides with the increase of exposure to light at night and shift work. These converging lines of evidence indicate that exposure to light at night may cause metabolic changes in mammals. Disruption of the sleep cycle in children can have a severe impact on learning. There should be a full examination of the ecological consequences of artificial night lighting.

FERC should study the compressor lighting impacts and determine if there is a reason why security lights could not use motion detectors or why night vision security cameras could not be employed as a mitigation measure. There is no reason why the facility cannot meet Dark Sky guidelines for shielding of glare.

A 1998 Phase 1A survey of the Totem Lodge area east of Burden Lake found remnants of a potential prehistoric archaeological site. referred to as the Totem Lodge Prehistoric site. It is identified as New York State Museum (NYSM) Site 4584. A phase 1B survey also found several prehistoric sites.

The proposed compressor station is 9,000 feet from Eastfield Village, a collection of colonial buildings in an historically authentic setting, used for educational and study purposes at 104 Mud Pond Road in East Nassau. The constant sound would be incongruous with the site's mission and purpose.

The applicant has offered no reason why the compressor station must be in the one-mile section identified, rather than in an industrial zone. Within that mile, the sole reason offered for the ultimate selection is that the landowner was willing to sell. That is an inadequate reason for not selecting the environmentally most suitable site in light of the applicant's right to the use of eminent domain proceedings.

This pipeline follows the route of a high power electric right-of-way, making the use of electric compressor station motors feasible. These release far fewer VOCs into the air and run more quietly. This alternative must be fully explored.

Compressor emissions would be unacceptably high for an area immediately adjacent to a highly settled recreational lake and an organic farm. It is widely known that there are simple and economical methods to reduce such emissions, but there is no indication that Tennessee Gas Pipeline would employ them. Among the methods recommended by the EPA are:

1. Keep compressors pressurized when off-line.
2. Connect blowdown vent lines to the fuel gas system and recovering all, or a portion, of the vented gas to the fuel gas system.
3. Install static seals on compressor rod packing.
4. Install ejectors on compressor blowdown vent lines.
5. Require low or no-bleed controllers.

Regardless of where the compressor is located, the applicant should be required to employ all of the above methods.

**Pipeline, M.P 40.3 to M.P. 44.** The pipeline would run just north of the former Dewey Loeffel landfill, a Superfund site which has produced contamination in Nassau Lake. FERC should study the compound effect on the affected lands and the waters of Nassau Lake of a potential leak from the pipeline flowing through the landfill area.

The EIS should study the effect of creating a preferential path for underground flow of water, from the perspective of connecting currently separate aquifers, one or more of which may be contaminated, to dewatering aquifers relied upon for potable water. It should be determined if the pipeline will connect the aquifer surrounding Dewey Loeffel to other aquifers.

The pipeline would be immediately on the other side of the existing electric transmission right-of-way from the proposed Troy Sand & Gravel hard rock quarry at MP 43.6. The quarry proposal is being litigated but, if finally approved, will use blasting. FERC should evaluate the effect of blasting on pipeline welds.

The pipeline would be less than 660 feet from two places of public assembly: the Nassau Sportsman's Club on Boyce Road and a church at the intersection of North Nassau Road and County Route 18.

The proposed northern route of the NED through the Town of Nassau will intersect numerous headwater streams and wetland areas of the Valatie Kill and the Tsatsawassa Creek. These two streams are protected C(t) streams. In the most recent rule changes to the Clean Water Act the EPA and the US Army Corps of Engineers have indicated that they intend to extend protection to the headwater segments of protected streams.

The proposed route of the NED will also cross over a major unconsolidated aquifer in the Town of Nassau and Stephentown. The aquifer roughly follows the Tsatsawassa Creek as it meanders through Dunham Hollow, both above and below State Route 43. This aquifer and its re-charge zones provide the water supply for many homes in the Town of Nassau and the Village of East Nassau. Protection of this aquifer is critical to the Town and is afforded such protection in Town law. Wells should be tested before construction and periodically during operation for the detection of VOCs.

Appendix K, p. K-91, Table 2.2-9 of the Resource Report indicates that the Hudson River, the Valatie Kill (at MP 40.8) and the Tackawasick Creek (at MP 45.32) would be used as source water for hydrostatic pressure testing. The Tsatsawassa/Tackawasick is a protected aquifer and trout stream. The Valatie Kill is a trout stream that is contaminated by discharges from the Dewey Loeffel Toxic Landfill Federal Superfund site. The use of water from the Valatie Kill has the significant potential of contaminating even larger areas of surrounding towns.

A 1996 study of the Hudson River showed that at that time it contained 113 non-indigenous species of vertebrates, vascular plants, and large invertebrates, not including algae and small invertebrates. (Exotic species

in the Hudson River basin: a history of invasions and introductions, EL Mills, DL Strayer, MD, Scheuerell, JT Carlton - Estuaries, 1996;

[http://dSPACE.gcswwd.com/bitstream/handle/123456789/111/Mills\\_et\\_al\\_Estuaries&Coasts\\_1996.pdf?sequence=1](http://dSPACE.gcswwd.com/bitstream/handle/123456789/111/Mills_et_al_Estuaries&Coasts_1996.pdf?sequence=1)). We would submit that there is no safe place to discharge this water.

**Rensselaer Plateau.** The pipeline would bisect the 118,000 acre Rensselaer Plateau, one of the largest and most ecologically intact native habitats in New York State.

The pipeline would isolate and fragment wildlife on either side of the line, defeating the goals of the Rensselaer Plateau Alliance's conservation plan. The RPA's Forest Legacy Grant proposal was recently ranked #5 nationally by the U.S. Forest Service Legacy Program. Running the pipeline adjacent to existing electric power easements exacerbates the problem of fragmentation of habitat by widening the existing gap separating contiguous habitats. The impact on the Plateau's animal and plant life should be closely studied. Consideration should be given to burying the pipeline deep enough to permit reforestation. The applicant should be required to provide "travel lanes" or corridors sufficiently wide for animal movement where the habitat is fragmented. If the pipeline must cross the Rensselaer Plateau and cut across its many trail systems, the applicant should offer a dedicated multi-use east-west trail on the right-of-way.

New York State has identified the Rensselaer Plateau as an important area for protection due to its diversity and bird breeding features and the Audubon Society has designated the Rensselaer Forest Tract as an important bird breeding area. The Audubon Society specifically cites the high diversity and abundance of forest breeders on the Plateau, including many at-risk species. Many birds are experiencing declining population numbers in the Northeast due in part to loss of large blocks of forest. The Plateau has also been the focus of conservation efforts by the Rensselaer Land Trust and The Nature Conservancy. We are concerned about the impact the pipeline and its supporting infrastructure will have on breeding bird populations in the Rensselaer Plateau area as well as the areas surrounding Burden Lake and the Valatie Kill watersheds. FERC should consult with and seek input from the NYS Chapter of the Audubon Society, the Rensselaer Land Trust and the New York Chapter of the Nature Conservancy on the impact the proposed NED project would have on the Rensselaer Plateau and the areas surrounding the Burden Lake and Valatie Kill watersheds. We would direct your attention to Dr. David M. Hunt's comments (Submittal 20150820-4024) regarding the Plateau and the three pipeline reports referenced therein.

The Plateau is characterized by steep topography. Construction across such areas creates a potential for flash flooding, affecting lakes and streams at lower elevations. Glass Lake and Crooked Lake are particularly vulnerable to flows from higher elevations in high volume storm events. Historically, the Glass Lake Dam has been overtopped twice and came dangerously close during Hurricane Irene. The dams along Wynantskill Creek are not capable of withstanding additional loads. Catastrophic collapse would threaten communities as far away as the City of Troy.

FERC should consult with and seek input from the Rensselaer Plateau Alliance, the Town of Nassau and the Town of Stephentown on the proposed route of the NED on the Rensselaer Plateau as it relates to impacts on streams, wetlands and groundwater quality and quantity. FERC should address this issue in the EIS they are preparing and delineate how these headwater streams, wetlands and groundwater aquifers will be afforded protection both during the initial construction and post construction phase.

**Stream Crossings.** Depending on the size, timing, duration and methods employed, stream crossings can have significant impacts on aquatic ecosystems by altering stream morphology, process and function including in-stream habitat both upstream and downstream of the crossing location, as well as at the crossing location itself. We recommend that the pipeline route avoid alteration of stream hydrology, sediment transport, and morphology by eliminating crossing streams of any size, including ephemeral streams, wherever possible.

Where avoidance is not feasible, measures to reduce impacts should include site specific evaluations of construction activities. For example, stream crossings should be located downstream from all confluences to reduce the total number of stream crossings and the impacts on stream morphology at these convergent loca-

tions. We recommend that the FERC include in the draft EIS appropriate measures to reduce both short-term and long-term impacts to stream morphology and hydrology. This is particularly important given the importance of small headwater streams that serve as spawning reaches and thermal refuges for coldwater fish, including native and wild trout.

The Resource Report describes the proposed methods that will be used for stream crossings, including: open cut, flume, dam-and-pump, conventional bore and horizontal directional drilling (HDD). While each of these methods is explained, the report fails to explain under what circumstances each method will be used, what information will be gathered during surveys and related analysis to inform which stream crossing method should be used, what criteria and type of evaluation process will be used by the applicant to determine which crossing method is appropriate, and when, during the planning process, a decision will be made on which method is appropriate.

We recommend that the draft EIS identify each stream crossing by mile post, as well as the proposed method for each stream crossing. We recommend that the open cut crossing method not be used in any circumstances on any streams within watersheds that support native and wild trout. We strongly recommend that the applicant use HDD, direct bore or Direct Pipe™ methods to cross sensitive streams where feasible.

HDD, direct bore and Direct Pipe™ methods are preferred for stream crossings because they have the advantages of minimizing land disturbance, avoiding the need for dewatering the stream, leaving the immediate stream bed and banks intact, and reducing erosion, sedimentation and project-induced watercourse instabilities. Further, the Direct Pipe™ method is favorable for stream crossings over other methods, including HDD and open trench, because it is suitable for unconsolidated sand, gravel, and cobbles (such as river bottoms), virtually eliminates the risk of blowouts associated with HDD, and does not disturb the channel bed as compared to dry crossing methods. Because the Direct Pipe™ method presents the least amount of risk to stream systems, it should be evaluated for proposed crossings of native and wild trout streams.

The draft EIS should evaluate whether the use of HDD, direct bore and Direct Pipe™ methods for each stream crossing is feasible, and where these methods are determined not to be feasible, provide a justification. Where HDD, direct bore or Direct Pipe™ methods are proposed, the draft EIS should describe the typical work area required and protective measures that will be used to limit runoff of sediment and other fluids into streams, as well as describe a contingency plan if the HDD, direct bore or Direct Pipe™ method fails and results in sediment and/or drilling fluid entering a stream.

If the dry crossing method is proposed, the Applicant should identify which type of dry crossing— whether dam and pump, flume, cofferdam, or dry open cut— will be used. Each type of dry crossing method has unique and individual impacts. In order for the Commission to identify the impacts of each stream crossing on stream hydrology and aquatic habitat and to propose appropriate mitigation measures, the specific type of dry crossing method proposed for each stream crossing must be identified in the draft EIS.

Field reconnaissance by pipeline personnel is necessary for the identification of stream crossings since many ephemeral and some perennial streams are not visible on topographical maps. Information that must be gathered during surveys and included in a draft EIS, in order to determine which type of crossing method should be used for each stream, what impacts may result, and what mitigation measures are needed, includes at a minimum:

- Geotechnical feasibility studies to determine if HDD, Direct Pipe™ or other conventional bore method is appropriate and feasible for each stream crossing;
- Proximity to the nearest confluence up and downstream;
- Stream discharge, channel gradient, channel sinuosity, stream substrate, cross-sectional surveys, channel debris and sediment storage, and stream order;
- Geomorphological data, including complete fluvial geomorphic characterization of the stream's hydraulic geometry, plan form, and profile, and information about bed and bank stability, scour depth and depth of pools; and

- A scour depth analysis either based upon measured pool depth or calculated scour for observed bed materials and design discharge, to determine the potential for vertical or lateral adjustment of each stream.

This information is necessary for a site-specific review of the proposed method and will provide an opportunity for interested parties to provide specific recommendations on mitigation measures appropriate for each specific stream crossing.

The EIS should describe the typical work area required and protective measures that will be used to limit runoff of sediment and other fluids into streams, as well as describe a contingency plan if the HDD, direct bore or Direct Pipe™ method fails and results in sediment and/or drilling fluid entering a stream.

**Effect of Compressor on Property Values.** In other pipeline applications, FERC has found that there is no peer-reviewed literature supporting the proposition that pipelines reduce property values in any significant way. However, a review of the existing literature shows that no such study even mentions compressor stations. Unlike pipelines, compressors can be seen, heard and smelled. Compressors of the size contemplated for Nassau are in fact indistinguishable from heavy industrial uses. There is a significant body of peer-reviewed literature that demonstrates large reductions in property values of residences located near such uses. FERC is relying, therefore, on the wrong body of literature with respect to compressors. (See, *Undesirable Facilities And Property Values: A Summary Of Empirical Studies*, Stephen Farber, Graduate School of Public and International Affairs, University of Pittsburgh, Pittsburgh, PA 15260, USA; Received 10 September 1996; accepted 13 March 1997.)

The EIS must consider the economic consequences of declining property values, the impact on mortgage agreements and the ability to secure reverse mortgages for seniors in the community. A complete economic analysis would consider this among other negative externalities such as increased health costs, environmental costs and additional costs to local government for fire, police and highway maintenance.

**Additional Mitigation.** FERC should consider the following matters and related mitigation measures:

- The No Action Alternative. The natural gas transported by the NED would add to total carbon emissions loads in direct contravention of the EPA's Energy Plan. It is unnecessary to relieve constraints on electric capacity since existing shortfalls are easily met with LNG purchases. These shortfalls could be eliminated entirely by repairing leaks in the current system, adding renewable sources of energy such as wind, water and solar and increasing energy efficiencies in general. Electric use has been flat since 2008 and the world is adding more capacity for renewables each year than coal, natural gas and oil combined. The NED and other northeast pipelines are likely to be obsolete and unused before they reach the end of their useful lives, leaving ratepayers to pick up the bill and leaving a trail of environmental destruction.
- Alternative routes. There is a southern route that follows a pre-existing pipeline. It is approximately 3 miles long and crosses from the Town of Schodack under Route 203 south of the Village of Nassau approximately 1800 feet north of Sweets Crossing Road, then travels easterly under Hanley Road, Malden Bridge Road and Jefferson Hill Road, where it intersects Mashodack Road, then ESA, crossing Middle Road and into Columbia County. This route has fewer elevation changes and avoids the Rensselaer Plateau. It is 3.6 miles shorter and involves only 10 acres of additional ROW instead of 24 to 40 acres. It is only 10% forested rather than 90%. It has only 7 sites of concern (1 classified stream, 5 unclassified streams, 5 wetlands) compared to 19 such sites (4 classified streams, 6 unclassified streams, 2 small ponds, 8 wetlands). Subsurface archaeological sites on the southern route are already disturbed. 1.5 miles of the northern route passes through a groundwater aquifer; .7 miles of the southern route passes through an aquifer. A route along the New York Thruway (Berkshire Spur) and the Massachusetts Turnpike is far preferable to either the northern or southern routes.

The applicant's analysis rejecting the Mass Pike Route (I-90) is conclusory, with no underlying detail. The treatment of the topic in the resource reports suggests that the true underlying reason is that the expense of installation would be greater. For example, it counts the number of major and minor water crossings. However, it fails to distinguish among these on the basis of their quality. On a trip down the

Mass Pike, one sees numerous small water bodies that are simply man-made detention ponds with little ecological significance. Their function and effectiveness would not change with a crossing. In contrast, the applicant's chosen route includes estuary marshes that are significant breeding grounds for threatened and endangered species. These cannot be equated. The EIS should explore the kind and quality of each water crossing on each route. The same is true of the applicant's other statements regarding the route. If there are conflicting, existing utilities, what are they and where? If there is development close to the route, what is it and how would it be affected? Are there industrial areas that can house compressor stations without residential conflict?

Thank you for the opportunity to comment.

**Institute for Health and the Environment**  
WHO Collaborating Center in Environmental Health

9 July 2015

The American Medical Association has Resolved to support legislation requiring comprehensive health impact assessments as an integral part of regulatory review of gas pipeline proposals. This position reflects the fact that significant adverse health impacts may be overlooked by current regulatory review.

In brief, the typical regulatory agency approach is to estimate the total short-term and long-term emissions directly sent into air or water by the project under consideration. Estimated total emissions are then compared with Federal or State standards for "acceptable" emissions. If the estimated levels fall below critical thresholds, the project is assessed as having a non-significant health impact.

A more complete and informative look at environmental impacts is called a comprehensive health impact assessment, and was outlined as a set of research protocols by the Centers for Disease Control and Prevention, and by the National Academy of Sciences.

Listed below are three examples of impacts which are not currently included in reviews by agencies such as New York State Department of Environmental Conservation or the Federal Energy Regulatory Commission:

1. Emission spikes. Regulatory agencies measure emissions in terms of averages taken over numerous short (for example, one hour or less) or long-term intervals (for example one or more days). Recent studies have found that these averages don't reveal the occurrence of very high levels of "peak" emissions which may occur at irregular intervals. These peaks may have serious adverse health impacts that are not captured by averaging over longer periods of time. A comprehensive assessment performed according to public health professional standards would capture information on peak emissions and their consequent health implications.
2. Dynamic evolution of emissions. Regulatory agencies take a very local and static view of toxic emissions, assessing them in isolation from each other and only at the time and place immediately adjacent to their source. Many if not most standards are based on single chemical emission, while under most circumstances it is a mixture of different chemicals that are emitted. In addition, it is well established that any single emission can disperse widely, evolve and combine with other emissions and atmospheric conditions, and become reabsorbed into distant water and soil. Only a comprehensive health assessment can properly evaluate the full range of emission impacts.
3. Downstream and upstream impacts. Regulatory agencies restrict their assessment of impacts to the operations of the project in question. But pipeline impacts extend far beyond pipeline operations. Pipelines are a "midstream" structure, placed between the start-point of gas well production sites and the endpoint of residential consumption. Adding a pipeline has the impact of expanding both production and consumption. And many studies have reported that the endpoint use of pipeline-provided gas in residential stoves has adverse impacts on respiratory function. Only a comprehensive health assessment would, correctly, view this as a pipeline impact.

These examples are not exhaustive. The issue of vulnerable sub-populations (such as people with pre-exist-

ing asthmatic conditions) is not routinely addressed by regulatory agencies, but is a key part of comprehensive health impact assessments. The complete list of differences between regulatory versus public health impact reviews is long and complex.

Nonetheless, the conclusion is quite clear to the American Medical Association: current regulatory procedures do not adequately protect public health and safety.

Yours sincerely,

David O. Carpenter, M.D.  
Director, Institute for Health and the Environment  
University at Albany

**20150824-5177**

**Plainfield Conservation Commission**

Town Office  
304 Main St.  
Plainfield, MA 01070

August 21, 2015

To: Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission

Subject: Comments on environmental Issues regarding the Northeast Energy Direct Project, Docket PF 14-22-000

We, the members of the Plainfield Conservation Commission, hereby request that FERC address the following issues in its preparation of an Environmental Impact Statement (EIS) regarding the “Northeast Energy Direct” project of the Tennessee Gas Pipeline, Inc. Submission of the following issues does not imply agreement with the current scheduling of scoping sessions in July and August, 2015. Given the incomplete nature of Kinder Morgan’s Resource Reports to date, we request that scheduling of scoping sessions be delayed until final, revised and complete editions of the reports have been issued and examined by all concerned. The following concerns presented by the Plainfield Conservation Commission apply not only to Plainfield, but to all towns through which the pipeline may pass and should be addressed relative to all such areas.

1. We request that impacts to habitat, wetlands, waterways, and protected open space should be avoided. Measures to avoid or mitigate impacts should be specified in detail for every aspect of construction and for each specific site along the route, including staging areas, temporary workspaces, temporary and permanent access routes, temporary contractor yards, pipe yards, cathodic protection and grounding bed sites, and mainline valves. To construct an “in-kind mitigation wetland resource”, detailed assessments of each wetland resource area need to be conducted, taking into account the functions and values relative to topography, hydrology, vegetation and soils.
2. The numerous unspoiled streams whose headwaters originate in Plainfield are tributaries to the National Wild and Scenic Westfield River to the south. Therefore, we request that all of the wetlands, waterways vernal pools (certified and certifiable), floodplains and all jurisdictional areas under the Mass. Wetlands Protection Act within 200 ft. of the disturbed areas along the route be detailed in the EIS, including those missing from the March and July, 2015 Resource Reports, together with mitigation strategies as outlined in (1).
3. We request that NHESP “Priority Habitats of Rare Species”, NHESP “Estimated Habitats of Rare Species” and BIOMAP II “Core Habitats” and “Critical Natural Landscapes” be studied so as to avoid habitat fragmentation and all other impacts on the biota. In the case of unavoidable impacts, means of minimization by all possible measures should be specified in detail.
4. The project route passes through rough topography and ledge which will necessitate careful attention to downstream impacts of blasting and erosion on streams and wetlands. Therefore, we request

that details of both pre- and post-construction erosion and sedimentation control procedures be described, including the restoration and post-construction monitoring for each specific site along the route.

5. Because Plainfield is relatively free of non-native invasive plants, we request that detailed procedures regarding the prevention of their introduction by construction equipment be included. Similar concerns apply to instances where soils may be trucked in for pipeline fill and bedding material.

6. In Plainfield, the large amounts of water used to pressure test segments of the pipeline would have to come from local surface waters. These withdrawals could have a serious impact. We request that the EIS include alternatives. If it becomes necessary to obtain water from another watershed and to discharge it into one of the town's watersheds, a detailed methodology for the prevention of the introduction non-native aquatic species and damage caused by hydrostatic testing in wetlands near the ROW should be included.

7. The proposed compressor station to be located nearby in the town of Windsor will periodically release airborne hazardous and carcinogenic chemicals which may spread to streams in Plainfield through drift or entrainment in rain or snow. Therefore, we request that baseline studies of stream biota be conducted to establish the potential impact of each chemical.

8. The proposed "Class 1", thin-walled pipes to be used through Plainfield are inadequate to provide the long-term protection needed to safeguard wetlands and vital ecological systems. The most robust pipes by regulation (i.e., "Class 4") that provide optimal protection must be installed through wetland resource areas as defined in the Massachusetts Wetlands Protection Act.

Respectfully Submitted,

Judith Williams, Chairperson

Erik Burcroff

John Nelson Jr.

Alice M. Schertle

Edward Stockman, Wetlands Scientist

#### **20150824-5197**

Richard P Murray, Nassau, NY.

The Tennessee GAs Pipeline Company has recently submitted documents totaling about 6,500 pages for inclusion in the scoping process. Many of these documents do not give specific details, but list those details as TBD or proprietary in nature. How can anyone prepare comments on those types of ambiguities?

Please extend the August 31 deadline for Scoping comments until Kinder Morgan and the Tennessee Gas Pipeline Company supplies those documents.

Note: Kinder Morgan has refused to supply the Town of Nassau, NY a site plan for the proposed compressor station on Clarks Chapel Road. The layout of the compressor station on the site - come on. They are stonewalling you and the public.

#### **20150824-5199**

Thank you for listening to our comments at the FERC Scoping meeting in Lunenburg, MA earlier this month.

What follows are the longer written comments I edited to fit into the 3 minute time slot.

Thank you for this opportunity to share concerns about the proposed Northeast Energy Direct (NED) project directly with you.

When I first learned of the project 18 months ago, I couldn't understand why Kinder Morgan would want to take land my family has protected for more than 100 years and also cut indiscriminately through a community I have worked for three decades to help make a great place to live. I soon learned that the issues

surrounding this massive infrastructure project were much bigger than my own backyards and hometowns. I found a huge corporation who has not diversified for the 21st century but rather is still following a mid-20th century business model to maximize profits at the expense of not only our communities but even our earth. After the proposed project moved north to NH, I stayed actively involved because I believe strongly that any pre-emption of a community's right to decide its future and of property owners right to manage their land should rarely be used and limited to projects that are truly NEEDED by the PEOPLE and not for one company's desire for increased profits.

Since then I've learned that, unfortunately, our current system provides a huge advantage to the power of money over the power of the people. There is indeed a built-in imbalance in the FERC process. Kinder Morgan not only has full-time personnel with experience in this complex regulatory process, they've hired lobbyists, and PR professionals who can spend their entire work day advocating on behalf of their interests - painting a picture of clear need when the truth is much more murky. No wonder it seems like the process is on a fast track to approval and people are led to believe this is a "done deal."

This is why we need FERC to protect our interests. We are learning about the process for this particular project and studying the larger issues of the energy industry and need for natural gas on nights and weekends. We have put aside other hobbies and even other responsibilities to become immersed in this energy debate. It's been even harder for some of our affected people and communities: older people who are not comfortable using the on-line information and places where there is no or very limited high speed internet access. We need your help to make our citizen voices and concerns heard.

Over the last 18 months I've spent studying this proposed project, two other things have become quite apparent:

1. It is unclear how much more gas pipeline capacity, if any, MA or New England really needs.
2. There are many corporations anxious to supply lots of natural gas to MA, New England and even the world.

**In order to provide the best solution to what may or may not be a problem, FERC needs to combine the various proposals from Kinder Morgan, Spectra Energy, Iroquois, and Portland Natural Gas into one regional Environmental Impact Statement and one coordinated FERC process. NEPA review should require nothing less. Added together these proposals could more than double the gas supply to New England at a time when the MA Global Warming Solutions Act (GWSA) and the federal Clean Power Plan (CPP) are demanding that we greatly reduce our consumptions of fossil fuels.**

In its Resource Reports, Kinder Morgan admits that other projects could also meet the needs of New England:

*"...without the proposed Project, other natural gas transmission companies will be required to increase their capacity and construct new facilities to meet the existing and growing demand for the additional transportation capacity. Such action will only result in the transference of environmental impacts from one project to another but will not eliminate such impacts in their entirety."*

Since Kinder Morgan acknowledges that the alleged need met by NED could be met by the competing projects, it makes sense that all the projects be analyzed together to see which one, if any, or which combinations of projects, would satisfy any demand with least impact to the environment and affected land owners.

The FERC review for these combined projects needs to determine:

1. What amount of gas, if any, is needed to meet the threshold of public convenience and necessity which could result in takings of private property by eminent domain?
2. What is the best way to meet that need by minimizing project impacts?

In undertaking this review, we'd expect that the project would follow a process through FERC that would be open and transparent, not just for the potential environmental impacts, alternatives and mitigation measures but also for the needs analysis critical to understanding and quantifying both the NO BUILD alternative as well as various alternatives by different gas transmission companies.

MA Attorney General Maura Healey is already undertaking a study to determine electric reliability needs including what gas capacity we need for electricity generation through 2030. The results of that study, expected in October, will provide answers to whether or not new pipeline capacity is needed to serve the electric generation market. That's part of the answer. There are other questions about need that need clear answers: What amount of the gas contracted through the various LDC proposals is currently replacing expiring volumes already under contract? How much is for future demand? How much is to arbitrage? How can the two offshore LNG "energy bridges" help meet LDC needs?

The No Action alternative should address the feasibility of increased use of LNG imports to cover any limited shortfalls and contrast the relative environmental impacts of construction of pipelines to this alternative. It should also consider whether further investments by LDC's in fixing leaks in the distribution systems and providing increased incentives for people with older gas furnaces and appliances to upgrade to more efficient ones would negate the need for any new pipeline while at the same time help met the state's obligation under the GWSA.

Kinder Morgan acknowledges that natural gas is a bridge fuel providing a reliable energy supply while alternative energy sources are developed. Connecticut and Massachusetts have released the Draft Clean Power RFP which seeks proposals for solar, hydroelectric and wind power to be delivered to those states. The RFP is scheduled to be released later this summer or early fall, with proposals due in November. The EIS for a regional gas transmission study should acknowledge the specific projects proposed in response to the RFP and fully consider their timing and future presence in assessing the need for increased natural gas in evaluating the No Action Alternative. Similarly, the Governor of Massachusetts has announced that the state seeks to contract for an additional 2,400 megawatts of hydroelectric power by 2020. The No Action Alternative must also evaluate whether the import of the 2400 MW of additional hydroelectric power by 2020 fully meets or greatly reduces the need for the project in the No Action Alternative.

In comparing and contrasting the NED project and other natural gas transmission projects with the reduced need alternatives, the relative impacts of increased natural gas use on greenhouse gas emissions must be considered. The EIS should specifically address consistency with the GWSA and federal CPP. It should compare and contrast the proposed projects with increased reliance on renewable energy sources, increased efficiency incentives, the use of new battery storage technologies and other ways which may be more consistent with GWSA and CPP. If increased natural gas is primarily a bridge fuel as Kinder Morgan indicates, then the NED project and others should be considered a potential temporary solution, especially since the Massachusetts Global Warming Solutions Act and the Clean Power Plan call for drastic reductions in the use of fossil fuels over the next 5-30 years. The temporary nature of increased need, if in fact additional pipeline capacity is needed at all, must be taken into account in comparing the permanent loss of critical forested habitat associated with the NED project to other short-term solutions, such as increased use of currently underutilized LNG imports using existing infrastructure.

The role of export in any proposed pipeline projects needs to explicitly explained. People bearing the impacts and loss of property need to know where the gas is going. If export is identified as a "need" for increasing pipeline capacity to and through New England, an alternative that needs to be considered is serving the export market by sending gas on existing pipelines south to existing export facilities on the Gulf and Mid Atlantic Coasts.

FERC needs to ensure that information is shared with citizens as widely, clearly and substantially complete as possible. From the first pre-filing notice in September 2014 it seems that Kinder Morgan was sending out information on a half-baked idea and the project was a moving target. Where in March there were just two upgraded meter stations, the July Resource Reports listed eleven meter stations that need to be modified. Many are in communities which have had no notice about this project. In addition, Kinder Morgan's route selection criteria and analysis seems severely flawed. In a table comparing alternative routes for the "Fitchburg" lateral, impacts in roadways bordering forests were considered the same as cutting down mature forests.

Those late July Resource Reports dumped more than 6500 pages of information just 5 weeks before the end of the FERC Scoping Period with many new project changes. Based on previous information released by Kinder Morgan, we know we have to look at it carefully at it all. In order to give us time to review this information and make our voices heard, FERC should extend this current Scoping Period by at least another month.

However, the best thing FERC can do for the citizens of New England is to take a step back and look at the larger picture of natural gas capacity in New England by combining the various proposals as I suggested earlier. This consolidated review would help you ensure reliable, efficient and sustainable energy for consumers as called for in your mission. Thank you.

Thank you again for the opportunity to comment.

Carolyn Sellars

## **20150824-5242**

Virginia Hastings, Northfield MA, MA.

NED Tennessee Gas project does not qualify as public use because it depletes a national resource and contributes to climate change.

Only 30% is slated for New England, at best.

Isn't this what we did to the Native Americans, took their land and gave them some trinkets!

The NED pipeline the way it is proposed, is clearly not needed in Massachusetts, please give our attorney general Maura Healey a change to provide you with the data about potential needs, renewable and incentives through 2030.

People want the scoping session restarted as we received the 6500+ pages a few days before the scoping session in July and there were over 10,000 TBD's...clearly we do not have all the material.

This renders the scoping period null and void.

Most people spoke articulately and passionately at the July 29th FERC meeting, in Greenfield, MA. and talked about the obvious concerns ...the pipeline's potential issues... air, water, earth, vegetation, inhabitants, wildlife, history, safety, fire, police, terrorism, etc. Each of these issues has been clearly documented as potential problems. Some Springfield labor union people also stressed the need for jobs, certainly valid. We can all harp on all the negative issues that are well documented but we all know this pipeline would be a very poor decision for everyone (except the 1%ers), but especially for climate change.

We are at a CRITICAL TIPPING POINT!

CLIMATE CHANGE IS EXPENSIVE!

A better stance would be to move towards the right solution...

We are transitioning to a fossil free fuel future,

and we will need some gas to help with this transition.

1. WAIT for the DATA ABOUT ENERGY USE! A COMPREHENSIVE REPORT THAT SHOWS ALL THE PLUSES AND MINUSES of the energy we will need through 2030. Thank you Maura Healey, Attorney General MA.!
2. INCENTIVES... CONSERVATION, INSULATION, SOLAR, WIND, and NEW BATTERY RESEARCH.

Conservation is easy and cheap, but people need daily reminders about – how and why to do it.

Isn't Massachusetts the leader in tech research? Put our college kids onto a race to create energy storage batteries!

Extend generous energy efficiency measures and incentives to businesses and schools.

3. HAVE A TIERED RATE SYSTEM FOR ELECTRICITY... for example...

1st TIER 400KWh @ a certain rate. Second TIER above 400KWh a higher rate, etc. so that people have an incentive to reduce their energy use.

4. FIX LEAKS IN EXISTING GAS PIPES, now! This would provide LOTS of labor union jobs.
5. JOB CREATION THROUGH INSULATION, SOLAR, and ENERGY EFFICIENCY MEASURES.
6. SOME COUNTRIES AND STATES HAVE BANNED FRACKED GAS,

how about ours!

7. United States needs to be a leader,  
we need to set the pace for our planet, NOW!

8. No NEW PIPELINES...ONLY REPAIR OR  
EXPAND THE EXISTING PIPELINES.

LOOK TO THE FUTURE! OUR SUSTAINABLE FUTURE IS FOR EVERYONE. DO NOT GIVE INTO  
THE CORPORATE BULLIES,

AS HAS BEEN DONE FOR TOO MANY YEARS!

Seems like common sense...but maybe not so common these days...

We need a fossil free fuel future!

There aren't any more fossils to provide fuel! It is finite.

But there is sun and ingenuity!

Virginia Hastings, 30 North Lane Northfield, MA 01360

**20150824-5278**

Kelly E Finan, Hop Bottom, PA.

To Whom it May Concern:

I oppose the Tennessee Gas Pipeline Company's Northeast Energy Direct (NED) Project. While the pipeline does not cut through my property directly, it will impact the values and the last uses of the properties of my neighbors and friends. I've witnessed FERC public hearings in which property owners plead to have their land spared from a pipeline path and even propose alternate routes which are ignored by the FERC completely. My friend Cathy Holleran is already faced with an unwelcome pipeline on her property and the NED project will only widen the corridor and cause her property, which is a producing stand of maple trees, further damage. It's outrageous that these kind folks who want only to be left alone to enjoy their property are being forced to submit to the will of a profiting corporation. NO MEANS NO.

Furthermore, I do not support any part of the infrastructure linked to natural gas extraction by hydraulic fracturing. Multiple sound studies have linked natural gas extraction to low birth weights, infant and childhood disease and death, and increased hospitalization. These studies took place in my home county of Susquehanna County, PA. I am not willing to be a lab rat for the profit of a gas company whose current practices are so harmful to both people and the environment.

Sincerely,

Kelly Finan

RE: Deny Kinder Morgan (KM) NED Pipeline Proposal PF14-22 and Supporting Local Gas Purchasing Contracts in NH and MA

DATE: August 24, 2015

I am writing to state that my family is completely opposed to the proposed NED pipeline and any proposed underlying NH or MA state gas purchasing contracts which may be used as a basis to justify it. We have repeatedly refused to give consent to allow a survey or access of our land and reiterate that refusal again here. We ask for your support in rejecting the pipeline in Fitzwilliam and the Monadnock Region for the following reasons and because little or no positive benefit to Fitzwilliam (or the Monadnock Region) can be demonstrated in exchange for the permanent environmental damage, violation of conservation protections, ongoing health and safety risks, lost quality of life, permanent municipal and landowner costs, and other burdens being imposed on the towns and the residents of this area.

The following are just a few of the reasons why NED as currently proposed should be stopped and any underlying gas purchasing contracts should be rejected.

A. Breach of the Public Trust and Charitable Trust Doctrines: NED proposes to cross and damage several valuable conservation properties or conservation easements/restrictions held by municipalities, state agencies, federal governments, and private nonprofit organizations in MA and NH (such as the Forest Society and the Monadnock Conservancy), as well as in other states. These lands are protected in perpetuity for the benefit of people and wildlife and are held in public trust for conservation purposes (known as the Public Trust Doctrine). *Illinois Cent. R.R. v. Illinois*, 146 U.S. 387 (1892); *Gould v. Greylock Reservation Comm.*, 350 Mass. 410 (1966); *Op. Att’y Gen.*, June 6, 1973. NED violates the Public Trust Doctrine by crossing and converting conservation lands to an inconsistent use (which is prohibited and actionable by the citizens) and which erodes the public’s confidence in government, conservation permanence, and the benefits of environmental protection and conservation for everyone. Furthermore, many (if not all) of these conservation lands being crossed are supported by federal funds/grants, federal tax dollars (including ongoing IRS charitable tax deductions), charitable donations, state funds/grants, and state tax dollars (including ongoing state charitable tax deductions). The use of government tax dollars, grants, and IRS/DOR charitable tax deduction benefits require that the conservation of land associated with these financial incentives continue as conservation land in perpetuity, many of these requirements are codified in federal, IRS, and state regulations. See *IRS Regulations*, 26 CFR § 1.170(A)-14. Similarly, under the Charitable Trust Doctrine, gifts or partial gifts of land or interests in land for conservation purposes can be enforced by the intended beneficiaries, including the general public, and cannot be undone by a vote or act of the Legislature. *Opinion of the Justices*, 368 Mass. 979 (1975). The environmental destruction promised by the pipeline violates that conservation protection and voids the purpose of any government funding/grants and IRS tax deductions awarded creating a need to reimburse or refund the government grant programs and IRS for the loss of the conservation benefits they originally underwrote. **FERC should explain how it intends to reimburse or compensate donors, taxpayers, land trusts, charities, government agencies, and the IRS for lost conservation benefits (and those which were paid for), lost conservation funding, and lost conservation tax deduction incentives, credits, and lost tax revenue due to the destruction promised by pipeline and breach of the**

**Public Trust and Charitable Trust Doctrines.** Even more damaging for our state's future and environmental health, breach of the Public Trust and Charitable Trust Doctrines completely erodes public confidence in government and faith in any future conservation initiatives. Such damage to public confidence and trust in government cannot be cured by any compensation or mitigation offered by KM or any entity for that matter. As some know, our farm was formerly owned by Jane Fiske who was a major force behind saving Gap Mountain with other Fitzwilliam and Troy residents and she donated a substantial part of our land to the Forest Society's Gap Mountain Reservation which we abut. Like her, we would like to contribute additional conservation land to the Forest Society's Gap Mountain Reservation, the Monadnock Conservancy, or the Town to preserve this property's historical and environmental significance, but sadly that effort is in jeopardy with the level of destruction promising to impact and devalue our area as well as the undoing of existing conservation protections contemplated by NED. **As a result, if not stopped the pipeline should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12, other major highways such as the I-90/MA Turnpike alternative, or within or along other existing pipeline corridors), and NOT in undisturbed virgin wetlands/forested areas adjacent to above-ground electric power lines.**

B. Breach of Due Process, Lack of Fairness in FERC Scoping Hearings, Segmentation, and Failure to Include Reasonably Foreseeable Pipelines Required by NEPA: As several state and federal legislators have repeatedly urged FERC, the current scoping period should be suspended in order for citizens and municipalities to evaluate the new information recently provided by KM and to provide meaningful feedback. The 79 volumes of their recent report have 6,571 pages of maps, tables and technical drawings, and contain significant gaps in information like a Horizontal Directional Drill Plan that consists of four pages containing one sentence, and over 10,000 instances of meaningless "TBD" in tables that should be completed with valid information. At the state and local government levels, such omissions would be a direct and unilateral basis for denial, even at a pre-filing stage. The same standard should apply here. Also absent is any information about the cumulative impact and overlap between the NED, KM's CT Expansion, other laterals currently being considered in NH and MA, and future compressor stations that would be reasonably required for new service areas and laterals contemplated as a result of NED. All reasonably related and anticipated projects as a predictable result of NED should be combined into one NEPA filing to avoid the growing evidence of segmentation as the Court said in *Delaware Riverkeeper v. FERC* and for the purpose of enabling citizens and governments to understand the full scope of NED, its overall environmental impact, and to understand other reasonably foreseeable and anticipated consequences for our region. 44 ELR 20126, No. 13-1015 (2014). **This is especially true where new gas purchasing contracts designed to justify NED are currently being advanced with NH and MA PUC's for new service areas in our region (such as Liberty Utilities and Berkshire Gas are currently doing). It is therefore reasonably foreseeable in the not too distant future that new laterals and new compression stations will be directly connected to NED, which would not exist without NED approval, and new environmental destruction will be required as a result of NED, such as in Troy, NH, Jaffrey, NH, Marlborough, NH, Swanzey, NH, and Keene, NH, to name just a few.**

As the Court held in *Riverkeeper*, FERC "fail[ed] to assess the additive effect of the Project together with the effects of existing or reasonably foreseeable gas development activities in the Project area, including . . . compressor stations, and other infrastructure. . . [and was] inadequate in considering the combined environmental impacts of related existing and reasonably foreseeable pipelines within the Commission's Jurisdiction [emphasis added]." As the Court instructed, NEPA is "in large measure, an attempt by Congress to instill in the environmental decision making process a more comprehensive approach so that long term and cumulative effects of small and unrelated decisions could be recognized, evaluated and either avoided, mitigated, or accepted as the price to be paid for the major federal action under consideration. *NRDC v. Callaway*, 524 F.2d 79, 88 (2d Cir. 1975)." Thus, an agency like FERC when reviewing NED must consider all "connected actions," "cumulative actions," and "similar actions." 40 C.F.R. § 1508.25(a). Cumulative actions are defined as "the impact on the environment which results from the incremental impact of the ac-

tion when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.” 40 C.F.R. §1508.7. The Court explained that “a meaningful cumulative impact analysis must identify (1) the area in which the effects of the proposed project will be felt; (2) the impacts that are expected in that area from the proposed project; (3) other actions – past, present, and proposed, and reasonably foreseeable – that have had or are expected to have impacts to the same area; (4) the impacts or expected impacts from these other actions; and (5) the overall impact that can be expected if the individual impacts are allowed to accumulate [emphasis added].” *Grand Canyon Trust v. FAA*, 290 F.3d 339, 345 (D.C. Cir. 2002).

As a result, and as other commenters have opined, FERC’s draft EIS fails to consider the reasonably foreseeable cumulative impacts of NED for our region and environment based on existing evidence supporting reasonably predictable laterals, compression stations, and environmental destruction directly connected to and as a direct result of NED. The absence of such information violates NEPA and deprives our region of, among many other things, a meaningful understanding of the full price to be paid for this major federal action being considered.

To comply with NEPA, as the Court held in *Grand Canyon*, the EIS should be revised to include “other actions – past, present, and proposed, and reasonably foreseeable – that have had or are expected to have impacts the same area; the impacts or expected impacts from these other actions; and the overall impact that can be expected if the individual impacts are allowed to accumulate.”

C. Wetlands and Drinking Water Aquifer: NED impacts a major wetland resource area and drinking water aquifer supply source located along the western and southern sides of my land abutting the electric power line corridor and which is associated with the Bowkerville Pond watershed and related aquifers. These wetland resource areas and aquifers should be avoided by the pipeline due to potential contamination and damage to underground aquifers and water flow due to pipeline construction and inevitable gas leaks. **To preserve wetland resource areas, values, functions and drinking water aquifers, if not stopped the pipeline should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90/MA Turnpike alternative, or within or along other existing pipeline corridors), and NOT in undisturbed virgin wetlands/forested areas adjacent to above-ground power lines.**

D. Substation Public Safety Hazard: NED directly abuts and passes within a few feet of the PSNH high voltage substation in Fitzwilliam. PSNH has acknowledged at recent Selectmen meetings that the substation has recently suffered structural failures and other failures of the high voltage transformer units. Such failures in close proximity to the pipeline would result in catastrophic destruction for our neighborhood and Town. Further, should a compromise in the pipeline integrity occur due to locating it near high voltage power lines and a high voltage substation (as is known to happen due to the electromagnetic fields generated), its location just a few feet from the substation would be equally as catastrophic. **Locating a volatile high pressure gas pipeline so close to a high voltage substation is a recipe for disaster. As a result, and to protect public safety, if not stopped the pipeline should avoid the substation area and should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90/MA Turnpike alternative, or within or along other existing gas pipeline corridors).**

E. Health Concerns: As recently cited in the Greenfield Recorder and other news media, KM has a long record of health and safety violations, felony convictions for deaths due to gas line negligence, gas pipeline leaks, and has demonstrated a knowing disregard for local health, safety, and environmental regulations that caused unreasonable risk to the public and the contamination of drinking water resources and private wells. This is unacceptable and should unilaterally serve to disqualify KM from filing any FERC or local applications. As we know, all residences in the Gap Mountain area use private drinking wells from underground aquifers or shallow wells and it is known in the industry that locating gas lines along or near high voltage

transmission lines (not to mention near a high voltage substation) and the electromagnetic fields they generate cause accelerated corrosion of the gas line coating resulting in gas leaks contaminating the ground water, among other health and environmental harms. Our drinking water also serves agricultural purposes and supports our livestock business. By allowing the gas pipeline in this location and by this company we are inviting trouble, health problems, and economic loss. **As a result and to protect public safety, if not stopped the pipeline should avoid the PSNH substation area and should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90/MA Turnpike alternative, or within or along other existing pipeline corridors).**

F. Increased Noise Concerns: As you know, the pipeline apparently cannot be located in the cleared area of the existing electric utility power line corridor due to the electromagnetic fields generated, although for some strange reason, the pipeline crosses through the cleared utility corridor at various points. This is an unacceptable risk to public safety and should be rejected. In addition, a new 150+ foot wide swath of cleared corridor next to the existing power line corridor must occur in which to install the gas pipeline. This extensive loss of trees along the current power line corridor would be devastating for my property aesthetically, environmentally, and would compromise the stability of the steep slope of my western boundary creating a future environmental and safety hazard. Further, this new cleared corridor would remove a substantial sound buffer currently serving to reduce noise from the PSNH substation and Route 12 traffic thus depriving us of the quiet use and enjoyment of our neighborhood and exacerbating harm to our neighborhood. **As a result, if not stopped the pipeline should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90/MA Turnpike alternative, or within or along other existing pipeline corridors).**

G. Wildlife Habitat: Above ground utility line corridors and the abutting forests are commonly occupied by various wildlife as important habitat. Clearing a new 150+ foot swath of land adjacent to the power lines would unnecessarily destroy this habitat occupied by numerous wildlife species, some endangered such as the Smooth Green Snake, which may also occur on my property. **As a result, if not stopped the pipeline should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90/MA Turnpike alternative, or within or along other existing pipeline corridors).**

H. Alteration of Landscape and Waterflow Patterns/Flooding Concerns: Installing the pipeline on the western boundary of my property as proposed will jeopardize the stability of steep slopes leading to a risk of land and rock slides and will change waterflow patterns associated with drainage leading to a risk of flooding and water contamination. All are factors that will jeopardize the safety and integrity of the pipeline leading to public health and safety risks and contamination of groundwater supplies. The extensive blasting required for installation will also destabilize and jeopardize this area. **As a result, if not stopped the pipeline should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90/MA Turnpike alternative, or within or along other existing pipeline corridors).**

I. Undue Overburdening: The Gap Mountain area where we live, once touted as a beautiful asset and important natural resource in Fitzwilliam and Troy for tourism, recreation, and hunting, is currently being degraded by the energy utilities. We already host a noncompliant high voltage substation damaging our neighborhood and PSNH is currently seeking to expand its power lines causing even more tree loss, environmental damage, and wetland alteration. We have made strides working with the Selectmen and Planning Board to help improve these issues. But now add the gas pipeline, and you have a perfect storm of environmental destruction and detriment to our neighborhood. Fitzwilliam and the Gap Mountain area is being overtaxed by the utilities and should not have to singularly bear the environmental damage, lost tourism, lost economic and agricultural opportunities, depreciated property values, and public safety risks caused by the combina-

tion of a volatile noncompliant substation, power line expansions, and a new KM gas line all in the same neighborhood. Further, it seems unfortunately predictable that either PSNH (or KM) will eventually seek to occupy adjacent land for additional structures, transformers, gas compressors, utilities, etc. further destroying our natural resources, threatening public health, and degrading our neighborhood and the Gap Mountain area. **As a result, if not stopped the pipeline should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90/MA Turnpike alternative, or within or along other existing pipeline corridors).**

J. Destruction of Upper Gap Mountain Road and Cobligh Hill Road: Installation of the pipeline will likely involve the use of narrow dead-end dirt roads and cart paths that provide access to and surround my property and in which I currently hold a possessory fee interest. These narrow dirt roads/cart paths are not suitable for heavy construction equipment and Cobligh Hill Road (which circumnavigates my property) is an abandoned path not passible by any vehicles or equipment. Use or alteration of these dirt roads for any access or travel relating to the pipeline construction would constitute an overburdening of any public or other easement right to pass that may exist, if any. As a fee owner of these dirt roads, I will be negatively impacted by any increased use associated with the pipeline construction and will require appropriate compensation, restoration, and mitigation if eminent domain or other proceedings require their use or occupancy. As a result, if not stopped the pipeline should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90/MA Turnpike alternative, or within or along other existing pipeline corridors).

K. Eminent Domain Taking is Wrong for Private Business Purpose: Currently, NH law prohibits the taking of land by government for private gain and for power transmission lines. The forced taking of a portion of my land for this project violates NH law and, even if permitted, is wrong without adequate compensation for the total financial losses suffered, including but not limited to, financial harm due to loss of resale value, loss of mortgage and refinance eligibility, loss of homeowner's insurance, loss of agricultural and subdivision opportunities, and lost quality of life and enjoyment. None of these very real and quantifiable losses are accounted for in the compensation guidelines provided by federal eminent domain. As a result, and as was proposed in part by the NH legislature, KM should be obligated to compensate me equal to the purchase of the entirety of my farm and homestead property connected with the pipeline portion at a fair market value based on comparable sales data determined by an independent appraiser. **Otherwise, if not stopped the pipeline should be rerouted and located in, on, under, or along existing hardscape and previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90/MA Turnpike alternative, or within or along other existing pipeline corridors).**

L. More Investigation of Nonimpact Alternatives, Highway/Existing Pipeline Colocation Alternatives, and Renewable Energy Alternatives must be done: In the interests of due process, fairness, and the efficient use of government resources and tax payer dollars, KM (its subsidiaries and agents) should be enjoined from submitting additional applications to FERC (and to any local public utility agencies) and FERC (and any local public utility agencies) should be enjoined from receiving and reviewing any further applications relating to NED until such time as a comprehensive review of the region's energy need is completed and compared against: (1) newly authorized energy and gas delivery projects, (2) new enhancement, maintenance, conservation, recovery, or expansion of existing projects and facilities available to provide gas/energy to serve the region, and (3) new renewable energy resources available to supplement energy needs. We are glad the Massachusetts Attorney General is currently undertaking such studies to inform the region's energy growth needs and balanced with government's critical climate change goals. Many have suggested the proposed Spectra Energy and Portland Natural Gas Transmission System pipelines as better alternatives to NED because: (1) they would utilize existing pipeline rights of way without destroying hundreds of miles of virgin forests and wetlands, (2) avoid the thousands of eminent domain takings NED would require, (3) supply more than enough gas for the Region's projected energy needs, and (4) it is anticipated they will be they

will be operational during a similar time frame as NED. It would be a more efficient use of taxpayer dollars and better for our environment and economy if FERC required additional analysis of these and all other potential alternatives, including the no-build option, and further explain the reasons why none are preferable to the public interest and environment compared to NED.

Furthermore, KM has failed to compare the impacts of the NH preferred route to the MA Turnpike (I-90) alternative and also failed to assess the impact of constructing and maintaining a pipeline and right of way on virgin forested lands as compared to on previously disturbed or hardscape lands. In most circumstances, a pipeline crossing conservation land, forests, wetlands, or rivers in a virgin or undisturbed land would have a greater negative impact on the ecosystem than would the same crossing in already disturbed hardscape lands. As a result, KM should be directed to utilize existing hardscape and previously disturbed lands and to avoid forested undisturbed lands.

M. Gas Capacity for the Pipeline Dramatically Exceeds Local Need and is not in the Public Interest: Research indicates any alleged need for additional gas in New England is very small (merely 25% or less) and much less for NH's alleged need (nearly 6% or less), as compared to the total gas capacity of the NED pipeline. As a result, at least 75% or even more of the gas travelling through NH can be expected for export to foreign countries and markets, and not for use in NH or even New England. Yet NH landowners and municipalities suffer a disproportionate majority of the costs, environmental damage, loss of property values, public health and safety risk, loss of tourism, loss of quality of life, loss of agriculture, and long term burden due to the NED pipeline and its reasonably anticipated future infrastructure expansion. Hence, NH unnecessarily assumes all of the permanent risks and environmental damage for its section, but gains little to none of the benefits and none of the profits in this lopsided arrangement. Whose self-serving idea was this? As an agency that purports to issue permits in the public interest, FERC should be offended by this prospect and reject it immediately. Ironically, it is anticipated that export of gas to the exclusive profit of KM will increase the cost of gas generally and thus harm all US citizens. Last, it has been well supported that the alleged need for additional gas in NH and New England can be readily obtained without the need for a new pipeline and its associated damage, costs and risks to the Monadnock region. Alternative sources of energy include, but are not limited to, adopting energy conservation measures currently being considered by all New England states, improved maintenance of existing gas pipelines currently serving the area, upgrading existing pipelines already in service in MA and NH, increasing capacity of currently planned and FERC approved pipelines currently serving all of New England. Any and all of these options would be abundantly preferable to permanently destroying over 450 new miles and thousands of acres of virgin forest, woodlands, and wetlands, and committing thousands of wrongful eminent domain takings for us to achieve the same ends. Furthermore, in today's era of confronting and mitigating climate change, the prospect of a new gas line in virgin land and forests should be the least desirable option, an absolute last resort, and to be considered only when all other alternative options and measures are completely exhausted. Yet in the case of NED, it seems to be a first and worst option for NH, although many other viable options exist that are less costly and less damaging to NH, its citizens, its landscape, and its resources. NH governments, officials, and representatives should refuse this option because it will work to negatively impact the entire state and instead act to protect the interests of its citizens and environment. Last, supplying the region with more gas through NED will likely not lower gas prices or energy costs which is the carrot KM and FERC seem to be leading us by. In addition to destroying our natural resources and quality of life, Ann Berwick (the former NESCOE President) recently opined on August 17, 2015 in a Boston Globe article that adding more gas capacity to the region will not necessarily lower energy prices. This was illustrated in PA, home of the largest supply of natural gas in the Eastern U.S., when gas prices spiked in the winter of 2014. If they are not immune to gas price volatility, it's hard to believe we would ever be after NED. Let's think smarter about energy delivery and energy efficiency before we decide to destroy more of our irreplaceable natural resources, reduce existing conservation lands set aside for people and wildlife, and take more private land for private business gain.

#### N. Conclusion

For these reasons, among many others (such as the pipeline cost/benefit analysis denouncing pipelines released by the Maine PUC on July 14, 2015 – one of KM’s former potential but now lost customers), the Town and NH Government should take whatever action is appropriate to prohibit NED or require that it is rerouted to existing hardscape, previously disturbed hardscape infrastructure (such as Route 12 and other major highways such as the I-90 MA Turnpike alternative), or located along existing disturbed pipeline corridors.

Thank you.

Re: Tennessee Gas Pipeline proposed Northeast Energy Direct Project  
Docket N. PF14-22-000

Dear Chairman Bay:

In my previous correspondence of April 2, 2015 and May 15, 2015, I pointed out the inadvisability of holding scoping hearings before the many “TBDs” that Tennessee Gas Pipeline (TGP) has incorporated in its filings have been addressed.

Unfortunately, TGP’s failure to correct the many deficiencies in its filings hasn’ seemingly resulted in any delays in its schedule. Their efforts to “run out the clock” appear undeterred.

“TBD’s” are, when used on the scale that TGP does, simply a means of avoiding public comments. In addition, they foster a sloppy approach and ensuing errors.

An incident in the Town of Richmond illustrates the problem. Recently the town discovered, through a chance encounter and conversation with a TGP employee, that a change was made in the previously understood plans. The pipeline’s path was originally understood to include uninhabited, heavily posted logging land. This has evidently changed, allegedly based on lobbying by its owners, and is no longer in the pipeline’s path. Instead, the pipeline’s new path will cross an important recreation area, sensitive wetlands, vernal pools, brooks, historic Bennett Gorge and go above and below ground springs that feed wells and streams. The new path along the eastern side of Scott Mountain also appears to threaten the protected Quint Preserve and possibly Yale University’s Goss Woods. I have also been told that the new path will severely damage and encroach on a number of homes.

This new path’s environmental impact is, by any standard, far greater than the original path. That the town discovered the change is purely serendipitous. I am advised that there was no notice of any change. Given the length of the pipeline and the haphazard way TGP does its required filings, it seems likely that this is not an isolated case.

I continue to believe that scoping hearings are premature and cannot contribute to a reasonable conclusion

without the cooperation of TGP, something we haven't seen in its filings.

TGP's failure to provide anything other than a moving target to those seeking to comment on its filings is consistent with its approach to FERC's requirements and its lack of concern for the environment, communities and property owners in the pipeline's proposed path.

Short of denying the project outright, clearly my preference, I believe the deadline for scoping hearing comments should be extended until at least December 31st.

Sincerely,

James W. McConnell

Project docket number (PF14-22)

Robert B Meyers  
152 Hinsdale Rd  
Windsor, Ma 01270  
1-413-684-3463  
windalewoods@verizon.net

These scoping meetings need to be repeated when more information on the project is available and they need to include meetings in compressor station towns. It is clearly unfair that almost no Scoping Meetings are being conducted in the communities most impacted - those who will bear the brunt of the impacts from compressor stations, several of which could be among the largest ever built in the US.

I would like to see a study done on repairing the gas lines now in use. Why are we not taking steps to repair existing gas line leaks? The cost alone could be less than running a new larger pipeline.

In Boston alone by Boston University Professor Nathan Phillips and colleagues identified 3,356 leaks with methane concentrations exceeding up to 15 times the Global Background levels, 34 times more potent than carbon dioxide.

Natural gas emissions from oil and gas operations:

An EDF-commissioned analysis shows that about 3.5 trillion cubic feet of methane, the main component of natural gas, escaped in 2012 from oil and gas activities. Unless we curb methane pollution, emissions will increase nearly 25% by 2030.

"If we cut today's methane pollution in half globally, the effect over the next 20 years would be equivalent to shutting down 1,000 coal-fired power plants." Says Drew Nelson, manager of EDF's natural gas program. "This is a low-cost opportunity climate negotiators can't afford to miss."

Wyoming is one of America's top natural gas producers. Regulators approved a rule in May that will reduce air pollution in western Wyoming that's a center of energy production. The new pollution controls apply to both new and old equipment. We need to start in Massachusetts to fix all the gas leaks. It would be a great savings on gas and less pollution, a no brainer.

*{3 pages of graphics omitted }*

CONCLUSION *{last page of article}*

Natural gas use for the generation of electricity has seen an unprecedented rise over the last few years, and this trend appears likely to continue. As the New England electric grid becomes more reliant on natural gas, reducing the losses on the distribution system should play an important role in enhancing reliability of the electric system and avoiding unnecessary expansion of natural gas infrastructure. Scientific and industry studies have confirmed that the current level of fugitive emissions from the natural gas industry is high, but difficult to quantify accurately. Although Massachusetts has no direct control over natural gas production, processing, or transmission, it may regulate the distribution of natural gas in a variety of ways. Indeed, meeting the Commonwealth's mandate to reduce greenhouse gas emissions by 25% below 1990 levels by 2020 and 80% below 1990 levels by 2050 requires the Commonwealth to address this substantial source. In addition, reducing fugitive emissions from the distribution system will provide direct benefits to ratepayers through the reduction of costs for LAUE. The policy options that could provide the most immediate benefits include establishing leak classifications and repair timelines and expanding TIRF programs to include enhanced reporting and measurement of the impacts on greenhouse gas emissions and LAUF reductions. However, ensuring that these programs are successful requires more accurate measurement and evaluation of the sources of these fugitive emissions, and Massachusetts should press industry and the federal government to direct resources to address this issue in a transparent and expeditious manner. Every day, thousands of methane leaks are actively releasing one of the most potent greenhouse gas emissions into the air in Massachusetts. Under our current regulations, we do not have an accurate accounting of these emissions, ratepayers cannot easily determine how much of their bill is going towards LAUF, and companies have no incentive to repair leaks unless they pose an immediate hazard. Massachusetts can and should take swift, direct action to change this state of affairs and bring fugitive emissions from distribution pipelines under control.

Norman C. Bay, Chairman  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE: Docket No. PF14-22-000

Dear Chairman Bay:

I respectfully request that the Federal Energy Regulatory Commission reject Tennessee Gas Pipeline Company's proposed Northeast Energy Direct (NED) Project. I have this request upon the following:

1. The pipeline and compressor station are located too close to Our Lady of Hope, our religious facility. This high-pressure, high-capacity station will bring significant human safety risks to our Sisters living there.
2. The pipeline and compressor station are located too close to a farm containing Newfoundland ponies, an endangered animal. There are only 250 left on earth.
3. The pipeline and compressor station are located too close an annual migration path of thousands of raptors. The high-pressure, high-capacity station's exhaust plumes of heated gases will bring significant safety risks to these birds.
4. The pipeline and compressor station are located too close to a school whose heating system uses outside

air to heat the facility. This high-pressure, high-capacity station will bring significant human safety risks to our teachers and children attending the school.

5. The pipeline and compressor station are located too close to our water supplies, parks, and conserved land and will bring significant environmental hazards .
6. FERC has already approved another pipeline to satisfy New England's natural gas-fired electric generation needs on the coldest days. We don't appreciate the need-to add more supply.
7. The particular gas that would be carried in the proposed pipeline is likely to be particularly high in toxins and radiation, and the health impact upon our families, animals and plants must be avoided.
8. The proposed pipeline route requires a new right-of-way that would cut through many miles of environmentally sensitive areas and take permanently protected land out of that protection.
9. Some "fracking" compounds and chemicals negatively impact the skin, eyes, sensory organs, the respiratory system, the gastrointestinal system, the liver; the nervous system; and are candidate endocrine disrupting chemicals. Endocrine disrupting chemicals (EDCs) present unique hazards, particularly during fetal and early childhood growth and development. We do not want to be exposed to any of these chemicals.

Respectfully submitted,

August 20, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission 888 First Street NE, Room 1A Washington, DC 20426

Project docket number PF14-22-000

Dear Commissioners,

There have been many articulate assertions for both postponing the deadline for comments and for stopping the pipeline due to the lack of need. I do not claim to have sufficient knowledge to decide either of those issues. It is the intent of this letter to share comments for your consideration in regards to the suitability of the currently proposed pipeline route followed by a couple of design comments if the pipeline is ultimately constructed.

Enclosed are five maps of Dracut, MA. Three of these maps were provided by our regional planning agency and one map was prepared by Dracut's Engineering Department. There is no claim that the maps are one-hundred percent correct, but they represent a sincere effort by professionals to provide up-to-date and accurate information concerning Dracut.

Our regional planning agency maps contain information in relation to the proposed pipeline route on known wetlands, BioMap2 Core Habitat, HESP endangered species habitat, public water supplies, private wells, aquifers, Child or Residential Care Facility, Historic Commission Register Sites, and Potential Impact Radius (PIR) Unofficial Estimates in Dracut. In your review of the maps please note the number of homes located within close proximity of the proposed route as well as the number of approved and or houses in the permit approval process.

The Engineering Department's map depicts the proposed or approved subdivisions within one-half mile of the proposed pipeline route and also the pipeline route in relation to vernal pools. On this map, please take special note of the estimated proximity of many certified vernal pools to the proposed pipeline route. Dracut takes the protection of vernal pools seriously. I have been informed that Dracut has the second most certified vernal pools of any community in Massachusetts. A number of years ago, the Town of Dracut adopted its own wetland bylaw that extended protection to vernal pools to a greater extent than the State of Massachusetts' laws and regulations. Please take Dracut's efforts into consideration when approving the pipeline route.

Also on the Engineering/vernal pool map, note the number and position of permitted or in process subdivisions are located along the proposed pipeline route. In my position as Dracut's Town Planner, I can verify that among the approved/in process subdivisions on the other Dracut Engineering Department map:

Broadway Village	278
Berube Farms	34
Wheeler Village	73
Green Acres	7
Freedom Court & Liberty Lane	11
Total approved or in-process units	403

Given the cumulative information contained in these five maps it is asked whether FERC should require that the proposed pipeline route be changed.

If the pipeline is ultimately built and/or where it is built is modified then please take into consideration my additional following comments:

- For public safety purposes shut-off valves should be required to be located as closely to one another as feasible; especially when in close proximity to where people live, work, and play.
- For public safety, shut-off valves of the latest pr-m-en technology should be installed and able to be remotely closed to avoid delays in case of a leak or explosion.
- Personnel should be on duty 24/7 at locations where the remote dosing of valves is to be administered.
- The improper/illegal use of all-terrain-vehicles (ATV's) is a challenge to our police department. Utility corridors are one of the favorite trails used by ATV operators when perpetrating this improper/illegal acts. It is important that impediments on these utility corridors be installed and maintained in order to deter these acts.

- Compressor and Meter Stations must be located to protect the safety and quality of life (noise, light, fumes, etc.) for residents.

Thank you for your anticipated attention to and consideration of the above comments.

Respectfully submitted,

Glen Edwards

Dracut Assistant Town Manager/Town Planner

August 17, 2015

Federal Energy Regulatory Commission

888 First Street, NE, Room 1A

Washington, DC 20426

Docket No. PFI4-22-000

The proposed pipeline would be parallel to an existing 36" line operated by Maritimes and Northeast on my property while Kinder Morgan TGP has a 10" line in the City of Methuen which they are replacing with the 20" line in most areas. There has been no explanation for not doing so in my area. This would result in the complete removal of the remaining tree line on my property and the blasting would certainly increase the safety risk to the surrounding area. The result would be a tremendous loss of property value to me and my neighbors and an increased safety risk which could be greatly reduced by simply replacing their 10" line which would require no blasting and less property damage to affected homeowners. This is obviously in addition to the fact that there has been no viable explanation of the need for this increased capacity by Kinder Morgan.

Thank you for your consideration of my concerns and for the patience exhibited at the scoping meetings while hearing the many points of view.

Respectfully submitted,

Michael Hubbard

I/We (Grantor) do hereby **DENY** permission to Tennessee Gas Pipeline Company L.L.C., a Delaware limited liability company, (Tennessee) its successors and assigns, affiliates, employees and contractors to enter upon my/our land for the purpose of performing civil and environmental surveys and studies that include, but are not limited to, project routing, characterization of land as to property ownership, topographic features, descriptions, cultural resource, wetland delineation and archeology.

Name: DiBiase Investments, Inc.

Address: 749 Lowell Street (locus is 1 745)

Lynnfield, MA 01940

Phone 1 781-334-3725

Notes/Comments: Notifying Lynnfield Police Dept.

**20150825-0072**

August 19,2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1 A  
Washington, DC 20426  
RE: PF 14-22-000

Dear Ms. Bose:

Thank you for the opportunity to provide testimony at this Scoping session on areas of inquiry for the Northeast Energy Direct project. PF 14-22-000. I am pleased to be able to make these comments directly to you as staff of FERC.

I have been to Washington twice in the last year, in November and May, spending several days at 888 First Street each time in an attempt to inform you of the concerns that many of us in frontline communities have about your perfect record of approving natural gas projects.

These projects have devastating impacts on individuals, households, communities, and the environment, and many are not needed. Gas from fracked wells contain a number of toxic and radioactive contaminants for which human health studies have not been reliably undertaken. Worse, they inhibit the development of energy projects that we do need to move our country forward and to give us the option of preventing devastating climate change.

The job you and the EPA have in vetting the volumes of the Environmental assessment is monumental. Indeed, it is monumental for us citizens also. Yet, when any specific &-ea of the Resource Reports is analyzed, it can be seen that there is significant repetition and vagueness. making the ability to assess impact quite challenging.

I started my professional life as a planner preparing the socio-economic impact sections of some of the first environmental impact assessments in the early 1970's - one for a hydroelectric facility and one for a nuclear power plant. Based on my background, I am commenting on the socio-economic and land use sections, with a particular focus on the areas around the terminus in Dracut, and the Lynnfield and Peabody laterals.

**EMPLOYMENT**

In the 7/24/15 draft, employment projections are provided for the entire length of the project. A projection is then provided roughly for an average length of pipeline called a "spread" - undefined in this portion of the report - at about 400-1000 workers over a 9 months-year timeframe.

**Please add to the scope** a break down the pipeline b} "spreads" on a map so that more clear estimates of housing concerns and job and economic benefits can be defined for a region.

There is mention of the use of national contractors coming into construction areas. **Please add to the scope** information on the percent of national contractors required for the more difficult construction projects (compressor stations and timing stations) vs. for the installation of pipeline only. Please provide information on whether national expertise is sought for construction in environmentally sensitive areas. . .

The Resource Reports project three permanent jobs in the Eastern Massachusetts area as summarized below:

Middlesex County - 1 Operations Specialist' for 52 wees/year at a salary of \$61,000

Middlesex County - 1 Damage Prevention Specialist for 52 weeks/year at a salary of \$61 ,000

Middlesex County - I Measurement Specialist for 52 weeks/year at a salary of \$83,000

This job creation potential is hardly worth noting as an incentive for undertaking the installation of gas pipe-

lines. There are also public safety concerns from this level of staffing as noted in the next section.

## RESPONSE TO EMERGENCY HEALTH SITUATIONS

Are the positions listed above adequate to respond to an emergency leak - particularly one that has ignited? **Please add to the scope** a more thorough analysis of the specific job responsibilities of these positions as they relate to notification of public safety emergencies. Also, **please add to the scope** the inclusion of a map that indicates the locations of shut-off valves.

There have been articles about so-called “man camps” in fracking areas and their impact on communities and public safety. **Please add to the scope** the likely locations of any relatively dense settlement in campgrounds or trailer parks that could create a temporary ‘public safety situation and demand a response from local public safety personnel.

Under Title 49 Code of Federal Regulations (“CFR”) Part 192, Section 192.615 of the U.S. Department of Transportation {“US DOT”) regulations, each pipeline operator must establish an Emergency Plan that provides written procedures to minimize the hazards from a gas’ pipeline emergency. Key elements of this Plan include procedures for:

- Receiving, identifying, and classifying emergency events--gas leaks, fires, explosions, and natural disasters; ..
- Establishing and maintaining communications with local fire, police, and public officials, and coordinating emergency response;
- Making personnel, equipment, tools, and materials available at the scene of an emergency;
- Protecting people first and then property from actual or potential hazards; and
- Emergency shutdown of system and the safe restoration of service. For emergencies during construction and operation, Tennessee and its contractors will employ 911 services for immediate response. Emergency responders will identify the nearest and appropriate area hospital for treatment based on distance and injury.

It appears from the Resource Reports that Tennessee will prepare an emergency plan. I did not see any significant description of training for local personnel in emergency events. The last item of the required procedures indicates Tennessee will “employ 911 services”. **Please add to the scope** any information about the type and extensive nature of training to local public safety officials, the location of shut-off valves, and the responsibility for turning off the gas in an emergency for all hours of the day.

**Please add to the scope** a discussion about the type of damages from emergency events, but also from routine operation, that can damage the property, value, and health of local residents, and describe how the injured party from each type of occurrence will be fully compensated. Such events might include the health and property value impacts of 24/7 lighting and noise of the operation of compressor stations, the loss of value of property due to the presence of the compressor station and the threat it poses, as well as the clear loss from a disaster situation.

## PROPERTY VALUES AND INSURANCE

The Resource Reports referenced several studies that purported to find that there was no impact on land and property values by proximity to gas pipelines and infrastructure. It indicated that if an easement were to be needed, property owners would be compensated. Specifically, the Resource Reports summarized, “No major impact on insurance rates, property sales, demand for properties, or development of surrounding properties is expected. Therefore, the Project will not cause any direct or indirect impacts that will contribute to a cumulative impact on property values.”

The Resource Reports went on to indicate that if property values were to decline in the absence of an easement needed, owners could seek an abatement from their taxes for the reduced value. The granting of an abatement is not assured. Further, this does not compensate for the loss of asset value. **Please add to the scope** newer, and most importantly independent, studies on the question of decline in property value, and provide information on a clear path that property owners can pursue seeking redress from Tennessee for the

reduced value.

**Please add to the scope** how insurance rates would be affected by the presence of and proximity to compressor stations specifically. Anecdotes indicate that there are serious issues with property values and insurability with proximity to compressor stations, **Please add to the scope** also what redress property owners could have if they are unable to insure their property.

Environmental justice is covered by the inclusion of general county data. **Please add to the scope** the environmental justice characteristics within the areas surrounding compressor stations.

#### **ARTICLE 97 LANDS**

“Based on MassGIS data and a title search, Tennessee identified 56 parcels in the proposed Project area that are identified as protected under Article 97 (Table 8.3.5). Tennessee is still in the process of determining title and compiling a complete list of Article 97 lands. If needed, revised information will be submitted in the final ER.” **Please add to the scope** all parcels of Article 97 land along the proposed route of the pipeline so communities and the state can consider their options for continued protection of this land.

Thank you for your consideration.

Sincerely,

Carolyn Britt  
I Shagbark Woods  
Ipswich, MA 01938

RE: Kinder Morgan/Tennessee Gas Pipeline, LLC Docket #PF-14-22-000  
Northeast Energy Direct (NED)

Dear Ms. Bose,

We are writing to express our opposition to Docket #PF-14-22 and together request FERC deny a permit to Kinder Morgan for the NED project.

Drinking water is critical to the health and quality of life of New Hampshire’s resident and tourist populations. New Hampshire has been nationally recognized as a leader in protecting its sources of drinking water. Given the composition of New Hampshire’s bedrock, the extensive geologic disruption caused by the construction of NED has the potential to substantially degrade its sources of drinking water. Aquifers and wells that are currently within acceptable levels may be disrupted by the extensive blasting required for NED, changing the composition of contaminants within our water supply.

Known as “The Granite State,” New Hampshire’s geology lends itself to naturally occurring contaminants, predominantly arsenic and radon. Arsenic and radon are inherent byproducts of the region’s bedrock. They are known carcinogens and pose significant health concerns. Arsenic and radon have no color and no odor, even when present at elevated levels.

Wells drilled into New Hampshire’s bedrock fractures have a 1 in 5 probability of containing naturally occurring arsenic above 10 parts per billion and wells within 50 feet of each other can present very different water quality because of the highly fractured bedrock inherent in New Hampshire. Chronic or repeated ingestion of water with arsenic over a person’s lifetime has been associated with increased risk of cancer (of the skin, bladder, lung, kidney, nasal passages, liver or prostate) and non-cancerous effects (diabetes, cardiovascular, immunological and neurological disorders). Although most of the arsenic in groundwater is of geologic origin, some of it originates from the historic use of pesticides on apple orchards and other crops as

well as ash disposal.

Radon gas is a byproduct of the radioactive decay of radium in certain rocks such as granite, so is naturally occurring here in "The Granite State". People are exposed to radon via its migration through the soil and into homes where it is inhaled, through groundwater entering the home as drinking water and released as gas when showering or running water, and through drinking the water.

Private well water testing is not required in NH. And state standards with regard to the treatment of private wells is non-existent in the State of New Hampshire. Although educational programs exist, New Hampshire landowners are on their own with regard to monitoring and maintaining the quality of their water supply.

We respectfully request FERC thoroughly investigate the impact NED will have on the aquifers and private wells that provide drinking water across southern New Hampshire and deny Kinder Morgan's permit for NED.

Thank you for your consideration.

Respectfully,

Timothy & Donna Butler

RE: Proposed Northeast Energy Direct Project (NED), Tennessee Gas Pipeline and Kinder-Morgan Pipeline

Dear Commissioners and Secretary,

I know you have many, many comments to read and you will not read them all I am sure. Please, please read this one as it is my second letter to you concerning the above stated pipeline due to the proposed changes in the path by the NED after my issuing the first letter. In the last four days, I have read about 90% of the comments submitted to the FERC library and only stopped because I could no longer see to read them. In all the comments I read, I only found two from the State of Connecticut that were in favor of this pipeline and felt a need for the gas due to cost only. Of course there is no proposed pipeline traversing their State's homeowners, conservation land, wetlands, aquifers and forests. I believe the change in direction of the pipeline was directly due to the resistance Kinder-Morgan received from the northern Massachusetts coalition of citizens. It is unfortunate that they decided to change their route to southern New Hampshire. Although, it will make no difference to those of us who resisted this pipeline, we will fight right along with the citizens of New Hampshire to preserve New Hampshire as we did Massachusetts.

You have received much information on the reasons why we feel this pipeline is not necessary to provide energy to us in the Northeast, I definitely agree with all the comments made against the need for this pipeline.

However, I feel you need to hear a personal reason for denying this project. My ancestors settled this county in the 1600s and several of my great, great, great, etc. grandfathers fought in the American Revolution and the War of 1812 to create this country. May I remind you the Revolution began in Massachusetts, Worcester, Concord, Lexington and Boston. Do you remember Bunker Hill, I just visited there again to renew my spirit of why this country was created. As a college graduate, I worked several years as a Social Worker

receiving pay for what constitutes low income. Now that I am retired, I survive on \$1084.00 a month from Social Security, savings and what I can obtain from the sale of Christmas Trees and timber. I own my own home, pay taxes, insurance, both property and health, rescued three abandoned cats, burn wood to supplement my oil and manage to still eat. I live very frugally and I do not receive any support from the State of Massachusetts or the Federal Government with the exception of Social Security which I paid into while employed. Two parcels of my property are under Chapter 61 Classified Forest and both already have a Fitchburg Gas and Electric (Aka Unitil) easements. I have recently learned that the proposed Fitchburg pipeline lateral will use one of these easements and require more land from me in order to accomplish this lateral pipeline. My question to you is when will I have given enough of my land, which provides a source of income to me, before the government stops. Let me ask you the question is my forest products grown to produce lumber for houses, furniture and as a by-product provides oxygen to the air any less valuable?

I have never been in favor of eminent domain as the 14 Amendment implies due to it being ambiguous. "... The power of eminent domain may only be exercised through legislation or through legislative delegation, usually to another government body, the power may be delegated as well to private corporations, such as public utilities, railroad and bridge companies, when they are promoting a valid public purpose. Explicit in the just compensation clause is the requirement that the taking of private property for a public use; the Court has long accepted the principle that one is deprived of his property in violation of this guarantee if a State takes the property for any reason other than a public use. The question whether a particular use is a public use is clearly a judicial one...The modern concept of public use equates it with police power in the furtherance of the public interest. No definition of the reach or limits of the power is possible, the Court has said, because such "definition is essentially the product of legislative determinations addressed to the purpose neither abstractly not historically capable of complete definition...Public safety , public health, morality, peace and quiet, law and order, - these are some of the traditional applications of police power...Traditionally, eminent domain has been utilized to facilitate transportation, supply of water and the like, but the use of power to establish public parks, to preserve places of historic interest and to promote beautification has substantial precedent. The values it represents are spiritual as well as physical, aesthetic as well as clean, well balanced as well as carefully patrolled. For "Public Use", then it may well be that "Public Interest" or "Public Welfare" is the more correct phrase." Excerpt taken from an annotation of the 14th Amendment to the Constitution of the United States.

In the case of Public Welfare and/or Public Interest please do not approve this pipeline, it is not needed and it is greatly abusing our rights and freedom as citizens of Massachusetts and the United States of America.

Julia Stockwell, 203 Lunenburg Road, Townsend, Massachusetts, jvstockwell@yahoo.com

## **20150825-5020**

Amy Glowacki, Mason, NH.

I am opposed to this pipeline project. Kinder Morgan has failed to provide documents that prove this project will benefit NH citizens. The survey denial rate for NH residents is 75%. If a certificate of convenience is issued for this project and eminent domain comes into play - how can Kinder Morgan be allowed to use eminent domain to take private property without providing proof that the residents of NH will benefit from this project?

With survey denial rates at 75% in NH this project cannot be sited properly at this time. Please slow this process down and allow time for the proper execution of the steps to provide opportunities for fair and accurate information to be exchanged. There are too many serious impacts to property values, our water supply including wells, streams, rivers, ponds, lakes, wetlands and the wildlife therein, and adverse health impacts from the potential dangers of this project to rush this through without proper documentation and thorough review.

There is no attempt to plan for future needs-what happens when our wells are contaminated? How will the project plan for the protection of our clean water? If Kinder Morgan is only claiming responsibility for wells

200 feet from the pipeline this is short-sighted. The blasting of granite and laying of pipeline will disturb our aquifers and failing to address these issues is an affront to every citizen of NH along this pipeline route. The pigging stations and the chemicals they will leech I to the ground need to be addressed. The pipeline with compromise and threaten it water supply I perpetuity. How will our water supply be protected?

Also, I am unable to sell my home. Kinder Morgan claims that pipelines do not impact property values. Well, they do. Nobody even entertain the idea of buying my home - not with the pipeline project slated for town. I want to sell my home for a job opportunity - but I am unable to do so and am trapped. Don't let Kinder Morgan state property values are not Impacted because they are. I am unable to sell my home due to this pipeline project.

I fear the day the construction begins. If Kinder Morgan fails to provide fair and honest answers to our questions how will we be treated when construction begins? There are very few roads in and out of Mason. The pipeline crossed one main artery into town twice and another main route is crossed three times. Residents will be forced to travel at least ten miles out of the way to come and go from their homes-extra time in our commutes and extra gas and wear and tear on our vehicles. Will there be a construction schedule that accounts for our needs as residents severely impacted by the project?

This project is not for the benefit of Mason residents yet we are set to bear the brunt of the project through the chemicals in our water and air, loss of wildlife habitat, torn up roads and impacted travel routes, polluted air, and lower property values. Kinder Morgan refuses to accept that these are the realities of this project. Where are the documents that show the benefit for NH residents from this pipeline? And if there are benefits - what other options exist that does not invoice such a drastic project that severely and unfairly burdens NH residents.

The volume of gas destined for these pipelines is not for the benefit of NH residents - it is slated to be exported at a massive profit through pipelines that are built by a private company for private gain under the guise if public benefit. Eminent domain should not be employed for this project. There is no proof of the public benefit that supports a project of this magnitude.

Please address the issues - chemicals, pollution so drinking water degradation, loss of aquifers, pigging stations and their impacts, leaking, air pollution - blow offs from compressor stations, impact to wildlife and their habitats-why is this process proceeding so quickly? Damage of this magnitude cannot be undone. We need more facts and less TBD from Kinder Morgan. There needs to be accountability in this project. The residents of NH and our future generations deserve this consideration.

## **20150825-5025**

Timothy Somero, New Ipswich, NH.

This comment is related to socio-economics.

Recently, I participated in what felt like an ad-hoc and poorly executed information gathering session with the SW Regional Planning Commission for NH.

During the Q&A session, we learned that this commission has regularly scheduled dialog with investors and the company that proposed the NED project.

It seems that from a socio-economic perspective, this advance information is used by the investors on Wall Street to determine a direction for continued investment into NED, before due process of the FERC filing, application, etc.

I asked a pointed question.

'When will we citizens of New Hampshire have an opportunity to review, correct, and possibly rebut the information provided in this session?'

The answer, 'There will be no such session. There is not enough time.'

But there appears to be ample time to provide regular anecdotal information by dubious proxy to the global investment community and the company who proposes NED.

Please understand that the information collected does not represent the voice of the American people who are working diligently to understand WHY this project is in the best interest of New Hampshire, New England, and America.

The voice of the American people desire the antithesis of NED.

We are turning to clean eating and clean living. We are increasingly declining processed food for natural nutrients sourced as locally as possible.

We see an opportunity to change our lifestyle from mass consumption of fossil fuels to a personally implemented hybrid of fossil fuels and renewable energy by focusing on a nice versus necessary allocation.

Fossil fueled energy is necessary to power the needed infrastructure for communication, safety, and health systems.

But we prefer to re-allocate most of our meager financial resources into renewable energy; by investing in personal infrastructure to transform our daily dose of sunlight, wind, and the temperature difference of the earth surrounding and below our homes; for nice purposes such as entertainment and lighting after the sun sets and before our families sleep.

The alternative to NED is not grand.

The alternative is dispersed across America and the world and very much like the clean eating movement, home by home, family by family, and person by person.

The voice of America is asking for the \$5k, \$10k, or whatever the total indirect and direct lifetime investment (TAX) of the NED project (and similar ones) to be available to our families so that we can design, develop, and implement personal, family-based energy systems.

Enough is enough.

Do you hear us?

Cheney, Bush, Clinton - these names opened the faucet for unrestrained consumption of 'big oil and gas'.

We the people are asking to stop opening the faucet further, but to reinvest and close the faucet.

Most directly, the contribution of groups such as the SW Regional Planning Commission do not reflect our American voice.

#### **20150825-5026**

Timothy Somero, New Ipswich, NH.

I am concerned that the electrical grounding system along the entire NED pipeline will adversely affect the integrity of the stratified drift aquifers, surface water flow, and the water source for every person, home, business, and community within proximity of the pipeline and all related infrastructure.

Please study this and provide scientific proof that the entire grounding system will not damage the natural water supply before approving the NED application.

#### **20150825-5035**

##### **Chesterfield Conservation Commission Position in Opposition to the NED (Pipeline) Project**

Energy company Kinder Morgan has proposed running a natural gas pipeline through roughly 20 towns in southern New Hampshire, entering Winchester from Massachusetts and re-entering Massachusetts from Pelham. This proposal is known formally as the North Energy Direct (NED) Project. The conservation commissions in many of these towns have formally expressed their opposition. The conservation commission in neighboring Winchester, a pipeline town, has prepared a statement opposing the pipeline, which will be sent to the Federal Energy Resources Commission (FERC), the final permitting body. Winchester's statement is attached. The Chesterfield Conservation Commission wishes to go on record as supporting their position.

We agree with their statement that a 36" underground pipe and resulting cleared right-of-way, with the

necessary construction and maintenance disruption, will cause significant damage to forests, wetlands and important wildlife habitat along the route. The Winchester Conservation Commission has identified specific environmental damage from the project, and we would like to raise two further objections.

**This project will bring little benefit to our state related to energy needs.**

In fact, not only is this gas going to pass through New Hampshire and go back into Massachusetts to a terminal in Dracut, but as recently as 2012 New Hampshire produced enough electricity that half was exported (Source: US Energy Information Agency as reported in the Keene Sentinel, Feb. 19, 2015, page A5.) There is clearly no impending electricity shortage in New Hampshire, particularly since the largest producer of electricity in New Hampshire, the Seabrook Nuclear Power Plant, is currently licensed until 2030.

In fact, Kinder Morgan, on their Home Page, has expressed a willingness to export this power: “ ... (5 proposed LNG export projects in northern Maine and Atlantic Canada) ... could find capacity on the NED Project useful to serve their LNG export facilities.” (Source: Kinder Morgan Home Page, NED Project.)

**There are alternatives being considered which would meet energy needs in the region.**

Until late 2014 this pipeline was planned to go directly through Massachusetts from the Connecticut River to Dracut. It was only political opposition from Massachusetts communities which led Kinder Morgan to propose the southern New Hampshire route. It had nothing to do with energy needs in New Hampshire, nor is it the less costly method of increasing regional electricity supply.

In addition to Kinder Morgan’s own all-Massachusetts alternative for NED, just mentioned, there is also a proposed pipeline project called Access Northeast which would carry natural gas directly to the Boston area for conversion to electricity. National Grid and Eversource Energy, representing 70% of the customers in the region, including New Hampshire, have signed on to this project, and the major electricity importer in the region is Massachusetts. A recent additional project to bring electricity into New Hampshire is the so-called Northern Pass, which would deliver Quebec hydropower on lines over new and existing power line corridors.

The environmental concerns identified by the Winchester Conservation Commission, together with these two issues above, make it difficult to justify the NED (pipeline) Project as currently proposed. The Chesterfield Conservation Commission joins the Winchester Conservation Commission in being opposed to this project being located in New Hampshire.

**Lower Merrimack River  
Local Advisory Committee(LMRLAC)**

77 Concord Street  
Nashua, NH 03064

August 24, 2015

Kimberly D. Bose, Secretary  
Nathaniel J. Davis, Sr., Deputy Secretary  
Federal Energy Regulatory Commission

888 First Street, NE Washington, DC 20426

DOCKET NO. PF14-22-000 Re: Tennessee Gas Pipeline Company, LLC, Proposed Northeast Energy Direct Project

Secretary Bose,

The Lower Merrimack River Local Advisory Committee (LMRLAC) welcomes the opportunity to comment on the proposed Northeast Energy Direct (NED) Project.

The Lower Merrimack River, which this Project, if approved, would cross, is a Designated River subject to the provisions of Chapter 483 (River Management and Protection) of Title L (Water Management and Protection) Of the Revised New Hampshire Statutes. As a Designated River, the Lower Merrimack is also a protected waterway under the provisions of the federal Public Utilities Regulatory Policies Act, section 210 (j)(2), 16 USC sections 824a-3(j)(2).

The LMRLAC, which I chair, is charged by the State to advise all relevant government agencies on matters pertaining to the management of the Designated River, including the Corridor that extends 1/4 mile inland from each river bank. The protected status of this Designated River compels the use of best practices to protect the attributes of the River, including fisheries, wildlife, vegetation, and public access, during and after any construction projects within 1/4 mile of the river banks.

### **Construction Issues**

Because the NED Project, if approved, would constitute the first crossing of this Designated River by a major natural gas pipeline, and considering the environmental sensitivity of the corridor, we hereby submit the following observations and recommendations as pertains to the specifics of the proposed crossing of this protected waterway;

LMRLAC acknowledges the importance of Kinder Morgan's reported decision to bore under the river as a "best practice", rather than trench across the river. However the FERC requires that "...the project sponsor shall file with the Secretary for the review and written approval by the Director a detailed, site-specific construction plan and scaled drawings identifying all areas to be disturbed by construction for each major waterbody crossing. LMRLAC has not yet been provided such detailed plans and reserves the right to submit additional comments once such plans become available for review. The following comments should therefore be considered preliminary in nature.

At the proposed crossing location just above Cromwell's Falls, the river is more than 300' wide with a median flow of 6800 cfs that peaks as high as 25,000 cfs after major storms. This highly variable flow, when coupled with the soft soils in the area, is conducive to bank and bottom erosion and shifting of the streambed.

On this basis, and in view of the environmental sensitivity of the corridor and the tendency of the riverbed to migrate laterally, albeit slowly, as a result of abnormal flooding, LMRLAC asks that additional steps be taken to:

1. Increase the overburden requirements above the bore hole by a suitable percentage to further limit the chance of the pipeline being dislodged by exceptional flows
2. Ensure that the entry and exit points are set back sufficiently far from the current shorelines to minimize the threat of exposure from future scouring and riverbed migration.
3. Ensure the river crossing section of the pipeline can be inspected frequently and rapidly and rapidly isolated if a problem develops.

- To this end as a minimum the River should be protected by "guard valves" on each side of the watercourse that can be remotely activated by on-site personnel who are assigned a monitoring function during periods of abnormal high flow in accordance with an Emergency Action Plan (EAP) of the type that FERC requires for hydropower dam operation. This monitoring function should include a procedure for verifying the integrity of the overburden that protects the pipeline from direct exposure

to the river flow.

- Even better would be a requirement to install automatic shutoff valves (ASVs). The PHMSA has recommended such valves for the protection of not just highly populated “High Consequence Areas” (HCAs, but also for liquid pipelines in environmental areas of particular sensitivity. It seems reasonable to request that this concept be extended to the NED project where it crosses the protected Merrimack. As a minimum TGP/KM should fund an extension of the study performed by ORNL that led to the recommended use of ASVs for pipelines crossing environmentally sensitive areas such as the Merrimack River.

- Additionally, internal inspection of the pipe condition should be required under the river more frequently than in other sections of the pipeline. This in turn would seem to require the installation of pig entrance and exit ports closer to the River than envisioned in the recent TGP Draft Environmental Report.

4. Consider installing the river crossing section of the pipeline in a ‘sleeve’ such that repairs could be effected with minimal disruption

### **Economic Issues**

1. The installation and maintenance of a major pipeline across this sensitive river will perforce adversely impact the recreational, and therefore economic, benefits that the River Corridor currently provides to the public. This may include restrictions on access to, and the use of, riverfront property that otherwise could be developed or used for public access to the river for fishing and other recreational activity, including shoreside hiking and biking. Both the State of New Hampshire and the riparian towns and cities have long standing policies that encourage both increased public access to the river and the establishment of a section of the NH Heritage Trail along this section of the Merrimack. Should this proposed NED crossing be permitted, then the TGP should be required to mitigate this loss of public amenities by funding alternative access arrangements including shoreside trail development.

2. Because the NED Project would constitute a major change to the Lower Merrimack River Corridor, TGP should take responsibility for financing the preparation of the revised Corridor Management Plan (CMP) that the LMRLAC will be required to prepare.

Cordially,

Gene Porter  
Chairman

re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Dear Secretary Bose:

Attached please find the testimony of the Ashby Conservation Commission as delivered at the Lunenburg, MA Scoping Hearing of August 12, 2015 regarding Kinder Morgan's Northeast Energy Direct proposed pipeline project Docket No. PF14-22.

Also attached are the two documents submitted along with our testimony at the hearing. The first document is the August 12, 2014 OpEd<sup>1</sup> by Senator Elizabeth Warren entitled "We can do better than pipeline" which closes with "Before we sink more money in gas infrastructure, we have an obligation wherever possible to focus our investments on the clean technologies of the future -- not the dirty fuels of the past -- and to minimize the environmental impact of all our energy infrastructure projects. We can do better -- and we should." The second document is the August 10, 2015 study from the Acadia Center entitled "Energy Efficiency in Massachusetts -- Optimizing the Electric System and Achieving Consumer and Environmental Benefits<sup>2</sup>." The study showed that \$1 spent on energy efficiency produces \$4.79 in benefits proving "how states can save by meeting demand through efficiency, rather than purchasing new supply."

Both documents are very pertinent to your environmental impact scoping. Please read them.

Thank you,

The Ashby Conservation Commission  
George A. Bauman, Chair  
Robert F. Leary  
Roberta Flashman  
Cathy Kristofferson

2 [http://acadiacenter.org/wp-content/uploads/2015/08/MA-EE-Summary\\_08102015\\_Final.pdf](http://acadiacenter.org/wp-content/uploads/2015/08/MA-EE-Summary_08102015_Final.pdf)

-----

Good evening, my name is Cathy Kristofferson. I am a Conservation Commissioner in the Town of Ashby for whom I speak this evening. We are a town of some 3,000 in this north central part of the state, one town to the west of this hearing. We unanimously resolved at last year's Annual Town Meeting to stand in opposition to this project.

We remain convinced this fossil fuel overbuild is not the solution needed to either our often dubiously claimed nation's highest energy costs or for the handful of peak days where competition between home heating and electricity generation drives prices temporarily high. There are much better sustainable solutions.

Let's be clear - we do not need, nor want, this pipeline. In the latest Interagency pre-filing conference call notes, landowner survey access was reported at only "20-30% access in NH and MA.<sup>1</sup>" That would seem you will be sanctioning unprecedented eminent domain in our future. So you must fully scope all of the environmental and socioeconomic impacts both the construction and operation of this pipeline and all of its requisite infrastructure will have on our region.

The announced downsizing of this project due to lack of customer demand does not in any way decrease any impacts on any us, only to the pocketbooks of the corporation seeking to take from the public for their private gain. This lack of what you define as "need" must enter into your decision making process.

The Commonwealth's citizens have a constitutionally guaranteed "right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment."<sup>2</sup> You must scope how blasting through ledge, trenching through wetlands, clear-cutting swaths through mature forest, segmenting habitats, permanently altering the landscape of our natural environment anywhere, but most particularly that which has been set aside in perpetuity protected by our constitution, could possibly be "in the public good."

More than 110 conservation parcels are still on the proposed route, 85 with Article 97 protections including

our shared Willard Brook State Forest. It would seem forcing this pipeline upon us violates everything our Constitution seeks to guarantee.

You must apply your own rule that the public benefits of a pipeline must exceed the costs to society. The societal cost of NED, as you've heard, are simply way too high.

How is it appropriate to risk any of our drinking water sources or our clean breathable air?

As Conservation Commissioners we know restoration and replication are the mitigation answers to resources destroyed. Our DEP's recent study<sup>3</sup> documents that more often than not these undertakings result in failure. The solution is not to destroy resources in the first place.

Conservation Commissioners are fairly wise to applicants coming before us with their project piecemeal hoping we won't notice the full extent of their impact. You must not allow Kinder Morgan their illegal segmentation of their NED and CT Expansion projects to continue. Review them combined.

Resource Report 10's No Action Alternative must be heavily weighed during your decision making process because Energy Conservation and Energy Alternatives are where our clean sustainable future lies, not dirty fossil fuels of the past.

This overbuild of fossil fuel infrastructure designed to last 50-80 years will guarantee non compliance of our statutorily required Global Warming Solutions Act (GWSA)<sup>4</sup>. FERC must fully scope the devastating impact of methane, which mixed with fracking chemicals, enters our atmosphere through both intentional blowoffs and accidental leaks, as it travels from drill bit to burner tip.

We urge you to be diligent and thorough in your environmental impact study on behalf of our Commonwealth and our neighbors of New Hampshire, New York, Pennsylvania and Connecticut.

Thank you for this opportunity to comment.

Sen. Elizabeth Warren: We can do better than pipeline

Updated: 08/12/2014 01:07:51 PM EDT BerkshireEagle.com

Sen. Elizabeth Warren: We can do better than pipeline

WASHINGTON -- Massachusetts has distinguished itself as a state with a strong and enduring commitment to environmental conservation, a commitment evidenced in the wetlands, forests, waters, and state and private conservation lands that run from our coastline to the Berkshires. The commonwealth is also a leader in developing clean energy and promoting energy efficiency. In fact, the American Council for an Energy-Efficient Economy ranks Massachusetts number one in the country in its energy efficiency policies and programs.

Our commonwealth has amazing energy entrepreneurs and smart policies that promote greener communities and energy conservation. These policies have helped to spur statewide investments and advancements in clean energy and energy efficiency. That, in turn, is helping develop more clean energy jobs, which grew 11.8 percent between 2012 and 2013 and now employ about 80,000 people statewide, according to the Massachusetts Clean Energy Center.

And these investments have paid off, helping to keep our air and water clean, helping to preserve the commonwealth's natural beauty, and helping to grow our economy. We should build on these successes, particularly when making decisions about investments in infrastructure that will affect our mix of energy consumption for decades to come.

In recent months, representatives of Kinder Morgan, Inc. and its subsidiary, Tennessee Gas Pipeline Company, LLC, have approached Massachusetts landowners, towns and land trusts to ask permission to conduct surveys for a proposed pipeline that would carry natural gas from the New York border across our state to Dracut.

Rather than using existing infrastructure, roads, and rights-of-way, the company is considering routing this pipeline largely through undeveloped land.

I have heard from many Massachusetts homeowners and businesses that are deeply concerned about the impact of this proposal on their farms and properties. Conservation commissions in towns along the intended route and citizen groups dedicated to protecting our state's environment have also raised concerns that this proposed natural gas pipeline would needlessly disrupt environmentally sensitive conservation land. Because I share many of these concerns, I do not support the current proposal.

\*\*\*

Kinder Morgan argues that the proposed pipeline could play a role in helping our region meet its energy needs. It is true that New England faces energy infrastructure challenges, and that we currently rely on natural gas for heating in the winter and for electrical generation year round. Over the past few winters, which have been especially cold, we have experienced some of the highest natural gas prices in the nation. This is a serious problem, which we cannot ignore.

But the need to improve our short-term energy outlook and reduce unacceptably high energy prices does not mean that we should rush to support every energy infrastructure project, no matter the consequences. The decisions we make about energy proposals today will have an impact on future generations, and in each instance we must weigh the potential benefits against the potential consequences -- both in the short term and long-term.

Given the cost and infrastructure realities of the Northeast, it is likely that natural gas will continue to play a role in our transition away from coal and oil electricity production and toward a cleaner energy future. But our aim must be to reduce reliance on carbon based fuels, and that means careful consideration of clean energy alternatives as well as other natural gas pipeline alternatives that do not create wholly new infrastructure. For example, upgrading our old, methane-leaking pipes can help provide affordable power for businesses and consumers without threatening our families and our state.

Before we sink more money in gas infrastructure, we have an obligation wherever possible to focus our investments on the clean technologies of the future -- not the dirty fuels of the past -- and to minimize the environmental impact of all our energy infrastructure projects. We can do better -- and we should.

Elizabeth Warren is a Democratic U.S. senator from Massachusetts.

August 16, 2015

Re: Tennessee Gas Pipeline Company, LLC Docket No. PF14-22-000  
Northeast Energy Direct Project

Dear Secretary Bose,

Please find below my testimony, with accompanying footnotes, submitted into the record last week at the FERC Scoping Session held in Dracut, MA on August 11, 2015.

Good evening. My name is Vince Premus, P-R-E-M-U-S, from Pepperell, MA. I can only hope to be as eloquent as my daughter, McKenna, was a few moments ago. I am here tonight to challenge the case for need, the singular weakness of this entire proceeding.

Last December, I sat across the table from Gordon Van Welie, CEO of ISO New England, to discuss his unabashed advocacy for pipeline expansion. Mr. Van Welie has not been the most ardent defender of ratepayer interests. Rising utility rates have far more to do with his actions, and inactions, than alleged pipeline constraints. I give you two examples.

Last September, FERC Commissioners Bay and Clark openly criticized ISO's failure to address the exercise of market power in the 2014 Forward Capacity Auction. 1 Just prior to the auction, a broker bought Brayton Point with the intention to close it. Unable to meet the installed capacity requirement, the auction defaulted to a non-competitive price, resulting in a 175 million dollar windfall for the broker and a record 13 Billion dollar price tag on us for future capacity payments. 2 Your Commissioners asserted that "ISO-NE may have violated its tariff by failing to carry its burden of establishing that the auction results Were just and reasonable." ISO, and FERC, declined to take action, despite being urged to do so by no less than 16 members of New England's Congressional delegation in a joint letter to Chairman LaFleur last October"

This winter, electricity cost 30% less than last winter thanks to peak-shaving LNG.<sup>4</sup> This despite suffering the most severe winter in 80 years. Recall that in 2013, ISO prohibited LNG from participating in its Winter Reliability Program out of concern for sending the "wrong signal" about the scarcity of natural gas.<sup>5</sup> Electricity prices soared when it could have been prevented. This action bore the unmistakable appearance of market manipulation with the aim of propping up the weak case for pipeline expansion. This is fuel source agnostic? Is this even legal?

New England's natural gas annual inflow capacity is nearly twice the region's demand. Energy efficiency, demand response, recovery of gas lost to leaks, and commercially available storage technology all combine to refute the specious case for need. Our actionable request of this Commission is: DO-YOUR-JOB! Regulate. Your job is NOT to "put steel in the ground" as Cheryl La Fleur quipped at an Energy Roundtable last October. Your job is to confirm what the numbers clearly show-the case for need is not made.

The export plan of a wealthy Texan is no justification to impose eminent domain on THESE- WORKING-FAMILIES. China may need this gas. But the New England ratepayers that will bear the burden surely DO NOT.

In addition, I wish to add the following points to the written record, which were not included in my verbal statement due to the three minute time constraint on each speaker:

In a statement dated October 3, 2014,<sup>6</sup> the New England States Committee on Electricity (NESCOE), criticized ISO New England for under-estimating the region's Installed Capacity Requirement (ICR)<sup>7</sup> by not fully accounting for distributed generation (DG), in particular smaller net-metered solar photovoltaic installations. NESCOE was quick to point out that such inaccuracies can lead to "electricity consumers paying for unneeded future capacity." This failure to correctly account for DG reflects the persistent and inherent bias of ISO New England in favor of fossil- fuel based generation. <sup>8</sup>

These examples reveal a pattern of behavior on the part of ISO-NE that clearly signals their intent to promote an over-reliance on natural gas infrastructure development. ISO-NE's unabashed courtship of the natural gas industry, and its advocacy for the overbuilding of natural pipeline infrastructure is irresponsible at best.

The time has come for ISO-NE to act upon the recent words of their president and CEO, and effect real energy policy leadership. Writing in Commonwealth Magazine in 2010, Mr. Van Welie lauded the Regional Greenhouse Gas Initiative's (RGGI) potential "to provide environmental benefits and to diversify the source of fuels used to produce electricity [thereby] creating a hedge against volatile fossil fuel prices." Mr. Van Welie appears to recognize that to embrace natural gas-fueled electricity generation is a policy choice. There is an opportunity here to establish Massachusetts, and all of New England, as the standard bearer for the integration of renewable energy. Acting as our agent, ISO New England must recognize their responsibility to start decarbonizing the region's electricity supply now, and promote a course that will shape the region's, and possibly the nation's, energy policy for decades to come.

I urge FERC to rigorously review the case for need put forth by ISO New England, and others, in support of this permit application. As I stated to Mr. Eric Tomasi at the Dracut Scoping Session, our principal actionable request of this Commission is to confirm what the numbers clearly show the case for need is not made- and deny the application under consideration for the Northeast Energy Direct project.

Respectfully submitted,

Vincent E. Premus, Ph.D.

Pepperell, MA

1 Joint Statement of Commissioner Tony Clark and Commissioner Norman Bay on ISO-New England's Forward Capacity Market Case, FERC Docket No. ER14-1409-000, September 16, 2014, and RTO Insider, September 2014

2 At issue is the late 2013 purchase of Brayton Point by the equity firm Energy Capital Partners (ECP). Five weeks after purchase, the hedge fund announced plans to close the generating plant, dramatically reducing the Installed Capacity for the 2017-18 market cycle and prompting a non-competitive, administrative price to drive the outcome of FCA #8. As a result of the auction, ECP realized a \$75 million windfall for electricity from four other generating facilities it owns in the region. See "Brayton Point power plant owner denies market manipulation," The Boston Globe, April 28, 2014.

3 Letter to Chairman LaFleur from U.S. Rep. Joseph P. Kennedy, III and Sen. Edward J. Markey, co-signed by 14 other members of New England congressional delegation, dated October 14, 2014.

4 ISO New England Monthly Market Operations Report-January and February 2015, Market Analysis and Settlements, February 17, 2015 and March 16, 2015.

5 FERC docket ER13-1851, Motion to Intervene and Comments of Algonquin Gas Transmission, LLC and Maritimes and Northeast Pipeline, L.L.c., (July 19, 2013); Also, CLF Letter to Heather Hunt, May 30, 2014, Re: Comments on Governors' Infrastructure Initiative in New England -Incremental Gas for Electric Reliability (UIGER") Concept and Electric Distribution Companies Proposal (UEDC") for Management of Pipeline Capacity.

6 NESCOE Statement at the NEPOOL Participants Committee on ISO-New England's Installed Capacity Requirement Values for the 2018-19 Capability Period (FCA9), October 3, 2014.

7 The ICR is the foundation underlying each year's Forward Capacity Auction, and thus the baseline electricity rates for the market period 3 years hence.

8 Their current underestimate of the ICR (which will inform the upcoming auction, FCA-9, to be held next February), by some accounts almost 1,000 MW, is the approximate difference in net capacity that triggered the non-competitive administrative pricing scheme in FCA-8 that was met with the disapproval of the FERC commissioners Bay and Clark earlier this year.

## **20150825-5082**

Beth Webb, Cummington, MA.

I am strongly against the pipeline. It is NOT needed and it will cost taxpayers too much money.

## **20150825-5095**

Dorothy Crawford, Fitzwilliam, NH.

One would hope that a decision about the NED pipeline would be based on need. Kinder-Morgan has stated from the beginning that this gas is primarily slated for export. There may be 10-20% available to New England. Since we don't have much of a natural gas infrastructure, it is clear that for us to take advantage of the gas from this pipeline, there would be a substantial investment from us the taxpayers. ISO New England states that the demand for electricity continues to decline. The wholesale price for electricity is down

50% from last year. The Spectra Pipeline through Peabody is running at 1/2 capacity. The US Department of Energy was able to make a 30% reduction in energy costs through conservation measures. As you study this proposal, please determine for yourselves that there is an actual need for us residents along the pipeline route who will have to live with this gash through our rural communities. If you do determine need, please also study other energy alternatives including renewable and conservation measures.

**20150825-5107**

Linda Dean Campbell, Methuen, MA.

To Whom It May Concern,

I am writing today to convey the concerns that have been raised by many of my constituents in the 15th Essex district, particularly those in the city of Methuen who will be directly impacted by the proposed North-east Energy Direct (NED) Pipeline.

First and foremost, I have yet to see definitive proof that the Commonwealth is currently facing a natural gas shortage and that a significant increase in natural gas supply brought about by a new pipeline will truly result in lower prices for my constituents.

The extent to which Massachusetts and New England has faced high energy prices in recent years largely seems to be due to a combination of mismanagement on the part of suppliers. In fact, the most recent winter of 2014-2015 actually featured lower prices than 2013-2014 despite being colder on average.

Kinder Morgan has also repeatedly changed the proposed size and distribution routes of the NED pipeline, suggesting that they do not have an accurate projection of natural gas demand for the region and that their main objective is to expand the pipeline to take advantage of export opportunities. (In my district, meeting times for constituent questions/feedback also changed repeatedly.)

This is a significant problem for a number of reasons:

The price of natural gas is highly volatile and an increase in our region's dependence on natural gas will make ratepayers vulnerable to price spikes.

Energy consumption actually appears to be decreasing in our region due to efficiency improvements and this only increases the likelihood that this expansion will be used to serve as an enhancement for export across the Atlantic.

Given these issues, I do not accept the premise that we can do and should do nothing in Government to ensure that this expansion benefits New England and Massachusetts whose ratepayers will likely bear the cost of this pipeline's construction.

With that in mind I ask that you also review the potentially significant local impacts that this pipeline could have on the property and safety of constituents in my district.

In Methuen, this pipeline is very dangerously close to homes, (within a few yards in some cases) and it transverses neighborhoods and driveways and through many wetlands.

Residents have legitimate concerns regarding investments in mature landscaping that will be removed by this expansion, particularly, mature trees that add considerably to their property value.

I also ask that you review the impact that this project will have on the Merrimack River which is the source of drinking water for the City of Methuen and vital to the safety and wellbeing on the region.

Thank you for receiving my comment on the proposed NED pipeline and allowing me to echo the concerns of experts, families, and property owners in my district. I hope that you will demand detailed evidence demonstrating that this pipeline will benefit the New England and the Commonwealth of Massachusetts.

Most Sincerely,

Linda Dean Campbell  
State Representative  
15th Essex District

Charles E Sullivan, JR, Averill Park, NY.

Initial comment

While Kinder Morgan Energy Partners, L.P., through its subsidiary, Tennessee Gas Pipeline Company, L.L.C., (collectively, “KM”) recently “downsized” its proposal to design, construct, and operate the Northeast Energy Direct project – a pipeline system, intended to be operational in 2018, connecting Pennsylvania’s high volume hydrofracked natural gas wells to Dracut, Massachusetts, that includes a compressor station proposed for the Town of Nassau in order to maintain the gas’s pressure and speed, it remains a project presenting significant substantive environmental, public health, economic, and other issues in need of addressing before it may be even considered to be authorized to proceed. This “downsized” project will cause the same amount of environmental and economic upheaval and disruption to landowners during construction as a larger pipeline would, except, as discussed below, further disruption should be expected in coming years, with “compression expansions” either in the towns currently targeted for compressor stations, or new ones to be determined. Authorizing this “downsized” pipeline project paves the way for future expansion by means of larger pipes, higher operating pressures, and more system support structures, such as more, and larger, compressor stations.

FERC’s NEPA analysis, and FERC’s decisionmaking flowing from that analysis, must consider mitigative measures even for impacts that by themselves would not be considered “significant.” 46 F. Reg. 18,026 (Q. 19a) (March 23, 1981). Thus, even individual or smaller harms to any component of the natural or man-made environment must be evaluated and mitigated.

FERC’s NEPA analysis also must address how inconsistencies between the proposed project and any State or local law will be reconciled. 40 CFR 1506.2(d). Thus, FERC’s NEPA analysis must examine the project’s compliance with state laws, such as, but not limited to, the 2011 Town of Nassau, New York Zoning Law. Such a condition would be consistent with FERC’s general expectation that natural gas companies will “comply with state and local requirements, to the extent that doing so does not interfere with actions that the Commission has determined are required by the public convenience and necessity.” Letter from Cheryl A. LaFleur, Acting Chairman, FERC, to Rep. James P. McGovern (June 18, 2014).

More detailed comments

1. Definition of “project” subject to NEPA review

a. Project can be for domestic gas supply only if eminent domain is to be considered

KM openly admits to having to “sell” the merits of its pipeline to exporters in order to get the pipeline’s capacity full subscribed. As a result, FERC may not have the authority to issue a Certificate of Public Convenience and Necessity since the pipeline’s main purpose appears to be to transport natural gas to exporters, and Section 7(a) is couched in terms of domestic consumption of the transported natural gas. Flowing from this is that KM will not be avail itself of the eminent domain authority and powers under the Natural Gas Act in order to get the pipeline path under its control since FERC’s authority to issue a Certificate of Public Convenience and Necessity leading to the empowerment of the Certificate holder with the power of eminent domain appears to extend only to a project transporting natural gas exclusively for domestic consumption.

b. No “project” segmentation

Extraction, transportation, and sale of natural gas are interdependent activities. Without a market, there is no need to extract; without extraction, there can be no market since no product to market; without a transportation mode, there can be no connection between extractor and purchaser. A pipeline project, then, has three interrelated components: a pipeline and the two sets of customers depending on it: extractors at one end of the pipeline and purchasers at the other.

In this case, the pipeline that KM seeks FERC permission to design, construct, and operate seeks to connect for the most part – whether presently or in the future -- the fracked gas fields of Pennsylvania and elsewhere to export terminals in the Northeast and Canada. This pipeline does not stand alone; its very

reason for being and its financing depend upon the existence of long-term supply contracts between the gas extractors in those fracked gas fields and those consumers, be they domestic or foreign. Therefore, the “project” subject to NEPA review consists of the extraction, transportation, and fate of fracked gas proposed to be carried in KM’s pipeline.

The fact that FERC’s jurisdiction extends only to the pipeline’s necessity and not to natural gas extraction or sale does not change the legal requirement that FERC is the NEPA lead agency in this matter and so, must ensure that the NEPA document generated for this project properly, fully, and comprehensively analyzes all aspects of this project, from extraction to export.

## 2. Need for this project

Before approving this project, FERC must determine that it is “necessary or desirable in the public interest.” 15 USC 717f (c): when the project’s projected public benefits outweigh its potential adverse consequences. FERC Statement of Policy, “Certification of New Interstate Natural Gas Pipeline Facilities,” 88 FERC (CCH) ¶ 61,227 (1999), orders clarifying policy, 90 FERC (CCH) ¶ 61,128 (Feb. 2000) and 92 FERC (CCH) ¶ 61,094 (July 2000).

“Need” has a number of components: need for this particular energy source among the many available; need for natural gas at the destination; need for natural gas in the quantity the pipeline will transport; need for the pipeline to travel the path proposed; etc. FERC’s NEPA evaluation, then, must encompass all environmental impacts associated with all components of “need.”

This comprehensive understanding of “need” is quite important to my family since we live along the proposed pipeline’s path and not far from the compressor station proposed for the Town of Nassau, Rensselaer County, New York. Since I understand that the potential blast impact radius for the proposed 30 inch pipeline operated to transport 1.3 BCFD of natural gas will operate at pressures that will generate an approximately 800 foot blast radius, requiring that pipeline to transport only that amount of natural gas sufficient to address the current gas supply needs of New England and nowhere else will help to minimize the safety impacts upon my community.

In terms of need for this particular energy source, consider:

- Energy conservation and renewable energy are the first priority for meeting future energy needs — green buildings, energy efficient appliances, flattening peak energy demand, wind generation, etc. and that more can be done to reduce reliance on fossil fuel sources. In fact, energy efficiency is decreasing the need for energy resources, fuel-free renewables are supplanting polluting power plants, and liquefied natural gas has become cost-competitive and available at times of peak need.
- ISO-New England has expressed concern about over-reliance on natural gas as the primary means of electricity generation.

In terms of need for the additional domestic gas supply, consider:

- KM has marketed this project as answering a New England-wide need for additional gas supply to, among other things, promote energy reliability. However, the report prepared by July 12, 2013 Synapse Energy Economics, Inc., “Avoided Energy Supply Costs in New England: 2013 Report,” which is one of KM’s cornerstone substantiations, projected a potential shortfall in future electricity generation capacity in Massachusetts only for peak demand on certain days of the year; and that report has been criticized for not adequately taking into account future benefits from improved energy efficiencies, as well as the growth of renewable sources.
- The analysis of need for additional domestic gas supply should encompass the study announced by MA AG Healey on electricity reliability needs, including natural gas capacity demands, in New England. A key focus of the study will be the question of whether more natural gas is needed in the region, and if so, how much more capacity is needed. Analysis Group, a Boston-based economic and financial consulting firm, will begin work on the study, which is slated to be completed by October 2015.
- In mid-July 2015, an independent consultant, London Economics International (LEI), hired by the Maine

Public Utilities Commission (PUC) concluded that Maine should not enter into contracts to purchase gas pipeline capacity because the costs of doing so would outweigh the benefits to Mainers. Conservation Law Foundation: <http://www.clf.org/blog/clean-energy-climate-change/maine-doesnt-need-new-gas-pipelines/> “Experts Weigh In: Maine Doesn’t Need New Gas Pipelines”; Jul 17, 2015 by Ivy Frignoca

- As KM noted above, (see fn. 1), KM is actively seeking exporters to provide demand for the pipeline’s capacity. Although KM proposes no new LNG storage facilities, the fact is that Pieridae Energy’s October 24, 2014 application to the Department of Energy seeks to export domestically produced natural gas out of Canada. The gas for this proposal would reach Canadian LNG export terminals via the Maritimes and Northeast pipeline that the Northeast Energy Direct pipeline, among others, would feed by reversing the flow of that pipeline to allow gas to reach Canada as part of the Northeast Energy Direct project. Thus, KM itself needs the extra capacity in its pipeline project not to provide domestic demand but to supply export markets.

In terms of whether there is a public need for the pipeline at all, consider a new study issued by Energyzt Advisors LLC and commissioned by France-based GDF Suez, an LNG importer, that challenges the notion that new natural gas pipelines are needed for the New England market, contending that demand for the product is expected to decline and noting that the region will benefit from a diversification in power generation resources. The Energyzt report concluded: “Even during extreme winter conditions, new pipeline capacity is not required to meet New England natural gas demand needs given existing infrastructure, current market conditions and policy initiatives.” See also ENE, “Pipeline Alternatives Assessment: Energy Resources to Meet New England’s Winter Needs” (June 2014), available at [http://acadiacenter.org/wpcontent/uploads/2014/09/ENE\\_Pipelines\\_Alternatives\\_Assessment\\_140612\\_RF.pdf](http://acadiacenter.org/wpcontent/uploads/2014/09/ENE_Pipelines_Alternatives_Assessment_140612_RF.pdf); and Feldstein, M. and Kessler K., “Burden of Proof: The Case Against the Proposed Northeast Energy Direct (NED) Fracked Gas Pipeline,” (Aug. 2014), available at [www.nofrackedgasinmass.org/notgp/wpcontent/uploads/2014/09/BurdenOfProof.pdf](http://www.nofrackedgasinmass.org/notgp/wpcontent/uploads/2014/09/BurdenOfProof.pdf).

In terms of whether there is a need to consume additional carbon-based energy resources, consider

- the long-term public health impacts of continued reliance upon carbon-based energy sources, especially when there already exist better alternatives. See, e.g., the wide-ranging and peer-reviewed report issued by the Lancet Commission on Health and Climate Change (The Lancet is a UK-based medical journal), Health and climate change: policy responses to protect public health, which declares that the negative impacts of human-caused global warming have put at risk some of the world’s most impressive health gains over the last half century; and that continued use of fossil fuels is leading humanity to a future in which infectious disease patterns, air pollution, food insecurity and malnutrition, involuntary migration, displacement, and violent conflict will all be made worse. When climate change is framed as a health issue, rather than purely as an environmental, economic, or technological challenge, it becomes clear that we are facing a predicament that strikes at the heart of humanity. Health puts a human face on what can sometimes seem to be a distant threat.

- the argument major economists and investors are making for divesting from fossil fuels such as natural gas. See, e.g., “Keep it in the ground: The argument for divesting from fossil fuels is becoming overwhelming” by Alan Rusbridger (Monday 16 March 2015 09.06 EDT), found at <http://www.theguardian.com/environment/2015/mar/16/argument-divesting-fossil-fuels-overwhelming-climate-change>: This is why the divestment movement has changed from being a fringe campaign to something every responsible fund manager can no longer ignore. How could they, when even the governor of the Bank of England, Mark Carney, has warned that the “vast majority of reserves are unburnable” and the bank itself is conducting an inquiry into the risk that inflated fossil fuel assets pose to the stability of the financial system? When the president of the World Bank, Jim Yong Kim, urges: “Be the first mover. Use smart due diligence. Rethink what fiduciary responsibility means in this changing world. It’s simple self-interest. Every company, investor and bank that screens new and existing investments for climate risk is simply being pragmatic”? When the Bank of England’s deputy head of supervision for banks and insurance companies, Paul Fisher, warns, as he did this month: “As the world increasingly limits carbon emissions, and moves to alternative energy

sources, investments in fossil fuels – a growing financial market in recent decades – may take a huge hit”? Or listen to Hank Paulson, no bleeding liberal, but secretary of the Treasury under Bush and former CEO of Goldman Sachs: “Each of us must recognise that the risks are personal. We’ve seen and felt the costs of underestimating the financial bubble. Let’s not ignore the climate bubble.” President Obama puts it most pithily: “We’re not going to be able to burn it all.”

- The Administration’s current efforts to combat climate change, which, among other things, seek to incentivize building renewable energy infrastructure and not new fossil fuel infrastructure.

In terms of the necessity for the proposed route, the NEPA assessment should encompass analysis of alternative routing and the rationale for the proposed route, which consumes so much “greenfield,” when it already has a path under its control sufficient to run the pipeline.

All the above, of course, raises the question, whether it is in the public interest to foster continued construction of carbon-fuel infrastructure such as this project, which will delay the changeover to more public-health and environmentally friendly alternatives.

### 3. Impacts on natural environment

#### a. Path crossing CERCLA site(s)/use of contaminated waters

KM needs to address its project’s impacts on the proper investigation and remediation of contaminated sites along the pipeline pathway. I raise this because of the following:

- I understand that KM proposes to draw water from the Dewey Loeffel federal Superfund site that under active remediation, in order to use the water for pipeline integrity testing. Aside from the fact that doing so will result in KM’s possibly becoming a Potentially Responsible Party for the site and its pipeline becoming part of that site, there is no description of how much water will be used and its fate once testing is complete – water that not only contains contaminants from the Dewey Loeffel site itself but contaminants within the pipeline.
- the pipeline project must cross the Hudson River, a federal Superfund site. Disturbing the riverbed, the river’s sediment, or the soil in the river’s floodplain invites PRP status. Since KM presently is not a PRP for the site and since state water quality requirements prohibit the introduction of PCB into the Hudson River and since any disturbance will result in introduction of at least a small amount of PCB into the water column, it does not appear that the New York State Department of Environmental Conservation will be in a position to issue a certification under the federal Clean Water Act. I intend to inform NYSDEC and the General Electric Company of my opinion on this matter to alert them to the possibility of KM’s attempt to cross the river.

#### b. Water resource protection

Implementing the Northeast Energy Direct Project proposal to dredge, horizontally drill, and blast a continuous excavation large enough to contain what is now proposed to be a 30-inch diameter pipe will perforate and hydraulically connect scores of miles of north-south trending aquifers, aquitards, streams, wetlands, and water-yielding bedrock strata through New York, Massachusetts, and New Hampshire, creating an extremely large manmade preferential groundwater contaminant transport pathway crossing state lines. This has the significant potential to cause a foreseeable harmful impact to drinking water and human health and needs careful comprehensive study and analysis.

Private drinking water supply protection is absolutely vital to sustain a viable rural residential existence. Residents of the Town of Nassau obtain their drinking water exclusively from private wells and are not alone in this regard: certainly this is the case throughout Schoharie, Albany, and Rensselaer Counties in New York and, as I expect throughout the rural portions of Massachusetts and New Hampshire along the pipeline’s pathway.

The NEPA analysis must assess protection of those supplies from contamination emanating from this project’s design, construction, operation, and closure. Of course, the first step must be to obtain a complete list of chemicals to be used during design, construction, operation, and closure of the pipeline system, as

well as the chemicals passing through the pipeline – not only the natural gas but the chemicals contained in that gas coming from the gas extraction process. Post-construction water runoff characteristics will differ from pre-construction conditions, as will land contours, vegetation, water retention capacity, etc.. The analysis must include assessment and identification of measures to be taken to prevent petroleum contamination during design, construction, operation, and closure and to prevent pesticide contamination (and in this regard, integrated pest management as an alternative to chemical control should be assessed).

FERC’s NEPA analysis should encompass such matters as: where will the waters used for testing come from, and where will they be taken for disposal; and what contaminants will they contain and how will those contaminants be addressed to ensure that they do not enter the environment?

c. Air resources protection

Air quality, environmental, and human health impacts of planned and unplanned blowdowns and main line valve releases are significant substantive concerns. The proposed path through the Town of Nassau is surrounded by hills. Depressurized natural gas released from the pipeline is expected to be significantly colder than the surrounding air; and this denser natural gas-contaminated air contains compounds left over from the high volume hydrofracturing process used to produce that gas within the pipeline. With prevailing winds, those gases will travel to neighboring residences resulting in potential health and safety issues and potential contamination of organic farms that already operate along the pipeline’s proposed path within the Town.

d. Critical habitat areas and threatened and endangered species protection

As currently proposed, the NED project crosses miles of pristine land that has been protected, or whose merits have been studied or have been touted, using state and federal dollars. One such land area is the Rensselaer Plateau. The NEPA review must encompass the need to run a pipeline directly through land within the Plateau and through other lands in Massachusetts and New Hampshire.

e. Noise impact minimization

The pipeline project lies within the Town’s Rural Residential District. To ensure that this project, which is otherwise incompatible with the objectives of that district, does not disturb that district’s allowed uses, FERC NEPA analysis should consider not only evaluation of project noise using the dBA scale for ambient noise but also using the dBC scale to evaluate the sharp noises inherent in compressor station operations. Further, the NEPA analysis should analyze the implementation of a requirement that there should be no gain of ambient noise at the boundaries of the easement, or other property subject to the control of KM, from the perspective of both the dB(A) and the dB(C) scales.

Pre-construction sampling and operational monitoring of ambient noise using such scales should be required as part of the environmental controls on the project, as well as should be allowing local governments to enforce the requirements directly.

f. Visual impacts

The Town of Nassau is a rural location noted for its scenic beauty. Scenic tourism contributes to the local economy. The pipeline pathway passes through other areas of rural beauty as it goes from Wright to Dracut. The NEPA assessment needs to encompass an analysis of the impacts on the scenic viewshed that this project will cause during all its phases – siting, design, construction, operation, and closure.

4. Impacts upon manmade environment

a. Local infrastructure protection (roads, bridges, culverts, electric transmission lines, etc.)

As a taxpayer, I am concerned that the equipment used to lay and to maintain the pipeline and to build and operate the compressor station proposed to be located near my home will ruin our town’s roadways, most of which are unpaved; and that my tax dollars will be spent either repairing them or upgrading them, all to benefit a private enterprise that burdens me with the risk of damage or loss without any compensation whatsoever. KM needs to develop an in-depth analysis of the Town’s roadway/bridge/culvert infrastructure to determine and to minimize the project’s impact on same and to evaluate the best financial mechanism

to ensure that it has the money to upgrade the roads it seeks to use and to maintain them during all phases of the project's life, until the pipeline system stops operating and the pipeline and pipeline infrastructure is dismantled..

b. This project as an economic disamenity

Pipelines, once constructed and buried, are out-of-sight and perhaps out of thought – at least until an explosion or other incident brings to mind the reasons for having opposed its construction in the first place. However, compressor stations, with their associated noise, lighting, gas release, and accidents, cannot be out-of-sight or out-of-mind. They are economic disamenities whose presence suppresses real estate sales prices and lengthens the time needed to sell a property.

FERC's NEPA analysis needs to evaluate the project's impacts on local real estate sales and marketing and what can be done to eliminate those impacts.

c. Business development protection

The construction and operation of the pipeline and its compressor station in the Town of Nassau could create significant impacts on farming and other agricultural activities, resulting in significant loss of revenue for established farms. The Town has at least one organic farm near the proposed compressor station. Emissions from that station, especially from blowdowns, could affect the organic certification, to the detriment of that family-owned small business to continue in operation.

Loss of revenue for commercial business along the pipeline's path and near the proposed compressor station and other infrastructure needs close examination, especially since loss of revenue for the businesses translates also to loss of taxes – taxes that I and other landowners will have to assume in order for my Town to remain financially viable – and to relocation of businesses, leading to further loss of taxes that I shall have to assume.

d. Government revenue protection (taxation; orderly development; etc.)

The Town of Nassau is a rural residential community. Its revenue structure depends heavily upon land tax receipts.

As noted above, this project, if implemented, may result in the creation of a significant economic disamenity in the northern part of the Town, with this disamenity pathway actually running from Wright to Dracut. Thus, the fiscal impacts upon the Town of Nassau's tax base are not inconsiderable and are not unique to it.

KM asserts that that the project will generate taxes. However, to evaluate whether the project will actually benefit this Town and the other municipalities in the project's pathway, FERC's NEPA analysis should encompass, among other things, a comparison of anticipated revenue from the pipeline over its entire life and loss of non-pipeline tax revenue over that life.

e. Public safety protection/emergency response

A pipeline is critical infrastructure. A high tension electric transmission line also is critical infrastructure. Both are prime targets for a terrorist target, which could be a considerable threat to nearby residents and visitors.

This project calls for a close paralleling of the pipeline with a high tension electric transmission line.

None of the towns along the pipeline's pathway, from Wright to Dracut, has the resources needed to secure the pipeline from attack. In any event, none of them should be burdened with that expense, both during construction and during operation.

FERC's NEPA analysis should evaluate the consequences of damage to, or loss of, pipeline system infrastructure (pipeline, compressor station, etc.) occasioned by deliberate malicious acts and the measures KM must take in order to keep those along the pathway, and their property, safe from harm. All forms of attack, not just from explosives or rifle shots, should be assessed in this evaluation.

Third party excavation activity is a significant cause of pipeline ruptures; and roads that cross the pipe-

line are areas where excavation activities are more likely to occur and damage the pipeline. The NEPA assessment should analyze this issue (in the Town of Nassau, for example, the pipeline path is expected to cross State Route 66 near a high tension electric transmission line. A rupture there could trigger not only a fire and blast but also loss of electrical supply to western New England's grid) and determine measures to eliminate a rupture from occurring..

Additionally, PL 112-90 obligates PHMSA to carry out scores of actions aimed at further ensuring that interstate natural gas pipeline transportation is conducted in a safe and environmentally protective manner. PHMSA yet to comply fully with that law, which is to sunset in September. FERC's NEPA analysis should address the project's compliance with the requirements of that act so that compliance will be assured once the law is reauthorized; or the project should be delayed until the law's requirements are reauthorized.

As previously noted, the potential blast impact radius for the proposed 30 inch pipeline operated to transport 1.3 BCFD of natural gas will operate at pressures that will generate an 800 foot blast radius. Requiring that pipeline to transport only that amount of natural gas sufficient to address the current needs of New England and nowhere else will help to minimize the safety impacts upon my community. Further, in view of the blast radius' size, KM needs to provide a detailed emergency response plan covering, at a minimum, the thermal, concussive, shrapnel, downwind, and emergency access aspects of an incident. Part of that response plan should be KM's equipping and training at its expense of the emergency response personnel of all emergency response entities along the pipeline's pathway. Simply put, it is not enough simply for KM to say – as it has done so far -- that when an incident occurs, local emergency responders should contact KM, evacuate local residents, and let the fire burn out.

## 5. Cumulative effects

As with all other aspects of this project, all assessment and resulting mitigative measures and plans must be location/municipality-specific. This is so to ensure that the analysis covers not only the unique characteristics of each location in the pipeline pathway but also to disclose the full extent of the cumulative effect of this project along its entire pathway. Thus, while I may discuss impacts to my Town, the Town of Nassau in Rensselaer County, New York, the NEPA analysis must discuss all the specific impacts – major and minor – to all locations, from Wright to Dracut.

The NEPA cumulative analysis for this project also should encompass the cumulative effects associated with the multiple pipeline projects presently under FERC review that purportedly seek to provide the same region with additional natural gas supply. “[P]roposals for ... actions that will have cumulative or synergistic environmental impact upon a region ... pending concurrently before an agency ... must be considered together. Only through comprehensive consideration of pending proposals can the agency evaluate different courses of action.” *Kleppe v. Sierra Club*, 427 U.S. 390, 410 (1976). The fact that these various projects may have different timeframes does not necessarily allow FERC to evade its cumulative effects assessment responsibility. For example, in *Riverkeeper Network v. Federal Energy Regulatory Commission*, 753 F.3d 1304 (DC, 2014), the projects that the Court ruled should be measured cumulatively were constructed over a three year period. Additionally, NEPA requires FERC to consider connected, cumulative, and similar actions.

I am not the only individual to raise this issue. For example, on June 30, 2015, New York State Senator Jim Seward urged FERC to reject this project on cumulative impact grounds, noting that the project, coming on the heels of the proposed Constitution Pipeline, would make the region a natural gas pipeline “highway” that is “not in harmony with what residents want or support.” “The cumulative effect of multiple pipelines through portions of [New York’s] Delaware and Schoharie Counties should be reviewed by FERC. It is not unreasonable to project that multiple pipelines would place arithmetically higher pressure on public infrastructure and public services, land values and the environment. This ‘multiplier’ effect should be evaluated carefully. ... [L]ong-term environmental and safety costs can also be anticipated. If the Kinder-Morgan project is given federal approval, none of these expenses should be the responsibility of local property taxpayers who are receiving absolutely no benefit and being forced to assume all of the risks associated with the

unwanted pipeline.”

The U.S. Court of Appeals for the DC Circuit ruled in 2014 that FERC failed to provide a cumulative impact analysis for a series of upgrades to the Tennessee Gas Pipeline system. *Delaware Riverkeeper Network v. Federal Energy Regulatory Commission*, 753 F.3d 1304 (DC, 2014) (2014). The court has defined such an analysis in this way: “A meaningful cumulative impact analysis must identify (1) the area in which the effects of the proposed project will be felt; (2) the impacts that are expected in that area from the proposed project; (3) other actions—past, present, and proposed, and reasonably foreseeable—that have had or are expected to have impacts in the same area; (4) the impacts or expected impacts from these other actions; and (5) the overall impact that can be expected if the individual impacts are allowed to accumulate.”

#### 6. Need for comprehensive health impact assessment

While FERC’s natural gas pipeline system infrastructure project review process encompasses environmental impact analysis, it does not encompass a comprehensive health impact assessment.

It should.

In June 2015, the American Medical Association recognized this gap in critical information concerning the potential impact on human health associated with natural gas infrastructure; and it resolved to support legislation requiring comprehensive health impact assessments regarding the health risks that may be associated with natural gas pipelines as an integral part of the regulatory review of gas pipeline proposals.

The typical regulatory agency approach estimates the total short-term and long-term emissions directly sent into air or water by the project under consideration. Estimated total emissions are then compared with Federal or State standards for “acceptable” emissions. If the estimated levels fall below critical thresholds, the project is assessed as having a non-significant health impact.

This approach is inadequate. For example, the following are but three examples of impacts that FERC, in applying this approach, presently does not include in its reviews:

- **Emission spikes.** Regulatory agencies measure emissions in terms of averages taken over numerous short (for example, one hour or less) or long-term intervals (for example one or more days). Recent studies have found that these averages do not reveal the occurrence of very high levels of “peak” emissions that may occur at irregular intervals. These peaks may have serious adverse health impacts that are not captured by averaging over longer periods of time. A comprehensive assessment performed according to public health professional standards would capture information on peak emissions and their consequent health implications.
- **Dynamic evolution of emissions.** Regulatory agencies take a very local and static view of toxic emissions, assessing them in isolation from each other and only at the time and place immediately adjacent to their source. Many if not most standards are based on single chemical emission, while under most circumstances it is a mixture of different chemicals that are emitted. In addition, any single emission can disperse widely, evolve, and combine with other emissions and atmospheric conditions and become reabsorbed into distant water and soil. Only a comprehensive health assessment can properly evaluate the full range of emission impacts.
- **Downstream and upstream impacts.** Regulatory agencies restrict their assessment of impacts to the operations of the project in question. However, pipeline impacts extend far beyond pipeline operations. Pipelines are a “midstream” structure, placed between the start-point of gas well production sites and the endpoint of commercial or residential consumption. Adding a pipeline has the impact of expanding both production and consumption; and many studies have reported that the endpoint use of pipeline-provided gas in residential stoves has adverse impacts on respiratory function. Only a comprehensive health assessment would, correctly, view this as a pipeline impact.

These examples are not exhaustive. The issue of vulnerable sub-populations (such as people with pre-existing asthmatic conditions) is not routinely addressed by regulatory agencies, but is a key part of comprehensive health impact assessments.

FERC should include as part of its review process a more complete and informative look at environmental impacts from a human health perspective, as outlined as a set of research protocols by the Centers for Disease Control and Prevention, and by the National Academy of Sciences.

7. Other matters

a. Frost line

There is a number of instances of pipeline fractures attributable to frost heaves.

The frost line in eastern New York is about four feet – and that is when the bedrock is deep enough to allow there to be frost-free soil above it. In many locations in Rensselaer County in the proposed pipeline’s path, the bedrock is less than four feet below the surface.

b. Design/construction matters

FERC’s NEPA assessment needs to address pipeline construction effects, both surface and underground. I note above some of the analysis needed as, for example, groundwater diversion and contamination. However, the analysis should encompass the effects of the chemicals used during construction (as well as during other aspects of design, construction, operation, and closure) on humans, fish, and other organisms.

The assessment should cover the actual details of siting, design, construction, operation, and closure. It is not enough to discuss these phases of the project in general terms, such as “conformity with recognized procedures, etc. Lack of detail prevents citizens from responsibly commenting on the adequacy of design, operation, closure, etc.

Necessity for the proposed route: Why is there a need for “greenfield” locations when KM already has a path within its control?

The NEPA analysis should detail the methods and procedures used for blasting. It is not enough to state that blasting will be conducted by licensed blasters using accepted methods and procedures. Each method, each procedure, has its own set of circumstances, including chemicals used and released into the environment. Baseline testing of private and public wells should be included as a requirement of this project, as should post-blast testing of wells on a complaint-driven basis, with KM bearing all costs to sample, analyze, and report to the well owner.

The NEPA analysis needs to assess the environmental, safety, and engineering consequences of locating a pipeline, or a component of the pipeline infrastructure near high tension electric transmission lines, as KM proposes to do. Since material, weld, and equipment failure and corrosion are the leading causes of natural gas pipeline significant incidents, the analysis should encompass, at a minimum, analysis of risk of equipment failure, longevity of sacrificial cathodes in cathode beds, and evidence-based maintenance plans.

The NEPA analysis should assess the sufficiency of a pipeline design – construction – operation – maintenance regulatory program applicable to this project that gives rural residents a lower level of protection, to such an extent as to treat them as second-class citizens in that regard. This is a critical environmental issue as it directly concerns the safety of this pipeline project. It comes from the basis for the regulatory program: natural gas transmission pipeline regulations establish pipe strength requirements based on population density near the pipeline. Locations along gas pipelines are divided into four “classes” by counting the number of dwellings within 660 feet of the pipeline for one mile (in the case of Classes 1 to 3) or by determining that four-story buildings are prevalent along the pipeline (Class 4). Pipelines in Class 1 locations – rural areas, which is the majority of the proposed pipeline corridor in New York as well as in Pennsylvania, Massachusetts, and New Hampshire – are allowed to have greater allowable pipe stresses, as a percentage of specified minimum yield strength (SMYS), than are allowed for pipelines in Class 2, 3, or 4 locations. Design factors, which are used in the formula to determine the design pressure for steel pipe and which generally reflect the maximum allowable percentage of SMYS, are 0.72 for Class 1, 0.60 for Class 2, 0.50 for Class 3, and 0.40 for Class 4. Thus, the possibility of greater personal and property loss in densely populated areas and consequent greater insurance industry payouts, as compared against those in rural areas, drive the pipeline safety regulations of the Pipeline and Hazardous Materials Safety Administration. In actual fact, then,

rural residents and their property get a lower level of protection and so, are treated as citizens less worthy of protection through no fault of their own other than to have chosen to live in a rural environment. For example:

- sectionalizing block valves (used to seal off sections of pipe in the event of an emergency, among other things) can be ten miles apart in rural areas, as opposed to 2-1/2 miles in more densely populated areas
- pipe used to transit rural areas can operate at pressures higher than is allowed in more densely populated areas
- plastic pipe can be used for higher pressured gas in rural areas than is allowed in more densely populated areas
- nondestructive testing of ten percent of each day's field butt welds must be undertaken in rural areas but such testing of all such welds must be undertaken in more densely populated areas
- soil cover of the pipe is less in rural areas (30 inches) than in more densely populated areas (36 inches).
- on steel pipe manufactured before November 12, 1970, with welded seams, the pipe must be tested to at least 1.25 times the maximum allowable operating pressure if it is to be installed in a rural location but to at least 1.5 times such pressure if installed in a more densely populated area.

Further, it does not appear that present-day federal regulation provides for many common-sense requirements that should have been put into place years ago had public safety been the key driver of pipeline safety requirements. Examples of such common-sense requirements include:

- Nondestructive testing of all girth welds at the time of construction, nomatter the class location
- Close interval surveys
- Ensuring that pipe in a cased crossing can be assessed for metallic and electrolytic shorts
- Coating surveys (for example, to assess whether pipe coatings on the pipeline and girth weld joints are, and remain, non-shielding to cathodic protection) and remediation
- Stress corrosion cracking surveys (SCC) and segment replacement (if a SCC threat is found and not remediated)
- An ongoing monitoring program for DC currents and induced AC currents in high-voltage power transmission line corridors (including proper remediation plans) – this is an especially important matter here since the pipeline is proposed to follow a high voltage transmission line's right-of-way
- In-line tool inspections (ILI) to inspect for pipe metal loss (corrosion), cracks, hard spots, weld seams, and other integrity threats in steel pipe (ILI tool evaluations for metal loss must use specified-or-greater interaction criteria to ensure defects meet a minimum integrity criterion)
- Repairs to defects within a periodic time interval that is based on maintaining the pipeline design safety factor with a maximum pipe wall loss
- Pipe surveys of the depth of cover over buried pipelines
- Data integration of all surveys, excavations, remediation, and other integrity threats
- Pipeline remediation based on assessment and data integration findings (for example, assess pipe seam quality issues and remove from service those pipes with quality or integrity concerns)
- Performance of monthly ground or aerial right-of-way patrols
- Conducting a root cause analysis to determine the cause of all in-service and hydrostatic test failures or leaks
- Requiring all sectionalizing block valves to be remotely and automatically activated upon occurrence of a pipeline leak or rupture

FERC cannot dodge its responsibility to address this issue by simply stating that pipeline design/construction/operation matters do not fall within its area of responsibility or that the pipeline will be designed,

constructed, and operated in accordance with applicable legal requirements. FERC as lead agency has the responsibility to ensure that the project can proceed safely; and authorizing a project to proceed that allows a lower level of safety to rural residents than that required to be given for urban residents is unsatisfactory. Thus, it has the requisite authority to require standards more stringent than that required under regulation when the circumstances so require. This is one of those circumstances.

c. Operation matters

FERC's NEPA analysis should identify all chemicals that will be encountered during the course of operation: those used in normal maintenance, those encountered in the gas itself, those needed to address emergency situations, etc. The analysis should then evaluate whether there are any less harmful chemicals that could be used to achieve the same operational or emergency response objectives.

The NEPA analysis should encompass the evaluation of the leakage potential of the pipeline system and the determination of methods to employ during design, construction, and operation to eliminate them and, that failing, to respond quickly to eliminate a leak should one occur.

Since a pipeline easement can cut across a parcel, the NEPA assessment should include a discussion of the maximum equipment weight, speed, and angle that is safe to drive over the pipeline. These are important considerations in my Town, which has many people engaged in forestry occupations.

Since blowdowns are seen as a normal component of pipeline operations, the NEPA assessment should analyze and decide upon the best course of action to eliminate blowdowns to the maximum extent practicable and to minimize the migration of blown-off gases. In line with this, the analysis should provide an accurate estimate of the quantity of gas released each quarter at each location along the pipeline project's pathway where blowdowns and other authorized releases occur (for example, at compressor stations), at STP. *{end of 20150825-5120}*

August 15, 2015

Ms. Kimberly D. Bose, Secretary  
The Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

RE: Docket Number PF14-22-000

Dear Ms. Bose:

As an abutter, I've been advised by some very learned people who apparently know a lot about this process that in order to give these comments the best chance of being taken seriously, I need to stick to facts and nothing but facts, while at the same time offering suggestions for ways to address these adverse environmental impacts. Why it's my responsibility to solve problems I didn't have a hand in creating and that I'm not being paid to solve is an absolute mystery to me, but since I happen to have a few recommended solutions anyway, I've included them.

Most of the environmental impacts detailed below are based upon my own site measurements, all made consistent with the Interstate Natural Gas Association of America guidelines specified in the attached drawing entitled "MAINLINE CONSTRUCTION PARALLEL TO POWER LINES RIGHT-OF-WAY". The drawing is numbered STD-INGAA-5 and is taken from a much larger document with which I'm sure you are familiar: "Building Interstate Natural Gas Transmission Pipelines: A Primer", available on the INGAA web site and carrying a publication date of January, 2013, with Kinder Morgan (KM) listed as a Key Contributor. While admittedly not a professional surveyor, I have taken and re-taken these measurements a total of four times now. They are accurate to +/- 3' and significantly more accurate than the CAD drawing of our home published without our prior knowledge by KM in its most recent Draft EIS.

Issues

- If INGAA guidelines are adhered to, the currently proposed pipeline routing would place its centerline within twenty (20) feet of our home, not the forty-one feet indicated by KM in the most recently published Draft Environmental Impact Statement, Drawing MK-SEG\_I-RES-001.
- Adhering to the INGAA guidelines means that there simply isn't enough room between the electric transmission lines and our home to allow for placing the pipeline between our home and the current Eversource right-of-way without the permanent pipeline right-of-way encroaching on a portion of our house.
- Given the planned permanent right-of-way width of fifty feet as previously stated by Kinder Morgan representatives, adherence to the INGAA guidelines will mean not only a permanent right-of-way on our property, but a permanent right-of-way through a portion of our home.
- The loss in value to our property and home will most certainly approach 100% under this scenario as it will be impossible to sell the home and equally impossible for a prospective buyer foolish enough to try and purchase it to obtain insurance or financing with an easement running THROUGH the house. Who in their right mind would agree to be obligated under an easement to seek Kinder Morgan's approval to re-paint their kitchen or install a new garage door? It's beyond absurd.
- If INGAA guidelines are adhered to, excavation and blasting will occur within twenty feet of our home, subjecting the structure to potential damage caused by flying debris, concussive blast waves, heavy construction equipment and construction personnel, and subjecting the occupants of the structure (our family) to physical and psychological stress and physical injury caused by such activity.
- If, on the other hand, INGAA guidelines are ignored, excavation and blasting will occur within forty-one feet of our home, subjecting the structure to potential damage caused by flying debris, concussive blast waves, heavy construction equipment and construction personnel, and subjecting the occupants of the structure (our family) to physical and psychological stress and physical injury caused by such activity. KM doesn't genuinely expect us to believe that an additional twenty-one feet would make any difference at all when they're detonating explosives or digging a 15' wide trench and laying pipe using equipment nearly as large as our house, do they? Do you?

#### Recommended Solutions

- Deny the project application with no chance of appeal.
- or-
- Require the applicant to reroute the pipeline.
- or-
- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

#### Issues

- The currently proposed pipeline routing would result in the only source of potable water on our property (a private well) lying within sixty (60) feet of the pipeline centerline.
- The currently proposed pipeline routing would result in excavation and blasting occurring within sixty (60) feet of the only source of potable water on our property.
- The currently proposed pipeline routing would also result in that private well lying within forty (40) feet of the permanent right-of-way.
- The currently proposed pipeline routing would also result in that private well lying 100% within the temporary construction right-of-way and work zone.
- These facts make it a virtual certainty that the only source of potable water available to supply our residence will be adversely and irreparably impacted by the currently proposed location of the pipeline including, but not limited to, line and casing integrity, turbidity, capacity, flow rate, and recovery rate.
- Due to setback requirements for the current septic tank, leach field, property lines, road way, and perma-

ment right-of-way, securing approval for and successfully drilling a new well location would be virtually impossible. Further, a change to the entry point of the main water supply line into the house would be extremely difficult, and may in fact be impossible.

- A permanent lack of a potable water supply to our home due to pipeline approval and construction as currently proposed will render it uninhabitable, unsaleable, and largely worthless.

#### Recommended Solutions

- Deny the project application with no chance of appeal.

-or-

- Require the applicant to reroute the pipeline.

-or-

- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

#### Issues

- The currently proposed pipeline routing will result in the construction right-of-way encompassing 100% of the overhead lines providing electricity and other utilities to our home, making service interruptions during construction highly likely.
- A careful reading of the previously mentioned INGAA guidelines makes clear that utility service interruptions are a fairly standard occurrence in pipeline construction near residences, with contractors advised to attempt to give residents advance notice of construction related utility outages.
- Due to our rural location, during periods of utility outages we will be without heat, without potable water and functional plumbing, without access to refrigerated foods, and without a way to prepare food.

#### Recommended Solutions

- Deny the project application with no chance of appeal.

-or-

- Require the applicant to reroute the pipeline.

-or-

- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

#### Issues

- The currently proposed pipeline routing will result in the temporary construction right-of-way encompassing a significant portion of the only ingress / egress route on the property (private driveway) with our access to our own home likely to be significantly and repeatedly compromised during construction and with substantial or total destruction of our paved driveway a virtual certainty.

#### Recommended Solutions

- Deny the project application with no chance of appeal.

-or-

- Require the applicant to reroute the pipeline.

-or-

- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

#### Issues

- The currently proposed pipeline routing will result in the removal of roughly 2/3 of all trees on our heavily wooded, 4-acre lot. That's literally hundreds of trees. As the trees are primarily evergreens, there is no

actively growing ground cover under the tree canopy.

- Due to the significant slope of our property, this lack of vegetation makes certain the significant erosion of soil and flooding of our home as rainwater follows the course of this slope unimpeded by trees or ground cover.
- The currently proposed pipeline routing in such extremely close proximity to the house will necessitate the removal of 15-20 trees exceeding 50' in height and growing very, very close to the house. To date, KM has done absolutely nothing that causes me to believe they will exercise the level of care necessary to ensure no incidental damage to our home during the removal of these trees.

#### Recommended Solutions

- Deny the project application with no chance of appeal.

-or-

- Require the applicant to reroute the pipeline.

-or-

- Mandate that the applicant purchase our home and property and the homes and properties of any similarly situated abutters willing to sell to them.

In closing, I readily acknowledge the lack of creativity in my recommended solutions. However, as the issues related to the pipeline's proposed proximity to our home and to our sole source of potable water appear to be addressable only through denial of the application, the rerouting of the pipeline, or the outright purchase of our home, I didn't spend any time trying to figure out additional possible solutions for all of the other issues. Frankly, if the pipeline being located within twenty feet, or even forty-one feet, of our home, and within sixty feet of our well, isn't significant enough for KM and FERC to take steps to try and mitigate the health, welfare, and financial impacts on my family, I doubt any alternatives I could suggest would receive anything approaching serious consideration.

Curtis L. Douglas  
Richmond, New Hampshire

Ms. Kimberly D. Bose, Secretary  
The Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

RE: Docket Number PF14-22-000

Dear Ms. Bose:

In a letter dated August 15, 2015, I previously submitted comments in response to the Kinder Morgan Draft Environmental Impact Statement in which I detailed the most significant impacts to me and my family resulting from the proposed pipeline. Consistent with what I've learned regarding this process, my previous comments were largely devoid of emotion or anything other than fact-based issues and recommended solutions. But, the inconvenient truth in all of this is that it is emotional – at least for those of us in the path of the pipeline. And while the players at KM, at FERC, and in Congress clearly have little to no regard for our families or our homes and just as clearly have reduced us to nothing more than data points on a collateral damage list, I nonetheless feel that those of us being asked to shoulder the burden of this project and process should count for something...heck, anything. Instead, I find that we've been marginalized to the point that we're now seen as just an enemy that must be deceived, manipulated, and outright destroyed whenever necessary, in order to realize some unspoken and unwritten list of broader objectives – money chief among them. Try as I might, I'm entirely unable to reconcile what I've observed thus far in the behavior of KM, FERC, and our elected officials with the fact that this is the United States, that those of us in the path of the

pipeline are citizens too, and that we have some right to expect that we be treated as such.

You know, I didn't ask for this fight – some company I didn't know anything about and its posse of fixers declared war on me while I was busy minding my own business. I'm not some Luddite (for anyone at KM or in Washington reading this, that's someone opposed to progress and technology) who rails against anything representing change. I'm also not opposed to this proposal because I'm worried about a pasture field and maybe a fence or two out on our “back-forty” somewhere, or because I care about garden slug habitats, endangered mushrooms, or mosquito breeding areas. I can assure you that in this particular context, I don't care about any of those things. This proposed project represents a very real threat to the health and well-being of my family. That's what I care about. To say nothing of the fact that we don't own enough to even have a back-forty.

Since I have previously documented my methods for arriving at the following measurements, I won't go into it again here. Suffice to say, they are accurate to +/- 3' and significantly more accurate than the CAD drawing of our home published without our prior knowledge by KM in its most recent Draft EIS. I know this because my measurements were taken using actual measuring tools instead of being guessed at using decades-old GIS maps, pictures taken from helicopters and satellites, Ouija boards, Magic 8-Balls, and whatever additional methods may have contributed to the numbers KM came up with.

- The currently proposed pipeline routing will place its centerline within twenty feet of our home, not the forty-one feet indicated by KM in the most recently published Draft Environmental Impact Statement. There simply isn't enough room between the electric transmission lines and our home to allow for placing the pipeline there without the permanent pipeline right-of-way encroaching on a portion of our house. Forcing the pipeline into this location will result in not only a permanent right-of-way on our property, but a permanent right-of-way through a portion of our home. Wishing there was more room, buying a new Ouija board, or hiring a new helicopter pilot won't change the facts. The loss in value to our property and home would most certainly approach 100% under this scenario as it would be impossible to sell the home and equally impossible for a prospective buyer foolish enough to try and buy it to obtain insurance or financing with an easement running through the house.
- In addition, excavation and blasting will occur within twenty feet of our home. It's stupefying to me that KM is seeking FERC approval for a project that may require them to, among other things, detonate explosives within two car-lengths of the house my family lives in and that FERC is willing to not only consider the proposal, but is highly likely to issue a CPC giving them carte blanche approval to do it. What if they wanted to blow up, say, our kitchen? Would FERC willingly consider that proposal too? What if we didn't want our kitchen blown up? Would it still be our responsibility to try and talk KM and FERC out of moving forward with the plan by offering a recommendation for a completely different room that could be blown up instead? Like maybe the bathroom or something? Just out of curiosity, is there anywhere that they could propose placing the explosives that would cause somebody at FERC - or anyone else in Washington - to finally speak up and say, “You know this might not be such a great idea”? What about under the sofa in our living room? No? OK, then how about under our son's bed? Would that do it? Or would that proposal receive serious consideration too as long as the law guaranteed us an offer equal to the fair market value of the mattress, sheets, and blankets? And would our elected officials continue to look the other way under those circumstances as well?
- The currently proposed pipeline routing will result in the only source of potable water on our property (a private well) lying within sixty feet of the pipeline centerline and will result in excavation and blasting occurring within sixty feet of that same well. Also, the well will lie within forty feet of the permanent right-of-way and 100% within the temporary construction right-of-way and work zone. Due to setback requirements for the current septic tank, leach field, property lines, road way, and permanent right-of-way, securing approval for and successfully drilling a new well location would be virtually impossible. Further, a change to the entry point of the main water supply line into the house would be extremely difficult, and may in fact be impossible, while a permanent lack of a potable water supply to our home will render it uninhabitable, unsaleable, and largely worthless.

- The currently proposed pipeline routing will result in the construction right-of-way encompassing 100% of the overhead lines providing electricity and other utilities to our home, making service interruptions during construction highly likely. During periods of utility outages we will be without heat, without potable water and functional plumbing, without access to refrigerated foods, and without a way to prepare food. Also, the temporary construction right-of-way will encompass a significant portion of the only ingress / egress route on the property (a private driveway) with access to our home highly likely to be significantly and repeatedly compromised during construction, with substantial or total destruction of our paved driveway a virtual certainty.
- The currently proposed pipeline routing will result in the clear-cutting of roughly 75% of all trees on our heavily wooded, 4-acre lot. That's literally hundreds of trees. Since the trees are primarily evergreens, there is no actively growing ground cover under the tree canopy. Due to the significant slope of our property, this lack of vegetation makes certain the significant erosion of soil and flooding of our home as rainwater follows the course of this slope unimpeded by ground cover or trees.
- Of course, there is an "out" in all of this. Simply ignore recommended pipeline construction practices and place the pipeline closer to the 345,000 volt electric transmission lines and a little farther away from our home. Obviously, FERC, OSHA and Eversource Energy will have to ignore the fact that construction is taking place in close proximity to 345kV transmission lines. And I would imagine some of KM's contractors will be significantly endangered by this work. But since at this point nobody sees anything wrong with our family being forced to live forty feet - or even twenty feet - from a pipeline and its well-documented pollution and explosion risks, I'm guessing they don't care much about the folks who are going to build it either. A few workers getting toasted by 345,000 volts may be a perfectly acceptable risk when there's billions of dollars to be made. Just pay a couple of fines, throw a little money at the survivors, and then get right back to work. It does make you wonder how it'll be decided who gets to operate the crane underneath the transmission lines though. Who knows, before they start blowing stuff up every morning, maybe we'll see 'em doing Rock-Paper-Scissors out in what used to be our woods.

You know, every time FERC approves another of these lunatic fringe projects while the EPA, the DOT, and Congress looks the other way, it hands a briefcase full of nuclear launch codes to the equivalent of a madman in the form of Eminent Domain. And here all we data points on the collateral damage list sit with giant targets already painted on our homes, our property, our finances...and our families. We're beginning to understand that there isn't one meaningful thing any of us can do about it in the current environment, but that doesn't make it any less emotional for us. Even though how we feel about it and how dearly we're made to pay doesn't matter to FERC or Congress, it still matters to us. So here's a heartfelt suggestion for you. For once, why don't you stop treating us like something you mistakenly stepped in that now has to be scraped off the bottom of your shoe? For once, why don't you and our elected officials try offering us a hand instead of sitting on your hands?

Curtis L. Douglas  
Richmond, New Hampshire

P.S.: Is there any way Kinder Morgan can be made to stop using helicopters to randomly hover and circle around 25' above our house? While technically legal, it's still an invasion of our privacy. Plus, if it's intended to intimidate us, it's not working. (Although it is starting to freak the dog out a little.) All in all, we were pretty pleased with how the pictures of the helicopter turned out and we have the video camera ready for the next time. But we're still wondering what they're doing up there in the first place? Trying to peep in the windows or get a few candid shots of my family members using the bathroom maybe? Regardless, it's still a little creepy - even by pipeline company standards.

**20150825-5140**

Miriam Kurland, Mansfield Center, CT.  
Dear Secretary Bose,

I am writing in regards to Docket number PF14-22, Kinder Morgan's Northeast Energy Direct (NED) project.

In the environmental impact statement, FERC needs to take into account the increased amount of methane emissions that this large project will pour into our atmosphere. Earlier this month the EPA proposed new standards to reduce methane emissions by 45% over the next 10 years. The EPA recognizes that methane is a potent global greenhouse gas, far worse than carbon dioxide at trapping heat in the atmosphere. The NED project will make those reductions in methane emissions impossible, and will cause irreparable harm to our climate.

Furthermore, these shale gas expansion projects are segmented into two, the Connecticut Expansion and NED. FERC must acknowledge that this is the case, and admit that the environmental harm caused by these two projects is cumulative. They are not separate projects, and FERC has been guilty of illegal segmentation in the recent past.

The potential harm to water has been raised by the Hartford MDC, the municipal corporation responsible for providing clean water to 400,000 people in the Hartford area. In a June 26 letter to FERC, MDC Chief Executive Officer Scott Jellison wrote "to express some concern that the proposed pipeline could potentially impact MDC's public drinking water supplies in West Hartford and Bloomfield, CT." FERC must address the concerns of MDC and the public about the impact of pipeline construction and operation on drinking water.

FERC should take into account the frequency of pipeline leaks and explosions, and factor in the costs to local communities, who bear a burden when environmental harm from pipeline accidents occur. According to the Pipeline Hazardous and Materials Safety Administration, leaks and explosions are not uncommon and have increased in frequency in recent years. We, in Connecticut, New York and Massachusetts DO NOT want increases in infrastructure for these very toxic and dangerous fossil fuels. Please listen to the People and stop this madness throughout the Northeast and throughout the nation. Thank You, Miriam Kurland

#### **20150825-5156**

ARTHUR KARIS, STEPHENTOWN, NY.

I AM WRITING CONCERNING THE PROPOSED NED PIPELINE AND THE POSSIBLE EFFECT IT WILL HAVE ON THE SHALLOW WELL THAT PROVIDES WATER FOR 3 HOUSEHOLDS ON GRIFFIN ROAD IN STEPHENTOWN NY. THE PROPOSED PIPELINE WILL IS WITHIN 800 FEET OF OUR WATER SUPPLY AND TRAVERSES THE UPHILL WATERSHED FOR THIS SHALLOW WELL AND OTHER WELLS IN THE VICINITY. SPECIFICALLY, THE BLASTING AND TRENCHING OF THE ROCK IN WHICH THE PIPELINE WILL BE INSTALLED HAS THE POTENTIAL FOR DISRUPTING AND POLLUTING THE WATERSHED FOR OUR WATER SUPPLY. I WOULD LIKE TO KNOW WHAT ACTIONS THE TENNESSEE GAS PIPELING COMPANY IS PROPOSING TO MITIGATE ANY NEGATIVE EFFECTS ON THE WATER SUPPLY FOR OUR HOME AND THE OTHER HOMES THAT ARE DOWNHILL FROM THE PIPELINE.

#### **20150825-5159**

carolyn bosch, dracut, MA.

We are opposed to the NED pipeline docket number PF-14-22. There are many alternatives to this pipeline. Kinder Morgan can invest a fraction of their cost to fixing the leaks in the existing pipelines to supply natural gas to New England. This will produce the 1% more in energy that we need on the coldest of days. Building a massive infrastructure that they are proposing only emphasizes that their real goal is to export our natural resources overseas. That in itself is not a reasonable strategy. Energy supplied by the United States will be lowballed in price by the Soviet Union and Australia who are currently in a better position to supply natural gas to Europe and Asia. A private company in the USA has the right to make money, however not at the expense of hundreds of thousands of Americans that will bear the risk of the cumulative negative effects

to our environment, our property, our health, and our way of life. This proposal is unconscionable.

Comments of the Town of Amherst, NH

Re: Tennessee Gas Pipeline Company, L.L.C. (“TGP”)

Docket No. PF14-22-000: Proposed Northeast Energy Direct (“NED”)

Dear Ms. Bose:

On March 23, 2015, the Town of Amherst Board of Selectmen submitted comments, including a preliminary environmental assessment prepared by the Amherst Conservation Commission (ACC), regarding the above-referenced project. Since that time, Kinder Morgan (KM) has presented three alternate route options through the Town of Amherst (attached) in response to the sensitive properties and populations identified by the Amherst Pipeline Taskforce and ACC. Amherst residents Alice and Kenneth J. Bury, on February 27, 2015 in a letter to FERC also proposed several potential alternative alignments to minimize the impact of the proposed NED pipeline project on a portion of the Town of Amherst.

The ACC has recently prepared an addendum to its preliminary environmental assessment to review the potential impacts of these alternate routes. The ACC addendum (attached) concludes that the overall environmental impacts from an alternative alignment that incorporates the Bury’s Alternative 2 and the Kinder Morgan Option 1 would be substantially reduced. The realignment of the pipeline through more commercial and industrial properties adjacent to the railroad right of way and the avoidance of sensitive environmental resources including the Souhegan River and Ponemah Bog would result in alleviated environmental impacts.

Additionally, the Board of Selectmen notes the following:

- Option 1 avoids impacts to the Souhegan River and Ponemah Bog entirely, as well as avoiding both Amherst’s Middle School and High School.
- Option 1 combined with the Bury’s Alternative 2 impact far fewer existing homes (though perhaps the same or slightly more properties) than the original proposal.
- Option 1 combined with the Bury’s Alternative 2 reduces the length of the pipeline through Amherst by one-third, with no disruptive horizontal directional drilling required.
- Option 1 combined with the Bury’s Alternative 2 represents a much less disruptive route through Amherst.

It would appear that there are alternative routes to the original KM proposed route which would minimize the impact of the pipeline on the Town of Amherst and its residents and its environmentally sensitive lands, and these should be given careful consideration by the FERC and KM.

This letter should not be taken as an endorsement of the pipeline or its route through Amherst and New

Hampshire on the part of the Amherst Board of Selectmen or the ACC. The Amherst Selectmen firmly believe that this pipeline should not be built in Amherst or in southern New Hampshire.

The Amherst Board of Selectmen looks forward to the FERC's continued rigorous analysis of the NED pipeline proposal, the need for it, the justification for its being in New Hampshire, and its alternative routes. Sincerely,

Dwight Brew, Chairman

John D'Angelo, Vice-Chairman

Nate Jensen, Clerk

Reed Panasiti

-----  
**Environmental Impact Assessment – Addendum 1**

**July 28, 2015**

In March 2015, the Pipeline Environmental Impact Assessment Committee (Committee) of the Amherst Conservation Commission (ACC) submitted a Preliminary Environmental Assessment (PEA) at the request of the Town of Amherst (Town) Board of Selectmen (BOS) regarding the Northeast Energy Direct (NED) pipeline proposed by Kinder Morgan (KM) in December 2014 (original proposal). In subsequent months, representatives of Kinder Morgan and the BOS's Pipeline Task Force (Task Force) discussed alternatives for the alignment through the Town.

In June 2015, KM presented three (3) options for alternative alignments (Attachment 1). Option 1 tracks the same alignment of the original proposal for the first portion of the pipeline through the Town, from the Milford Town Line to Hertzka Lane, then the alignment diverges to the east, adjacent to the Pan Am Railway Right-of-Way (ROW), crossing sixteen (16) properties abutting the railroad to the south. Option 2 diverges from the original proposal in the Town to the west of Rt. 122 in Amherst, traveling northwest back into Milford and the Rt. 101A/Rt. 101 interchange, then northward in the east side of the Rt. 101 Right-of-Way, underneath the Souhegan River (River), crossing Merrimack Road and Rt. 122, then northeastward, crossing Beaver Brook, Corduroy Road, Boston Post Road, Meadow Road, between Ravine Road and Storybrook Lane, then following County Road to the south of the pavement southeastward into the Town of Merrimack, where it would subsequently cross under the River again. Option 3 diverges from the original proposal in Milford west of Federal Hill Road, traveling north to the Rt. 101 Right-of-Way, meeting Option 2 at the Rt. 101A/Rt. 101 interchange for the duration of the alignment in the Town. Based on a variety of parameters including the avoidance of waterways, the Task Force has decided that Option 1 would be preferable to either the original proposal, Option 2, or Option 3.

The Task Force has asked the Committee to provide a preliminary environmental assessment addendum for Option 1. Given that Option 1 does not address issues with properties on the first portion of the alignment (adjacent to Rt. 122), the Task Force has asked that the current assessment include one of three alternative alignments proposed by Alice and Kenneth J. Bury on February 27, 2015 in a letter to the Federal Energy Regulatory Commission (FERC), which is attached as Attachment 2. Based on the Bury's "Summary of Pipeline Routing Alternatives", the Committee selected Alternative #2, which diverges from KM's original proposal west of Rt. 122 in Amherst, traveling southeast rather than northeast (as in the original proposal), then eastward parallel to the original proposal by approximately 600 feet to the south, reconnecting with the original proposal at Hertzka Lane.

The combination of the Bury's Alternative #2 and KM's Option 1 constitutes the alignment assessed in this addendum.

The total length of the original proposal is approximately 18,500 linear feet (LF) in the Town; this assessment is reviewing an alignment of approximately 12,500 LF (67%).

The format of this addendum will follow the initial PEA and correspond to the sections therein.

## **2.1 Land Use**

The proposed Alternative #2/Option 1 alignment, by principally paralleling the ROW, crosses or abuts primarily vacant, commercial, and/or industrial land uses along most of its path. Otherwise, only one utility and three residential parcels abut this alignment option. Unlike the original proposal, no school, conservation, or recreational land uses are encountered.

## **2.2 Water Resources**

The Alternative #2/Option 1 alignment does not encounter any surface waters in the Town. This alignment does traverse the highest yielding portion of the underlying aquifer in the properties adjacent to the ROW. The alignment passes adjacent (within 200 feet) to four (4) public water supply wells and over three (3) wellhead protection areas, one of which is for the supply wells of the Merrimack Village Water District, according to the Town of Amherst Environmental Features map prepared by the Nashua Regional Planning Commission. Given the local geology, it is not envisioned that blasting would be required to place the pipe in this area, minimizing the disturbance to wells from excavation, although dewatering activities may require lowering localized groundwater elevations. Blasting may still be required to the west along the properties on or adjacent to Federal Hill; impacts to groundwater resources would require significant hydro-geologic investigation.

## **2.3 Habitat and Species**

The Alternative #2/Option 1 alignment is restricted principally to commercial and industrial properties and, consequently, impacts significantly less highly ranked wildlife habitat when compared to the original proposal. Alternative #2/Option 1 traverses only one parcel (a 22 acre parcel abutting the rail ROW along Howe Ave.) that is highly ranked for ecological values, listed as Appalachian oak-pine by the New Hampshire Fish and Game, although it appears that this area has been cleared subsequent to the most recently available aerial photography. Potential impacts to terrestrial and aquatic species and their associated habitats are expected to be significantly less than the original proposal since the Ponemah Bog and Souhegan River environments are avoided.

## **2.4 Wetlands**

The Alternative #2/Option 1 alignment may encounter two small wetlands on Tax Map Parcel 2-26-4, which are listed as 0.32 and 0.44 acres and classified as freshwater forested/shrub wetlands.

## **2.5 Geology and Soils**

The bedrock and surficial geology of the Amherst area remain as described in the original Preliminary Environmental Assessment report. Option 1 traverses Glacial Lake Merrimack deposits (sands and gravels) along its entire length through Amherst. No blasting would likely be required due to the depth to bedrock. There are no agricultural soils along this alignment as compared with the original proposal.

2.6 Visual Resources Impacts to visual resources are anticipated to be less along Option 1 as the area is already principally developed for commercial and industrial use resulting in fewer existing trees and impacted viewsapes. Visual impacts along the Alternative #2 alignment also would be reduced as the alignment is shifted away from previously developed residential properties and an existing roadway to previously undeveloped areas.

## **2.7 Recreation**

None of the recreational impacts identified along the originally proposed pipeline route are anticipated to occur along Alternative #2/Option 1 since the River and Ponemah Bog are avoided by this alignment.

## **2.8 Public Health**

It is not anticipated that the types of public health impacts from the alignment covered under the assessed alignment would differ significantly from the original proposal; however, since the length of this alignment

is 67% of the original proposal, it is anticipated that the quantity of the public health impacts would be less. One specific area in which it is believed that the impacts would be significantly reduced is in terms of noise from blasting; due to the re-alignment of the western portion of the pipeline to the south of the existing Eversource powerline right-of-way, a bedrock formation upon which the Pennichuck Bon Terrain water tank sits, will be avoided, potentially reducing the amount of blasting required for excavation and installation.

## **2.9 Hazardous Materials**

As the alignment covered under this addendum is passing through additional commercial properties including those adjacent to the ROW, it is anticipated that the excavation of soils may encounter additional unknown materials. Hazardous materials expected in association with railroad rights-of-way include creosote (from railroad ties), diesel hydrocarbons, and any material transported along the ROW. As in the original PEA, the Town should ascertain that KM verify the presence of subsurface materials during their due diligence period and prior to full-scale excavation and pipe installation.

## **2.10 Air Quality**

It is not anticipated that the types of air quality impacts from the alignment covered under the assessed alignment would differ significantly from the original proposal; however, since the length of this alignment is 67% of the original proposal, it is anticipated that the quantity of the air pollution impacts would be less.

## **Summary**

It is anticipated that the overall environmental impacts from the Alternative #2/Option 1 alignment would be lessened as a result of the reduced length of the pipeline. Additionally, the realignment of the pipeline through more commercial and industrial properties adjacent to the ROW and the avoidance of many environmental features such as Ponemah Bog, unnamed wetlands, and the Souhegan River would result in alleviated environmental impacts.

It is possible that excavating soils adjacent to the ROW may disturb additional hazardous materials; however, as these potential contaminants exist in a commercial/industrial area, any remedial actions required would be less disruptive to daily activities and would present less of a health risk due to potential exposure durations during remediation than if it were to occur on residential properties.

Chairman Cheryl A. LaFleur  
Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

Madam Chairman:

We are stake holders in the proposed Northeast Energy Direct Project (NEDirect) natural gas pipeline planned to pass through our section of New Hampshire. While we are not convinced of the need for this or in any case the need for such a large pipeline we are not addressing this issue in this correspondence.

Our immediate concern is the pipeline route proposed for my immediate area. As I believe the attachments show although this pipeline routing is planned to co-locate with an existing electrical power right of way it still will require easements to access abutting property. Also unlike a high voltage electrical line any problem such as leakage and or fire and explosion would have a major impact on a much wider surrounding area than an electrical power line catastrophe.

We have attached what we consider a fair analysis of the impact of following the existing route proposed by Kinder Morgan as well as (3) alternative routes that we have identified.

We believe the comparison shows it is worth investigating and refining these proposed alternate routes rather than following the Kinder Morgan proposed route. We feel that a better routing for this pipeline in our area can be found and in any case the routing must be changed from what has been proposed by Kinder Morgan.

Please feel free to contact us at any time to discuss our proposal.

Thanks for your time.

Alice and Kenneth J. Bury, Trustees

-----  
Pipeline Current Routing Issues/ Concerns and Proposed Alternative

I. Routing - the current pipeline routing is close to/ through/ near many residents in Amherst. Alternative routing should be considered to go around these residences. These alternatives may involve deviating from the use of the electrical power right of way (ROW) which on the surface may sound like a problem. However, since the pipeline cannot go directly under the electrical power lines' co-locating along this ROW still requires obtaining numerous residential easements for construction and ultimately maintenance.

II. Specifically in my one mile area (between mile 161.6 and mile 162.6) the current pipeline routing is planned (see attachment #1) to:

- a. Pass near 44 residences. 28 currently inhabited and 16 planned to be built.
- b. Cross a state highway at an intersection (NH Route 122 and Patricia Lane) that if closed in an emergency would isolate a (27) family community,
- c. Through Amherst Christian Church's parking lot near the church building,
- d. Crossing a road that would isolate a (10) unit condo development preventing access or egress in an emergency,
- e. Require easement from 9 property owners, a church, 2 condo associations and 1 homeowner's association bordering or being transversed by the pipeline.
- f. Up to and along side of a public water tower which services this section of town,
- g. And also run next to a (16) unit work force housing project currently being planned for the area.

III. We believe that an alternative route can be found which would reduce the residential exposure, impact on the church, and move route away from the Water Tower. While not on the power line right of way, this routing would be through undeveloped residential and industrial land.

IV. Attachment #5 contains a summary analysis of the existing and the 3 alternative pipeline routings.

## SUMMARY OF PIPELINE ROUTING ALTERNATIVES

*{spreadsheet, not included here}*

### 20150825-5169

carolyn bosch, dracut, MA.

We are opposed to the NED pipeline docket number PF-14-22. “The annual “State of the Climate in 2014” report, which was compiled by NOAA and released by the American Meteorological Society (AMS) has confirmed that 2014 was the warmest year on record globally.

A total of 413 scientists from 58 countries contributed to the report.”

We should not continue to fuel this disaster by adding additional toxins to our environment from fossil fuels.

Here are the highlights of the 267 page report:

---Four independent global temperature datasets showed that 2014 was the warmest year on record going back to 1880. Europe observed its warmest year on record by a large margin, while eastern North America was the only major region to experience below-normal temperatures. Currently, 2015 is on pace to set another new global temperature record with some help from a strengthening El Nino.

---The globally averaged sea surface temperature for 2014 was the highest on record despite much of the year being under ENSO neutral conditions. However, a transition from a negative to a positive phase of the Pacific Decadal Oscillation (PDO) certainly enhanced the pronounced warming of the north Pacific Ocean.

---Upper ocean heat content was the highest on record. The report states that the oceans absorb over 90 percent of Earth’s excess heat from greenhouse gas forcing.

---Speaking of oceans, the global sea level continued to steadily climb at a rate of 3.2 mm per year, making 2014 a record high for average global sea level. The database goes back to 1993.

---Sea ice extent reached a record high in the Southern Hemisphere but was the sixth lowest on record in the Northern Hemisphere. Records go back to 1979.

---There were a total of 91 tropical cyclones for 2014, which is above the average of 82. The most active region was the eastern and central Pacific, while the Atlantic was relatively quiet.

---Carbon dioxide, methane and nitrous oxide, which are the three major greenhouse gases that are released into the atmosphere all reached record high concentrations for 2014.

---A total of 5 major and 15 minor greenhouse gases contributed 2.94 watts/sq. meter of direct radiative forcing in 2014, which is 36 percent greater than what it was just 25 years ago.

---Precipitation as usual was quite variable across the globe in 2014. Overall, precipitation was above-average over the oceans and below average over land areas.

---The Greenland Ice Sheet experienced extensive melting in summer 2014. The extent of melting was above the 1981-2010 average for 90% of the melt season, contributing to the second lowest average summer albedo over Greenland since observations began in 2000 and a record-low albedo across the ice sheet for August. (direct from the abstract).

---The ozone hole over the Antarctic continued to shrink as it was the sixth smallest on record since 1998. However, this decrease was still statistically insignificant.

### 20150825-5170

Donna Butler, Pelham, NH.

August 25, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street NE, Room 1A

Washington, DC 20426

RE: Kinder Morgan/Tennessee Gas Pipeline, LLC Docket #PF-14-22-000  
Northeast Energy Direct (NED)

Dear Ms. Bose,

We are writing to express our opposition to Docket #PF-14-22 and request FERC deny a permit to Kinder Morgan for the NED project.

Pelham, New Hampshire has the highest number of landowners directly affected by the proposed NED project in New Hampshire. Kinder Morgan scheduled a 2-hour information session with Pelham residents on March 26, 2015 but upon arrival announced they would be staying only 60-minutes due to another commitment in nearby Merrimack, NH. With some negotiations, Kinder Morgan agreed to stay for 90-minutes. Kinder Morgan expressed their sincerest apologies.

Kinder Morgan was ill-prepared for the information session, answering many questions as “To Be Determined” and distributing outdated maps despite a revised filing to FERC two weeks earlier. Materials lacked the revised pipeline route effective January, 2015 and failed to include multiple Pelham neighborhoods in close proximity to the proposed route, citing “not enough time to print accurate materials.” Kinder Morgan expressed their sincerest apologies.

When questioned about which methods would be used in the construction of pipeline within Pelham’s water resources, Kinder Morgan stated it would not traverse any of our waters, contradicting the plans provided at the meeting and to FERC. At best, the information provided was incomplete, inaccurate and misleading. At worst, the information was incorrect. Kinder Morgan expressed their sincerest apologies.

Kinder Morgan is sorry. It’s quick to acknowledge and apologize for broken commitments. Given the level of risk involved, Kinder Morgan’s sincerest apologies are simply not enough. We respectfully urge FERC to consider the lack of transparency and effort from Kinder Morgan as an indication of things to come. Please don’t allow Kinder Morgan the opportunity to issue their sincerest apologies to Pelham following a catastrophic event due to the approval of NED.

Please deny Kinder Morgan’s permit for NED.

Respectfully,

Timothy & Donna Butler

**20150826-0008**

August 12,2015

Eric Tomasi,  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426

Re: NED Pipeline, FERC Docket #PF 14-22-000

Dear Mr. Tomasi,

At the FERC Scoping Hearing in mid-July you mentioned to my wife Shelley and I that if we didn’t want the proposed Clark’s Chapel Road compressor station in our residential neighborhood that we should suggest alternate sites. I have driven the pipeline route in the Town of Schodack, Rensselaer County and have concluded the best site for the compressor station is adjacent to US Route 9 near the Shuffelt Road intersection. This location is where the existing Tennessee Gas Pipeline, and the proposed NED pipeline, both cross under US Route 9. There are 3 adjacent properties on the east side of Route 9 that the existing and proposed gas pipelines pass alongside or through. The three total 185.47 acres. The three adjacent properties run from west to east and are explained below.

Starting on the east side of Route 9 are 21.07 acres belonging to Ken Morris & Son Excavating. 1590 US

Route 9, Castleton, New York 12033. He told me he is willing to sell. Morris's land also contains a large garage for maintenance of his gravel-hauling trucks. This land is zoned HC (Highway Commercial).

Abutting Morris on his east are 63.52 acres of vacant land belonging to William J. Keller & Sons Realty Corp., business address 1435 US Route 9, Castleton, New York 12033-9649. This land is zoned HC (Highway Commercial).

Abutting Keller & Sons Realty to their east are 100.88 acres of vacant land belonging to Robert E. Kohler, 66 Craver Road, West Sand Lake, New York 12196. This acreage is zoned RA (Rural Agricultural).

Kinder Morgan may not opt to buy all three properties. If not, all three properties can be accessed separately from Shuffelt Road.

For Kinder Morgan the advantages of the US Route 9 properties over the Clark's Chapel Road site are as follows. The US Route 9 site abuts a 4-lane road built for heavy traffic while the Clark's Chapel site is on a road not built for heavy traffic, and it's 6 miles from US Route 9. The Route 9 site is about two miles north of the entry/exit to Interstate 90. The Route 9 site compressor station is more in keeping with its HC zoned neighbors; Bonded Concrete gravel operation, Piasecki Steel fabricators, Servidone heavy equipment contractors, Venneer heavy equipment sales, Hannaford grocery chain regional distribution center, Town of Schodack Highway Department storage yard, etc. These similar pseudo-industrial uses should quell homeowners' resistance to its siting. The Route 9 site has a large truck maintenance building that could be used for sensitive equipment secure storage of compressor station building components while under construction. The building's offices can be used for night watchmen and construction manager offices. The Route 9 site is hidden from view by trees along both Route 9 and Shuffelt Road. There are less residential houses within a half-mile radius of the Route 9 site. There are no lakes or ponds within the half-mile radius and the nearest stream (Valkie Kill) is south of my proposed compressor site. The closest road to the north of my proposed compressor site is one mile away. If the major winds are from the south at the Route 9 site (as they are at the Clark's Chapel site) the nitrogen dioxide and other pollutants will blow north over forested land and some open fields, not onto residences and onto Burden Lake, a major recreational and residential lake in Rensselaer County.

Also, think about the following. Electrical service from National Grid is more abundant on Route 9 than on Clark's Chapel Road where many temporary black outs have occurred this past year while servicing the smaller electrical power needs of residences. Telephone service here on Clark's Chapel Road/Burden Lake Road (one road that changes name as it leaves one township and enters another) has been interrupted for several days 3 times in the last 20 months, once for a week. If your remote control of pipe valves, pressure regulators, etc. is controlled through the telephone systems Kinder Morgan may be left at times with no connection for days.

Clark J. Shaughnessy  
474 Burden Lake Road  
Nassau, NY 12123

To The FERC

Re: Docket No. PF14-22-000

Our farm is located in Schoharie County, town of Middleburgh in Ecker Hollow. A community of 60 homes, which includes a horse boarding business and a large campground.

I have lived here for 87 years and have made my living off this land, raised 4 children and hope to spend the rest of my life here. I am facing eminent domain easement on our land for the Constitution pipeline. The Tennessee Gas Line is looking to go alongside the Constitution Pipeline.

I am concerned with what this will do to my property value and our drinking water. It will disrupt the many waterfowl that use and raise young on our large pond. We have many deer, turkey, beaver, muskrats, eagles and osprey that call this valley home. This line will also cross 2 sections of large wetlands and 2 feeding streams.

The pipelines could be kept at the top of the hill and travel a little farther south through more woods and acres of abandoned land, affecting no crop fields and not close to any homes. You really need to visit this area to see what will destroy a quiet neighborhood and our 300 acres that has been in the Bixby family for over 150 years.

I am very much opposed to these lines and ask for you to not give your approval.

James E. Bixby

**20150826-0014**

Hand written FERC Comment form: Thomas J. Berube, 270 Wheeler Rd, Dracut, MA 01826: many concerns about Meter station.

**20150826-0015**

Dear \_\_\_\_\_

Kinder Morgan and its subsidiary, Tennessee Gas, propose to build and operate a 36-inch pipeline to daily transport up to 2.2 billion cubic feet of hydro-fractured gas at a pressure of up to 1,460 pounds per square inch from Pennsylvania through New York to Dracut, Massachusetts. The proposal is called the Northeast Energy Direct pipeline project (NED) and has been assigned Federal Energy Regulatory Commission (FERC) Docket # PF 14-22.

Please stop the NED in order to protect my family, my community, and our future. I oppose the NED because:

- No New Yorkers will receive any of the gas, and almost all of it will be exported to foreign markets.
- Pipeline safety standards in rural areas are lower than in urban areas, effectively treating constituents who live in the rural communities along the proposed route as second-class citizens.
- The governing federal and state regulations and the resources available to ensure pipeline safety during construction, operation and decommissioning phases are woefully inadequate.
- Only landowners whose lands abut the pipeline route may receive compensation. All other residents along the pipeline corridor, even those within the "incineration zone," involuntarily assume the risk of death, personal injury, illness, and property damage in the event of a rupture, but receive no compensation for their risk, diminished quality of life, or the assault on the quiet enjoyment of their homes.

- Property values along the pipeline will decline and reduce assessed valuations. This in turn will increase the tax burden on properties further away from the pipeline.

-- The federal process for approving and constructing gas pipelines violates the requirement of the National Environmental Policy Act (NEPA) to minimize cumulative negative impacts that federal agency decisions may have on public safety, health and the environment.

-- No single federal entity oversees the NED project as a whole. For example, FERC decides whether and where the NED is built The Department of State decides whether the gas may be exported. The Pipeline and Hazardous Material Safety Administration governs pipeline safety. Each agency pleads lack of jurisdiction to review or do anything that could be seen as falling within the jurisdiction of another agency. Oversight of the project is therefore segmented, eliminating the public's ability to effectively review and voice concerns about the NED.

-- Investment in dirty 20th century gas infrastructure (thousands of pipeline miles; industrial-sized compressor stations) delays development of sustainable, safer energy sources and associated permanent jobs and gives competitive advantage to countries investing in the development of green technologies and energy.

Thank you for your attention to this matter,

Dalton MacN?  
149 Momrow Rd  
Averill Park, NY 12018

#### **20150826-0016**

Re: Please oppose the NED project.

To Whom it may Concern

The high pressure gas pipeline proposed by the Kinder Morgan and Tennessee Gas Companies called The Northeast Energy Direct Project (NED) would carry hydro-fracked gas from Pennsylvania through New York, Massachusetts, and New Hampshire. As a resident of New York, I object to the fact that people in my area, though burdened by the risks associated with the project, will receive no reward. Jobs will be few and temporary, the gas transported by the project will not be available to us or lower our utility bills.

I am also concerned about the detriment to our health and the risk to our safety that the project poses. In addition to the very real possibilities of: 1) insurance rates rising due to increased risk; 2) property values decreasing because of the degraded environment the project will create; 3) additional taxes imposed to support the upgraded training and equipment our fire department will need; and 4) the general nuisance and inconvenience during construction, the pipeline represents a real and present danger to all of us.

Increasingly, we hear about accidents along pipelines. Every week it seems, there are reports of leaks, ruptures, even explosions. Fracked gas contains carcinogens, neurotoxins, and endocrine disruptors that are proven promoters of disease and disability. Experts in metallurgy point out that even reasonably sound pipes develop small holes over time. The cumulative effect of even tiny leaks of these toxins on a regular basis can be devastating. The proposed location of this particular pipeline is adjacent to National Grid's massive power lines—an accident waiting to happen.

If you believe we risk the health and well-being of everyone in our community by allowing the installation of this pipeline, then I hope you will publicly say so and actively work against the NED.

Sincerely,

Christopher Consuello  
149 Momrow Rd  
Averill Park, NY 12018

**20150826-0017**

Re: Opposition to the Proposed NED project by Kinder Morgan/Tennessee Gas

The proposal by Kinder Morgan and its' itthndiary, Tennessee Gas, to build the &acked gas pipeline called NED will be detrimental to the people, in&astructure, and environment ofmy county.

I am writing to you in the hope that you will listen to those of us who are aware of the dangers this project poses and will take whatever action you can to stop its construction.

My opposition to the NED stems from the following facts:

1. Pipeline safety ~sin rural areas are much lower than in urban ones. People who live along the proposed route are being treated as ifthey are less worthy ofprotection than their fellow urban citizens because fewer of them may be harmed by the project.
2. The pipeline as proposed, will be 36 inches in diameter and will carry hydro-&acked gas at approximately 1400 psi through pristine woods and under various (currently) unpolluted rivers and stteams. This land, which many ofus have fought to protect, will be adversely affected by the construction and on-going operation of the NED.
3. In addition to the possibiTity ofrupture, pipelines like this inevitably develop leaks &om welding joints. The process ofhydro-&eeking gas has been banned in New York State in part because of the known toxins the pmcess produces. Yet this pipeline will transport these same toxins through leaky pipes across our state.
4. According to many reports, the federal and state agencies responsible for pipeline safety are very under-funded and under-manned.
5. Most ofthe residents along the pipeline route will receive no compensation for bearing the risks the NED poses. In &ict, their burden is increased by potentially higher taxes and insurance rates, as well as lower property values. In addition, no New Yorker will get any ofthe gas or will benefit by lower gas prices, because it is most likely that Kinder Morgan's plan is to market the gas abroad.

I would appreciate your attention to this matter and thank you in advance for your help

To The FERC

Re: Docket No. PF14-22-000

I am a landowner at 190Bixby Rd, Schoharie, NY 12157in the town of Middleburgh, Schoharie County. I am opposed to the Tennessee Gas Pipeline that is proposed to be co-located with the Constitution Pipeline that has an eminent domain easement on our property waiting for water permits from the Department of Environmental Conservation.

This pipeline will divide the land running through hay fields, forests, and government designated "wetlands that include 2 streams feeding our nearly 19 acre lake that has many Canadian geese, wood ducks, mergansers, mallards, and other ducks and herons. Also, American eagles and osprey feed from this lake. There are beaver, muskrats, and mink that use these two streams. Construction and maintenance will certainly discourage these waterfowl and disrupt seasonal migrations.

I am very concerned about the loss of value in the property of the whole 300- acre farm and the increased

cost of insurance due to leaks or explosions as well as emissions from venting that will be done.

Another concern is what will happen to our excellent drinking water. They are avoiding largely populated areas because the hazards would involve fewer residents in case of tragedy. This tells me that there are dangers in these pipelines, a very big concern.

American Medical Association has passed a resolution to have serious, allinclusive health impact studies done on pipelines and compressor stations. Surely the health of our residents is important

I apologize to Eric Mossey and his staff at scoping meetings. Very few residents of our Schoharie County are as discourteous as several speakers were at the meeting I attended in Schoharie.

RE: Docket No. PF14-22

Kinder Morgan Northeast Energy Direct Pipeline

8 August 2015

I congratulate you on IFRC's well-run meeting in Milford, NH. It was impressive, overflowing with articulate, determined, well-prepared citizens expressing concern over their myriad concerns attending the proposed Kinder Morgan Northeast Energy Direct Pipeline (Docket No. PF1422). Thousands of frightened New Hampshire residents have written and called FERC begging to be

Of the manifold objections to the project, this letter will explore the impact of environmental degradation on tourism in New Hampshire.

Tourism is vital to New Hampshire's economy. More than 15.4million visitors came to NH in 2014, up 5.3% from 2013. Famously, they come to enjoy the fall foliage. They come to ski, to hike, to swim, to take hay rides and sleigh rides —to ski, to fish, to pick berries —to enjoy concerts, theatrical productions, country dances, garden, barn, and house tours. They visit antique stores and organic fauna and tractor shows. They spill out beyond the area in every direction, staying at southern New Hampshire's myriad bed-and-

breakfast establishments, inns, and hotels and motels, and eating at its many excellent restaurants.

And they spend money: \$2,015 million last year, up 4.3%. The New Ipswich compressor station is scheduled to be built a mile from my own bed and breakfast, Auk's Nest, which has served visitors to the area for nearly 50 years. Half a dozen other lodging facilities, plus numerous restaurants, flourish within a dozen miles, all of which will be forced out of business by the pipeline.

The impact on the thriving tourist industry in this peaceful corner (fondly known as The Currier Back Ives Corner) will be calamitous. The statistics provided below and on the attached sheet are from the Institute for New Hampshire Studies (INHS), at [www.plymouth.edu/institute-for-newhampshire-studies/](http://www.plymouth.edu/institute-for-newhampshire-studies/):

### **Tourist spending in the Monadnock Region, 2012: \$246,000,000**

Residents and visitors alike prize New England for its peaceful rural character, for the agrarian values and way of life that give our beloved homeland its special character. One example of many:

In July, the Historical Society of Temple presented Temple Bares 8'11" uncs, a tour of farms dating between 1754 and 2015. A couple of hundred men, women, and children visited the barns, petted lambs and baby goats and miniature horses, admired tractors and trucks and other vintage farm apparatus dating from the late 19th century. Several of the old vehicles, gleaming with fresh paint, were kept running full blast and filling the air with satisfying groans, shrieks, and chugging sounds. That is the kind of low-trade cacophony that rural New Englanders — and their envious guests and friends — enjoy!

The throngs that crowd such popular events are not made up solely of country people. Visitors to Temple Bares 8'11" uncs came from the Boston area, from New York, and from cities across New England, as well as from towns and villages

While tourism is a crucial element of New Hampshire's economy, it is just one of residents' any pressing concerns. Some of the most daunting include:

- ~ Hazards to wetlands, wetlands, and wells
- ~ Disruption of habitat, migratory patterns, mating habits of our fragile flora and fauna
- ~ Calamitous impact on property values
- ~ Light and noise pollution

The compressor will be situated one-half mile from the Temple Elementary School (TES) and within five miles of schools in Greenville and New Ipswich. How can pupils learn when they are unrelentingly assailed by deafening noise? How can teachers teach? Will towns be forced to relocate the schools, and if so, how can we ensure the calm, reflective atmosphere essential to study and to learning?

TES serves as the single emergency refuge for Temple's 1,300-plus citizens.

The Tobey Reservoir, which supplies water for Temple and Greenville, is even closer to the planned compressor. What heedless recklessness prompts proponents of the pipeline to put the water supply for a thousand families at risk?

Is our agrarian way of life, so treasured throughout America, to vanish under the onslaught of this pipeline and similar projects? Together with fellow citizens of Temple and the surrounding towns, I beg that you will give your thoughtful consideration to our myriad concerns. Thank you.

Anne D. Lunt

RE: Docket No. PF14-22

Northeast Energy Direct Project

Lynnfield Lateral Pipeline through Wilmington, MA

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street, N.E.

Washington, DC 20426

Dear Secretary Bose:

The Town of Wilmington has reviewed the July 24,2015 draft resource report filing from Kinder Morgan (Klvl) regarding the proposed Northeast Energy Direct Project (NED). From our review of the proposal, it is evident that the Town of Wilmington (Town) will be subject to long term impacts that do not result in any benefit to its residents. Additionally, it is unclear whether NED is necessary; specifically it is unclear if the construction of NED will result in a condition of overdeveloped pipeline capacity for the New England area. Given these circumstances, the Town strongly prefers a no-build alternative that would avoid both short-term and long-term impacts to the Town's resources and on-going safety concerns of its residents.

The full breadth of impacts to the Town have not been fully evaluated considering the short period of time between Kinder Morgan revising their proposed route and the Federal Energy Commission (FERC) comment period deadline of August 31,2015.

Kinder Morgan first presented their proposal for a new gas transmission pipeline in Town to the Wilmington Board of Selectmen on July 10, 2014. The proposed route was reviewed and carefully evaluated by the Town, parcel by parcel, over the subsequent eight (8) to nine (9) month period.

The Town of Wilmington was opposed to the original location for a multitude of reasons; the primary being the direct impact to the Zone 1 protective radius for two (2) of the Town's remaining primary drinking water

well fields: the Browns Crossing well field and the Salem Street GP well field. Among our other concerns were impacts to wetlands, buffer zones, Zone 2 Groundwater Protection District, riverfront area, three (3) vernal pools and overall safety of residents in close proximity to the pipeline.

While it was verbally stated by KM that the pipeline route through Wilmington would be altered to avoid impacts to our primary drinking water well fields, the change was not made official until their latest filing on July 24, 2015. KM has also revealed new information in this filing regarding above ground appurtenances, contractor yard locations, typical construction sections and temporary work disturbances.

Given all of this new information it seems an extension to the comment period is warranted. An extension would allow the Town of Wilmington adequate time to fully evaluate all of impacts of the revised pipeline route as we had done with the original route.

**The Town respectfully requests that the FERC comment period be extended beyond August 31, 2015.**

From our cursory review of the NED, the Town has considerable concerns about the proposed route. Should FERC determine that the NED is necessary following their comprehensive review, the Town requests that the following concerns be thoroughly evaluated and addressed:

**1. The revised pipeline route would traverse a parcel owned and operated by Benevento Companies - an aggregate based material supply company and active quarry.**

The Town is specifically concerned with the proximity of the revised pipeline route to blasting operations at the quarry. KM has indicated this portion of the pipeline would be designed to co-exist with the expected operations at the Benevento site. The Town had requested that KM provide case studies related to their experience with routing a gas pipeline through conditions similar to the Benevento parcel.

Since that request, the Town has received only general information of two (2) locations of existing gas pipelines located near active quarries. The information received thus far consisted only of an aerial photograph of each quarry, at a very small scale, with a superimposed line indicating the “existing gas pipeline”. It is simply impossible for the Town to draw any meaningful comparison from this information to the current proposal.

The Town requests that FERC require an independent and thorough evaluation be performed and submitted to the Town for review of the short-term and long-term impacts of this condition. The evaluation should include information at each quarry site regarding blasting frequency, seismic readings, geological attributes, pipe detail sections, pipe bedding specifications and depth of pipe. The evaluation should comment upon whether a high pressure gas transmission pipeline can be located at the edge of an active quarry without posing undue risk to the surrounding area. The evaluation should also make recommendations related to restrictive zones, as well as operational and monitoring procedures.

**2. Construction of the revised pipeline route will impact wetland resource areas and land area within the Town’s Zone 2 Groundwater Protection District for two (2) of our remaining well fields: the Browns Crossing and Salem Street well fields. Refer to the proposed pipeline locus map enclosed herewith.**

The Town has estimated that the total length of proposed pipeline located within the Zone 2 Groundwater Protection District is 1.5 miles. The potential area of disturbance within the Zone 2 Groundwater Protection District has been estimated at 697,500 SF± or 16 Acres. This figure is very concerning. In 2003, the Town discontinued use of 5 of its 9 well fields due to contamination from an industrial site. Understandably, protecting the remaining well fields and their contributing watershed area is a priority. The Town has spent considerable resources to protect this area including purchasing approximately 14 acres of land for aquifer protection.

The Town requests that FERC require an independent study that evaluates the impact that an open-cut trench for a 24-inch diameter gas main, with a permanent clear cut corridor of 50 feet, and tem-

porary workspace corridor of 90 FT, has on existing drainage patterns, hydrology, and groundwater flow within the Zone 2 Groundwater Protection District. This study should take into account the active rock quarry (also in the Zone 2 area) and include the anticipated depth of excavation, anticipated subsurface conditions (i.e. ledgelbedrock, soil layers, groundwater elevations), construction sequencing and construction protocol within this area. The study should also provide an alternatives analysis demonstrating no impact to our Groundwater Protection District.

Again, the Town strongly prefers a no-build alternative that would avoid both short-term and long-term impacts to the Town's resources and on-going safety concerns of its residents. However, should FERC determine that there is a need for the proposed gas pipeline and associated infrastructure to serve the general public, in the identified market area, as a matter of convenience and necessity; we ask that FERC evaluate the concerns outlined above and any additional concerns that are identified during an extended comment period. Please do not hesitate to contact me with questions at 978-658-3311 or via email at [jhull@wilmingtonma.gov](mailto:jhull@wilmingtonma.gov).

Sincerely,

Jeffrey M. Hull

Hello my name is \_\_\_\_\_ and I am a Union Laborer and I would like to express my support for this project. The hard working men and women of the Laborers' International Union of North America build pipelines all across this country safely and efficiently. We have access to first class training and safety certification programs at our training facility in Hopkinton, MA specifically designed for the construction of transmission and dltribution pipeiines. This project will be built safe, on time and on budget with respect for the environment. I urge FERC to approve and support this project. The time to address our New England energy crisis is now.

20150826-4005

**Townsend Conservation Land Trust**  
PO Box 734, Townsend, MA 01469

August 12, 2015

The Townsend Conservation Land Trust thanks the Federal Energy Regulatory Commission for the opportunity to comment on the proposed Kinder Morgan/Tennessee Gas Pipeline “Fitchburg Lateral”.

We are concerned, first and foremost, that this proposed pipeline is within the Squannassit Area of Critical Environmental Concern. The Squannassit ACEC is noted by the State of Massachusetts for its open spaces and habitat resources and for having highly significant drinking water resources present. All residents of Townsend drink water drawn from wells in town. We are concerned about the effect this pipeline will have on our water supply, on wildlife habitat and on our wilderness areas.

Please analyze how this pipeline is consistent with state and local policy and regulations including that of ACECs, Water Resources and the Master Plan of the Town of Townsend.

Second, what is the need for this proposed lateral pipeline? Within the past 7 years, the existing pipeline from the south to this same terminus was expanded (called the TGP Fitchburg Expansion Project with a certificate issued by FERC on Oct 27, 2008).

Please delineate the NEW need that requires a NEW greenfield pipeline from the North in such a short time-frame.

Third, what alternatives, including the no-build alternative, have been considered for this pipeline lateral? If you look around this area, what you see are solar panels on more and more rooftops; solar farms in open fields.

Please analyze how other sources of energy, particularly renewables, as well as the repair of leaks in existing natural gas infrastructure, and other currently proposed gas infrastructure projects, and all of these in combination, could meet the energy needs of Central Massachusetts.

Please examine all alternatives to this proposed route and their viability.

Lastly, the bylaws of the Townsend Conservation Land Trust states that our purpose is to “promote for the benefit of the general public the conservation of natural resources of the Town of Townsend, including water resources, marshland, swamps, woodland and open spaces and the plant and animal life therein. ... This lateral crosses from north to south a 43-acre parcel from a family expecting that it would be maintained in its natural state. The now alternate main pipeline path crosses another two of our parcels. It is ironic that the open space corridor TeL T has worked so hard to build and protect can be commandeered by a private corporation.

Please analyze and quantify the impact a pipeline has on a conservation organization.

Please ensure that our properties, our drinking water, our open space, our safety and health, are not sacrificed solely for the convenience of Kinder Morgan/Tennessee Gas Pipeline providing, for their own profit, a path for natural gas export while promising us low rates that never materialize.

Thank you.

Townsend Conservation Land Trust, Inc Board of Trustees

20150826-4006

Emily Argo

Townsend, MA

Thank you for the opportunity to voice my opposition to the Kinder Morgan Tennessee Gas Pipeline’s proposed Northeast Direct Expansion and so called “Fitchburg and Lynnfield Laterals” in this forum.

I was born and raised in Townsend, Massachusetts. This is a town that values open space and has shown its

commitment to this through protecting lands through conservation measures. The installation of the Fitchburg lateral would irreparably damage many of the conserved areas in Townsend and place residents at risk. Kinder Morgan has been unable to demonstrate the need for this lateral and has not disclosed the “customer” requesting the construction of this lateral. Please identify this need and evaluate the necessity of this lateral given that Kinder Morgan upgraded a pipeline to this terminus from the south in the past 7 years. Additionally, I request that FERC evaluate all alternatives to this pipeline and its laterals, including the no build option.

In addition to my residence in Townsend, I am also a graduate student at the University of Massachusetts Amherst examining residential water conservation practices and behaviors in the Ipswich River Watershed. The watershed is being heavily impacted by the Lynnfield Lateral. Two of the towns the lateral passes through, Wilmington and North Reading, are towns where I have been focusing my research. These and almost all towns in the watershed initiate outdoor watering restrictions every year to help protect the Ipswich River. The Ipswich River was identified as one of the most endangered rivers in the United States in 2003 by American Rivers and since then the towns, their residents, and conservation organizations have worked to protect the Ipswich River. Over 350,000 residents and businesses rely on the Ipswich River for drinking water. The impact this pipeline will have on the environment and hydrology of an already taxed system needs to be evaluated. And not just the impact on the towns the pipeline would be constructed within, but on the entire watershed.

The effects of the pipeline and associated laterals will not end at town boundaries. I ask that the Federal Energy Regulatory Commission make sure that Kinder Morgan stringently evaluates the impacts of this proposed pipeline and laterals on the air, the water, the flora and fauna of the communities within which they have been proposed and all towns within all watersheds impacted by the construction of this pipeline. Kinder Morgan should fund an independent research team to conduct a study of baseline conditions at sites that adequately evaluate the state of the ecosystem within each of the watersheds they would be impacting. They should also provide funding to continually evaluate these sites during and after construction should this pipeline be approved.

My final point is this ... it will be my generation that will be trying to remedy the effects of this pipeline on our natural resources. Fossil fuels have already been identified as the leading contributor to climate change. In fact, many of my peers are already working tirelessly to remedy the damage caused to our natural resources by previous generations. Please evaluate how this pipeline system that Kinder Morgan has proposed will contribute to climate change.

Thank you.

## **20150826-4007**

August 12, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20216

RE: Tennessee Gas Pipeline Company, Docket No. PF14-22-000, Northeast Energy Direct Project

The following comments are submitted in response to the Northeast Energy Direct Project (NED) FERC Docket No. PF14-22-000, and are focused primarily on “reasonable alternatives” that when in full consideration of impact now, and certainly in the near-term (« 5 years), will render the need for a greenfield pipeline unnecessary.

The New England region is host to a wide variety of viable alternative renewable energy resources including, but not limited to, on-shore and off-shore wind, solar, domestic hydro and imported hydro, hydro-kinetic and others.

Energy Efficiency - as stated in the July 2015 Resource Report 10 Alternatives, Section 10.1.1 Energy Conservation - “they (energy efficient technologies) are not expected to eliminate the steadily increasing demand for energy or natural gas”.

1. ISO-New England has recently stated that the 2014 energy consumption numbers are 2% lower than 2013 and the winter peak for those years is also lower (4.2%), and further indicate that EE and Solar are having an impact. “When the EE savings are factored into the region’s load forecast, energy usage is expected to remain flat, with an average annual growth rate of 0.0% , rather than the 1.0 “ projected in the baseline load forecast” 1 •
2. Why are these two entities on absolute opposite sides of the spectrum?
  - a. This warrants a comprehensive analysis as Massachusetts has been ranked #1 in Energy Efficiency 2 in the U.S. for the last four years in a row - adding major fossil fuel infrastructure is clearly NOT the answer if Massachusetts intends to continue this trend toward a clean and renewable future.
3. According to the US Environmental Protection Agency 3, “improving energy efficiency is one of the most constructive and cost-effective ways to address the challenges of high energy prices, energy security and independence, air pollution, and global climate change.”

Wind Power - as stated in the July 2015 Resource Report 10 Alternatives, Section 10.1.2.1 - “Wind power is not an option •.. “ and then closes by stating that “Should these projects be developed, the 2,800 MW proposed by GLIA could reduce pressure from the New England gas supply and reduce greenhouse gas emissions.”

1. Why has Tennessee Gas Pipeline Company, LLC (TGP) upfront in RR 10 dismissed this ‘free’ (zero fuel cost and zero emissions) source of energy? ISO-New England references 4,000 MW of wind power 4&S in the 2015 queue
  - a. The above discrepancies must be accurately assessed and also combined with energy storage viability as addressed within the next section - Solar Power.

Solar Power - as stated in the July 2015 Resource Report 10 Alternatives, Section 10.1.2.2 Solar Power “These systems generally are not well-suited for use as large-scale generation in the proposed Project area ...“

1. Why is solar power so promptly dismissed? When in fact, worldwide, nationally, and regionally solar is increasing exponentially (reference ISO NE for regional increases), yet TGP has chosen to state that it is not a viable energy source despite the fact that the cost of this energy source (a.k.a fuel) is zero?
  - a. From the Solar Energy Industries Association “Solar provided roughly one third of all new electric generating capacity in the U.S. in 2014,.6. Yet this is dismissed in RR 10

Energy Storage (Battery) technology is not addressed at all in RR 10, yet is currently available by a number of companies, one which “offers its clients a 20-year insured warranty” 7 for grid-scale batteries.

**Energy Efficiency, wind, solar and energy storage (battery) capabilities require accurate analysis and full consideration in addition to fixing the leaks in the existing pipeline infrastructure estimated to be 15Bcf per year 8.** With an estimated cost to rate payers of \$90 million / year.

Other Systems - contrary to the statement listed in the July 2015 Resource Report 10 Alternatives, Section 10.2.2 Other Systems, Portland Natural Gas Transmission System {PNGTS} has offered in their statement to the MA DPU, an existing alternative to supply the amount of Natural Gas requested by the LDC’s.

1. “PNGTS is working with interested parties and is participating in regional initiatives to potentially expand its total system capacity up to 600,000 Dth/day by the addition of compression, in 100,000 Dth/day increments. This service could start as early as November 2018” 9.

Existing Alternatives

New England, particularly Massachusetts is already host to underutilized and unused infrastructure, namely three LNG terminals:

1. Distrigas in Everett, MA is currently underutilized, and “on a sustainable basis, has the vaporization capacity of approximately 700 million cubic feet per day” 10, which is 200 million cubic feet per day more than the NED LDC commitments.
2. Northeast Gateway deepwater port (off the coast of Gloucester) was commissioned in 2008. This past winter (2014/2015), it received its first shipment in 4 years.
3. Neptune deepwater port (off coast of Gloucester) has been unused since its commissioning in 2010
  - a. In July 2013, “The U.S. Maritime Administration announced it was issuing the temporary license suspension at the request of the company, a subsidiary of France’s GDF Suez. In its notice of the suspension, the Maritime Administration said the company requested the action because “the Neptune Port has remained inactive since its commissioning and will likely remain inactive for the foreseeable future”11.

The U.S. Coast Guard, the Maritime Administration, and FERC all deemed these deepwater ports to be a matter of “public convenience and necessity”12, yet within five (5) short years, these deepwater ports have shown that they are not convenient and clearly NOT necessary, as they remain essentially unused.

In closing, why would New England as a region, and in particular Massachusetts, need additional fossilfuel infrastructure, which its residents will ultimately pay for over the next twenty years, while directly conflicting with compliance to the Massachusetts Global Warming Solutions Act?

Respectfully Submitted,

Kenneth W. Berthiaume  
52 Fryeville Road  
Orange MA 01364

As a reminder, Natural Gas is NOT clean - reference the chart below, but in Resource Report 10 Page 10-4 Section 10.1.2.1, it is stated that “wind projects have zero operational emissions”. Yet wind power is dismissed.

Pounds of CO2 emitted per million Btu of energy for various fuels:

Coal (anthracite)	228.6
Coal (bituminous)	205.7
Coal (lignite)	215.4
Coal (subbituminous)	214.3

Diesel fuel & heating oil	161.3
Gasoline	157.2
Propane	139.0
Natural gas	117.0

Hand written 3 page letter, Mary Ann Broden, Mason, NH, reiterating unanswered questions from Scoping. *{Also included the following reprint of an article in the Berkshire Eagle by Senator Elizabeth Warren.}*

Berkshire Eagle

Posted: 08/12/2014

### **Sen. Elizabeth Warren: We can do better than pipeline**

WASHINGTON -- Massachusetts has distinguished itself as a state with a strong and enduring commitment to environmental conservation, a commitment evidenced in the wetlands, forests, waters, and state and private conservation lands that run from our coastline to the Berkshires. The commonwealth is also a leader in developing clean energy and promoting energy efficiency. In fact, the American Council for an Energy Efficient Economy ranks Massachusetts number one in the country in its energy efficiency policies and programs.

Our commonwealth has amazing energy entrepreneurs and smart policies that promote greener communities and energy conservation. These policies have helped to spur statewide investments and advancements in clean energy and energy efficiency. That, in turn, is helping develop more clean energy jobs, which grew 11.8 percent between 2012 and 2013 and now employ about 80,000 people statewide, according to the Massachusetts Clean Energy Center.

And these investments have paid off, helping to keep our air and water clean, helping to preserve the commonwealth's natural beauty, and helping to grow our economy. We should build on these successes, particularly when making decisions about investments in infrastructure that will affect our mix of energy consumption for decades to come.

In recent months, representatives of Kinder Morgan, Inc. and its subsidiary, Tennessee Gas Pipeline Company, LLC, have approached Massachusetts landowners, towns and land trusts to ask permission to conduct surveys for a proposed pipeline that would carry natural gas from the New York border across our state to Dracut.

Rather than using existing infrastructure, roads, and rights-of-way, the company is considering routing this pipeline largely through undeveloped land.

I have heard from many Massachusetts homeowners and businesses that are deeply concerned about the impact of this proposal on their farms and properties. Conservation commissions in towns along the intended route and citizen groups dedicated to protecting our state's environment have also raised concerns that this proposed natural gas pipeline would needlessly disrupt environmentally sensitive conservation land. Because I share many of these concerns, I do not support the current proposal.

Kinder Morgan argues that the proposed pipeline could play a role in helping our region meet its energy needs. It is true that New England faces energy infrastructure challenges, and that we currently rely on natural gas for heating in the winter and for electrical generation year round. Over the past few winters, which have been especially cold, we have experienced some of the highest natural gas prices in the nation. This is a serious problem, which we cannot ignore.

But the need to improve our short-term energy outlook and reduce unacceptably high energy prices does not mean that we should rush to support every energy infrastructure project, no matter the consequences. The decisions we make about energy proposals today will have an impact on future generations, and in each instance we must weigh the potential benefits against the potential consequences -- both in the short-term

and longterm.

Given the cost and infrastructure realities of the Northeast, it is likely that natural gas will continue to play a role in our transition away from coal and oil electricity production and toward a cleaner energy future. But our aim must be to reduce reliance on carbon based fuels, and that means careful consideration of clean energy alternatives as well as other natural gas pipeline alternatives that do not create wholly new infrastructure. For example, upgrading our old, methane-leaking pipes can help provide affordable power for businesses and consumers without threatening our families and our state.

Before we sink more money in gas infrastructure, we have an obligation wherever possible to focus our investments on the clean technologies of the future -- not the dirty fuels of the past -- and to minimize the environmental impact of all our energy infrastructure projects. We can do better -- and we should.

*Elizabeth Warren is a Democratic U.S. senator from Massachusetts.*

**Congress of the United States  
House of Representatives  
Washington, DC 20515-2103**

**Congresswoman Tsongas - FERC Scoping Meeting Statement**

August 12, 2015 - Lunenburg, MA

First, I would like to thank you for hosting this scoping meeting in my district today and I hope it is the first of several opportunities for the constituents I represent to provide their input.

I recognize FERC's challenging responsibility to ensure that our energy system is reliable and to minimize natural resource degradation in the face of a quickly changing energy market. Constituents and businesses across Massachusetts have had trouble absorbing the increasing cost of energy. And, there is agreement that the best solution to New England's energy issues will be through careful, long-term planning with significant public input. Meetings like this begin to provide the public with that opportunity,

I also appreciate the opportunity to continue my office's dialogue with FERC and to share directly with you some of the foremost concerns brought to me by my constituents, hundreds of whom have contacted me about this proposal, concerns that I share and believe must be taken seriously by the regulators reviewing this proposal.

As I am sure you will hear tonight, there are many concerns with the impact this proposed pipeline will have on the environment and the surrounding ecology. My constituents and I have worked hard to preserve our diverse and historic Massachusetts landscape and I value this long determined effort, shared by so many of the communities I represent, so that future generations can enjoy our treasured landscape well into the future. We must protect our historic farmland as it is rooted in New England's character, heritage, and economy; being both an important source of income for local families and integral to the historic New England landscape. Environmental protections should be held to the strictest of standards for this proposed project. We know how precious and vital our wetlands, state and local conservation land, threatened and vulnerable species, and watersheds are to our own quality of life and the ecology surrounding us. A lesson hard learned from New England's industrial past. We have made significant progress cleaning up our rivers and restoring habitats. To see this work regress would be devastating. Questions such as, Does drilling a pipeline crossing rivers such as the Nashua River, currently being studied for Wild & Scenic status by the Department of Interior, agitate settled pollutants? How will construction and alterations to the hydrology of the headwaters of the Squannacook River impact our water resources? How will farmers be compensated for loss of future crop production? And, how temporary is "minimal impact"? These questions should be thoroughly explored.

Homeowners are understandably concerned with how the pipeline might affect individual property values. A house is an investment for one's family and for a future generation. As pipelines are sited near residences, how will homeowners be compensated for potential loss in property value even if their property is not di-

rectly impacted? I have heard the very reasonable concern that property owners both directly and indirectly impacted by the construction and route of the pipeline may see the value of their property decrease, only to see the gas ultimately moving through the pipeline exported overseas, with no benefit to the community serving as its host. How is a community compensated for loss in property value, especially when they are not serviced by natural gas but are simply hosting a portion of the mainline? How will FERC know the company has made every effort to avoid utilizing eminent domain? How will public need be determined if there is the slightest potential to export natural gas?

Residents are also concerned with the public safety risks from potential accidents, a reality we must confront with honesty and transparency. While remote technology has improved dramatically in the last few decades, can residents living near a remotely manned compressor station feel at ease? What measures will be taken to ensure that disruption of the ground while drilling, blasting, and laying pipe will not negatively affect the wells that so many of my constituents depend on for drinking water? Will there be constant monitoring of the groundwater in residential areas that depend on wells?

I have also heard concerns regarding the process with which this project has proceeded. Contact with local town officials best able to identify local concerns has not gone as smoothly as desired. For example, local officials were not the first parties contacted, but instead discovered an energy company was proposing to build a massive infrastructure project from their own constituents. There have also been many concerns with the speed with which public meetings have been scheduled without providing complete Resource Reports in advance. For example, in the most recent release, thousands of “To Be Determineds” were noted throughout the report. As is the case with very large infrastructure projects there will be constantly changing information and this process is in the early stages, however, I fail to see how my constituents can comment as informed citizens with so many unknowns.

Additionally, I would like to ask that FERC consider viewing the numerous natural gas pipeline projects pending or approved in the New England region in a holistic manner to ensure that we are not overbuilding our pipeline infrastructure for domestic need. As a country, we have made a commitment to building a renewable future and not reducing the competitiveness of solar, wind, hydropower, and other alternative sources in favor of additional pipeline infrastructure. Accordingly, would FERC consider a “no-build” option, instead considering the option to repair our existing pipeline infrastructure to answer our region’s energy needs?

Also, knowing that the Massachusetts Attorney General’s office is conducting a study to determine regional pipeline infrastructure need, to be released in October 2015, I ask in advance that this study be given consideration in FERC’s decision.

I respectfully request consideration of these questions raised by my constituents closely and carefully before deciding. And, I would like to request additional FERC scoping meetings to be held in the early months of fall in locations that have not yet hosted scoping meetings to give my constituents further opportunities to review and provide input on this project. Thank you again, FERC, for hosting these scoping sessions and providing me with this opportunity to present the concerns my constituents have brought to me.

I look forward to your responses and to continuing this dialogue on behalf of the Third Congressional District.

Sincerely,

Niki Tsongas  
Member of Congress

**20150826-4010**

My name is Garth Fletcher. I’ve lived the past 45 years in Mason New Hampshire.

I would like to speak about what you call the Socioeconomic issues and also concerning an unnecessary divisiveness I’ve noticed.

I am not a union member, but I am a strong supporter of them.

Unions are the only way that those who do the work can get large corporations to pay a decent wage. And it was those good union jobs through the 40s, 50s, 60s and into the 70s which built our prosperous middle class and our modern economy.

In the past 40 years the unions have been under unrelenting legal, political and economic attack; membership has decreased from over 30% down to single digits. It is no surprise that our middle class has stagnated for those 40 years despite enormous gains in productivity.

So I do get it - jobs matter and union jobs really really matter!

I am glad that Kinder Morgan will use all union labor. I doubt that was what they would have preferred, but it is encouraging that unions still have enough clout to demand fair pay for their work.

So, if the NED pipeline gets built, and I hope it will NOT, I will be happy that union labor is building it, even though it be only a few hundred jobs for a year or two.

HOWEVER, I am very concerned about the long run effects of the NED project on jobs.

Our most famous project - Boston's "Big Dig" - took 20 years and \$20 billion; state and national taxpayers will still be paying for it 20 years from now.

NED is smaller - only \$5.5 billion now, maybe 8 billion when done - so perhaps only 1/3 of the Big Dig's size - but still a really BIG expense.

Those billions have to come from somewhere - it certainly won't be from Kinder Morgan shareholders or executives. I fear that lots of it will come from the cancellation of clean energy projects - and that could cost thousands of good long term jobs.

Clean energy jobs are BIG and very significant. Quoting from the:

*2014 MASSACHUSETTS CLEAN ENERGY INDUSTRY REPORT: EXECUTIVE SUMMARY* which ... is the fourth annual report released by the Massachusetts Clean Energy Center (MassCEC) on the size, scope, and nature of the Commonwealth's clean energy industry.

*THE MASSACHUSETTS CLEAN ENERGY INDUSTRY CONTINUES TO BOOM, GROWING 47% SINCE 2010. ... to 88,372 clean energy workers and 5,985 firms.*

*Clean energy firms have added more than 28,000 ... jobs ... since 2010*

*Employers expect to add another 11,700 jobs over the coming 12 months, a 13.3% growth rate.*

*The Massachusetts clean energy industry is expected to exceed 6,000 employers and 100,000 workers by early 2015.*

*Clean energy employment now equals 2.4% of all workers in the Commonwealth ...is responsible for 2.5% of Massachusetts' Gross State Product at about \$10 billion.*

Those who have worked on big projects know you can't just flick a switch to stop them and later flip the switch back to resume them. Like a huge ocean freighter it takes a long time to stop and a very long time to get back up to speed. What NED stops may not restart when the NED jobs are gone.

So I fear those few hundred short term jobs may cost a much larger number of much longer term jobs. Of course, Kinder Morgan does not care about that, but the local workforce should!

So I would ask that FERC include an analysis which compares jobs, and especially good jobs, over the next 2, 5 and 10 years for the cases of:

NED built, funding to clean energy is decreased as a result  
versus

no NED, investments in clean energy continue

Thank you

## Lunenburg, MA Scoping Meeting Comments: August 12, 2015

**Diane Hewitt**

I am Diane Hewitt from Groton, MA.

This evening, I want to look at the big picture of the NED project through the lens of a terrible national tragedy-the 1986 Space Shuttle Challenger that exploded within minutes of takeoff. While this may seem far afield from tonight's discussion, I believe the Challenger disaster, which I teach to Engineering students as a classic case study in professional ethics, offers us a strong cautionary tale as we consider KM's project.

Let me explain. The direct cause of the Challenger explosion was technical-a failure of the O-rings to operate in cold temperatures. But a commission, set up by the federal government, to investigate the cause of the explosion concluded:

1. that the serious flaws in the decision making process played an equal, if not more important role in the disaster-had there been a open and transparent communication system that went up and down the ranks, they would have caught the rising doubts about the defective parts. Instead serious problems were silenced. Issues were not communicated forward.
2. Decisions by top management appear to have been at the expense of flight safety-and were, in large part, the result of political pressure and the need to satisfy a big customer-NASA.
3. Perhaps most critically, they did not heed the very serious concerns of 6 mid level engineersthe whistle blowers- who just hours before takeoff pleaded with the space center to abort the launch.

So how does the Challenger inform the NED project? In short, many of the same conditions exist.

Like the Challenger, this massive project is being rushed to launch .... Why? Because it benefits KM and satisfies their major customer, the shareholders. -it continues to speed ahead on KM's timetable, and to their distinct corporate advantage-and with their army of lobbyists, and legions of PR professionals, they misrepresent and or simply refuse to provide the facts, they minimize the risks, and try their darrest to silence every thorny issue associated with compressor stations, falling property values, Article 97 land, blasting near the Wilmington quarry-you just name the topic,

Like the Challenger, we have every reason to believe that decisions will be made at the expense of safety. Why? Because why else would they submit out of date maps, not respond to Selectmen's questions about emissions, not conduct studies on blasting near a quarry, minimize the size and scope of compressor stations, only ordorize pipelines where it is required by law, not have training protocols in place for first responders ... the list goes on. let's be clear. KM's marginal safety record has been well documented by Pipeline and Hazardous Safety Administration and by so many speakers during these proceedings Are we now really to believe that top level decisions about this pipeline will adhere to their slogan, Safety First?

Like the Challenger disaster, FERC also appears to be a closed agency with no real way for anyone to effectively penetrate this deeply flawed bureaucratic system. How can we believe that significant, rising doubts matter when FERC has never denied a permit?

But, here's the big difference between the Challenger and the NED project.

NASA had only the voices of 6 mid level, boots on the ground engineers asking them to abort the mission, but FERC, you have so more.

You have 3400 written comments;

You have the 73 towns who have voted in active opposition and entire congressional delegations, our municipal coalitions, and environmental groups who are speaking with one voice;

You have the 3,000 people who have attended these sessions;

You have the staunch opposition of well over 60 elected officials—from Senator Elizabeth Warren to Town Selectmen;

And most importantly, you have the 100s well-articulated, reasoned comments and questions from your boots on the ground, Massachusetts and New Hampshire residents.

FERC, we are your army of whistle blowers. We are the voices you need to stop this pipeline and approve the No Build Alternative. Listen to the people. DO your Job, FERC.

### **20150826-4012**

FERC Scoping Meeting, Lunenburg MA, August 12, 2015

The Townsend Conservation Commission stands in opposition to the proposed Northeast Energy Direct pipeline and we are confident that the Federal Energy Regulatory Commission will take our concerns into consideration when reviewing this proposal.

Conservation Commissions in Massachusetts are charged with the responsibility of open space and natural resource protection in our communities.

Tennessee's pipeline would cross all of the headwaters of the Squannacook River, clearing at least a 100 ft. wide construction corridor across each one of them. An undetermined number of trees would be cleared in that corridor, and a 50 ft wide permanent easement without any tree canopy would be required.

Of the 27,560 linear feet of pipeline proposed in Townsend, 81% of the pipeline crosses the Aquifer Protection District, the source of Townsend's water supply, the High Yield Aquifer are in DEP Water Supply Zone II, 100% of the proposed pipeline route is in the Squannassltt Area of Critical Environmental Concern. 52% of it is located in the Priority Habitat of the Massachusetts Endangered Species Act. 11 % traverses through intact forest cores. Much of the pipeline path is through Article 97 protected open space.

Please analyze and quantify the long term effect that the pipeline will have on these issues. Please explain how these effects will be mitigated ~by Kinder Morgan/TGP.

Assurances that there will be no effect on surface or groundwater of a 6 ft deep open cut trench through Outstanding Resource Waters are easy to make, but the damage done can be irreparable. We have yet to be shown that there will be no negative effect on groundwater of blasting a trench through bedrock. There are more than 50 homeowners along the proposed pipeline route who have private wells. All of the 65+ homes along the path have private septic systems. How will drilling and blasting impact those wells and systems?

What are the effects on surface water temperatures with a permanent open canopy? How will opportunistic invasive species filling in that void be treated other than with herbicides?

Townsend held a special town meeting in July 2014 and unanimously opposed the pipeline. Townsend's residents have long recognized what they have and know that it is worth protecting. FERC's statement of policy (Docket # PL 99-3-000) states that Certificate policy" should be designed to foster competitive markets, protect captive customers and avoid unnecessary environmental and community impacts while serving increasing demands for natural gas." Please consider other existing supply options that will have less impact on the environment in determining whether to issue a certificate.

Thank you.

### **20150826-4013**

I would like to address concerns about the heavy metals and other toxins known to be in the sediment of the Nashua River, particularly in the section of the River just upriver from the dam in Pepperell, Ma., where Kinder-Morgan's original and, now, alternate route is proposed. The Nashua River is currently under active consideration by the U.S. Forest Service for designation as a national treasure as a "Wild and Scenic River". This would be a milestone achievement for a remarkable, citizen-initiated environmental movement that was featured in National Geographic and earned the movement's founder, Marion Stoddard, international recognition from the United Nations. While I am speaking about one river tonight, I believe my concerns

may well apply to other rivers and streams in Ma. and NH. because of our shared industrial past when water-powered mills could be found in small and large towns across NE. In addition to power, these mills also used the rivers to dump their industrial waste and, this combined with the wide-spread use of rivers as open urban and agricultural sewers resulted in the heavy pollution of many rivers such as the Nashua.

Today on the news we are witnessing the slow motion train wreck that is occurring in southern Colorado and New Mexico as the toxic spill in the Animas River makes its way to the Gulf of Mexico. When efforts began in the late 60's to save the Nashua, it was much like the mustardcolored Animas is today only on a frequent, sometimes daily basis. The river was famous for being different colors - red, blue, yellow - on different days due to the heavy pollution and dumping of chemical dyes and other contaminants into the river from the mills and sewers in Fitchburg and Leominster. locals knew you couldn't live within half a mile of the river during the summer because of the stench emanating from it and swimming and fishing were unthinkable.

Flash forward to today and the river's potential designation as a national resource. Today the river is a recreational magnet for the region with boating, fishing swimming and adjacent hiking and rail trails that, in turn, hav spawned local businesses, There is abundant wildlife on the river including beaver, otter, bobcat, bear, deer, fisher, coyote, turkey, heron, ducks, osprey, endangered turtles and, of course, fish among many others. The area on both sides of the river, where Kinder-Morgan proposes to lay a pipeline, is so rich in wildlife and ecological importance that both sides have been designated by the Commonwealth of Mass. as Areas of Critical Environmental Concern or ACECs.

As beautiful as the river is today the heavy metals and contaminants of yesterday are still present in the thick sediment on the river's bottom, especially where it collects just below the Pepperell Dam. These heavy metals and other chemicals have been collecting there for decades. Yet this is precisely where Kinder-Morgan proposes drilling. The vibrations from heavy equipment, drilling and excavation activities could easily disturb the sediment lying above, potentially releasing these metals and chemicals into the water. We are all witnessing the heavy environmental, economic and agricultural damage toxic releases into a river can cause in Colorado and we do not want to see it repeated here or in any of the other similar mill rivers throughout Mass. and NH.

I request that, at a minimum, should this ill-conceived project be approved and this route be selected by FERC, that KM would be required to determine what exactly is in the sediment at the river's bottom and in what concentrations, something no one knows, and monitor the release of these contaminates throughout construction and, that should levels of toxins increase, construction should immediately cease until a remedy to the problem is identified and implemented. This pre-analysis, monitoring and remediation should be done by an independent professional at KM's expense. Response plans and preparations for such an event should be established, including notification and post event remediation plans, before work is allowed to commence. Additionally, any FERC approval should require KM to be responsible for all costs associated with clean-up and/or prevention efforts for as long as necessary.

Richard Hewitt

Groton, MA 01450

#### **20150826-4014**

<https://pennsylvaniaallianceforcleanwaterandair.wordpress.com/the-list>

The Pennsylvania Alliance for Clean water and air has just updated their list of the harmed. This is an ever growing list of the individuals and families that have been harmed by fracking (or fracked gas and oil production) in the us. It was recently updated on July 21, 2015.

If you think that this pipeline or compressor station will not bring harm to us you need to go ahead and read this list. "There have been 16,447 families harmed and it is still growing. "

Just think 16,447 families effected by pipelines, compressor stations and it's causes such as fires, explosions, soli and ground water contaminated with benzene, mercury, lead and arsenic. Fumes from the blowdowns

which are causing pollution in the air so bad that they cannot stay outside their homes, in their yards, for any length of time due to the smell of methane. At times the smell lasts for hours and the fumes cause nausea, nosebleeds and breathing problems and that is just the short term. Jennifer Young of Northhampton County PA states that she cannot do any yard work because she gets nauseous from being outdoors for too long. She also states that the noise from the 3000 HP compressor station which is 700 ft away from her home is so loud, that at night they cannot sleep with their windows open. Her house is unsaleable. Can you imagine? This is a 3000 HP compressor station and they are trying to tell us that a 40,000 HP compressor station will not be a problem to us. Here is a list of states that these 16,447 people are living in with these issues. They are: North Dakota, Pennsylvania, Texas, West Virginia, Colorado, Montana, California, Oklahoma, Louisiana, Wyoming, Ohio, Montana, New Mexico, New York, Missouri and Mississippi and if this is built it will also have Massachusetts, Connecticut and New Hampshire on it too.

A little note to the union guys let me ask you this, if you had to think about your own families being effected by this would you be fighting us or joining us. What if your mother was suffering from cancer or your wife is pregnant and because of the air pollution or the poison in the water your child is deformed and/or mentally challenged. Is Kinder Morgan going to stand by you like you are standing by them? If your child cannot go outside and play because of the pollution in the air caused by blowdowns and you find yourself rushing her or him to the ER because for some reason she/he can't breathe. Will Kinder Morgan stand by you like you stand by them? What if this was in your backyard would you still stand up for Kinder Morgan because they sure in hell would not stand by you. Ask the 16,477 families on this report if the gas companies across this country are standing up for them. No they are not, all they are thinking about is their profits.

So before you fight us for this pipeline you should go to the website and read "the list of the harmed". Show it to your wife or child or parent and let them tell you what they think. Then I want you to tell all of us here that the stories we are hearing are untrue and that this pipeline and compressor station is safe. 16,477 families can't all be wrong. Who do you think we should believe you or them.

I read an article in the Lowell Sun this week. Kinder Morgan has promised that the NED project will be 100 percent union-made and will create as many as 3,000 jobs along its route. The laborers are looking forward to that work, which could net them as much as \$50 per hour including benefits, but they are just as eager for what will come when the pipeline is complete. This is BS, there are other jobs out there that you could be working on. The unions could be getting the same amount, if not more work, by helping to repair the existing pipelines that are losing about 15% of gas. We do not need the new pipeline. Rather than adding to the problem repair the pipes that are already there.

To FERC in reading this report I do not understand how you can rubberstamp this pipeline. Does Kinder Morgan have you in their pocket like the union and anyone else who is for this pipeline. I am finding the more I hear people say they are for this pipeline, the more I think that they are being paid off. How could anyone honestly look at this list and then look at their family and tell them that this is safe. I look at my family and every bit of my being cries out that this needs to be stopped, and so do the majority of the people in Massachusetts and New Hampshire.

Scoping Comments to FERC Project Docket Number PF 14-22

Emily Norton  
81 Vinton Pond Road  
West Townsend, MA 01474  
978-597-3553

willardbrookfriend@yahoo.com

History is filled with examples of perceived needs resulting in shortsighted decisions that caused more harm than good.

According to FERC, “need” is determined by very limited criteria, primarily the number of contracts a pipeline company is able to negotiate. Once FERC concludes a need for a pipeline, it approves the pipeline construction despite the fact that the pipeline will forsake other critical needs.

I ask you to use wiser criteria to determine “need”.

- We need a clean, safe drinking water supply.
- We need a habitable climate that will continue to support earth’s ecosystems and agriculture for our food supply.
- We need freedom from our addiction to fossil fuels.

These are true needs, necessary for the survival of human civilization. We can not survive without a habitable climate, an adequate food supply and clean water.

Whether you like it or not, the decisions that you of FERC make to approve more and more fossil fuel infrastructure are also decisions that you make to endanger our water and food supply and exacerbate climate change. If you approve this pipeline proposal, your decision will threaten the survival of our children and grandchildren.

- We need FERC to acknowledge the gravity of the decision you will make.
- We need FERC to admit that its definition of “need” is outdated and shortsighted at best and dangerous at worst.
- We need FERC to update its definition of “need”.
- We need FERC to remember you are human beings first and cogs of a dysfunctional system second.
- We need FERC to find the courage to say “no” to a project that is wrong for the people.
- I can’t believe that I need to ask you, people of FERC, to value human survival needs above the profits of a pipeline company.

Yes, we need energy. But we need to DECREASE our use of fossil fuels while we INCREASE the use of green, renewable energy sources.

We need FERC to be a part of the solution, not part of the problem.

## **20150826-4017**

Commissioners Bay, Clark, LaFleur, Moeller, and Honorable: thank you for your focus, your on-the-road endurance, and for the seriousness with which you assume your roles as part decision-makers in this issue. Your diligence helps you to earn well the salaries that we provide to you. I trust that you take your charge seriously to serve the public interest and fulfill your fiduciary duty in protecting our common assets of air, water, and land under the National Environmental Policy Act and the U.S. Constitution. Lastly, thanks for providing the rnic, but...if John Adams did not have a microphone, I don’t see why I would need one and I certainly don’t want to have my back to my neighbors.

What an exciting time to be alive! We are on the cusp of a massive transformation in energy. Non-polluting solar, wind, geo-thermal, wave energy, bio-mass, and tidal power technologies are operating today to varying degrees. Research at M.I. T. in nano-technology with input from professors at U.C.L.A. will create the next wave of super-efficient solar cells and lithium storage. Ocean Renewables Company is developing underwater turbines that will rest at the bottom of Passamaquoddy Bay in Maine where President Roosevelt in 1936 came very close to launching an electricity project that harnesses the nearly continuous power of the tides. Simultaneously, we are witnessing the last gasp of fossil fuels: an industry that has burned us into a climate crisis and often works hand-in-hand in the lobbies of government agencies to ignore our hard-earned

legal protections of nature. Fortunately, citizens have grassroots Community Rights Ordinances at their disposal to non-violently block any corporate project within their town.

Now, who in the room knows who wrote the following? “ I hope that we shall crush in its birth the aristocracy of our monied corporations which dare already to challenge our government to a trial by strength, and bid defiance to the laws of our country.” ?? [ Anyone - Yes, Thomas Jefferson - door prize to this fine gentleman/woman!]

Thomas Jefferson wrote that at the inception of this country because he knew that corporate greed was and is a massive danger. Commissioners, I hope that you won't be bribed by the big bucks of Kinder-Morgan/Tennessee Pipeline.

No to 412 miles of leaky pipeline that would transport methane and deadly chemicals from Pennsylvania to Dracut only to be sold to Europe leaving us with scars and poison. And yes, it's true that on farms next to existing leaky fracking wells in Pennsylvania, calves are being born without irises or pupils in their eyes!

Common sense in the citizenry is a stalwart foundation. In the words of my at-home professor Robert Zimmerman, minimally adapted for tonight:

*Come senators, congressmen, multi-national C.E.O.s, please heed the call  
Don't stand in the doorway, don't block up the hall  
For he who gets hurt will be he who has stalled  
There's a battle outside, and it's ragin'  
It'll soon shake your windows and rattle your walls  
For the times they are a-changin'*

No to benzene in the plumbing of the good people of Fitchburg and Ayer. No to children in cancer wards with vacant eyes because of blow-off from nearby compressor stations.

Let now the clarion call for a new Green Governance\* ring forth from this beautiful hamlet of Lunenburg to then be heard in the hallowed, bespectacled halls of M.I.T. and Harvard where our clean-energy inventions are being born, southward still to our nation's capital where lawmakers are constitutionally required to respond to the will of the people, and then resound farther yet afield to a much greater power in Geneva and New York City.

The United Nations can be presented with an exposition of how this proposed project, like so many others now up and running away with profit and pollution, would also threaten human health, wildlife reproduction, and even decimate those pesky little insects critical to pollination and without which we will have no vegetables or fruits.

Crude oil from the B.P. Gulf disaster will lie under the sand for decades.

Love Canal has effected hundreds of families without mercy Minerals mining happens against Federal Law in our own National Parks. I consider these callous activities to be crimes against humanity, felonies against our defenseless feathered friends, and a stinging slap in the face to our grandkids.

I will use any non-violent, repeat non-violent civil strategy to practice damage control for anyone who continues to use the atmosphere as a sewer. No more destruction of lifeboat Earth: the only home that any of us will ever have.

So, I hope that my friends will indulge me to speak on their behalf just a tad. After all this hubris and criminal behavior of oil companies, we now have zero tolerance for government of the corporation, by the corporation, and for the corporation. We will not be bullied. We will be represented faithfully and with honesty. We will congregate, encourage, and fortify one another in protecting our precious and essential natural resources so that life itself shall not perish from this Earth.

\*The two-word phrase Green Governance was coined by Mary Christina Wood in her book Nature's must.

FERC Scoping Meeting August 12, 2015

**Jack Petropoulos**  
**Chair, Board of Selectmen**  
**Town of Groton Massachusetts**

1. On December 8 of last year the town of Groton was notified by KM in a letter to Secretary Bose that Groton was no longer on the proposed path. Specifically, in its letter, Kinder Morgan said:
  - a. “By increasing the percentage of co-location for the proposed pipeline segment, the revised route will reduce the construction of new pipeline facilities in undeveloped portions of the Market Path, thus reducing environmental impacts and avoiding habitat fragmentation. In addition, the proposed route change will enable Tennessee to avoid (in certain cases) Areas of Critical Environmental Concern in Massachusetts. “
  - b. No communication at all from Kinder Morgan to the Town of Groton. ~.\f.O..Sl.A request for contact information from Ron McClain, VP of Products at the Pipeline Safety Trust conference and a commitment to dialogue proved empty, as no contact was made.
  - c. Our town breathed a collective sigh of relief. No mention was made that the former routes were still considered viable and remained in contention.
  - d. There are certainly documents that can be found that will indicate that Groton is still on an alternative route/but the public is hard pressed to find any easily available information in the press that would alert them to same. The result is a public in Groton, and I am sure elsewhere, that is under the impression that the threat to their homes and land has passed. Rightly or wrongly this is the case, and Groton’s public participation in the process has predictably waned.
  - e. No public process that intends to engage in good faith with an ‘1’- informed public can move forward ignoring these human realities.
  - f. Request: If FERC sees fit to move the path of the proposed pipeline to include the Town of Groton, we would like the time to generate again, the public awareness that can bring to you the kind of concerns that you seek in these public meetings. We request that if the path moves to include Groton, that the process be delayed by 6 months to afford us that opportunity.
2. According to the same letter KM states that one of the “ ... primary reasons that led to Tennessee’s decision to adopt the <new path> is that it will enable a very substantial portion of the proposed new pipeline construction to be located adjacent to, and parallel with, existing utility corridors in the states of NY, MA and NH. I’ It is clear to me, and presumably to Kinder Morgan, that there is far less environmental impact to running along already disturbed routes. But it is equally clear to me that there is far less economic impact by running along routes that are already disturbed and in which property values and usage patterns have already been affected by the impact of the existing corridors.
  - a. Has FERC studied the assessed value of the land in the primary and secondary routes as part of an evaluation of the economic impact of bringing the pipeline through greenfield properties rather than already disturbed land?
  - b. Has FERC studied the impact to land usage in the primary and secondary routes?
  - c. Request that such an evaluations be completed and published and that land owners and affected constituents be provided with the ability to evaluate that study, and a forum be provided to discuss and affect the suggested impact prior to any decision on route being made.
3. How can FERC assure that there is Zero risk to the students and teachers at our High School, portions of which are within 600 ft of the proposed route?
4. Drilling under the Nashua River

- a. The Nashua, until recently, was among the most polluted rivers our nation.
- b. There has never been an assessment of the contaminants contained in the soils below the river.
- c. The proposed horizontal drilling beneath the Nashua poses a threat to the release of contaminants with the potential to impact ACEC of the Squannassit and Petapawag as well as other sensitive environmental areas surrounding the proposed crossing.
- d. How will FERC:
  - i. Assess this risk
  - ii. Prevent impact
  - iii. Mitigate impact if any
- e. Request that you require:
  - i. Study of the current levels of pollutants in the proposed crossing
  - ii. Creation of a plan for eliminating any impact
  - iii. Creation of regulations to stop activity and consult State and Federal Environmental agencies should any unanticipated condition
  - iv. Impose strict monitoring program post construction with leverage to require full remediation as prescribed by both State and Federal Environmental agencies

5. My understanding is that the number of TBD items in the current plan that is available to citizens is in the thousands. How can citizens be expected to participate in this evaluative and discovery process when they are given incomplete materials to work with?

- a. Why will you not wait until after the final plan is complete and impacted communities have had a chance to understand it and to meet to formulate educated questions?

Hi Ron

I want to thank you for reaching out to me at the PST Conference. This has been a great experience and has helped me to understand how much work there is left to do to bridge the gap between public perception and industry objectives. Our (Groton's) experience seems to reflect a number of those themes.

Yours is a very difficult task. There is intransigence on the side of many in the public and, I believe that this is to the detriment of the many. Though it is impossible to overcome every objection, failure to try is an invitation to unnecessary criticism.

I have no idea if there is ground that can be made up in our region but I am glad to work with you to try to help, or simply to take the time to give you our perspective as I see it.

Thanks,

Jack Petropoulos

### **20150826-4019**

Hi, My name is Jennifer Schongar and I live in Mason, NH. I am not directly affected by this pipeline but I am here to talk about the unconstitutional act of taking personal property through eminent domain for corporate gain.

Everyone who has looked at the numbers knows that the energy shortage in New England two winters ago was fabricated. ISO New England tried to implement a new winter reliability program and it failed horribly and we all paid for it through higher energy prices. The root of the problem was they refused to buy electricity from gas generators using stored LNG. The lower costs we experienced during a much harsher winter this past winter were a clear indication that there is no shortage of natural gas. That is a fact.

The Maritimes & Northeast pipeline, which is the large pipeline from Dracut, MA up to Canada has asked to have it's flow reversed which will send the natural gas that is supposedly for New England up to the export facility in Canada. That is a fact.

Industry specialists have predicted that when this Natural Gas gets exported the price of Natural Gas will go up 200 to 500% to compete with the price of Natural Gas in Europe. That is a fact.

The town of Mason that this 12" high pressure lateral pipeline goes through will get NO benefit from this pipeline, ever! Mason can't even afford to run internet wires above ground. There is no way it will ever be able to afford to run NG to individual houses. That is a fact.

This pipeline and lateral will go through many state forests and conservation land. Land that has been set aside to help mitigate the destruction that is happening to other parts of the world. You can't effectively mitigate the areas that are already there to mitigate other contaminated areas. That is a fact.

100% of the NH towns that are affected by this pipeline OPPOSE this pipeline. That is a fact.

Property values are already being hit hard by this pipeline. Kinder Morgan, with FERC's approval, will be stealing thousands of dollars from each property owner, as well as from the other residents in each town who will now have to pay higher taxes because the properties directly affected will lose value. Just so Kinder Morgan, a private company, can make a profit selling this natural gas overseas. That is a FACT!

So, I am here today to express my OUTRAGE at the unconstitutional actions that Kinder Morgan is proposing and FERC is considering. This isn't just happening in New England. This push to export Natural Gas is happening all over the US right now. FERC needs to understand that the American people are outraged and we WON'T let this happen without a fight!

### **20150826-4020**

18 months ago I learned Kinder Morgan wanted to take land my family has protected for 100 years and also cut indiscriminately through a community I have worked for three decades to make a great place to live. I soon learned that the issues surrounding this massive project were much bigger than my own backyards and

hometowns. I found a corporation who has not diversified for the 21 st century - instead is still following a mid 20th century business model to maximize profits at the expense of not only our communities but even our earth.

I've learned that our current system provides a huge advantage to the power of money over the power of the people. There is indeed a built-in imbalance in the FERC process. Kinder Morgan not only has personnel with experience in this complex regulatory process, they've hired consultants, lobbyists, and PR people to advocate on their behalf - painting a picture of clear need when the truth is more murky. No wonder it seems like the process is on a fast track to approval and people are led to believe this is a done deal.

This is why we need FERC to protect our interests. We need your help to make our citizen voices and concerns heard.

Over the last 18 months two other things have become quite apparent:

1. It's unclear how much more new gas pipeline capacity, if any, we need
2. Lots of corporations are anxious to supply lots of natural gas to MA, New England and even the world.

In order to provide the best solution to what mayor may not be a problem, FERC needs to combine the various proposals from Kinder Morgan, Spectra Energy, Iroquois, and Portland Natural Gas into one regional Environmental Impact Statement and one coordinated FERC process. Added together these proposals could more than double the gas supply to New England at a time when we need to greatly reduce our consumption of fossil fuels.

Even KM acknowledges in its Resource Reports that the alleged NED need could be met by the competing projects. In a combined FERC process, all these projects could be analyzed together to see which one, if any, or which combinations of projects would satisfy any demand with the least impact to the environment and affected land owners.

The FERC review for these combined projects needs to determine:

1. What amount of gas, if any, is needed to meet the threshold of allowing eminent domain takings.
2. What is the best way to meet that need while minimizing project impacts.

My written comments provide more details on the analysis needed, requests that all information be shared with citizens and that comment periods be extended to allow the citizen-reviewers a chance to read and provide thoughtful comments on the lengthy documents.

Now is the time for FERC to take a step back and look at the larger picture of natural gas capacity in New England by combining these various proposals. This consolidated review would help you ensure reliable, efficient and sustainable energy for consumers as called for in your mission. Thank you.

Carolyn Sellars

## **20150826-4021**

My name is Fred Sellars; I am a resident of West Townsend. I am not only an affected property owner, but also an environmental consultant with over 35 years of experience in the siting and comprehensive environmental permitting of major energy infrastructure projects. I have directed or been a key contributor to the siting and licensing of over 25 power plants, most of them powered by natural gas, as well as thousands of miles of electric transmission, gas pipeline and other linear projects. I have been qualified as an expert witness in 8 states. I am confident that I have a pretty good understanding of the environmental impacts associated with energy projects, how to assess and minimize them, and, most importantly, how to identify and evaluate alternative sites and routes.

The Resource Reports for the NED project fall short in numerous areas as will be detailed in my written comments. Tonight I will focus on the project's evaluation of alternatives.

The alternatives assessment section of the Resource Reports is both inadequate and inaccurate.

- The analysis qualitatively dismisses alternative solutions such as increased use of the existing offshore LNG injection terminals that proved to be incredibly effective last winter, one of the most severe we've experienced in quite some time, completely avoiding the capacity constraints experienced in the milder winter the year before, when they were not in use. You, the FERC, approved those projects as being "necessary" just a few years ago, yet their proven ability to address short-term capacity constraints was virtually ignored in the Resource Report. Given the longer-term energy outlook in New England, particularly in response to the USEPA's Clean Power Plan goals set for the region, statewide initiatives such as the Massachusetts Global Warming Solutions Act, the recently issued Clean Energy RFP, and Governor Baker's proposal for contracting an additional 2,400 MW of hydroelectric capacity, I believe that any need for increased gas capacity is finite and short-term. These new regulations and initiatives must be fully considered in the assessment of the No Action Alternative. Further, the benefits of actually using the LNG infrastructure already approved by FERC, already built, and whose construction impacts have already occurred, must be quantitatively and comprehensively compared and contrasted to the proposed creation of new massive infrastructure across numerous ecologically sensitive areas, and entailing the forcible taking of private citizens' properties to address potential capacity constraints that may only exist for a few days a year and for only a few years to come.
- Even assuming for a minute that new pipeline capacity is needed, the alternatives analysis qualitatively dismisses the numerous competing proposals currently before the FERC or recently announced. Taken together, these proposals would double the gas import capability of the region, far more capacity than called for by even the most aggressive forecasts. I call on the FERC to either combine all of these projects into a single comprehensive FERC Proceeding and a single combined NEPA review consistent with Council on Environmental Quality guidelines for such situations, or at a minimum require fair, complete and quantitative treatment of them in the alternatives analyses of each of the projects, as opposed to the mere paragraph-long summary dismissal of them that currently appears in the NED Resource Report.
- Beyond the broader alternative solutions ignored by the current analysis, the Resource Report fails to identify a reasonable range of alternative routes for the NED project itself. Take the Fitchburg Lateral as an example. I only became an affected land owner a few weeks ago when the previously proposed alignment near West Meadow Road was abandoned in favor of traversing across a heavily wooded residential neighborhood that is entirely within a designated Area of Critical Environmental Concern. Yet, the previous preferred route does not even appear as an alternative that was considered and rejected in the Resource Report. How are we, and you, to determine if the previous route was really inferior to the new alignment if Kinder Morgan now pretends that this alternative never existed? The sole alternative to the entire lateral is a single in-street route down Route 31. If in-street construction is viable enough to be considered as an alternative, where is the alternative of placing the pipe under West Meadow Road, which would avoid cutting a 100-foot-wide swath across 7 private landowners' forested properties? What about other in-street alternatives that might be superior to the Route 31 alignment?
- The evaluation criteria used in the alternatives analysis are inappropriate and deeply flawed. As an example, based on the alternatives assessment criteria as applied in the Resource Reports, are we to believe that crossing "forested land use" under the pavement of Route 31 is the same as cutting a 100-foot-wide swath across privately owned forest, in an Area of Critical Environmental Concern, atop an esker that overlooks an important wildlife migration corridor and one of the state's few remaining true cold-water fisheries? Yet those two starkly different situations are treated identically with respect to the alternatives analysis criteria. Criteria for the comparison of alternatives must be based on the actual impacts of the project's construction and long-term maintenance not vague and meaningless surrogate indicators.
- Finally, the very need for the Fitchburg Lateral has not been demonstrated, yet a No Action Alternative for this lateral is not considered. The need determination for this lateral cannot automatically be tied to a more vague demonstration of alleged need for more gas into New England from Marcellus. The specific need for this lateral has not been demonstrated, nor has the proponent even attempted to demonstrate it. Without a clear demonstration of need, the FERC cannot include this element of the project in the larger NED project

and it should be rejected.

Docket number: PFI4-22-000  
FERC Public Scoping Meeting  
Lunenburg H.S.  
Lunenburg, MA 01462

Thank you for letting me speak tonight and entering the attached proclamation, signed by the Lunenburg Board of Selectmen, into the public record.

This proclamation stands in OPPOSITION to the proposed Energy Direct Project and in OPPOSITION to the proposed Fitchburg Lateral within Lunenburg Boarders.

Sincerely,

Jamie Toale  
Chair, Lunenburg Board of Selectmen

-----

**PROCLAMATION**

WHEREAS, Kinder Morgan has proposed a new 36” high pressure gas pipeline through Massachusetts and New Hampshire, as part of a Northeast Energy Direct Project hereinafter called the “Project”; and

WHEREAS, the “Project” also proposes a new 12” high pressure (1460 psi) natural gas pipeline, which it calls the “Fitchburg Lateral, to be installed, not in Fitchburg, but in Lunenburg, Townsend and Mason, NH; and

WHEREAS Lunenburg is already crossed by a Kinder Morgan pipeline hereinafter called the “South Lunenburg Lateral,” which runs from Lancaster to the proposed southern terminus of the Fitchburg Lateral; and

WHEREAS, the South Lunenburg Lateral has already caused financial damage to Lunenburg citizens; and

WHEREAS, the completion of the Project appears to create a connection between the proposed Fitchburg Lateral and the South Lunenburg Lateral; and

WHEREAS, said connection could provide Kinder Morgan the opportunity to provide gas service to Worcester through Lunenburg including a possible future addition of a compressor station in Lunenburg, or other re-adaptation and re-use of the South Lunenburg Lateral; and

WHEREAS, Kinder Morgan has been silent about its plans to create such a connection, despite its proposing a metering station in Lunenburg at the Southern terminus of the proposed Fitchburg Lateral in its Resource Report I files with the Federal Energy Regulatory Commission; and

WHEREAS, the currently proposed pipeline route was chosen in a private, closed process so that there has been no chance for open, public discussion or debate of alternate routing possibilities and tradeoff’s; and

WHEREAS, Kinder Morgan identified properties in Lunenburg that it intends the Fitchburg Lateral to cross but declined to provide the town of Lunenburg with detailed and current information on the exact route it is proposing; and

WHEREAS, landowners are being asked to permit surveying on their property or to sign agreements to forfeit some of their property rights; and

WHEREAS, federal eminent domain powers may be used to forcibly take pipeline easements from unwilling landowners; and

WHEREAS, a high-pressure gas pipeline, by its nature, carries the potential for leak, rupture or devastating explosion causing untold damage to property and lives; and

WHEREAS, said pipeline goes against current Massachusetts commitments to renewable energies and combating global climate change; and

WHEREAS, our energy challenges are better addressed through investment in energy conservation measures as well as green and renewable energy solutions; and

WHEREAS, a high-pressure gas pipeline, by its nature, carries the potential for leak, rupture or devastating explosion causing untold damage to property and lives; and,

WHEREAS, Lunenburg and our neighboring communities have adopted comprehensive master plans, zoning bylaws, wetlands bylaws and other land use controls to provide for the orderly development of our communities and the conservation and protection of our communities for future generations to come, as good stewards of the land should; and

WHEREAS, the elimination of environmental threats to our forests and streams from improvident development is the fundamental purpose for the adoption of our land use controls and master plans; and

WHEREAS, Lunenburg and our neighboring communities have publicly and privately set aside large tracts of land and restricted their development for conservation and open space purposes as part of their master plans;

NOW, THEREFORE, be it RESOLVED that the Board of Selectmen of the Town of Lunenburg, do hereby declare that it”

STANDS IN OPPOSITION to Kinder Morgan’s proposed Energy Direct Project and to the Fitchburg Lateral, and

STANDS IN OPPOSITION to any effort to locate the proposed Fitchburg Lateral within Lunenburg’s borders, and

FURTHER COMMITS to participate in and provide comments to any meetings held under the Federal Energy Regulatory Commission (FERC) review process with regard to the proposed Fitchburg Lateral to oppose Kinder Morgan’s application, and

BE IT FURTHER RESOLVED, that the Board of Selectmen of the Town of Lunenburg do hereby call upon our State and Federal Legislators and Executive Branch Officers to enact Legislation and take any such other actions as are necessary to oppose such energy projects that go against our commitment to public safety, our environment, our economic well-being and our sense of community.

SIGNED THIS 10th day of February 2015.

Tom Alonzo, Chair

Paula J. Bertram, Vice Chair

Jamie Teale, Clerk

Robert Ebersole, Member

Phyllis M. Luck, Member

The Townsend MA Board of Selectmen greatly appreciates this opportunity to share our concerns about the proposed Northeast Energy Direct (NED) project with the Federal Energy Regulatory Commission's (FERC).

Townsend has a major interest in NED. In the original September pre-filing notice, the main pipeline route and a proposed lateral cut through Townsend. A large compressor station was also planned to be sited somewhere along a four mile path on the pipeline in our town. In the revised route released in December 2015, the mainline pipe moved north to NH but a lateral is still proposed to bisect Townsend from north to south, affecting many public and private landowners. In addition, the Townsend route is still listed as an alternative to the NH route and compressor station location.

The Townsend Board of Selectmen believe the proposed NED project as currently described is not necessary to meet the energy needs of New England. It would be an unwise use of our important conservation lands and natural resources and an inappropriate potential use of eminent domain for the benefit of a private corporation.

Kinder Morgan's proposed Northeast Energy Direct project would be an overbuilt and unnecessary solution to what may be a small temporary need for some additional energy sources to meet peak demand in winter-time months. There are many already existing and proposed projects that can meet that demand using existing infrastructure such as offshore LNG facilities or upgrades to existing gas pipelines along existing gas pipeline rights of way. We applaud Governor Bakers' continued insistence that upgrading existing pipeline infrastructure is the best way to meet any unmet needs for natural gas.

Townsend, like most of the communities along the proposed route, is a place where our citizens highly value our natural resources, historical areas, open space and conservation land. People come to Townsend to enjoy Willard Brook and Pearl Hill Brook State Parks, hike along our open space trails, and fish, kayak and canoe our cold water streams. The proposed Fitchburg Lateral bisects West Townsend, crossing significant ecological, historical and water resource areas including Willard Brook and Pearl Hill Brook State Parks and the heart of the Squannassit Area of Critical Environmental Concern. The proposed Main Street crossing of the lateral occurs between two two-hundred year old homes on a stretch of road that remains much as it has been since Townsend was settled.

This destruction of historical and natural resources is unnecessary. Kinder Morgan has yet to explain why the Fitchburg Lateral is needed. Indeed, Kinder Morgan has yet to give a straight answer about the "Fitchburg Lateral." They call it the "Fitchburg Lateral" even though it doesn't go to Fitchburg - it goes through Mason, NH, Townsend and ends in Lunenburg at a Tennessee Gas pipeline. Until which serves Fitchburg, Lunenburg and Townsend has NOT signed on for capacity and has said they do not need the capacity. Kinder Morgan claimed the lateral was to serve National Grid but the National Grid Capacity Agreement DPU Docket (15-34) did not mention this lateral or any gas needs in central MA. State Representative Sheila Harrington reported that Kinder Morgan told her someone in Townsend requested this lateral. This is not a distribution pipeline that someone can tap into. There is no large user of gas anywhere near the proposed lateral. Finally, some thought this "Fitchburg Lateral" was planned to deliver gas to the proposed North Worcester Lateral and were quite surprised that the Fitchburg lateral was not dropped when the North Worcester Lateral project was dropped in early June.

There doesn't appear to be any "public need" for this particular lateral yet Kinder Morgan is asking FERC for eminent domain authority to take 14 miles of land in three towns across two states to build it

This is not right Eminent domain authority should only be used very sparingly for projects that address a real public need. The proposed NED project and the "Fitchburg Lateral" in particular do not pass the threshold for a public need determination.

The Townsend Board of Selectmen have been following NED for more than a year. We first became aware of the project in early 2014, when Kinder Morgan land agents talked to individual land owners at their homes before contacting the town about the proposed project. It took months before Kinder Morgan pre-

sented information to the town. Following their presentation in June 2014, the Board of Selectmen voted not to provide survey access to any town land. On July 31, 2014, voters at a Special Town Meeting voted unanimously to adopt a resolution in opposition to the pipeline. Townsend is not the only community opposed to the project. Fifty-five communities in Massachusetts, representing more than half a million people (based on the 2010 Census), have taken at least one vote in opposition to the NED proposal.

While Townsend officials have shared our concerns about the project with FERC through letters from the Selectmen, Conservation Commission and through the Northeast Municipal Gas Pipeline Coalition, it is unclear how much weight our comments have with FERC. We are grateful for this opportunity to share some of our concerns with you directly and trust that you will take these concerns seriously in your project review. Thank you again for the opportunity to comment.

#### **20150826-4024**

Last summer former governor Deval Patrick signed legislation requiring the accelerated detection and repair of natural gas pipeline leaks in Massachusetts.

This was necessitated because one half of all pipes in this area are made of leak-prone materials and are more than 50 years old. There is one verified leak approximately every mile in the Greater Boston area.

A study initiated by Senator Ed Markey indicates that around \$1.5 billion has been lost through natural gas leaks over the past decade.

This is both economically and environmentally disastrous. More importantly it creates a very dangerous situation that has resulted in serious explosions such as the one in Springfield MA in 2012. My simple question is: Why not fix existing pipelines first?

1540 Lakeview Ave  
Dracut, MA 01826

#### **20150826-4026**

*{Testimony of Chairman, Tony Archinski, could not be OCR converted}*

#### **Resolution Opposing the Northeast Expansion of the Tennessee Gas Pipeline in Dracut, Massachusetts**

WHEREAS, a proposed High-Pressure Pipeline carrying natural gas may come through Dracut and our neighboring communities; and

WHEREAS, a high-pressure gas pipeline, by its nature, carries the potential for leak, rupture or devastating explosion causing untold damage to property and lives; and

WHEREAS, said pipeline may potentially destroy forests, wetlands, conservation land and farmland, and would pass beneath the Merrimack River, and require maintenance in perpetuity of an expanded utility right-of-way through the possible use of herbicides; and

WHEREAS, said pipeline may adversely affect property values, adversely affect residents' safety, livelihood and otherwise may negatively impact the integrity of the town's bucolic character; and

WHEREAS, the cost of said pipeline may require Massachusetts citizens to pay a utility bill tariff, as well as environmental costs not required by law for Tennessee Gas Pipeline Company, L.L.C. ("TGPII, a subsidiary of Kinder Morgan Energy Partners, L.P.), potentially making ratepayers bear financial risk for the endeavors of a private corporation; and

WHEREAS, our energy challenges are better addressed through investments in energy conservation measures as well as green and renewable energy solutions; and

WHEREAS, the currently proposed pipeline route was chosen in a private, closed process so that there has been no chance for open, public discussion or debate of alternate routing possibilities and tradeoffs; and

WHEREAS, federal eminent domain powers will be used to forcibly take pipeline easements from unwill-

ing landowners; and

NOW THEREFORE BE IT RESOLVED THAT the Selectmen of Dracut, Massachusetts:

1. Stand in opposition to Tennessee Gas Pipeline Company, L.L.C.'s Northeast Expansion pipeline and not allow it within town borders;
2. Oppose any pipeline that potentially threatens the safety of any Dracut residents, visitors, or property; and
3. Hereby request that our state and federal legislators and executive branch officials to enact legislation and take any such other actions as are necessary to disallow such projects that go against our commitments to life, the environment, our economic wellbeing and our bodily safety, and, instead, to legislate more stringent energy efficiency and further exploration of and subsidies for renewable energy sources.

-----  
**BOARD OF SELECTMEN**

Board of Selectmen Minutes of January 13, 2015 Selectmen's Chamber, Town Hall

Present: Cathy Richardson, Chairperson, Joseph DiRocco, Jr., Vice Chairman, Tony Archinski, Clerk, Tami Dristiliaris, Alison Hughes, Jim Duggan, Town Manager, Glen Edwards, Assistant Town Manager/Planner, Attorney James Hall and Recording Secretary Shannon Rowe Beaulieu

The Chairman opened the meeting at 7:02 p.m.

.....

**COMMUNITY INPUT:**

- \* Ms. Caroline Zuk, 100 Old Parker Road, appeared before the Board and stated that a Community based Dracut Pipeline Awareness Group has been formed to deal with concerns with the proposed pipeline. Ms. Zuk discussed the Groups concerns with wetlands, public safety, farming, natural habitat, loss of property, homes, etc.
- \* Mr. Peter Clark, 135 Heather Road, appeared before the Board and stated that he is a direct abutter to the proposed pipeline and stated that the Town and residents are up against a large well organized Corporation.
- \* Mr. Jim Carr, 136 Fox Avenue, appeared before the Board and stated that Kinder Morgan is not here to preserve open space, Dracut is a great rural Town and the proposed pipeline is going through farm land.
- \* Mr. Rich Cowan, 12 Greenlawn Avenue, appeared before the Board and discussed the new proposed pipeline route and potential other ways to bring in gas.
- \* Mr. David Simpson, 161 Pelczar Road, appeared before the Board and discussed the fire and explosion aspects of the proposed pipeline, 12 major explosions and fires within the last year and discussed this could be a catastrophic event and they don't want the pipelines in their backyards.
- \* Mr. Daniel Mooney, 71 Heather Road, appeared before the Board and stated that the proposed pipeline is in his backyard and there is no upside for Dracut.

Motion made by Mrs. Dristiliaris to extend the Community Input for three minutes. Motion seconded by Mr. DiRocco. Motion passed unanimously.

- \* Ms. Colleen Garry, 55 Chapman Street, appeared before the Board and discussed the Kinder Morgan letter and her meeting with Kinder Morgan and the Town Manager regarding the proposed new pipeline route. Ms. Garry stated that they are in a critical junction and discussed the Non-Binding Resolution against the pipeline. Ms. Garry asked that the Board respectively postpone their vote on the Non-Binding Resolution for 30 days so herself and the Town Manager could continue their discussions with Kinder Morgan and allow them to continue with negotiations.

.....

**AGENDA ITEMS:**

\* Ongoing Discussion regarding Tennessee Gas Pipeline and Non-Binding Resolution Ms. Richardson discussed the Non-Binding Resolution drafted by Mr. Edwards. Ms. Richardson read the draft Non-Binding Resolution.

Mrs. Hughes stated that she appreciates Representative Garry's and Mr. Duggan's work with Kinder Morgan and she would like to see the vote on the Non-Binding Resolution postponed for thirty days. Mrs. Hughes stated that this is not an endorsement of the proposed pipeline.

Mrs. Dristiliaris stated that there are no environmental impact studies and the Board needs to take a stand and she would like the Non-Binding Resolution put forth.

Mr. DiRocco stated that he is not happy with the proposed route but Kinder Morgan would not come back to the table if a Non-Binding Resolution is done. Mr. DiRocco stated that he would rather have negotiation availability.

Mr. Duggan explained to the Board what would happen with the line of communication with Kinder Morgan if a Non-Binding Resolution is done. Mr. Duggan stated that he would like to continue the lines of communication and he doesn't see a unanimous vote with the Board right now. Mr. Duggan stated that the vote should be unanimous when the times comes and it is his opinion to postpone the vote.

Mr. Archinski stated that it is time for the Board to weigh in on the proposed pipeline. Mr. Archinski stated that he does not see any benefits of the proposed pipeline.

Mrs. Hughes discussed her concerns with Kinder Morgan, FERC and the Government's relationship.

Ms. Richardson stated that she appreciates the efforts but with corporate America there is no guarantee that what Kinder Morgan's says is the truth. Ms. Richardson stated that she does not trust them, she has seen their presentation and the Board needs to stand up for the residents.

Motion made by Mrs. Dristiliaris to Sign the Non-Binding Resolution as read by the Chairperson. Motion seconded by Mr. Archinski. Under Discussion:

Ms. Colleen Garry, 55 Chapman Street, appeared before the Board and stated that if the resolution is passed it ties her and the Town Manager's hands with their discussions with Kinder Morgan.

Ms. Richardson stated that the next Coalition meeting will be held in Dracut.

Mr. Peter Clark, 135 Heather Road, appeared before the Board and stated that Kinder Morgan is a for profit organization.

Mr. Rich Cowan, 12 Greenlawn Road, appeared before the Board and discussed the permitting process with the other pipeline proposals.

Ms. Karen Pelletier, 32 Cart Path Road, appeared before the Board and asked if postponing the vote for thirty days would help or hurt the negotiations with Kinder Morgan?

Ms. Richardson stated that Kinder Morgan has to negotiate with the Town anyway. Ms. Richardson stated that the Conservation Commission needs to make sure everything pertaining to wetlands is documented.

Mr. Thomas Pelletier, 32 Cart Path Road, appeared before the Board and discussed his concerns with Kinder Morgan and stated that he does not trust Kinder Morgan.

Mr. Dave Simpson appeared before the Board and stated that the Town Manager is looking for additional income and stated that one fire truck is not going to help.

Mr. DiRocco stated that he would like to see the vote postponed for thirty days as he does not have enough information to vote on the Non-Binding Resolution tonight.

Mrs. Dristiliaris requested that the motion be voted on.

Roll Call Vote:

Mrs. Dristiliaris - Yes

Mrs. Hughes - No

Mr. Archinski - Yes

Ms. Richardson - Yes

Mr. DiRocco - No

Motion passed 3 to~2.

**20150826-4030**

Good evening. My name is Josh Chase, from the **Merrimack River Watershed Council**, a 39 year-old regional environmental nonprofit based in Lawrence. First let me thank you for having this event.

I want to make two points on our reasons for opposing this project.

First, the main concern we have is the effect that the pipeline construction will have on our drinking water and the health of the river due to the chance of re-suspension of toxic chemicals and heavy metals in the sediment that may end up in our water supply.

The Merrimack River is the second largest surface-water source of drinking water in New England. The river provides drinking water to nearly 300 and 60 thousand people in New Hampshire and Massachusetts. This number is projected to grow to over half a million in the coming years. The Merrimack was one of the 10 most polluted waterways in the US in the 70’s. Today, the water quality is dramatically better, but the pollutants of the past are still there in the sediment. We are very concerned that these past problems will come back to haunt us and end up in our drinking water.

The currently proposed path crosses the Merrimack and its tributaries many times, but some of these crossings have a chance to re-suspend some harmful chemicals and heavy metals that could impact our drinking water and the health of the river. For example, the proposed pipeline crosses the Souhegan River in Wilton, NH. According to the New Hampshire 303 d list of impaired waters, this segment of river contains high levels of aluminum, iron, and lead in the sediments.

Another example, the Lynnfield lateral pipeline is proposed to cross the Merrimack River between Dracut and Tewksbury. That particular stretch of the river is listed by Massachusetts as being contaminated with mercury and PCBs. These are just two examples.

From the site where the pipeline would cross from Dracut into Tewksbury it is under 10 miles to the intakes for the public water supplies for Tewksbury, Andover, Methuen, and Lawrence. From the section of the Souhegan River that contains lead and aluminum, there is less than 20 miles of river until Nashua gets its water from the Merrimack.

Second, the other major concern we have is the loss of forested land and the impact of permanently losing

this land on water quality. In a study from the US Forest Service, the Merrimack River watershed was rated the most threatened watershed in the country for loss of privately owned forested lands, 4th in the country for threats to water quality, and 7th in the country for loss of habitat for species at risk. The completed project is going to occupy over 1 thousand acres of land that will never have trees on it again. We will lose 38 hundred acres during construction. The Merrimack watershed can not afford to lose that land. The American Water Works Association studied 27 water supplies and found that a 10% increase of forested land lead to a 20% drop in treatment costs, and the EPA found that every dollar spent to protect the water reduced treatment costs by 27 dollars.

So, when I say we can not afford to lose this land, I really mean we can't afford it.

Because of these reasons, the MRWC has some major reservations about this project. We hope that FERC will take these important public health concerns into account, especially if the project goes forward. All parties involved must take the National Environmental Policy Act review process, along with the Clean Water Act, very seriously, or those of us who depend on the Merrimack River for our drinking water will end up paying for it.

Thank you.

AI: In 1988, a population of about 20,000 individuals in Camelford, England, was exposed for at least 5 days to unknown but increased levels of aluminum accidentally distributed to the population from a water supply facility using aluminum sulfate for treatment. Symptoms including nausea, vomiting, diarrhea, mouth ulcers, skin ulcers, skin rashes, and arthritic pain were noted. (WHO, 2003)

**20150826-4031**

*{duplicate of 20150826-4031 above}*

**20150826-4032**

Hand written letter, Virginia Costa, 191 A North Lowell St, Methuen, MA 01844, opposing

**20150826-4033**

GOOD EVENING. My NAME IS STEVEN FERRI AND MY HOME IS LOCATED AT 217 TROUT BROOK RD, IN DRACUT, WITHIN A FEW HUNDRED FEET OF THE PROPOSED DRACUT PIPELINES AND COMPRESSOR STATION.

YOU KNOW MUCH OF WHAT I AM ABOUT TO SAY. YOU KNOW THAT THE PROPOSED PROJECT IS FAR TOO BIG FOR THE NEEDS OF MASSACHUSETTS, MUCH LESS DRACUT. You KNOW THE OBVIOUS DANGER TO HUMANS, DUE TO THE TOXIC EMISSIONS FROM COMPRESSOR AND METERING STATIONS, AND THE METHANE GAS THAT IS EMITTED FROM LEAKY GAS PIPES. You KNOW THAT MY PROPERTY VALUE AND THE PROPERTY VALUE OF MY NEIGHBORS WILL DECREASE. You KNOW THAT MY HOMEOWNERS INSURANCE MAY INCREASE. You KNOW THAT THE QUALITY OF LIFE FOR THE RESIDENTS WHO LIVE ON AND AROUND THE PIPELINE WILL BE NEGATIVELY IMPACTED DUE TO

THE NOISE AND ODOR OF THE COMPRESSOR AND METERING STATIONS, AND You KNOW THERE WILL BE A CHANGE IN THE OVERALL LANDSCAPE. AND YOU ALSO KNOW THE DEVASTATING IMPACT A PROJECT LIKE THIS WOULD HAVE ON OUR ENVIRONMENT. You KNOW ALL OF THIS.

SO THE OBVIOUS QUESTION IS THIS: WHY YOU WOULD CONSIDER GIVING A COMPANY LIKE KINDER MORGAN, A CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY AS A WAY FOR THEM TO MAINTAIN AND INCREASE THEIR PROFITS, TO BUILD A PROJECT THAT WOULD PUT SO MANY OF US AT RISK AND RISK THE NATURAL AREAS AROUND US. WHEN IN THE PAST THEY HAVE BEEN CHARGED WITH FAR TOO MANY 'SIGNIFICANT INCIDENTS' AND BEEN ACCUSED OF 'DEFERRED MAINTENANCE.'

KINDER MORGAN'S ANSWER, AS STATED IN THEIR CURRENT AND PREVIOUS PROPOSALS, IS THAT THE NED PIPELINE IS NEEDED TO MEET LOCAL DEMAND.

BUT WHY THEN ARE THEY STRUGGLING TO FIND ENOUGH NEW ENGLAND CUSTOMERS FOR THEIR GAS? THE REAL REASON FOR THE PROJECT SEEMS QUITE OBVIOUS. THE REAL REASON, AS EVIDENCED BY THE MANY APPROVED AND PROPOSED LIQUID NATURAL GAS EXPORT TERMINALS IN THE US AND CANADA AND THE SHEER SIZE AND SCOPE OF THIS PROJECT, IS THAT KINDER MORGAN PLANS ON EXPORTING THIS GAS, WHERE THEY WILL BE ABLE TO GET FAR HIGHER PRICES.

IT WOULD BE EXTREMELY UNFAIR OF FERC TO FORCE US, THE LANDOWNERS AND TAXPAYERS, MOST IMPACTED BY THIS PIPELINE PROJECT, TO BEAR THIS GREAT BURDEN FOR A PRIVATE CORPORATIONS' 'FOR PROFIT' PROJECT, WITH ABSOLUTELY NO BENEFIT TO US. INSTEAD, THE PROJECT WILL LEAVE US WITH LONG TERM ENVIRONMENTAL HARM, LOWER PROPERTY VALUES, AND POTENTIAL HEALTH RISKS. SO I WOULD LIKE TO ASK FERC TO DEFINE THE WORD 'NEED' AND THE PHRASE 'PUBLIC CONVENIENCE AND NECESSITY'. SPECIFICALLY, PLEASE TELL US WHAT PORTION OF THE CAPACITY RIGHTS THAT ARE MADE AVAILABLE BY A PIPELINE PROJECT HAVE TO BE SPOKEN FOR BY POTENTIAL CUSTOMERS IN ORDER FOR YOU TO APPROVE A PIPELINE PROPOSAL?

SO IF THERE IS NO NECESSITY AT THIS TIME AND EXPORTING GAS IS THEIR OBJECTIVE, PLEASE DO NOT CONSIDER GIVING KINDER MORGAN A CERTIFICATE. EXPORTING NATURAL GAS WOULD OBVIOUSLY DO NOTHING TO ADDRESS MASSACHUSETTS ENERGY NEEDS. EXPORTING GAS WILL CREATE A SPIDER WEB OF WINDING PIPELINES AND NOISY, POLLUTING COMPRESSOR STATIONS THAT WILL RISK LIVES, DAMAGE THE ENVIRONMENT, POLLUTE THE AIR WE BREATHE AND THE WATER WE DRINK. PLEASE THINK LONG TERM AND TELL KINDER MORGAN NO.

THANK YOU FOR LISTENING.

**20150826-4034**

August 11, 2015

Kinder Morgan/Tennessee Gas Pipeline  
Testimony for Scoping Session - FERC Docket 14-22  
**John P. Hess, Andover Pipeline Awareness Committee**  
145 Chestnut Street, Andover, MA 01810  
978 470-0806

My name is John Hess, H\_E\_S\_S. I am a resident of Andover, Massachusetts. Today I represent the Andover Pipeline Awareness Committee. The Lynnfield Lateral of NED will go through Andover as well as other cities and towns south and east of Dracut.

KM has changed the route several times as well as made changes in compressor stations and other features of the pipeline, including the amount of natural gas to be transported. These actions confuse local citizens and create a sense of competition among communities and even among states. We look to FERC to fully analyze this project and to assure the citizens that it is needed for the public good.

I would like to ask you to pay particular attention to the following four points:

1. There are Questions about the need for NED
  - a. Is the Lynnfield Lateral needed? - NED proposes two parallel Laterals out of Dracut (one through Andover and one through Methuen). Both go to or near Danvers. Why are two Laterals needed?
  - b. Proponents of NED state that there is not enough capacity in alternatives to NED. This is refuted by an official from GDF Suez, an LNG gas supplier, who was quoted in a March 23, 2015 article in the Boston Globe as saying that "There's no need for major changes or new fees to pay for new pipelines."
  - c. Is the entire project the correct place for our country to be spending so much time and money? In light of the recent White House announcement on global warming, FERC should focus on alternative energy sources rather than condoning additional construction of fossil fuel infrastructure.
2. Given the large number of people who live in the communities south and east of Dracut that are affected by the NED project FERC should schedule more Scoping Sessions in these communities. It is completely unfair to the residents of those cities and towns to require them to travel such a large distance to be heard. If not, FERC is rushing the process and is ignoring the impact of a significant segment of this proposed pipeline.
3. As of July 24, 2015, the size of the pipeline through Andover has been upgraded from a 20" to a 24" pipe at a time when the diameter of the main line has been decreased. I ask that FERC fully explore the reasons for this increase in diameter.

4. In closing, I would like to let you know that this past May, the Andover Town Meeting overwhelmingly supported a resolution against the NED pipeline. Andover is designated as a Green Community. The Town Meeting voters believed that emphasis should be on repair of existing lines, use of renewable energy sources, and reduced energy consumption. Voters agreed that the size of the pipeline is too large for what is needed - Town Meeting was concerned that the excess capacity could be exported, increasing the price of natural gas for local consumption.

Thank you for your consideration of my comments.

## **20150826-4036**

John Hovanasian

Background: I grew up in Methuen which abuts Dracut and is just east of here. My father was a third generation farmer and we worked with and knew some of the farmers in Dracut. So I've known about and have been associated with Dracut and the community as long as I can remember.

My wife Debbie and I we knew we wanted to live in Dracut and bought our house on Pelczar road in 1983. We are proud to live in Dracut and the efforts we collectively participated in over the decades to keep our town a great place to live.

The Dracut community has always worked together to expand and improve the infrastructure to keep this town viable now and for future generations like the families before us ha~one.

32 years: During our 32 years we raised 2 daughters in the Dracut School System. These were challenging but our town came together for a new library, new schools, new fire stations, a new police station, and most recently a new town hall. And everyone has always been concerned about and supported saving open space. This was all possible because the people of Dracut cared about their town and each other.

Our dream was to stay in our house in retirement and enjoy our community hoping one day in the future our daughters would live in Dracut and maybe even in our house.

Changes: Kinder Morgan with the proposed pipe line has taken that dream away:

- Our house like many others is now in an area they are calling the incineration zone
- Our planning for retirement now fraught with uncertainty and anxiety
- We wouldn't risk having our daughters or later their families here; we are staying in Dracut, it is our home
- After all these years, we now have in our Town a challenge from which we cannot overcome and never recover
- It's a conscious decision imposed upon us from outside our community and which is completely unnecessary

Different :. We can't imagine why anyone would allow this to happen and would do this to this to our town and its people

- For us it's inconceivable, and leaves us at a complete loss over this numbing potential
- Just think about it as if it were you; would you want to live in an incineration zone
- Would they want your children and grandchildren in this situation

Call to action: We're here tonight because we need your help:

- 1.)We need you to hear us
- 2.)We need you to listen and truly understand what this will do to us and the surrounding towns
- 3.)We need you to help us stop this project now

Thank you for allowing me to view my concerns.

My name is Lisa Lipomi - I hold a degree in Chemistry and Masters in Chemical Engineering and I am a certified Master Gardener.

I am in the progress of setting up a small business called Dracut Daylilies which may or may not happen now.

I have worked for 2 chemical companies, a water testing facility and presently for the Department of Defense. I have remotely monitored manufacturing facilities and monitored gas pipelines in lieu of terrorist's attacks, when we have been at heightened security alerts.

I am not in the "Incinerator Zone", but nearby and I have already submitted via EComment a lengthy comment about the infrastructure and environmental issues with the proposed compressor/metering stations.

I have lived in Dracut for 50 years and I can remember clearly driving down Route 113 and seeing all the contaminated well signs from the Exxon Terminal!

I am gravely concerned with the environmental impacts and risks this proposal presents to Dracut and the surrounding towns.

Methane Gas is going to be produced by the 7/24 compressor station. Methane Gas is highly explosive and when combined with other substances is poisonous.

In high concentrations, it is deadly.

These substances are going to be dispersed in certain concentrations in our area.

Other substances such as benzene, lead, toluene, formaldehyde, ethylene glycol (or anti-freeze) and radioactive sludge (or Radon) (Radium 226 and Radium 228 ) are some of many hazardous and carcinogenic chemicals that will be present due to this proposal. These substances will also compromise public health, safety and environmental quality in the area.

We have no idea what long term issues this will leave our environment and ecology with, since this pipeline and compressor/metering stations are being situated in a High Consequence Area (and technically in the Valley -the Merrimack Valley) as per the last FERC submittal in June.

The US Department of Transportation - Pipeline & Hazardous Materials Safety Administration States under their Quick Facts on High Consequence Areas:

- Consequences of inadvertent releases from pipelines can vary greatly, depending on where the release occurs, and the commodity involved in the release.
- Releases from pipelines can adversely affect human health and safety, cause environmental degradation, and damage personal or commercial property
- Pipeline safety regulations use the concept of "High Consequence Areas" (HCAs), to identify specific locales and areas where a release could have the most significant adverse consequences

The other concern of mine is our water.

Many of us have well water. My area of town is on private wells only. I depend on my well for drinking, washing, sewerage and watering my flowers and crops.

Many people, farms, businesses, and our environmental habitat in this area depend exclusively on this water too!

Once a community's water system is made toxic, property values plummet. Homeowners end up with homes that they cannot sell at anywhere near their original value. They are forced to live in their unsellable homes and continue to be exposed to a toxic environment. WE SAW THIS AS A RESULT OF THE EXXON SPILL.

We do not need the possibility of our water being contaminated!

I first experienced chemo at 17 years old - so I know what chemicals can do and also the “side effects” that one has to live with after the fact - And that these “side-effects”- may take a considerable amount of time after the fact to manifest.

The real questions are: Do we really need this pipeline?

And does the Safety, Health And Environmental Impacts outweigh the benefits of this proposal?

We already have serious issues with a metering station on Brigham Rd and a small compressor station in Pelham - these will probably never get fixed due to the exemption of gas companies from the Clean Water, Clean Air and Safe Drinking Water Acts.

Thanks you.

*{photographs omitted}*

Library # 20150603-5017 RE: Docket PF14-22

Dear Federal Energy Regulatory Commission:

As a long-time resident of Dracut, Massachusetts, I am not convinced that a 36-inch compressed natural gas pipeline with a compression and metering station proposed by Kinder-Morgan{Tennessee Gas Corporation pumping (bi-directionly) 2.2 billion cubic feet of gas per day through the town of Dracut is necessary and that the benefits (if any to us) outweigh the huge risks and impacts to Dracut and its surrounding areas.

The location of the proposed pipeline compression station, metering station and large gas pipelines are proposed to be constructed in a High Consequence Areas (HCA) with a Potential Impact Radius of 900-2000 feet. This megaplex is near places of assembly such as the Campbell School, St. Francis Church and adjacent to prime farm land, conservation land, electrical utility lines as well as a quarry where blasting happens daily. Residents will have to deal with construction, blasting, losing land (resulting in non-conforming lots), closed streets and possibly no access, lots of noise, stadium lighting, air pollution (methane and other carcinogenic chemicals), global warming, pigging, diminishing property values, increased insurance costs, potential well water pollution/contamination, and the some, the anxiety of being in the “incinerator zone” - never knowing if you were going to lose your life and that of your family in 59 seconds.

The colonial town of Dracut with its active farms and open space/conservation areas are doomed if this pipeline becomes reality, not to even guess at the potential health impacts for future generations. Note, I have been told that someone will be monitoring this compression station from Texas if anything should happen - that really sets off alarms to me.

On a personal note, I am saddened that Kinder Morgan{Tennessee Pipeline would even consider impacting the Ogonowski Farm. Hasn't this family lost enough with their son being the first victim of 9/11? All this so Kinder Morgan{Tennessee Pipeline can export the natural gas to other countries? (See page 2 for a KM Presentation Oct 2015) Before issuing any certification to this company, please examine all the impacts thoroughly and think about what the permanent losses and impacts are to our town and New England too.

Lisa Lipomi

34 Gilbert Street Dracut, MA 01826

library #20150603-5056

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission 888 First Street NE, Room 1A Washington, DC 20426

Re: Tennessee Gas Pipeline Northeast Expansion Project

RE: Northeast Energy Direct, PF14-22-000

Dear Secretary Bose,

The NEW map of area of the NED pipeline was published from Kinder Morgan that reflects the 1/2 mile radius around the proposed compressor station. Did anyone look at the map and realize that the Fire Depart-

ment at the corner of Jones Avenue is within the radius and the Police Department is just on the edge of that radius?

Dracut has more affected homes than any other community with a compressor/metering stations, can't we have an Environmental Scoping Meeting here in Dracut? We wanted an open house but never got that.

Compressor Stations push out heat from multiple generators. This heat is exhausted 24x7 at an avg. temperature of 950 degrees. Climate change! If station is unoccupied, managed via "remote control" from Texas, who locally in Dracut will know how or if valves are properly shut if there is a catastrophic "event". Random spewing of toxic gases will rise rapidly into the air we breathe as we race to take cover when you hear the "jet engine noises" called a "blow down". Blown downs can happen anytime. Not much is known yet about how long you need to remain indoors with windows and doors shut until it is safe to re-emerge. Where will you be if a warning siren sounds? Jogging? Pushing your baby's carriage? Walking your pet? What are we (including our animals) going to eat or breathe if the wells are contaminated so our crops and animals do not have potable water or clean air? Bad news for Dracut!

Lisa Lipomi

To: Federal Energy Regulatory Commission

From: Julia Steed Mawson, 17 South Shore Dr. Pelham, NH 03076

Re: Kinder Morgan Northeast Energy Direct (NED) Pipeline Docket # PF 14-22-000 Date: August 11, 2015

My name is Julia Steed Mawson, I am a biologist and UNH Emeritus, I am an abutter to this pipeline proposal -land that I inherited from my family to steward as open space. Further I live on Little Island Pond, which is located less than 2,000 feet from the proposed pipeline. Finally, I am a neighbor of Dracut MA and I am seriously concerned about the loss of precious agricultural lands and the industrialization of Dracut. A 22,000 hp compressor station in Dracut is not a welcome neighbor to them or to us who live less than 3 miles away. Here is just one of my concerns.

In 1973 there were no loons on Little Island Pond, caused by the unintended consequences of DDT. Thirty years later, a loon returned. Since 2012 a breeding pair has successfully raised two chicks each year. Our story is a positive one, but in general this Threatened species, is not doing well in southern NH and MA.

Mercury and other contaminants have been found to be a causative factor in population decline in loons. Other species along other biomagnified food chains are affected, including fish, songbirds and bats. In general, Mercaptan and the long list of emissions produced by compressor stations, metering stations and leaking pipes as well as other construction contaminants is of grave concern but is little researched.

As recommended by the Biodiversity Research Institute in their report, "The Extent and effects of Mercury Pollution in the Northeast of North America", long term monitoring is essential. I extrapolate their recommendations to say that such research regimes need to be done on existing pipelines, metering stations and compressor stations of comparable size in order to identify potential hazards. Not enough information is available to ensure that endangered and threatened species and prime habitat is conserved. Unintended consequences over the years have cost our communities untold loss of human life, health and species diversity.

At one meeting this spring, one of Kinder Morgan's staff said "this (pipeline) is not something that you are used to." I later heard an interview of a survivor in Syria who noted that "We humans have an incredible ability to get used to things." I contend that that may be true, but it does not mean that it is right. Deny this pipeline.

### **20150826-4039**

Good Evening,

My name is Edward Nadolny. I live at 155 Heather Road in Dracut. I would be both a pipeline abutter and a resident within a quarter mile of the proposed compressor station. I am concerned about the negative impact this project will have on property values and the analysis surrounding this subject. For Kinder Morgan to propose placement of a massive compressor station in close proximity to two previously established, densely populated residential neighborhoods indicates their lack of commitment to minimize the economic and environmental impact of pipeline construction. This is unacceptable.

There are several studies on the effects of pipeline construction on property values referenced by Kinder Morgan. Each states that there is little to no affect from pipeline construction on property values. Many studies are performed in areas with low population density. Some have been performed in arid climates where the clear cutting of mature forest and loss of privacy are not factors.

The studies are old and do not reflect current data available on mortgage appraisal techniques, health risks, fear of terrorism, and the impact of social media.

Most importantly, none of the larger studies adequately quantify the financial impact of living within close proximity of a compressor station or metering station; and none adequately define the impact of decreased property value and the resulting loss of revenue for the town.

The editor and publisher of the Marcellus Drilling News, a pro pipeline publication, just this week has admitted that property values within

one half mile of a compression station may be negatively impacted. He goes on to state:

“We’ve heard, first hand, from people living very close to compressor stations whose property values are affected - because of the noise and odors. This is a valid issue”

(Jim Willis, Editor and Publisher, Marcellus Drilling News; Natural Gas Now Guest Blogger, posted 8/5/15)

What is not admitted is that massive pipeline compressor stations and metering stations have a long lasting devastating impact on families, neighborhoods and farms.

Therefore, I would like FERC to study and quantify the loss of property value for homes within one half mile of 30 comparably sized compression stations where 100 or more homes are affected.

I would also like FERC to study and quantify the loss of property value for homes within one-quarter mile of 100 comparably sized metering stations where 50 or more homes are affected.

Both of these studies should include the impact of current day social media, contemporary property appraisal techniques and the impact of decreased residential tax revenue for the town.

Thank you for your attention to this matter.

Edward Nadolny

Dracut, MA 01826

## **20150826-4040**

Scoping Meeting Testimony

August 11, 2015, Dracut, MA

Re Docket PF 14-22 (Kinder-Morgan / Tennessee Gas Pipeline proposed Northeast Energy Direct (NED) pipeline)

I would like to address concerns about pipeline and compressor station safety. There is established evidence that transport of natural gas through pipelines is inherently unsafe. Since January of 2014 the Pipeline and Hazardous Materials Safety Administration (PHMSA) statistics indicate that there have been 1093 pipeline incidents, 25 fatalities, 134 injuries and over \$500 million in property damage. Close examination of PHMSA’s incident reports for Kinder Morgan’s onshore gas transmission pipelines shows that in Texas alone from 2003 to 2014, Kinder Morgan experienced 36 “significant incidents”, resulting in fatalities, hospitalization, fires, explosions, or spills.\* Throughout the U. S, since 2003, Kinder Morgan and its subsid-

aries' pipelines have been responsible for at least 180 spills, evacuations, explosions, fires, and fatalities in 24 states. \*\* Kinder Morgan states in their F AQ from the town of Londonderry NH that it is "committed to public safety, protection of the environment and operation of its facilities in compliance with all applicable rules and regulations" but that statement does not line up with the facts.

The facts are these: In 2007, the US Environmental Protection Agency (EPA) fined Kinder Morgan \$613,000 for violations of the US Clean Air Act after regulators discovered that the company had been illegally mixing an industrial solvent-a dangerous hazardous waste described as a "cyclohexane mixture"- into unleaded gasoline and diesel. The company distributed 8 million gallons of the contaminated fuel \*\*\* In 2010, the federal government fined Kinder Morgan \$1 million for repeatedly violating the Clean Air Act at its Port Manatee Terminal in Florida. The US Department of Justice found that, among other crimes, Kinder Morgan managers lied in permit applications, stating that the company would control its pollution when they knew the control equipment was not being used or even properly maintained.

These are only two of a myriad of examples of not only Kinder Morgan's failure to maintain commitment to the environment and guard public safety, but also to engage in criminal activity and deception that placed the public at grave risk. They are great at talking the talk with regard to safety, but when it comes to walking the walk they get a failing grade. So what are you, FERC going to do to hold them accountable? What kind of inspections will be required before, during and after construction to ensure that there is NO harm to the environment, to the residents of Dracut and the other communities along the pipeline? This company cannot be trusted to guard the health and safety of its neighbors. Permitting a company with a track record of neglect and abuse to move ahead with a project associated with such high risk would be fool hardy at best and criminal at worst.

## 20150826-4041

HEARING REMARKS 08/11/2015

Good evening:

My name is Michael Payette, and I am a Dracut resident,

I appreciate this opportunity to voice my concerns about the proposed pipeline, which are as follows.

One of the alleged benefits of this project is that the added supply the pipeline will provide will cover any shortfalls currently experienced. The truth is that our current supply of Natural Gas meets our needs on all but a few of the coldest days of the winter, which can be offset in many ways.

- We should continue using LNG as we already do during the winter months.
- We can continue to liquefy pipeline gas at facilities in Boston, Hopkinton, and Connecticut for winter

use. In fact, the gas companies have plans to update all of these facilities!

- We can access stored LNG from imports at ports along the Maritimes Northeast pipeline that flows into Dracut - from Canaport in New Brunswick, the largest import terminal now in use.
- We can access compressed gas storage now being built right along the Halifax Lateral in Nova Scotia & Northeast pipeline that is under-utilized, and that already feeds from Canada into Dracut.

If our gas companies contract for this storage, it will be available some time in 2018 - at a cost that could be even lower, with less overall environmental impact, than building a 400 mile greenfield pipeline across three states that would remove thousands of acres of trees and put compression stations right next to the homes of many of my East Dracut neighbors.

One of the allegations made by Kinder Morgan was that we should not be using LNG to meet peak demand since there is no place to dock the tankers. A report funded by Kinder Morgan released in June stated, "Siting new port facilities to receive tankers has long been a contentious issue." [1]

This is a ridiculous argument. They are trying to confuse lawmakers. FERC and Kinder Morgan are well aware that there is no siting problem because we have two mostly unused terminals, built in 2008, located off the coast of Gloucester.

[1] <http://www.sentinelenterprise.com/news/ci28379094/beacon-hHl-institutesees-economic-benefit-building-kinder>

Kinder Morgan is also telling law makers that LNG is 5x as expensive as other fuels. Not true. On peak days when it is really needed, LNG has often been Less expensive than the natural gas prices in all of New England.

It would also seem that the case for this pipeline has been built on questionable demand forecasts. The ISO NE has issued predictions that power demand will go up. In reality, thanks to the switch to energy efficient bulbs and appliances, and the proliferation of Solar Panels on many homes in the area, power demand has gone down by 6% since 2005 and the need for power generation has declined by over 15%, and continues to decline.

So why do we need a pipeline again?

I would respectfully request that FERC use the more realistic estimates for both power generation demand and heating demand for natural gas, which were incorporated into the recent Maine PUC study, conducted by London Economics. This study validates our contention that this pipeline has bqen proposed to serve a need that simply does not exist.

Finally I ask that FERC use all due dilligence reviewing any statements made by Kinder Morgan on projected future gas prices. Current Winter Gas futures prices are down over 40% from last year, which i' contrary to he message they have been spreading via the media.

FERC should view the high cost of LNG as a temporary occurrence driven by events in Japan like the shut-down if their nuclear reactors in 2013, not as an indication that the usefulness of LNG as a bridge fuel to the future has ended,

Thank you for allowing me the opportunity to address the Commission,"

Hand written letter, Cherylann Pierce, 23 Mayflower Drive, Londonderry, NH 03053, opposing.

*{enclosures: several articles, not reproduced here, and copy of }*

*{ Londonderry Town Council Resolution 2015-04, adopted 7/20/2015, below }*

RESOLUTION 2015-04

A RESOLUTION REGARDING NORTHEAST DIRECT PROJECT

First Reading: 07/20/2015 Adopted: 07/20/2015

WHEREAS Tennessee Oas Pipeline Company, L.L.C., (“TOP”) a subsidiary of Kinder Morgan Energy Partners, L.P. , has proposed to construct a new natural gas distribution pipeline in southern New Hampshire, known as the Northeast Energy Direct Project (“NED”); and

WHEREAS TOP has filed proceedings in the United States Federal Regulatory Commission (“FERC”), Docket No. PR14-22-000, requesting comments on environmental issues and other matters, and meetings for receipt of public comments are scheduled in New Hampshire in July; and

WHEREAS In addition, related proceedings have been or may be filed in the future with the New Hampshire Public Utilities Commission (“PUC”) and the New Hampshire Site Evaluation Committee (together, the “State Agencies”); and

WHEREAS A portion of the proposed NED pipeline is proposed to be constructed in Londonderry; and

WHEREAS The proposed pipeline will create no direct benefit to the residents of Londonderry, and the disruption to the residents of Londonderry caused by the construction of the new pipeline may outweigh the benefits to the Town and its residents.

NOW THEREFORE BE IT RESOLVED by the Londonderry Town Council that the Town of Londonderry does not support the location of the proposed pipeline in the Town of Londonderry, and

BE IT FURTHER RESOLVED that the Town Manager is authorized to file such statements at the proceedings and meetings held by FERC and the State Agencies as he determines appropriate to convey the foregoing resolution to TGP and to FERC and the State Agencies.

John Farrell, Chairman Town Council

Serry Farrell, Town Clerk

A TRUE,COPY ATTEST: 0712012015

## **20150826-4043**

Comments of Vince Premus at FERC Scoping Session

August II, 2015

The singular weakness of this entire proceeding is the case for need. last December, I sat across the table from Gordon Van Welie, CEO of ISO New England, to discuss his unabashed advocacy for pipeline expansion. Mr. Van Welie has not been the most ardent defender of ratepayer interests. Rising utility rates have far more to do with his actions, and inactions, than alleged pipeline constraints. I give you two examples.

last September, FERC Commissioners Bay and Clark openly criticized ISO’s failure to address the exercise of market power in the 2014 Forward Capacity Auction. Just prior to the auction, a broker bought Brayton Point with the intention to close it. Unable to meet the installed capacity requirement, the auction defaulted to a non-competitive price, resulting in a \$75 million dollar windfall forthe broker and a record \$3 Billion dollar price tag on us for future capacity payments. Your Commissioners asserted that “ISO-NE may have violated its tariff by failing to carry its burden of establishing that the auction results were just and reasonable.” ISO, and FERC, declined to take action, despite being urged to do so by no less than 16 members of New England’s Congressional delegation in a joint letter to Chairman LaFleur last October.

This winter, electricity cost 30% less than last winter thanks to peak-shaving LNG. This despite suffering the most severe winter in 80 years. Recall that in 2013, ISO prohibited LNG from participating in its Winter Reliability Program out of concern for sending the “wrong signal” about the scarcity of natural gas. Electricity prices soared when it could have been prevented. This action bore the unmistakable appearance of market manipulation with the aim of propping up the weak case for pipeline expansion. This is fuel source agnostic?

New England’s natural gas annual inflow capacity is nearly twice the region’s demand. Energy efficiency, demand response, recovery of gas lost to leaks, and commercially available storage technology all combine to refute the specious case for need. Our actionable request of this Commission is: DO-YOUR-JOB! Regu-

late. Your job is NOT to “put steel in the ground” as Cheryl LaFleur quipped at an Energy Roundtable last October. Your job is to confirm what the numbers clearly show-the case for need is not made.

The export plan of a wealthy Texan is no justification to impose eminent domain on THESEWORKING-FAMILIES. China may need this gas. But the New England ratepayers that will bear the burden surely DO NOT.

**Testimony of Senator L'Italien on the Kinder Morgan/Tennessee Gas Pipeline**

Good evening. My name is Barbara L'Italien and I serve as the State Senator representing the communities of Dracut, Andover, Tewksbury, and Lawrence. Like many here tonight, I am deeply concerned by the Kinder Morgan/Tennessee Gas Pipeline proposal and how it may impact the communities of my district.

Since the legislative term began in January, I have actively worked to address many of my constituents' concerns related to this issue. I have met with representatives from Kinder Morgan and urged for more transparency from the company as they continue to craft their proposal for the construction of a gas pipeline in our region. I have continuously stressed the need for public input, particularly in the communities most impacted by this proposal, and have advocated for local scoping meetings so that residents can have an opportunity to formally express their concerns to the federal government. I, as well as my staff, have also engaged with activists throughout the district to learn more about how this pipeline will shape our communities moving forward and how it poses a significant risk to homes and local resources.

Over the past six months, Kinder Morgan has continued to alter details of the pipeline proposal and residents have had little time to digest these new plans. Residents of affected communities need additional time to process the information and understand the extent of the impact of the construction so that they can contribute their voices to the process during the public comment period. I come here tonight urging you, the Federal Energy Regulatory Commission (FERC), to extend its public comment filing deadlines for this project and ask that you schedule an additional scoping session in our region aimed at the communities impacted by the proposed Lynnfield Lateral pipeline. The solicitation of public input is essential throughout the process of evaluating the pipeline proposal, and as Kinder Morgan continues to alter details of its plan, citizens deserve adequate time to fully understand the potential impacts of these new changes, as well as opportunities to interact with federal authorities and express their concerns. As this pipeline proposal continues to take shape, our communities also require more transparency from Kinder Morgan so that we may accurately measure the pipeline's potential impacts on property values, the environment, and public safety.

Like many constituents who have contacted my office over the past months, I am concerned that the pipeline will negatively impact individual homeowners and the values of their properties as a result of permanent easements related to the construction and operation of the pipeline, permanently altered land features resulting from the pipeline's construction, increased risks of air and noise pollution from the pipeline and compressor stations, and the use of eminent domain as a means of construction.

I am fortunate to represent a district that is home to multiple multigenerational, family-owned farms. For these individuals in Dracut, Andover, and Tewksbury, their livelihoods depend on the ability to raise and sell crops to individuals as well as commercial vendors. The construction of a pipeline in close proximity to their lands raises serious concerns about how the pipeline might impact the safety of local food sources or detriment farmers' abilities to tend their land and maximize their profits. As the proposed route of the pipeline continues to shift, many questions are left unanswered. Property owners in my district need additional time to consider how the pipeline might impact their communities, and as newly drawn maps indicate additional neighborhoods impacted by the pipeline route, residents should be afforded more time and opportunities to fully analyze the proposal and ask questions to Kinder Morgan's company representatives.

I am also concerned that this pipeline will threaten the natural beauty and resources of protected open and agricultural spaces in my district. Some of the lands lying in the current path of the pipeline include local habitats, water supplies, vegetation, and recreation spaces protected by private conservation trusts. Over one hundred land parcels in the path of the pipeline are protected by Article 97 of the Massachusetts Constitution, and their use for the public good could be threatened by possible invocation of eminent domain during the pipeline's construction. Many of the aforementioned farms located in my district are protected by federal open space laws and agricultural preservation restrictions, and the construction of this pipeline could threaten the purity and safety of their fertile soils.

I worry that the pipeline may also pose a Significant threat to local water sources and waterways. Kinder Morgan currently plans to employ methods of Horizontal Directional Drilling when constructing the pipeline under wetlands or major water bodies, including the Merrimack River. Moving forward, it is important that we analyze how this mode of construction will impact downstream communities such as Lawrence, which depend on the Merrimack River as their primary water source and could be threatened by the disruption of river sediments from past milling and farming activities. I believe this pipeline project requires ongoing monitoring to address any negative impacts of blasting and drilling on local wells and wetlands, as well as any negative effects to properties as a result of water displacement. As Kinder Morgan continues to alter its reports, it is difficult to generate an accurate environmental impact study. Prior to FERC's approval, we must gather more data to analyze how a pipeline will impact air and water qualities, archaeological resources, socio-demographically diverse populations, natural resources, and existing agricultural infrastructure.

I am gravely concerned about how pipeline failures during construction might pose a safety risk to individuals and properties in my district. In Dracut, the combination of a proposed main line with 30" diameter and pressure of 1460 PSI, in addition to a remotely controlled and monitored 23,000 horsepower compressor station, poses a significant risk to the community with large potential impact radii should anything go awry. In Andover and Tewksbury, the recent increase in diameter of the Lynnfield Lateral from 20" to 24" suggests that those communities will also face significant risks associated with the piping of high-pressure natural gas. I ask you to address some of these public safety concerns with elected officials, homeowners, and safety response teams before approving this pipeline proposal. Possible incidents related to pipeline failure have the potential to overly burden our public safety infrastructure, and Kinder Morgan must develop a detailed public safety response plan to address any issues with the pipeline or compressor stations. If Kinder Morgan expects local public safety officials to respond to such incidents, the company must develop a strategy to adequately train these public safety teams.

As you will see tonight, this pipeline proposal has generated much concern among state officials, Boards of Selectmen, Town Meetings, local businesses, activist groups, and individual homeowners. While Kinder Morgan continues to alter details of the pipeline proposal, it is nearly impossible for local entities to generate accurate studies of the pipeline's possible impacts to public safety, individual properties, and the local environment. Additionally, the (FERC) public comment-filing deadline of August 31, 2015, is too soon for citizens to have an adequate opportunity to comment on the most recent plan revisions released by Kinder Morgan. Additional scoping sessions are needed to ensure that the public has had a fair opportunity to express their concerns about this plan and suggestions for compromise or other improvements.

With the most recently revised Resource Reports having been issued by Kinder Morgan on July 24, 2015, it

is particularly difficult for community members to fully analyze and comprehend the most current details of the proposal. Furthermore, no scoping sessions have been scheduled in communities specifically impacted by the Lynnfield Lateral, including Andover and Tewksbury, and I believe that the residents of these densely populated areas should also have an opportunity to voice their concerns. The proposed pipeline has the potential to dramatically impact the communities of my district and add increased pressures to our existing public infrastructure, and Kinder Morgan must address some of the aforementioned concerns related to impacts on home values, the environment, and public safety, before FERC makes its final decision to approve this pipeline.

John Yurka

63 Cranberry Rd Dracut, MA 01826

Ref.: High Pressure Compression Station in Dracut, MA Dracut town meeting Aug 11

Tennessee Gas Pipeline Company, L.L.C. / Kinder Morgan NORTHEAST ENERGY DIRECT PROJECT  
Good Morning

1. A few years ago my understanding some gas lines were put through Dracut for gas coming from Canada to USA. Last town meeting, we were told Kinder Morgan is going to continue this pipeline to Canada, so to send Canada gas. I am confused - Canada is sending USA gas and Kinder Morgan wants to send Canada gas. This makes no sense. How can FERC allow this to happen?
2. My insurance company tells me they will not cover any gas pipeline/compression plant accidents/damage. I will have to hire a lawyer to go against a 100+ billion dollar company. My guess the likelihood of winning a case is probably is zero. Which would mean I probably have no coverage to my home if a problem occurs from the plant! pipeline. How is that even close to being logical just so Kinder Morgan can sell their gas over seas for profit. Why doesn't Kinder Morgan have to take a bond out to cover all the home property in the blast zone?
3. FERC my understanding is involved in all these pipeline issues from the gulf coast to New England. Why doesn't FEAC let the people know
  - a. If our property values go down and by how much
  - b. Will our home insurance increase and by how much
  - c. What other issues have other towns had that we don't know about yet

FERC should already know these answers. Please tell us, why keep the people in the dark?

4. We have so many questions, who is going to answer our questions?

5. Why do people have to take property value drop so Kinder Morgan can make a profit exporting gas? Average people could loose 10's of millions if not more, why?

Please stop the high compression plant and pipeline

John Yurka

Nancy Hann, Winchester, NH.

President Barack Obama is at the National Clean Energy Summit in Las Vegas, NV. His very recent speech

yesterday mentioned attaining the goal of 20% renewable energy by the year 2030, and that is beyond hydroelectric power. Here is a link to his speech: [http://www.nytimes.com/2015/08/25/us/obama-solar-power-renewable-energy.html?\\_r=1](http://www.nytimes.com/2015/08/25/us/obama-solar-power-renewable-energy.html?_r=1)

His point is, "It's a debate between those who fear the future as those who are eager to seize the future."  
STOP Northeast Energy Direct Project PF14-22-000

Thank you very much, Nancy Hann

## 20150826-5001

Mark Shoemaker, Nassau, NY.

Re: Scoping Notice; Tennessee Gas Pipeline Company, LLC, Docket No. PF14-22-000 Northeast Energy Direct Project

My name is Mark Shoemaker and I reside at 1208 Nassau Averill Park Road which is located across the street from the site where the proposed fracked gas compressor station would be built. I have lived at this location with my wife Gail for the past 38 years.

The following are verifiable facts and reasons why the compressor station should not be built at the Clarks Chapel Road, Nassau, N.Y. location.

- I know the property of the proposed site better than anyone alive, being a good friend of the former owner and hunting the area for over 30 years. I am not sure why, but I can tell you that noise in this particular area travels an unbelievable distance. The geography is such that sound somehow amplifies. On many occasions I can remember clearly hearing the conversations of my children while they waited for the school bus while I was hunting approximately 300-400 yards away. At my house you can clearly hear motor boats that are on the second Burden Lake which is over a mile away.
- There are two small feeder streams that run near and along both the east and west boundaries of the proposed site. Any contamination at this site would most likely end up in these two small streams that run into the Valatie Kill creek which feeds both Nassau and Kinderhook Lake.
- There are approximately fifty small children that live within the half mile buffer zone that was established by Kinder Morgan, five of them are my grandchildren. Located less than two miles to the south of the proposed site is a summer camp for children named Camp Schodack. On any given summer day up to 500 children spend most of their time outside participating in outdoor activities. The Valatie Kill creek also runs directly through the camp property.
- This community is already struggling with the effects of the former Dewey Loeffel landfill, a Superfund site which is less than a mile away from the proposed site. The combined effect from both sources polluting the area would be devastating to the health of the people living in this area.
- A portion of the third Burden Lake is located within the half mile buffer zone. Water from the third lake empties into the second lake, then into the first lake. Any stack exhaust pollutants emitted from the compressor station will most likely contaminate all three lakes with the potential of affecting hundreds of people and wildlife.
- The subsoil at the selected site is composed of coarse gravel which runs the entire length of the property. No outside fill would need to be brought in for construction purposes. This feature would save the gas company a tremendous amount of money. This fact along with the current owners' relationship with surrounding land owners and willingness to sell is more than likely the reason that this site was selected.

Sincerely

Mark Shoemaker

John Leoutsacos, Temple, NH.  
John Leoutsacos  
79 Mountain View Drive  
Temple, NH 03084

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1A  
Washington, DC 20426 !

Docket # PF14-22-000

My name is John Leoutsacos. I live in Temple, NH.

I have several serious concerns regarding the water sources for hydrostatic testing.

There is a definite need to identify the water sources to be used for hydrostatic testing during construction.

As typical hydrostatic testing utilizes MILLIONS of gallons of water, will these sources be replenished and if so, how?

Is monitoring of “used” hydrostatic testing water for toxins required?

If this water is found to be contaminated,

who is this information reported to?

how is this water purified or disposed of?

An extremely high number of New Hampshire residents rely on private wells as their sole water supply. Being that Gas companies are currently exempt from the Safe Drinking Water Act and do not have to disclose the chemicals in the pipeline; a pipeline leak could contaminate water sources with undisclosed chemicals. In addition to potential damage caused during the construction process, these wells may be negatively impacted by contamination from ground and surface waters.

**20150826-5007**

Evelyn Taylor, New Ipswich, NH.

I just read that Kinder Morgan would ensure no farms would be harmed by the NED pipeline or compressor station. I am in the 1/2 mile radius from the proposed New Ipswich, NH compressor station. I have been growing an organic garden for over 20 years to obtain clean food free from pesticides. How does Kinder Morgan propose to keep my land free of toxins? I deserve equal opportunity to be able to continue my organic farming. FERC needs to hold Kinder Morgan responsible to ensure that I can continue to grow an organic garden free from toxic air, soil and water spoiled by the compressor station or other pipeline equipment, product and activities.

**20150826-5011**

Evelyn Taylor, New Ipswich, NH.

Kinder Morgan makes the following claim to Product Quality and Safety:

“Federal laws require the reporting of suspect chemical hazards and/or defects in consumer products to the proper authorities. Failure to report can result in substantial civil and criminal penalties for the Company and for individuals aware of the hazard.”

To what proper authority has Kinder Morgan reported the suspect chemical hazards released from Fracking, compressor stations and fracked gas pipeline activities? We have asked Kinder Morgan about the hazards but they have not disclosed the chemicals and hazards to us. I will ask again during the upcoming Open House.

**20150826-5014**

Benjamin Martin, Wallingford, CT.  
Connecticut does not need more gas.

Connecticut does not need more pipelines.

The pipeline proposed in this docket would be use to transport highly volatile, highly explosive and highly toxic gas through my state so it can be exported from ports in New England and Canada. The people of CT do not need or want this gas or pipeline. We do not want to worry about explosion similar to the ones that destroyed buildings in Springfield, MA, Brooklyn, NY or Middletown,CT where 6 people were killed at the Kleen Energy plant. We do not want the methane leaks from these pipelines or the gas released from the compressor stations when maintenance is performed. Our energy demand has been declining due to energy efficiency programs and installation of renewable energy. This project is neither wanted nor needed by the people of CT.

I urge FERC to reject this project and any other pipelines carry fossil fuels. We demand renewable energy projects to power the future and that FERC abandon the energy of the past.

Thank you,

Ben Martin  
329 Ward St  
Wallingford, CT 06492

audrey m greene, Windsor, MA.

I am a resident of Windsor, MA a town that is slated by Kinder Morgan to have a compressor station.. I feel there is not enough research concerning the long term effects of emissions for FERC or Kinder Morgan to say it will be safe..for the residents of this town, not only the humans but the wildlife..I would like to know what studies Kinder Morgan has done re: the safety of these compressor stations and how emissions and their effects are monitored..also how will the noise and emissions from the proposed compressor station impact both our local birds and the migratory species affected. Because of I am unable to reliably find any objective scientific studies that assure me these compressor stations and their omissions are safe for humans and birds ..this is one reason why I Object to this pipeline.

audrey greene

**20150826-5016**

Emily Koester, Northfield, MA.

It is my sincere belief that NED is the worst option for meeting the energy needs of Massachusetts and the rest of New England. There is really no acceptable route for the pipeline without significant damage to pristine woodland.

Repairing leaks of existing pipelines and encouraging energy conservation would be much less expensive and more environmentally sound options, as would the encouragement of solar and wind power.

I duly request that FERC's analysis of the impacts (positive and negative) of alternatives be studied as thoroughly as the impacts of the proposed project, so that a meaningful evaluation can be made of the alternatives versus the proposed project.

Finally, please note that the Connecticut Expansion and NED are improperly segmented, and the projects should be reviewed together by FERC to best achieve solutions that meet our energy needs with the least risk to ratepayers and the least impact to landowners and the environment.

Re: Tennessee Gas Pipeline Company, LLC Docket No. PF14-22-000  
Northeast Energy Direct Project

Dear Secretary Bose,

Please find below my testimony, with accompanying footnotes, submitted into the record last week at the FERC Scoping Session held in Lunenburg, MA on August 12, 2015.

Good evening. My name is Vince Premus, P-R-E-M-U-S, from Pepperell, MA. I am here once again to challenge the case for need.

According to the U. S. Energy Information Administration, the six New England states consumed a total of 889 billion cubic feet of natural gas in 2013. Their data also show that New England's natural gas inflow capacity is currently 1,709 Bcf/yr. 1 This is exclusive of the region's three LNG import facilities, which sit virtually idle of late, yet in the past have contributed additional capacity of up to 150 Bcf/yr.2 So why, despite a natural gas inflow capacity that is nearly twice the region's annual demand, does Gordon Van Welie, the CEO of ISO New England, persist in his claim that we must expand our gas pipeline infrastructure to keep electricity prices down and avoid the threat of rolling black outs?

It is well known that during a handful of days per year, generators in New England who have not contracted for firm pipeline capacity may be forced to sit idle." They do not commit to long-term contracts with their suppliers, and are thus lower on the priority list than local distribution companies that commit to firm supply to heat people's homes. What this means is that electricity price spikes in winter have much more to do with market practice than pipeline constraints, especially given that the same winter price spikes have been observed in parts of the United States where supply and access to natural gas is abundant. 4

If you were to add up all of the gas required to get through these so called "peak-shaving" intervals during the course of one year, it is estimated to total on the order of 5-10 Bct, or about 1% of the region's annual demand-roughly the equivalent of one or two LNG tankers"

To the businessman looking to export natural gas to global markets, a massive overbuild of pipeline infrastructure looks like the perfect solution to the peak shaving problem. However, to the people, many of them before you tonight, whose lives are about to be turned upside-down due to a forcible land taking via eminent domain, it is unconscionable. If ISO New England is truly fuel source agnostic with regard to power generation, then the sword dangled over the heads of these working families demands that we ask: "Is there another way? "

YOU BET YOUR GAS THERE IS. Energy efficiency, demand response, recovery of gas lost to leaks, and commercially available storage technology all add up to a resounding YES to the question, "Is there another way?" Last night at the Dracut Scoping Session, you asked for inputs to help in developing a mitigation plan. I can think of three: 1) Direct ISO New England to facilitate the purchase of 1 or 2 or 3 LNG tanker deliveries each winter, 2) Make sure ISO New England correctly accounts for distributed generation and renewables in the calculation of their Installed Capacity Requirement prior to each year's Forward Capacity Auction/ and 3) Hold ISO-NE accountable!

I will close by saying that I implore you to consider the NO BUILD OPTION as FERC reviews environmental impact, socio-economic impact, and any other impact that is within your commission's jurisdiction to consider. As I requested in Dracut last night, please confirm what the numbers clearly show, the case for need IS NO T MADE.

In addition, I wish to add the following points to the written record, which were not included in my verbal

statement due to the three minute time constraint on each speaker:

By the very words of Mr. Eric Tomasi, FERC Project Manager of the Northeast Energy Direct application, the scoping sessions are aimed at the development of an Environmental Impact Statement and measures for the mitigation of the negative impact the proposed project will have on the homeowners and stewards of protected open space of the Commonwealth of Massachusetts.

As such the implication is that the approval of the Northeast Energy Direct project is all but a foregone conclusion.

**Therefore, I respectfully request that a new set of scoping sessions be convened by FERC to address the issue of need in a quantitative, public, and transparent forum.**

The comments submitted to this docket have shown there has been a pattern of behavior on the part of ISO New England, and other energy policy makers, which clearly signals an intent to promote an over-reliance on natural gas infrastructure development. I believe that by doing so, they have placed the region at risk. If anything, there is now a vital need to pump the brakes on the development of new natural gas infrastructure and accelerate the development of distributed, renewable resources to counter balance the region's over-reliance on gas fueled generation. Ann Berwick, the former Chair of Massachusetts' Department of Public Utilities, would seem to agree. In her recent op-ed piece published in The Boston Globe, she wrote, "Natural gas now accounts for about half of the electricity produced in the region, compared with 15% in 2000 ... just as we diversify financial investments, we need to avoid becoming over-dependent on one source of energy."?

The issue of need is of paramount importance as FERC deliberates whether the standard of "public need and convenience" has been met by the applicant. However, public comment on the subject of need is not of immediate relevance to Mr. Tomasi's task of developing an Environmental Impact Statement. The standard of need must be reviewed in an objective and public manner, with an opportunity to comment by all concerned, not just industry stakeholders and energy policy makers with a perceived, or actual, conflict of interest. I urge you to open a new set of public hearings specifically dedicated to the assessment of need, at which informed testimony may be delivered by local elected officials, affected homeowners, and utility ratepayers.

Respectfully submitted,

Vincent E. Premus, Ph.D.  
Pepperell, MA

5 <https://jstrausscenter.org/hormuz/Ing-tankers.html>

6 NESCOE Statement at the NEPOOL Participants Committee on ISO-New England's Installed Capacity Requirement Values for the 2018-19 Capability Period (FCA9), October 3, 2014 in which they criticized ISO New England for under-estimating the region's Installed Capacity Requirement (ICR) by not fully accounting for distributed generation (DG), in particular smaller net-metered solar photovoltaic installations. NESCOE was quick to point out that such inaccuracies can lead to "electricity consumers paying for unneeded future capacity." Their current underestimate of the ICR, by some accounts almost 1,000 MW, is the approximate difference in net capacity that triggered the non-competitive administrative pricing scheme in FCA-8 that was met with the disapproval of the FERC commissioners Bay and Clark in 2014.

Re: Tennessee Gas Pipeline Company, LLC Docket No. PF14-22-000 Northeast Energy Direct Project

Dear Secretary Bose,

Please find below my testimony submitted into the record at the FERC Scoping Session held in Dracut, MA on August 11, 2015.

My name is McKenna Premus and I am from Pepperell, Massachusetts. I was thirteen when a Kinder Morgan representative came to our door in January of 2014, and asked to survey our land for the proposed pipeline. We soon came to find out that the path for the pipeline was going to cut through a piece of our 2 acre property, only about 100 feet away from both mine and my brother's bedroom windows. Ever since then my family and countless others, both affected and not affected, have been putting in almost all of their free time to fight this major corporation.

Now, on the FERC website, it states that the job of FERC is to regulate and review proposals to build LNG terminals and natural gas pipelines. But regulating shouldn't mean that hard-working individuals lose their land to a multi-billion dollar corporation. Regulating shouldn't mean that people must pay a tariff to build the actual pipeline. And regulating shouldn't mean that they should have to fight and defend what is rightfully theirs.

What I'm wondering is how can a federal board compromised of former energy industry executives approve pipeline installations that destroy people's land? Who's in charge here? Who are we the people relying on to represent us? Who can we "the homeowners", the ratepayers, rely on to represent OUR interests?

This is MY generation's future.

I have asthma; I want my air contaminant-free.

Keep our air clean. Keep our water pure. Keep our skies dark.

And our protected lands should remain just that: protected.

With power comes responsibility, and I would ask you to listen to each of these people here tonight, and as a federal agency represent us, the people, in this fight for our rights, our freedom, and our property.

Regardless of where the pipeline is proposed to be placed, it is wrong. Even as a teenager, I know that. My 11-year old brother knows that. If kids were allowed to hold positions in government, I can assure you that we would not be here tonight.

**Review the issue of need.** I know the difference between right and wrong, do you?

Respectfully submitted,

McKenna Premus (Age 15)

Pepperell, MA

Re: Tennessee Gas Pipeline Company, L.L.C.

Proposed Northeast Energy Direct Project, FERC Docket No. PF14-22-000

Dear Secretary Bose,

The Warwick (MA) Conservation Commission (further – Commission) is writing to offer its comments on the scope of studies to be done for FERC’s Draft Environmental Impact Statement on the proposed North-east Direct natural gas pipeline project.

To ensure proper determination of environmental impacts from proposed pipeline construction and maintenance activity Commission would like to request the following studies and surveys to be performed in course of EIS draft preparation:

1. On-the-ground delineation of wetlands and streams for the entire project corridor and buffers.
2. On-the-ground surveys for vernal pools within 1,000 feet of the potential project corridor. These surveys should be performed during the relevant breeding seasons. The time frame for preparation of the Draft EIS should be extended accordingly.
3. Identification and prior testing of drinking water sources within 5 miles of the potential project corridor.
4. Baseline sampling of ambient air quality and noise levels within 5 miles of proposed compressor stations and other pipeline facilities.
5. Baseline study of bird migration in the nearby portion of the Connecticut River flyway.

A number of reasons for these studies and surveys were listed in our previous letter filed with FERC 8/4/2015 Submission ID: 597295.

In addition, we would like to bring to your attention our experience that wetland resources in the town of Warwick, as shown on Massachusetts Department of Environmental Protection map layers, are under-represented by a factor of several times. We believe that forested wetlands, intermittent streams and vernal pools are the most seriously under-represented types of wetland resource areas. We also believe that this under-mapping of wetlands is typical of all the Massachusetts municipalities where the proposed NED project would be located.

This under-reporting is due to the fact that map layers are developed chiefly by interpretation of aerial photos. The great majority of land in our town, as well as in many other towns along the proposed pipeline route, is forested and large numbers of wetland resources are hidden by the forest canopy, especially in areas dominated by coniferous trees.

The thorough delineation of vernal pools, almost all of which are located under tree cover, is of particular concern to us. This Commission has devoted attention each spring to certification of vernal pools in Warwick, and it is our experience that their actual frequency is several times greater than what is suggested by the DEP map layer for potential vernal pools. Based on our findings, the Massachusetts Natural Heritage and Endangered Species Program certifies several vernal pools a year. Nevertheless, we believe that only a small fraction of certifiable vernal pools along the potential NED corridor have actually been certified.

Obligate amphibian species, including several identified as rare under the Massachusetts Environmental Policy Act, are entirely dependent on these vernal pools for breeding. Since these species have an upland range of up to 1,000 feet from their breeding pools, we would like to request on-the-ground surveys for vernal pools within 1,000 feet of the potential project corridor. Reconnaissance in our area must be done during the brief breeding season in April and May. Not accurately delineating these pools risks destroying whole local populations. Vernal pool habitat cannot be reliably replicated, making mitigation all but impossible.

The protection of perched wetlands, which form in depressions in the underlying bedrock, is also a great concern for us. Perched wetlands are particularly vulnerable to destruction by the opening of drainage fissures resulting from blasting during pipeline construction. Mitigation by replication is not possible for this class of wetlands. Because of so much shallow bedrock topography along the proposed pipeline corridor in Warwick and other hilltowns, thorough on-the-ground delineation of perched wetlands is imperative.

Identification and prior testing of drinking water sources is another important concern of the Commission. The town of Warwick is entirely dependent on private springs and wells, both shallow and artesian, for its entire drinking water supply. Also, the Grandin Reservoir and its watershed of over 400 acres lies immediately downgradient of the proposed pipeline route in Warwick. The steep watershed of this reservoir is particularly vulnerable to erosion and pollution. Because much of the hydrology of our area is unknown, we request that the Draft EIS include testing of all private wells and public drinking water supplies within 5 miles of the proposed pipeline corridor. We believe that testing has to be performed by an independent party. It is important to establish an objective baseline for water quality prior to natural gas pipeline construction.

Because the town of Warwick is immediately adjacent to and downwind of the proposed super powerful gas-fired compressor station in Northfield, the Commission also requests that the Draft EIS include prior baseline sampling of ambient air quality and noise levels within 5 miles of the proposed facility. Negative impacts from compressor stations, including noise and air contamination within a 5-mile radius, are well documented. Since the Warwick State Forest is one of very few unbroken wildlife habitats remaining in Massachusetts, this sampling should be performed year round and at different times of day. In addition, we request a baseline study of bird migration in the nearby portion of the Connecticut River flyway, a major migration route.

The Commission also wants to see the Draft EIS include an evaluation of the cumulative effects of the project on the large contiguous blocks of forest that comprise most of the potentially affected towns in Franklin and Berkshire Counties. Over 90% of our town is forest and over 50% of our land area is public conservation land protected under Article 97 of the Massachusetts Constitution. This largely unfragmented forested area is relatively free of invasive species and provides ideal habitat for a wide variety of animal and plant species, both common and rare. The combined effects of the proposed pipeline route drawn across this intact landscape could severely degrade its ecological integrity.

The Conservation Commission also requests that the timetable for studies used in the preparation of the Draft EIS be extended to a minimum of one full year. We do not believe that complete and accurate delineation of wetlands resources, particularly those which serve important seasonal functions in breeding and migration for wildlife, can be conducted in a shorter time frame.

Sincerely,

Gregory Brodski, Co-Chair

Re: Tennessee Gas Pipeline Company, L.L.c., Docket No. PFI4-22-000 Northeast Energy Direct Project

Dear Ms. Bose:

I would like to formally express my staunch and complete opposition to this project. From its initial, deceitful description of purpose, to its false representation of need, to its thousands of pages of vague rhetoric that do not address the questions or concerns of impacted residents along the proposed pipeline route, this project is completely unnecessary and should not even be considered as a possibility. Please allow me to explain ...

First, on the matter of need, please refer to the comments of New Hampshire State Representative Jim Parison made at the July, 30 2015 FERC Scoping meeting in Milford, NH:

*“I’ve also learned from talking with Kinder Morgan representatives, that they actually .. besides the rumored doubling, maybe, of Liberty Utilities customers, that they actually haven’t got any agreements with any utilities for this gas to be used to generate electricity. So I don’t see it as satisfying any kind of shortfall in the electric grid anyway, because they don’t have any contracts with electric generators.”*

This in and of itself is in direct conflict with TGP’s own filings which state that it will be used to secure electric generation for New England,. This alone should be ample reason to deny the approval of this project.

I would also like to call the FERC’s attention to recently published articles that further reinforce this point:

**More gas pipelines may not be the energy answer**

(Boston Globe, August 16, 2015) <https://www.bostonglobe.com/opinion/2015/08/16/more-gas-pipelines-may-not-energyanswer/p.Ilnofiu1wtRgWWbMH5NyrO/story.html>

**Winter Reliability Analysis of New England Energy Markets** report, which concluded “Even during extreme winter conditions, new pipeline capacity is not required to meet New England natural gas demand needs given existing infrastructure, current market conditions and policy initiatives.”

Second, regarding the FERC’s obligation to consider better alternatives, please refer to further comments made by Representative Parison during that same scoping meeting which went on to say

*“I know that the Spectra Energy projects would be much less disruptive than the one being proposed to go through the state of New Hampshire because they are proposing to increase capacity within existing*

*pipeline corridors.* “

Third, pertaining to the subject of **environmental impact and safety,**

**Kinder Morgan and its subsidiaries have had an unacceptable safety record with their transmission infrastructure thus far:**

<http://nhpipelineawareness.org/lwp-content/uploads/2014/05/Kinder-Morgan-Accidents.pdf>

**Project reveals 20,000 leaks in Mass. gas lines**

(Boston Globe, August 20, 2015) <https://www.bostonglobe.com/metro/2015/08/20/new-law-casts-light-state-natural-gasleaks/qJJPCjRZITc5aiOJeHNOqO/story.html>

**Methane Leaks in Natural-Gas Supply Chain Far Exceed Estimates. Study Says**

(NY Times, August 19, 2015) [http://www.nytimes.com/2015/08/19/science/methane-leaks-in-natural-gas-supply-chain-far-exceed-estimates-study-says.html?\\_r=1](http://www.nytimes.com/2015/08/19/science/methane-leaks-in-natural-gas-supply-chain-far-exceed-estimates-study-says.html?_r=1)

Last, the residents of New Hampshire do not want to take on the environmental burden or risk associated with this proposed project. After all, this is a pipeline that goes from Massachusetts to Massachusetts. There is no need to put a pipeline through 71 miles of pristine rural setting just because Tennessee Gas Pipeline LLC/Kinder Morgan has an opportunity to “co-locate” next to a utility right-of-way. Why undertake a greenfield project of this magnitude at all when other proposed projects in the ISO queue can achieve the same goals merely by upgrading existing pipeline or repairing leakage within the current natural gas infrastructure?

The voice of opposition to this project is overwhelming. Recent counts indicate only 7 comments on the docket in support of, and 1,967 comments in opposition to this project for the state of New Hampshire.

I formally request that you deny the approval of this project for the reasons outlined above as well as the thousands of additional reasons that have also been submitted to this docket. Thank you for your consideration.

Sincerely,

Matthew Zinicola

## **20150826-5038**

From: Dana L. Atwood  
86 Pelczar Road  
Dracut, MA 01826  
HM: 978-441-9793  
Email: [djatwood31@yahoo.com](mailto:djatwood31@yahoo.com)

To: FERC

Thank you for taking the time to review my input to the Northeast Energy Direct Project.

### **Background**

My wife and I have spent 12 years renovating our house to make it into a beautiful home in which to raise a family, and we have done it with our own two hands working nights and weekends. We now have a 2 year old, and as of July 2015 we have two newborns. The proposed path of the Lynnfield Lateral pipeline is 43ft from our house with a fence 18ft from our house. My family would lose access to the backyard, and direct access to dozens of acres of open space located adjacent to our property. If there is an explosion, my family doesn't stand a chance. If there is a leak, my family's health is at risk from the air we breathe and from the well water we drink. My neighbors face the similar risks, as this pipeline is going directly through a densely populated neighborhood. There are clear alternate routes that Kinder Morgan could have proposed for the Lynnfield lateral rather than to go directly through my neighborhood, affecting the families, the wetlands, and the endangered species in the path. With the rapid proliferation of solar energy, the known excess

capacity of existing pipelines, the known fact that the gas is planned for export, and the known significant negative impact to the ground we stand on, the air we breathe, the water we drink, and the ozone layer that protects the earth, this pipeline is not needed and is not in the best interest of the directly affected residents, the town of Dracut, the state of Massachusetts, or our country.

### **Here are my Key Points**

- **Need for the pipeline:** There are many individuals and groups arguing that there is no need for additional natural gas infrastructure in the Northeastern United States. I can only say that I believe this to be true, as I am constantly seeing more and more homes in Dracut and everywhere else I go with solar panels now on the roof. For my home we have started looking into it as well.
- **Well water:** Many of the homes in the neighborhood have well water, including mine. I have the water tested regularly and it is actually safer to drink than town water. One thing is for certain, the ground water won't get better from all of the digging and blasting to install the pipeline. If there is even a small leak the ground water may become contaminated. I test my water regularly, but some residents never do because they have never had a problem. People could go for years drinking water contaminated by the pipeline without knowing it and develop an illness as a result. In August 2015, it was reported by the gas utilities to the state of Massachusetts (reporting is now required by law) that there are over 20,000 officially documented gas leaks in the state of Massachusetts.
- **Property values:** Aside from the safety issues, this project will destroy the property values for residents that have spent decades going to work every day to earn money to pay their mortgages. For most people, their homes are their single largest investment.
- **Eminent Domain:** It has been clearly stated in the proposal that a portion of this gas will be sold outside of the United States. If this is the case, the pipeline cannot be considered "necessary" for the "public good", and eminent domain cannot be allowed to apply.
- **False Kinder Morgan proposal to FERC:** In Kinder Morgan's latest submission on July 24, 2015, they are using inaccurate maps. There are housing developments missing on the Kinder Morgan maps that were in my neighborhood when I moved to Dracut in 1998. (See satellite image courtesy of Google Maps on following pages). Anyone on earth with access to the Internet has access to maps which are much more accurate than those submitted by Kinder Morgan to the FERC. This is an obvious attempt by Kinder Morgan to deceive the FERC, and thus Kinder Morgan is demonstrating that information provided by them is never to be trusted.
- **Dracut Compression station:** The site Kinder Morgan is proposing for the compression station in Dracut is directly next to a residential neighborhood. This neighborhood is missing for some reason from the Kinder Morgan maps submitted to the FERC. The site is also very close to several organic farms. It is my understanding that the proposed site was selected because it was easy to purchase from the current land owner. Selection of a site must be driven by what is the safest and lowest impact, not what is cheapest and easiest. In the following pages, an alternate site is proposed which is at least located a little further away from homes and closer to an industrial area. Ideally, if the FERC decides to allow Kinder Morgan to move forward with the overall project, they will force Kinder Morgan to find compression station locations which are located far from residential homes and farmland.
- **Dracut Lynnfield Lateral:** The path Kinder Morgan is proposing for the Lynnfield Lateral (Segment N) goes directly through a residential neighborhood, including within a few feet of my home. In the following pages are 2 suggestions for alternate paths, based on compressor station location, that keep the Lynnfield lateral away from the residential area of Pelczar Road, Sesame Street, and Parker Road.

Thank you for your consideration of each of these key points.

Sincerely,  
Dana L. Atwood

**20150826-5041**

**The Trustees**  
200 High Street, 4th Floor  
Boston, MA 02110

August 26, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, 1A  
Washington, DC 20426-0001

**Re: Tennessee Gas Pipeline, LLC. , Northeast Energy Direct Project; Docket No. PF14-22-000 Scoping Comments**

Dear Ms. Bose;

On behalf of The Trustees, thank you for the opportunity to submit the following comments on the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project (NED). The Trustees is the oldest and largest nonprofit land conservation and historic preservation organization in the Commonwealth of Massachusetts, and the nation's first land trust. With the support of our 100,000 members, we preserve, for public use and enjoyment, properties of exceptional scenic, historic, and ecological value in Massachusetts. We care for 113 spectacular and diverse reservations spanning more than 26,000 acres throughout the Commonwealth – from working farms, landscaped and urban gardens, community parks and gardens, to barrier beaches, forests, campgrounds, inns and historic sites, many of which are National Historic Landmarks – located within minutes of every resident.

The Trustees is a directly impacted landowner. The NED project, as currently proposed, crosses The Trustees 3,200 acre Notchview Reservation in Windsor, MA and a 41,000 horsepower compressor station is proposed nearby.

In addition to Notchview Reservation, we are deeply concerned about potential impacts from NED to natural, cultural, and recreational resources across Massachusetts and the climate change impacts of such a significant expansion of fossil fuel infrastructure. This project would entail roughly 100 miles of new pipeline, plus three new compressor stations and ten new meter stations. Roughly 1/4 of the current proposed NED mainline route cuts through public or private conservation land, fragmenting and devaluing the network of public and private conservation land that we, along with citizens, fellow conservation organizations, municipalities, and the Commonwealth of Massachusetts, have worked for decades to protect. It would cut through state forests and wildlife management areas, endangered species habitats, under the Connecticut River and the Wild and Scenic Westfield River, across family farms, and through national scenic trails including the Appalachian Trail.

**PERMITTING REQUIREMENT - DEMONSTRATING NEED**

Massachusetts' need for a new natural gas pipeline has been questioned, a portion of the gas that would run on this line would be for export, and alternatives to meet local needs have not been fully explored. Demonstrating need is a critical step in federal approval of natural gas pipelines. NED has an estimated capacity, according to Tennessee Gas Pipeline (TGP), of 1.3 billion to 2.2 billion cubic feet of natural gas per day. At this time, TGP has contracts to ship roughly 550 million cubic feet per day, which is significantly less than capacity. A recent study by London Economics International, commissioned by the Maine Public Utilities Commission, found that the benefit to consumers from NED or other projects would not outweigh costs.<sup>1</sup>

There are a number of natural gas pipeline proposals in Massachusetts, including the TGP Connecticut Expansion Project (Docket No. CP14-529-000). The Massachusetts Attorney General has called for a regional

gas capacity study to evaluate the need for additional gas capacity and how new natural gas capacity would affect our ability to meet mandatory greenhouse gas reduction goals put in place through the 2008 Massachusetts Global Warming Solutions Act (GWSA, Chapter 298 of the Acts of 2008). This study will “examine options to address electricity reliability needs in New England region through 2030, evaluate costs and benefits of all available energy resource options” and is to be completed by October, 2015<sup>2</sup>. The Attorney General’s study will also investigate other ways to meet energy needs, including energy efficiency and renewable energy generation as well as updating existing infrastructure.

### **CONSIDERING CLIMATE CHANGE IMPACTS**

Climate change is a recognized threat to public safety and the environment, and it is incumbent upon this generation to act. The Massachusetts GWSA established a framework for reducing heat-trapping emissions to levels that scientists believe provide a decent chance of avoiding the worst effects of global warming. Natural gas is in large part methane. Although the combustion of natural gas causes significantly less greenhouse gas emissions than the combustion of coal or oil, methane itself is a much more potent greenhouse gas and leaks in Massachusetts are well documented<sup>3</sup>. A recent report documented 20,000 natural gas leaks from our aging pipes in Massachusetts alone, many over 20 years old<sup>4</sup>. A study by researchers at Purdue and Cornell Universities showed that leaks in the natural gas supply chain are significantly greater than originally estimated<sup>5</sup>. The Environmental Protection Agency has recognized this threat and has proposed new rules to reduce these leaks in the natural gas supply chain. The Federal Council on Environmental Quality has issued draft guidelines for National Environmental Policy Act review that require that potential greenhouse gas emissions and climate change impacts of projects be evaluated<sup>6</sup>.

Massachusetts has been a leader in state efforts to address greenhouse gas emissions, including the GWSA, participation in the Regional Greenhouse Gas Initiative and according to the American Council for an Energy-Efficient Economy, leading the nation on energy efficiency efforts<sup>7</sup>. We don’t want to go backwards. In addition to direct natural resource impact concerns, discussed further below, The Trustees as an organization rooted in land conservation does not believe that a significant expansion of natural gas/fossil fuel infrastructure and subsequent growth in greenhouse gas emissions is in the best interest or public benefit of the Commonwealth.

### **HISTORY AND VALUE OF LAND CONSERVATION**

Massachusetts has a long history of intentional land conservation, and sophisticated environmental analysis tools available. A 2013 report on The Return on Investment in Parks and Open Space in Massachusetts found that every dollar invested in land conservation returned \$4 in natural goods and services to the Massachusetts economy, including clean air and water, recreation and tourism, and fish and wildlife habitat.<sup>8</sup> The Massachusetts Supreme Judicial Court has also recognized that lands held in conservation use by charitable trusts support a wide range of public benefits.<sup>9</sup>

Significant state and federal funds have been used to protect many of the parcels that would be impacted by NED, and state and federal tax law in the form of deductions and credits is also significant.

### **IMPACT TO THE PUBLIC TRUST AND PUBLICLY OWNED AND PROTECTED OPEN SPACE**

More than one hundred parcels of “permanently protected” lands conserved by public and private entities, many held in public trust by charitable land trusts, will be impacted by this project. At least 85 of these parcels are constitutionally protected by Article 97 of the Massachusetts Constitution<sup>10</sup> and the use of such parcels for a natural gas pipeline are subject to the requirement of a 2/3 roll-call vote of the Massachusetts legislature.

Article 97 states that:

“The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose.”

Natural gas pipelines and their accessory facilities, including compressor stations, impact all of the values articulated in Article 97. The pipelines themselves impact clean air and water, and natural, scenic, historic, and esthetic qualities. The lights, noise, and fumes associated with compressor stations further impacts these resources. And, a pipeline built across public protected lands reduces the public's ability to utilize the agricultural, mineral, forest, water, air and other resources that are declared a public purpose when consistent with the intent and values for which a parcel was protected.

I also note that there is donor intent, conservation and agricultural preservation restrictions, deed restrictions, and in Massachusetts M.G.L. c. 61A tax status to be considered on a parcel by parcel basis and that significant donor and public trust is the foundation of every land conservation project.

Specifically, The Trustees has yet to receive any communication from TGP in regards to a parcel adjacent to our Notchview Reservation upon which we hold a Conservation Restriction, which suggests that TGP is not researching Restrictions associated with parcels. We have sent notice to TGP and have yet to hear a response. This practice may be resulting in violation of Restrictions on the many restricted parcels in the pipeline path.

### **AVOIDING IMPACT**

The tools that guide land conservation can also be used by TGP and FERC to guide analysis of protected open space and to avoid, minimize, and mitigate impacts. BioMap2, by the Division of Fisheries & Wildlife Natural Heritage & Endangered Species Program, "guides strategic biodiversity conservation in Massachusetts over the next decade by focusing land protection and stewardship on the areas that are most critical for ensuring the long-term persistence of rare and other native species and their habitats, exemplary natural communities, and a diversity of ecosystems."<sup>11</sup>

Rare species and their habitats are protected under the Massachusetts Endangered Species Act (M.G.L. c. 131A), and their habitats are identified in the Natural Heritage & Endangered Species Priority Habitat maps<sup>12</sup>.

Massachusetts has identified Forest Reserves<sup>13</sup>, areas of state owned lands where timber harvesting isn't allowed in order to capture certain elements of biodiversity, and Areas of Critical Environmental Concern which are places in Massachusetts that receive special recognition because of the quality, uniqueness and significance of their natural and cultural resources<sup>14</sup>. These areas should be considered.

Building on the available conservation data sets, the University of Massachusetts analyzed NED and its potential impacts to habitat values in "A Natural Resources Assessment of the Tennessee Gas Pipeline Company's Proposed Northeast Energy Direct Project's Pipeline Route within Massachusetts".<sup>15</sup> This study provides specific analysis of impacts to BioMap Core Habitats and other natural resources values. This analysis technique, called CAPS, or the Conservation Assessment and Prioritization System, "is an ecosystem-based (coarse-filter) approach for assessing the ecological integrity of lands and waters and subsequently identifying and prioritizing land for habitat and biodiversity conservation. We define ecological integrity as the ability of an area to support biodiversity and the ecosystem processes necessary to sustain biodiversity over the long term."<sup>16</sup> This tool can be used to further assess this project, impacts to natural resources, and if this project is deemed necessary any future route changes.

### **IMPACTS TO THE TRUSTEES NOTCHVIEW RESERVATION**

Notchview is over 3,200 acres of rolling hills and high elevation spruce/fir forest in the Hoosac Range, with wildlife habitat, scenic vistas, and Nordic ski and hiking trails. Each year, roughly 12,000 Nordic skiers visit Notchview, and many hikers and walkers visit during rest of the year. During the winter, we hold a Ski Fest, high school races, the high school state championship, a Bill Koch league youth program, moonlight skiing, and master's races. Off season, we also host bird and nature walks and volunteer trails days. It is a destination for star gazing, as its elevation and lack of light pollution make it an ideal spot. We host roughly six star gazing events each season, with up to 30 people attending each time and attendance has been on the upswing.

As I noted earlier, in addition to the pipeline itself a 41,000 horsepower compressor station is proposed nearby to Notchview Reservation. This would be one of the largest compressor stations in the North East. These are loud, well-lit industrial facilities that are not at all consistent with the character of the town of Windsor and would very likely have a direct impact on the quality of experience and visitation to our Reservation.

Notchview is part of a greater complex of protected open space, including Massachusetts Department of Fish & Game Wildlife Management Areas, Massachusetts Department of Conservation & Recreation State Forest, and private land protected by conservation and agricultural preservation restrictions as well as municipal watershed protection lands.

### **IMPACTS TO WILD AND SCENIC WESTFIELD RIVER**

Notchview Reservation abuts the Westfield River, a National Wild and Scenic River. The Trustees is a cooperating organization on the Westfield River Wild and Scenic Committee. The Westfield River is an ecological, cultural, and scenic gem. It is one of the best cold water fisheries in the Commonwealth, a whitewater canoe and kayak resource, has the historic Keystone Arch Bridges (ca. 1840) and Glendale Falls – one of the highest waterfalls in the state, historic river-side villages and colonial era archaeological remains, unique geological features like the Windsor Jambes and the Chesterfield Gorge, is critical habitat for a host of species, provides clean drinking water, and is set in one of the largest roadless wilderness areas in Massachusetts. The animals that call the Westfield River home rely on the clean, clear water of the river.

There is a tremendous lack of information thus far provided by TGP on how the pipeline construction, including horizontal drilling under the river and related sediment removal, would avoid impact to all of these resources. Where the pipeline is currently slated to cross the river is quite steep and construction conditions very complex. Additionally, where the compressor station is sited would require clear-cutting of the area around a headwater stream to the Westfield. In addition to erosion concerns from construction, pipeline failure would likely mean significant pollution on this pristine river. I also note that the Westfield Wild and Scenic Committee, through the National Park Service, has a role in the federal assessment of this project.

### **REQUEST TO FERC**

We request that the following be considered in the Draft Environmental Impact Statement.

- When assessing need, consider the forthcoming Massachusetts Attorney General study referenced above, as well as the amount of contracted gas on the TGP NED line and the amount slated for export.
- When assessing climate change impacts, consider the GWSA and federal requirements to evaluate climate change impacts of project, and include the recent assessment of gas leaks in Massachusetts referenced above as part of this assessment.
- If NED proceeds to the next step in the process, when assessing and assuring avoidance or minimum impact on the environment, that
  - o environmental, including local wetlands, and climate change laws are upheld;
  - o surveys for state-listed rare species be conducted by experts and that they happen during the appropriate time of year, when species are most likely to be found;
  - o that conservation and agricultural preservation restrictions, as well as deed restrictions, be identified and followed for each parcel;
  - o protections to public conservation land afforded by Article 97 of the Massachusetts Constitution are upheld and that a 2/3 roll call vote is required;
  - o impacts to natural resources are avoided when can not be fully mitigated;
  - o analysis recognizes that impacts extend beyond the footprint of development, and may include habitat fragmentation, creation of invasive species corridors, sound and light pollution – both from pipeline construction and operation of compressor stations, air quality impacts, wetland degradation, and potentially far reaching impacts to drinking water supplies;

- and further, that sound and light pollution from compressor stations be fully mitigated to current site-specific existing ambient sound and light levels, to the maximum extent practicable;
  - o right of way management protocols are thorough and effective, with meaningful monitoring requirements, building on the understanding that
- invasive species migration into utility corridors and their negative impacts on native species and natural communities are well documented and best management practices from both the federal government and the Massachusetts Natural Heritage & Endangered Species Program are available<sup>17</sup>.
- That the full value of impacted conservation land is considered, recognizing that
  - o significant public dollars go into identifying, purchasing, and stewarding conservation land and that those costs be identified when considering value;
  - o the value of conservation land is greater than the acreage value, both in ecosystem services and in recreation dollars into local economies;
  - o local, state and federal tax law supports land conservation, and that those benefits be included in calculations;
  - o and that all of the above be considered when assessing likely extent of eminent domain, as well as percentage of natural gas meant for Massachusetts markets verses for export. Eminent domain is meant only to be used when there is clear public benefit.
- For public safety, as an organization that hosts 12,000 or more people each year at our Notchview Reservation we are concerned about the safety of the public both from construction and blasting, pipeline failure, and from potential issues at the proposed nearby compressor station.
  - o How does TGP plan to address these concerns, and how do they plan to address potential pipeline failure or compressor station failure from a public safety perspective?
- On tourism and as a major driver of local tourism in Windsor, what is the baseline data for tourism and recreation? How does TGP plan to avoid or mitigate impacts to regional tourism, both at our Notchview Reservation and at the state parks and forests, as well as privately protected recreational and conservation sites?

There are many issues to be considered with a project of this complexity and scope, but the overarching questions of need, public benefit, and the public trust inherent in conservation land are significant and must be answered. Thank you for your consideration.

Sincerely,

Barbara Erickson  
 President and CEO  
 The Trustees

Richard P Murray, Nassau, NY.

Dear FERC -

I request that when YOU do the noise study for the compressor station located on Clarks Chapel Road in teh Town of Nassau, NY, would you please take the ambient noise level readings at locations where excess noise will make the most impact. For example, taking it along the road or at an intersection will give you an idea that this is a suburban or city like area and not a rural one. You should take it in our back yard (within the 1/2 mile FERC boundary) at all times of the day and night.

Also, please contact the manufacturers of the compressors to get more accurate anticipated noise levels from these turbines. We live uphill of the proposed station and with only vegetation between us and the station, we will hear it 24/7. Right now, at night we do not hear anything. Anything mechanical that is. We hear the wind in the trees, owls, peepers, etc. During the day, we hear excavation equipment working in the gravel pit where the station is proposed; as well as us and our neighbors mowing our grass.

YOU, as the lead agency, must ensure that a correct and detailed noise analysis is performed. Not one influenced by the applicant.

Thank you.

Richard Murray

**20150826-5044**

Richard P Murray, Nassau, NY.

Dear FERC -

I am very concerned that the applicant, Kinder Morgan dba Tennessee Gas Pipeline Company will provide you with a skewed needs analysis in order to justify them installing about 400 miles of gas pipeline. You should have this done by your own staff or you own consultant, and NOT rely on any data supplied by Kinder Morgan.

Thank you.

Richard Murray

**20150826-5045**

Rita Jaros, Shelburne Falls, MA.

During a handful of days each winter, generators in New England who have not contracted for firm pipeline capacity may be forced to sit idle. Local distribution companies that do commit to firm supply to heat people's homes get their gas first. By waiting until the last minute, power generators may be forced to buy gas on the spot market, where competition can be fierce, or sit it out.

Electricity price spikes in winter have much more to do with market practice than pipeline constraints, especially given that the same winter price spikes have been observed in parts of the United States where supply and access to natural gas is abundant, like Pennsylvania.

Add up all of the gas required to get through these so called "peak-shaving" intervals during the course of one winter and it is estimated to total on the order of 5-10 Bcf, or about 1 percent of the region's annual demand — roughly the equivalent of one or two LNG tankers.

Note! The March 2015 ISO-NE Monthly Market Operations Report showed that this winter, electricity costs were about 30 percent less than last, despite suffering the most severe winter in 80 years. This thanks to availability of peak-shaving LNG. In 2014, ISO New England actually prohibited LNG from participating in its Winter Reliability Program out of concern for sending the "wrong signal" about the scarcity of natural gas. Electricity prices soared when it could have been prevented. In hindsight, this action bears the unmistakable appearance of market manipulation with the aim of propping up the weak case for pipeline expansion.

For the businessman looking to export natural gas to global markets, the Northeast Energy Direct pipeline, sized to deliver up to 800 billion cubic feet of gas each year, looks like the perfect solution to the 10 Bcf peak-shaving problem. However, to the Massachusetts and New Hampshire homeowners whose lives are about to be turned upside-down due to a forcible land taking via eminent domain, it is unconscionable. The sword dangling over the heads of the working families, farmers and landowners directly in the path demands that we ask, "Is there another way?"

Yes! Energy efficiency, demand response, recovery of gas lost to leaks, distributed generation and commercially available storage technology all combine to refute the specious case for need of this pipeline. Federal Energy Regulatory Commission, your job is not to "put steel in the ground" as FERC Chairman Cheryl LaFleur quipped at an Energy Roundtable held in Boston last October. Your job is to regulate! Confirm what the numbers clearly show — the case for need is not made.

The export plan of a wealthy Texan is no justification to impose eminent domain on our working families. China may need this gas. But the New England property owners that will bear the burden surely do not.

August 25, 2015

Re: Tennessee Gas Pipeline Company, LLC  
Docket No. Pf14-22-000  
Northeast Energy Direct Project

Secretary Bose:

I am writing complain about the quality of the maps issued by Kinder Morgan/Tennessee Gas Pipeline Company LLC most recently on July 24, 2015. I am referring specifically to the three maps of Winchester, New Hampshire in Cheshire County.

Referring to the first page, which is an overview and shows how page one and page two intersect, it is an inaccurate map. I just could not make page one and page two overlap as shown on the overview. Finally I got out scissors and tape, enlarged the map, and taped the sections together.

Since I cannot include a picture in my text-only comment, I ask you to try and fit pages one and two together yourselves. You will find that there is not enough overlap to show the extreme southeast portion of the preferred route through Winchester. This area includes a curve in the pipeline route that increases difficulty in determining what properties are affected.

Upon close comparison of the most recent maps and the first Winchester map issued by Kinder Morgan, one can see that the company merely re-issued their original map, adding the second route (now the preferred route) without checking to make sure that all of the route would be shown on map. And in addition, Kinder Morgan removed property lines which had been on the first map. The result is Winchester has received an inferior map which is missing information vital to its citizens.

How is it that a company with millions of dollars in assets and thousands of employees who are experts in their fields was unable to issue an accurate map? Yet an amateur internet surfer, with a few simple tools was able to create such a map, albeit without the pipeline.

I respectfully request that FERC require Kinder Morgan/Tennessee Gas Pipeline to immediately reissue all the maps that were published on July 24, 2015. I would also ask that the reissued maps include property lines and show the entire pipeline route.

Please look into why property lines were removed. With property lines deleted, it is more difficult for residents to identify how the pipeline affects them. This appears to be a deliberate effort by the company to under inform affected property owners. This is deceptive business practice and reflects upon the integrity of Kinder Morgan/Tennessee Gas Pipeline.

**MY SECOND MAP ISSUE:**

In June 2015, I attended an informational meeting held By Kinder Morgan at Winchester, New Hampshire Town Hall. During that meeting, a question about siting the pipeline was posed to the Kinder Morgan representatives. The question asked was about an alternative pipeline route, but it involved placing the pipeline on ae side hill.

The Kinder Morgan representative explained quite clearly why this was not possible. He stated that gravitational forces exerted on a structure placed horizontally on the side of the hill would be disastrous for a gas

pipeline, causing it to move down the hillside. We were told that any pipeline would have to go directly up and over a steep grade.

On the new maps issued by Kinder Morgan on July 24, 2015, the Winchester, New Hampshire preferred route now is located in exactly the place we were told would be disastrous. I refer to the section that runs parallel to and east of Scotland Road in Winchester. Please refer to the map of the Mount Grace Quadrangle, Massachusetts-New Hampshire, 7.5-Minute Series prepared by the U.S. Department of the Interior, U.S. Geological Survey in 2015.

As you can easily see, this area is a steep slope. I have personally been on a driveway cut into this slope. The soil there is sand mixed with liberal amounts of rounded rocks varying from a small potato to a car in size. When this hill is impacted by torrential rains, deep gullies are cut, loosening rocks and boulders. I have no professional training in geology or engineering, but it's easy to see this is not a spot where any large structure should be placed perpendicular to the slope.

As I see if there are two possibilities. The engineers at Kinder Morgan are drawing random lines on maps without checking anything. The second is that they are unable to read topographical maps. Either conclusion is appalling.

I would ask that FERC please look into the education and competence of the engineers employed by Kinder Morgan/Tennessee Gas Pipeline.

I would also ask that FERC determine the person(s) responsible for hiring these engineers and determine their education and expertise, as I would consider them incompetent as well.

I would also request FERC require Kinder Morgan to pay for an independent company to review the siting of this pipeline, paying special attention to safety issues.

How can pipeline failure be avoided if this is the level of professionalism exhibited by Kinder Morgan?  
How can we trust them to build a safe pipeline through our community?

Sincerely,

Susan L Durling  
Harrisville New Hampshire

**20150826-5068**

*{xx pages}* skip to end of 20150826-5068

To: Federal Energy Regulatory Commission (FERC)

Filing Party: Troy Conservation Commission, Troy, NH

Docket: PF 14-22-000 (Applicant - Tennessee Gas Pipeline Company, L.L.c.) Date: August 2015

The Troy Conservation Commission (Troy NH) requests that FERC address the following comments when preparing an Environmental Impact Statement regarding the Northeast Energy Direct Project proposed by Tennessee Gas Pipeline Company and I or Kinder Morgan (Docket PF:14-22-000).

**Subject: Vegetation (Riparian) - Comment Number TCC001**

Please identify the potential negative environmental impacts of related pipeline construction activities on riparian vegetation and identify how the impacts would be minimized during pipeline construction.

**Subject: Drinking Water (Wells) - Comment Number TCC002**

Please identify all drinking water wells and springs within 150 feet of right-of way including extra work areas, access roads, or staging areas, identify the potential negative environmental impacts of related pipeline construction activities on the wells and identify how the impacts would be minimized during pipeline construction.

**Subject: Groundwater (Blasting) - Comment Number TCC003**

Please identify the potential negative environmental impacts of related pipeline construction activities on groundwater and look into methods used to mitigate and minimize impact on groundwater in regards to blasting and how groundwater quality will be monitored before and after construction.

**Subject: Drinking Water (Wells) - Comment Number TCC004**

Please identify the potential negative environmental impacts of related pipeline construction activities on private, residential wells and investigate how, in the event of damage, restoration, repair or replacement of wells is undertaken.

**Subject: Groundwater (Testing) - Comment Number TCC005**

Please look into any large quantities of groundwater to be withdrawn for hydrostatic testing along with a detailed groundwater resource and drawdown analysis and a detailed wastewater disposal method.

**Subject: Groundwater (General) - Comment Number TCC006**

Please study existing groundwater resources in the project area and identify the potential negative environmental impacts of related pipeline construction and operational activities on groundwater.

**Subject: Drinking Water (Aquifer) - Comment Number TCC007**

Please describe the type, depth, current and projected uses, average yield, known contamination problems, and water quality of each aquifer underlying the project area and identify the potential negative environmental impacts of related pipeline construction and operational activities on each aquifer.

**Subject: Groundwater (Springs) - Comment Number TCC008**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on any and all springs within 150 feet of proposed construction site.

**Subject: Surface Water (Water Quality) - Comment Number TCC009**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on any and all perennial surface water bodies crossed by the proposed project and their water quality classification.

**Subject: Wetlands (General) - Comment Number TCC010**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on watershed areas, designated surface water protection areas, and sensitive water bodies crossed by the proposed project and the total acreage and acreage of each wetland type that would be affected by construction.

**Subject: Construction (Wetlands) - Comment Number TCC011**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on wetlands and describe construction and restoration methods proposed for crossing wetlands.

**Subject: Groundwater (Mitigation) - Comment Number TCC012**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on groundwater resources and proposed mitigation for impacts on groundwater resources.

**Subject: Blasting (Wells) - Comment Number TCC013**

Please identify the potential negative environmental impacts of related blasting activities on water wells, springs, and wetlands, and associated mitigation.

**Subject: Construction (Water Quality) - Comment Number TCC014**

Please identify all sources of hydrostatic test water, the quantity of water required, methods for withdrawal, and treatment of discharge and any waste products generated, the associated potential negative environmental impacts of related pipeline construction and operational activities on those concerns.

**Subject: Drinking Water (Mitigation) - Comment Number TCC015**

Please investigate mitigation measures to be used to ensure private water supplies are returned to previous capacity in the event damage results from construction and operation.

**Subject: Wetlands (Water Quality) - Comment Number TCC016**

Please study the measures used to compensate for permanent wetland losses due to pipeline construction and operation. Please look into the quality of discharge water resulting from contact with a pipeline and chemicals used in the pipeline and provide information regarding waste products and disposal methods.

**Subject: Vernal Pools (General) - Comment Number TCC017**

Please identify all vernal pools within 150 yards of all pipeline segments, work area, or staging area associated with pipeline construction and operation, and specify how the vernal pool habitat will be avoided in each instance.

**Subject: Hazardous Materials Management {Construction} - Comment Number TCC018**

Please identify all protocols regarding the inadvertent release of drilling fluid into local aquifers and the type of mitigation required.

**Subject: Wetlands (General) - Comment Number TCC019**

Please investigate all impacts to and provide plans for remediation for all wetlands within 100 yards of all pipeline segments, work area, or staging area associated with pipeline construction and operation including field-verified wetland delineations before the completion of the EIS in order to fully understand the real wetland impact.

**Subject: Hazardous Materials Management (Construction) - Comment Number TCC020**

Please look into the potential negative environmental impacts of related pipeline construction activities on the inadvertent release of drilling mud into surface water, how this would be contained and procedures used to clean up releases.

**Subject: Drinking Water (Water Quality) - Comment Number TCC021**

Please look into the effects of pipeline construction and operation on private artesian wells in southwest NH and conduct preliminary testing including arsenic and radon to have a baseline of information in case future problems/contaminants should arise.

**Subject: Hazardous Materials Management (Staging) - Comment Number TCC022**

Please investigate how fuels, lubricants, and explosives will be stored during construction as well as disposal of construction waste, dredge spoil, and hazardous chemicals and identify the related potential negative environmental impacts of related pipeline construction activities.

**Subject: Staging (Flora and Fauna) - Comment Number TCC023**

Please look into the size and location of pipeline staging areas and its impact on local flora and fauna in southwest NH.

**Subject: Blasting (Drill Holes) - Comment Number TCC024**

Please identify the potential negative environmental impacts of related pipeline construction activities on abandoned drill holes, what materials would be used and how these would be sealed if necessary.

**Subject: Hazardous Materials Management (Blasting) - Comment Number TCC025**

Please identify the potential negative environmental impacts of related pipeline construction activities, specifically drilling, blasting and digging through of soils contaminated with toxic chemicals and provide a description of the type of contamination along with site specific sampling and analysis.

**Subject: Parks (General) - Comment Number TCC026**

Please investigate the effects of a pipeline construction and operation on the aesthetic value and natural/wild setting in Rhododendron State Park and other parks and / or recreational areas.

**Subject: Flora and Fauna (General) - Comment Number TCC027**

Please investigate the long term effects of a pipeline construction and operation on local flora and fauna in southwest NH.

**Subject: Historical Preservation (Homes) - Comment Number TCC028**

Please look into the effects of pipeline construction and operation on historic homes that are located near utility corridors and right-of-ways in southwest NH.

**Subject: Parks (General) - Comment Number TCC029**

Please look into the effects of pipeline construction and operation on the ecological integrity of Rhododendron State Park.

**Subject: Erosion (Maintenance) - Comment Number TCC030**

Please investigate long term erosion control methods on pipeline corridors especially on steep slopes in areas where there is an increased use by ATV's/dirt bike and off road vehicles.

**Subject: Risk Management (General) - Comment Number TCC031**

Please identify how FERC and Kinder Morgan will address unknown and unforeseeable impacts of the proposed pipeline construction and operation and identify, in general, the types of impacts of potential concern.

**Subject: Wetlands (Construction) - Comment Number TCC032**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on forested wetlands and identify the measures used to restore forested wetlands following construction.

**Subject: Roads (Construction) - Comment Number TCC033**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on crossing state and local roads and describe the methods used for crossing state and local roads. If roads would be open cut describe the duration of construction and how access would be maintained along the road.

**Subject: Risk Management (Accidents) - Comment Number TCC034**

Please determine the potential impact radius for 73 miles of NED Pipeline.

**Subject: Superfund Sites (Accidents) - Comment Number TCC035**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on hazardous waste sites, landfills and / or Superfund sites. For example, adjacent to the Troy NH Superfund site is an 8-acre landfill full of mill waste, fabric scraps, filters, die cutters and other solid waste. Much of this is considered to have flammable potential in case of a fire. Please determine the impact of a pipeline explosion, rupture and leak - all three scenarios -- on the Troy Superfund site, the adjacent landfill and all related water resources.

**Subject: Superfund Sites (Accidents) - Comment Number TCC036**

Please study what protocols are necessary and what studies exist regarding how to handle a pipeline explosion or incident affecting the integrity of hazardous waste sites, landfills and / or Superfund sites and subsequent safety impacts on residents and first responders.

**Subject: Superfund Sites (General) - Comment Number TCC037**

Please study and analyze what data exists regarding natural gas pipelines and hazardous waste sites, landfills and / or Superfund sites, particularly ones within a few hundred feet of one another.

**Subject: Emergency Response (Accidents) - Comment Number TCC038**

Please identify and describe Kinder Morgan's pipeline accident protocols on all levels.

**Subject: Emergency Response (Accidents) - Comment Number TCC039**

Please study what has been Kinder Morgan's response to pipeline accidents, explosions, ruptures, leaks. Their record of pipeline accidents, explosions, ruptures, leaks is readily available. In determining the potential impacts of pipeline accidents, explosions, ruptures, leaks, please assume that the response by Kinder Morgan and / or local emergency responders would be inadequate and / or would increase the resultant magnitude of the event.

**Subject: Emergency Response (Accidents) - Comment Number TCC040**

Please determine how Kinder Morgan and small towns and rural areas have dealt with previous Kinder Morgan Pipeline incidents. Identify the required and recommended local/municipal emergency responder planning, initial training and retraining programs. Identify the required and recommended emergency response equipment that should be provided by local/municipal emergency response agencies. Estimate the initial cost, operational cost and total cost throughout the expected life of the pipeline to each municipality in NH, including municipalities that would provide mutual support, that would be expected to provide emergency response in the event of a pipeline accident. Identify the available funding sources that would compensate municipalities for emergency response training, planning and equipment, throughout the life of the pipeline.

**Subject: Water Quality (Parks) - Comment Number TCC041**

Kinder Morgan wants to put its pipeline through Rhododendron State Park and other parks and / or recreational areas, affecting the three towns of Troy, Fitzwilliam and Richmond, which include the park in their town areas. Please determine the pipeline's impact on the various water sources in such locations.

**Subject: Vegetation (Parks) - Comment Number TCC042**

Please determine the pipeline's impact on all vegetation and forests in Rhododendron State Park.

**Subject: Endangered Species (Parks) - Comment Number TCC043**

Please determine the pipeline's impact on all threatened or endangered species in Rhododendron State Park.

**Subject: Staging (Temporary) - Comment Number TCC044**

Please identify specific usage plans Kinder Morgan has for an 8.26 acre Contractor Yard site in Troy, NH and identify what criteria were used in its selection.

**Subject: Staging (Temporary) - Comment Number TCC045**

Please determine how long a Contractor Yard site in Troy NH and / or other municipalities will be an Additional Temporary Work Space (ATWS).

**Subject: Staging (Temporary) - Comment Number TCC046**

Please identify Kinder Morgan's Spill Prevention and Response Plan for Contractor Yards in an Additional Temporary Work Space

**Subject: Hazardous Materials Management (Temporary) - Comment Number TCC047**

Please identify the chemicals, explosives and related building and construction materials Kinder Morgan will house in each Additional Temporary Work Space.

**Subject: Drilling (Horizontal) - Comment Number TCC048**

Please determine whether Kinder Morgan's Horizontal Directional Drilling Contingency Plan has been empirically tested and the plan's results for addressing potential impacts associated with an inadvertent release of drilling fluid through hydraulically induced cracks during the HDD process.

**Subject: Invasive Species (General) - Comment Number TCC049**

Please provide current data (not more than three years old) in the EIS for invasive species and vulnerable and threatened species in Troy NH and other impacted municipalities.

**Subject: Risk Management (Blasting) - Comment Number TCC050**

Please determine if Kinder Morgan's Blasting Management Plan has actually been used and what the results were.

**Subject: Risk Management (Blasting) - Comment Number TCC051**

Please identify if the procedures and safety measures of Kinder Morgan's Blasting Management Plan has been used in harsh winter climate with frozen ground of several feet and what the results were.

**Subject: Fish and Wildlife (General) - Comment Number TCC052**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on federally listed essential fish habitat.

**Subject: Biological Resources (General) - Comment Number TCC053**

Please describe any significant biological resources that would be affected by the proposed pipeline construction and operation and describe impacts and any mitigation proposed to avoid or minimize that impact.

**Subject: Fish and Wildlife (General) - Comment Number TCC054**

In the EIS, please provide copies of all correspondence from federal and state fish and wildlife agencies (along with responses to their recommendations to avoid or limit impact on wildlife, fisheries, and vegetation) to elected officials in affected towns.

**Subject: Fish and Wildlife (General) - Comment Number TCC055**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on significant wildlife habitats crossed by the proposed pipeline (73 miles) and identify the length and width of crossing at each significant habitat.

**Subject: Construction (General) - Comment Number TCC056**

Please look into how topographic maps will be provided for each affected town in NH showing clearly and accurately all pipeline segments, aboveground facilities, pipe storage yards, extra work/staging areas, contractor yards, and access roads.

**Subject: Wetlands (Staging) - Comment Number TCC057**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities associated with typical staging area requirements at waterbody and wetland crossings.

**Subject: Wetlands (General) - Comment Number TCC058**

Please provide information concerning the total acreage of wetlands that would be temporarily affected, and the total acreage of wetlands that would be permanently affected by the proposed pipeline.

**Subject: Wetlands (Blasting) - Comment Number TCC059**

Please describe the potential for blasting to affect wetlands and measures to be taken to detect and remedy such effects.

**Subject: Wetlands (Restoration) - Comment Number TCC060**

Please identify the potential negative environmental impacts of related pipeline construction and operational activities on forested wetlands and look into how restoration plans for forested wetlands would take place including the planting of wetland trees or shrubs, post-construction monitoring, and the development and application of criteria to determine restoration success.

**Subject: Wetlands (Mitigation) - Comment Number TCC061**

Please describe in detail any proposals to compensate for permanent wetland losses and include criteria to determine mitigation success.

**Subject: Invasive Species (Management) - Comment Number TCC062**

Please look into the long term effectiveness of the invasive species management plan for the proposed pipeline and identify the success rates of keeping invasive species off pipeline corridors in other regions.

**Subject: Soil Protection {Management} - Comment Number TCC063**

Please look into the Best Management Practices for soil protection and subsoil decompaction mitigation for the proposed pipeline construction and identify how effective these measures have been in other areas similar to the proposed pipeline route.

**Subject: Construction (Winter) - Comment Number TCC064**

Please look into the specific types of construction techniques and material handling during winter months for pipeline construction and operation in NH. Consider the potential impact if the pipeline was not buried below the frost line. Consider the long term effects of freezing and thawing of soil surrounding buried pipelines. Identify the kinds of ramifications poor construction practices, including wintertime construction problems, might have on the structural integrity of the pipeline.

**Subject: Wetlands (Construction) - Comment Number TCC065**

Please look into any special permits that may be needed for construction within wetlands and special permit conditions for the proposed pipeline project.

**Subject: Wetlands (General) - Comment Number TCC066**

Please provide an assessment of any cumulative effects on wetlands as a result of the proposed pipeline project.

**Subject: Fish and Wildlife (General) - Comment Number TCC067**

Please provide a classification of the type of fisheries for each waterbody that would be crossed, including fisheries of special concern and associated significant habitat.

**Subject: Fish and Wildlife (General) - Comment Number TCC068**

Please study terrestrial and wetland wildlife and habitats that would be affected by the proposed pipeline project.

**Subject: Vegetation (General) - Comment Number TCC069**

Please study the major vegetative cover types that would be crossed and provide the acreage of each vegetative cover type that would be affected by the proposed pipeline project and include unique species and species of special concern.

**Subject: Endangered Species (General) - Comment Number TCC070**

Please identify all federally listed or proposed endangered or threatened species or species of special concern that potentially occur in the vicinity of the proposed pipeline project.

**Subject: Risk Management (Accidents) - Comment Number TCC071**

Please do a statistical analysis of the potential environmental and human health risks in NH of pipeline construction and operations. Consider previous Kinder Morgan safety violations.

**Subject: Economics (General) - Comment Number TCC072**

Please do an economic study which weighs the cost of the project in terms of value of property to be taken, potential health costs based on known health issues that could be attributed to other pipeline projects in the U.S., the loss of property values in the areas affected by the pipeline project, and the loss of tax revenue to all affected towns due to decreased property values, versus the suggested savings that energy rate payers are supposed to expect when gas becomes available to NH through NED.

**Subject: Staging (Security) - Comment Number TCC073**

Please identify and describe what security measures Kinder Morgan will have in place at Contractor Yards and / or Additional Temporary Work Spaces, including ones in Troy or municipalities adjacent to Troy NH, regarding storage and accessibility of chemicals, explosives and other equipment.

**Subject: Staging (Security) - Comment Number TCC074**

Please identify and describe the specific monitoring process Kinder Morgan will use in its security measures at Contractor Yards and / or Additional Temporary Work Spaces, including ones in Troy or municipalities adjacent to Troy NH.

**Subject: Superfund Sites (Design) - Comment Number TCC075**

Please identify why Kinder Morgan changed its third NED proposal to now locate its pipeline within 110-feet of the Troy Superfund Site.

**Subject: Construction (Blasting) - Comment Number TCC076**

Please describe what measures would be taken to rectify any damage to wells, springs, wetlands, and structures caused by blasting during the NED project in South Western NH.

**Subject: Archeology (General) - Comment Number TCC077**

Please provide a copy of the “detailed archeological reconnaissance of the proposed Project area” (4.6) that Tennessee Gas Pipeline says it has conducted specifically regarding Troy, N.H.

**Subject: Cultural Resources (Residential) - Comment Number TCC078**

Please specify and identify what Kinder Morgan’s plan is to protect the cultural resources per their self-identified ground-disturbing, blasting, drilling, and excavation activities on identified cultural resources, including the Green Farm on South Street in Troy NH, which was built in the mid-1700s, still has most of the original construction and features and the Owner is listed as an impacted landowner.

**Subject: Drinking Water (Design) - Comment Number TCC079**

Please get specific numbers, locations and details to answer the current information blanks on chart 5.5-2 regarding wells and water supplies located within 200-feet of the construction site in Troy NH and other municipalities.

**Subject: Staging (Locations) - Comment Number TCC080**

Please specify and describe the Additional Temporary Work Space Areas to be located in Troy, NH and other municipalities.

**Subject: Staging (Locations) - Comment Number TCC081**

Please identify and describe locations and details of all staging areas, additional spoil storage areas and which ones are within 50-feet of any waterbodies located in Troy, NH and other municipalities.

**Subject: Emergency Response (Spill) - Comment Number TCC082**

Please provide all specifics regarding Kinder Morgan's Spill Prevention and Response Plan (SPRP) and mitigation protocols that relate to and are reflective of proposed staging areas and additional temporary work space area located in Troy, NH and other municipalities.

**Subject: Hazardous Materials Management (Containment) - Comment Number TCC083**

Please provide specific procedures and plans for any and all containment areas, pipeline route or staging area/workspace area on storage containment areas, with or without drains located in Troy, NH and other municipalities.

**Subject: Hazardous Materials Management (Containment) - Comment Number TCC084**

Please identify and describe secondary containment systems of any and all bulk storage of hazardous materials, including chemicals, fuels and lubricating oils to be located anywhere along the pipeline route or the staging/workspace area located in Troy, NH and other municipalities.

**Subject: Superfund Sites (Design) - Comment Number TCC085**

Please identify the information sources and research criteria used to justify locating the NED pipeline within 110-feet of the Troy Mill Superfund Site and the meaning of the phrase on p. 191 of: "Impact unlikely based on status/location."

**Subject: Superfund Sites (Design) - Comment Number TCC086**

Please specify and describe any written arrangements between Kinder Morgan and the U.S. EPA and the N.H. DES regarding which entity is financially liable if the Troy Mill Superfund site and / or any other similar site is contaminated or disturbed in any way by any construction or other actions.

**Subject: Risk Management (Accidents) - Comment Number TCC087**

What written arrangements have been made between Kinder Morgan, U.S. EPA and N.H. DES as to liability if there is a NED pipeline rupture, leak or explosion that impacts the Troy Superfund Site and / or any other similar type of site.

**Subject: Risk Assessment (Accidents) - Comment Number TCC088**

Please conduct a risk assessment that considers the potential impacts of pipeline spills, leaks, fires, explosions and other accidents on high consequence risk areas and / or other areas of concern such as Superfund sites, industrial facilities, and solid waste landfills. The risk assessment should identify the potential consequences (injuries, deaths, property damage), and calculate the likelihood of occurrence of risk scenarios throughout the expected operational life of the pipeline, based on a range of pipeline management quality.

**Subject: Risk Assessment (Chemical Interactions) - Comment Number TCC089**

Please conduct a risk assessment that considers the potential impacts and interactions of chemicals and thermal energy released from pipeline spills, leaks, fires, explosions and other accidents with chemicals located within the soil in proximity to the pipeline, including but not limited to chemicals known to exist in the Troy NH Superfund Site (plasticizers, bis (2-ethylhexyl) phthalate (DEHP) and Varsol, a petroleum-based solvent).

**Subject: Risk Assessment (Life Cycle) - Comment Number TCC090**

Please conduct a risk assessment that clearly defines the life expectancy of the pipelines being considered and calculate the likelihood of occurrence of pipeline spills, leaks, fires, explosions and other accidents

throughout the life cycle of the pipeline.

**Subject: Risk Assessment (Pipeline Degradation) - Comment Number TCC091**

Considering Kinder Morgan's history of safety violations involving failure to properly inspect, test, maintain and monitor pipelines (reference 2011 Safety Citations by the United States Department of Transportation - Pipeline and Hazardous Materials Safety Administration (PHMSA)), the risk assessment activities should consider the potential impact of expected degradation in pipeline integrity over time associated with best management practices as well as poor management practices.

**Subject: Risk Assessment (High Risk Areas) - Comment Number TCC092**

Please conduct a risk assessment that determines the different likelihoods of a pipeline leak and / or failure within various distances (100 feet, 500 feet, 1000 feet, etc.) of each high consequence risk area and / or superfund site.

**Subject: Risk Assessment (Maintenance) - Comment Number TCC093**

Please conduct a risk assessment that determines the different likelihoods of a pipeline leak and / or failure presuming that the pipeline is maintained using best management practices (BMP) and that the pipeline is maintained poorly (as apparently has been typical of Kinder Morgan's history).

**Subject: Risk Assessment (Maintenance) - Comment Number TCC094**

Please conduct a risk assessment that determines and / or calculates the potential consequences (magnitude of fire and explosions, property damage, injuries and deaths) associated with a pipeline leak in general, and at (or near) each specific area of concern, incrementally over the lifetime of the pipeline, based on varying pipeline management practices.

**Subject: Risk Assessment (Earthquakes) - Comment Number TCC095**

Please conduct a risk assessment that determines the different likelihoods of a pipeline leak and / or failure over the lifetime of the pipeline considering inadequate seismic bracing due to deterioration of bracing over time, improper installation of bracing and / or improper design of bracing.

**Subject: Risk Assessment (Pipe Corrosion) - Comment Number TCC096**

Recognizing that corrosion is a primary cause of many Kinder Morgan pipeline failures, please conduct a risk assessment that determines the different likelihoods of a pipeline leak and / or failure over the lifetime of the pipeline considering significant internal pipe corrosion and / or external pipe corrosion, with the severity of corrosion increasing over time and assuming a failure to identify corrosion through any planned inspection activities.

**Subject: Risk Assessment (Stress Cracking) - Comment Number TCC097**

Recognizing that environmental stress cracking is a relatively common cause of pipeline failures, please conduct a risk assessment that determines the different likelihoods of a pipeline leak and I or failure over the lifetime of the pipeline considering environmental stress cracking, with the severity of cracking increasing over time and assuming a failure to identify cracking through any planned inspection activities.

**Subject: Risk Assessment (Erosion) - Comment Number TCC098**

Please conduct a risk assessment that determines the different likelihoods of a pipeline leak and I or failure over the lifetime of the pipeline considering the erosion of underground pipe support material, and I or the the erosion of surfacial pipe support material/with the severity of erosion increasing over time and assuming a failure to identify erosion through any planned inspection activities.

**Subject: Design (Alternatives) - Comment Number TCC099**

Please provide maps of two pipeline system alternatives to the proposed NED project and a description of

different existing pipelines that would obviate the need to construct all or part of the project.

**Subject: Emergency Response (Local) - Comment Number TCC100**

Please study and develop an emergency plan with local fire departments and other agencies to identify personnel to be contacted, equipment to be mobilized, and procedures to be followed to respond to a pipeline gas leak or fire resulting from a pipeline gas leak.

**Subject: Blasting (Staging) - Comment Number TCCI01**

Please identify extra work, or staging areas, at road, railroad, waterbody, and wetland crossings in areas of steep slopes or where blasting is required. Also, please identify the land use category for each extra work or staging area in Troy, NH.

**Subject: Construction (Temporary) - Comment Number TCC102**

Please identify all temporary access roads that would be used to access the right-of-way during pipeline construction, including farm lanes, private driveways, logging roads, Jeep trails, or other roads that may be modified or improved for construction equipment in Troy, NH,

**Subject: Design (Staging) - Comment Number TCCI03**

Please identify the location, size, and land use of all staging areas and show location on USGS topographic maps, Maps should include the distance and direction to the nearest pipeline construction site, acreage requirements, and the extent of ground disturbance that would take place in Troy, NH.

**Subject: Construction (Notification) - Comment Number TCC104**

Please identify each residence, or building that would be within 50 feet of the edge of the construction right-of-way and extra work or staging area. Provide the distance in feet between the residence and the pipeline centerline, and how landowners would be notified of activities and how hazards such as open ditches would be minimized during construction.

**Subject: Parks (Impact) - Comment Number TCC105**

For Rhododendron State Park, please identify the primary uses, peak use periods, and any seasonal restrictions. Identify, address, and describe planned mitigation for the construction and reduction of construction and permanent right-of-way requirements, selective tree removal, replanting of trees and shrubs, and any special restoration practices in forested areas. Also address off road vehicle controls that would be installed, maintained, and monitored before, during, and after construction of the pipeline.

**Subject: Superfund Sites (Impact) - Comment Number TCCI06**

Please look into how the environmentally fragile Troy Mills Superfund Site could, upon being disturbed by pipeline construction, cause contaminants from the site to enter Rockwood Brook, and what would be done to correct this, and prevent any of the released contaminants from reaching Sand Dam Pond-a public swimming/fishing area.

**Subject: Wildlife (Impact) - Comment Number TCC107**

Please hire a wildlife biologist to look into how animal pathways and movement would be impacted by the construction and the permanent 50 foot right-of-way of the proposed NED pipeline in Troy, NH, and how these impacts can be avoided or minimized based on hours and time of year of construction.

**Subject: Superfund Sites (Stormwater) - Comment Number TCC108**

Please look into how storm water runoff from the construction could interfere with the ongoing EPA testing at the Troy Mills Superfund Site, and what will be done to minimize and avoid such interference.

**Subject: Groundwater (Impact) - Comment Number TCC109**

Please determine how blasting, digging, or drilling during pipeline construction could interfere with contaminated groundwater flow at the Troy Mills Superfund Site in Troy, NH and how impacts would be avoided and minimized,

**Subject: Superfund Sites (Impact) - Comment Number TCC110**

Please determine the location of monitoring wells at the Troy Mills Superfund Site in relation to the location of the proposed NED pipeline in Troy, NH and how this could have the potential to negatively impact the wells, and how these impacts would be minimized during pipeline construction.

**Subject: Groundwater (Impact) - Comment Number TCC111**

Please determine the current size and spread of the groundwater plume at the Troy Mills Site and the potential for negative environmental impacts of related pipeline construction activities on or near the site, and any additional testing that will be performed to ensure that the plume has not increased in size as well as what will be done by Kinder Morgan if does increase in size.

**Subject: Superfund Sites {Wetlands} - Comment Number TCC112**

Please look into the wetlands area located west of the Troy Mills Superfund Site, and how contaminated leachate and high levels of Manganese might be impacted by the NED pipeline construction, and how these impacts would be minimized and corrected if there is an increase compared with the EPA historic testing levels data.

**Subject: Erosion (Impact) - Comment Number TCC113**

Please look into the impact of pipeline construction on sedimentation and erosion on Rockwood Brook, Nester Brook, and Bowker Brook in Troy, NH, and how these impacts would be minimized or avoided.

**Subject: Construction (Impact) Comment Number TCC114**

Please identify all designated sensitive scenic areas and what mitigation measures will be used to reduce visual impact including route deviations to avoid areas of high visibility in South Western NH.

**Subject: Air Quality (Impact) - Comment Number TCC115**

Please provide estimates of pollutant emissions and air quality impacts of the construction equipment that will be used for constructing the pipeline, as well as any pollution emissions and the air quality impacts that will come from the NED pipeline once it is in operation.

**Subject: Noise (Impact) - Comment Number TCC116**

Please describe the noise impacts from the NED pipeline construction activities including drilling and blasting, and how these impacts would be minimized.

**Subject: Economics (Impact) - Comment Number TCC117**

Please address the consequences of not constructing the NED pipeline project and look in to accomplishing the energy objectives of the project through other means including energy conservation.

**Subject: Design (Landmarks) - Comment Number TCC118**

Please identify all natural and registered national natural landmarks, and scenic and recreational areas that will be crossed by the proposed NED project.

**Subject: Design (Trail System) - Comment Number TCC119**

Please identify any areas crossed, or within 0.25 miles of the proposed NED project which are included in the National Scenic Trail System (Metacomet-Monadnock-Trail), and look into mitigation measures as well as how impacts can be minimized or avoided.

**Subject: Cultural Resources (Impact) - Comment Number TCC120**

Please identify land of local historical or cultural significance in Troy, NH that would be affected by the proposed NED pipeline construction and after it goes into operation.

**Subject: Design (Details) - Comment Number TCC121**

Please provide typical right-of-way cross section diagrams that clearly identify land requirements for pipeline construction and operation. These diagrams should include width of total right-of-way, width of permanent right-of-way, and width of temporary construction right-of-way for Troy, NH.

**Subject: Open Land (Impact) - Comment Number TCC122**

Please identify all use of open land (open space, scrub land). Also identify all lands managed under conservation easements, and consult with appropriate state agencies to determine if pipeline construction would affect the status of the land, and what special construction revegetation techniques should be used in Rhododendron State Park.

**Subject: Superfund Sites (Accidents) - Comment Number TCC123**

Please determine the effects a pipeline leak or explosion would have on the Troy Mills Superfund Site and adjacent landfill, and how this risk will be avoided or minimized.

**Subject: Construction (Restoration) - Comment Number TCC124**

Please identify all tracts of upland and wetland forest or woodland that would be removed for pipeline construction, operation, and staging areas, and identify characteristics of the land based on vegetative cover type and predominant land use for revegetation after construction.

**Subject: Agricultural Land (Impact) - Comment Number TCC125**

Please identify all agricultural land (hayfields, crop lands) within 150 yards of the right-of-way that would be affected by construction and operation of the proposed NED pipeline, and how these impacts would be avoided, minimized, or mitigated.

**Subject: Construction (Workers) - Comment Number TCC126**

Please estimate the total number of construction workers temporarily relocating to South Western NH and the duration of their stay. Also estimate the number of construction workers who would commute daily to the construction site.

**Subject: Construction (Economic Impact) - Comment Number TCC127**

Please assess the effects that temporary construction worker emigration will have on the availability and cost of local housing to permanent residents, and college students as well as identifying if there would be competing demands from seasonal recreationists in south western NH.

**Subject: Construction (Operational Impact) - Comment Number TCC128**

Please estimate the number of commuters who will be affected during the proposed NED pipeline construction and the amount of time that will be added on to local commuters travel time due to pipeline construction and the need to reroute traffic in some construction areas.

**Subject: Construction (Emergency Response) - Comment Number TCC129**

Please assess the effect of worker emigration on local police, fire protection, and medical facilities during the proposed NED pipeline construction.

**Subject: Construction (Operational Impact) - Comment Number TCC130**

Please determine the effect that the movement of construction equipment, materials, and workers will have on local roads in South Western NH. Please prepare estimates of construction related traffic trips to and from the work sites and the repair of roads to preconstruction conditions.

**Subject: Low Income (Impact) - Comment Number TCC131**

Please address the environmental effects, including human health, social, and economic, that the NED project will have on low income communities in South Western NH.

**Subject: Construction (Stump Removal) - Comment Number TCC132**

Please identify the practice of stump removal and their related disposal in the process of clearing land for the proposed NED pipeline construction.

**Subject: Design (Fertilizer) - Comment Number TCC133**

Please identify the type of fertilizer used to apply to wood chips on the right-of-way, and explain the need for such fertilizer.

**Subject: Construction (Impact) - Comment Number TCC134**

Please look into the impacts, visual, economic, and quality of life, that the proposed NED pipeline construction will have on residential properties and their owners including tree removal, noise, dust, inconvenience, disturbance of lawns, potential damage to wells and septic systems, building foundations, fences, and sheds.

**Subject: Construction (Erosion) - Comment Number TCC135**

Please identify areas for potential soil erosion due to water, wind, loss of vegetation, soil compaction from construction vehicles, areas with wet soils and areas that have poor drainage in the NED project area and identify what will be done in each specific area to eliminate the hazard.

**Subject: Construction (Restoration) - Comment Number TCC136**

Please determine where there is a potential for poor revegetation including capability classification of the soil, topsoil quality, available water capacity, salinity, acidity, and the potential for the project to affect soil drainage.

**Subject: Agricultural land (Impact) - Comment Number TCC137**

Please identify cropland and residential areas where loss of soil fertility due to trenching and backfilling could occur in the proposed pipeline project area, and explain what will be done to mitigate this issue in the affected areas.

**Subject: Geologic (Impact) - Comment Number TCC138**

Please identify any geologic hazards and areas of non-routine geotechnical concern that may exist, or have the potential to develop in or near the proposed NED project area. Hazards include earthquakes, slope instability, areas susceptible to land sliding, slumping, or flash flooding. Also include any monitoring that would be conducted before, during, and after construction of the pipeline.

**Subject: Soil Protection (Impact) - Comment Number TCC139**

Please identify, describe, and group the soils affected by the proposed NED pipeline, its potential effect on those soils, and measures that will be taken to minimize and avoid impact.

**Subject: Soil Protection (Impact) - Comment Number TCC140**

Please identify specific measures that will be taken to reduce impact on soils in each specific area of the pipeline construction, and how these soils will be restored after compaction and rutting.

**Subject: Design (Geology) - Comment Number TCC141**

Please summarize the physiography and bedrock geology of the project area and include areas where bedrock is likely to be near (less than 5 feet below) the surface in Troy, NH.

**Subject: Construction (Blasting) - Comment Number TCC142**

Please identify where blasting will be necessary in order to construct the NED pipeline in Troy, NH.

**Subject: Construction (Blasting) - Comment Number TCC143**

Please create a list of any applicable federal, state, and local blasting regulations, including the responsible agency, contact information, and permits that must be obtained to do blasting in NH.

**Subject: Construction (Blasting) - Comment Number TCC144**

Please identify where blasting will be required along the proposed NED pipeline project in South Western NH, and analyze potential impacts the blasting may have on water wells, springs, wetlands, slopes, and nearby (within half a mile) structures. Describe measures that will be taken to minimize vibrations from the blasting and flyrock.

**Subject: Construction (Blasting) - Comment Number TCC145**

Please describe the procedures for pre and post blast inspections of nearby (within half a mile) structures and wells, and any monitoring that would be done during the NED project. *{end of 20150826-5068}*

**20150826-5090**

deborah pomerleau, Londonderry, NH.

This is an e-mail I sent yesterday to NH's Attorney General, Joseph Foster.

I am very concerned about this proposed Kinder Morgan gas pipeline.

- 1) The "need" issue for gas for NH has not been established.
- 2) Water. Huge risk to wells, septic systems, streams, rivers, ponds, lakes, wetlands.
- 3) Noise pollution. The noise from the compressor stations will be huge. The noise during construction will be huge.
- 4) Light pollution at night. The lights from the compressor station at night will be a huge problem.
- 5) Small town roads are not made for constant heavy trucks using them.
- 6) Small town bridges are not made for heavy trucks using them constantly.
- 7) Fire departments and police departments are in no way whatsoever able to protect people from hazardous explosions or leaks.
- 8) Weather issues, like lightning striking the compressor station can cause problems. This has not been discussed at all, and can't be underestimated.
- 9) Weather issues, like flooding can wash out roads and areas where a pipeline could be, thus exposing it to air, and breakage. Then explosions.
- 10) Weather issues, like ice storms can cause huge problems at a compressor station.
- 11) Fire. This summer's drought is a true indication that any kind of fire would be devastating. A fire with any kind of wind would be catastrophic.
- 12) Emotional distress of our citizens and children. This can not be underestimated. This will also be especially true for fire fighters, police officers, and teachers.
- 13) The granite of NH is also a huge concern. Does Kinder Morgan truly intend to blast straight through granite to keep a pipeline in place?
- 14) Soil and ground pollution by run off and chemicals leaking. Many small farms exist in NH that would be impacted by a leak and/or explosion.
- 15) Because NH's population is low, FERC allows for a thinner type of pipe for this gas pipeline. FERC's rationalization is there are fewer people who will be digging and thus a lower risk to a pipeline being hit. BUT, what this does not take into consideration is the fluctuation of the ground due to frost heaves, droughts, normal rain, and excessive rain.

16) Fish. Please see these 3 pleadings as a reminder. These are from your website about Pleadings Filed in Massachusetts v. Pritzker, U.S. D. Ct. Mass. No. 13-CV-11301 :

a)Petition for Judicial Review.

b)New Hampshire's Motion for Intervention.

c)New Hampshire's Memorandum of Law Supporting Motion for Intervention.

17 ) Consumer Protection. There have been numerous "mistakes" in Kinder Morgan's data, maps, and information. This needs to be looked into by your: Consumer Protection and Anti Trust Department. From your website: "The Consumer Protection and Antitrust Bureau acts to protect consumers from unfair or deceptive trade practices in New Hampshire. When a business does not provide services or products, misrepresents its services or products, or does not provide quality services or products, the Consumer Protection and Antitrust Bureau may question the business practices and seek appropriate measures to remedy the situation on behalf of the State of New Hampshire. The Bureau's mission also includes consumer education and outreach. The best consumer protection is widespread public awareness of consumer's rights and common scams to prevent problems. This website is designed to provide such essential information to New Hampshire's consumers. "

18) Tourism is NH's largest industry. What would happen to the income of many, if there was an explosion or fire during tourist season. Also, what would be the liability issue to the state to allow this pipeline to be put in and potentially hurt or kill tourists?

19) Citizens could sue NH for allowing this pipeline to go in when their health is directly impacted by this pipeline and gas.

20) AIR POLLUTION IS THE MOST DAMAGING ITEM TO OUR HEALTH. Many chemicals will be released constantly and intermittently by the compressor stations. This goes against all EPA laws, and 100% needs to be addressed.

The air pollution issue is the huge issue because these chemicals are not like smoke. You can see smoke, you can't see the release of these chemicals.

Would our NH health system of doctors and hospitals be able to care for the numerous health issues that would face our citizens, children and tourists?

Your website states: "

The Environmental Protection Bureau is a unit of the Department of Justice, Office of the Attorney General. Attorneys in the bureau prosecute civil and criminal violations of New Hampshire's environmental laws and provide legal advice and representation to the state entities that oversee the environment and natural resources in New Hampshire. Attorneys in the Environmental Protection Bureau work closely with the Department of Environmental Services, which is responsible for the administration of the State's environmental protection programs relating to air pollution, water pollution, and hazardous and solid waste management. Bureau attorneys also work closely with the Fish and Game Department, the agency responsible for administering many of the State's wildlife and natural resource programs, and with the Office of Energy and Planning which provides information, data and guidance to assist decision makers on issues pertaining to development, land protection, energy use and community planning."

Your department has the legal responsibility to protect NH citizens and NH's environment.

Please step up and look into this situation.

Please.

Debbie Pomerleau

Bernhard Porada, Northfield, MA.

I wish to register with your agency my strident opposition to this pipeline for the following reasons;

This pipeline is unnecessary to meet the energy needs of natural gas consumers both residential and business because its prime objective is to export natural gas overseas for which ratepayers will end up subsidizing for no benefit. Also another reason is the severe environmental impact it will have on our environment due to its construction and operation. For this pipeline to be installed environmentally sensitive areas will be damaged which will include protected conservation lands both public and private. This pipeline will also seriously impact people who reside near proposed compressor stations who will suffer from environmental impacts to them from air and noise pollution and risk to their safety of their lives and property in case of an accident involving these facilities. I am not alone in this opposition for many of my neighbors and fellow citizens feel that in our democracy

The rights of the public must be protected against the corporate need for greedy profit. This need must not trump our legitimate constitutionally protected rights. Thank you for allowing me the opportunity to address your agency. Bernhard Porada

#### **20150826-5111**

Alison Wahlstrom, Northfield, MA.

I would like to comment on the Tennessee Gas Pipeline. This pipeline and the proposed compressor station will cause many problems for residents, wildlife and environment, especially the waterways. I would like to voice my opposition to this project and hope that your regulatory commission will stop the pipeline and compressors from our beautiful New England area. Thank you, Alison Wahlstrom

#### **20150826-5122**

Nicholas E. Motmans, Cheshire, CT.

Dear Secretary Bose,

I am writing in regards to Docket number PF14-22, Kinder Morgan's Northeast Energy Direct (NED) project.

In the environmental impact statement, FERC needs to take into account the increased amount of methane emissions that this large project will pour into our atmosphere. Earlier this month the EPA proposed new standards to reduce methane emissions by 45% over the next 10 years. The EPA recognizes that methane is a potent global greenhouse gas, far worse than carbon dioxide at trapping heat in the atmosphere. The NED project will make those reductions in methane emissions impossible, and will cause irreparable harm to our climate.

Furthermore, these shale gas expansion projects are segmented into two, the Connecticut Expansion and NED. FERC must acknowledge that this is the case, and admit that the environmental harm caused by these two projects is cumulative. They are not separate projects, and FERC has been guilty of illegal segmentation in the recent past.

The potential harm to water has been raised by the Hartford MDC, the municipal corporation responsible for providing clean water to 400,000 people in the Hartford area. In a June 26 letter to FERC, MDC Chief Executive Officer Scott Jellison wrote "to express some concern that the proposed pipeline could potentially impact MDC's public drinking water supplies in West Hartford and Bloomfield, CT." FERC must address the concerns of MDC and the public about the impact of pipeline construction and operation on drinking water.

FERC should take into account the frequency of pipeline leaks and explosions, and factor in the costs to local communities, who bear a burden when environmental harm from pipeline accidents occur. According to the Pipeline Hazardous and Safety Material Administration, leaks and explosions are not uncommon and have increased in frequency in recent years.

Yours,

A Concerned Citizen

**20150826-5124**

francis martucci, hamden, CT.

Dear Secretary Bose,

I am writing in regards to Docket number PF14-22, Kinder Morgan's Northeast Energy Direct (NED) project. The government should start listening to the people and not the lobbyists and agents of the oil companies!

In the environmental impact statement, FERC needs to take into account the increased amount of methane emissions that this large project will pour into our atmosphere. Earlier this month the EPA proposed new standards to reduce methane emissions by 45% over the next 10 years. The EPA recognizes that methane is a potent global greenhouse gas, far worse than carbon dioxide at trapping heat in the atmosphere. The NED project will make those reductions in methane emissions impossible, and will cause irreparable harm to our climate.

Furthermore, these shale gas expansion projects are segmented into two, the Connecticut Expansion and NED. FERC must acknowledge that this is the case, and admit that the environmental harm caused by these two projects is cumulative. They are not separate projects, and FERC has been guilty of illegal segmentation in the recent past.

The potential harm to water has been raised by the Hartford MDC, the municipal corporation responsible for providing clean water to 400,000 people in the Hartford area. In a June 26 letter to FERC, MDC Chief Executive Officer Scott Jellison wrote "to express some concern that the proposed pipeline could potentially impact MDC's public drinking water supplies in West Hartford and Bloomfield, CT." FERC must address the concerns of MDC and the public about the impact of pipeline construction and operation on drinking water.

FERC should take into account the frequency of pipeline leaks and explosions, and factor in the costs to local communities, who bear a burden when environmental harm from pipeline accidents occur. According to the Pipeline Hazardous and Safety Material Administration, leaks and explosions are not uncommon and have increased in frequency in recent years.

Thank you.

Marnie Meyers, Windsor, MA.

Project Docket Number: PF14-22

My family lives in Windsor, MA which is the "sacrifice zone" for a proposed Kinder Morgan/Tennessee Gas pipeline compressor station.

I am deeply concerned about the impact of the unnecessary NED pipeline and specifically the toxic compressor stations upon the air, water and soil along the length of this project:

The pipeline is unnecessary because storage and conservation can easily meet peak demand and renewables are steeply increasing. So, with most of the gas earmarked for overseas, it can hardly be classified as "for the public good and necessity" but for corporate greed and profit!

It is toxic because it emits benzene, toluene, xylene and dozens of other carcinogens and neuro-disrupters as a normal part of compressor operation, leaks and explosions aside. Please determine all chemicals contained in transported fracked gas and make it public information under The Freedom of Information Act.

In Windsor, and the other compressor towns, I respectfully request that independent Environmental Impact Studies of air, water and soil samples be conducted, paid for by Kinder Morgan, to determine current baseline status. This must be done again after completion and frequently into the future so that changes resulting from pipeline construction and operation can be assessed. Our rainfall and fog will rapidly bring these poisons to earth rendering our environment forever poisoned!

Further, please determine how to avoid, minimize and/or offset the impacts of those toxins on human health, critical habitats of migratory birds and rare species as well as wetlands, vernal pools, streams, wells/springs, aquifers natural flora and agricultural soils. To that end, please require that all compressor apparatus be built underground with filters, scrubbers, shields and all necessary mitigations to light, sound and emission concerns.

Thank you

Best Regards,

Marilyn (Marnie) Meyers

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/Kinder Morgan (FERC Docket No. PF14-22-000)

Dear Secretary Bose,

The Connecticut Forest & Park Association (CFPA) is the oldest conservation organization in Connecticut (established in 1895), and is perhaps best known as the maintainer of 825+ miles of Blue-Blazed Hiking Trails in Connecticut. The crown jewel of the Blue-Blazed Hiking Trails is the New England National Scenic Trail (New England Trail) which was designated by Congress as one of only 11 national scenic trails in the United States in 2009 (Public Law 111-11).

The New England Trail stretches 215 miles from the Long Island Sound in Connecticut to the New Hampshire border. The New England Trail is managed in partnership with the National Park Service in Connecticut, and the National Park Service works with the Appalachian Mountain Club to maintain the northern stretch of the New England Trail in Massachusetts. CFPA has maintained the New England Trail, also known locally as the Metacomet or Mattabesett Trails, since 1930.

The route of the Proposed Northeast Energy Direct natural gas pipeline crosses the New England Trail in several locations (Bloomfield, Farmington, Simsbury, and West Hartford) as the pipeline and trail run side by side oriented north/south. If the pipeline width were to be expanded, the clearing, digging, soil compacting, etc. necessitated by the project would significantly disrupt the scenic experience that this Trail was designated by Congress to provide. It is currently unclear what the length of disruption would be, and what measures are proposed to reduce any disruptions to the New England Trail.

We put forward the following questions as part of docket # PF14-22-000 with the expectation that FERC and Tennessee Gas Pipeline LLC/Kinder Morgan (Kinder Morgan) will address them:

- Will the National Park Service be included in this docket due to their direct involvement with the management of the New England Trail?
- Will the CT Department of Energy & Environmental Protection be included in this docket to speak to

the fact that the New England Trail was designated as a State Greenway in 2001, and Public Act 13-231 was passed by the CT General Assembly in 2013 to proclaim “It is declared to be the policy of the state of Connecticut that the Connecticut portion of the New England National Scenic Trail be preserved in its natural character as proposed by Public Law 111-11, March 30, 2009.”

- CFPA has provided a digital version of its trail line for the New England Trail to Kinder Morgan. Will that trail line be shown on maps to depict clearly what efforts are necessary to avoid disruptions to trail users?
- If avoidance of the New England Trail corridor is impossible, will Kinder Morgan mitigate impacts with signage, alternate routes, and other considerations to minimize the extent and/or duration of disruption to trail users?
- Will Kinder Morgan communicate with CFPA to ensure any trail disruptions are shown prominently and specifically on CFPA’s online interactive trail maps for the New England Trail?

At CFPA, when asking people to use the New England Trail, we will often use positive encouragements like “be safe,” “leave no trace,” “leave the place better than you found it,” and “have fun.” It is our hope that your review of this proposal ensures the New England Trail will remain as safe, undisturbed, improved, and fun as possible for the many thousands of people who recreate on it each year. We have a long history of facilitating this recreation for the benefit of the public, and your recommendations on this docket are essential to preserve this nationally significant trail corridor both for current use and the enjoyment of many future generations.

Sincerely,

Eric Hammerling, Executive Director  
Connecticut Forest & Park Association (CFPA)

#### **20150826-5218**

Janice Fiandaca, Rindge, NH.

In Rindge, the KM/TGP will cut through and disrupt wetlands that have been protected by town ordinances. Anyone in the pipeline path could be easily affected as a result of the drilling/connectivity. All Rindge drinking water comes from wells. Analysis of the depths and sources of aquifers should be conducted by a third party. Without this information before construction begins, we have no way to determine if the quality, quantity and/or flow rate of our wells will be affected. Repeating a statement made by others: we can find an alternate source of energy; we cannot find an alternate source of water.

#### **20150827-0006**

Hand written FERC Comment form: Priscilla & Robert Borden, 199 Fulham Hill Rd, Fitzwillian, NH 03447: requesting various independent studies.

#### **20150827-0008**

Hand written card, Melinda Hildreth Honkala, 143 Monument Rd, Richmond, NH 03470: less than 10% of gas will actually be used in US.

#### **20150827-0009**

Hand written card, John Leoutsacos, 79 Mountainview Drive, Temple, NH 03084: harmful compressor effects.

Hand written card, Lisa Derby Oden, 6 Upper Pratt Pond Rd, New Ipswich, NH 03071, FERC should evaluate all pipelines proposed for region.

**20150827-0011**

Hand written card, John Leoutsacos, 79 Mountainview Drive, Temple, NH 03084: harmful compressor noise effects.

**20150827-0012**

Hand written card, Holly Koski, 123 Red Gate Lane, Rindge, NH 03461, KM must provide emergency egress from all dead end roads in “Incineration Zone”.

**20150827-0013**

Hand written card, John Leoutsacos, 79 Mountainview Drive, Temple, NH 03084: compressor will increase illness of thousands along pipeline route, just look at “List of Harmed” to confirm this.

**20150827-0014**

Susan Levin Wessels 182 Sunridge Road Rindge, NH 03461

RE: Docket #PF14-22-000 August 15,2015

Dear FERC Commissioners:

My husband and I are being told the home we built 20 years ago in Rindge, NH is in the “study zone” of the planned Kinder Morgan NED pipeline. Almost our entire wooded 3-acre lot will be permanently cleared of all the natural and planned vegetation we have so lovingly planted and maintained to provide a peaceful, natural and private setting. The water well will be destroyed, by blasting harmful chemicals into our ground and ground water. The house, itself, would remain, tho in an uninhabitable form, since it will be surrounded by denuded land which itself will be sprayed regularly with toxic chemicals to prevent vegetation from growing. We would be subjected to routine pipeline leaks, un-potable water, formaldehyde blow-back from nearby release valves, etc.

Our house represents our most important financial asset. That will be destroyed. Despite poor health, I will be required to live in this house after it is essentially destroyed. The exposure to chemicals of various sorts will, no doubt, influence the health and life expectancy of both of us. Yet Kinder Morgan will not buy the house, just the easement they need to build the pipeline just feet away, in our back yard.

The fragile state of the facked gas industry is described below as is the trend toward reversing pipeline directions favoring transporting westerly over eastern export paths. Both these issues bear directly on the wisdom of New Hampshire investing so much in building this NED pipeline.

Please understand how much will be destroyed along the pipeline route. Creating a wide scar across Southern New Hampshire will bring destruction to human, vegetative and animal habitats; water, air and quality of life in general. Please take these tremendous costs into consideration as you wrestle with your decision to approve or not approve this pipeline. Real people stand to lose everything if this pipeline is built. You have the power to stop this disastrous investment, the costs of which we will all be living with far beyond any conceivable benefit.

Some pertinent information follows:

Excerpted From The Nation. August 5. 2015 By Tara Loban

“The US boom in the productiog of oil and gas in the past seven years has been largely driven by horizontal dJ:illing and hydraulic fcturing (or fracking) of rock formations known as shale plays. But the growth may not be as long-lived as advertised. For starters, there’s good evidence to suggest that the amount of economically recoverable reserves of both shale oil and gas are not as much as previously hyped ...

J. David Hughes, a geoscientist and fellow at the Post Carbon Institute, who spent 32 years with the Geological Survey of Canada, found that while short-term production of shale oil and. gas is undoubtedly significant, the long-term view shows that the growth is not sustainable. His research reveals production peaking

in both shale oil and gas in most of the significant plays in the United States by 2020.” For the past five years we’ve been told we’re going to be energy independent. .. it’s just not going to happen. II

The next problem facing the industry is the price tag of its operations. The costs to drill and complete a shale well can range from \$6 million to \$8 million or more a well—depending on the play and the number of drilling stages.

Production on shale wells also declines very quickly. For shale oil, the three-year average well decline rate in most major US plays falls between 60 and 91 percent. Around half of all the oil that will be produced from these wells will come in the first three years. For shale gas, the three-year average well decline rate is between 74 and 82 percent.

This means that in order to maintain or increase production, you have to keep a frenetic pace of new drilling—what Lawrence Berkeley National Laboratory scientist David Fridley likened to being on an “accelerating treadmill.” The drilling frenzy that has characterized the shale boom caused a spike in production, contributing to a global glut, which has resulted in falling prices. It’s a vicious circle, and one that was hard to make economical even when crude was selling for \$100 a barrel.

When prices dropped earlier this year to around \$50 a barrel, things became more dire for the shale industry, and they haven’t greatly improved in the last six months. Despite briefly reaching around \$63 a barrel in late spring, prices have fallen again. “For the past five years we’ve been told we’re going to be energy independent and we will have all this oil and we’re going to export gas to Europe and we’re going to export gas to Asia, and it’s just not going to happen,” said Fridley.

In the past seven years, wind and solar capacity in the United States has tripled.

Overproduction, combined with declining consumption, has resulted in plummeting crude prices in the past year. It’s the same script that occurred just a few years earlier, when shale gas prices bottomed out in the United States. So what’s the industry to do?

Investor Jeremy Grantbam, the founder of GMO, a Boston-based money manager, wrote in the financial publication *Barron’s*. “Almost no new drilling programs will be initiated at current prices except by the financially desperate and the irrationally impatient, and in three years over 80 percent of all production from current wells will be gone!”

Given the costs of drilling and completing wells, and the number needed to keep production growing, companies must have lots of cash to stay on the treadmill. And that may become harder and harder for many to do.

The Energy Policy Forum’. Lawrence has been comparing the financials of some of the industry’s top companies for years; she found that they lack free cash flow. “They were spending a lot in capital expenditures—the money needed to drill and complete the wells,” she said “And that was growing every year while the money they were actually making; the cash that was left over at the end of the day, was deteriorating. It was never positive. “

Lawrence crunched the numbers on more than 20 US shale operators and found that the companies had been cash-flow-negative since 2009. As *Alberta Oil Magazine* reported, “In 2013, U.S. onshore oil producers outspent their operating cashflow by 111 to one.” The record-high production boom we’ve witnessed has been sustained by companies taking on high levels of debt, including \$120 billion in high-risk, high-yield bonds. JPMorgan’s estimate of the default rate for these junk bonds is nearly 4 percent this year and will be a whopping 20 percent next year, if crude prices remain around \$56 a barrel.

This may mean lights out for a number of debt-laden companies. Some will go out of business, while others may be gobbled up by larger corporations. Expect lots of consolidation and cherry-picking of assets by the big players. Giants like Chevron and Exxon Mobil will likely make out well, but they aren’t the only ones. “It will be fantastic for the investment banks, because they will make a fortune out of fees,” says Lawrence. Those who won’t make out well, however, include more than just the debt-heavy industry players. It could be you. “A lot of pension funds invest in energy stocks, and the energy stocks have just gotten creamed,”

says Lawrence. “They haven’t had good share returns. You’re going to see that reflected in your portfolio.” Despite the bad news on shales, Lawrence sees a lot of good economic news when it comes to renewable energy. “I have this feeling that we are on the cusp of a new energy paradigm and things are changing so rapidly,” says Lawrence. “I think you’re going to see a lot of disruption in the next five to 10 years, and I don’t think the oil and gas industry really thinks it’s coming.”

From Fortune magazine, August 13, 2015

“Unlike conventional projects, shale wells enjoy an extremely short life. In the Bakken region straddling Montana and North Dakota, a well that starts out pumping 1,000 barrels a day will decline to just 200 barrels by the start of year two, a shrinkage of 72%. By the beginning of year three, more than half the reserves of that well will be depleted, and annual production will fall to a trickle. To generate constant or increasing revenue, producers need to constantly drill new wells, since their existing wells span a mere half-life by industry standards.

In fact, fracking is a lot more like mining than conventional oil production. Mining companies need to dig new holes, year after year, to extract reserves of copper or iron ore. In fracking, there is intense pressure to keep replacing the production you lost last year.

On average, the “all-in,” breakeven cost for U.S. hydraulic shale is \$65 per barrel, according to a study by Rystad Energy and Morgan Stanley Commodity Research. So, with the current price at \$48, the industry is under siege. To be sure, the frackers will continue to operate older wells so long as they generate revenues in excess of their variable costs. But the older wells—like those in the Middle East or the North Sea—produce only tiny quantities. To keep the boom going, the shale gang must keep doing what they’ve been doing to thrive; they need to drill many, many new wells.

Right now, all signs are pointing to retreat. The count of rotary rigs in use—a proxy for new drilling—has fallen from 1,930 to 1,881 since October, after soaring during most of 2014. Continental Resources, a major force in shale, has announced that it will lower its drilling budget by 40% in 2015. Because of the constant need to drill, frackers are always raising more and more money by selling equity, securing bank loans, and selling junk bonds. Many are already heavily indebted. It’s unclear if banks and investors will keep the capital flowing at these prices.

Still, the future of fracking is extremely hard to predict. Continental, for example, pledges to raise production in 2015 despite the fall in its drilling budget. It would be a mistake to underestimate the ingenuity of the entrepreneurs who led the shale revolution. They will exploit new technologies that combine vertical and horizontal drilling to lower their costs. In the boom times, equipment rental, trucking, and labor were all priced at huge premiums; at \$100 a barrel oil, producers put sinking the next well far ahead of fretting over their fat payrolls. Now, those costs are falling.

So it’s difficult to know where all-in costs will settle. If oil stays at around \$50, a group of super-efficient producers may still be able to make money. Bruce Everett, who teaches petroleum economics at the Fletcher School at Tufts University, is optimistic. “There will undoubtedly be some tailing off in U.S. drilling activity,” he says, “but I expect continued development drilling in major new areas, particularly the Bakken, even at \$50.”

If demand rebounds—and it may—prices may very well rise above \$60 once again, and fracking will once again become extremely profitable. But it’s not clear if the famous foe of fracking, Saudi Arabia, will let that happen. The Saudis have invested heavily to gain extra capacity of 2 million barrels a day. The Saudis may use that cushion to hold prices around \$50, just out of range—at least today—for most shale oil producers.

Then again, the shale industry’s ability to hike production quickly could put a cap of \$50 or \$60 on oil prices. If prices rise much higher, either the Saudis will intervene, or more shale supplies will flood the market, stabilizing the price. “Because shale wells have short lives, allowing production to come on and off more quickly, fracking could moderate price fluctuations so they’re less volatile than in the past,” says David Kreutzer, an economist at the Heritage Foundation.

But the numbers are still daunting. It's easy to get financing when your costs are \$65 and you're selling at \$100. But when the price is \$50, where will the producers find the funds to keep sinking those new wells? It will take a lot of new drilling just to keep production where it is now. A steady but no-growth shale industry is not what America has been counting on. The spread of rigs and jobs that seemed such a certainty, and such a staple of our recovery, may be a fading vision."

Impact 00 NED - These cost trends will lead to what is described below: reversal of pipeline flow (from West-to-East (for overseas shipments) to East-to-Western U.S. thus negating a primary justification for NED:

As more western drilling operations are sidelined, the price of natural gas in the western 2/3 of the country is expected to go up due to the laws of supply and demand. The new western demand for Marcellus gas was NOT PREDICTED when NED was on the drawing board. Between Texas and the West there is about a trillion cubic feet of underground GAS STORAGE. Next year a lot of that storage will be filled up with cheap Marcellus Gas.

It makes sense that expansion of pipelines from the east to the west will reduce the incentive for industry to pursue projects like NED -- THAT WERE ORIGINALLY DESIGNED TO SEND GAS OVERSEAS.

Here are some citations from EIA and the Trade publications to support this claim.

1. Just one year after the larger-than-NED REX (Rockies Express) east to west pipeline went into service to send gas from east coast to west coast:

[citation: <http://www.eia.gov/todayinenergy/detail.cfm?id=16751>, dated June 18, 2014 J ...

2. the KIA is reporting in its weekly Natural Gas report that the east to west flows, which were in excess of IBCF in the past, are getting reversed

[citation: <http://www.eia.gov/naturalgas/weekly/archive/2015/08/06/ind.ex.cfm> dated August 6, 2015]

"REX reversal complete. The Rockies Express Pipeline completed its east-to-west reversal early this month, officially placing into service an additional 1.2 Bcf/d of incremental east-to-west capacity, bringing the total capacity to 1.5 Bcf/d. However, ongoing construction at downstream interconnections may be hampering westward flows, according to Bentek Energy analysis. Outflows on REX have been below the 1.5 Bcf/d capacity since the reversal was officially completed. "

3. and apparently the east to west capacity is still expanding ••• FERC approved additional east to west flows in March

[http://webcache.iog!usercontent.com/search?](http://webcache.iog!usercontent.com/search?g=cache:U73EYUCNKWOJ:www.naturalgasintel.com/articles/101529-rockies-express-gets-ferc-approval-for-east-to-west-capacity-expansion+&cd=4&hl=en&ct=clnk&gl=us)

[g=cache:U73EYUCNKWOJ:www.naturalgasintel.com/articles/101529-rockies-express-gets-ferc-approval-for-east-to-west-capacity-expansion+&cd=4&hl=en&ct=clnk&gl=us](http://www.naturalgasintel.com/articles/101529-rockies-express-gets-ferc-approval-for-east-to-west-capacity-expansion+&cd=4&hl=en&ct=clnk&gl=us)

"REX has received approval from the Federal Energy Regulatory Commission (FERC) to modify "certain facilities" along the REX pipeline from Monroe County, OH all the way to Moultrie County, IL - something they call the Zone 3 East-to-West Project. When complete, it means REX will flow an additional 1.2 billion cubic feet of natural gas per day from the Utica and Marcellus to Midwest markets"

Citation: Marcellus Drilling News. March 3, 2015, "Rockies Express Gets FERC Approval For East-to-West Capacity Expansion"

4. It appears that just a few days ago this pipeline reversal went into service •••

"The Rockies Express Pipeline (REX), originally built from Colorado and Wyoming to Monroe County, OH to bring natural gas from west to east, will reverse the flow for a large and important section of the pipeline. On August 1, the section of REX from Monroe County, OH to Mexico, MO will reverse the flow and carry 1.8 billion cubic feet per day (Bcf/d) of Utica and Marcellus Shale gas to the Midwest, including to the greater Chicago area. This flow reversal has the power to a) increase prices northeast drillers receive for their natural gas, and b) lower the cost of natural gas for consumers (and industrial companies, and electric generating plants, etc.) in places like Chicago. ENGI, July 30, 2015, emphasis mine]

<http://webcache.googleusercontent.com/search?g=cache:9vOs34xgRkJ:marcellusdrilling.com/2015/07/30/rockies-express-pipeline-reversal>

S-bcfd-ofmarcellusutica-gas-hsads-west-on-rex-starting-aug.1/+&cd=l&hI=en&ct=clnk&gl=us

So if more gas flows west to Chicago and eventually to Colorado, Oregon (on existing pipelines originally designed to flow the other way) it keeps prices low in the west but raises the weD head price in the east.

If the wellhead price goes up from \$2 to \$4 in Pennsylvania it will undercut the argument used by Anthony Buxton and Kinder Morgan in their presentations about saving money for Northeast consumers, particularly electricity consumers. Their argument is that New England electricity consumers paid \$7 billion extra on energy costs because we didn't have the access to the \$2 gas available a few hundred miles to the west. Well now thanks to REX, and other pipelines like it to send gas to other parts of North America on existing pipelines, the predicted \$2 gas they are telling us we can get by building NED is unlikely to be QIIQilable to us at ANY time after 2016 or 2017. As a result the industry appears to be backing off from their original concept which w(u complete reversal of th« Maritimes and Northe(Ut pipeline from Dracut to Nova Scotia. The change in primary project scope and purpose may warrant a restart a/the entire FERC pre-file and/or scoping process.

Given the precarious viability of shale produced products, is it prudent for New Hampshire to bet so heavily on future shale production? Is it wise for our state to carve up land and put so many lives, precious ecosystems, private property, water quality and quality of life at risk for this uncertain gamble? This is madness I In what rational scheme does this make sense? Please stop NEDI

Thank you

Susan Wessels

## 20150827-0015

August 19, 2015

Kimberly D. Bose Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Re: Tennessee Oas Pipeline Company, L.L.C ("TGP")  
Docket No. PFI4-22-000: Proposed Northeast Energy Direct

Dear Ms. Bose,

I am writing to you as a concerned resident of Milford NH who is in opposition to Kinder Morgan's plan to run a gas pipeline through 18 Southern New Hampshire towns. Kinder Morgan insists that the purpose of the proposed pipeline and ancillary infrastructure is to provide gas to help relieve energy shortages and reduce gas and electric prices here in New Hampshire. However as numerous comments submitted to the FERC website have already illustrated the company is untrustworthy. Unfortunately Kinder Morgan just sees the environment and people of New Hampshire as an inconvenience they must deal with as quickly and inexpensively as possible so they can move forward with in what my and many other people's opinion appears to be their actual goal - building a pipeline to move gas to coastal terminals in Canada for export overseas.

Kinder Morgan needs you to believe that there is an energy crisis here in New Hampshire. They need you to believe that this "crisis" can only be solved by building a 30 inch (or 36 inch) gas pipeline. However Kinder Morgan has been having difficulty getting gas distributors to sign up to purchase gas from the pipeline. To my knowledge as of today, August 1~ 2015, only a single gas distributor in New Hampshire, Liberty Utilities, has committed to purchase gas from the pipeline. Liberty Utilities commitment is to purchase up to 115,000 dekathenns of gas a day for the next twenty years. This would represent only a small fraction of the pipeline's capacity. And it would seem even this small amount is overly optimistic. A consultant hired by the Public Utilities Commission stated that the deal would leave Liberty with "substantial excess capacity that it

would not completely absorb or grow into over the life of its contract”( I}.

The lack of distributors in NH would be of little concern to Kinder Morgan except that they need a Certificate of Public Convenience and Necessity from FERC. They desperately need this certificate because although Kinder Morgan likes to say that the majority of the pipeline in New Hampshire will be “co located” with the Eversource power line the reality of this “co location” is essentially none of the required permanent 50 foot pipeline easement will be within the PSNH corridor. This land will come from parallel easements taken from abutting property owners through coercion and the threat of eminent domain! These easements will result in the removal of trees that help aesthetically shield these property owners from the power lines and leave the land unusable for anything besides growing grass!

Now I would like to remind FERC about eminent domain and the 5111 amendment to the United States Constitution which states in part: “ “•.. nor shall private property be taken for public use, without just compensation.” The “takings” clause includes (or, more correctly, has been interpreted to include) two elements, which are:

1. Any taking by a government must be for a “public use” to be valid; and
2. Any government that does take property, even for a public use, must fully compensate the owner of the property for the taking.”(2)

If in fact the majority of the gas carried by this pipeline is headed overseas the use of the 5111 amendment and eminent domain will be at best highly questionable and, if approved by FERC, likely result in statewide anger and costly lawsuits.

It has already been documented in other comments submitted to the FERC website that this pipeline represents a destructive overbuild providing little value to the State of New Hampshire. With this in mind I would like FERC to investigate the following:

- The actual size of the NEED for additional gas in New Hampshire.
- Whether the Spectra Access Northeast Pipeline will meet this need. It will cause far less disruption to our neighborhoods, forests, and wetlands.

Sincerely,

Douglas Rick

Re: Northeast Energy Direct Project Docket 1PF14-22

Dear Ms. Bose,

Furnace Brook in New Ipswich, NH is a tributary of the Souhegan River. It in turn is fed by several small streams all of which are seasonal except ons. There is a spring on my property (Map6 Lot21) on Kidder Mountain adjacent to the power line that never ddes insuring that Furnace Brook always has water. Should construction of the pipeline disturb that flow it is inevitable that Furnace Brook would be dry at certain times changing the current ecology of that waterway.

Sincerely,  
Michael Maki  
71 Maki Road  
New Ipswich, NH 03071

Norman C. Bay, Chairman  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE: Docket No. PF14-22-000

Dear Chairman Bay:

I respectfully request that the Federal Energy Regulatory Commission reject Tennessee Gas Pipeline Company's proposed Northeast Energy Direct (NED) Project. I base this request upon the following:

1. The pipeline and compressor station are located too close to Our Lady of Hope, our religious facility. This high-pressure, high-capacity station will bring significant human safety risks to our Sisters living there.
2. The pipeline and compressor station are located too close to a farm containing Newfoundland ponies, an endangered animal. There are only 250 left on earth.
3. The pipeline and compressor station are located too close an annual migration path of thousands of raptors. The high-pressure, high-capacity station's exhaust plumes of heated gases will bring significant safety risks to these birds.
4. The pipeline and compressor station are located too close to a school whose heating system uses outside air to heat the facility. This high-pressure, high-capacity station will bring significant human safety risks to our teachers and children attending the school.
5. The pipeline and compressor station are located too close to our water supplies, parks, and conserved land and will bring significant environmental hazards.
6. FERC has already approved another pipeline to satisfy New England's natural gas-fired electric generation needs on the coldest days. We don't appreciate the need to add more supply.
7. The particular gas that would be carried in the proposed pipeline is likely to be particularly high in toxins and radiation, and the health impact upon our families, animals and plants must be avoided.
8. The proposed pipeline route requires a new right-of-way that would cut through many miles of environmentally sensitive areas and take permanently protected land out of that protection.
9. Some "fracking" compounds and chemicals negatively impact the skin, eyes, sensory organs, the respiratory system, the gastrointestinal system, the liver; the nervous system; and are candidate endocrine disrupting chemicals. Endocrine disrupting chemicals (EDCs) present unique hazards, particularly during fetal and early childhood growth and development. We do not want to be exposed to any of these chemicals.

Respectfully submitted,

Name: Paulette Slovonka, 9 Falen Rd, New Ipswich, NH 03071

**20150827-0024**

**FEDERAL ENERGY REGULATORY COMMISSION  
WASHINGTON, DC 20426**

August 25, 2015

OFFICE OF THE CHAIRMAN

Ms. Margaret Burch  
Town of Conway Board of Health  
5 Academy Hill Rd.  
P.O.Box 240  
Conway, MA 01341

Dear Ms. Burch:

Thank you for your July 27, 2015, letter regarding Tennessee Gas' proposed Northeast Energy Direct Project (Docket No. PP14-22-000).

On June 30, 2015, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the planned Northeast Energy Direct project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, which initiated the formal public scoping period and indicated the locations, dates, and times for the public scoping meetings. The Notice of Intent established a scoping period that will conclude on August 31, 2015. Although we do not intend to extend the formal scoping period, staff will continue to consider comments throughout its review of the project. I encourage the Board of Health of the Town of Conway to continue to participate in the review of the project, and to file any comments that you believe will help the Commission consider this matter.

Your letter indicated that your primary areas of concern included air and water quality, noise, public safety, and emergency response. As stated in the Notice of Intent, after Tennessee Gas files its formal application with the FERC, Commission staff will produce a draft environmental impact statement (EIS) that analyzes environmental impacts that may result from construction and operation of the project. The EIS will address impacts on environmental resources and public safety. Public comment meetings will be conducted to consider comments on the draft EIS. Staff will then issue a final EIS, which will address comments received on the draft.

The Commission will then make its decision on the application. The decision will be based on a careful review of the entire record, including public comments, and will be rooted in the law, facts, and science.

If I can be of further assistance in this matter, I hope you will not hesitate to let me know.

Sincerely,

Norman C. Bay  
Chairman

WASHINGTON, DC 20426

August 25, 2015

OFFICE OF THE CHAIRMAN

Carol Jameson  
Town of Richmond  
105 Old Homestead Highway  
Richmond, NH 03470

Dear Chairman Jameson:

Thank you for your July 14, 2015, letter regarding Tennessee Gas' proposed Northeast Energy Direct Project (Docket No. PF14-22-000).

On June 30, 2015, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, which initiated the formal public scoping period and indicated the locations, dates, and times for the public scoping meetings. The meeting locations were selected to be convenient for the greatest number of people who might be interested in the project.

I appreciate your offer to host a scoping meeting at your historic Veteran's Hall.

However, Commission staff does not plan to hold a meeting in the Town of Richmond. As mentioned in the Notice of Intent, Commission staff is planning a scoping meeting in Cheshire County, New Hampshire, which should be convenient for the citizens of your town. The date and location for that meeting will be announced with a future notice, once the details are finalized.

While scoping meetings are a valuable tool for us to receive comments from the public, they are only one of several ways for interested parties to bring their concerns to the attention of the Commission. Stakeholders may also file written comments with the Commission. Those comments will receive the same attention and scrutiny as comments received at the public meetings.

As in any Commission matter, please be assured that we strive to make our review of energy proposals both accessible and transparent to the public. If I can be of further assistance in this or any other Commission matter, I hope you will not hesitate to let me know.

Sincerely,

Norman C. Bay  
Chairman

August 25, 2015

OFFICE OF THE CHAIRMAN

Senator Stan Rosenberg  
State House, Room 332  
Boston, MA 02133-1053

Dear Senator Rosenberg:

Thank you for your July 14, 2015, letter regarding Tennessee Gas' proposed Northeast Energy Direct Project (Docket No. PF14-22-000).

On June 30, 2015, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, which initiated the formal public scoping period and indicated the locations, dates, and times for the public scoping meetings. The meeting locations and dates including for

the July 29 Greenfield meeting were selected to be convenient for the greatest number of people who might be interested in the project.

While scoping meetings are a valuable tool for us to receive comments from the public, they are only one of several ways for interested parties to bring their concerns to the attention of the Commission. Stakeholders may also file written comments with the Commission. Those comments will receive the same attention and scrutiny as comments received at the public meetings. As a matter of policy, Commission staff continues to fully evaluate any comment received after the close of the comment period, making any formal extension of the comment period unnecessary. I encourage you and your constituents to continue to participate in the review of the project, and to file any comments that you believe will help the Commission consider this matter.

As mentioned in the Notice of Intent, Commission staff is planning a scoping meeting in Cheshire County, New Hampshire, which may be convenient for the citizens near Greenfield. The date and location for that meeting will be announced with a future notice, once the details are finalized.

As in any Commission matter, please be assured that we strive to make our review of energy proposals both accessible and transparent to the public. If I can be of further assistance in this or any other Commission matter, I hope you will not hesitate to let me know.

Sincerely,

Norman C. Bay

**INTERAGENCY PRE-FILING CONFERENCE CALL**

Tennessee Gas Pipeline Company, LLC

Docket No: PF14-22-000

NORTHEAST ENERGY DIRECT PROJECT

**August 20, 2015**

Agencies in Attendance (list of attendees is attached):

- Federal Energy Regulatory Commission (FERC)
  - o Cardno (FERC 3rd Party Contractor)
- U.S. Army Corps of Engineers (USACE)
- U.S. Environmental Protection Agency (USEPA)
- U.S. Fish and Wildlife Service (USFWS)
- PA Department of Conservation and Natural Resources (PA DCNR)
- NY State Department of Environmental Conservation (NYSDEC)
- NY State Department of Agriculture
- NY State Parks and Rec
- NY State Department of Public Health
- MA Attorney General's Office
- MA Department of Public Utilities (MA DPU)
- NH Fish and Game Department (NH FGD)
- NH Public Utilities Commission (NH PUC)
- NH Division of Historical Resources (NH SHPO)
- NH Office of Energy Planning (NH EP)
- NH Natural Heritage Bureau
- CT Department of Energy and Environmental Protection (CT DEEP)
- CT Department of Public Health (CT DPH)
- Nashua Regional Planning Commission
- Berkshire Regional Planning Commission
- Northern Middlesex Council of Governments
- Southwest Regional Planning Commission
- Tennessee Gas Pipeline (Tennessee Gas)
  - o Hatch Mott (Contractor for Tennessee Gas)
  - o AECOM (Contractor for Tennessee Gas)

**Meeting Summary**

The conference call was conducted to review the general status of the Northeast Energy Direct (NED) Project, including the Project's schedule, field surveys, landowner coordination, and the National Environmental Policy Act (NEPA) process. Topics discussed included:

- Project Reporting and Scoping

- o Last week FERC held scoping meetings in Dracut, MA and in Lunenburg, MA. Both were well-attended. Close to 600 people attended Dracut meeting and approximately 200 - 250 people attended Lunenburg meeting.
- o FERC met with MA state agencies in Boston and the Dracut Pipeline Awareness group in Dracut, MA last week.
- o Approximately 4,200 comments are on the record for the NED Project. FERC still has approximately 100 more to put on the record.
- o The scoping meeting location previously identified in Cheshire County, NH was not viable given the short amount of time to notify the public. FERC will likely schedule a scoping meeting in Cheshire County, NH in late September.
- o There will be an extension of the scoping comment period by at least two weeks 8/15/. FERC will issue the Notice of Intent (NOI) soon, once a location for the additional scoping meeting in NH is identified.
- o Tennessee Gas will be holding additional open houses in MA and NH the weeks of Sept. 7th and Sept. 14th. FERC will hold scoping meetings during a separate timeframe so people will be able to attend both the open houses and scoping meeting.
- o FERC is preparing the data request to send to Tennessee Gas. FERC requests agencies please send Eric Tomasi questions to include in the data request by Sept. 4th.
- o If agencies are not satisfied with responses provided by Tennessee Gas in the previous data request, they can request the data again. If Tennessee Gas states they do not have the data and will provide it, they will need to provide a schedule for when the information will be provided. If the response from Tennessee Gas is still not satisfactory then agencies can request more specific information.
- o Tennessee Gas has been monitoring the comments as they come in. They are prepared to address as many as they can.
- o Federal agencies may plan to schedule a meeting with Tennessee Gas prior to the October 24 filing.
- Tennessee Gas status update:
  - o Surveys
    - Access
      - NED East (Wright to Dracut) – 37% access granted.
      - NED West (Pennsylvania to Wright) – 53% access granted
      - Starting to work on surveying access roads and yards along NED East
    - Wetlands and Threatened and Endangered (T & E) species
      - Focusing wetland surveys in areas they can complete prior to FERC filing.
      - o NED East – 75 miles completed
      - o NED West – 98 miles completed
      - Continuing surveys for T & E species within applicable timing windows and in areas they have approval.
    - Cultural Resources
      - ≠ About 41 miles along surveyed NED East.
      - ≠ About 98 miles surveyed along NED West.
    - The survey window for acoustical bat surveys closed August 15th. All acoustical surveys completed. Conducting two bat hibernacula studies next month.
    - Berkshire Planning Commission will provide Tennessee Gas with additional information regarding bat hibernacula locations.

- Tennessee Gas preparing for mussel, herpetological, and bog turtle surveys next month.
- Civil Survey –
  - ≠ Detailed Survey, includes centerline survey, only for property they have access to
    - o NED East – 47% completed, 23% partially completed
    - o NED West – 88% completed, less than 1% partially completed
  - ≠ Staking
    - o NED East – 56% of accessible areas are staked
    - o NED West – 100% of accessible areas are staked
  - o Staking
    - o NED East: 56.3-miles + 15.3-miles = 71.6-miles
    - o NED West: 101.1-miles + 2.4-miles = 101.5-miles
    - o TOTAL: 173.1-miles
  - o Tennessee Gas has flown the entire route and will be presenting this data as hi-resolution aerial photography on maps in the application. Data presented in the application will be a combination of real-time survey data from accessible properties and wetlands delineated on non-accessible properties by hi-resolution aerial photography data. If both of these data sources are not available then Tennessee Gas will use publically available data. Ground-truthing would only be possible on inaccessible properties if FERC issues a certificate.
  - o An open house was held in Farmington, CT on August 13th. Five additional open houses in NH are planned in Sept.
  - o FERC requested Tennessee Gas provide additional information to the public during open houses regarding representation of compressor stations. FERC also requested Tennessee Gas ensure that appropriate company representatives are on hand to answer questions.
  - o Tennessee Gas is coordinating NH Site Evaluation Committee (SEC) information sessions to occur prior to NH SEC application filing around the end of Sept.
  - o Tennessee Gas continues to work on revising resource reports towards an application filing date of Oct. 24th.
  - o Meetings are scheduled in NY for next week and week after. Tennessee Gas is meeting with MA agencies regarding the MA Environmental Policy Act (MEPA) and SEC process. Also arranging pre-application meetings with PA agencies and USACE.
- Miscellaneous:
  - o Transcripts of the scoping meetings will be posted on Elibrary.
  - o Request that Tennessee Gas archaeology survey teams digging on agricultural property put soil back after survey. Also request that survey teams notify all landowners that requested notification prior to survey.
  - o Issue from another pipeline project - No metal stakes, pins or flags of any kind should be put in agricultural fields.
  - o Request for more information regarding alternative route proposed on North Stamford Rd. in Broome County, NY. This alternative may be part of a larger route alternative being analyzed by Tennessee Gas as requested by NYSDEC. Information regarding this alternative will be provided in Resource Report 10 in next filing and will be provided to NYSDEC.
  - o Field surveys are typically not conducted along alternative routes, only desktop studies. FERC may require field surveys along a route alternative as a recommendation of the order, or anytime in the filing process, but only in special cases. If a route variation becomes a viable alternative, FERC

would initiate the scoping process and would open a comment period for those landowners along the alternative route.

### Next Call

- Agency call will be held every 2 weeks.
- Next call scheduled for September 3, 2015.

### List of Attendees

<u>Organization</u>	<u>Name</u>
FERC	Eric Tomasi
FERC	Elaine Baum

Nic Tedesco, Groton, CT.

Broadly, FERC should consider methane emissions and the climate disruption that results; air pollution from increased emissions and leaks of methane and other pollutants; harm to water; harm to human health; and the risk to endangered and threatened species of plants and animals.

Specifically in the environmental impact statement, FERC needs to take into account the increased amount of methane emissions that this large project will pour into our atmosphere. Earlier this month the EPA proposed new standards to reduce methane emissions by 45% over the next 10 years. The EPA recognizes that methane is a potent global greenhouse gas, far worse than carbon dioxide at trapping heat in the atmosphere. The NED project will make those reductions in methane emissions impossible, and will cause irreparable harm to our climate.

Furthermore, these shale gas expansion projects are segmented into two, the Connecticut Expansion and NED. FERC must acknowledge that this is the case, and admit that the environmental harm caused by these two projects is cumulative. They are not separate projects, and FERC has been guilty of illegal segmentation in the recent past.

The potential harm to water has been raised by the Hartford MDC, the municipal corporation responsible for providing clean water to 400,000 people in the Hartford area. In a June 26 letter to FERC, MDC Chief Executive Officer Scott Jellison wrote “to express some concern that the proposed pipeline could potentially impact MDC’s public drinking water supplies in West Hartford and Bloomfield, CT.” FERC must address the concerns of MDC and the public about the impact of pipeline construction and operation on drinking water.

FERC should take into account the frequency of pipeline leaks and explosions, and factor in the costs to local communities, who bear a burden when environmental harm from pipeline accidents occur. According to the Pipeline Hazardous and Safety Material Administration, leaks and explosions are not uncommon and have increased in frequency in recent years.

**20150827-5003**

David M. Hutchison, Oneonta, NY.

FERC must consider Global Warming as one of the environmental issues associated with the Northeastern Energy Direct gas Pipeline.

Recently the Environmental Protection Agency (EPA) has announced regulations to reduce methane emissions which are a major contributor to global warming. FERC also must comply with this global warming concern in its environmental review of all natural gas (mainly methane) pipelines including the Northeastern Energy Direct(NED)pipeline.

Methane emissions occur during drilling for natural gas, transmission of natural gas (via migration thru the steel pipes and welds between lengths of pipe) and compression of natural gas along the pipeline.

Cornell University Professors Robert Horowath and Anthony Ingraffea have demonstrated this concern in peer reviewed papers published in the last three years. FERC MUST consider methane as no better than the carbon dioxide released from the burning of coal.

Construction of the NED pipeline will support the use of natural gas, but we now know gas is really no better than coal when we look at its effect on global warming. Natural Gas (Methane) is really no better than coal and the environmental review by FERC should consider this. Methane is the “Elephant in the Room”- which FERC needs to acknowledge in its review of the environmental effects of pipeline construction.

David M. Hutchison PhD in Geology and retired geologist

**20150827-5004**

Evelyn Taylor, New Ipswich, NH.

Kinder Morgan/Tennessee Gas indicates no organic farms will be put in harm's way by the pipeline or compressor station. I grow organic foods for me, though why would I pay to become certified? Furthermore, if pipelines and compressor stations are safe, why would this matter? **THEY ARE NOT TO FOOD, SOIL, AIR, WATER, WILDLIFE, PLANTS or PEOPLE.** They are harmful, they are toxic, they inflict torturous harm. FERC must wake up to common sense and reject this pipeline. We need to construct renewables and protect what small places remain with potable supplies of fresh water drinking supplies. This is common sense. This is something's that's understood by children. FERC needs to call these pipelines out and stop destroying the **FOOD, SOIL, AIR, WATER, WILDLIFE, PLANTS and PEOPLE.** FERC -- go visit people who have become ill. Go see the farms that can no longer grow edible food. Go see the animals that being born with defects. Go see the aborted fetuses. Open your eyes and see the real world. This is a diaster to the planet, as coal mines have become, as gold mining destruction has become, as nuclear waste has become. I will not be a victim of this torture. Go tell Kinder Morgan I want to know how they will protect me from the torture the New Ipswich compressor station will rain upon me. Go tell Kinder Morgan I want a list of all the toxins. Go tell Kinder Morgan I want the Hazardous Material Data Sheets for each toxin. Go tell Kinder Morgan I want their assessment of these toxins. Go tell Kinder Morgan I want them to **PROVE** unequivacably that there will be no toxins harming me as I sit within the 1/2 mile radius of the proposed New Ipswich Compressor Station. Go tell Kinder Morgan I want them to **PROVE** to me that I will have my clean water preserved. Go tell Kinder Morgan to **PROVE** to me that I will have dark, quiet, uninterrupted peaceful sleep in my home. Go tell Kinder Morgan that they can't prove any of this and thus it is proof this project is torturous as it destroys life-sustaining ecosystems and our human biology.

**20150827-5005**

Monika Ph, WH, CT.

Dear Secretary Bose,

I am writing in regards to Docket number PF14-22, Kinder Morgan's Northeast Energy Direct (NED) project.

In the environmental impact statement, FERC needs to take into account the increased amount of methane emissions that this large project will pour into our atmosphere. Earlier this month the EPA proposed new standards to reduce methane emissions by 45% over the next 10 years. The EPA recognizes that methane is a potent global greenhouse gas, far worse than carbon dioxide at trapping heat in the atmosphere. The NED project will make those reductions in methane emissions impossible, and will cause irreparable harm to our climate.

Furthermore, these shale gas expansion projects are segmented into two, the Connecticut Expansion and NED. FERC must acknowledge that this is the case, and admit that the environmental harm caused by these two projects is cumulative. They are not separate projects, and FERC has been guilty of illegal segmentation in the recent past.

The potential harm to water has been raised by the Hartford MDC, the municipal corporation responsible for providing clean water to 400,000 people in the Hartford area. In a June 26 letter to FERC, MDC Chief Executive Officer Scott Jellison wrote "to express some concern that the proposed pipeline could potentially impact MDC's public drinking water supplies in West Hartford and Bloomfield, CT." FERC must address the concerns of MDC and the public about the impact of pipeline construction and operation on drinking water.

FERC should take into account the frequency of pipeline leaks and explosions, and factor in the costs to local communities, who bear a burden when environmental harm from pipeline accidents occur. According to the Pipeline Hazardous and Safety Material Administration, leaks and explosions are not uncommon and have increased in frequency in recent years.

Yours,  
A Concerned Environmentalist

August 26, 2015  
RE: Northeast Energy Direct Project  
Docket Number PF14-22

I am writing to add my voice to those of the many individuals who are opposed to the Northeast Energy Direct (NED) proposed gas pipeline. While my family and I reside on Long Island, we do have a second home in Stephentown, New York (Rensselaer County) where we spend a great deal of time.

I am extremely concerned about the safety aspects connected with this pipeline, and the impact it will have on the lives of thousands of people who would live near it if it were completed. We have seen time and time again the disastrous results of so many accidents connected with the oil and gas industry, yet lessons have not been learned. I am fearful that the clock is ticking, waiting for another catastrophe to occur. Say what you will about the assurances given to us by the managers of these ventures – I just don't believe them.

In addition to the safety concerns, I also worry about the impact on our environment. I would not want to live near one of the compressor stations that Kinder Morgan plans to build, and I certainly support others who might reside in the shadows of these stations in their efforts to stop them from being constructed.

New York State has a moratorium on hydro-fracking for good reason – why should we support a process that has many risks and downsides associated with it? Therefore, it stands to reason that if my state is opposed to hydro-fracking, we should also stand against any infrastructure through our state connected with this.

And finally, I am a staunch believer in the development of reusable forms of energy such as solar and wind. Individuals supporting hydro-fracking are simply shackling us once again to a dependence on fossil fuels. We must do all we can to protect our earth. After all, if we don't, then what?

Thank you for taking the time to read my comments.

Sincerely,  
Alan Fox

**20150827-5008**

Patricia H. Silvestro, Temple, NH.  
Comment on FERC Docket PF14-22

Dear Secretary Bose:

The Temple Elementary School would be in the “burn zone” and within close proximity to the “incineration zone” of the pipeline, as well as within the half-mile “buffer zone” of the compressor station. That's immoral! If there's an accident, the students would perish before volunteer fire and police department personnel could save them. Toxic chemicals released by compressor station “blow downs” will settle in the air where they will be inhaled by the children, and to the school grounds where they will be absorbed through their skin. As these toxins perk down to our aquifers, our water source will be poisoned. The NED pipeline/compressor station project proposed by NESCOE, KM, & TGP is in violation of FERC Statements of Policy, and thus illegal, as it won't benefit the people of NH, only KM/TGP who stand to make large profits. NH doesn't need more gas; we already have a surplus! Granting approval for this pipeline/compressor station

project is granting permission to endanger our kids' lives, and all for unmitigated greed!

Sincerely,

Patricia H. Silvestro

**20150827-5009**

Richard R. Silvestro, Temple, NH.

Dear Secretary Bose:

New Hampshire news carried the story a a short time ago that Liberty Utilities made some agreement with Kinder/Morgan to use a bit of the gas from the NED Pipeline. This does not change the fact that New Hampshire has an excess of available energy that should last for the next thirty years. This agreement between the two corporations does not qualify as a need for more gas, and under no circumstance justifies the personal health, fiscal wellbeing and safety risks to the people nor the environment of Southern New Hampshire. And yes, our Temple Elementary School is in the incineration zone of the New Ipswich compressor station as is the reservoir which is the potable water supply for the town of Greenville, NH. STOP THEM!

Richard R. Silvestro

**20150827-5011**

Julia Steed Mawson, Pelham, NH.

Kimbery D. Bose, Secretary

Federal Energy Regulatory Commission

888 First St. NE

Washington, DC 20426

Dear Ms. Bose

I am an abutter, biologist and extension educator emeritus with the University of New Hampshire. I am writing to express my concern and opposition regarding the Kinder Morgan Northeast Energy Direct (NED) export pipeline proposed to cut through southern NH and the region. I request that the Federal Energy Regulatory Commission (FERC), put the brakes on projects like NED that perpetuate fossil fuel addiction. Further I find it unconscionable that Kinder Morgan (aka Tennessee Gas Pipeline, aka Algonquin ... linked to Liberty Utilities) are planning to add a tariff to all NH utility ratepayers to pay for this 5.2 BILLION DOLLAR project that is not needed and that does not benefit NH. The sole purpose is to move methane, a fracked, high potency greenhouse gas, through NH in high volume, high pressure pipes to Dracut, MA to facilitate export. This is an overbuild project for export. I highly resent that my property, those of my neighbors, and those of our rural treasures to the west (and south in Dracut) would be taken by eminent domain for the enormous profit of a private company.

I recommend that you deny this proposal.

Sincerely,

Julia Steed Mawson

17 South Shore Dr.

Pelham, NH 03076

**20150827-5021**

RE: Proposed 90,000 HP Compressor Station On Clarks Chapel Road In Nassau, NY

Dear FERC Board Members,

My name is Brian Wiese and I am writing this letter to express my opposition to the proposed compressor station and pipeline to be located on Clarks Chapel Road in Nassau, NY. My wife, myself and our 3 young

children live ~ mile away from the proposed compressor station site and I have many concerns regarding the impact this will have on our local environment, our safety, as well as on us economically. We have lived in our home for 10 years and my wife and I built our home with the intent to live our lives out here. Our property was passed down to us by my wife's parents and we specifically chose to live here to stay near family and to raise our children away from commercial and industrial structures such as the proposed compressor station.

Our town's zoning laws prohibit this compressor station and it seems as though these zoning laws are not even being given consideration. This is a private company and they should be expected to uphold not only federal and state, but also local laws. These laws are set forth to protect the town's tax paying residents and these laws alone should contribute to the outcome of this proposal.

### **ECONOMIC IMPACTS**

If this proposal is accepted and the compressor station goes on our road it will have an economic impact on us in multiple ways. We have invested a tremendous amount of time and finances these past 10 years to clearing our property, setting up barns and fencing with the intention of using our property to becoming more self-sufficient and with a longer term goal of starting up a non-profit organization utilizing our animals (currently goats, chickens, and a horse) for rehabilitating physically and mentally challenged children. We have also begun the learning process of how to make soaps, cheese, and other products from the goats' milk with the intentions of selling these products at some point in time. Another concern I have is in regards to Chanterelle mushrooms we have growing in our woods. These mushrooms are a specialty and I know for a fact they are also growing on properties surrounding the proposed site. They can only be harvested in a natural environment setting and have not been able to be produced commercially. While we mostly use them personally at this time we have provided them to an area restaurant in the past for compensation.

The mere hazards, both environmental and with safety, that come with a compressor station will prompt us to look to moving away from this area and trying to start all over. This would lead into another economic hardship for us due to property value decreases. I have seen articles posted regarding a drop in property values of surrounding residential properties from the construction of a compressor station from anywhere between 31% and 50%. Even if this is conjecture the reality would be that people are not going to be interested in paying the current value of our property if the compressor station and pipeline are in the picture. I ask that FERC and/or Kinder Morgan provide independent studies/assessments done on surrounding property values in the vicinity of existing Compressor Stations to prove that property values are not impacted based on market sale price and not only municipal assessed values for taxing purposes.

### **ENVIRONMENTAL IMPACTS**

Another major concern we have is in regards to the impact on our local environment. Not but a little more than a mile from the proposed compressor station site currently sits an EPA Superfund Site, the Dewey Loeffel Landfill (Article included). This site is where GE dumped PCBs, amongst other things, a few decades ago that has since contaminated residents well water along with water ways including the Valatie Kill and Nassau Lake. The proposed compressor station site currently has a water way running through it that dumps into the

Valatie Kill which is one of the contaminated streams currently being addressed. I would like to know how FERC and Kinder Morgan plan to address this to ensure the Dewey Loeffel cleanup is not impacted. In addition, there is a nearby aquifer (See Map Appendix A) that comes very close, if not on, to the current proposed property of the compressor station. The location of the compressor station and pipeline path will directly impact this aquifer. I would like to know how Kinder Morgan plans to keep that aquifer undisturbed and safe from any chemicals or toxins.

As far as a direct impact on us, we have a large garden with fruit trees, blueberries, strawberries, raspberries, blackberries, and all kinds of vegetables. Our new addition this year were bees so we could have natural honey and they could help with the pollination process of our garden. We have a pond with all kinds of species of fish and for the past two years we have tapped our maple trees to make natural maple syrup.

Based on my research into the emissions of compressor stations it appears that there are a good number of toxins released with the most prevalent being Methane. I have tried to use objective and credible information to make my assessments. Sources I have used and attached to this letter are as follow:

1. Natural Gas STAR Program - U.S. EPA (Appendix B)
2. Overview of Greenhouse Gases - U.S. EPA (Appendix C)
3. U.S. Greenhouse Gas Inventory Report: 1990 - 2013 (Appendix D)
4. Southwest Pennsylvania Environmental Health Project - Summary of Compressor Stations and Health Impacts (Appendix E)
5. Sources and Environmental Impacts of Acid Rain and Acid Deposition - NYS Department of Conservation. (Appendix F)

These articles speak to the potency of Methane, numerous toxins emitted from compressor station facilities, health impacts experienced from those living and working near compressor stations, and the effects acid rain will have on the environment which will likely increase with emitted toxins.

There are many other articles I have researched, but these are definitely the most credible. Based on this research I am of the opinion that because of the emissions given off by the compressor station my animals, garden, and fish are at a much greater risk of pollution and contamination which puts my family at greater risk because this is a part of our food source and well-being.

As part of my research I also tried to gain a better understanding of FERC's role in this project which I found the Strategic Plan for 2014 - 2018. What was encouraging to me was what was stated on pages 17 - 21 regarding these projects. On page 18 it states that "terms and conditions are designed to protect, mitigate, and enhance the environmental resources of the project areas". On page 17 it also states that FERC has on staff "highly trained biologists, archaeologists, geologists, other environmental scientists, and engineers to thoroughly analyze the environmental effects of proposed gas pipelines and facilities".

Based on these statements I would ask that FERC provide us with what the impacts are on the soil, air and water for the site and surrounding community for existing compressor stations that are similar in size to the 901000 HP proposed facility? It is apparent from the strategic plan that FERC conducts regular inspections for the "life cycle" of these facilities and I would like to review the actual impacts on communities surrounding current compressor station sites to see what the long term risks would be on my family and community. I would also ask that FERC provide independent studies of environmental impacts on water, soil, and air of surrounding communities to existing compressor stations to show that these facilities are safe to the environment as Kinder Morgan claims. If studies do not exist then I ask that this project be delayed until these studies can be produced or the location of this project be moved all together to a path that has minimum exposure to personal property and human life.

## **SAFETY IMPACTS**

My greatest concern with the proposed compressor station and pipeline is the safety of my family and neighbors if something should go wrong. Accidents happen and natural gas is a volatile and explosive substance. One thing I noticed was that the proposed path of the pipeline runs up against the property line of a proposed, but most likely soon to be operational mine owned by Troy Sand and Gravel. It is also my understanding that because the pipe is going in a rural environment Kinder Morgan is allowed to install a thinner grade pipe. The combination of blasting in a mine with a natural gas pipeline nearby does not seem too safe. I would like to know how FERC and Kinder Morgan plan to address this danger to ensure the safety of the nearby residents.

In an article attached entitled "Kinder Morgan Accidents & Safety Violations" (Appendix G) it shows that Kinder Morgan has experienced 36 "significant incidents" in Texas alone from 2003 to 2014. That is an average of 3 per year in just 1 state. It also states that they have had at least 180 accidents nationwide in that time period which is an average of at least 15 per year. My concern centers around what is being called the "incineration zone". There are two parts to this. The first being the pipeline itself. In the graph below it

shows that the incineration zone for a pipeline explosion with a 36" pipe is about 1000'. Just following the proposed pipeline out from the compressor station and going west ~ mile there are 4 possibly 5 households that would be within that zone.

*{figure omitted}*

Figure 2.4 Proposed hazard area radius as a function of line diameter and pressure.

Where I have had some difficulty in getting a solid distance is with the compressor stations. I have found information indicating anywhere from .2 to .4 or even ~ mile is the incineration zone. Within ~ to 1/2 of a mile from the compressor station we counted 50 known children living in the surrounding homes. There is a high likelihood that the number is higher and increases dramatically more as you get closer to Burden Lake. I would ask that FERC please provide us with what the correct "incineration zone" distances for both pipeline and compressor stations are.

The proposed compressor station site falls in the jurisdiction of the Hoags Corners Volunteer Fire Department. If you look at the Albany Fire Department where the firefighters are paid and fire houses staffed 24/7 you will see that according to the Albany Permanent Professional Firefighters Association, citywide the department responds to more than 22,000 calls annually with an average response time of 4 minutes. In comparison, the Hoags Corners Volunteer Fire Department shows on its website that it responds to only 150 - 275 calls annually. When you MapQuest the Hoags Corners Volunteer Fire Department to the proposed compressor station site the drive time is 9 minutes. You combined that with the fact that the firefighters are volunteers and would have to first travel to the fire house from home, work, or where ever, get their gear on and then take the 9 minute drive the response time would have to be 15 to 20 minutes. In a catastrophic event how could the Hoags Corners Volunteer Fire Department be expected to handle it when they would be under manned and under equipped in their current state? I would like to know how FERC is going to require Kinder Morgan to deal with this situation. In addition, I find that the pipelines being located where they are proposed would make it extremely difficult for emergency personnel to respond to an incident or leak in the winter when there may be several feet of snow built up and there is no requirement for the clearing of the proposed line. On page 19 of the 2014 - 2018 FERC Strategic Plan there is a recognition of the inherent dangers of compressor stations and pipelines when it states "failure of an LGN facility or a non-federal hydropower project can result in loss of life and significant environmental and economic consequences". This is a real viable danger to our community and given the current challenges for emergency personnel and how close homes are to this proposed site I don't think this makes any sense for the safety of all those in the cross hairs of this project.

An additional safety concern we have is the fact that these compressor stations are to be "unmanned" and run remotely. In today's world of terrorism that would make for a "soft" target. I would like to know how Kinder Morgan plans to protect this facility against any acts of terrorism or vandalism that could result in a catastrophic event on our community.

### **ADDITIONAL CONCERNS**

There are two additional concerns I would like to address. The first being with construction of the proposed compressor station. Our local roadways are in no way rated to handle the heavy equipment needed for the construction of this project. Most county roads, including Clarks Chapel Road, have weight limits of 10 ton. An empty triaxle dump truck weighs about 20 ton empty and around 40 ton full. A lowboy trailer with equipment weighs about 50 ton. We also have multiple roads that will have to be used for the pipeline that are dirt roads only. The weight of numerous construction vehicles will without question have a negative impact on our roads. With a tight municipal highway budget our town is not in a financial position to be repairing our roads due to excessive wear and tear. I would like to know how Kinder Morgan is going to ensure that these roadways are not damaged or negatively impacted through the construction process.

Another item of concern is the Nassau Sportsman Club where the pipeline is proposed to pass through their pond and property. Over the past two years they have made major investments into their property to be better suited for weddings and events. They hold anywhere from 50 to 75 events annually. They just had their

annual fishing derby where it was estimated that around 400 people, mostly children, took part. This site should be considered a High Consequence Area because of the number of people that could be impacted if there should be a catastrophic event. It should also be noted that Kinder Morgan should provide the Nassau Sportsman's Club with a detailed plan as to how they plan to run the pipe through the club's pond, where there was a huge investment last year to improve it, and make sure it is restored to its current state.

### **ALTERNATIVE LOCATIONS**

One thing that has been conveyed as an option is the suggestion of alternate routes. I would like to make three suggestions.

1. Since the gas is coming from Pennsylvania why has it not been proposed to make a direct line through Pennsylvania to the Port of Philadelphia? There is a YouTube video discussing how the Port of Philadelphia is expanding its facilities, services and now has a deeper river channel. You can see this by searching the Philadelphia Regional Port Authority on YouTube. Currently there are 9 proposed compressor stations planned to go through New York, Massachusetts, and New Hampshire. If the path went to the Port of Philadelphia it would cut out a number of compressor stations there by reducing the overall methane emissions. The gas could then be shipped to Boston.
2. If it is necessary to go through NYS then I would suggest when the pipeline to come up the 1-88 corridor and follow 1-90 to the Massachusetts Turnpike corridor. For most of the stretch to Boston there is a median between the west bound and east bound lanes where the pipe could be buried. I would even go as far as suggesting Kinder Morgan put in their own exits and entrances to the highway for the compressor stations and set the compressor stations off the road a reasonable distance and in an area where there are no households. This path would provide emergency personnel with easy and quick access to both compressor stations and the pipeline if needed.
3. There is an existing pipeline going through southern Rensselaer County owned by Kinder Morgan. Use that existing line and upgrade if needed to larger and newer lines.

On page 17 of the 2014 - 2018 FERC Strategic Plan there is the claim of expectation that "the responsible development of interstate natural gas infrastructure - pipelines, storage, and LNG facilities - is a critical link in ensuring that natural gas supply can reach market areas". I would think that a critical factor in ensuring responsible development would first be location. With the reality of "incineration zones" can and will the federal government ever set a location requirement for compressor stations and pipelines where residential structures are to be beyond the distance of the defined "incineration zone". Kinder Morgan's proposed location on Clarks Chapel Road does not line up with FERC's stance to "promote the development of safe, reliable, secure, and efficient infrastructure that serves the public interest". Let's be honest here. The gas moving through these proposed pipes will not benefit this community in any way yet we are expected to assume 100% of the risks involved. I don't see where this serves our public interest in any way. The stated purpose of the NED Pipeline from Kinder Morgan is fulfill the need for natural gas in the northeast. These pipes are projected to move 2.2 billion cubic feet per day yet we were informed by James Hartman from Kinder Morgan that at this point they have only locked up customer orders for .5 billion cubic feet per day. That is only 23% of production. Again the need is not there and does not meet the parameters of serving the public interest. Even if Kinder Morgan "downsizes" the size of the pipe or the compressor station my concern would still be with the fact they can always upgrade the pipe and/or facility in the future to make either larger which would only increase the concerns outlined in this letter.

I would just ask that you put yourself in our shoes. The home should be a place of safety, solitude, and comfort. A place where you can peacefully relax and get away from the everyday stresses we all deal with. As a father I am in charge of my families' safety and protection. I can tell you that my nights will not be filled with restful sleep if this project is approved. I would have to be on the alert at all times to be ready to get my family out and to safety if something should ever happen. It no longer sounds like "Home Sweet Home" to me. All I ask is that you apply what is outlined in FERC's Strategic Plan to this current proposal and make the decision that serves this public's interest which I would confidently say it should not go here.

Thank you for your consideration,  
Brian Wiese

**Re: Tennessee Gas Pipeline Company, L.L.C. (“TGP”) / FERC Docket No. PF14-22-000 –  
Comments on Environmental Issues with respect to the Environmental Impact Statement for the  
Planned Northeast Energy Direct Project (“NED”, “NED Project”, “NED Pipeline”) -- particularly  
regarding procedural issues and alternatives to the NED Project**

To the members of the Commission:

I respectfully request that the public comment deadline for the scoping of the Environmental Impact Statement (“EIS”) being prepared by the Federal Energy Regulatory Commission (“FERC”, “Commission”) be extended for the time period(s) discussed in Section I of this letter, for the reasons given therein.

I also request that the scope of the EIS with respect to the NED Project include a rigorous investigation and analysis of the renewable energy, energy efficiency and conservation, energy transmission, energy storage and demand-shifting alternatives to the NED Project, including but not limited to the alternatives discussed below, both individually and in any effective and reasonable combinations that would serve as an alternative(s) to the NED Project. Their likely respective environmental impacts, particularly including climate change impacts, should be compared to those likely with the NED Project. To the extent possible, that analysis and comparison should be quantitative, preferably presented both in units conventionally used for each respective energy source (e.g. MW, Bcf/d), and also presented using a common energy or energy equivalent unit, to facilitate comparison of alternatives (e.g. MMBtu). The alternatives should be comparatively assessed through an appropriate planning horizon (at minimum 2015 through 2038), for the reasons discussed below.

These EIS scoping comments are divided into the following sections:

- I. Procedural objections requiring the extension of the scoping process and the public scoping comment period (p.2)
- II. Need and uses
  - A. Demonstration of need and quantities involved, types of uses involved (p.5)
  - B. The export question (p.5)
- III. Timeframes and related scoping questions
  - A. Timeframe for planning horizon -- 23 years? 53 years? (p.10)
  - B. The merged nature of the electricity and gas demand questions (p. 11)
- IV. Alternatives, and scoping questions for each
  - A. Energy efficiency and conservation, including leak repair
    1. Energy efficiency (p. 13)
    2. Leak repair (p. 17)
  - B. Demand shifting into off-peak hours or off-peak days (p. 18)
  - C. Wind
    1. Growth of wind (p. 21)
    2. Dispatchability (p. 23)
    3. Intermittency, including a discussion of intra-regional transmission upgrades (p. 24)
  - D. Hydropower and interregional transmission (p. 25)

- E. Energy storage
  - 1. LNG (p. 28)
  - 2. Pumped Storage (p. 32)
  - 3. Grid-scale battery storage (p. 34)
  - 4. Other forms of storage (p. 35)
- F. Solar (p. 36)
- G. Biogas (p. 38)

**I. Procedural objections requiring the extension of the scoping process and the public scoping comment period**

As the D.C. Circuit Court of Appeals recently re-affirmed, an Environmental Impact Statement with respect to a pipeline project should not only discuss “in detail” the environmental impact of the proposed project, it should also discuss “alternatives to the action.”<sup>1</sup> NEPA more broadly requires FERC to “study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources”,<sup>2</sup> and to “recognize the worldwide and long-range character of environmental problems”.<sup>3</sup> In the age of dangerous climate change, this latter requirement could not be more relevant.

The Commission’s own implementing regulations with respect to NEPA also require the Commission to include in its EIS a discussion of “[a]ny alternative to the proposed action that would have a less severe environmental impact or impacts . . . .”<sup>4</sup> These regulations also require the project applicant to submit a Resource Report (Resource Report 10) that “describe[s] alternatives to the project and compare[s] the environmental impacts of such alternatives to those of the proposal.”<sup>5</sup> Under these regulations, the applicant’s Resource Report 10 must discuss the “no action” alternative “and the potential for accomplishing the proposed objectives through the use of other systems and/or energy conservation.”<sup>6</sup>

The Commission requires that the detail of such report “must be commensurate with the complexity of the proposal and its potential for environmental impact.”<sup>7</sup> Given the complexity and potential for environmental impact of the NED proposal, this requirement sets a high bar for providing enough detail in the Resource Reports, including Resource Report 10.

For this reason, I respectfully request that the public comment deadline for the scoping of the EIS be extended to at least sixty days after TGP submits fully completed Resource Reports. As many public officials and members of the public loudly complained at the Greenfield scoping meeting on July 29<sup>th</sup>, it was premature to hold the scoping meetings when the thousands of pages of revised Resource Reports had just been submitted a few days earlier by TGP. As many also complained, the revised July Resource Reports were notably incomplete, with hundreds – some said thousands – of “To Be Determined / TBD” entries noted in page after page of the Reports.

These Resource Reports are necessary for the public to have a better sense of the size, location and potential impacts of the project, in order to make informed comments on matters that need to be addressed in the EIS. As the Commission is aware, the required content of the Resource Reports under the Commissions regulations implementing NEPA is directly germane to the topic areas the Commission intends to cover in the EIS.<sup>8</sup>

Without limiting the generality of this request, I particularly request that FERC suspend or extend the comment period for the EIS, and refuse to accept any formal application for the project, until a sufficiently detailed Resource Report 10 is submitted by the applicant, in order to make the alternatives discussion (and related environmental impacts discussion) in the Commission’s EIS meaningful and adequate.

In addition to the completed Resource Reports, the public also needs to see at least the redacted versions of all or nearly all of the Precedent Agreements supporting a 1.3 Billion cubic feet of gas per day (Bcf/d) pipeline – showing quantities, customers and some indications of the types of uses – in order to make informed comment on many of the impacts, and particularly on the alternatives component of the EIS. Different quantities of gas, being delivered to or used by different customers, for different purposes will have different feasible alternatives, and different potential impacts – particularly with respect to climate

impacts. Please see the more detailed discussion in Section II relevant to this point.

A delay / restart of the scoping process would also benefit the Commission's review by the Commission being able to take advantage of (i) the Massachusetts Attorney General's planned October 2015 release of a report on energy options and gas demand,<sup>9</sup> and (ii) the Massachusetts Department of Energy Resource's planned January 2016 release of its Energy Storage Study.<sup>10</sup>

Therefore I request that the current scoping process be extended until (i) Kinder Morgan / TGP<sup>11</sup> has submitted complete Resource Reports, (ii) all, or nearly all of the Precedent Agreements for the full project capacity are on the table, (iii) the public has had at least 30 days to review the completed Resource Reports and all or nearly all of the Precedent Agreements, (iv) another round of public scoping meetings has occurred after that 30 day period, with 30 additional days after the meetings to submit written comments, and (v) the above-referenced Massachusetts Attorney General report and Massachusetts Department of Energy Resources energy storage study have been released and the public has had at least 30 days to review and comment on these to FERC with respect to their impact on EIS scoping.

## **II. Need and uses**

### **Scoping questions with respect to need and uses**

- (1) What is the current signed aggregate and individual Precedent Agreement(s) capacity requirement, and how much of that is 'repackaging' of pre-existing transportation agreements currently being transported on existing pipelines. What is the net incremental capacity required once that repackaging is netted out?
- (2) What entities are the Precedent Agreement customers, what would be the point of physical delivery to each customer, and what would be the likely principal uses of the gas for each customer?
- (3) What is the quantity of gas likely destined for U.S. consumers as the end users (i.e., users at the point of combustion or process use), compared to the quantity of gas likely destined for Canadian end users, and for overseas (non-Canadian foreign) end users?
- (4) Which Precedent Agreements, if any, are directly with electrical generators, and which generators are these?
- (5) What portions of the Precedent Agreement quantities for each Local Gas Distribution Company (LDC) are anticipated to serve electrical generators?
- (6) What Precedent Agreements, if any, have been signed with secondary gas capacity marketers, whose intent is to later resell NED transportation capacity on the spot market? What percentage of the NED capacity is projected to be contracted with such secondary marketers, directly or indirectly?
- (7) What is the likely amount of transported gas that will be used for electricity generation? How much of that will be used to displace oil-fired generation and at which generating stations will the oil displacement likely occur? How much will displace coal-fired generation and at which generating stations will the displacement likely occur? How much will displace nuclear generation and at which generating stations will the displacement likely occur?
- (8) What is the likely amount of transported gas that will be used to displace oil-fired space heating? Oil-fired water domestic water heating? Oil-fired commercial space and water heating? Oil-fired industrial water heating and process heating (and where)?

### **Reasoning behind scoping questions regarding need and uses**

Without knowing who will be receiving the gas from the Kinder Morgan pipeline, the volume of gas they will be receiving, and what they will be using it for, it will not be possible for the Commission to adequately assess the net environmental impacts of the NED project, particularly with respect to climate change impacts. Moreover, without knowing this information, it will be difficult or impossible to determine what alternatives could meet those needs, at that amount of energy (or energy savings), and whether those

alternatives would likely have lower environmental impacts.

## **II.A. Amount of gas needed, if any; types of uses**

As the *Boston Globe* recently reported, Kinder Morgan has gas transportation contracts for less than half of the recently downsized NED proposal – contracts for about 550 million cubic feet per day of gas<sup>12</sup> in a pipeline now planned to have an initial capacity of 1.3 billion cubic feet of gas per day (Bcf/d). (This 550 million cubic feet of gas per day [0.55 Bcf/d] corresponds approximately to the 500,000 dekatherms per day of executed precedent agreements that TGP reported in its July 2015 Resource Report 1.<sup>13</sup>) It's not clear how much of that 550 million cubic feet of gas per day is really just rewrites of existing gas capacity contracts, and so does not really require new pipeline volume (i.e., is being met on the current pipeline(s)).

So, at this time it is not possible for the public to determine where most of the gas in the NED project will be going, the net amount of new delivered energy it will really be providing to New England, what public benefits for American consumers it will therefore provide, and what net impacts it will have, particularly on the climate front, as discussed in more detail below. As noted in Section I above, that is one of the reasons the EIS scoping process should be extended until precedent agreements for all or nearly all of NED's planned capacity are in hand and on the table for review.

## **II.B The export question**

### **Scoping questions with respect to export**

- (1) What is amount and percentage of NED-transited gas that is likely to have Canadian customers as its ultimate end point users (point of combustion and/or industrial process use)?
- (2) What is the amount and percentage of NED-transited gas that is likely to go to LNG exporters for LNG export to foreign countries?
- (3) Where will those export facilities likely be located?
- (4) What is the likely shipping route, ultimate destinations and distances of such exported LNG based on ongoing negotiations, precedent agreements with those exporters or other evidence?
- (5) What will be the net increase in greenhouse gas emissions, and other environmental impacts, that will result from such export compared to the alternatives to such export, including, but not limited to impacts from export facility construction, liquefaction to LNG, maritime shipping fuel (bunker oil or other) for the LNG tankers, and re-gasification of the LNG?
- (6) Will any such export involve pipeline expansion or facility changes on the Maritimes & Northeast Pipeline ("M&NP") system to transit forward gas being delivered to the M&NP by the proposed NED Project? If so, a review of the environmental impacts of such M&NP expansion and changes should be incorporated into the NED Project's EIS, to avoid impermissibly segmenting NEPA review of interdependent projects that are physically, functionally and temporally related.<sup>14</sup>
- (7) How much of the NED pipeline's non-peak capacity is likely to become available to LNG exporters at each point in the year seeking to move Marcellus or other gas to Dracut, MA or other export avenues, and what are the contracting mechanisms that would allow such exporters to acquire such capacity from TGP, other NED Precedent Agreement contractees or the capacity spot market?<sup>15</sup>
- (8) Which, if any, LNG exporters has Kinder Morgan or TGP been in discussions or negotiations with regarding possible Precedent Agreements / Transportation Agreements or other agreements or memoranda of understanding with respect to NED capacity? What is the capacity amount involved in each such case?
- (9) Which, if any, LNG exporters does TGP already have executed Precedent Agreements / Transportation Agreements or other agreements or memoranda of understanding with, with respect to the NED? What are the capacity amounts involved in each?
- (10) What direct or indirect ownership interest does Kinder Morgan or TGP or any of their subsidiaries have in any company planning LNG export from the Northeastern U.S. or Atlantic Maritime Canada

area, and what direct or indirect ownership interest does any such LNG export company have in Kinder Morgan or TGP or any of their subsidiaries?

### **Reasoning behind scoping questions regarding export**

The Commission's EIS will inevitably inform the Commission's ultimate decision on whether to issue a certificate of public convenience and necessity for the proposed NED Project under 15 U.S.C. §717f. In its Statement of Policy providing guidance with respect to such certification, for example, the Commission stated that "[i]n considering the impact of new construction projects on existing pipelines, the Commission's goal is to appropriately consider the enhancement of competitive transportation alternatives, the possibility of overbuilding, the avoidance of unnecessary disruption of the environment, and the unneeded exercise of eminent domain."<sup>16</sup> (Emphasis added.)

The Commission has similarly explained that it "will determine whether a project is in the public convenience and necessity by balancing the public benefits against the adverse effects of the project", and that environmental impacts are among the adverse effects the Commission will consider.<sup>17</sup> For a U.S. federal commission, operating under U.S. federal law, this balancing test certainly cannot mean a balancing of public benefits to foreign energy consumers against adverse project effects that will be disproportionately imposed on U.S. residents. The Commission must weigh benefits to the U.S. public against adverse effects of the Project.

Therefore, an assessment of the proportion of the Project benefits that will accrue to U.S. energy consumers, versus benefits that will accrue to foreign energy consumers, will be critical in making the Commission's balancing test to determine whether to issue a certificate of public convenience and necessity for the NED Project. If the benefits of the Project will primarily, or even heavily, accrue to foreign energy consumers,<sup>18</sup> and the adverse effects, including environmental impacts, will disproportionately fall on members of the U.S. public, this should tip the scale heavily towards Commission denial of certification for the proposed Project. The scope of the EIS should be such that it can help the Commission assess the proportion of benefits that will accrue to the U.S. public versus the adverse effects that will disproportionately fall on that public.

In addition, environmental impacts would likely be greater with any export of the gas being transited through any NED Pipeline, particularly if the gas is converted to LNG for maritime export. Export would likely require longer pipeline transportation (e.g. to the Canadian border, or on to Nova Scotia or New Brunswick) with the attendant energy / climate impacts of the additional compressor energy and other pipeline facility energy required. LNG export would further involve additional climate and other impacts for the energy to liquefy, transport by ship and re-gasify the gas. (See discussion below.)

As Kinder Morgan has reported, the proposed NED gas pipeline would run from the Marcellus shale gas fields in Pennsylvania<sup>19</sup> into Dracut, MA,<sup>20</sup> to connect there to the Maritimes & Northeast Pipeline (M&NP) to Canada.<sup>21</sup>

Kinder Morgan recently stated that the NED project will provide additional natural gas transportation "to meet the growing energy needs in the Northeast U.S., particularly in New England".<sup>22</sup> However, TGP also recently reconfirmed that "[t]he proposed interconnection with the Joint Facilities, together with the anticipated reversal of the primary flow direction of the Joint Facilities and Maritimes & Northeast Pipeline, will potentially enable the [NED] Project to access more markets in the region, including . . . the Atlantic Canada region . . . ."<sup>23</sup>

Earlier statements by Kinder Morgan, filings by LNG export project proponents, and press reports suggest that a substantial portion of the NED pipeline's throughput could be destined for Canadian consumption and/or for foreign export as LNG out of proposed LNG export terminals in Nova Scotia, New Brunswick and/or Maine connected to the Maritimes & Northeast Pipeline, whose gas flow direction could be reversed to Canada (and away from New England).<sup>24</sup> The *Pittsburgh Post-Gazette* reported that five LNG export terminals are being planned for Canada's Atlantic coast, and that it "is likely all would need natural gas from the Marcellus [fields] . . . ."<sup>25</sup> Kinder Morgan has told investors: "Kinder Morgan's unparalleled natural gas

footprint is . . . [w]ell-positioned relative to major trends (Marcellus, . . . LNG exports . . .).”<sup>26</sup>

So, export to Canada via the proposed NED Pipeline seems a very real possibility, and subsequent LNG export of that gas from Canada (or Maine<sup>27</sup>) also seems likely.

Kinder Morgan in fact more specifically told your Commission: “Potential Atlantic Canada customers [for the NED project] include . . . liquefied natural gas (‘LNG’) export projects.”<sup>28</sup> Three of these exporters, Pieridae Energy, Bear Head LNG, and Saint John LNG, have already filed applications to export US gas through a reversed M&NP.

For example, the Canadian natural gas firm, Pieridae Energy, submitted an October 24 2014, export application to the U.S. Department of Energy (DOE) for shipping natural gas from Dracut north through the M&NP,<sup>29</sup> up to a proposed LNG export terminal in Goldboro, Nova Scotia, to be loaded on ships for sale overseas.<sup>30</sup> Pieridae’s proposed export quantity in that application was 0.8 Billion cubic feet of gas per day (Bcf/d).<sup>31</sup>

Pieridae told the DOE: “The natural gas . . . is intended to be exported from the US and imported into Canada via the M&N [Maritimes & Northeast] Pipeline . . . connecting Dracut, Massachusetts to . . . Halifax, Goldboro [Pieridae’s LNG export location], and Point Tupper, Nova Scotia.”<sup>32</sup> Pieridae added: “Although the present capacity of these facilities is not sufficient to accommodate the full volume of exports for which Pieridae US is seeking authorization, M&N US and other third parties have announced various projects to construct or expand pipeline infrastructure for the purpose of transporting natural gas from the Marcellus and Utica producing regions to customers in northeastern US and eastern Canada.”<sup>33</sup>

Pieridae listed some of those pipeline construction projects that could help move gas from the Marcellus shale fields to customers (like Pieridae’s LNG export terminal) in eastern Canada, and the list included Kinder Morgan / TGP’s NED Project.<sup>34</sup>

The Canadian National Energy Board recently approved Pieridae’s request to import gas from the U.S. and export it as LNG.<sup>35</sup> The U.S. Department of Energy approved Pieridae’s export request in May with respect to LNG export to Free Trade Agreement countries.<sup>36</sup> The LNG will be delivered to Europe and other countries.<sup>37</sup>

Pieridae hasn’t been the only company hoping to move Marcellus shale gas through the M&NP to Canada for LNG export abroad.<sup>38</sup> On November 6, 2014, Bear Head LNG Corporation applied to Canadian authorities for a license to bring 1.3 Billion cu. ft./day of gas from the U.S. into Canada through the M&NP, or from other import points if they become accessible.<sup>39</sup> The gas would be piped on to a proposed Bear Head LNG export terminal near Point Tupper, Nova Scotia for shipping to international markets.<sup>40</sup> Bear Head LNG is owned by the Australian company, Liquefied Natural Gas Limited.<sup>41</sup>

On February 25, 2015, Bear Head made a parallel export application to the U.S. Department of Energy.<sup>42</sup> In it, Bear Head noted that Kinder Morgan’s Northeast Energy Direct project would “transit gas from the Marcellus Shale region to the Dracut Hub in Massachusetts” and that new Canadian demand for Marcellus gas (like the Bear Head project, apparently) is “bolstering the need for additional New England pipeline expansion projects.”<sup>43</sup>

Bear Head attached an assessment of its export impact on the New England gas market where the base case assumed that Kinder Morgan’s proposed Northeast Energy Direct pipeline, and Spectra Energy’s proposed “Atlantic Bridge” and “Access Northeast” gas pipelines, would all be built and operating by 2018,<sup>44</sup> a year before the Bear Head export terminal would come on line, tapping gas through the M&NP.<sup>45</sup>

Saint John LNG Development Company Ltd. similarly applied to Canadian regulators to import about 0.7 Billion cu. ft./day of gas from the U.S. through the Maritimes & Northeast Pipeline, or such other import points as may become accessible, and to export the gas to international markets through a proposed LNG export facility in Saint John, New Brunswick.<sup>46</sup> Saint John LNG is indirectly owned by the Spanish firm Repsol.<sup>47</sup>

As Saint John LNG told Canadian regulators: “In the case of feed gas supply from the United States, gas would be procured from producers in the Appalachia [read: Marcellus shale region] and transported

to Dracut or Beverly, Massachusetts via expansions or extensions of the Tennessee Gas Pipeline and/or Algonquin Gas Transmission systems. From Dracut, the gas would be transported on [the] Maritimes & Northeast Pipeline” to the Canadian border and then on to Saint John’s proposed LNG project in New Brunswick for export.<sup>48</sup> (Emphasis added.)

While the details of these various export plans may be in flux, like the plans for the NED, it is clear from the above that from time to time LNG exporters have been extremely interested in using the possible transportation capacity of the proposed NED pipeline to get gas to their planned LNG export facilities from the Marcellus shale region in the U.S.

### **Some of the environmental impacts of LNG export**

LNG export will likely increase the drilling for, and combustion of, natural gas. The Department of Energy commissioned a study by the U.S. Energy Information Administration (“EIA”) that modeled a variety of U.S. LNG export scenarios. The Department reported that the “EIA projected that, across all cases, an average of 63 percent of increased export volumes would be accounted for by increased domestic [natural gas] production.”<sup>49</sup> In other words, LNG export will likely increase new natural gas drilling and production in the U.S., with the consequent burning of that gas produced.

Moreover, a key U.S. Department of Energy study suggests that LNG shipped from the United States could have a higher “expected value” for greenhouse gas impact, than LNG shipped to Europe and Asia from closer regional suppliers of LNG (Algeria to Europe, and Australia to Asia, respectively), although the DOE cautioned that these “expected value[s]” “should not be interpreted as the most likely values due to the wide range of scenario variability and uncertainty in the underlying modeled data” and “should be interpreted as general guidance to provide perspective on trends only”.<sup>50</sup> This DOE study definitely does not support any clear conclusion that US export of LNG will have a climate change mitigating effect better than available alternatives (such as regionally supplied LNG from Algeria and Australia, or renewable energy in Europe and Asia).

The Commission’s EIS needs to explore in much greater detail this “perspective on trends” of LNG climate change impacts as they may relate to LNG export from Maine and Maritime Canada supplied by gas transported by the NED project. The Commission needs to compare such impacts to those of alternatives like closer regional LNG shipment to Europe and Asia from Algeria, Australia or other suppliers, and also compared to renewable energy and energy efficiency alternatives to that LNG in Europe, Asia and other possible LNG destinations.

It would make sense, for example, that shipping LNG from Algeria to Europe, or from Australia to Asia, would generally have lower greenhouse gas emissions than shipping LNG from the United States to Europe and Asia, respectively, due to the greater (fossil fuel) tanker-ship energy used for shipping the LNG the greater distance from the United States. As the above-noted DOE Report notes, “[c]ompared to domestically produced and combusted gas, there is a significant increase in the life cycle GHG [Greenhouse Gas] emissions that are attributed to the LNG supply chain, specifically from liquefaction, tanker transport, and regasification processes.”<sup>51</sup> (Emphasis added.)

Because FERC certification of the NED Project would likely be a key permitting step helping to facilitate such LNG export from Maine and Atlantic Maritime Canada, and which could therefore lead to any net increase in greenhouse gas emissions resulting from such export, the Commission’s EIS should address scoping questions with respect to LNG and other export.

### **III. Timeframes**

#### **Scoping questions with respect to timeframe concerns**

With respect to the proposed NED project:

- (1) What is the presumed planning horizon within which alternatives must become available? 2018? 2038? 2068?
- (2) What are the projected quantities of daily transportation capacity use by each customer (where

known) plotted daily or weekly throughout the year, particularly during winter and summer peaks and what are the likely uses during each of these days or weeks for each of these customers, through that planning timeframe? Where are the peak demand shortfalls, when do they occur, and what is the quantity of the shortfall for each year through the planning horizon?

(3) What is the likely daily / monthly / yearly transport for end delivery into the Maritimes and Northeast Pipeline for northbound shipment from Dracut, MA through the planning horizon?

(4) What is the likely NED pipeline capacity that will not be used by Precedent Agreement contractees at each point in the year that would conceivably be used for spot market shipments of gas?

(5) What is the likely quantity of gas destined for delivery to LNG export facilities during each week of the year?

### **Reasons behind the scoping questions on timeframe**

#### **III.A Timeframe for planning horizon**

Even if the proposed NED pipeline gets built, TGP acknowledges that it would not be operational until November of 2018.<sup>52</sup> So the first segment of the planning horizon is over 3 years – from now until late 2018 – for comparing the alternatives that might be available to address the energy needs that purportedly would be addressed by the proposed NED project.

Beyond that, at least some of the Precedent Agreements that have been offered to partially ‘justify’ the NED project are 20 year agreements,<sup>53</sup> and, in the Berkshire Gas case at least (the one I have looked at most closely), that agreement is based on the assumption of growing demand through the 20 year agreement term.<sup>54</sup> Thus, the amounts of alternative energy resources needed at the beginning of the 20 year agreement – in November 2018 – are smaller than the amount of alternative energy resources that would be needed later, at the end of the Precedent Agreement term in October 2038, to substitute for the proposed NED Pipeline capacity.

The alternatives discussion has to be nuanced accordingly, with changing requirements over a long time horizon. Alternatives that may not be available until 2018, or 2028, or 2038 may still be relevant and significant, if they come in to supply additional quantities of energy resources that are not needed until these later dates.

If built, the TGP gas pipeline would likely be in service 50 years or more<sup>55</sup> – that is, until about 2068 – helping lock in more fossil fuel burning for over half a century.<sup>56</sup> Therefore, an argument can be made that we should really be looking at alternatives that are reasonably likely to, or could be caused to, come into force from 2015 through 2068.

At a minimum, it seems like the planning horizon for alternatives review should be 2015 through 2038 (i.e., through the first 20 year Precedent Agreements / Transportation Agreements that would begin no earlier than 2018).

#### **III.B. – The merged nature of the electricity and gas demand questions**

Kinder Morgan / TGP has stated that among the needs that would be met by the proposed NED Project would be the needs of gas-fired power generators (electrical generators) in New England.<sup>57</sup> In addition, it has argued that “[t]he Project will also have ancillary environmental benefits by reducing the region’s reliance on GHG-emitting [Greenhouse Gas-emitting] coal and oil-fired power plants.”<sup>58</sup> Therefore it is appropriate in discussion of need, impacts, and alternatives to look at energy alternatives more broadly, on both the gas side and on the electricity side (including improving efficiency, demand shifting and demand reduction with respect to both), because the energy questions being raised by review of the NED Project now involve both gas and electricity.

In that light, the Commission needs to address in its EIS whether increased use of gas-fired electrical generation in New England is likely to increase fossil fuel use for electrical generation, displacing (i) nuclear-generation, and (ii) renewable generation and electrical efficiency – to the detriment of the climate.<sup>59</sup>

*(i) Displacement of nuclear generation.* Increased gas-electric generation fueled by the gas from these

pipelines would likely be used to replace some significant portion of retiring nuclear generation of electricity,<sup>60</sup> with nuclear generally considered to have lower climate impact than fossil-fuel-sourced electricity.<sup>61</sup> Nuclear power provided 34% of New England’s net electric energy in 2014,<sup>62</sup> and, as ISO-New England (ISO-NE), the region’s electric grid administrator, has observed, “[e]nergy prices in the wholesale electricity markets may be too competitive for some nuclear resources because of the shale gas boom . . . . And the building of new nuclear resources in the region is unlikely.”<sup>63</sup> If expanded gas-generation, facilitated by large shale gas pipelines from the frack fields of the Marcellus region like the NED – rather than efficiency and renewables – fills the nuclear-generation space, the proposed NED Pipeline will have helped expand fossil fuel combustion for electricity generation.

(ii) Displacement of renewables and energy efficiency. There are growing worries that a flood of temporarily cheap Marcellus shale gas delivered in volume by pipelines like the proposed NED would significantly slow recent advances in energy efficiency and renewable energy development. This could mean that less wind, solar and other renewables are developed for electricity generation, and more gas generating stations are built, substituting more fossil fuel combustion for renewable energy use.<sup>64</sup> Temporarily cheap Marcellus shale gas could also cause a delay or deferral in the implementation of some energy efficiency measures, if those efficiency measures have to compete on narrowly judged “cost-effectiveness” grounds.<sup>65</sup>

#### **IV. Alternatives**

In reviewing the various alternatives to the pipeline, including those discussed below, the scope of the Commission’s EIS should include:

- (1) A qualitative and, to the extent possible, quantitative assessment of the disruption of the environment that would be involved in that alternative (as well as for the NED Project proposal itself), and the extent to which such disruption is unnecessary due to better available alternatives;
- (2) An assessment of the extent to which each alternative’s environmental impacts can be avoided or mitigated (including a comparison to the potential for avoidance or mitigation of the NED Project’s environmental impacts);
- (3) A cost comparison of the alternatives compared against the NED Project, including initial investment costs, operating costs, life-cycle costs, including the costs of any environmental externalities, and the decommissioning costs at the end of the alternative’s life cycle,<sup>66</sup> to the extent such can be estimated;
- (4) An assessment of the extent to which the alternatives would enhance the resilience, diversity, reliability, pricing stability and sustainability of the region’s energy supply (compared also to the NED Project);
- (5) An assessment of the extent to which each alternative (as well as the NED Project proposal itself) would require the exercise of eminent domain to implement, assessing whether the NED Project or particular alternatives would involve the “unneeded exercise of eminent domain”;
- (6) An assessment of the extent to which each alternative (as well as the NED Project) would advance compliance with national and state environmental laws, including whether any waivers of provisions of such laws or special dispensation would be required, including but not limited to legislative waivers of Article 97 land protections in Massachusetts;
- (7) An assessment of the extent to which each alternative would advance state and national greenhouse gas reduction goals, including but not limited to compliance with the goals set in Massachusetts by the Global Warming Solutions Act.

The following sections of this letter concern scoping questions regarding various possible alternatives to the pipeline, particularly focusing on those that received cursory, insufficient or no analysis in TGP’s Resource Report 10.

#### **IV.A. Energy efficiency and conservation, including leak repair**

The Commission's EIS scope should include:

- (1) A detailed review of the extent to which energy efficiency and energy conservation is likely to, or could reasonably, replace some or all of the need for the proposed pipeline over the 2015 to 2038 horizon;
- (2) A detailed review of the extent to which off-peak demand shifting by technological, market and/or voluntary means is likely to, or could reasonably, eliminate some of the need for the proposed pipeline;
- (3) A detailed review of the extent to which pipeline leak repair is likely to, or could reasonably eliminate some of the need for the proposed pipeline.

#### **Reasoning behind IV.A scoping questions**

##### **IV.A.1 Energy efficiency**

TGP argues that “Energy conservation alone is not a viable alternative to the proposed Project.”<sup>67</sup> (Emphasis added; TGP appears to be using the phrase “Energy conservation” to also sometimes include energy efficiency.)

However, a reasonable alternative to the NED Project may, and probably will, involve some combination of:

- energy efficiency (technology that does the same with less energy),
- energy conservation (humans deciding to use their technology less often or less extensively – like turning down the heat, or turning off lights),
- demand shifting to off-peak use by
  - automatic means (e.g., smart appliances in a smart grid<sup>68</sup>),
  - market means (e.g., peak hour pricing, off-peak rebates, or demand management contracts with larger users who have flexibility in hour of gas use and/or other substitutable options for energy – such as UMASS-Amherst's CHP plant that can burn pipeline gas, stored and re-gasified LNG, or ULSD fuel oil <sup>69</sup>), and/or
  - voluntary means (e.g., Connecticut's ‘Wait Until 8’ voluntary demand shifting program for night-time use of washers, dryers, dish washers and the like),
- pipeline system leak repair,
- energy storage (e.g., grid-scale or building-scale batteries, pumped storage, LNG)
- renewable energy, and
- more efficient or reorganized use of existing fossil fuel infrastructure on an interim basis (e.g., making use of existing LNG or gas pipeline infrastructure as the diminishing back-up to an increasingly renewably-based economy).

TGP, in fact, acknowledges that “energy conservation . . . may be a . . . partial alternative for the Project . . . .”<sup>70</sup> Here's one place where I essentially agree with TGP, energy conservation (including efficiency) is part of the alternative to the Project.

TGP asserts, however, that federal, state and municipal programs to increase efficiency and conservation “will most likely minimize energy use, [but] they are not expected to eliminate the steadily increasing demand for energy or natural gas.”<sup>71</sup> Actually, in the New England electricity arena at least, we are already seeing some reversal in the “steadily increasing demand for energy”.

For example, ISO New England now projects that winter peak electricity demand in New England should actually shrink by about 0.1% per year during its current ten year electricity demand forecast period, once expected energy efficiency gains and certain other factors are included.<sup>72</sup> Therefore, from a New England regional perspective, certainly in the electricity sphere, efficiency programs are already making a substantial change in the demand picture for New England.

Because winter peak electricity demands are the ones that could have most justified expanded gas pipelines

for electricity generation, due to the winter electric peaks overlapping with winter gas heating needs,<sup>73</sup> the peak demand rationale for expanded gas infrastructure for electricity generation thus appears extremely weak on a regional level, at least for the next decade.

Despite these marked efficiency improvements in New England, there is no doubt room for continued efficiency improvements in the electric sector. National Grid, one of the largest New England electricity (and gas) distribution companies, observes that, at least at a national level:

“Despite these [efficiency]efforts, approximately 57% of the energy consumed across the U.S. is lost each year to heat loss, leaks, and friction, putting us at the bottom of the world’s energy utilization rankings, just as we trail in energy efficiency. . . .

By cutting in half the energy wasted by 2030, we would be able to reinvest \$327 billion into the U.S. economy and create as many as 1.3 million new jobs.”<sup>74</sup>

Winter peak gas demand for space heating is obviously a somewhat different question, but there is significant evidence, discussed elsewhere in this letter, that we have alternatives to such demand that will have lower environmental impact than the proposed NED pipeline. The Commission needs to rigorously review and assess these alternatives.

In the gas space heating arena, there are some indicators that a reversal in the “steadily increasing demand for energy” may be possible. For example, Berkshire Gas, one of the LDCs planning to contract for gas transportation on the NED, has shown that energy efficiency programs have been reducing the average yearly residential gas use measurably.

According to Berkshire Gas, in the thirteen years from 2000 to the commencement of its current Forecast and Supply Plan in 2013, average gas use for its residential customers dropped from more than 118 Dth/year to 97.0 Dth/year,<sup>75</sup> i.e. an average residential gas use reduction of 21 Dth/year or 17.8% over the 13 years, or roughly a 1.4% reduction in average residential gas usage per year. Berkshire Gas attributed “this marked reduction in use per customer primarily to successful and comprehensive energy efficiency initiatives.”<sup>76</sup> Berkshire expects average residential use for its customers under Base Case conditions to continue to drop over its current five year forecast period (although at a slower rate of reduction).<sup>77</sup> In the same current forecast period, Berkshire expects the average low load factor Commercial and Industrial (C&I) customer’s use to also decrease, from 618.2 Dth/year to 608.4 Dth/year,<sup>78</sup> i.e. an average low load C&I gas use reduction of 1.6% over the five years, or about 0.3% reduction per year.

Of course, while average gas use for residential space heating and many business uses is dropping, any increase in the number of residences and businesses may mean that aggregate gas demand continues to grow, although at a slower rate than it would have without the gas efficiency measures being adopted by thousands of customers. Where we cannot further reduce any increasing demand for winter space heating, we will likely be able to satisfy an increasing percentage of that demand by higher energy efficiency standards in building construction and rehab, and high efficiency electric air-to-air heat pumps powered by renewably-generated electricity.

Energy efficiency continues to improve dramatically in nearly all arenas and will be an important component of any alternative strategy for the Commonwealth and New England, helping us avoid the need for damaging and costly new gas pipeline infrastructure. As two of the many possible examples of notable efficiency improvements in New England, as well as the potential for increased efficiency improvement, (i) the gathering revolution in building energy performance, and (ii) conversion to LED street lighting underway, are worth noting (both discussed below).

Frugal New Englanders also know how to conserve, and conserve in a hurry when we need to. In the face of spiking electric and gas prices last year, in one year’s time New England cut its total electricity usage by 2.6% this January (2015) compared to January a year ago (2014), despite the fact this January (2015) was actually colder and had more heating degrees than last January, according to ISO New England.<sup>79</sup>

(i) Dramatic energy efficiency improvements in building energy performance in New England

Buildings are responsible for about 40% of the nation’s energy use.<sup>80</sup> As a project manager, as well as a staff attorney, working in affordable housing development,<sup>81</sup> I know from experience that a revolution in building

science and technique is taking place, one that is making new buildings dramatically more energy efficient. Over the past several years, our affordable housing agency has regularly been building single family homes and multi-family apartment building that achieve a HERS index score of 56 to 50, or below. As you know, the HERS Index is a measure of the energy efficiency of a home, under a nationally adopted industry standard, with 100 equal to the energy performance of a standard new home, and every point below 100 indicating another 1% more efficient than a standard home (so lower scores mean a more energy efficient home).<sup>82</sup> The lowest HERS index I've gotten on some of our new housing so far is 46, meaning that tests by an independent energy rater projected that that housing unit would be 54% more energy efficient than a standard home (100 – 46 = 54).

Said another way, it will take less than half of the usual energy needed to heat and run this home. Less than half. This is not in 2018, 2028 or 2038. This is now. And this is without even using the more aggressive energy efficiency measures such as those under the "PassivHaus" standard that is growing in Europe. We can, right now, build buildings that use less than half the energy we have been conventionally using. Such highly efficient buildings are increasingly being referred to as "high performance buildings."

The most recent project I have been managing could very well beat that 46% score. It has double walled construction (giving about a 12 inch cavity for sidewall insulation), significant insulation above the ceiling, triple-glazed windows, and extremely rigorous air sealing in the construction of the apartments.

The end result is that each two-story apartment can be heated with two of the new highly energy efficient electric, air-to-air (aka "air source") "mini split" heat pumps, one per floor. These heat pumps offer the additional advantage that they can provide both winter heat and summer air conditioning with one system. These electric heat pumps use only about 1/3 of the electricity the old electric resistance heating used,<sup>83</sup> so they bring a much higher level of energy efficiency to electric heat than we knew in the last century.

So in this recent project, gas is not being used for the main space heating at all. Energy Star appliances, low flow shower heads (to save on water heating), and LED lighting help round out the energy savings package.

The renewably-powered energy system of our near future will be based on electricity, from both "distributed generation" resources, like roof top solar, and from important centralized renewable sources, like wind farms, solar fields, pumped storage and the like, coordinated and moved over a smart electric grid. In that rapidly coming energy realm, high efficiency electric space heating is likely to become one of the major heating methods, or even the major heating method. This will help us end our dependence on both gas and oil for space heating in New England. Local gas pipeline hook-up moratoria, including some linked to the NED Project, may have inadvertently accelerated this transformation, turning a gradual trend toward electric heating into a forced march.<sup>84</sup>

I do not think it would be an overstatement to suggest that with a few more years of such high performance building, we will see nearly all new buildings in New England using less than half the energy our recent 'standard' buildings did. We will also be seeing many buildings going far beyond that, to "net zero" or even "net positive" generation of energy at or on the building.

In a back of the envelope calculation, with new construction and significant rehab of buildings effectively turning over maybe 1% of the building stock each year,<sup>85</sup> over the 15 years until 2030, such dramatic new improvement in building energy efficiency should enable us to further reduce our overall energy use in New England by around 3 percentage points, just through efficiency changes in the building sector.

Very rough back of the envelope calculation here: at least 50% reduction in energy use in a new or substantially renovated high performance building, applied to, say, 1% per year of building stock change-over x 15 years (from 2015 to 2030) = 15% of the building stock affected, applied to the 40% of overall energy used for buildings = 50% x 15% x 40% = roughly 3% of overall regional energy demand eliminated over the 2015 to 2030 horizon by this construction sector, generating more highly skilled local employment and better pay along the way.<sup>86</sup> More aggressive adoption of high performance building, pushed by more

aggressive building codes, might take this rough estimate higher.

#### (ii) LED street lighting

Converting all of New England's remaining energy-extravagant mercury and sodium street lighting into energy efficient LED street lighting is likely another promising place to cut a notable chunk out of New England's electricity demand. Many street lights are deliberately left on all night, every night, so improving their efficiency could have a marked effect. They are on longer during the long nights of the winter, and kick on just as households ramp up their after-school/after work usage, when winter peak demand is an issue. So, efficiency here is likely to have a beneficial and disproportionate impact on peak winter electric demand as well as overall demand, making LED street lighting another part of the alternative to long-term investments in more gas transmission infrastructure.

Many Massachusetts municipalities are already taking advantage of LED street lighting substitution. Holyoke Gas & Electric (HG&E), for example, converted all of its 4,000 streetlights to LED lighting from 2011 to 2014.<sup>87</sup> The \$1.5 million conversion cost was partially funded by a \$168,000 grant from the Department of Energy Resources through the Green Communities Program,<sup>88</sup> so state subsidies here can and will clearly play a positive leveraging role. The 60% savings in electricity with the LED fixtures translates into more than \$100,000 in cash savings each year, according to HG&E.<sup>89</sup> HG&E estimates that the total energy savings from this street light conversion is equivalent to the annual output of a 2 MW solar facility.<sup>90</sup>

Easthampton, MA has similarly saved more than \$36,000 a year in electricity on street lighting since it converted 470 streetlights to LED fixtures.<sup>91</sup> This is a notable return on the \$227,740 spent to make the conversion,<sup>92</sup> and that doesn't count savings in maintenance costs, not to mention savings for the environment.

The City of Boston found that it was using a little over 1,000 kilowatt-hours of electricity a year for each of its 64,000 conventional street lights. It also reported about a 60% per light electricity savings when it began converting to LED street lights.<sup>93</sup> That's about 38.4 million kilowatt-hours of electricity potentially saved yearly just in Boston that can be used for something else, with no added gas pipelines for electricity generation, and no added generation capacity needed.

I have been unable to locate a statistic for the overall number of remaining mercury and sodium street lights left in New England, and their total energy use. However, a casual night-time drive, even just around western Massachusetts, suggests that number of lights has to be in the many, many thousands, and the kilowatt-hours of electricity wastage they represent, in the many millions.

#### **IV.A.2 Pipeline system leak repair**

Pipeline leak repair can serve as a significant source of additional gas, without increasing transmission pipeline or hydraulic fracturing ("fracking"), simply by retaining gas in our distribution pipelines that is now being lost to the atmosphere.

A 2013 report prepared by Congressional staffers for Senator Markey ("Markey Report" hereafter) made this sobering observation:

"[G]as companies in Massachusetts own and operate one of America's oldest natural gas pipeline distribution systems, ranking sixth among state systems in the number of miles of main distribution pipelines made of [leak-prone] cast iron or bare steel. These companies have replaced less than 4 percent of their leak-prone pipes per year while billing Massachusetts ratepayers an estimated \$640 million to \$1.5 billion from 2000-2011 for unaccounted for gas . . . ."<sup>94</sup> (Internal citations omitted.)

The Markey Report estimated that there were 99 to 227 Billion cubic feet of natural gas unaccounted for in the 2000 to 2011 period in Massachusetts.<sup>95</sup> This amounts to a yearly average of 9 to 20.6 Billion cubic feet of gas gone missing in Massachusetts -- roughly 0.025 to 0.056 Billion cubic feet of gas per day. A more recent study by atmospheric scientists at Harvard's School of Engineering and Applied Sciences similarly found about 15 Billion cubic feet of natural gas were leaking from the Boston regional gas delivery system annually, about 2.7% of the gas brought to the region.<sup>96</sup>

The *Boston Globe* similarly just reported the results of a new study of gas pipeline leakage in Massachusetts,

noting that “[t]he state’s aging natural gas pipelines are riddled with about 20,000 potentially dangerous and environmentally damaging leaks, many decades old, according to the first statewide analysis of the problem in Massachusetts.”<sup>97</sup> So, gas system leak repair may be able to address a notable percentage of possible peak demand shortfalls in New England, without bringing in additional gas.

#### **IV.B Demand shifting to off-peak times**

The Commission’s EIS scope should include:

- (1) A detailed review of the extent to which flattening the energy demand curve by shifting demand into off-peak hours or off-peak days, for both electricity and gas demand, is likely to, or could reasonably, replace some or all of the need for the proposed pipeline over the 2015 to 2038 horizon;
- (2) A review of the ways in which time-of-use billing, off-peak use rebates, and other market pricing tools are likely to, or could reasonably, replace some or all of the need for the proposed pipeline over the 2015 to 2038 horizon;
- (3) A review of the ways in which smart grid and smart appliance technology are likely to, or could reasonably, replace some or all of the need for the proposed pipeline over the 2015 to 2038 horizon;
- (4) A review of the extent to which increased demand management contracts and resources are likely to, or could reasonably, replace some or all of the need for the proposed pipeline over the 2015 to 2038 horizon;
- (5) A review of the extent to which public education campaigns for voluntary demand shifting, such as Connecticut’s “Wait Till 8” program, are likely to, or could reasonably, replace some or all of the need for the proposed pipeline over the 2015 to 2038 horizon.

#### **Reasoning behind IV.B scoping comments**

As ISO New England,<sup>98</sup> the Synapse / Mass. DOER “Massachusetts Low Gas Demand Analysis: Final Report”,<sup>99</sup> and others<sup>100</sup> have explicitly or implicitly noted, the big electric (and consequently gas) demand problem in our region is a peak demand problem, not an absolute demand problem. Thus the problem is apparently not one of absolute current gas pipeline capacity into the region. It is the problem of pipeline capacity when many users make demands on the system at the same time, during relatively short peak demand periods, particularly during the winter when gas heating demand peaks and winter peak electricity demand overlap. Flattening the electric load curve, and/or the gas demand curve, by moving portions of the electric and gas demand to other times of the day can actually reduce the amount of gas/electric infrastructure needed, even when the overall energy demand stays constant or even grows.

Thus, peak demand flattening is an important part of solving the gas infrastructure and electric generation capacity problem. Some of the alternatives discussed below specifically address flattening the demand curve, by shifting demand to less congested hours of the day, as one means to avoid the need for new gas infrastructure. Gas and electricity storage facilities and other energy storage also indirectly flatten the demand curve, by storing gas, electricity, or other energy during off-peak times and releasing it during peak demand times. (Some of the storage alternatives are discussed in Section IV.E of this letter, below.)

In Massachusetts, differently priced time-of-use electric rates are already being used in some non-residential rate classes,<sup>101</sup> and, in some areas, for residential billing, where off-peak electricity is billed at a lower rate than peak hour electricity. Time-of-use billing creates a price/market incentive to shift demand to late night hours, for example, when other users are not drawing electricity, helping to flatten peak demand and lower infrastructure needs. However, time-of-use billing is not available for all Massachusetts residential customers, so there are still extensive opportunities for widespread market incentives for residential users to wait to use washers and dryers, dishwashers, and the like at low demand parts of the day (usually later at night).

Fortunately, some Massachusetts utilities are beginning to test time-of-use residential electric rate differentials, and this partial alternative to increased pipeline infrastructure could be encouraged and accelerated, and will help our region moderate peak demand. National Grid, for example, is running a

pilot program in part of Worcester, MA that it calls its “Smart Energy Solutions Program,” where the price of electricity will be higher at peak times of year, and during certain peak demand hours during the day, allowing customers to save money by shifting their electricity usage to less expensive off-peak hours. In January, 2015, National Grid began billing most customers in this pilot area under a time-of-use “Smart Pricing” program which charges customers more for electricity in peak hours from 8 AM to 8 PM, and less for it from 8 PM to 8 AM and on weekends and holidays (“Off Peak” hours). A second pricing option under the program allows customers to obtain rebates for reducing electricity usage during “Peak Event” hours.<sup>102</sup>

The coming “smart grid”, wedding computer and internet-based monitoring and electricity dispatch with the electric transmission and distribution grid, will make even more refined time-of-use pricing and purchasing of electricity possible.<sup>103</sup> In the not-to-distant future, electricity pricing may vary throughout the day, and be “read” by appliances, and possibly electric vehicles, waiting to cycle or charge when the price for electricity used will be lowest.<sup>104</sup> This would help ‘automatically’ shift power usage from peak to off-peak hours, helping us better manage and lower peak demand in our electric grid. It may also enable more precisely timed and computer-controlled use of “demand response assets” to further reduce electricity demand during peak demand events. Smart grid technology may help increase the efficient utilization of our electric grid, effectively getting more power out of less cable-and-wire (and pipeline) infrastructure, and may also help us better integrate intermittent renewables like wind and solar into the electric grid.<sup>105</sup>

While we may need to monitor and mitigate the impact of such time-of-use pricing on lower income families, conceptually, wide-spread implementation of time-of-use rates seems to be coming, looks like a promising method of flattening peak electric demand, and could serve as a part of the alternative to costly gas and generation infrastructure investments being proposed primarily to address avoidable and needlessly excessive peak loads.

Another part of the alternatives to help shift demand to off-peak hours could and should be widespread adoption of public education campaigns similar to Connecticut’s “Wait ‘til 8” program. This Connecticut program encourages all of the state’s residents to wait until after 8 PM to run washers, dryers and dish washers, to reduce peak demand.<sup>106</sup>

In the commercial sector, demand response / demand management programs are being used to reduce commercial electricity use during periods of peak demand. Use of such programs should, and is likely to, increase over the decades ahead.<sup>107</sup> (Similar arrangements are already being made on the direct gas demand side. In 2014, Berkshire Gas, for example, reported that it had “entered into agreements with several large customers (with alternate fuel capabilities) that provide significant load management flexibility in that the Company [Berkshire] may curtail [gas] service for a designated period of time in order to promote the efficient use of its distribution system (also referred to as ‘demand-side management’).”<sup>108</sup>)

#### **IV.C Wind**

The Commission’s EIS scope should include:

- (1) A detailed review of the extent to which wind energy is likely to, or could reasonably, replace some or all of the need for the proposed pipeline through the 2015 to 2038 horizon;
- (2) A detailed review of off-shore wind potential and the likely timeframe for its acceleration for New England;
- (3) A detailed review of the coming changes in dispatchability and solutions for intermittency and their

impacts on the scale-up of wind energy in New England through this planning horizon.

### **Reasoning behind IV.C scoping comments**

In TGP's July 2015 draft Resource Report 10 on alternatives to the proposed NED project, TGP asserts that "[w]ind power currently is not an option for providing the existing or projected power needs in the region where the Project is located", arguing for example, that wind is "an intermittent and non-dispatchable source of generation" and that "[e]lectricity demand also varies during the day in ways that the supply from wind and solar generation may not match".<sup>109</sup>

TGP creates a strawman with respect to wind. As discussed above regarding other alternatives to the proposed NED Project, the question is not whether a single alternative, like wind generation of electricity, can answer the asserted power needs of the region, but whether a combination of alternatives, such as wind, solar, efficiency improvements, expansion of energy storage, shifting demand to off-peak times, etc. can answer the power needs of the region at the pace needed over the planning horizon appropriate for this project.

Moreover, as the Commission is aware, ISO-New England has already proposed to the Commission automated, so-called "Do Not Exceed" dispatch of wind, as discussed below, and there are numerous ways the intermittency issue can and will be addressed, as discussed below.

TGP's discussion of the wind alternative is therefore lamentably incomplete and does not reflect the current and changing environment for wind energy in New England, as discussed in more detail below. The Commission will have to undertake a much more rigorous review of wind energy in the EIS.

This is particularly needed given the international examples of the growing capability of wind and other renewables to take over from fossil fuels, as well as the growing strength of these alternatives in our own country. Germany, for example produced 31% of its electricity from renewables in the first half of 2014 (including 17% from wind and solar), according to *Bloomberg Business*.<sup>110</sup> Scotland has announced its intention to produce the equivalent of all its electricity needs from renewable energy by 2020, powered heavily by wind energy.<sup>111</sup> Denmark, one of the early pioneers of off-shore wind, is aggressively pursuing the elimination of fossil fuels in its entire energy system by 2050.<sup>112</sup>

#### **IV.C.1 Growth of windpower in New England**

Wind is the second largest type of new generation capacity requesting interconnection in the ISO-New England generator interconnection queue as of June, 2015, representing proposed projects totaling 33% of the 12,000 MW of newly proposed electric energy resources in our region.<sup>113</sup>

Large increases in land-based wind power are in the ISO-New England interconnection queue, including over 800 MW of proposed wind generation in northeastern Maine, and over 500 MW of proposed wind generation elsewhere in Maine and in New Hampshire, all making interconnection requests to the ISO.<sup>114</sup> SunEdison expects to complete its 56-turbine, 185 MW Bingham wind project (a/k/a Blue Sky West Wind project) in Maine by 2016.<sup>115</sup> SunEdison/First Wind's 50-turbine 150 MW Oakfield wind farm in Aroostook County, Maine began construction last September.<sup>116</sup> The *Portland Press Herald* reported that the Oakfield project has contracts to supply utility companies in Massachusetts.<sup>117</sup>

The *Portland Press Herald* also reported that EDP Renewables is planning a separate 250 MW wind project in Aroostook County, Maine (presumably the Number Nine Wind Farm), and that First Wind and EDP Renewables "say they see the potential for hundreds of additional megawatts of capacity in Aroostook County, and are willing to spend tens of millions of dollars to hook into the New England grid. The two projects, as well as others that may come, have the potential to create a major hub for wind power . . ." <sup>118</sup>

At year's end in 2014, New England had already installed wind generation capacity of 846 MW,<sup>119</sup> all on land at this point. Moreover, as the Maine examples above show, wind power is only going to grow in New England in the period from 2015 to 2020 and beyond. TGP itself appears to acknowledge that the 2,800 MW of wind (and hydro) generation that would be connected to Anbaric and National Grid's "Green Line Infrastructure Alliance's" ("GLIA") proposed underground HVDC electricity transmission line to southern New England "could reduce pressure from [sic, s/b "on"?] the New England gas supply and reduce

greenhouse gas emissions.”<sup>120</sup>

Notably, TGP does not estimate what portion of the energy proposed to be supplied to New England by the NED could be answered by these and other wind projects. The Commission’s EIS should make such an estimation, along with estimating what portion of the asserted New England energy need to be answered by NED could be answered by other alternatives or combination of alternatives. (Energy to be supplied to foreign consumers by the NED, whether in Canada or through LNG export, should not be factored into this need.)

This promising landside wind installation is, however, a very small fraction of the 391,892 MW of offshore wind resource potential existing within 50 nautical miles of shore along coastal New England, estimated by the Department of Energy.<sup>121</sup> This offshore wind potential is more than ten times the 36,100 MW in generating capacity that ISO New England predicts New England will need to meet electricity resource requirements in 2023.<sup>122</sup>

Offshore wind is still moving forward. The 462 MW Cape Wind offshore wind project is clearly struggling at this point. However, Cape Wind was still listed as an “active project” in ISO New England’s interconnection request queue as of 8/1/15.<sup>123</sup>

More significantly at the moment, the Deepwater Wind offshore wind project is moving forward and seems poised to become New England’s, and the nation’s, first offshore wind farm. Deepwater Wind announced March 2, 2015 that it had fully financed its initial group of offshore wind turbines, its 30 MW “Block Island Wind Farm.”<sup>124</sup> Just a few days ago, Deepwater Wind reached another milestone, placing “steel in the water” for the first of its offshore turbines,<sup>125</sup> installing the first of the steel structures in the ocean that will support its wind turbines about three miles off Block Island. The company reports that the turbine blades have already been manufactured for the project, with other components under construction, and that the offshore wind farm should be operational in late 2016.<sup>126</sup>

The company believes if it meets that operational date, its Block Island Wind Farm will become the nation’s first offshore wind farm.<sup>127</sup> Deep Water Wind hopes that the Block Island Wind Farm will be just the first installment in its plans to build 1,000 MW in offshore wind generation capacity off the coasts of Massachusetts and Rhode Island.<sup>128</sup>

Deepwater Wind New England LLC was the winner of the federal government’s historic 2013 auction of leases for the 164,750 acre “Wind Energy Area”, nine nautical miles off the Rhode Island coast.<sup>129</sup> According to the Department of the Interior, this Wind Energy Area “has the potential to support 3,395 megawatts of wind generation”, enough energy “to power more than one million homes.”<sup>130</sup>

There are other indicators that offshore wind will continue to move forward in the northeast during the NED planning horizon period. For example, the University of Maine is leading an offshore wind technology research initiative, the “DeepCwind Consortium,” funded by the Department of Energy and others.<sup>131</sup> Maine’s Public Law 270 allows the University of Maine to establish a Deepwater Offshore Wind Test Site.<sup>132</sup> The University of Delaware’s Special Initiative on Offshore Wind (SIOW) also just completed a study for the NY State Energy Research and Development Authority (NYSERDA) showing how costs for offshore wind could be reduced.<sup>133</sup>

More aggressive wind development, including offshore wind, could offer another sizable portion of the alternatives to the proposed NED pipeline during the 2015 – 2038 period.

#### **IV.C.2 Dispatchability of wind**

TGP asserts that “[w]ind power currently is not an option for providing the existing or projected power needs in the region where the Project is located.”<sup>134</sup> TGP further complains that wind power is an “intermittent and non-dispatchable source of generation”, and does not have the NED’s ability to supply generators with a source of energy on short notice when renewables like wind are not generating due to their “intermittability.”<sup>135</sup>

First, TGP’s assertion that wind power is “non-dispatchable” is a dubious one in the region served by ISO-New England, our region’s power grid coordinator. ISO-New England has reportedly been manually

dispatching wind generation resources since 2003.<sup>136</sup> More significantly, as the Commission is aware, since last year, ISO-New England has been working out the details of so-called “Do-Not-Exceed Dispatch” (aka “DNE Dispatch”) for wind energy, a type of generation dispatch adapted for wind- (and, with modifications, also certain hydro-) generation using short-interval localized wind forecasting, and computer-assisted dispatch of wind, at a generation output not to exceed a varying maximum (the Do-Not-Exceed point) that available transmission capacity can reliably handle.<sup>137</sup> ISO-New England believes that with this “use of an automated process for determining and telemetering Do Not Exceed Dispatch Points, the changes are expected to achieve higher utilization of existing limited transmission facilities which, in turn, will maximize the use of low cost renewable resources [like wind].”<sup>138</sup>

#### **IV.C.3 Addressing intermittency**

In addition to using more sophisticated means of dispatch for wind, the “intermittent” nature of wind (and solar) will likely be increasingly addressed by a combination of:

- Intra-regional transmission upgrades (so that renewably-generated electricity in one locale with an ‘excess’ of wind or sun can support an area where the wind has flagged or the sun isn’t shining, discussed below);
- Inter-regional transmission upgrades (to bring in Canadian hydropower, for example; see Section IV.D below);
- Energy storage facilities, both grid-scale and building-scale (discussed in section IV.E below);
- Smart grid advances (where grid-interfaced “smart” appliances, car chargers and other devices wait until times when renewable energy is peaking to operate or charge – see Section IV.B above); and
- residual existing gas-fired generators and existing pipeline infrastructure used as a diminishing part of the back-up (for a transition period).

#### **Intra-regional electricity transmission upgrades**

ISO New England has reported that some of the planned wind electricity generation will be challenging to integrate into the grid without major transmission improvements, for example in certain parts of Maine.<sup>139</sup>

In fact, ISO New England has acknowledged that “[a]t times, the [ISO New England] system can’t bear [the] full output from wind resources. . . . [W]ind farms are often built in remote areas where the transmission system isn’t designed to carry large amounts of power. To avoid overloading the transmission system, the ISO sometimes has to call on wind resources [i.e. wind generators] to reduce their electricity output.”<sup>140</sup>

It is shocking that we are actually shutting off wind turbines at times for lack of adequate transmission capability in certain parts of the regional electric grid. Obviously this circumstance can and will be remedied in the near term as competitive economics push more northern New England wind generating assets into the market. ISO New England appears to be actively working on these wind-related transmission problems, as are certain private developers.

Some Maine wind developers are making their own significant investments in transmission upgrades, or proposing to do so. The EIA notes, for example, that “First Wind built its own 38 mile 115-kV transmission line that began operating in 2009 to connect the 83 megawatt (MW) Stetson Wind projects to ISO-NE. . . . [The Oakfield wind farm and Number Nine Wind Farm both] have contracts with New England utilities for the power . . . and both plan to pay for their own transmission line connections to ISO-NE (each more than 50 miles).”<sup>141</sup>

The U.S. Energy Information Administration (EIA) also notes that “Loring Energy has proposed using a 200 mile corridor, initially used as a jet fuel pipeline to the former Loring Air Force Base, to construct the land-based portion of a land/sea HVDC [high voltage, direct current] line to Boston”.<sup>142</sup>

Similarly, a partnership involving the Massachusetts-based Anbaric Transmission company has also proposed an HVDC transmission line, from the Canadian border and Aroostook County, Maine, to the Boston area, the “Green Line,” capable of transmitting the electrical output of 1,000 MW of (wind and

other) generation, potentially expandable to 2,000 MW.<sup>143</sup> About 160 miles of the Green Line power cable would run on land, and about 190 miles of the cable would run underwater.<sup>144</sup> Although the project was initially expected to serve First Wind and other Maine wind generators it may also serve to link Boston with Canadian hydroelectric generation.<sup>145</sup>

The Maine project is part of an alliance between Anbaric Transmission and National Grid, an alliance they are calling the “Green Line Infrastructure Alliance,” advocating for “2800 MW of new High Voltage Direct Current (HVDC) transmission projects that combine wind and hydroelectric resources.”<sup>146</sup> The Alliance suggests that “[t]he extra \$3 billion New England consumers paid in wholesale electricity prices in the winter of 2014 is **enough to finance most of the proposed 2800 MW clean energy transmission system.**”<sup>147</sup>

In addition to the Maine Green Line project, the alliance is also proposing the 400 MW Vermont Green Line project (f/k/a the “Grand Isle Intertie”) to connect upstate New York wind and other renewable energy sources with the New England grid. The Vermont Green Line project is currently planned to be in service by 2019.<sup>148</sup>

Discussing their Green Line Infrastructure Alliance, National Grid’s vice president of Business Development claimed:

“We are committed to diversifying new England’s energy options and meeting renewable portfolio requirements as affordably as possible for New England consumers . . . . Anbaric’s track record as an innovative and efficient transmission developer will help us do that. . . . The New England states inevitably will have to address these issues, and we offer a very attractive, cost-effective regional option to do so.”<sup>149</sup> (Emphasis added.)

As noted below in Section IV.D, TGP itself, in its July 2015 Resource Report 10, appears to recognize the 2,800 MW potential of the proposed Green Line transmission projects as conceivably part of an alternative to the NED project.

When one of the larger New England utilities is describing such electricity transmission projects as a “cost-effective regional option”, and when TGP itself appears to acknowledge these as a conceivable part of an alternative to the NED Project, these proposed transmission projects (and others) should be reviewed in detail as possible alternatives, in whole or part, in the EIS.

#### **IV.D Hydropower and interregional transmission**

The “Wind Power” section of TGP’s July 2015 Resource Report 10 (Section 10.1.2.1) discusses in some detail the planned Anbaric / Green Line Infrastructure Alliance underground High Voltage Direct Current (“HVDC”) transmission lines to bring 2,800 MW of hydroelectric and wind power from Eastern Canada and northern New England into southern New England and concludes that if these projects are developed they “could reduce pressure from [sic] the New England gas supply and reduce greenhouse gas emissions”. However, puzzlingly, in the one-paragraph “Hydroelectric Power” section of that report (Section 10.1.2.7), TGP does not mention these underground HVDC projects, instead briefly mentioning unnamed “aboveground transmission line projects requir[ing] exhaustive review and extensive siting approval” and other unnamed transmission lines in a very generalized discussion of “proposed electric transmission line projects designed to import hydroelectric power from Canada to New England”.

After this unspecific and cursory “Hydroelectric Power” section of the report, TGP concludes that “a large electric transmission line project designed to import hydroelectric power from Canada will face similar siting difficulties” and that “use of domestic and imported hydroelectric power cannot meet the specific purpose and need of the Project and provide the required natural gas transportation capacity provided by the Project.”

It is obvious that electric transmission lines for hydropower will not provide gas transportation capacity, but that cannot seriously be given as the reason hydroelectric power is not feasible as an alternative to the NED project, given the growing interchangability of gas and electric energy resources, and TGP’s own arguments for the proposed NED project based in part on supplying gas to electricity generators. The question

regarding alternatives should not be centered on provision of gas, but rather upon the provision of sufficient energy resources (whether positive energy production or negative energy demand reduction or demand shifting), so this argument by TGP has no merit.

The other argument that TGP appears to be making against hydropower as an alternative, however, that siting difficulties will prevent the timely completion and availability of such hydropower resources, deserves detailed review by the Commission. However, it should be noted from the start that NED Project siting is also facing “similar siting difficulties”, so siting difficulties alone cannot decide the question about the viability of hydropower transmission as part of the alternative to the NED pipeline.

For the reasons discussed below, I believe there is facial evidence that one or more HVDC transmission lines for importing Canadian hydropower may be able to be sited and completed during the NED planning period, and likely in the early years of the 2015 to 2038 planning horizon.

Environmental disputes concerning the impacts of expanded overhead electric transmission lines from Canadian hydropower facilities to New England, such as the proposed Northern Pass project, have slowed the expansion of Canadian hydropower back-up for intermittent sources like wind and solar in our region. However, new approaches using buried and/or underwater high voltage direct current (HVDC) cables might be able to mitigate enough of that transmission impact to overcome this impasse.<sup>150</sup>

Several new underwater/underground HVDC transmission lines connecting from Canada to serve New England have been proposed, and at least one has permitting review pending.

TDI New England, for example, has proposed the “New England Clean Power Link,” a planned 1,000 MW HVDC transmission line to run underwater in Lake Champlain from Canada, and then underground in highway and other public right of ways, to connect to the New England power grid in central Vermont.<sup>151</sup> The transmission line would be composed of two six-inch-wide transmission cables, along with ancillary facilities.<sup>152</sup>

This \$1.2 billion HVDC transmission line proposal to bring more Canadian hydroelectric power to New England is currently under review by the Vermont Public Service Board.<sup>153</sup> The U.S. Department of Energy just recommended approval of this HVDC transmission project.<sup>154</sup> If approved, this high capacity transmission line is projected to come on line in 2019.<sup>155</sup> The Boston Globe recently reported that the TDI transmission project “cleared a major hurdle” when TDI reached a settlement with the Conservation Law Foundation (CLF) to do millions of dollars of additional Lake Champlain clean-up in exchange for CLF not opposing the project.<sup>156</sup>

TDI has reportedly received final approval from federal regulators for the similar, but even longer and more complex Champlain Hudson Power Express HVDC project, routed through Lake Champlain, the Hudson River, and the East River, to deliver Canadian power to New York City.<sup>157</sup> So, TDI seems to have the resources and technical capacity to get such projects permitted.

Another HVDC project, being proposed by a partnership of National Grid and Emera Inc., the 1,100 MW “Northeast Energy Link” (“NEL”) is under development to connect Orrington, Maine to the grid further south in Tewksbury, MA, and is projected to come on line by 2018.<sup>158</sup> The project proponents have “state[d] that the primary purpose of the NEL is to deliver renewable [electricity] generation to New England load centers to satisfy state renewable portfolio standard goals and to meet carbon reduction requirements over the next three years”, according to FERC.<sup>159</sup> According to the Energy Information Administration, the 230 mile Northeast Energy Link would deliver renewable energy from “Maine and eastern Canada into southern New England, using existing transportation corridors in eastern Maine, New Hampshire, and Massachusetts.”<sup>160</sup>

The proposed Maine Green Line, part of National Grid and Anbaric’s Green Line transmission projects, as well as the Vermont Green Line, discussed in the intraregional transmission section above (Section IV.C.3), may also involve possible interregional transmission capability, including the capability to

import electricity generated by Canadian hydro and wind facilities.

#### **IV.E Energy storage alternatives**

The Commission's EIS scope should include:

- (1) A detailed review of the LNG storage alternatives likely and/or possible, in the 2015 to 2038 horizon;
- (2) A detailed review of the pumped storage alternatives that would be possible in the 2015 to 2038 horizon;
- (3) A detailed review of distributed and grid-scale battery storage alternatives likely in the 2015 to 2038 horizon;
- (4) A detailed review of other storage alternatives that might be possible at scale in the 2015 to 2038 horizon,<sup>161</sup> such as compressed air,<sup>162</sup> thermal storage, flywheels, electrolysis / stored hydrogen / hydrogen fuel cells.<sup>163</sup>

#### **Reasoning behind IV.E scoping comments**

##### **IV.E.1 LNG storage**

TGP acknowledges that both liquefied natural gas (“LNG”) and propane/air storage and vaporization “have the potential to meet the Project objectives”.<sup>164</sup> However, TGP then summarily dismisses these options in one sentence, asserting “siting constraints, increased environmental impacts, and the time required to develop them” make them “not viable”.<sup>165</sup> This is a grossly inadequate discussion of these options, particularly LNG, considering how advanced and well-seasoned LNG infrastructure is in New England, and the planned additions to such infrastructure already in motion.

Expanded LNG storage could help diversify New England's energy supplies, helping mitigate supply risks during winter peaks and at times of any transmission pipeline disruption, a growing vulnerability concern.<sup>166</sup> It could make more efficient use of existing gas infrastructure, including New England's underutilized offshore LNG import terminals.

LNG storage can be more closely calibrated to any local area's actual winter peak gas shortfall – and avoid costly, high impact, decades-long over-investment in massive gas pipeline infrastructure – as we work on our transition to a renewable energy economy. Smaller-scale LNG storage is typically faster to put up, a smaller investment, and could mean less sunk and wasted investment (fewer “stranded assets”) in fossil fuel infrastructure, as we un-wind New England's dependence on fossil fuels in the years ahead.

As the Northeast Gas Association has noted, “LNG remains an important fuel for New England - providing from 25% to over 40% of design day supply in the winter for several local gas utilities. LNG provides about 6% of New England's total annual gas supply.”<sup>167</sup> The operators of the Distrigas LNG facility in Boston have in fact argued that their facility can meet the rising demand for natural gas and is an alternative to new gas pipelines (such as the NED project).<sup>168</sup>

The Energyzt energy consulting firm doing analysis for GDF Suez (the latter, the owner of the Everett, MA Distrigas LNG import terminal) has stated that:

“In total, deliverability from the existing LNG facilities (on-shore and off-shore) is 3.7 billion cubic feet per day, nearly the maximum demand for natural gas in New England. . . .

Existing LNG infrastructure represents enough delivery capacity to meet the entire winter peak demand (i.e., 3.7 billion cubic feet per day) on a continuous basis, as well as a higher peak delivery capacity with LNG storage that can hold more than five days equivalent of winter peak demand. . . .

LNG import facilities are an existing energy asset that can provide winter reliability without expensive infrastructure investment costs and risks.”<sup>169</sup>

As ISO New England has observed, “increased use of existing LNG storage capability or the expansion of this capability also could improve fuel certainty” for the electric power system (as well as other uses).<sup>170</sup> (Emphasis added.) In a similar vein, the U.S. Energy Information Administration has suggested:

“Utilities in New England might also enhance winter supply reliability by investing directly in proposed

U.S. LNG liquefaction plants and receiving occasional LNG cargoes as a stipulation of their investment. It may be possible that investing a relatively small amount of capital could provide access to this source of swing supply during periods of high winter demand in New England.”<sup>171</sup> (Emphasis added.)

Thus, in general terms, LNG and expanded LNG storage should be seriously reviewed as a potentially cost-effective alternative to the NED.

Moreover, Massachusetts is unusual among northeastern states in that it has three LNG import facilities that can be used for stopgap deliveries of LNG to help address peak gas needs during the winter, during the transition to a fully renewable energy system. Those facilities are the GDF Suez Distrigas LNG import terminal in Everett, MA,<sup>172</sup> the Northeast Gateway Deepwater Port, thirteen miles offshore from Gloucester,<sup>173</sup> and the Neptune Deepwater Port offshore LNG import buoy facility, ten miles offshore from Gloucester, MA.<sup>174</sup> In addition, New England receives gas supplies from the Canaport LNG import facility in Saint John, New Brunswick, Canada, approximately 60 miles over the Maine border.<sup>175</sup>

Low or, (in the case of the two Deepwater Port facilities) no,<sup>176</sup> LNG deliveries to Massachusetts were an important factor in high prices during the winter of 2014.

The greater delivery of LNG this past winter (2015) has played a role in keeping gas more available and wholesale gas prices lower in our region,<sup>177</sup> and it can again in winters to come, and without any additional pipeline infrastructure needed in Massachusetts for the supply. As the Boston Globe reported, “shipments of liquefied natural gas, or LNG, into the region have dramatically increased this winter, and at prices 50 percent lower than last winter. The change has prevented natural gas shortages caused by pipeline constraints and moderated fuel prices.”<sup>178</sup>

LNG tankers bring in an immense quantity of gas in a single ship. The LNG tanker the Suez Matthew, for example, which unloaded at Distrigas in Everett this past February, holds the equivalent of 2.6 Billion cubic feet of gas, once the LNG is regasified.<sup>179</sup> The LNG tanker, the Excelerate, which unloaded at the Northeast Gateway Deepwater Port in January (2015), holds the equivalent of 2.85 Billion cubic feet of gas, and includes an on-board regasification unit.<sup>180</sup> These huge cargoes amount to about 3 to 4 days of the Synapse Report’s estimated peak Massachusetts gas shortfall in 2030, in a single ship’s delivery. We likely only need to cover a few dozen days peak demand in a winter in Massachusetts, the equivalent of maybe 6 to 10 LNG tanker loads, even if we adopt none of the other alternatives suggested here to reduce peak gas demand.

Market forces will likely bring this LNG import capacity into play during future winter peak demand events, if the price signals are strong enough.<sup>181</sup> However, we will likely pay a premium to wait for market forces to draw LNG shipments to New England, and availability on the LNG spot market in severe winters could be constrained -- that was part of the price spike problem during the winter of 2013/2014.

Therefore, it seems likely New England could consider public LNG hedging, contracting or leasing arrangements by individual New England states, or a New England regional public consortium, to acquire and reserve LNG at lower prices in advance of each winter, as one more alternative to manage peak winter demand.

The nation created the national Strategic Petroleum Reserve in the 1970s to improve the nation’s petroleum energy security.<sup>182</sup> Oil stocks in the reserve are federally owned,<sup>183</sup> and the reserve is maintained by the U.S. Department of Energy.<sup>184</sup> Later, the similar 1 million barrel Northeast Home Heating Oil Reserve was established in Groton, Connecticut and Revere, Massachusetts, managed by the U.S. Department of Energy, but held in private oil terminals (the Hess terminal in Groton, and the Global Montello Group, LLC terminal in Revere).<sup>185</sup> According to the Department of Energy, the Northeast Home Heating Oil Reserve “provides protection for homes and businesses in the northeastern United States should a disruption in supplies occur.”

<sup>186</sup>

The possibility of one or more of the New England states creating a similar publicly owned natural gas / LNG reserve, and stockpiling winter gas reserves and/or LNG there, should be considered among the alternatives to the proposed NED pipeline.

The Commission’s EIS needs to review the wide range of LNG options that will be, or could reasonably be

part of the alternative to the NED Project during the 2015 – 2038 planning horizon.

### **A local example of LNG storage alternatives not adequately explored – Berkshire Gas**

As the Commission is aware, Berkshire Gas is one of the Local Distribution Companies (LDCs) for gas that has signed a Precedent Agreement with TGP for capacity on the proposed NED pipeline. Berkshire Gas recently announced a gas hook-up moratorium in its Eastern Division until the NED is built, basically arguing that the NED is the only solution that can allow it to keep adding customers and accommodate growth on its local gas distribution system.<sup>187</sup>

It is, in essence, making a small parallel argument to the one TGP is making about the NED project writ large – that there are no other feasible alternatives to accommodate growing gas demand except the NED. The Berkshire case is therefore instructive about whether other alternatives, like LNG, are being overlooked in the rush to build a massive new gas transmission pipeline.

Critics like me have argued that Berkshire could have at least addressed part of growing demand by greater utilization of LNG storage, a plan that Berkshire itself had to accommodate winter peak demand growth but did not implement. Berkshire’s Manager – Regulatory Economics in fact acknowledged that “the expansion of on-system peaking resources” was one of the “‘conceptual’ alternatives to the NED Project” for Berkshire.<sup>188</sup> (According to this Manager, Berkshire’s on-system peaking resources are LP and LNG.<sup>189</sup>)

It’s hard to accept Berkshire’s argument that it has no other options except the NED, when Berkshire failed to carry out its own plan to accommodate demand growth with increasing LNG storage. Here’s the LNG plan that Berkshire Gas did not carry out:

In 1999, to alleviate pressure, capacity and peaking issues, Berkshire added a permanent LNG storage facility to its system, at 369 Long View Road in Whately, MA, originally comprised of two 70,000-gallon LNG tanks.<sup>190</sup> In 1999, at least, Berkshire determined that the proposed LNG storage would be lower cost, in net present value of 20 year revenue requirements, than the alternative of building a 12” diameter pipeline upgrade in the Northampton, Hatfield and Whately portions of its line coupled with increased gas transport from Tennessee Gas Pipeline.<sup>191</sup> According to the Massachusetts Energy Facilities Siting Board (EFSB) in 1999, “Berkshire [Gas] stated that the proposed [Whately] LNG storage and vaporization facility would make it possible to ‘maintain adequate operating pressures during peak or near peak periods’ for the next twenty years . . . .”<sup>192</sup>

Berkshire had originally planned in 1999 to add three additional LNG tanks in Whately in about 2003, 2011 and 2018, with the installation taking place over these twenty years “as needed to meet projected [gas] sendout requirements”, according to the EFSB.<sup>193</sup> But in 2006, Berkshire Gas still only had two 70,000-gallon LNG tanks at its Whately LNG facility, with space for three more LNG tanks.<sup>194</sup> Based on this author’s personal observations, a Google Earth view of Berkshire Gas’ Long Plain Road site in Whately, and Berkshire’s own recent testimony,<sup>195</sup> it appears that there are still only two LNG tanks there, with space still vacant for three more LNG tanks.

So, Berkshire seems to be ignoring this possible local LNG capacity upgrade to “maintain adequate operating pressures during peak or near peak periods”, and to “meet projected [gas] sendout requirements.” Berkshire’s Manager – Regulatory Economics’ arguments for not exploring the expansion of LNG as an alternative to the NED Project were not convincing. This manager first argued that such expansion could not meet Berkshire’s identified design-day need through this alternative.<sup>196</sup> However, the methodology for arriving at that design-day may have inappropriately inflated that need. Moreover, even if expanding Berkshire’s LNG storage could not meet the full ten year design-day need, it seems possible that it could meet some significant portion and sooner than the 3 ½ year moratorium delay.

Secondly, this Berkshire Manager argued there are gas-mixing constraints involved in expansion of such on-system peaking resources. However, LNG is already being used by Berkshire for answering peak demand, so clearly they have mastered any gas-mixing issues with the use of LNG.

Thirdly, this Manager argued there are operational issues with (LNG) product and trucking availability, and that the price has typically been higher and more volatile (than piped gas). However, as noted above, the Boston Globe reported LNG shipments into the region increased “dramatically” during the winter of 2015, at prices 50% lower than the previous winter, moderating gas prices.<sup>197</sup> For the first time in several

years, for example, one of the moth-balled offshore LNG import buoy terminals off the coast of Gloucester, MA, the Northeast Gateway Deepwater Port, was put back into service during 2015.<sup>198</sup> So any issues with availability and price may be moderating. Thus, the arguments against at least exploring LNG use seem to be weakening.

Within the 20 year term of the proposed Precedent Agreement, and perhaps even prior to its possible November 2018 commencement date, it also seems possible that LNG shipments might also be available by rail tank car to Berkshire's LNG facility,<sup>199</sup> further alleviating Berkshire's asserted concern about trucking issues. Berkshire's Whately LNG facility site immediately abuts a rail line.

UMASS-Amherst isn't waiting for the NED pipeline to be built 3 years from now. The University is currently proposing to build a new permanent 108,000 gallon LNG storage facility next to its Combined Heat-Power plant on its Amherst, MA campus.<sup>200</sup> UMASS-Amherst plans to begin construction of the first 56,000 gallon LNG tank in the fall of 2015, and to have that tank operational by November 2016.<sup>201</sup> So such LNG storage facilities can be built in roughly a year.

In addition, Columbia Gas has found economic justification for a gas liquification facility in Ludlow,<sup>202</sup> enabling it to purchase gas off-peak at lower cost, and liquefy it for storage until winter peak use. These local examples of LNG utilization, storage expansion and expansion possibilities point to the likelihood of LNG being a significant part of the New England-wide alternative to the proposed NED pipeline, that the Commission's EIS needs to address in detail.

#### **IV.E.2 Pumped storage**

As the Commission is well aware, pumped storage stores energy from surplus electricity generation during off-peak hours, by using that electricity to pump water up into reservoirs or dam headwaters that are connected to raceways equipped with hydropower generating turbines.<sup>203</sup> When electricity is needed later, for example during peak demand periods, the pumped and stored water is released and gravity takes it down the raceways, spinning hydropower turbines to generate electricity on demand.

In the past that surplus electricity generation for pumped storage came from high volume baseload generating stations like the Vermont Yankee nuclear plant. In the near future pumped storage could be used to store the energy from surplus renewable generation like off-shore wind overnight, or solar generation on a bright but temperate day, and make it available when the wind or sun are down, or during peak demand.<sup>204</sup>

With the coming surge of wind and solar power, pumped storage is experiencing renewed interest nationally, as we look for ways to expand energy storage to complement intermittent generation by wind and solar.<sup>205</sup> Pumped storage creates, in effect, a giant battery, rechargeable by wind and solar for later use.

New England currently has large-scale pumped storage capability of 1,777 MW,<sup>206</sup> about equal to 5% of the electrical generating capacity in the region<sup>207</sup> – a great, if insufficient, start in high capacity regional energy storage to balance a renewable energy portfolio. This pumped storage is comprised primarily of the very large Northfield Mountain 1,124 MW pumped storage facility in Northfield, MA, which, at the time it was completed in 1972, was the largest such facility in the world.<sup>208</sup> New England also includes the oldest operating U.S. pumped storage facility, the Rocky River Station in Connecticut, completed in 1929,<sup>209</sup> and the 600 MW Bear Swamp (a/k/a Jack Cockwell) pumped storage facility in Florida, MA on the Deerfield River.<sup>210</sup> Not far is the recently modernized 1,160 MW Blenheim-Gilboa pumped storage facility in New York's Catskills.<sup>211</sup>

An expansion of New England's pumped storage capacity during the 2015 – 2038 horizon could help support the reliability of greater renewable energy generation in our region, and could be part of the alternative to massive new gas pipeline infrastructure. The fastest opportunities for such expansion may be at one or more of the existing pumped storage facilities.

Northfield Mountain, in fact requested permission last fall to increase its power production by about 2,170 megawatt-hours/ per day of generation on a temporary basis overwinter (equivalent to about 90 MW of added generation capacity),<sup>212</sup> by simply raising the reservoir's upper limit by 4 feet and its lower limit by 18 feet.<sup>213</sup> Modernization of pumps, turbines and other equipment might offer another avenue for expanding

the effective electrical output of existing pumped storage facilities.<sup>214</sup>

New pumped storage facilities could also be investigated, and implemented where feasible. Last year, a study by the Idaho National Laboratory (INL), a U.S. Department of Energy National Laboratory, looked for possible new pumped storage sites around the nation, including sites with existing hydropower dams and non-powered dams that had nearby lakes or reservoirs that were plausible candidates for higher elevation pumped storage connected to the dam.<sup>215</sup> It also screened for sites that promised at least 10 megawatts (MW) of pumped storage hydro generating capacity.

The INL study found five such sites in New England, out of the 38 such sites nationwide. They are:

- i) A Connecticut River / Turners Falls Pond reservoir combination in Massachusetts (current nameplate hydropower generation rating of 51 MW);
- ii) A Little River / Cobble Mountain Reservoir combination in Massachusetts (current nameplate rating of 33 MW);
- iii) A Deerfield River / Fife Brook Reservoir combination in Massachusetts (current nameplate rating of 11 MW);
- iv) A Pemigewasset River / Webster Lake reservoir combination in New Hampshire (non-powered dam with an estimated potential generating capacity of 42 MW);
- v) A Deerfield River / Sadawag Lake reservoir combination in Vermont (current nameplate rating of 34 MW).<sup>216</sup>

While these potential power storage facilities would be small additional pumped storage generators compared to the very large existing 1,124 MW Northfield, MA pumped storage facility,<sup>217</sup> they apparently have not been assessed for upgrades to increase power output, and would in any event appear to offer the possibility in the aggregate of about a 15% increase in New England pumped storage capacity over Northfield alone.

Moreover, the INL study did not look at so-called “closed loop” pumped storage possibilities in New England or elsewhere (where both upper and lower reservoirs are newly constructed, and do not relate to existing water bodies). I am also excluding from detailed mention here INL’s list of potential “greenfield” pumped storage sites (no existing dam or reservoir, 97 sites nationally) and paired waterbody sites (2,370 sites nationally), as likely being too challenging to get permitted and built in the coming decade.

The INL study recommended follow-on feasibility studies of the sites it identified, along with new studies of possible “pump back” pumped storage (where water is pumped from the tailwater back up to the headwater of an existing dam, without a separated reservoir<sup>218</sup>), closed loop pumped storage (including abandoned mines), and shoreline saltwater-based pumped storage, among other recommendations.<sup>219</sup> So, ultimately there could be other opportunities for pumped storage that could serve as part of the on-demand back-up to renewable energy in New England.

With respect to the INL’s note of closed loop, abandoned mine pumped storage, it is worth mentioning that a 1981 U.S. Army Engineer Institute for Water Resources study observed that it would be possible to construct one or two pumped storage reservoirs underground in connection with a surface reservoir, pumping up and down between them to store and then generate back-up / peak demand power,<sup>220</sup> potentially reducing competition with other surface land uses.<sup>221</sup> Such an approach might liberate pumped storage from needing to be located in certain topography near certain water bodies, although geological factors would no doubt come more strongly into play.<sup>222</sup> The Army Institute of Engineers study noted that an underground pumped storage system could use the water descending through hydropower turbines into an underground reservoir to also compress air in the underground reservoir, driving a second set of compressed air turbines to deliver additional peak demand electricity.<sup>223</sup>

In line with this renewed interest in pumped storage as support for renewable energy, since 2008 your Commission has received more than 100 preliminary applications for new pumped storage projects around the country, mostly closed-loop / off-stream proposals,<sup>224</sup> including a number that reportedly plan to use underground caverns as the lower reservoir.<sup>225</sup> So the Army Institute of Engineers’ intriguing underground

pumped storage concepts may yet be tested in the U.S.

### **IV.E.3 Grid-scale battery storage**

As the Commission is no doubt aware, high capacity, grid-scale battery storage is already being installed around the United States. As the *Economist* noted last December, grid scale batteries have an immediate advantage in smoothing out “irregular demand through the day by absorbing electricity during troughs and regurgitating it during peaks. If that pans out, it will eliminate the need for gas powered ‘peaker’ stations which fire up quickly when needed, but are expensive to run.”<sup>226</sup>

Beyond that, battery storage promises to be one of the multiple paths to overcoming the question of “intermittency” of wind, solar and other renewable energy sources. Moreover, grid-scale battery storage has proven useful in frequency regulation and improving the quality of the electricity being supplied.<sup>227</sup>

Grid-scale battery development is a rapidly expanding field. The Swiss energy services and battery company Alevo just opened a new production facility in North Carolina last fall in which it plans to build batteries totaling 16.2 Gigawatt-hours (GWhr) in capacity each year.<sup>228</sup> Alevo believes the facility will ultimately create 2,500 to 6,000 new jobs.<sup>229</sup> In an interesting twist potentially heralding changed directions for the U.S. economy and manufacturing, Alevo bought the 3.5 million square foot former Philip Morris cigarette factory in Concord, North Carolina for this facility.<sup>230</sup> Ironically, the former cigarette factory may help us clear the air of fossil fuel emissions.

Tesla is building a similarly enormous factory near Reno, NV to produce batteries for both cars and grid-scale utility storage.<sup>231</sup> Tesla has partnered with Panasonic in this \$5 billion “gigfactory” in Nevada, which Tesla’s founder says will produce more battery capacity than all of the world’s current total lithium-ion battery production combined, up to a quarter of which will be for stationary power supplies including grid-scale storage batteries.<sup>232</sup> Tesla’s huge battery factory will employ up to 6,500 people, according to the *Wall Street Journal*.<sup>233</sup>

But grid-scale battery storage is not just “coming soon” to an electric utility near you. Such storage is already installed and operating on the grid in different parts of the country. Examples of grid-scale battery storage already installed include:

- the 36 MW Notrees Battery Storage Project in Texas, adjoining the 153 MW wind farm there,<sup>234</sup>
- the 32 MW battery storage facility adjoining the 94 MW wind turbines at the AES Laurel Mountain facility in West Virginia,<sup>235</sup>
- the 20 MW battery storage facility at the Tait Electric Generating Station in Ohio,<sup>236</sup>
- the 3 MW Lyon Station, PA battery storage facility.<sup>237</sup>

The California Public Utilities Commission has set a target of 1.3 GW of electrical storage installed by 2020.<sup>238</sup> This is already pushing energy storage development significantly. Late in 2014 Southern California Edison announced 261 MW of storage-related development contracts, including a 100 MW battery storage facility to be built by AES in Los Angeles County.<sup>239</sup>

Closer to home, one modular energy storage company has announced plans to work with Holyoke Gas & Electric and UMASS-Amherst to develop a network of residential energy storage systems.<sup>240</sup>

Moreover, as home power batteries system enter the market, like Tesla’s Powerwall, in the future utilities may benefit from reduced peak demand on their grid due to the home batteries, or even be able to interface with thousands of these batteries to create “virtual power plants” for the grid.<sup>241</sup> This may also be possible with electric vehicles’ batteries in the future.<sup>242</sup> While cabled in for charging, these batteries might be drawn from when the need for peak power is high and the cost of it makes it worthwhile for the owner to automatically send power from his or her car battery back into the grid to make more money than the owner paid for the electricity during off-peak charging.

### **IV.E.4 Other forms of storage**

As the Commission is aware, other forms of grid-scale energy storage have already been installed around

the country, or are in active development, including:

- compressed air storage,<sup>243</sup>
- thermal storage (molten salts, gravel, possible ice manufacture and storage for cooling loads, etc.),<sup>244</sup> and
- flywheels.<sup>245</sup>

At the residential level, in addition to residential battery storage, such as Tesla's Powerwall, VCharge presented a discussion of home thermal storage using its water- or ceramic-based home storage units, at the recent Massachusetts DPU conference on energy storage.<sup>246</sup>

The Commission should examine these and other energy storage alternatives, including those discussed above, in its EIS.

#### **IV.F Solar**

The Commission's EIS scope should include:

- (1) A detailed review of the extent to which expanded solar energy (particularly solar photovoltaics) is likely to, or could reasonably, replace some or all of the need for the proposed NED Pipeline through the 2015 to 2038 horizon;
- (2) A detailed review of the coming changes in dispatchability and solutions for intermittency and their impacts on the scale-up of solar energy in New England through this planning horizon.

#### **Reasoning behind the IV.F scoping questions**

Similar to its dismissal of wind as an alternative, TGP, in its July 2015 draft Resource Report 10, asserts that "renewable resources, such as solar power . . . are not being developed at a pace fast enough to provide for the projected energy needs in the region", also arguing, as with wind, that solar is "an intermittent and non-dispatchable source of generation".<sup>247</sup>

But as with wind, TGP has again created a strawman with respect to solar. Again, the question is not whether a single alternative, like solar generation of electricity, can answer the asserted power needs of the region, but whether a combination of alternatives, such as wind, solar, efficiency improvements, expansion of energy storage, etc. can answer the power needs of the region at the pace needed over the planning horizon appropriate for this project.

TGP does not offer even the semblance of a quantitative review of solar capacity or its growth in New England, so it's worth mentioning some basics here. Massachusetts, for example, has been rapidly increasing the installation of solar/photovoltaic (PV) electricity generation over the past three years. In 2011, Massachusetts had less than 100 megawatts (MW) of photovoltaic generation capacity installed in the state,<sup>248</sup> in a state with approximately 14,321 MW of net generating capacity.<sup>249</sup> By 2014, installed photovoltaic generating capacity in Massachusetts had reached 776 MW,<sup>250</sup> more than a seven-fold increase in three years, equivalent to an average annual increase in PV capacity in Massachusetts of about 225 MW per year.

Assuming no increase in that 225 MW/year rate of PV installation, a conservative assumption at this point, the state should be able to install at least another 1,125 MW of photovoltaic capacity by 2020, taking us to a statewide photovoltaic generation capacity of about 1,901 MW (776 MW + 1,125 MW). This estimate is more or less in line with the Massachusetts Executive Office of Energy and Environmental Affairs' new solar goal of 1,600 MW installed by 2020, since the state has reached previous solar goals earlier than expected.<sup>251</sup>

Similarly, although a little more conservatively, ISO New England forecasts that photovoltaic generating capacity will be over 1,800 MW regionally by 2023, with almost 70% of that projected to be in Massachusetts (i.e., about 1,260 MW).<sup>252</sup> For capacity comparison, 1,800 MW of solar is approximately equal to the 1,838 MW in conventional electricity generation capacity of the 604 MW Vermont Yankee nuclear generating station,<sup>253</sup> 749 MW Salem Harbor coal- and oil-fired station,<sup>254</sup> 143 MW Mount Tom coal-fired generating station<sup>255</sup> and 342 MW Norwalk Harbor oil-fired generating station<sup>256</sup> combined,

which all retired prior to January 2015.<sup>257</sup> (Their retirement was much pointed to as a reason for needing the NED pipeline and more gas-fired generation, with predictions of catastrophic regional electricity prices in the winter of 2015 that did not materialize.)

ISO New England acknowledges that it has typically not been aware prospectively of the timing or location of distributed generation [“DG”] resources, like small-scale solar, although it “is working to improve its operating forecasts to more fully account for PV.”<sup>258</sup> So it is quite possible its estimates of future solar installation are on the low side.

At a new installation rate of 225 MW per year, we should be able to achieve an additional PV installation of at least 2,250 MW more by 2030, giving us at least 4,151 MW of installed solar (PV) capacity in Massachusetts by 2030 (1,901 MW + 2,250 MW), about 29% of the state’s current net generating capacity<sup>259</sup> (4,151 MW ÷ 14,321 MW).

The Commonwealth will of course need to make sure it keeps in place any necessary policies and incentives to maintain, and hopefully increase, this level of photovoltaic installation and push our sister states in New England to do likewise.

Two such important policies are (i) continuing to raise the net-metering cap, and (ii) encouraging more solar “co-location” with other land uses.

(i) Raising the net metering caps. As the Commission is aware, net metering allows a consumer with photovoltaic panels or other renewable energy installation to run its electric meter ‘backwards’ when it produces more electricity than it is using and sends the surplus electricity back into the grid. Net metering has encouraged the installation of a large quantity of new photovoltaic generation capacity in Massachusetts. Raising the net metering cap is an alternative fully within the technical capability of the state within the near-end of the planning horizon for this project.

The state, however, has imposed two caps on how much solar and other renewable energy over a certain production capacity can be installed in each utility’s area and net metered back into the grid – a 4% of peak historic electric demand cap on private installations, and a 5% of peak historic electric demand on public installations.<sup>260</sup> These net metering caps put a limit on the amount of possible solar and other renewable generation that can be installed under this favorable economic arrangement.<sup>261</sup>

The U.S. Department of Energy’s National Renewable Energy Laboratory projected that Massachusetts would reach these net metering caps around 2017 (a year before the proposed NED Pipeline could come on line), with some utilities “likely to meet the private and/or public cap before 2017.”<sup>262</sup> In fact, by 2015, National Grid, for one, had already hit its net metering cap in Massachusetts.<sup>263</sup>

In other words, unless these statutory net metering caps are again raised, in about two years the phenomenal escalation of renewables in Massachusetts will likely hit the caps across all the utilities involved, and the caps will put the brakes on the installation of solar and other renewables. Said another way, Massachusetts state law will soon slow the phenomenal growth of electricity generation by solar and other renewables under net metering. Raising the net-metering caps, fortunately, is being actively debated in the legislature, and there is a good chance that this arbitrary limit dampening solar development will soon be raised.

(ii) Greater co-location of solar. Greater co-location of photovoltaic panels with existing land uses is also possible in New England. One solar co-location option where Massachusetts has been a national leader, but which is still significantly underdeveloped, is co-location of photovoltaic panels over parking lots.<sup>264</sup> Although cost is currently still an issue, redirection of some portion of a possible multi-billion dollar misinvestment in gas pipelines might make parking lot co-location of photovoltaics feasible at a much larger scale. Again, this is one of the partial alternatives to the proposed NED pipeline that is achievable within the near end of the planning horizon at issue here.

Another very visible opportunity for more co-location of solar panels has appeared along the Massachusetts turnpike (Mass Pike). A number of 250 KW to 300 KW solar panel arrays have already been installed along the north side of the Mass Pike right-of-way by the Massachusetts Department of Transportation (“DOT”), notably in the Framingham to Boston section of the east-west turnpike, to save money and reduce carbon emissions according to the Department’s project manager for this initiative. The Massachusetts Department

of Transportation has planned other such installations and has actually studied 600 possible locations for such panels.<sup>265</sup> The DOT estimates the initial solar arrays will save or earn taxpayers about \$15 million over the life of the power purchase agreements with the solar company operating these highway right-of-way solar sites.<sup>266</sup>

In its EIS, the Commission should thoroughly examine the potential that solar energy will, or reasonably could, provide at least part of the alternative to the proposed NED Pipeline through the 2015 to 2038 planning horizon.

#### **IV.G Biogas**

The Commission's EIS scope should include:

- (1) A detailed review of the potential for biogas heat and electricity generation in New England that will be or could reasonably be installed during the planning horizon;
- (2) An analysis of the net climate impacts, and other net environmental impacts, of such biogas as compared to the gas that would be transported on the proposed NED pipeline, derived from hydraulically fractured or other fossil-sourced gas.

So-called "biogas" is typically derived from the controlled anaerobic digestion of organic wastes, such as cow manure, discarded food wastes, and sewage, inside containment tanks. The biogas can then be burned for either space or process heating, or to power electrical generators, or in "Combined Heat and Power" (CHP) units that produce both heat and electricity.

Because it represents a contained and controlled generation of methane, methane that could otherwise be naturally produced in the breakdown of these wastes and lost to the atmosphere (where it would have significantly more impact per pound than carbon dioxide), biogas potentially has positive climate change mitigation impacts.<sup>267</sup> Even if climate impacts were neutral, biogas would likely present advantages over imported fracked gas in terms of:

- being a renewable energy source,
- distributing energy production geographically,
- diversifying energy supply sources and the companies that control them / reducing over-reliance on a handful of critical energy facilities (e.g., a few critical transmission pipelines) and a handful of energy monopolies,
- mitigating fuel price volatility,<sup>268</sup>
- reducing municipal,<sup>269</sup> farm and food industry energy and/or disposal costs,
- increasing energy system resilience,
- supporting rural economies,<sup>270</sup>
- retaining energy dollars in New England,
- reducing solids sent to landfills, and
- lessening aggregate environmental and health impacts due to hydrofracturing and pipeline transmission projects.

(Many of the above advantages also apply to other alternatives discussed in this letter.) As a Massachusetts study of biogas potential at the states many waste water treatment plants ("WWTPs") observed: "Treating millions of gallons of wastewater containing biosolids, these Massachusetts WWTPs are processing a potential fuel every day, and more often than not, that fuel simply passes through the plant and goes to [a] landfill."<sup>271</sup>

Biogas is not simply a theoretical possibility within the NED planning horizon; it is already being produced and used to generate electricity in numerous installations throughout New England. Examples of biogas production and energy generation facilities already installed in New England include:

- Jordan Dairy Farm's manure and food waste-based anaerobic digester and on-site 300kW CHP biogas-

fueled electrical generating facility in Rutland, MA,<sup>272</sup>

- Barstow’s Longview Farm anaerobic digester and 300kW on-site biogas-fueled generator in Hadley, MA, which reportedly produces heat for the farmhouse and milking parlor and supplies enough electricity into the WMECO electric grid to supply 250 homes continuously,<sup>273</sup>
- Massachusetts Water Resources Authority (MWRA) anaerobic digesters and biogas-generating turbine at Deer Island;<sup>274</sup>
- Fairhaven, MA Water Pollution Control Facility’s 149kW biogas-fueled combined heat and power plant and anaerobic digester.<sup>275</sup>

In addition, the Pittsfield, MA Waste Water Treatment Plant “which generates 80,000 cubic feet of methane per day, recently obtained funding for a co-generation system that will use three turbines to convert excess methane into electricity.”<sup>276</sup>

The Department of Energy’s National Renewable Energy Laboratory (NREL) has estimated that the methane potential from landfills, animal manure, sewage, and industrial, institutional and commercial organic wastes is about 7.9 million tons per year nationally, equal to about 420 billion cubic feet of gas, sufficient to displace about 5% of the drilled gas being used to generate electricity in the U.S., as of 2013.<sup>277</sup> Duke University’s Nicholas Institute for Environmental Policy Solutions similarly estimated that, given appropriate conditions, “biogas could be expanded to perhaps 3-5% of the natural gas market” within the 2040 energy planning horizon.<sup>278</sup>

The European Union is reportedly already obtaining 2% of its gas consumption from biogas.<sup>279</sup> The European Union managed to increase its production and use of biogas by 30% in just the short period from 2009 to 2010, according to one study.<sup>280</sup>

According to NREL, all of the New England States have counties with the potential to each produce biogas exceeding 5,000 tons (annually) in methane potential, and some counties in New England have the potential to produce over 10,000 tons each.<sup>281</sup> As noted, biogas is already being produced in New England at numerous locations, including farms and wastewater treatment plants, and is being used for both heating and electricity generation.

Biogas production could likely be expanded significantly as an alternative source of gas during the NED project planning horizon.<sup>282</sup> For example, a 2011 Massachusetts Department of Environmental Protection study on the energy potential for biogas production at wastewater treatment plants noted that, “[a]s of June 2011, only six of 133 municipal WWTPs [Waste Water Treatment Plants] in Massachusetts utilize anaerobic digestion, and of those six, only three are using or in the process of installing a CHP [Combined Heat and Power] system to generate renewable energy on-site.”<sup>283</sup>

The Commission’s EIS should include an assessment of biogas as part of the alternative to the proposed NED Project.

## **Conclusion**

In sum, TGP’s analysis of alternatives in its July 2015 Resource Report 10 was a completely inadequate discussion of the potential alternatives to the NED Project. A number of important alternatives such as energy storage, demand shifting, and biogas were barely discussed or not discussed at all. Other important alternatives, such as hydropower, wind and solar were dismissed by TGP without a thorough-going and quantitative review of their potential as alternatives.

The scope of the Commission’s EIS will need to include a much more rigorous review of such alternatives over the appropriate planning horizon, a comparison of their adequacy to deliver equivalent energy resources in the appropriate timeframes, and their respective environmental impacts when compared to the impacts of the proposed TGP Project.

It is my strong belief that when such a review of the alternatives is properly done, the likely conclusion will be that there are reasonable and sufficient alternatives to the NED Project that have far less environmental impact, particularly with respect to climate change, and that we should be pursuing these alternatives,

instead of wasting billions of dollars on the proposed NED Pipeline.

Thank you for your consideration of these comments.

Sincerely,

/s/ Rutilious (Rudy) B. Perkins III, Esq.

ES-3:

“Given existing energy infrastructure, expansions already underway, and other market responses to winter peak prices, a new pipeline subsidized by electricity ratepayers will overserve the New England market, resulting in a glut of natural gas throughout the year that is likely to flow to markets outside of New England into Canada and overseas. This would leave New England ratepayers paying for the cost of building a new pipeline for twelve months of the year, and reselling back unused capacity at a lower rate for at least nine months to natural gas shippers selling into other markets.”

Report / Resource Report 1 / General Project Description / Public [Version],” (July 2015), available through the FERC Online docket at FERC Accession number 20150724-5061, p. 1-12.

<sup>24</sup> For a quick overview of this possibility, please see my op ed piece “On the trail of the natural gas shell game,” Hampshire Gazette (Northampton, MA) (March 6, 2015), p. A6.

Unbeknownst to me at the time, the very day this op ed was published, the Department of Energy used a more lenient section of the Natural Gas Act to approve the LNG export application of 0.46 Billion cubic feet of natural gas per day from yet another LNG export terminal to be connected to the M&NP, the proposed Downeast LNG export terminal to be built in Robbinston, Maine. See United States of America / Department of Energy / Office of Fossil Energy / Downeast LNG, Inc. / FE Docket No. 14-172-LNG, “Order Granting Long-Term, Multi-contract Authorization to Export Liquefied Natural Gas by Vessel from the Proposed Downeast LNG Terminal in Robbinston, Maine, to Free Trade Agreement Nations / DOE/FE Order No. 3600,” (March 6, 2015), available at [http://energy.gov/sites/prod/files/2015/03/f20/ord3600\\_0.pdf](http://energy.gov/sites/prod/files/2015/03/f20/ord3600_0.pdf) , pp. 2, 4.

<sup>25</sup> Michael Sanserino, “Northern Exposure / Canada Offers More Avenues for Overseas LNG Exports,” Pittsburgh Post-Gazette (Aug. 12, 2014), Westlaw Doc #2014 WLNR 22047524.

See also “Eastern Canada LNG projects look to Marcellus,” Energy Monitor Worldwide (Nov. 15, 2014), [Westlaw doc. # 2014 WLNR 32155634] :

“Five LNG projects have been proposed for eastern Canada and are in various stages of development, with plans to export the fuel to Europe, South America and Asia. Which of them will succeed depends on approvals, financing, timing and -- most importantly -- securing gas supply. . . . Three projects in Nova Scotia -- Goldboro LNG, Bearhead LNG and H-Energy -- have plans to build liquefaction plants . . . with startup dates estimated at around 2018 -- 2020. All plan to source most of their gas from the huge Marcellus shale in the US via the existing Maritimes & Northeast Pipeline (M&NP) . . . .”

and Joe Mahoney, “Another pipeline rules out I-88 route,” The Daily Star (Oneonta, NY) (Nov. 12, 2014) (West Law Doc. #2014 WLNR 31771970 :

“Tennessee [Gas Pipeline], based in Houston, noted in a list of ‘frequently asked questions’ about the project that it ‘cannot discriminate among customers based on the ultimate destination of the gas’ and it was powerless to stop receivers of the gas from exporting it to foreign markets.

The company pointed out that there are four liquefied natural gas export projects on Canada’s Atlantic Coast and one LNG export project in northern Maine ‘that could find capacity on the NED Project useful to service their proposed LNG export facilities.’”

and “Nova Scotia regulator approves transfer of LNG plant build permit,” The Canadian Press (8/15/14) [excerpt available at <http://www.news957.com/2014/08/15/nova-scotia-regulator-approves-transfer-of-lng-plant-build-permit/> ], (reporting that the Nova Scotia Utility and Review Board has approved transfer of permit to build Bear Head LNG plant to Mayflower LNG PTY Ltd., a wholly owned subsidiary of Liquefied Natural Gas Ltd.; “Liquefied Natural Gas Ltd. announced last month that it would purchase the partially constructed Anadarko Bear Head LNG terminal for U.S. \$11 million and develop it as a liquefied natural gas export facility.”; original owner had planned to build an LNG [import] terminal supplying natural gas to the Maritimes and Northeast pipeline [but that plan encountered problems]. [Emphasis added]);

and Quentin Casey, “Nova Scotia hopefuls; Proponents keen to capitalize on geography, create jobs,” National Post (Ontario, Canada) (Nov. 27, 2014):

“When it comes to proposed LNG export terminals, Canada’s West Coast gets most of the national attention, yet there’s growing talk of building LNG export terminals on Canada’s East Coast.

At this point there’s no clear front-runner, and it’s unclear if any of the projects will make the leap from idea to reality. Still, proponents are bullish on the potential of LNG projects, especially in Nova Scotia.

Bear Head LN, a subsidiary of Perth, Australia-based Liquefied natural Gas Ltd., is among the proponents hoping to capitalize on the province’s North Atlantic geography.

When compared to U.S. Gulf ports, Nova Scotia is about half the shipping distance to European markets, and closer to India than British Columbia. . . .

On Nov. 6, Bear Head LNG filed an application with the National Energy Board, seeking an export licence for up to 12 million tonnes of LNG per year. Its proposed Nova Scotia development site is situated near Point Tupper, on the Cape Breton side of the Strait of Canso and comes complete with roads, utilities and foundations for LNG holding tanks. . . .

Bear Head LNG is expected to source gas from three potential sources: Nova Scotia’s offshore fields, Western Canada and the U.S., including the Marcellus shale fields. Indeed, the company is seeking permission to import up to 503 billion cubic

feet of natural gas annually from the U.S.

‘We are in serious negotiations with major natural gas suppliers in North America as well as major LNG buyers globally, both in Europe and Asia,’ Mr. Godbold said. ‘I think the odds of Bear Head going ahead are incredibly high given the global demand for LNG.’

Bill Gwozd echoes that point. The Calgary-based consultant with Ziff Energy says it’s no surprise that three LNG export proposals have popped up in Nova Scotia, given its proximity to Europe. . . .

According to Mr. Gwozd, global demand for LNG is 35 billion cubic feet per day, a figure that is forecast to grow by two bcf a year for the next decade. . . .

The Maritimes and Northeast Pipeline, a 1,101-kilometre route that takes Maritime gas to the northeast U.S., could be reversed to take American gas to LNG plants in Nova Scotia. . . .

Pieridae Energy Ltd. [is] another of the Nova Scotia [LNG export] hopefuls.

Thomas Dawson, Pieridae’s chief operating officer, believes his project’s advantage lies in its proposed location at Goldboro, where Nova Scotia’s offshore gas makes landfall and enters the Maritimes and Northeast Pipeline. . . .

The company [Pieridae] also benefits from having an agreement with E.ON SE, a German utility, to purchase half of the proposed facility’s 10 million tonne output. . . .

A third proposal, floated by India’s H-Energy Private Ltd., would involve a 13.5 million tonne export terminal in Melford. The company says memorandums of understanding have been signed for six million tonnes of LNG, roughly half of the proposed output at the estimated \$9-billion plant. The MoUs involve undisclosed customers in India, the Middle East and Europe. . . .

Spanish giant Repsol YPF SA, which owns 75% of the Canaport LNG facility in Saint John, N.B. is also considering turning its LNG import terminal into an export plant. In addition, GNL Quebec Inc., backed by U.S.-based Freestone Capital LLC and Breyer Capital LLC, have proposed a \$7-billion LNG export terminal in Saguenay, Q.C.” (Emphasis added.)

and Department of Energy, Office of Fossil Energy, “Pieridae Energy (USA) Ltd.; Application for Long-Term Authorization To Export Domestically Produced Natural Gas Through Canada to Non-Free Trade Agreement Countries After Liquefaction to Liquefied Natural Gas for a 20-Year Period,” [FE Docket No. 14-179-LNG] Federal Register, Vol. 79, No. 237, (Dec. 10, 2014), p. 73285, available at [http://energy.gov/sites/prod/files/2014/12/f19/FR%20Published%202014\\_179%2012\\_10\\_14\\_0.pdf](http://energy.gov/sites/prod/files/2014/12/f19/FR%20Published%202014_179%2012_10_14_0.pdf) :

“The Office of Fossil Energy (FE) of the Department of Energy (DOE) gives notice of receipt of an application (Application) filed on October 24, 2014, by Pieridae Energy (USA) Ltd. (Pieridae US) requesting long-term, multicontract authorization to export domestically produced natural gas in a volume up to 292 billion cubic feet per year (Bcf/yr), or approximately 0.8 Bcf per day (Bcf/d). Pieridae US proposes to export domestically produced natural gas as follows: (i) To export the natural gas to Canada at the United States-Canada border near Baileyville, Maine, at the juncture of the Maritimes & Northeast (M&N) U.S. Pipeline and the M&N Canada Pipeline; (ii) to use a portion of the U.S.-sourced natural gas as feedstock in a Canadian natural gas liquefaction facility called the Goldboro LNG Project, to be developed by one or more Pieridae affiliates and to be located at the Goldboro Industrial Park in Guysborough County, Nova Scotia, Canada; and (iii) to export a portion of the U.S.-sourced natural gas in the form of liquefied natural gas (LNG) by vessel from Canada . . . .” (Emphasis added; internal citations omitted.)

<sup>38</sup> See Bear Head LNG, a subsidiary company of Liquefied Natural Gas Limited, Application of Bear Head LNG Corporation to the National Energy Board of Canada, “IN THE MATTER OF the National Energy Board Act, being Chapter N-7 of the Revised Statutes of Canada, as amended, and the Regulations made thereunder; AND IN THE MATTER of an Application by Bear Head LNG Corporation pursuant to Section 117 of the Act for licences authorizing the importation of natural gas and the exportation of liquefied natural gas.”, filed November 6, 2014, [available through National Energy Board of Canada, <https://www.neb-one.gc.ca/pplctnflng/mjrpp/lnxprtclnc/index-eng.html> ], p. 9, paragraphs 22 and 23:

“The Applicant [Bear Head LNG Corporation] currently anticipates that its natural gas supply will be transported to the LNG Facility by a dedicated lateral pipeline connected to the existing facilities of the Maritime and Northeast Pipeline (‘M&NE Pipeline’). . . . The M&NE Pipeline currently carries natural gas from offshore Canadian sources south to northeast United States markets. However, . . . there is the potential to reverse the flow on the M&NE Pipeline. If the demand in Nova Scotia, including from the proposed LNG Facility [Bear Head’s], exceeds the supply available from the Canadian offshore [sources], this expanded Canadian natural gas market in the Maritimes Provinces may provide an economic market for other Canadian or United States onshore production. The LNG Facility [Bear Head’s] will enhance the potential for this [Maritime and Northeast Pipeline] reversal . . . .”

The pipeline is constructed to last virtually forever, through ongoing operation and maintenance of the system.”);

and Robert W. Howarth, “A bridge to nowhere: methane emissions and the greenhouse gas footprint of natural gas,” *Energy Science & Engineering*, available at [http://www.eeb.cornell.edu/howarth/publications/Howarth\\_2014\\_ESE\\_methane\\_emissions.pdf](http://www.eeb.cornell.edu/howarth/publications/Howarth_2014_ESE_methane_emissions.pdf) (“Half of the high-pressure [gas] pipelines in the United States are older than 50 years . . . .”).

<sup>56</sup> Potential for more fossil-fuel combustion due to possible substitution of gas for renewable energy and energy efficiency. There are growing worries that a flood of temporarily cheap Marcellus shale gas delivered in volume by these pipelines would significantly slow recent advances in energy efficiency and renewable energy development. This could mean that less solar and

wind is developed for electricity generation, and more gas generating stations are built, substituting more fossil fuel combustion for renewable energy use. See the discussion of the possibility that natural gas could displace renewables and energy efficiency at endnote 10. Compare also Synapse Energy Economics, Inc., “Massachusetts Low Gas Demand Analysis: Final Report / RFR-ENE-2015-012 / Prepared for the Massachusetts Department of Energy Resources [DOER],” (Jan. 7, 2015), p. 30 (“This study does not consider pipeline investments[‘] potential displacement of alternative resources, thereby slowing their growth.”).

Potential for more fossil-fuel combustion due to possible substitution of gas for nuclear. To the extent any gas from the Kinder Morgan pipeline fuels electricity generation, it is likely the gas would in essence be used to replace some significant portion of retiring nuclear generation of electricity, with nuclear generally considered to have lower climate impact than fossil-fuel-sourced electricity. See, e.g., ISO New England, “2015 Regional Electricity Outlook,” (Jan. 2015), p. 20 (“New England has long relied on its nuclear plants to help supply baseload power (the region’s minimum electricity needs). But the 2014 closing of the Vermont Yankee Nuclear Power Station is another example of how interrelated market and policy forces are shaping the region’s generating fleet. Energy prices in the wholesale electricity markets may be too competitive for some nuclear resources because of the shale gas boom . . . . And the building of new nuclear resources in the region is unlikely.”).

Nuclear power provided 34% of New England’s net electric energy in 2014. See ISO New England, “2015 Regional Electricity Outlook,” (Jan. 2015), p.15.

If gas-generation fills the nuclear-generation space, we have expanded fossil fuel combustion for electricity generation, and not simply substituted gas for coal- or oil-fired electricity generation.

Potential for more fossil-fuel combustion due to possible LNG export.

As discussed in the text of the Fact Sheet and related endnotes, it’s likely that much of the gas that would be transported by Kinder Morgan’s Northeast Energy Direct pipeline could be exported out of Canada to overseas markets as liquefied natural gas (LNG). See this Fact Sheet and its endnotes 43-50.

The U.S. Department of Energy commissioned a study by the U.S. Energy Information Administration (“EIA”) that modeled a variety of U.S. LNG export scenarios, and noted that the “EIA projected that, across all cases, an average of 63 percent of increased export volumes would be accounted for by increased domestic [natural gas] production. Of that 63 percent, EIA projected that 93 percent would come from unconventional sources (72 percent shale gas, 13 percent tight gas, and 8 percent coalbed methane . . . )”, with certain caveats. See U.S. Department of Energy, [Final] *Addendum to Environmental Review Documents Concerning Exports of Natural Gas From the United States*, 79 FR 48,132 (Aug. 15, 2014) [hereinafter, “Addendum”], pp. 4-5.

In other words, increasing LNG export is likely to increase domestic production and ultimate global combustion of natural gas, a fossil fuel contributing to climate change. Moreover, that increased domestic production is likely to come primarily from unconventional sources, like shale gas, which may have a higher methane leakage rate (and therefore climate change impact), as compared to conventional gas production, according to a study by both the National Energy Technology Laboratory and by Cornell University’s Howarth. See Addendum, p. 41, Table 10 (Comparison of Leakage Rates from Upstream U.S. Natural Gas Industry by various authors, listing a 2014 National Energy Technology Laboratory (NETL) study that found a 1.4% methane leakage rate for unconventional resources and a 1.3% methane leakage rate for conventional resources, and a Howarth (Cornell University) study that found a 5.75% methane leakage rate for unconventional resources and a 3.85% methane leakage rate for conventional resources).

The U.S. Department of Energy also did a “Life Cycle Report” of Greenhouse Gas Emissions / climate change impacts for four scenarios for providing Europe, and Asia, with electricity, either by (1) US natural gas exported as LNG, (2) Regional export of LNG, to Europe from Algeria, and to Asia from Australia, (3) piped natural gas from Russia, and (4) regional coal. Charts in this Life Cycle Report show that the lowest end of the range for expected possible Greenhouse Gas emissions was for the scenario of LNG from a nearer regional source (Algeria for Europe / Australia for Asia), not LNG from the United States, on both the 20 year and 100 year time horizons, although the Department of Energy cautioned that these “expected value[s]” “should not be interpreted as the most likely values due to the wide range of scenario variability and uncertainty in the underlying modeled data” and “should be interpreted as general guidance to provide perspective on trends only”. See U.S. Department of Energy, Office of Fossil Energy / National Energy Technology Laboratory, *Life Cycle Greenhouse Gas Perspective on Exporting Liquefied Natural Gas From the United States*, (May 29, 2014), DOE/NETL-2014/1649, referenced in 79 FR 32,260 (June 4, 2014), p. 9, and Fig. 6-1; p. 10, Fig. 6-2.

Nevertheless, it would make sense that shipping LNG from Algeria to Europe, or from Australia to Asia, would generally have lower greenhouse gas emissions than shipping LNG from the United States to Europe and Asia, respectively, due to the greater (fossil fuel) tanker-ship energy used for shipping the LNG the greater distance from the United States. As the Life Cycle Report

notes, “[c]ompared to domestically produced and combusted gas, there is a significant increase in the life cycle GHG [Greenhouse Gas] emissions that are attributed to the LNG supply chain, specifically from liquefaction, tanker transport, and regasification processes.” *Ibid.*, p. 10. (Emphasis added.)

<sup>58</sup> July 2015 Resource Report 1, p. 1-13.

<sup>59</sup> In my opinion nuclear energy presents other severe environmental risks that mean that it must also be phased out and replaced with renewable energy and energy efficiency. However, looking solely from a climate change perspective, natural gas would appear to have greater negative climate change impacts than nuclear energy, even considering the embedded fossil fuel energy in the nuclear fuel cycle and construction of nuclear facilities.

<sup>60</sup> See, e.g., ISO New England, “2015 Regional Electricity Outlook,” (Jan. 2015), p. 20 (“New England has long relied on its nuclear plants to help supply baseload power (the region’s minimum electricity needs). See generally Associated Press, “Natural gas switch won’t slow climate change, study suggests / Greenhouse gas emissions boosted by leaking methane, displacement of greener energy,” *CBC News* (Oct. 16, 2014), available at <http://www.cbc.ca/news/technology/natural-gas-switch-won-t-slow-climate-change-study-suggests-1.2800549>:

“Cheap and plentiful natural gas isn’t quite a bridge to a brighter energy future as claimed and won’t slow global warming, a new study projects.

Abundant natural gas in the United States has been displacing coal, which contains a higher proportion of carbon and produces more of the chief global warming gas carbon dioxide.

But the new international study says an expansion of natural gas use by 2050 would also keep other energy-producing technologies like wind, solar and nuclear, from being used more. And those technologies are even better than natural gas for avoiding global warming.

Computer simulations show that emissions of heat-trapping gases to make electricity would not decline worldwide and could possibly go up, says the study, released Wednesday by the journal *Nature*.”

and “Can natural gas help tackle global warming? A primer,” *Washington Post* (August 20, 2012), available at <http://www.washingtonpost.com/blogs/wonkblog/wp/2012/08/20/can-natural-gas-really-help-tackle-global-warming-heres-everything-you->

[need-to-know/](#) (“One study from MIT suggested that cheap natural gas could actually lead to higher greenhouse-gas emissions in the United States by 2050 if it stunts the growth of renewable energy.”);

[and](#) David J. Unger, “US eases natural gas glut with second export terminal,” *Christian Science Monitor* (May 18, 2013), available at <http://www.csmonitor.com/Environment/Energy-Voices/2013/0518/US-eases-natural-gas-glut-with-second-export-terminal-video> :

“The US Department of Energy approved Friday the country’s first liquified natural gas (LNG) export terminal since 2011. It’s a shift in policy that opens up America’s newfound – and vast – natural gas resources to world markets. Advocates say they will improve the US trade balance and provide a boost for the natural gas industry, creating more jobs. The announcement is also a boost to key US allies, especially Japan, which has been lobbying the Obama administration to allow LNG exports as it transitions away from nuclear power.

But US consumers and manufacturers have benefited from the oversupply in the form of lower energy costs. Natural gas prices, which in March 2012 reached a 13-year low, will soar with the increase in foreign demand, critics warn. There are environmental concerns, as well. A global interest in US natural gas means an extended reliance on fossil fuels, delays a shift to clean-tech energy, and increases the use of potentially damaging drilling techniques, environmentalists say.

“It’s a bad deal all around: for public health, the environment, and America’s working people,” Deb Nardone, director of the Sierra Club’s Beyond Natural Gas campaign, said in a statement Friday.” (Emphasis added.)

“The state’s aging natural gas pipelines are riddled with about 20,000 potentially dangerous and environmentally damaging leaks, many decades old, according to the first statewide analysis of the problem in Massachusetts. . . .

‘The leaks are potentially explosive, kill trees, harm human health, and release an extraordinarily destructive greenhouse gas,’ said Audrey Schulman, president of the Home Energy Efficiency Team, a Cambridge nonprofit that mapped the leak data submitted by the utilities. ‘To add insult to injury, we ratepayers have to pay for the lost gas.’ . . .

Schulman said there may be even more leaks than the utilities are reporting. Last year, her organization tested for gas leaks in Somerville and found nearly 500 of them — almost three times the number reported by Eversource Energy and National Grid, the region’s main gas suppliers, she said. . . .

A federal study commissioned two years ago by Senator Edward Markey found that Massachusetts residents paid as much as \$1.5 billion from 2000 to 2011 for gas they never used because of leaks.”

and David Abel, “Leaks in Boston area gas pipes exceed estimates,” *Boston Globe*, (Jan. 22, 2015), available at <http://www.bostonglobe.com/metro/2015/01/22/natural-gas-leaks-boston-area-are-far-more-extensive-than-thought/5BykQrnaGRr2XLxpHqLIM/story.html> :

“The amount of methane leaking from natural gas pipelines, storage facilities, and other sources in the Boston area is as much as three times greater than previously estimated — a loss that contributes to the region’s high energy costs and adds potent greenhouse gases to the atmosphere, according to a new study by scientists at Harvard University.

The leaks would be enough to heat as many as 200,000 homes a year and are valued at \$90 million a year, the authors said.

The study — the first of its kind to quantify methane emissions from natural gas leaks in an urban area — also suggests that regulators are substantially underestimating the amount of the nation’s methane emissions. Methane is 20 times more

powerful than carbon dioxide, meaning small amounts of the heat-trapping gas can have a significant impact on global warming. . . .

The instruments found about 300,000 metric tons of natural gas leaks — about 2.7 percent of all natural gas delivered to the region. State and federal authorities had previously estimated that 1.1 percent of natural gas was being lost to leaks from a range of sources in the area, including homes, businesses, and electricity generation facilities.

If federal estimates are correct, that would mean the Boston area is contributing to 9 percent of the nation’s methane from natural gas, the authors said.

‘That seems pretty impossible, and it suggests the entire national estimate is wrong,’ McKain said. ‘It’s difficult to imagine that our region is contributing that much to the total number.’”

<sup>97</sup> See David Abel, “Project reveals 20,000 leaks in Mass. gas lines / Trouble spots widespread, some decades old,” Boston Globe (Aug.21, 2015), available at <http://www.bostonglobe.com/metro/2015/08/20/new-law-casts-light-state-natural-gas-leaks/qJJPCjRZITc5ai0JeHNOqO/story.html>.

<sup>98</sup> See generally ISO New England, “2015 Regional Electricity Outlook,” (Jan. 2015), p. 23:

“If power systems were planned to simply meet average electricity use, there wouldn’t be enough electricity at times of very high demand. That is why the power system is designed with enough capacity to meet peak demand (the points of highest use) even though it’s just a couple hours each day and for longer periods a few days in winter and summer. Like much of the country, New England’s peak demand is growing faster than average demand because of things like greater household air conditioning use. As a consequence of greater peak demand: More regional [generating] capacity sits idle during non-peak hours.”

<sup>99</sup> See Synapse Energy Economics, Inc., “Massachusetts Low Gas Demand Analysis: Final Report,” Prepared for the Massachusetts Department of Energy Resources, RFR-ENE-2015-012 (January 7, 2015), [“Synapse Report” hereafter], p. 2 (“New England’s natural gas infrastructure has become increasingly stressed during peak winter periods as regional demand for natural gas has grown. This situation has led to gas supply and transmission deficits into the region [sic] for the gas-fired electric generators during those winter months.”).

and “National Grid and Anbaric Transmission Join Forces to Deliver Clean, Reliable Energy to New England,” *Electronics Business Journal* (Dec. 24, 2014), Westlaw doc # 2014 WLNR 35867486 (The “Green Line Infrastructure Alliance initially

will develop the Maine Green Line – a hybrid land-and-sea HVDC project that will initially transmit 1,000 MW (expandable to 2,000 MW) of wind from northern Maine, firmed up by imports of hydropower from eastern Canada, via a submarine cable to Massachusetts.”).

and Anbaric Transmission, “Maine Green Line” (downloaded 3/24/15), available at <http://anbarictransmission.com/projects/mainegreenline/> :

“Maine Green Line will move 1000 megawatts (MW) of power from Maine to eastern Massachusetts. Its goals are to encourage the development of renewable resources in northern New England by providing the necessary infrastructure to bring ‘green’ power to more densely populated areas to the south, including the Boston area . . . .

The New England states can only meet their expanding renewable portfolio standards (RPS) and Regional Greenhouse Gas Initiative (RGGI) goals by substantially expanding the New England transmission grid. Energy efficiency, demand side management, and renewable energy generation projects in southern New England will help to achieve those goals, but the bulk of the scale of new renewable supply resources needed to meet growing RPS goals will need to come from Maine and eastern Canada, where the greatest potential exists for renewable energy development in the form of wind, biomass, tidal and hydro-electric power.”

and Tux Terkel, “Companies want to build multimillion-dollar power lines through Maine,” Portland Press Herald, (March 25, 2014), available at [http://www.pressherald.com/2014/03/25/companies\\_wants\\_to\\_build\\_multimillion-dollar\\_power\\_lines\\_through\\_maine/](http://www.pressherald.com/2014/03/25/companies_wants_to_build_multimillion-dollar_power_lines_through_maine/) (“Anbaric Transmission LLC said Monday it will submit plans to build its so-called Green Line project from the Canadian border overland to an undisclosed point on the Maine coast, where it would connect with Greater Boston by undersea cable. The high-voltage, direct-current line also would link major wind farms in Aroostook County that are under construction or being proposed.”).

<sup>145</sup> See Tux Terkel, “Companies want to build multimillion-dollar power lines through Maine,” Portland Press Herald, (March 25, 2014), available at [http://www.pressherald.com/2014/03/25/companies\\_wants\\_to\\_build\\_multimillion-dollar\\_power\\_lines\\_through\\_maine/](http://www.pressherald.com/2014/03/25/companies_wants_to_build_multimillion-dollar_power_lines_through_maine/) :

“Anbaric Transmission LLC said Monday it will submit plans to build its so-called Green Line project from the Canadian border overland to an undisclosed point on the Maine coast, where it would connect with Greater Boston by undersea cable. The high-voltage, direct-current line also would link major wind farms in Aroostook County that are under construction or being proposed. . .

In Maine, building a line that transmits both hydroelectricity from Canada and wind power from northern Maine would be complementary, [Anbaric’s chief executive officer Ed] Krapels said. It would satisfy policy and legal demands in southern New England for renewable power, as well as using Canadian hydro when the wind’s not blowing.

‘That to us is a perfect package,’ Krapels said. ‘It fills the line all the time, and that’s a really efficient way to build a transmission line.’”).

and Kelly Andrejasich, “New England generators seek changes to clean energy RFP,” SNL Power Daily with Market Report (July 24, 2015), Westlaw doc # 2015 WLNR 22261603:

“National Grid has paired up with independent transmission developer Anbaric Transmission LLC to form the Green Line Infrastructure Alliance, through which the companies ultimately hope to deliver up to 2,800 MW to New England’s grid.

When the alliance was announced in December 2014, the companies said they will start with the Maine Green Line, a hybrid land-and-sea high-voltage, direct current project that will initially transmit 1,000 MW of onshore wind from northern Maine, firmed up by imports of hydropower from eastern Canada, through a submarine cable to Massachusetts.”

<sup>149</sup> Quoted in “National Grid and Anbaric Transmission Join Forces to Deliver Clean, Reliable Energy to New England,”

Electronics Business Journal (Dec. 24, 2014), Westlaw doc # 2014 WLNR 35867486.

<sup>150</sup> See, e.g., Wilson Ring, Associated Press, “Power line developer focusing on Vermont project,” (Oct. 5, 2014), available at <http://www.washingtontimes.com/news/2014/oct/5/power-line-developer-focusing-on-vermont-project/?page=all> :

“So far there has been no significant opposition to TDI New England’s major energy infrastructure project [the proposed “New England Clean Power Link” HVDC transmission line to be routed in part underwater in Lake Champlain and buried where running on land]. Others, however, have seen opposition, including plans to build ridge-top industrial wind projects and to extend a natural gas power line from the Burlington area to Rutland or build a 180-mile above-ground power line between the Canadian border and northern New Hampshire. . . .

‘I think that one of the key differentiators of [from?] other proposed projects is that we are all buried,’ said TDI New England CEO Donald Jessome.

Burying the cable is a huge change from previous projects, said Vermont Public Service Department Commissioner Chris Recchia, which represents the Shumlin administration before the Public Service Board.”

See also Terry Boston, PJM Interconnection, “The Case for HVDC,” *Transmission & Distribution World* ( July 1, 2015) Westlaw doc # 2015 WLNR 20748136 (HVDC transmission “provides higher transmission capacity than AC over the same distance. It lowers losses over long distances compared with high-voltage AC (HVAC) transmission. As voltage increases, losses decrease, so more electricity can be transmitted. It [HVDC] can also be used underwater and underground, although at a much higher cost. It requires smaller rights of way and smaller towers when used in overhead applications.”).

HVDC lines do generate magnetic and thermal effects that are being reviewed, for example, by the Vermont Public Service Board. See, e.g., “Petition of Champlain VT, LLC d/b/a TDI New England , for a Certificate of Public Good, pursuant to 30 V.S.A. §248, authorizing the installation and operation of a high voltage direct current (HVDC) underwater and underground electric transmission line with a capacity of 1,000 MW, a converter station, and other associated facilities, to be located in Lake Champlain and in the Counties of Grand Isle, Chittenden, Addison, Rutland, and Windsor, Vermont, and to be known as the New England Clean Power Link Project (“NECPL”),” [to the State of Vermont Public Service Board], Docket No. \_\_\_\_ [apparently not then assigned], “PREFILED DIRECT TESTIMONY OF WILLIAM BAILEY, PH.D. ON BEHALF OF CHAMPLAIN VT, LLC,” (Dec. 8, 2014), available at <http://psb.vermont.gov/sites/psb/files/docket/8400/2014-12-08%20Bailey%20PFT%20Direct.pdf> .

<sup>151</sup> See “Petition of Champlain VT, LLC d/b/a TDI New England , for a Certificate of Public Good, pursuant to 30 V.S.A. §248, authorizing the installation and operation of a high voltage direct current (HVDC) underwater and underground electric transmission line with a capacity of 1,000 MW, a converter station, and other associated facilities, to be located in Lake Champlain and in the Counties of Grand Isle, Chittenden, Addison, Rutland, and Windsor, Vermont, and to be known as the New England Clean Power Link Project (“NECPL”),” [to the State of Vermont Public Service Board], Docket No. \_\_\_\_ [apparently not then assigned], “PREFILED DIRECT TESTIMONY OF DONALD JESSOME, EUGENE MARTIN AND JOSHUA BAGNATO ON BEHALF OF CHAMPLAIN VT, LLC”, (Dec. 8, 2014), available at <http://psb.vermont.gov/sites/psb/files/docket/8400/2014-12-08%20Jessome-Martin-Bagnato%20PFT%20Direct.pdf>, pp. 6-7, Q.6/A.6:

“NECPL [New England Clean Power Link] is a proposed electric transmission line that will run from the Canadian border to Ludlow, VT along underwater and underground routes. The electricity shipped through NECPL will be generated by renewable energy sources in Canada, and will be delivered to Vermont and the New England electric grid. The transmission line will utilize high voltage direct current (HVDC) technology, capable of transmitting 1,000 megawatts (MW) of electricity. The underwater portions of the transmission line, approximately 98 miles in length, will be buried in the bed of Lake Champlain, except at water depths of greater than 150 feet where the cables will be placed on the bottom and self-bury. The overland (terrestrial) portions of the transmission line, approximately 56 miles in length, will be buried underground within existing public road rights-of-way (‘ROWS’). . . . [and] one portion of the route will be on a railroad right-of-way.

The transmission line will begin at a converter station in the Province of Québec, Canada and transmit electricity as described above from Alburgh, Vermont to Ludlow Vermont, where it will tie into TDI-NE’s proposed converter station. The Ludlow Converter Station will convert the electrical power from direct current (‘DC’) to alternating current (‘AC’) and then connect to the 345 kV Coolidge Substation in Cavendish, Vermont that is owned by the Vermont Electric Power Company (‘VELCO’).” [Footnotes and line numberings omitted.]

Now, they are only one step away from beginning construction as they await a final set of permits from the Army Corps of Engineers.”).

<sup>158</sup> See Northeast Energy Link / A Bangor Hydro/Emera, National Grid partnership, “The Northeast Energy Link / Letter of interest / Prepared for Maine Energy Infrastructure Interagency Review Panel,” (Oct. 1, 2012), available at [www.northeastenergylink.com/files/documents/nel\\_presentation.pdf](http://www.northeastenergylink.com/files/documents/nel_presentation.pdf) , p. 4 (“Anticipated Project Schedule . . . In-Service November 2018”).

Parties connected to the Northeast Energy Link previously suggested an earlier completion date of 2016/2017. See United States Federal Energy Regulatory Commission, 139 FERC ¶ 61,129, “National Grid Transmission Services Corporation and Bangor Hydro Electric Company / Docket No. EL11-49-000,” (May 17, 2012) (“The NEL Parties state that they are currently developing the Northeast Energy Link (NEL), a predominantly underground, approximately 1,100 MW HVDC transmission line, that will extend approximately 230 miles from Orrington, Maine, to Tewksbury, Massachusetts with completion anticipated by the 2016-17 Power Year.”). However, knowing how development schedules go, it seemed prudent to use the later date (2018).

See also Kelly Andrejasich, “New England generators seek changes to clean energy RFP,” SNL Power Daily with Market Report (July 24, 2015), Westlaw doc # 2015 WLNR 22261603 (“National Grid has also partnered with Emera Inc. subsidiary Emera Maine to plan the Northeast Energy Link, a 230 mile, underground HVDC line from Orrington, Maine, to Tewksbury, Mass., that could carry up to 1,100 MW.”).

<sup>159</sup> United States Federal Energy Regulatory Commission, 139 FERC ¶ 61,129, “National Grid Transmission Services Corporation and Bangor Hydro Electric Company / Docket No. EL11-49-000,” (May 17, 2012), p. 1.

See also Northeast Energy Link / A Bangor Hydro/Emera, National Grid partnership, “The Northeast Energy Link / Letter

of interest / Prepared for Maine Energy Infrastructure Interagency Review Panel,” (Oct. 1, 2012), available at [www.northeastenergylink.com/files/documents/nel\\_presentation.pdf](http://www.northeastenergylink.com/files/documents/nel_presentation.pdf), p. 4 (“Anticipated Project Schedule . . . In-Service November 2018”).

<sup>160</sup> U.S. Energy Information Administration, “Today in Energy / Northern Maine considers options to gain direct access to New England electric grid,” (Jan. 22, 2015), available at [www.eia.gov/todayinenergy/detail.cfm?id=19671](http://www.eia.gov/todayinenergy/detail.cfm?id=19671).

See also Tux Terkel, “Companies want to build multimillion-dollar power lines through Maine,” *Portland Press Herald*, (March 25, 2014), available at [http://www.pressherald.com/2014/03/25/companies\\_wants\\_to\\_build\\_multimillion-dollar\\_power\\_lines\\_through\\_maine/](http://www.pressherald.com/2014/03/25/companies_wants_to_build_multimillion-dollar_power_lines_through_maine/) :

“Also jockeying for position is the Northeast Energy Link, a \$2 billion project that aims to carry vast amounts of renewable power from northern and eastern Maine and Atlantic Canada to Massachusetts through underground cables along interstate highways.

The partners in Northeast Energy Link are Emera Inc., the Nova Scotia-based parent of the two largest utilities in eastern and northern Maine, and the American arm of British energy giant National Grid, which owns power companies in New York and New England. . . .

Gerry Chasse, president and chief operating officer of Emera Maine, said that the governors’ plan and new federal energy regulations for renewable power will create opportunities for several projects. The[y] include some that connect with Hydro Quebec and others focused on northern New England wind and imports from the Canadian Maritimes.

Northeast Energy Link would be built for the latter and is working with Maine officials on routing through Maine.”

<sup>161</sup> For an interesting, if now a little dated, quick review of a variety of grid scale energy storage approaches being worked on in the U.S., Europe and Japan, see Chris de Morsella, “Fifteen Grid Scale Energy Storage Solutions to Watch,” *The Green Economy Post* (2011), available at <http://greeneconomypost.com/fifteen-grid-scale-energy-storage-solutions-watch-15924.htm> .

<sup>162</sup> See, e.g., “Grid-scale storage: Smooth operators,” *Economist* (Dec. 6, 2014), Westlaw doc # 2014 WLNR 34291766 (discussing installed compressed air grid-scale storage facilities in Germany and Alabama, and new heat-storing compressed air storage being developed by LightSail Energy based in Berkeley, CA);

and Charlotte Cox, “Saving some for later: US utility-scale battery storage sited at power plants,” *SNL Renewable Energy Week*, (Oct. 10, 2014), Westlaw doc # 2014 WLNR 28834584 (discussing 110 MW McIntosh compressed air energy storage facility in Alabama owned by PowerSouth Energy Cooperative, and three additional compressed air facilities totaling 904 MW that are in active development, two of them in Texas);

and Eversource Energy, “Eversource’s Point of View on Energy Storage / Prepared for [Massachusetts] DPU’s Stakeholder Conference on Energy Storage,” (July 9, 2015), , available through <http://web1.env.state.ma.us/DPU/FileRoom/dockets/bynumber> at DPU Docket no. 15-ESC-1, p. 4 (noting various storage technologies already deployed in the U.S. and globally, including compressed air storage which represents approximately 0.5% of current U.S. total [energy storage] capacity).

In such facilities, air compressed during off-peak electric generation hours is later used to drive electricity-generating compressed air turbines during periods of peak electric demand.

<sup>163</sup> See, e.g., Siemens, “Smart distribution and storage,” (downloaded 8/8/15), available at <http://www.energy.siemens.com/hq/en/sustainable-energy/smart-distribution-and-storage.htm> (“surplus power can be used to produce environmentally friendly hydrogen in electrolysis plants, which can drive fuel cell vehicles”).

<sup>164</sup> See July 2015 Resource Report 10, p. 10-9.

<sup>165</sup> See July 2015 Resource Report 10, p. 10-9.

<sup>166</sup> Concerns about over-reliance on pipeline gas are not limited to pipeline opponents. ISO New England stated in its 2015 *Regional Electricity Outlook*, for example: “Because natural gas plants make up such a large part of the generating fleet, the availability of this fuel has an immediate effect on power grid reliability. For example, the planned or unplanned outage of a major gas pipeline at any time of year would impact many thousands of megawatts of generation.” ISO New England, 2015 *Regional Electricity Outlook*, (Jan. 2015), p. 16.

Two months earlier it expressed a similar thought: “Adding to the concern about the increased use of natural gas are concerns about the capacity of the region’s gas pipelines and the adequacy of the gas supply for serving electric power generation reliably; at any time of the year a natural or geopolitical event could interrupt supplies of gas . . . .” ISO New England, 2014 *Regional System Plan*, p. 17.

Although endorsing some increased gas infrastructure, Massachusetts Undersecretary for Energy / former DPU head Ann Berwick

expressed a similar worry in an op ed in the *Boston Globe*:

“Another problem with expanding the use of natural gas is that it exacerbates our dependence on a single fuel. Natural gas now accounts for about half of the electricity produced in the region, compared with 15 percent in 2000. And on the residential front, it’s becoming the new heating oil, as more homeowners have dumped their old burners and rusting tanks.

But just as we diversify financial investments, we need to avoid becoming overdependent on one source of energy. Otherwise we’ll be susceptible to price spikes, and possibly even terrorist activity if a major gas pipeline were to become an attractive target.”

Ann Berwick, “Don’t fall in love with natural gas,” *Boston Globe* (March 26, 2015).

customers are stuck with spiking rates based on last fall's . . . [Westlaw truncated the article title]," [Boston Globe](#) (2/25/15) [Westlaw Doc # 2015 WLNR 5666557] ("Excelerate's Northeast Gateway Deepwater Port, as the buoy system is known, hadn't been used since 2010; this year it has received one shipment of LNG.").

<sup>177</sup> See Annalee Grant, SNL Financial, "LNG, oil pushing New England through yet another cold winter," [SNL Power Week](#) (Canada), (Feb. 23, 2015) [Westlaw Doc # 2015 WLNR 5979115]:

"If last year's winter was an anomaly, residents of New England are wondering what to call the 2014-2015 edition, but even with foot after foot of snow falling, the [electric] grid in the region has stayed strong.

Grid customers can give thanks in part to . . . injections of LNG in the East that have improved the pipeline constraints that plagued the region in 2014, in an area that relies heavily on natural gas-fired generation. . . .

LNG injections in East help entire footprint

Wholesale power prices in New England have dropped significantly this year over last, and Bloomberg said this is due to lower natural gas and LNG prices, as well as the plummeting price of oil.

'Competition in the natural gas market has helped put a lid on the cost of both pipeline natural gas and LNG so far this winter; on average, natural gas prices so far this winter have been lower than fuel price levels last winter,' [ISO-New England spokeswoman Marcia] Blomberg said.

ISO-NE has also had greater access to LNG in its system . . . which has caused a ripple of relief."

See generally Thad Walker, "Northeast gas demand hits record high on Monday," [Platts Energy Trader](#) (Feb. 18, 2015) [West Law Doc # 2015 WLNR 6456702] ("Sendout to pipelines from LNG terminals will likely remain elevated in New England as demand remains strong amid continuation of below-normal [temperature] weather.").

See also Mark Hand, "In New England power market, small changes lead to big price differences," [SNL Gas Utility Week](#) (March 9, 2015) [Westlaw Doc # 2015 WLNR 7544101] ("Based on an uptick in customer demand, particularly from local gas utilities and gas marketers, GDF Suez SA subsidiary Distrigas of Massachusetts LLC requested an increase in LNG cargoes into its Everett import terminal this winter. In total, about 8 Bcf of LNG supply was delivered into Everett in January to help meet heating and power demand in the region, compared to 5.5 Bcf in January 2014, GDF Suez spokeswoman Julie Vitek said.").

<sup>178</sup> Jay Fitzgerald, "Unbalance of power / Even as cheaper supplies are cutting bills for homes heated with natural gas, electricity customers are stuck with spiking rates based on last fall's . . . See also Jay Fitzgerald, “Pipeline opponents say LNG is underutilized / As battle intensifies over pipelines, some assert imports can sate growing natural gas appetite,” Boston Globe, (March 23, 2015) available at <http://www.bostonglobe.com/business/2015/03/22/with-increase-lng-supplies-does-region-really-need-new-pipelines/mrRbwgaiKwYuAJoxDiPMN/story.html> (“Greg Cunningham, director of the clean energy program at the Conservation Law Foundation, . . . questioned the need for most new pipelines, noting that the price of LNG has plunged by about 50 percent in recent months and should stay low for years because of the vast increase in global supplies of oil and natural gas.”);

and Annalee Grant, SNL Financial, “LNG, oil pushing New England through yet another cold winter,” SNL Power Week (Canada), (Feb. 23, 2015) [Westlaw Doc # 2015 WLNR 5979115]:

“If last year’s winter was an anomaly, residents of New England are wondering what to call the 2014-2015 edition, but even with foot after foot of snow falling, the [electric] grid in the region has stayed strong.

Grid customers can give thanks in part to . . . injections of LNG in the East that have improved the pipeline constraints that plagued the region in 2014, in an area that relies heavily on natural gas-fired generation. . . .

Wholesale power prices in New England have dropped significantly this year over last, and Bloomberg said this is due to lower natural gas and LNG prices, as well as the plummeting price of oil.

‘Competition in the natural gas market has helped put a lid on the cost of both pipeline natural gas and LNG so far this winter; on average, natural gas prices so far this winter have been lower than fuel price levels last winter,’ [ISO-New England spokeswoman Marcia] Blomberg said.

ISO-NE has also had greater access to LNG in its system . . . which has caused a ripple of relief.” (Emphasis added.)

<sup>198</sup> See Thad Walker, “Northeast gas demand hits record high on Monday,” Platts Energy Trader (Feb. 18, 2015) [West Law Doc # 2015 WLNR 6456702] (“The Northeast Gateway terminal has delivered 2.62 Bcf onto the Algonquin Gas Transmission system since early January, suggesting just 0.23 Bcf of cargo remains on the Excelerate, a 2.85 Bcf floating storage and regasification unit.”).

See also Sean Horgan, “Gas Port off Gloucester being used for first time since 2010,” Gloucester Daily Times (Feb. 5, 2015) [Westlaw Doc # 2015 WLNR 3556644]:

“For the first time since March 2010, Excelerate Energy is unloading imported natural gas into its Northeast Deepwater Port situated in the Atlantic Ocean about 13 miles southeast of Gloucester. . . . Denise Madera, Excelerate’s director of communications, said Wednesday that the company’s tanker Excelerate is unloading gas into the Algonquin Gas Transmission pipeline system that extends about 1,100 miles south and west of the Massachusetts coast . . . Madera said the tanker . . . has been at the site since the first week of January. . . . The ship, which the company refers to as a Floating Storage Regasification Unit . . . is one of the Excelsior class of LNG tankers.”

and Jay Fitzgerald, “Unbalance of power / Even as cheaper supplies are cutting bills for homes heated with natural gas, electricity customers are stuck with spiking rates based on last fall’s . . . [Westlaw truncated the article title],” Boston Globe (2/25/15) [Westlaw Doc # 2015 WLNR 5666557] (“Meanwhile, Excelerate Energy of Texas is finally using its \$350 million offshore floating buoy system, which receives natural gas from LNG ships anchored about 13 miles off the coast of Gloucester and transports it via underwater pipelines into the land-based pipeline system. Excelerate’s Northeast Gateway Deepwater Port, as the buoy system is known, hadn’t been used since 2010; this year it has received one shipment of LNG.”).

In order to capture the benefits of energy storage technologies, the California Public Utilities Commission last year ordered the state’s three largest investor-owned utilities to prepare to procure a total of 1,325 MW of electricity storage capacity by 2020.”).

See also Jeff St. John, “California Passes Huge Grid Energy Storage Mandate,” Greentechmedia.com (Oct. 17, 2013), available at <http://www.greentechmedia.com/articles/read/california-passes-huge-grid-energy-storage-mandate> (reporting on 2013 California Public Utilities Commission decision requiring state’s three investor-owned utilities to add 1.3 gigawatts of energy storage to their grids by decade’s end):

“California is a hotbed for grid batteries, ranging from massive utility-operated sodium-sulfur and lithium-ion batteries to cabinet-sized battery arrays sitting inside solar-equipped buildings and homes.

And that’s not mentioning the thermal energy storage systems that turn rooftop air conditioners and campus-wide cogeneration plants into virtual grid energy-shifting arrays, or the compressed-air energy storage (CAES) system being developed by PG&E, or the plug-in electrical vehicle storage projects underway at SCE, or the microgrid projects in SDG&E territory.”

and Mike Ramsey & Cassandra Sweet, “Tesla’s Next Big Idea: Electricity Storage,” Wall Street Journal (April 29, 2015), p. B.8, ProQuest document ID: 1676291337 (“The Golden State is requiring its big utilities to install enough batteries or other equipment so that they can store 1,325 megawatts of electricity by 2024 [sic].”).

<sup>239</sup> See Christine Cordner, “SoCalEd’s energy storage winners say RFO results legitimize the resource,” SNL Power Week (Nov. 24, 2014), Westlaw doc # 2014 WLNR 33608787.

<sup>240</sup> See Sparkplug Power, “Bridging the Gap,” (PowerPoint presentation to the Massachusetts Department of Public Utilities, July 9, 2015 conference on energy storage), available through <http://web1.env.state.ma.us/DPU/FileRoom/dockets/bynumber> at DPU Docket no. 15-ESC-1.

<sup>241</sup> See, e.g., Green Mountain Power, “Green Mountain Power to Offer Tesla Home Battery,” (May 1, 2015) (press release), available at <http://news.greenmountainpower.com/press-releases/green-mountain-power-to-offer-tesla-home-battery--11g040221-001?feed=d51ec270-a483-4f6c-a55e-8e5fbc2238c2> :

“Green Mountain Power is pleased to announce that it will be one of the first energy companies in the country to offer Tesla’s new home battery, the Powerwall, to customers. . . .

This exciting innovation in battery technology is part of delivering on Green Mountain Power’s mission to deliver cost effective, low carbon and reliable energy solutions for its customers. The technology will empower customers to become more energy independent while also allowing the company to reduce peak demand on the system, providing cost savings to all of its customers.”

and “What do you really get for a \$7,000 Tesla Powerwall home battery?” autoblog (May 21, 2015), available at <http://www.autoblog.com/2015/05/21/what-do-you-really-get-for-7000-tesla-powerwall-home-battery/> :

“[I]t’s expected that more utilities and regulators will allow power prices to change throughout the day based on market conditions. Such a change would mean the software that controls the solar and battery system could help customers save money by using home-generated power when grid prices are high.

Batteries could really start to make financial sense if home and commercial batteries could be turned into so-called virtual power plants. Companies are working on systems that control a large group of batteries together as if it were one large power source. Battery owners might be able to sell their stored electricity to utilities during periods of high demand on the grid – which would help them pay off their otherwise ignored and expensive appliances faster.”

See also Seth Blumsack, “How effective is Tesla’s Powerwall?” Christian Science Monitor (May 28, 2015), available at <http://www.csmonitor.com/Technology/Breakthroughs-Voices/2015/0528/How-effective-is-Tesla-s-Powerwall> (“one utility, Green Mountain Power in Vermont, announced it would be happy to sell the Powerwall directly to its customers. This is a sign not only that utilities are taking the potential of the Powerwall seriously, but that they may be trying to figure out a way to profit from

potentially disruptive technologies.”).

<sup>242</sup> See, e.g., Siemens, “Smart distribution and storage,” (downloaded 8/8/15), available at <http://www.energy.siemens.com/hq/en/sustainable-energy/smart-distribution-and-storage.htm> ([S]o-called smart grids help make cities more energy efficient by feeding energy back into the grid. They involve the ‘prosumer,’ such as buildings or electric vehicles – which are consumers on the one hand, but can also feed energy back into the grid. . . . Electric vehicles can be used as mobile energy storage units. They can feed energy back into the grid.”);

and National Renewable Energy Laboratory (NREL), “Transportation Research / Electric Vehicle Grid Integration,” available at [http://www.nrel.gov/transportation/project\\_ev\\_grid\\_integration.html](http://www.nrel.gov/transportation/project_ev_grid_integration.html) :

“[NREL’s] Integrated systems functionality efforts focus on:

- Emergency backup power — Exploring strategies to enable the export of vehicle power to assist in grid outages and disaster-recovery efforts . . .
- Bi-directional power flow — Developing and evaluating integrated vehicle-to-grid systems for reducing peak-power demands.”

<sup>243</sup> See, e.g., “Grid-scale storage: Smooth operators,” *Economist* (Dec. 6, 2014), Westlaw doc # 2014 WLNR 34291766 (discussing installed compressed air grid-scale storage facilities in Germany and Alabama, and new heat-storing compressed air storage being developed by LightSail Energy based in Berkeley, CA);

and Charlotte Cox, “Saving some for later: US utility-scale battery storage sited at power plants,” *SNL Renewable Energy Week*, (Oct. 10, 2014), Westlaw doc # 2014 WLNR 28834584 (discussing 110 MW McIntosh compressed air energy storage facility in Alabama owned by PowerSouth Energy Cooperative, and three additional compressed air facilities totaling 904 MW that are in active development, two of them in Texas).

In such facilities, air compressed during off-peak electric generation hours is later used to drive electricity-generating turbines during periods of peak electric demand.

<sup>244</sup> See, e.g., Eversource Energy, “Eversource’s Point of View on Energy Storage / Prepared for [Massachusetts] DPU’s Stakeholder Conference on Energy Storage,” (July 9, 2015), , available through <http://web1.env.state.ma.us/DPU/FileRoom/dockets/bynumber> at DPU Docket no. 15-ESC-1, p. 4 (noting various storage technologies deployed and in demonstration phase, including thermal storage using molten salt, etc.).

See also Bill Paul, “Current Trend: Big Electric Utilities and Consumers Push Conservation Strategy – Producers Gladly Avoid Costs of Constructing Plants, and Users Get Innovative – Saving by Making Ice at Night,” *Wall Street Journal* (Dec. 8, 1987):

“In the basement of Alabama Power Co.’s new headquarters . . . stands a glass-enclosed water tank as big as a basketball court. Four giant compressors hum nearby. Inside the tank, murky blue-green water bubbles up around ice-covered rods. This \$4 million ‘ice storage’ machine saves the utility \$90,000 a year by making ice at night – when bulk power already contracted for would otherwise go unused. Air is then blown over the ice during the day to cool the building.”

<sup>245</sup> See, e.g., “Grid-scale storage: Smooth operators,” *Economist* (Dec. 6, 2014), Westlaw doc # 2014 WLNR 34291766 (noting flywheel energy storage under development by ABB of Zurich and Berkeley Energy Sciences of California);

and Charlotte Cox, “Saving some for later: US utility-scale battery storage sited at power plants,” *SNL Renewable Energy Week*, (Oct. 10, 2014), Westlaw doc # 2014 WLNR 28834584 (“other energy storage technology types, such as battery, flywheel and compressed air, are on the rise”; “Northeast is home to four operating utility-scale flywheel plants that total 43 MW” in New York and Pennsylvania, all owned by Beacon Power LLC).

<sup>246</sup> See VCharge, “Practical Thermal Storage for Grid Balancing,” (PowerPoint presentation to the Massachusetts Department of Public Utilities Conference on Energy Storage, held July 9, 2015), available through <http://web1.env.state.ma.us/DPU/FileRoom/dockets/bynumber> at DPU Docket no. 15-ESC-1.

<sup>247</sup> See July 2015 Resource Report 10, p. 10-6.

<sup>248</sup> See Massachusetts Department of Energy Resources, Mass DOER Renewables Division, “Installed Renewables 2008-2015,” (March 2015), available at <http://www.mass.gov/eea/images/doer/energy-dashboard/progress-implementing-clean-energy/renewable-energy-installation-chart-2.png> .

<sup>249</sup> See U.S. Energy Information Administration (EIA), “Massachusetts Electricity Profile 2012,” (most recent Massachusetts state data posted by EIA), available at <http://www.eia.gov/electricity/state/massachusetts/index.cfm> . This figure is the net summer generation capacity for Massachusetts in 2012; winter was not posted.

<sup>250</sup> See Massachusetts Department of Energy Resources, Mass DOER Renewables Division, “Installed Renewables 2008-2015,” (March 2015), available at <http://www.mass.gov/eea/images/doer/energy-dashboard/progress-implementing-clean-energy/>

[renewable-energy-installation-chart-2.png](#) .

See also ISO New England, 2014 Regional System Plan, p. 10 (“By the end of 2013, the installed nameplate [capacity] of PV was almost 500 MW<sub>AC</sub> which was approximately double the amount installed in 2012.”).

This fast growth for solar is consistent with a nationwide trend. According to the Department of Energy, in 2013 “solar electricity was the fastest growing electricity generation technology, with cumulative installed capacity increasing by nearly 66% from the previous year.” U.S. Department of Energy, 2013 Renewable Energy Data Book, available at [www.nrel.gov/docs/fy15osti/62580](http://www.nrel.gov/docs/fy15osti/62580) , p. 3. This DOE report noted, more generally, that in the United States in 2013, “renewable electricity accounted for more than 61% of all new electricity capacity installations in the United States. By comparison, renewable electricity captured 4% of new capacity additions in 2004 and 57% in 2008.” *Ibid.*, p. 4.

See generally Glen Boshart, “FERC staff: Uplift declined sharply this winter due to lessons learned, reforms,” SNL Energy Finance Daily (March 23, 2015) (“Electricity demand in 2014 remained flat nationally compared to 2013, [FERC] staff said. . . . ‘Energy efficiency measures and growth in behind-the-meter generation, such as rooftop solar, also helped moderate the electricity demand at utilities,’ staff said.”).

<sup>251</sup> See Massachusetts Executive Office of Energy and Environmental Affairs, “Solar,” (downloaded 3/17/15), available at <http://www.mass.gov/eea/energy-utilities-clean-tech/renewable-energy/solar/> (“The goal to achieve 250 megawatts of solar power installations was met four years early; an aggressive new goal was set of 1,600 MW by 2020.”).

<sup>252</sup> See ISO New England, 2014 Regional System Plan, (Nov. 6, 2014), p.10.

<sup>253</sup> See ISO New England, 2015 Regional Electricity Outlook, (facts and figures said to be current as of Jan. 2015 [see p.3]), p. 22 “Imminent retirements” list (giving list of closed or retiring electrical generating plants, their fuel source and capacity; note that the chart includes multiple plants that had already retired prior to the publication date, and were no longer actually “imminent”).

<sup>254</sup> See ISO New England, 2015 Regional Electricity Outlook, (facts and figures said to be current as of Jan. 2015 [see p.3]), p. 22 “Imminent retirements”. I have used the higher MW capacity figure ISO New England used for Salem Harbor Station in this Jan. 2015 Regional Electricity Outlook report.

ISO New England gives a lower MW figure for Salem Harbor Station in other documents. See, e.g., ISO New England, “2014/2015 Winter Outlook: Sufficient Power Supplies Expected, but Natural Gas Pipeline Constraints an Ongoing Concern / Winter Reliability Program in place to help maintain grid reliability” (press release) (Nov. 20, 2014), available at <http://www.iso-ne.com/static-assets/documents/2014/11/2014-winter-outlook-press-release-final.pdf> (“Salem Harbor Station . . . on May 31, 2014, retired its two remaining coal and oil units totaling about 585 MW”).

<sup>255</sup> See ISO New England, 2015 Regional Electricity Outlook, (facts and figures said to be current as of Jan. 2015 [see p.3]), p. 22 “Imminent retirements” list .

<sup>256</sup> See ISO New England, 2015 Regional Electricity Outlook, (facts and figures said to be current as of Jan. 2015 [see p.3]), p. 22 “Imminent retirements” list.

<sup>257</sup> For the retirement date of Vermont Yankee, see:

Jess Bidgood, “Vermont Yankee Nuclear Plant Begins Slow Process of Closing,” NY Times (Jan. 4, 2015), available at [www.nytimes.com/2015/01/05/us/vermont-yankee-nuclear-plant-begins-slow-process-of-closing.html?\\_r=0](http://www.nytimes.com/2015/01/05/us/vermont-yankee-nuclear-plant-begins-slow-process-of-closing.html?_r=0) (“[L]ast week, the [Vermont Yankee nuclear] plant was taken off the grid and its nuclear reactor was shut down. It was not unexpected; the plant’s parent company, Entergy, announced in 2013 that it would close the plant, saying it was no longer economically viable.”); and AP, “Entergy: Nuke plant closing costs not covered past 60 years,” AP Alerts (Feb. 11, 2015 / loaded into Westlaw 2/11/2015 with no document number given) (“[Entergy Corp.’s] Vermont Yankee [nuclear power plant] shut down permanently in December, with Entergy officials saying it no longer was economical to operate.”);

and Annalee Grant, “Industry leaders say nukes paramount to reaching proposed EPA targets,” SNL Electric Utility Report (Feb. 2, 2015) [Westlaw Doc # 2015 WLNR 3728933] (reporting Edison Electric Institute President Tom Kuhn reference to the recent retirement of Entergy-owned Vermont Yankee nuclear plant which shut down in December 2014).

For the retirement date of Salem Harbor, see:

Erin Ailworth, “New Salem plant a test case for Mass. climate law,” Boston Globe, (Jan. 19, 2014) (noting that Salem Harbor Power Station coal-fired electricity generating plant would shut down in June (2014));

and Annalee Grant, SNL Financial, “LNG, oil pushing New England through yet another cold winter,” SNL Power Week (Canada), (Feb. 23, 2015) [Westlaw Doc # 2015 WLNR 5979115]:

“New England Power Generators Association President Dan Dolan told SNL Energy that the region is seeing the coldest temperatures of winter so far and reaching below zero for the first time in half a decade. What is notable about the [electric]

grid staying firm is that generators have been performing well, and doing so without Entergy Corp.'s Vermont Yankee nuclear plant or Footprint Power's Salem Harbor coal facility, and wholesale power prices are remaining low."

and Luke Jackson, "Northeast's January power burn robust, a sign of things to come," Platts Gas Market Report (Feb. 13, 2015) [Westlaw Doc # 2015 WLNR 5957922] (noting "recent retirement of the 560-MW Vermont Yankee nuclear plant, which went offline in late December, as well as the retirement of more than 300 MW of coal capacity at Salem Harbor during the summer"). See also Mark Hand, "In New England power market, small changes lead to big price differences," SNL Gas Utility Week (March 9, 2015) [Westlaw Doc # 2015 WLNR 7544101]:

"There is no question [Conservation Law Foundation senior attorney Christophe] Courchesne emphasized, that a bitter cold February in New England led to higher wholesale electricity prices than the region faced earlier in the winter. . . .

But Courchesne noted that, even with the monthlong cold snap, electricity prices climbed only to levels seen during the same period last year, which was relatively much warmer. 'Notably, there have not been any reliability issues, despite generator issues like Pilgrim's repeated shutdowns and the lack of the retired non-gas units at Salem, Mount Tom, Norwalk and Vermont Yankee,' he said."

For the retirement date of Mount Tom, see:

ISO New England, "2014/2015 Winter Outlook: Sufficient Power Supplies Expected, but Natural Gas Pipeline Constraints an Ongoing Concern / Winter Reliability Program in place to help maintain grid reliability" (press release) (Nov. 20, 2014), available at <http://www.iso-ne.com/static-assets/documents/2014/11/2014-winter-outlook-press-release-final.pdf> ("Other generators, including the 350 MW oil-fired Norwalk Harbor Station, the 125 MW coal-fired Mt. Tom Station, and a unit totaling 150 MW at the Bridgeport Harbor Station are no longer providing power to the grid.");

and Mike Plaisance, "Reuse of coal plant on agenda Wednesday," The Republican (Springfield) (Feb. 10, 2015) (reporting on meeting to be held concerning "what to do with the closed Mount Tom Power Station"; noting "GDF SUEZ Energy North America closed the plant in December. It had operated only on and off for several years as the economics of burning coal to create energy clashed with the cheaper alternative of natural gas").

See also Erin Ailworth, "Mt. Tom coal plant to close in fall," Boston Globe (June 3, 2014) ("Mt. Tom, one of the state's remaining coal-fired power plants, will close for good by October. . . . The 146-megawatt plant in Holyoke has stopped making electricity, but workers probably will remain employed until Oct. 1.").

For the retirement date of Norwalk Harbor, see:

Stephen Singer, "New England Power Plant Closings Pinching Supply," WBUR, (Feb. 5, 2014), available at <http://www.wbur.org/2014/02/05/new-england-power-plant-closings-pinching-supply> ("NRG Energy Inc. shut oil-fired Norwalk Harbor in Connecticut last year.");

and Greg Canuel, "Norwalk Leaders Consider Future of Manresa Island Power Plant," Norwalk Daily Voice, (12/11/13), available at <http://norwalk.dailyvoice.com/news/norwalk-leaders-consider-future-manresa-island-power-plant>, including photo caption ("The Norwalk Harbor Power Station was shut down earlier this year . . . Norwalk officials will gather to discuss the fate of the former site of the Norwalk Harbor Power Station on Manresa Island later this month . . . . The oil-powered 340 megawatt plant was the only large-scale plant between Bridgeport and New York, according to NRG. But the company decided to shut down the site last summer, citing the high cost of oil compared with natural gas.");

and ISO New England, "2014/2015 Winter Outlook: Sufficient Power Supplies Expected, but Natural Gas Pipeline Constraints an Ongoing Concern / Winter Reliability Program in place to help maintain grid reliability" (press release) (Nov. 20, 2014), available at <http://www.iso-ne.com/static-assets/documents/2014/11/2014-winter-outlook-press-release-final.pdf> ("Other generators, including the 350 MW oil-fired Norwalk Harbor Station, the 125 MW coal-fired Mt. Tom Station, and a unit totaling 150 MW at the Bridgeport Harbor Station are no longer providing power to the grid.").

See also Luther Turmelle, "NRG Energy to deactivate Norwalk plant," New Haven Register (5/21/13), available at [www.nhregister.com/general-news/20130521/nrg-energy-to-deactivate-norwalk-plant](http://www.nhregister.com/general-news/20130521/nrg-energy-to-deactivate-norwalk-plant) ("New Jersey-based NRG Energy is deactivating its Norwalk Harbor generation station, one of the six power plants it operates in Connecticut. The oil-fired plant, which produces 340-megawatts of power and operates on a peaking basis, is scheduled to be deactivated June 1, said Dave Gaier, a company spokesman.");

and Brad Kane, "NRG shutting Norwalk oil-fired plant," Hartford Business Journal / HartfordBusiness.com (May 21, 2013) ("NRG Energy will shut down its oil-fired plant in Norwalk on June 1 . . . the company told HartfordBusiness.com on Tuesday. Prices in the New England market have dropped too low to make the plant's operation economical, said Dave Gaier, NRG spokesman. The Norwalk Harbor Generator Station churns out 340 megawatt[s] only when demand for electricity is high.");

and Nicole Rivard, "NRG to deactivate its Norwalk Harbor power plant," ctpost.com (May 21, 2013), available at <http://www.>

[cpost.com/local/article/NRG-to-deactivate-its-Norwalk-Harbor-power-plant-4536674.php](http://cpost.com/local/article/NRG-to-deactivate-its-Norwalk-Harbor-power-plant-4536674.php) :

“Faced with difficult market conditions in southwestern Connecticut, including low energy prices fueled by the sustained low price of natural gas, NRG Energy, Inc. will remove its Norwalk Harbor Station the ISO New England wholesale market and deactivate the station, effective June 1.

‘Its just too risky to stay in the market as a capacity supplier,’ David Gaier, a spokesperson for NRG, told the Norwalk Citizen Tuesday.

‘We don’t take this action lightly, but market conditions in southwest Connecticut and in New England generally made this decision necessary. . . .’

Deactivation is a process that takes generating units out of service. The plant provides 352 megawatts of generation capacity,” (Emphasis added.)

<sup>258</sup> See ISO New England Inc., 2014 Regional System Plan, p. 10, 11.

<sup>259</sup> As noted above, yearly energy efficiency gains have been keeping the overall increase in electricity demand essentially flat.

<sup>260</sup> See Mass. General Laws, Chapter 164, Section 139(f).

See also 220 Code of Massachusetts Regulations (CMR) 18.07(1).

<sup>261</sup> See, e.g., Massachusetts Executive Office of Energy and Environmental Affairs, “Net Metering Frequently Asked Questions and Answers, available at <http://www.mass.gov/eea/grants-and-tech-assistance/guidance-technical-assistance/agencies-and-divisions/dpu/net-metering-faqs.html> , question 6 (“State law requires each [electric] distribution company to maintain separate net metering caps for public and private net metering facilities. Each cap is equal to a percentage of each company’s highest historical peak load, which is the most electricity consumed by the distribution company’s customers at any one time. . . . Once an electric distribution company fills its net metering caps, it can no longer allow customers to take service under its net metering tariff (note that exempt Class I net metering facilities will be able to net meter even if the caps are full . . . )”).

## **20150827-5035**

Julia Steed Mawson, Pelham, NH.

August 15, 2015

Norman C. Bay, Chairman  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE: Docket No. PF14-22-000

Dear Chairman Bay:

I respectfully request that the Federal Energy Regulatory Commission reject Tennessee Gas Pipeline (TGP) Company’s proposed Kinder Morgan Northeast Energy Direct (NED) Project. I base this request upon the following:

1. The compressor station in Dracut MA is too close to our Pelham NH borders and there is not enough research concerning the long term effects of emissions from compressor stations to deem them safe for us or our neighbors in Dracut who are next door to it. The same is true for the even larger compressor station proposed for New Ipswich, NH.
2. The pipeline and compressor station are located too close to farms in Dracut MA and the New Ipswich region, from which we in NH buy our fresh produce and dairy products.
3. The pipeline is located too close to Little Island Pond and its watershed. Emissions from the Dracut compressor station will threaten the populations of loons (a threatened species in NH) that have just re-established themselves after an absence of over 50 years and can damage the aquatic systems there. Similar issues face the New Ipswich compressor station and the wildlife and humans there.
4. The pipeline and compressor station are located too close to a neighborhood in Dracut MA and the surrounding neighborhoods in Pelham, NH. This high-pressure, high-capacity station will bring significant human safety risks to our families and the businesses nearby. In Pelham alone the pipeline affects over 500 families. (118 abutters and 380 in blast zone.)
5. The pipeline and compressor station are located too close to our water supplies, parks, and conserved

land and will bring significant environmental hazards. This pipeline cuts through Pelham's aquifer that supports the drinking water wells of Pelham landowners and affects 180 acres of hard-earned conservation land.

6. FERC has already approved another pipeline enlargement to satisfy New England's natural gas-fired electric generation needs on the coldest days. There is no need to add more supply. Further, there are at least 17 other energy projects currently being considered for New England (wind/solar, hydro, natural gas) and energy conservation measures are showing to be effective and decrease energy need.

7. The proposed pipeline route requires a new right-of-way that would cut through many miles of environmentally sensitive areas and take permanently protected land out of that protection. Tree loss is substantial and contrary to good climate protection practices.

8. The particular gas that would be carried in the proposed pipeline is likely to be particularly high in toxins and radiation, and the health impact upon our families, animals and plants must be avoided.

9. "Fracking" compounds and chemicals negatively impact the skin, eyes, sensory organs, the respiratory system, the gastrointestinal system, the liver; the nervous system; and are candidate endocrine disrupting chemicals. Endocrine disrupting chemicals (EDCs) present unique hazards, particularly during fetal and early childhood growth and development. We do not want to be exposed to any of these chemicals.

10. Leakage from existing pipes in the region is well documented and substantial and need to be repaired before any new pipelines are considered.

11. The importance of the rural character of southern NH is a vital and is a well documented part of this region's economy and social fabric. It must be preserved as a legacy for the future and this threat of industrialization is not acceptable.

Respectfully submitted,

Name: Julia Steed Mawson Address: 17 South Shore Dr. Pelham, NH 03076

Lisa Derby Oden, New Ipswich, NH.

Since we live in a rural environment, there are many farms and individuals who grow their own food. Many of both of these operate using organic practices, whether they have applied formally for that designation or not. Kinder Morgan needs to conduct a town wide survey of every individual, and should do so across southern NH, to determine how many farms are using organic practices, as well as how many individuals are growing their own food using organic practices. The toxins released from the compressor station, metering stations, pigging and the methane released from the compressor station and pipeline will have negative impacts on these practices.

#### **20150827-5042**

Donald Simms, Northfield, MA.

My name is Don Simms and I am a certified climate reality leader trained by the Climate Reality Project, led by former Vice President Al Gore. There are over 8,000 trained climate leaders in 122 countries that have made a pledge to attempt to make a positive change with the issues of global climate change. The fracked gas pipeline not only is not needed but will be another nail in the coffin in fighting climate change, as well as being devastating to the environment all along its planned 412 miles. I have lived off and on in Northfield on the upper section of Old Wendell Road since 1982. I have built two homes on Old Wendell Road over the years and remember when the previous dirt road on Old Wendell Road was not wide enough to let two cars pass. The Town of Northfield does not even have a gas station, let alone the infrastructure to support or secure the 80,000 horsepower compressor station.

The reality is this pipeline is not in the best interest for the community, MA or our national security. Conservation, weatherization programs and renewable energy projects should be priority methods in order to achieve a sustainable national energy policy.

A new pipeline subsidized by electric ratepayers violates the beneficiary pays principle. Given existing energy infrastructure, expansions already underway, and other market responses to winter peak prices, a new pipeline subsidized by electricity ratepayers will overserve the New England market, resulting in a glut of natural gas throughout the year that is likely to flow to markets outside of New England into Canada and overseas. This would leave New England ratepayers paying for the cost of building a new pipeline for twelve months of the year, and reselling back unused capacity at a lower rate for at least nine months to natural gas shippers selling into other markets.

The lowest cost and lowest risk way to meet power generation demand and reduce natural gas prices in the New England market in the near to medium term is to contract with existing infrastructure, including LNG imports and dualfuel capability, that can provide peaking response at little to no capital cost and without ratepayer commitment. With existing infrastructure and projected needs over the next ten years, there is plenty of time to monitor how existing policy initiatives, infrastructure availability, market response and therefore new pipeline infrastructure needs evolve over the long-term.

## **20150827-5052**

Marcia Tessier, W Townsend, MA.

I am writing to express my concern about the proposed gas pipeline for Massachusetts and southern New Hampshire. I have lived in Massachusetts all my life and for the past 30 years lived on Pearl Brook Road in West Townsend. I am a house away from the proposed Fitchburg lateral pipeline. I will list my concerns to hopefully make it easier to read.

1. The pipeline will pass under the Pearl Brook River which flows directly through the wells in West Townsend which is the drinking water for a number of people in Townsend. The land surrounding the proposed pipeline abuts the right of way of the Townsend Water Department and the Pearl Brook State Park, part of the Massachusetts park system. I am concerned that this will pollute the river and wells as well as damage the ecosystem of these wetlands. A house could not be built on the site the pipeline will go through because it did not meet the wetlands protections standards of the town. How can a gas pipeline be placed there?
2. The proposed pipeline then parallels Pearl Brook Road behind the houses on the street under the existing electrical lines. All the homes on this street have wells for our drinking water. Some of the wells are artesian and some are just dug wells. I am very concerned that the construction of the pipeline including blasting and digging that will be done to place the pipeline will disrupt and possible contaminate our wells. Who will test the drinking water to determine if it is still safe? What recourse will we have as homeowners if our wells are contaminated?
3. When I was at the Sitting Board meeting in Lunenburg on August 6th it was mentioned that blasting will occur and could effect the foundation of homes and structures nearby. Will Kinder Morgan and Tennessee Gas be responsible for damages? Why should homeowners have to bear a cost when they did not request any work be done near the home. Damage to the structure of our homes and drinking water will affect the property values and possibly make our homes unsaleable in the future.
4. We do not have a gas pipeline on our street. The town of Townsend does not receive gas from this company. No one on this route can benefit from the disruption of our water supply, destruction of wetlands and the ecosystem surrounding the pipeline and possible home damage and air quality.
5. My neighbors and my family will be greatly affected by the construction of this pipeline by the reasons I have listed above.. All the towns, homes and people all along the pipeline will have similar situations. The destruction of rivers, wetlands, parks, forests, farms and neighborhoods by eminent domain and the collat-

eral damage does not seem to be in the best interest of the states of Massachusetts and New Hampshire. The pipeline does not benefit the communities that will be damaged. We will receive no gas from this pipeline. Unitil the utility company for the town of Townsend does not have and has not requested gas from Tennessee Gas and the proposed pipeline. As a taxpaying citizen of the state and country I can not believe that private lands and state protected lands can be used and taken by a private corporation for their own economic benefit. Honestly, it seems UnAmerican and unconstitutional. I really have believed that the laws and protection written into our laws are meant to protect citizens, not have an outside business taking our land and destroy our property.

I hope you will take into consideration all the information given to you at the meetings that have been held across the state and the written information you are receiving when you make your recommendations about this pipeline.

Is this pipeline really necessary? Can existing infrastructure and services like LNG storage tanks already in existence meet energy needs?

How will this pipeline impact the environment and lives of the people on the proposed route?

Are there safer energy alternatives we should be working on as a state such as solar and wind?

What is the environmental legacy we will leave for the future?

How and who will clean up the inevitable accidents and mishaps? Where does that money come from? The Boston Globe recently had an article on all the gas line leaks in the greater Boston area. A gas line leak in this area will pollute wells and wetlands. I will be one of many on this route that will have a polluted well.

What is Kinder Morgan and Tennessee Gas's track record as a corporation and good neighbor?

Thank you for taking the time to read my email. I hope you will not give support or approval for this pipeline in any form. It is not needed, hazardous to the environment on many levels and exploitation of private citizens and small towns for the sole purpose of a large corporation's profit.

Marcia Tessier

**NOTE: The Town of Deerfield and/or its Board of Health do not waive their rights as per the Order issued by the Board of Health of Deerfield banning construction and operation of the Kinder Morgan/ Tennessee pipeline within the confines of the Town of Deerfield.**

## **PUBLIC SAFETY**

### **Deerfield does not have resources to protect against terror or vandalism threats**

The Deerfield Police Department is very well trained, and very capable, and has a proud record of demonstrated protection of Deerfield residents and businesses. However, the police department does not have the resources to provide detailed oversight of the pipeline infrastructure as planned. This leaves a significant threat to life and property vulnerable to extraordinary or unanticipated threats.

### **Deerfield does not have manpower or equipment to address pipeline accidents**

The town has excellent police, fire and emergency medical services available to its residents. The town has committed itself to active participation in regional and state-wide emergency management training and drills, including Emergency Response drills that have prepared the town to respond to natural disasters, and active operation of a four-town Emergency Preparedness Group. However, given the fact that pipe ruptures, compressor station failures and explosions at or associated with natural gas pipelines, it is very likely that the town would be ill-equipped to deal with a major incident related to a damaged or ruptured pipe, or to damage or failure at the meter station.

### **Pipeline's presence could will cause changes to town and regional preparedness requiring additional resources**

Deerfield enjoys the experience and efforts of many dedicated individuals serving with local fire services, as well as on the Emergency Preparedness committees and boards. However, extensive training, planning and other resources would be required in order to adequately plan for and protect against the extraordinary threat of a major incident related to the pipeline. These measures would result in costs of both time and money – and still may not adequately prepare for a possible incident.

### **Pipeline's high-pressure capacity could be a potential cause of a catastrophic failure in secondary connected gas systems.**

Current gas infrastructure carries natural gas from a number of sources, and to a number of destinations. Some of that infrastructure is old, and may have been designed for gas delivery at a lower capacity or pressure. By introducing new gas sources, at a higher capacity and pressure, without considering the capability of existing infrastructure to carry that volume and pressure, could increase the risk of critical failures, fire or explosion.

### **Pipeline's proximity to Deerfield Rail Yard could affect or alter remediation efforts at that site.**

The Deerfield Rail Yard has seen its share of negative environmental incursions. Through the diligent efforts of MassDEP, Pan Am Railways, Environmental Resources Management Inc., and the Town of Deerfield, extraordinary progress has been made to isolate, encapsulate, and remediate past environmental impacts, and to prevent future incidents. However, the sensitive nature of the remediation on this site could be undermined by any underground drilling, excavation or other construction. In particular, the pipeline's planned route could allow the spread of hazardous materials, and could potentially introduce them to the Deerfield or Connecticut River resources areas.

### **Pipelines have inherent and significant safety risks.**

While statistically safer than transporting gas with trucks and trains, natural gas pipelines still pose a danger. Any break or explosion would be catastrophic in comparison since the cutoff values typically are miles apart, and the volume of gas being exposed is much greater than any other means of transportation. Further, the US DOT Pipeline Safety rules requires a gas company to report an accident only if there is a loss of life, severe injury to a person, or \$50,000 or more of property damage. Pipeline accidents are "self" reported by the operator. There is evidence of leaks going unreported and off the radar to the public exposure due to these reporting guidelines.

### **Pipeline safeguards are implemented by the operator, with no oversight**

Proper safeguards are basically within the control of the pipeline operators. While these companies have an interest in operating safe infrastructure, there is no independent source keeping watch, investigating, or inspecting natural gas transmission lines. Additionally, considering the potential for domestic terrorism, a natural gas pipeline is a huge unprotected target.

### **CONSTRUCTION**

#### **Heavy equipment during construction will damage town roads**

The proposed pipeline has the same scale, scope and impact as that of an interstate highway construction project. The amount of heavy excavation and other equipment that would need to be transported through Deerfield across low-volume roads, some of which have ancient culverts, bridges and sub-base and base construction that simply cannot withstand the extensive use that such a project would require. The Stillwater bridge, in particular, has been negatively affected by numerous natural disasters (including Tropical Storm Irene in 2011), and shows further and extensive wear from the recent I-91 bridge reconstruction project. A project of this scale would undoubtedly result in further deterioration of the town's infrastructure.

#### **Blasting adjacent to power and communication lines, threatening transmission integrity**

The pipeline's path, as proposed, places it adjacent and parallel to high-tension power lines operated by EverSource (formerly the Western Massachusetts Electric Company). These lines represent part of an infrastructure that carries electricity across all of Western Massachusetts. Construction of the pipeline in such close proximity to these electrical lines introduces the potential for inadvertent damage to the lines that could result in outages. Further, close proximity of these lines represent multiple risks in the case of a major incident. If the pipeline were breached by cause or malfunction, resulting in a fire, it would likely present a major threat to the surrounding area; it would also result in serious damage to the electricity transmission lines, which could in turn result in an extended power outage across Western Massachusetts.

#### **Construction could have a detrimental effect on farms and businesses along the construction route**

The path of the pipeline passes across several areas that have been actively farmed for hundreds of years. These farms are located in the Deerfield / Connecticut River watershed, an extraordinarily rich agricultural basin. The impact of such an extensive construction project, which will bisect this area along a path at least 1.6 miles in length, is measured in lost productivity, lost agricultural real-estate, and the long-term potential of environmental damage that could preclude use of this area for farming altogether.

#### **Critical nature of construction should mandate independent, third-party construction monitoring and certification**

Deerfield is mandated by state law to provide oversight on all private construction projects, small or large, through elected or appointed bodies, or inspection services that review plans, provide comparison to as-built construction, and advise and review the projects at all phases of construction. Further, state law mandates that an independent Owners Project Manager be appointed for any major public works project, providing independent oversight of contractors and subcontractors, and representing the interests of the Town. The scope of the proposed pipeline, the nature of the project, and the potential for a massive, negative detrimental impact caused by a construction error or defect in materials, is clear justification for required third-party monitoring of all construction activity, regular comparison of as-built construction to design specifications, and complete monitoring and overview of all contractors and subcontractors associated with the project. Additionally, the actual materials and methods of the construction of the pipeline should be reviewed by engineers and geologists familiar with the industry, in order to minimize the possibility of critical failure due to corrosion, and other issues that have caused recent pipeline failures elsewhere.

## **CONSERVED AND PRESERVED LANDS**

### **Pipeline will pass through private and public conserved and preserved land**

Residents of Deerfield have been proactive in seeking out protection for open space, farmland, and woodland, through Massachusetts General Laws (“MGL”) Chapter 61 protection, private trusts, and other means. The path of the pipeline as proposed passes through many privately-held protected properties, and the impact of the pipeline on the status of these properties is not yet known. Certain Chapter 61 protections are deeded, and granted in perpetuity. The impact of a Federally-mandated project on a state-mandated conservation restriction is also not yet known.

### **Pipeline will adversely affect vistas and scenic byways of conserved and preserved land**

Deerfield is a rural community, with larger areas of undisturbed wilderness, and large areas of open farmland. A small number of light industrial corporations are located in specifically zoned areas of town. The Town’s Zoning bylaws have been developed to preserve open space, agriculture, and forested lands, while still allowing reasonable or “smart” growth of commerce and industry. The pipeline as proposed would create an industrial infrastructure in areas that have no industry, and which are zoned for agricultural or private residential uses. This infrastructure could have a long-term impact on the planning and development of the town’s industrial base, and could negatively impact the areas around Old Deerfield and the Deerfield River, which are historically and culturally rich.

## **OPEN SPACE AND RECREATION**

### **Pipeline will cross bodies of water and recreational areas**

Deerfield has enjoyed the benefits of two major waterways as its principal northern and eastern boundaries. Initially used as an avenue of transportation for local commerce, these two rivers now serve primarily as sources of recreation for many local and regional residents. The impact of a pipeline rupture at or near the resources areas of these waterways would be absolutely devastating to the ecology and economy along the rivers’ resource area. The long-term impact of a pipeline crossing these rivers at arguably least three points into, out of, or immediately adjacent to Deerfield, is not yet known.

### **Pipeline will affect recreation (Pocumtuck Ridge) and retreat areas (Woolman Hill)**

Originally founded in 1979, the Traprock Peace Center is located on Woolman Hill, in East Deerfield, and is the country’s premiere training and advocacy center for non-violent protest and peaceful communication. The construction of the pipeline will have a significant effect on this nationally renowned retreat and education center. Further, the pipeline is proposed to bisect the Pocumtuck Ridge, which runs parallel to the Connecticut River. The pipeline’s installation could affect local recreation, particularly along the agrarian areas of North Deerfield (along Upper Road, Lower Road, and surrounds) as well as the rural areas along the Pocumtuck Ridge. The pipeline’s placement in could result in significant interruption to this undisturbed area. Further, use of any land along the route of the pipeline for walking, hiking, biking or other recreational use, will likely be significantly restricted due to the protective easements that will be in place.

## **AIR QUALITY**

### **Venting of gases will alter air quality**

Aside from automobile and train traffic, there are no major sources of pollution in Deerfield. Industry in Deerfield is light industry, and poses no major sources of light, sound, air or water pollution. The metering station, to be located near the north entrance of Old Deerfield, is a potential source of pollution, particularly during blowdown of the meter station piping, accomplished by a vent stack located on the station inlet piping and vents on the meter skid downstream of the meter and flow control valve. Additionally, vent stacks may be a source of noise pollution, depending on whether or not the stacks are designed with silencers.

## **WATER RESOURCES**

### **Pipeline's construction could cause damage to wetlands**

Near the confluence of the Deerfield and Connecticut rivers, there are numerous natural wetland areas, including natural flood plains that help to alleviate the impact of major storms and floods. Additionally, wetlands provide a natural biofilter, allowing for sequestration of carbon and carbon dioxide, storm water reclamation, aquifer restoration, and filtration of natural and some man-made pollutants. Construction in wetlands, and the presence of a pipeline in these ecologically-sensitive areas, could permanently and detrimentally alter this delicate ecological balance.

### **Placement could cause alteration of surface water drainage patterns**

Nearly all of the land bisected by the proposed route of the pipeline is undisturbed forest, hillside agriculture, agricultural fields, and flood-plains. These areas provide natural management of stormwater, abatement of flood waters, and protection against erosion during storm events. The construction of the pipeline would potentially disturb these areas, and could result in significant and permanent damage to native or agricultural areas.

### **Pipeline could be a source of contamination of water supplies**

The route of the pipeline passes within yards of a dozen or more private wells, as well as crossing natural resources areas for two major rivers, which are themselves part of an interconnected aquifer resource area that stretches from Bellows Falls, Vermont, to the Mount Holyoke range in Hadley and Easthampton. Contamination from a pipeline break could potentially pose a dramatic risk to water supplies and resources in Deerfield and other towns along these rivers.

### **Construction could cause a reduction of well capacities for bedrock wells**

Extensive studies by a number of agencies have concluded that horizontal drilling can result in migration of groundwater and other materials from one location to another along the borehole. Given that the expected depth of the pipeline will be similar to that of several private wells, and their supporting aquifers, it is reasonable to conclude that horizontal drilling will affect local aquifers and private wells.

## **GEOLOGY**

### **Drilling and blasting during construction could impact geology and groundwater**

The proximity of the pipeline route to and through natural ledges (igneous and sandstone) in the Pocumtuck Range will require either intensive horizontal bore drilling, or blasting. Either method of excavation could have significant effect on local geological stability, and water resource areas.

### **Installation of pipe in frost zone can pose threat to pipe integrity**

State Building Code mandates that direct-burial water, sewer, and electrical lines must be placed at specific depths, and must be bedded with appropriate materials, in order to reduce the risk of rupture due to frost heaving, surface incursion, or other possible hazards. The pipeline project, as proposed, does not sufficiently detail the measures to be taken to insure that the gas pipeline is sufficiently protected against similar threats.

### **Depth of pipeline could impact farming or recreational use**

Clarkdale Fruit Farms celebrated their 100th anniversary this year as a local grower of fruit along Upper Road. A number of farms lie in the lowlands adjacent to the Deerfield and Connecticut Rivers. Much of the rivers' floodplain areas are actively used for agriculture by several full-time professional farms. The pipeline as proposed will cross these areas of land. Based on the estimated depth of the line, and issued warnings and restrictions governing the easements that will likely be in place, use of the land for agriculture will be significantly affected, and will result in a detrimental economic impact. Irrigation systems could incur damage due to the construction of the easement, including the disruption of above ground "boom" units which

would not be permitted to operate as designed, thus reducing the proper irrigation of a field. Damage or loss of use of irrigation systems, or the potential for crop loss, are speculative at best before the actual time of construction.

## **ECONOMIC**

### **Pipeline’s presence could cause severe devaluation of residential property**

Deerfield is a bucolic town, with many homes in rural or semi-rural settings. Overall, natural gas pipelines have an observable effect on traffic, recreation opportunities, safety, and available resources, that we anticipate will directly impact property values. Three recent studies (completed by the gas line companies) found little to no effect on property values due to the presence of such pipelines. However, other independent firms have completed studies which found a measurable devaluation experienced by residential properties that have gas pipeline easements on their property.

Further, the fact that the pipeline’s path follows existing power-line easements creates a de facto ‘utility corridor’. The creation of this corridor (which could be expanded to include water and sewer pipelines, cable lines, etc., running within or alongside the existing easements) could prevent a buyer from purchasing a property encumbered with such a easement, or cause them to demand a discount on the purchase price. Utility corridors are a reality that, when recognized by the market, create market resistance.

Finally, perceived market prejudice (known as “stigma” or “severance” damages) could affect property values. These perceptions drive the view of the potential buyer as to the potential enjoyment or return on investment they may receive in the purchase of the property. Though it is true that the properties affected by a large diameter natural gas transmission line do sell in the market, it may not be true that these properties sell at the same price as a similar property not so affected.

### **Pipeline’s presence could affect financing, refinancing, or insuring property**

There is considerable evidence in hand proving that energy projects can have a dramatic effect on the sale, financing, or insuring of private homes. The impact is most clearly seen in mortgage contracts between major banks and lenders, and homeowners, in which lenders can choose not to finance – or refinance - if the potential buyer signs a lease associated with a gas well or a pipeline. While this impact is mostly felt in areas where active drilling is concerned, it is possible that lenders and insurers may increase rates or premiums for those owners of land, or purchasers considering land, in proximity to the proposed pipeline.

### **Pipeline’s course could effect changes to land-use and zoning**

The pipeline’s path follows existing power-line easements creates a de facto ‘utility corridor’. The creation of this corridor (which could be expanded to include water and sewer pipelines, cable lines, etc., running within or alongside the existing easements) could be construed as a non-conforming use, but could establish a precedential non-conforming use, opening the town up to the possibility of additional limitations or negotiations related to

### **Pipeline could adversely affect travel and tourism in Deerfield**

Deerfield relies on tourism and travel as a major source of new revenue for non-profit organizations, schools, and local businesses.

Historic Deerfield is a museum dedicated to the heritage and preservation of Deerfield, Massachusetts. Its historic houses, museums, and programs provide visitors with an understanding of New England’s historic villages and countryside. It is located in the village of Old Deerfield which has been designated a National Historic Landmark District (as the Old Deerfield Historic District), and is listed on the National Register of Historic Places.

The Pocumtuck Valley Memorial Association (PVMA) of Deerfield, Massachusetts is a nonprofit, membership-based cultural and historical organization incorporated by an official act of the Massachusetts Legislature in 1870. PVMA is focused on preserving and communicating the multi-cultural history of

the Connecticut and Deerfield River Valleys, with emphasis on “old Hampshire County,” and present day Franklin, Hampshire, and Hampden Counties. PVMA maintains Memorial Hall Museum, a research Library, Deerfield Teachers’ Center, Indian House Children’s Museum, and Community Outreach projects. Further, PVMA’s annual Old Deerfield Craft Fairs promote Old Deerfield’s Arts and Crafts tradition started in 1898. The impact of such a significant construction project could have a dramatic effect on tourism and revenue; delays in travel due to construction could seriously impact tourism, and the presence of a natural gas facility could result in a perceived “stigma” in an otherwise pristine and historically significant area.

## **EDUCATIONAL**

### **Pipeline will pass adjacent to three major private educational institutions**

Deerfield Academy was chartered in 1797 by Governor Samuel Adams, and quickly established itself as one of the finest schools in the new republic, drawing boys from prominent families across New England. The Academy is a highly selective, independent college-preparatory school with approximately 640 students and about 120 faculty, all of whom live on or near campus during the school year.

The Bement School began in 1925 when Grace “Menty” Bement agreed to a request of Headmaster Frank Boyden of Deerfield Academy that she tutor one of his students. The school grew as word spread. The school’s emphasis on the individual child was a revolutionary approach, balancing the rights of the individual and the responsibility for the rights of others. Bement currently maintains an enrollment of approximately 220 students, including 40 boarders, who come from many different states and countries.

The Eaglebrook School was founded in 1922 by Howard Gibbs, a friend of Headmaster Frank Boyden of Deerfield Academy. Gibbs, who graduated from Amherst, envisioned a younger boy’s boarding school that allowed boys to develop their innate abilities, discover new interests, and gain confidence. The school was expanded under the direction of Thurston Chase, to include a gymnasium, tennis courts, a learning center, a science building, and four new dormitories. Later, the school bought 500 adjacent acres, adding new playing fields, a track, a ski area with snow making and chair lift, a swimming pool, and two new dormitories. Currently, the school has a student body of approximately 260 boys in grades six, seven, eight, and nine.

These schools lie within one-quarter mile of the proposed pipeline route, and the proposed site for the metering station. There is no way to estimate the impact of such an extensive industrial infrastructure project on the day-to-day educational mission of these three revered institutions.

## **HISTORICAL**

### **Pipeline could expose, damage or destroy archeologically significant sites**

Over the past several decades, a number of sites have been identified and categorized as historically-significant sites in terms of their impact on Paleo Indian (12,000-8,000 BCE) and Late Paleo Indian (8,000-7,000 BCE) studies. In particular, two sites have been identified in Old Deerfield, along the Deerfield River, and have been subjects of complete archeological excavations and documentation. Ongoing study of these sites in Deerfield indicate that information is not isolated to any given site, but that there may be other, potentially significant sites yet to be explored. This ongoing exploration continues to reveal valuable information about the Pocumtuck people.

The route of the proposed pipeline passes immediately adjacent to the so-called “Pine Hill” site (North and West of Old Ferry Road, Old Deerfield (42.56022, -72.60412), which has been described as “a key locus in the cognitive map of the Pocumtuck”. Further, archeological site studies have been conducted in East Deerfield, along the path of the Franklin County Greenway (42.5737108, -72.5759376), as well as a number of other sites in close proximity to the Deerfield and Connecticut Rivers. No provision for archeological study or preservation has been indicated in any proposal or plan related to the pipeline.

Further, and as is noted in the Economic section of this report (above), there could be a significant effect on Old Deerfield. The area is a National Historic Landmark District (as the Old Deerfield Historic District), and

is listed on the National Register of Historic Places. The pipeline's effect on historically valuable vistas and byways that remain a vital part of Deerfield's past could be extremely detrimental to preservation of those areas.

Katherine Richter, Windsor, MA.  
To Whom It May Concern:

I am writing in protest of the this application. Windsor is a rural community, one I personally live there for the peace and quiet. As well as for the ability to enjoy nature which includes the beauty of wild animals and the changing seasons.

This project would not only disrupt our peace and quiet(as the plant itself will be within hearing distance of my house). The traveling industrial sized trucks will disrupt our roads,bridges and land. The actual building of the plant will dislodge wild animals from their homes and the noise itself will cause disruption to the local ecosystem. Not to mention the hearing and sanity of those closest to the plant. I have a young child under the age of 1 and the damage to her hearing from the plant could cause long term damage.

Windsor will not be reaping any benefit of getting the gas that will be produced and this whole project will ruin what is a town full of history, independent minded people and the beauty of nature that brings tourism.

In closing, please take the town's amount of citizens who are against this project and not just listen to people paid by Tennessee Gas to lobby on their behalf.

RE: ADDENDUM TO THE FERC COMMENTS (PREVIOUSLY FILED) OF THE TOWN

Dear Ms. Bose:

Please accept the following comments as additions to our previously filed comments regarding the Northeast Energy Direct Project as proposed by Kinder Morgan (Docket No. PF14-22-000).

Thank you.

Sincerely,

BRIAN S. NOBLE  
Town Administrator

BSN:mt enclosures

**The Concern:** Berkshire gas is now a 2/12% owner of the NED pipeline project. It is highly likely that they knew this at the time they issued a moratorium on new customers. Their refusing to take on new custom-

ers must be viewed as a ploy to convince FERCC and other regulators of a need when in fact the need for a moratorium is questionable at best.

**The Requirement:** That any moratorium that was called by Berkshire gas be considered a marketing ploy and not a true assessment of need. That others who followed their lead must also be considered as an invalid response and should be ignored.

**The Concern:** The calculation of need needs to be limited to the Northeast and not Canada.

**The Requirement:** That need be based on US need only and if there was a shortfall of gas then we must first consider that all gas goes first to US based customers. That any shortfall estimates be reduced by the amount of gas shipped to Canada or off shore.

**The Concern:** That calculation of need consider small scale solar and other energy generation.

**The Requirement:** That we consider individual generators of solar or wind power in estimates of need and consider that these forms of energy will increase over time.

**The Concern:** That conservation measures can be used to provide an alternative to increased energy production.

**The Requirement:** That when calculating energy projections and need we give full consideration to an energy conservation initiative that could be sponsored by the state or the Northeastern states. With a strong campaign, focusing on simple solutions we can reduce use across Massachusetts and the northeast.

**The concern:** That the issue of public convenience and necessity must take into account the necessity of production of food, the need for clean water and the need for trees and forests to produce oxygen.

**The Requirement:** That we give value of the necessity of rural New England to maintain the ability to produce crops at the current rate, to prevent water pollution and to have enough green land to generate oxygen. While it is true that no one pipeline will destroy the global production, the water pollution can destroy a town. The overall trend, of which this pipeline would be a part is to destroy the environment on favor of energy. This trend must stop to guarantee adequate resources for future generations.

Rosenberg FERC Hearing:

There needs to be a clear need for FERC to approve the taking of land by eminent domain. The land in question is private land, town lands state lands and federally funded protected lands. I want to address the question of need.

Let me start with the definition of need. Need is something that is required, a necessity a condition marked by the lack of something requisite. Need is distinguished from desire by the necessity and requirement rather than something that one would like to have.

There is no need for more gas. There are no peer reviewed studies that support the need for gas as proposed by Kinder Morgan. There are many alternative solutions available.

- Stop the leaks.

- o From to WBUR radio "According to Senator Edward Markey's 2013 study, the state's gas customers paid between 640 million dollars and 1.5 billion dollars for gas that never even reach their home or business." If this gas was not leaking then it would help solve any problem that might exist.

- o From the Boston Globe "Detailed maps of the leaks became available this week as a result of a new state law requiring utility companies to report the location and age of all their known gas leaks, which according to one estimate have cost ratepayers more than \$1 billion." If the gas companies stop these leaks we will have more gas and cleaner air with less toxic pollutants.

There must be a requirement that gas leaks be fixed before we add more infrastructure. The solution is to clean up the problems before thinking about creating new ones.

- The cheapest way to deal with the issue of a perceived shortage of energy is conservation.

- o As we did during WWII, conserving gasoline we need to have a "war" on energy waste.

- There needs to be a statewide campaign to be “cool” in the winter having everyone lower their thermostats to under 70 degrees. Let all politicians and public figures lead this effort and be shown wearing sweaters in all public appearances during the cold months.
- There should be an “I Save Energy” sweatshirt campaign that has everyone in Massachusetts getting a free sweatshirt with that slogan when they commit to reducing household or office temperatures in the winter.
- Be “hot” in the summer. All people must be encouraged to raise the temperatures in air conditioned places to a minimum of 72 degrees.
- Promote the statewide energy audit program. Have grants for low income people and interest free or low interest loans to others for energy savings efforts on homes and offices. Expand that program so that everyone in the state is aware of it and uses it.
- Provide loans for solar, wind and small scale hydro energy generation.

FERC needs to demand an explanation from Kinder Morgan on their projected increase of need when federal studies show a decline in the use of gas and the use of energy.

Last year the fears of an energy shortage did not materialize. LNG ports were able to help meet any needs. According to a study commissioned by GDF Suez any gas shortages can be remedied by the use of a combination of dual-fuel power plants and more efficient LNG gas contracting.

- There are 2 LNG terminals in Everett that are currently operating at only 50% of capacity. This is an underutilized resource that should be used to help resolve any potential shortages.

- There are two pipelines under construction or in the planning phase. One is along an existing pipeline route and the other is a short pipeline that will help feed the Connecticut area, part of our region. There are also proposed High capacity electric lines from Canada that will be providing additional energy to the region lessening the need for gas generated electricity.

There is no way that need for more gas can be proven. As for a desire, I think the main desire we are trying to accommodate here is the desire for Kinder Morgan to increase revenue.

Do people need to have their houses heated above 70 degrees. NO. Do they need to cool them below 72 degrees, NO. They may want to, but that is desire, not need. Do we need more fossil fuel energy generation, NO. It is desired by some but not needed by anyone.

As a country we are facing a dilemma.

Do we continue to increase our demands (not needs) for more fossil fuel energy generation or do we look towards alternatives.

Do we aggressively move towards a green solution that is sustainable over time or do we continue to keep our heads in the sand and rely on fossil fuel as though it has no down sides and will last forever.

Do we accept the destruction of our environment for short term corporate profit or do we value the land, air, water, forests and farms that are needed for life itself.

While I will be the first to admit that one pipeline in itself will not be the destruction of rural America, the ongoing trend of Fracking and distribution of gas through a leaking and poorly maintained infrastructure added to the oil pipelines that have wreaked havoc across the nation must be stopped. Stop it here, stop it now. Say NO to NED

**20150827-5133**

Johanna Graves, Nashua, NH.

I nor many of the other residents of NH do not want or need the danger that an energy pipeline brings to my state. Keep Kinder Morgan out. We don't want spills and the scars on our landscape, nor do we want to give up our property for it.

The State, International and Public Affairs Division Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

Re: Docket No. PF14-22-000

Dear Ms. Waldstein,

I am writing to offer my comment on the FERC application filed by the Tennessee Gas Pipeline, L.L.C. regarding the Northeast Energy Direct Project, docket number PF14-22-000. As the state Senator for the Second Essex District, I would like to raise some important points on behalf of Peabody constituents who strongly oppose this project.

First, the Lynnfield Lateral portion of the project could have a significant environmental impact. As currently proposed, the pipeline could follow the route of the Peabody Independence Greenway, an eight mile trail that runs through the city. The greenway provides valuable outdoor recreational opportunities for walkers, runners, and cyclists from Peabody and throughout the North Shore. In addition to the greenway, the proposed pipeline route could adversely impact the wetlands and plant life surrounding the Ipswich River. If this project advances, it could threaten the future of these open spaces and natural resources in the community.

Second, the Lynnfield Lateral portion of the project could have a detrimental impact on many Peabody neighborhoods, its homeowners, and their families. I have heard many Peabody residents express their concerns about how the project may impact public safety and private property in their community. I understand the project's 101 miles of new pipeline in Massachusetts may offer a public benefit, but I believe that special consideration should be given to the neighborhoods and residents that would have to live with the project's lasting adverse effects.

Far too often, a project's economic benefits take precedence over its social costs. The Northeast Energy Direct Project presents significant environmental costs to the City of Peabody as well as quality of life issues for homeowners along the currently proposed pipeline route. Without a clear understanding of the project's necessity and benefits to the city, I do not believe that Peabody residents should have to endure any negative consequences associated with the proposed pipeline. I truly hope that you will consider these concerns throughout the review process. Thank you.

Sincerely,

Joan B. Lovely

Subject

Scoping comments from the **Winchester NH Board of Selectmen and the Winchester NH Conservation Commission** on the natural gas pipeline proposed by Tennessee Gas Pipeline LLC (TGP) and Kinder Morgan (KM). FERC PF14-22-000

Conveyance

Comments to be filed electronically with copies to Kinder Morgan and the US Army Corps of Engineers.

Communications

All communications related to this filing should be directed to:

Roberta Fraser, Chair  
Winchester Board of Selectmen  
1 Richmond Road  
Winchester, NH 03470  
Phone - 603 239 4951  
Email – swalker@winchester.nh.gov

**Background and Interest of the Winchester Board of Selectmen and the Conservation Commission**

The Board of Selectmen (BOS) is a board of five people elected to govern the day-to-day affairs of the town. It is the executive branch of town government. The Select Board establishes policy, sets the long-term goals and direction of municipal services, and reviews budgetary expenditures and other appropriations necessary to operate the town.

The Winchester Conservation Commission (WCC) was established by the voters for the proper utilization and protection of our natural resources and for the protection of watershed resources of Winchester. It manages and oversees conservation areas and town land, (including the first property that the proposed Tennessee Gas Pipeline would cross in Winchester,) and advises the Board of Selectmen. The WCC reports to the Winchester BOS.

The Town of Winchester appreciates this opportunity to make scoping comments related to the TGP plans to build a gas pipeline through the Town of Winchester.

Following news of a planned pipeline through Winchester, the voters by a significant margin passed ballot referendums in 2015 opposing the pipeline and denying survey access to town owned land. The BOS and WCC voted to deny survey access on town owned land, citing the conservation language in the deed. In addition both the BOS and WCC voted in opposition to the proposed pipeline. That said, the town continues to honor the FERC process. The town and Kinder Morgan have cooperated with each other.

The town has requested information from TGP and KM regarding the proposed pipeline, and has received responses. Many citizens and members of the WCC and BOS attended the open house held by TGP and KM at the Winchester Town Hall on February 4, 2015, and the public presentation on June 2, 2015 in Town Hall. The WCC reviewed the initial Resource reports and looks forward to seeing the revised environmental Resource Reports following the comments of the FERC filed on May 15, 2015. WCC provided information about the proposed route of the pipeline that was requested by AECOM.

The BOS and WCC met directly with Kinder Morgan in early July. At that meeting Kinder Morgan proposed a revised route that crossed the town stratified drift aquifer further east. [http://www.sentinelsource.com/news/local/kinder-morgan-reroutes-pipeline-path-in-winchester/article\\_1923c480-026b-52c2-904b-aec04673bb48.html](http://www.sentinelsource.com/news/local/kinder-morgan-reroutes-pipeline-path-in-winchester/article_1923c480-026b-52c2-904b-aec04673bb48.html) Subsequent to this meeting the BOS and WCC escorted representatives of Kinder Morgan through the Pulpit Falls area on July 30, 2015. The revised route proposed by Kinder Morgan at the July

1, 2015 meeting has not been filed yet with FERC.

The Winchester Conservation Commission has provided Kinder Morgan and AECOM with all the information they requested concerning scenic areas, conservation areas, town drinking water supplies, the town aquifer, steep slopes, existing and planned wells, schools, existing and planned subdivisions. We have provided GIS maps - one of which was made in response to AECOM's inquiries - and copies of the town ordinances relating to the aquifer, excavations, and steep slopes. See especially the "Pipeline Map Final" map that we provided KM and AECOM in May.

The WCC is charged with protecting sensitive or aesthetic areas, and drinking water resources. Winchester will need the assistance of FERC to enable us to protect these areas important to the town's future.

Using Conservation funds, the WCC long ago purchased two pieces of property that would be impacted by the proposed pipeline. One contains Pulpit Falls and Pulpit Rock and in the current plan is the first piece of property the pipeline would cross as it enters New Hampshire. The other property is in the town aquifer and was purchased as a future site for a town drinking water well. This property is in the area of Winchester considered for a future Silvio O. Conte Refuge by the U.S. National Fish and Wildlife Service.

These scoping comments are intended to state our interests and concerns about sensitive areas, wetlands, aquifers, agricultural and conservation areas, and land that was purchased or acquired by either the Town of Winchester or the WCC. We also make comments about the financial impact of the proposed pipeline on the town.

## **Town of Winchester Scoping Comments**

### **Pulpit Falls Property**

The current and the previous proposed routes of the pipeline cross the Massachusetts border and enter Winchester, NH on a piece of property owned by the town and managed by the Winchester Conservation Commission. The proposed pipeline route is co-located with an existing power transmission line, although it requires widening the right-of-way, and remains on the Pulpit Falls property for approximately two-tenths of a mile before crossing Pauchaug Brook. This property contains a site on the brook called Pulpit Falls that is of local significance for its scenic beauty and history. Town residents and tourists visit Pulpit Falls and Pulpit Rock during all seasons. The proposed location of the pipeline is near Pulpit Rock itself. Construction of the pipeline could damage or destroy this historic rock referenced in colonial maps and writings.

### **Pulpit Falls**

*{photo omitted}*

"The word pauchaug signifies, dancing place; and from the peculiar application of the term by the first English comers, and from the peculiar conformation of the bluffs on the easterly side, as well as from the fact that the place was about equidistant from Massemet's and Nawelet's villages, it is believed that the two native clans were accustomed to meet here for their annual games and merry-making." (History of Northfield, Massachusetts for 150 Years, Temple and Shelton, 1875, p15.) A recreational area from before written language described it; Pauchaug Brook and Pauchaug Meadow are special places then and now. Pauchaug Meadow and the mouth of the brook at the Connecticut River is conserved by the Massachusetts Department of Fisheries and Wildlife, the upper Pauchaug Brook area containing Pulpit Falls and Pulpit Rock is conserved by deed by the Town of Winchester, NH.

The site was listed in several publications as a tourism feature in the late and early 20th century, including Early Maps of Winchester, NH 1733 to 1892, The Guide to Northfield published about 1901, All about Northfield by Arthur Percy Fitt (1910), and The History of Northfield (1875). In 2008, the Winchester Conservation Commission purchased the 30-acre Pulpit Falls property. The seller of the property, Amy Sinclair now of Leyden, MA and formerly from Northfield, MA, sold the land to the town because she thought the town would be better able to protect what she considered to be a "spiritual place." A map dated 1945 puts into perspective the historical significance of Pulpit Falls and Pulpit Rock. Apparently these areas were of more importance than the Town of Winchester itself, because the cartographer incorrectly identifies the town

as Hinsdale, even as he correctly identifies footpaths to the area.

*{map omitted}*

The Pulpit Falls area remains a conservation priority for the town because of Master Plan goals of preserving rural character, preventing sprawl, and protecting the economic engine of tourism, and also because it connects with the over 1,000 acres of forest land Northfield Mount Hermon is preserving through an agreement with the Trust for Public Land. In addition, Pulpit Falls land abuts another larger area that hosts hardened logging roads, significant wetlands, a cemetery, cellar holes, and connects directly with protected areas in Warwick, MA. The jewel in the forest is the Pulpit Falls and Pulpit Rock area of Pauchaug Brook.

The deed signed with the Winchester Conservation Commission on July 9, 2008, contains this conservation restriction:

*“This conveyance is made subject to the express condition and limitation that the premises conveyed shall forever be held as a nature preserve or conservation area for scientific, education and/or aesthetic purposes, and shall be kept entirely in its natural state, excepting only fences, foot trails and property maintenance activities as may be appropriate to effectuate the foregoing purpose without impairing the essential natural character of the premises.”*

The Winchester Conservation Commission manages the Pulpit Falls land in an unusual way. There are no signs, no official trails, and no map. Wandering the woods and being overcome by the magic of streams, trees, rocks and solitude enhances the charm of this precious place. Even during the 7/29/15 tour the BOS and WCC gave to KM officials, all agreed the trip was special and fun in spite of the extreme heat and humidity, a tumultuous thunderstorm, slips and falls and occasional uncertainty about the route.

The Winchester Conservation Commission and the Board of Selectmen believe that routing this pipeline through the Pulpit Falls property violates the conservation restriction in the deed. The Commission objects to allowing another permanently cleared swath bifurcating the forest and violating the conservation terms of our deed.

If FERC allows the pipeline to go through the conserved Pulpit Falls property, the town would like to know the specific details of the construction process. As directed by the FERC on May 15, 2015, regarding Resource Report 1, we would like to know in Section 1.3.2.1 (page 1-73), what special measures Tennessee Gas would use in the rugged terrain of this property to address potential issues such as erosion control, rocks rolling off during construction (especially Pulpit Rock), and post restoration slips and landslides. We would like to know what heavy equipment would access this land, and whether or not blasting would be used. If horizontal directional drilling were used instead of trenching, what equipment would be involved? Despite these concerns, we believe there should be no passage of the pipeline through the Pulpit Falls property.

Public funds obtained through tax dollars purchased the Pulpit Falls land in the interest of the public good. All visitors are welcome without charge. The area is well used despite (or even because of) the difficulty of access. The use of federal powers of eminent domain to violate a written trust entered into by the Town of Winchester for the public benefit is wrong headed. Using eminent domain simply because this property is on a route chosen by a private corporation for its financial profit is not just. There are many alternatives to the transmission line route chosen! Entering New Hampshire on conserved land presumes the use of eminent domain, is indifferent to state law, and flaunts public opinion.

### **Proposed Route’s Impact on Winchester town drinking water**

The currently proposed route of the pipeline crosses the town aquifer and significant streams and threatens the town’s drinking water supply.

The route leaves a north-south power line right-of-way and takes a shortcut to the northeast to rejoin another power line running east to west. The proposed route cuts across forested lands and some prime farmland. It crosses a watershed that includes Snow Brook. Then the route crosses Mirey Brook, the outlet of the Sprague Brook and Roaring Brook watershed that enters the Ashuelot River within the borders of Winchester. Mirey Brook runs through the center of the town aquifer and drinking water supply.

Winchester has an Aquifer Protection District with specific requirements for any development. A copy is attached as Attachment A of this document.

Winchester is very concerned about the impact of a natural gas pipeline on the safety and health of the aquifer both during construction and the operational life of the pipeline as well as after the pipeline use is discontinued. Crossing the aquifer creates a major concern for the town.

This stratified drift aquifer is considered rare in the Northeast. Because it has an extremely high transmissivity rate, disturbances at its surface are reflected at its depth. The town aquifer is part of a drainage system including Mirey Brook, Roaring Brook, and Snow Brook in the Sprague Brook watershed.

According to the Natural Resources Inventory for Winchester, created from GIS analysis by the Southwest Region Planning Commission in 2007, “Stratified Drift Aquifers are geological formations of sand and gravel deposited by the melting glaciers 12,000 years ago. Some are vast and extend through several towns. Having been sorted by running water, the deposits can be made up of stones or particles of sand that have very uniform size and therefore a great deal of open space. Stratified drift aquifers can store and yield vast volumes of ground water. These aquifers are also highly susceptible to pollution due to the ease with which contaminants can spread through the porous formations.” (p. 10-11) The report lists 5,926 acres in the Winchester stratified drift aquifer (about 17% of land in the town), and 1,657 acres contained in wellhead protection areas. The water table is less than 18 inches beneath the surface in much of the land in the aquifer, according to Map8 of the NRI report.

A town well that supplies drinking water to Winchester is located downstream from the proposed pipeline route in this aquifer, and another well has been proposed here for the future. The WCC bought a parcel of land at the corner of Mirey Brook and Piney Woods Road, on the south side of Piney Woods Road. This property is intended to become another town drinking well. The town is concerned the pipeline could affect the drinking water supplies.

The currently proposed route crosses the wellhead protection zone for the proposed well. At the July 1 meeting with the town, Kinder Morgan proposed a changed route crossing the aquifer east of the filed route. However, this route while not in the wellhead protection zone is still in the aquifer. Furthermore, having different routes under consideration places more property owners and areas under the stress of threatened eminent domain.

The town of Winchester is unaware of the aquifer’s depth at any given location. The aquifer may be deeper than Horizontal Directional Drilling (HDD) could reach for crossing the town aquifer. We respectfully request the assistance of FERC in determining the depth of the aquifer and the potential threats to the areas of the aquifer not previously studied but under consideration for alternative routes by Kinder Morgan.

In 2006 the watersheds of Snow Brook, Mirey Brook and Sprague Brook were proposed for inclusion in the Silvio O. Conte National Fish and Wildlife Refuge to be managed by the US Fish & Wildlife Service. The Nature Conservancy previously supported this proposal. The Conte Refuge is comprised of over 36,000 acres within parts of the four Connecticut River watershed states of New Hampshire, Vermont, Massachusetts, and Connecticut. Andrew C. French, who received the Paul Kroegel Refuge Manager of the Year Award in 2013, is project manager at the Conte Refuge. French said the Snow Brook and Sprague Brook region is a “nationally significant fish and wildlife habitat.”

In July 2004, The Nature Conservancy prepared “A Land Conservation Plan for the Ashuelot River Watershed” with contributions from the Society for the Protection of New Hampshire Forests, the Southwest Region Planning Commission, and the Monadnock Conservancy, with additional funding from the New Hampshire Department of Environmental Services Watershed Assistance Program. The report (p. 109) said: “The Sprague Brook Watershed area contains a high quality headwater tributary system of the Ashuelot River...This collection of small watersheds is relatively unfragmented by roads and development, and contains a significant amount of core hemlock-beech-oak-pine forest habitat that can support wildlife benefiting from interior forest conditions (Zankel et al. 2004). In fact, the focus area lies within a +/- 7,300-acre unfragmented forest block that extends south into Massachusetts, and was identified through The Nature

Conservancy's ecoregional planning as an outstanding opportunity to conserve large unfragmented forest ecosystems. (Barbour et al. 2002).

Sprague Brook watershed is entirely free flowing, with no dams, allowing for outstanding natural aquatic ecosystem conditions and streamside wetlands...Sprague Brook supports an exemplary emergent marsh-shrub swamp ecosystem with a high diversity of embedded wetland natural communities (Nichols and Kimball 2002; Sperduto 2004). This wetland system is a complex of emergent marsh, beaver flowages, scrub-scrub floodplain, riverbanks, and seepage swamps."

The Town of Winchester has an Aquifer Protection District that includes the outermost edge of the surficial extent of all aquifer deposits presently designated as stratified drift as supported by information included in the United States Geological survey shown on the Winchester Aquifer Map titled "Saturated thickness and transmissivity of stratified drift aquifers in the lower Connecticut River Basin, Southwestern New Hampshire."

The purpose of this ordinance is to protect, preserve and maintain existing and potential groundwater supply and groundwater recharge areas within the known aquifer from adverse development, land use practices or depletion. This is to be accomplished by regulating the uses of land over certain known aquifers and their recharge areas to protect them from contamination caused by adverse or incompatible land use practices or developments. The Aquifer Protection District Ordinance is intended to limit the uses of land so designated to those which will not adversely affect water quality by contamination or water quantity by preventing recharge of the aquifer.

See especially the previously provided "Pipeline Map Final" that shows the aquifer and its transmissivity rates, as well as the associated steep slopes along with the brooks mentioned above.

The pipeline may need a permit or review by the Winchester Planning Board to determine if its construction and operation are within the permitted uses in the Aquifer Protection District and other ordinances. The New Hampshire Department of Environmental Services would also require review. The proposed route crosses a wetland in the aquifer that includes land under water, banks, bordering vegetative wetland, and considerable land subject to flooding. Pipeline construction that involves dredging and filling a trench would presumably also require a US Army Corps of Engineers individual permit.

### **Concerns with Stream Crossings**

If the pipeline were built in the Town of Winchester, the Conservation Commission recommends that all stream crossings as well as other sensitive crossings use Horizontal Directional Drilling (HDD) rather than wet trenching or other techniques that might result in runoff or pollution, especially in the area of our town aquifer and water supply wells. This would include at least Pauchaug Brook, Snow Brook, Mirey Brook, and Roaring Brook. Wet trenching or boring through the aquifer is a polluting activity.

In its May 15, 2015 requirements concerning revised Resource Reports, the FERC requested regarding Resource Report 1 that the Section 1.3.2.1 (p.1-73) should include a discussion of any special measures that Tennessee Gas would use in rugged terrain to address potential issues such as erosion control, rocks rolling off of the right-of-way during construction, and post restoration slips and landslides. We are especially concerned with blasting and construction in the area of Pulpit Rock and Pulpit Falls, and with any potential erosion or shaking that may alter the historic landscape.

### **Respecting the Natural Resources and Economic Development of Winchester**

The current route of the pipeline could damage Winchester's economic development efforts. Damage to any of the natural or conservation areas in town threatens future town revenues from tourism. The Winchester Master Plan (2008) says, "The town is protective of its abundant natural resources, particularly its steep slopes, high yield aquifers and the streams, which directly feed the Ashuelot and Connecticut Rivers." (p.2) Potential business interests often try to tap into the tourism potential of Winchester.

The main natural resources for tourists include Pisgah State Park, Pulpit Falls and Pulpit Rock, the Snow

Brook conservation area, two covered bridges, the 177 acre Pied property easement with the largest black gum tree in Cheshire County, the Ashuelot River, Mirey Brook and Roaring Brook. Construction of a pipeline could damage our economic potential. One of the Economic Development Goals listed in the Master Plan (p. 4) is “Encourage development that focuses on the recreational and natural beauty of the town of Winchester and reflects the communities desire to preserve our natural resources.”

The Master Plan pages 116-117 focuses on Winchester’s natural resources. “The most striking characteristics are the preponderance of steep slopes and the large, high-quality aquifers. Together these two natural features have physically saved the town and have been determining factors in the location of villages, farms and working forests...Random development, modern technology, new building techniques, financial pressures on farms of all types, severe logging practices, and the encroachment of growth from more urban areas are only some of the immediate pressures on Winchester’s natural resources and the quality of life in the Ashuelot and Connecticut River Valleys.”

Presently and for at least the last one hundred years, the proximity of steep slopes to each other has been one of the most defining characteristics of Winchester’s rural character. These slopes protected wildlife and varied land cover. They provided wildlife corridors, which today enable Winchester to be home to as many wildlife species as the northern woods. These corridors, made possible by our rugged terrain provide for natural movement of wildlife and the genetic strength of both plants and animals associated with such migration. These sometimes-difficult slopes protect many sensitive plants and microorganisms simply by reducing human traffic...

“In addition to offering views from within and without, the interconnection of these steep slopes makes Winchester a destination for hunting, fishing, hiking, bird watching and all the other woodland recreational activities. These slopes even contribute to the area being a hawk migration route with updrafts, abundant small game, and good nesting cover... Breaking the connection of Winchester’s steep slopes to each other diminishes these benefits and threatens the rural character of the town. Once broken or interrupted, it is unlikely to ever be reestablished...

“Winchester has abundant ground and surface water. The town also has beautiful and integral wetlands that protect the aquifers. Unfettered development, pollution of high ground areas, over aggressive logging, run off from impervious surfaces, excessive road salting, more roads, more septic systems, and failed municipal treatment systems are some of the immediate threats to Winchester’s abundant water resources. Once lost or polluted, restoration is a long, difficult and expensive task. The town’s Aquifer Protection Overlay must be upheld and used to strengthen water quality control...”

### **Co-location Concerns**

The proposed pipeline in NH is described as a co-located route. In fact the pipeline itself will be parallel to existing electric transmission lines, not co-located with the power lines. The WCC requests the assistance of the FERC in understanding the science of parallel location and also the political aspects of parallel location. How close should a natural gas pipeline be to high voltage transmission lines? Is there a danger of electrical conductivity? What happens when the power line is struck by lightning? What happens if the pipeline explodes near a high voltage power line? What are the construction distances and repair distances needed by both the pipeline and the transmission lines? Other than possible reduced construction costs, what are the compelling reasons for locating parallel to transmission lines?

Why is parallel location considered better than an independent route? In the name of “co-location” the pipeline is marching through conserved areas and ecologically sensitive areas, relying on eminent domain to override conservation easements and state regulations.

In the name of “co-location” the pipeline route continues north and west from Massachusetts before heading east and south to the final destination of Dracut, MA. Shorter, more direct route exists to reach either Dracut or the NH transmission line crossing NH from west to east. Apparently the only reason to route the pipeline through the Town of Winchester is an arbitrary commitment to follow transmission lines.

Kinder Morgan asserted they are being asked to follow the transmission lines. Who is asking and why?

The existing electric transmission lines in Winchester impact more property owners than the proposed route. The existing power lines cross the Ashuelot River twice and Route 10 twice, cross a drinking water watershed for Hinsdale located in Winchester, cross Pisgah State Park, travel through a northern aquifer in Winchester before arriving at the location of the proposed route on the transmission line.

Wider swaths through forest are not necessarily better than separate swaths. In fact if easement corridors attract other easement corridors, the result is serious bifurcation of woodlands and animal habitat.

### **Conclusion**

A pipeline should not be routed through conserved land or near residential areas, including the watershed serving these residential areas.

A pipeline should be located in communities whose energy needs it serves. The proposed pipeline does not provide energy resources to Winchester. Given the net energy needs of NH, the state itself is being exploited to prevent the exploitation of Massachusetts and for the benefit of private corporations. There is no need for the pipeline route to come this far west and north given its functional destination of Dracut, MA.

There is no suitable route in the Town of Winchester given the widespread distribution of natural resource areas intermingled with town residents' homes.

Respectfully submitted,

Roberta Fraser, Chair  
Winchester Board of Selectmen

Gustave Ruth, Chair  
Winchester Conservation Commission

Washington, DC 20426

Tennessee Gas Pipeline Company, LLC, Docket No. PF14-22-000 NED Project

Dear Ms. Bose,

The Town of Andover is hereby submitting written comments under the Scoping Process for Tennessee Gas

Pipeline Company, LLC's (TGP) Northeast Energy Direct Project.

The Town of Andover, Massachusetts falls within the path of the proposed Lynnfield Lateral for the NED natural gas pipeline project. In addition to the construction and operation of the proposed pipeline, TGP has proposed the siting of one Mainline Valve Station (MLV) within Andover, and another on the Tewksbury/Andover town-line; as well as several temporary and permanent access roadways that will be used for the construction and maintenance of the pipeline. The Town of Andover has many concerns regarding the pipeline and the additional supporting facilities; including: environmental, public safety, the proposed co-location within existing utility Right of Ways (ROWs), and impacts to both private and public properties. We respectfully request that our concerns be addressed in the draft and final Environmental Impact Statements (DEIS/EIS).

### **Air Quality Impacts and Greenhouse Gas Emissions**

Please require a comprehensive assessment of the air quality impacts from the operation of MLV s. Include data demonstrating the chemical composition of the natural gas that will flow through the lateral pipelines. Include data on the frequency and duration of blow-down events during accidental releases, emergencies and scheduled maintenance activities. Also include in the comprehensive study dispersion modeling results to demonstrate air quality impacts downwind of the facilities, considering multiple wind directions, different times of day, and varying meteorological conditions.

Please address the applicability of Greenhouse Gas Emissions (GHG) regulations for the construction of the pipeline and the operation of MLVs, and provide pertinent discussion and quantitative data.

Also, please address noise impacts by demonstrating the baseline noise levels in the surrounding neighborhoods and the anticipated noise levels including frequency and duration of ML V blow-down events during accidental releases, emergencies and scheduled maintenance activities.

Please provide information regarding anticipated odors (nuisance or otherwise) that may be detected during ML V blow-down activities. Study the baseline odor thresholds for neighborhoods surrounding the ML V locations, and anticipated odor compositions and odor thresholds related to the operation of ML V s. Please provide answers to questions, including whether or not the natural gas contained within the lateral pipelines will have an added odorant to alert residents and businesses of close proximity to potential leaks?

### **Impacts/rom Temporary and Permanent Access Roads**

Please require detailed data and assessment of the environmental impacts (including but not limited to heavy equipment emissions, noise, and odor and dust mitigation) related to the construction and use of both temporary and permanent access roads. This information, in addition to easements required, impacts to wetlands and vegetation, stormwater management considerations, and data on the volume and frequency of machinery/vehicles must be included in the assessment.

### **Water Resources**

TOP is proposing to conduct a total 0[2700 feet of Horizontal Direction Drilling (HDD) under the Merrimack River for the Lynnfield Lateral originating in Dracut, MA. The Merrimack River is a public water supply for Andover and surrounding communities. We have concerns related to but not limited to the following: siting of the pipe staging and storage areas for drilling mud and borehole cuttings, potential for stirring up sediments during drilling activities, disposal of fluids and cuttings from drilling activities. We respectfully request that complete and comprehensive assessment be completed.

Fire hydrants and other sources of water are proposed to be used for hydrostatic pressure testing of the pipeline, once it has been installed. The EIS must include details regarding the volumes of water required for hydrostatic testing, the specific locations for water withdrawal and disposal. Additionally, the quality of the water after water has sat

in the pipes should be tested to confirm non-contamination before it is discharged. The discharge locations also need to be presented to assess potential impacts to receiving land/wetlands or other water bodies.

## **Public Safety**

Our public safety officials are concerned about road closures, detours, and details that will be required during pipeline construction.

Once the pipeline facilities are operational, public safety officials have concerns related to the volume of natural gas that will be transported and the gas pressure. Additionally, please provide a plan with specific detail on who will provide and finance first responder training.

### **Co-location with Existing Rights-of-Ways (ROWs)**

TGP states that 84 percent of the NED project will be co-located with existing utility corridors including interstate gas pipelines and powerline rights-of-way (ROWs). However, in Section 3 of the recent Resource Reports, TOP states that they have engaged in discussions with the power companies regarding co-location and the proposed overlapping of NED project temporary and permanent easements with that of existing powerline easements and the discussions are ongoing. What will happen if one or several utilities do not grant permission for co-location? TOP must be required to evaluate the impacts for potential alternate routes, in preparation of co-location not being a viable option.

## **Property Impacts**

An undetermined number of residential and commercial properties will be negatively impacted by the pipeline construction and operation. For example, Table 5.5-1 of the Resource Reports issued on July 24, 2015 lists locations by milepost designations where there may be residential and commercial buildings within 50 feet of the pipeline, yet details such as building type, line/tract # are all "TBD." Why are buildings only within 50 feet listed? If TOP presents a 400 foot alignment of the pipeline route, why is that distance not used as a minimum for potential impacts? Additionally, the potential exists for damage to private septic systems and drinking water wells due to the proximity of construction easements and pipeline location. Table 5.5-2 of the Resource Reports issued on July 24, 2015 notes two possible locations in Andover where private wells and their protected area are within 200 feet of the pipeline and construction easements, but the details are lacking. Please require a full assessment of potential impacts to drinking water wells from all aspects of construction as well as the operation of the pipeline, including natural gas leaks below ground; and, include a complete presentation of how such occurrences (damage and/or contamination from construction and leaks) will be mitigated.

Review of the "Residential Site Specific" Plans presented in the Resource Reports issued on July 24, 2015 show construction easements within distances of 6 feet to 32 feet of residential homes and other outdoor structures. Temporary workspace easements are

located in the front yards of residential homes. Consider the hugely negative impacts to these homeowners with construction equipment in their yards. Please require a thorough presentation of how air emissions, dust, noise, odors, and stress will be addressed and mitigated. Consider the impacts to property values, where a 24-inch diameter natural gas pipeline, transporting gas at 1460 psi exists; as well as the inconvenience and restrictions on property use. Please provide substantiated data to support the TGP's claims that the proposed project will have negligible impacts on residential property values and their marketability. Request that TOP disclose a list of right-of-way use restrictions that may apply to the pipeline easement which may impact property values.

Please include in the DEIS/EIS the documents to support the potential insurance impacts of the project on private property owners including an assessment on whether property owners will have difficulty purchasing insurance due to the presence of the pipeline.

Furthermore, evaluate the liability exposure for every municipality along the pipeline and determine municipalities affected by the proposed project including abutting communities. Require TOP to list affected communities as additional insured's on their liability insurance policy and provide to each affected municipality a copy of the insurance policy with the affected municipality listed as an additional insured.

## Protected Open Space, Wetlands and Endangered Species

The preferred pipeline route will impact significant environmental resources.

Please consider the cumulative effects of damage to permanently protected open space, rare and endangered species habitat, and natural and cultural resource areas.

Thank you for the Federal Energy Regulatory Commission's thoughtful consideration of our concerns and issues with the Tennessee Gas Pipeline Company's Northeast Direct Energy Project.

Sincerely,

Lawrence J. Murphy  
Interim Town Manager

### 20150827-5239

Richard P Murray, Nassau, NY.  
Socio - Economic Issue --

Please investigate who will actually own the pipeline and/or the compressor stations. If you find that an LLC company owns any of this infrastructure, then you MUST reject this proposal, as the public and adjacent neighbors will not be protected if an accident occurs. Having an LLC company as the owner significantly decreases their liability, both corporately as well as officer personally. Do not allow this to happen.

Thank you.

Richard P. Murray

Re: Tennessee Gas Pipeline, LLC., Northeast Energy Direct Project (NED); Docket No. PFI4-22-000 Scoping Comments

Dear Ms Bose:

Thank you for the opportunity to submit comments on the Notice of Intent to Prepare an Environmental Impact Statement (EIS) for the Planned Northeast Energy Direct Project (NED).

Health Care Without Harm (HCWH) is a Massachusetts-based, global non-profit <https://llnoharmuscanada.org> working with thousands of hospitals and their supply chains to transform the health sector nationwide and worldwide, without compromising patient safety or care, so that it becomes ecologically sustainable and a leading advocate for environmental health and justice. Some of HCWH's most ambitious efforts focus

on energy efficiency, renewable energy and climate change at a local, regional, national and international level. We work with the biggest health care systems and hospitals around the region and nationally to reduce energy use and GHG emissions for hundreds of millions sq. ft. of complex hospitals, laboratories and related medical facilities. HCWH's Senior Advisor for Energy & Buildings, Paul Lipke, is also a landowner within the proposed NED pipeline route's impacts in Montague, Massachusetts.

**Put most simply, Health Care Without Harm urges FERC to do its job properly and ensure the EIS accurately assesses NED's full projected environmental impacts with on-the-ground natural resource mapping of the entire route and assessments conducted by disinterested 3rd party experts. We urge FERC to insist the EIS consider lower impact no pipeline alternatives. We further urge FERC to require the EIS also assesses NED's environmental health impacts and costs.**

**Our estimates of NED's health impacts, the unsubstantiated need, and other factors outlined below indicate NED cannot legitimately be granted a certificate of public good.**

FERC needs to ensure NED has the minimum impact on the environment at the lowest possible cost. Environmental impacts include but are not limited to air quality, water resources, water quality, visual, noise, safety, electromagnetic fields, and land use issues, as well as alternative means of meeting a proven need for additional energy resources.

This sounds straight-forward enough, except that the entire energy infrastructure project development and approval process is both cut into silos so that no-one takes responsibility for the whole, and biased in favor of large 'simple' projects over initiatives that can deliver more benefits using multiple wedge strategies, such as on non-transmission, non-pipeline alternatives. Furthermore, while "public health" is notably absent from the above list of environmental factors, it is obvious FERC would not care about air, water, noise, and other issues if these had no impact on health, on community quality, and costs.

As this document will demonstrate, burning natural gas is injurious to human health, causing premature death, chronic bronchitis, asthma and more, so **we ask FERC to require the NED EIS to specifically address the health impacts of pipeline construction, operation and maintenance, and the emissions from burning NED gas by end users.**

In considering this request, first please consider the situation we face as a health care organization and as a key sector: **Health care is on the front lines of environmental, energy and climate issues** due to:

- Our mission; we are the only sector sworn to "First do no harm." Energy and climate have deep impacts on public and individual health, and ...
- Because extreme weather events, air quality and other factors impact facility operations and clinical services at the same time we are reinventing ourselves to deliver care more effectively and efficiently, and with much greater emphasis on prevention, and ...
- Our own facilities' and supply chain's energy intensity, and ...
- Energy is our biggest cost after labor and pharmaceuticals.

Health care costs are 18% of GDP. Health care has been estimated to generate 8% of the nation's commercial and industrial sector's greenhouse gas emissions. As of 2013, health care in MA spent about \$580 million on energy costs. In Massachusetts and Boston, health care is largest employer (454,000 / 100,000 respectively), and Boston's largest real estate holder with over 23 million owned square feet (much more is leased). While statewide health care energy consumption figures are not available, Boston health care consumes about 700 million kWh, 8.6 million therms of natural gas, 82 million ton/hours of chilled water, and 2.7 MBtu of steam annually, and that doesn't include significant leased space.

**With this energy profile, you might expect the health care sector to be strongly supportive of NED, and bringing more gas to the region, but health care has many reasons to assert the primacy of public health concerns, energy/GHG reductions, and to oppose Northeast Energy Direct Project (NED) and other pipelines sized to over-supply our region.** These interconnected, overlapping reasons include:

1. Public health impacts from individuals, to communities, the state, region, nation and world,

2. Its contribution to dangerous, rapid climate destabilization and significant GWSA compliance costs compared to energy efficiency and other wedge strategies,
3. Its poor value in light of integrated, longer term regional strategies, especially more cost-effective nonpipe alternatives,
4. Unnecessarily high costs for health care, businesses, communities and citizens, particularly as the result of exposure to global market prices, lack of price hedging, and the already-increasing reverse flows of Marcellus gas from east to west,
5. The direct environmental impacts of construction and operations,
6. Highly questionable industry and federal assessments of Marcellus shale (and other) natural gas production.

1) Based on the material below, we urge **FERC to insist the NED EIS include a rigorous analysis of environmental health, climate, and public health impacts in its scope, based on current, peer-reviewed science by disinterested third parties. The EIS should include, at a minimum, the number of health incidents per ton of emissions for particulate matter (PM 2.5), sulfur dioxide (SO2), nitrous oxides (NOX), mercury (Hg) and global warming health impacts, as well as these incidents' medical costs to treat and societal costs. Whether KMINED provides this analysis or not, we urge the FERC to consider such incidents and costs in its deliberations and decisions.**

**Natural Gas' Public Health Impacts** can be estimated using the Healthcare Energy Impact Calculator (EIC) [www.eichealth.org](http://www.eichealth.org), which is widely used and respected in health care, and based on data from US Environmental Protection Agency, the US Department of Energy and peer-reviewed environmental health science. HCWH's EIC version 2.0 (screenshot below, in FIGURE 1) shows some annual health impacts of emissions from burning NEDs gas in the cleanest burning turbines. Less efficient equipment will generate more harm.

What then, are the health and cost factors that need consideration? **NED gas consumption will annually cause many thousands of premature deaths, chronic bronchitis, hospital emergency room visits, asthma attacks, respiratory symptoms, lost work days, and mercury-related incidents, as well as many other harms.**

**Every year, these will cost the Commonwealth and other places the gas is burned at least 71 cents per MMBTU in societal costs, and 8 cents per MMbtu in direct medical treatment costs, or around \$600 million and 65 million dollars respectively.**

#### FIGURE 1

From EIC v2.0: Some (but not all) annual health impacts of burning NED pipeline's proposed 2.2 Bcf/day.

*{chart omitted}*

These sobering numbers omit the health, environment, water quality and climate destabilization impacts and costs of fracking itself, compressor stations, and related pipeline infrastructure during both construction and operation.

2) **We urge FERC to insist the EIS evaluate NEDs impact on climate destabilization, including the huge impact of methane leaks in fracking, gas transport, compression, and delivery. We support full and rapid compliance with federal executive branch green house gas reduction goals, and so assert the FERC must not support NED unless FERC can demonstrate how it can reconcile using and transporting that much natural gas and federal executive compliance, with respect to both emissions and costs.**

Clinically speaking, it is impossible to have healthy populations on a sick planet. The World Health Organization estimates climate change is already causing 150,000 deaths/year worldwide. That says nothing of the non-mortal health impacts, such as many injuries, and those listed above. NED gas' estimated Global Warming Potential of over 99 billion pounds cannot be ignored. And, from a health care mission/

public health point of view, the location of the harmed people is irrelevant.

The Hippocratic Oath says, “First do no harm.” There is no geographical limit in that oath, no exemption because those harmed might be beyond immediate sight. We find it morally unacceptable to disregard health impacts and costs that might be incurred elsewhere, i.e. from gas fracked or burned out of state. There are also moral, spiritual, mission and legal dimensions to our stewardship, just as there are to the responsibilities of all public servants.

Massachusetts Institute of Technology modeling shows that **natural gas is grossly over-valued as a low greenhouse gas “bridge fuel”** when methane and other decay rates are properly accounted for. The MIT study, referenced below, further says, **“While the climate impact of natural gas is initially about 50% that of using coal, within three decades it grows to 75% ... the new analyses demonstrate the importance of getting to the other end of the bridge relatively soon.”**

<https://mitei.mit.edu/news/assessing-climate-impacts-energy-technologies>. In addition, on August 4, 2015 the New York times reported on a new peer-reviewed study, “Methane Leaks May Greatly Exceed Estimates, Report Says: A device commonly used to measure the methane that leaks from industrial sources may greatly underestimate those emissions, said an inventor of the technology that the device relies on.” The actual study is at <http://onlinelibrary.wiley.com/doi/10.1002/ese3.81/abstract>

And while there are those who will argue that NED and other pipelines merely transport what drillers produce, and that such considerations are outside a given entities’ jurisdiction, we can only ignore the many interconnections at our serious peril. The Lancet Commission, perhaps the world’s most authoritative medical organization and publication, wrote in June, 2015:

*“A siloed approach to protecting human health from climate change will not work ... the time when fuel switching could decarbonise the global economy sufficiently quickly to avoid dangerous climate change has almost certainly passed. It is increasingly difficult to justify large-scale investment in unabated gas-fired infrastructure.”* -- “Health and climate change: policy responses to protect public health” -- <http://www.thelancet.com/commissions/climate-change-2015>

*Such impacts (and their interactions) are unlikely to be trivial and could be sufficient to trigger a discontinuity in the long-term progression of humanity. Whilst the poorest and most vulnerable communities might suffer first, the interconnected nature of climate systems, ecosystems, and global society means that none will be immune. **Indeed, on the basis of current emission trajectories, temperature rises in the next 85 years may be incompatible with an organised global community.*** -Ibid

And Vivek Murthy, US Surgeon General, said in June, 2015 at the Whitehouse Summit on Climate and Health, in which HCWH was a key participant, “Climate change is a current and pressing threat to human health. “

**We urge the FERC not to put NED and other oversized gas pipeline projects’ stakeholders’ profits ahead of a stable climate that can support the well being of our citizens, especially our most vulnerable children, elders and the poor.** We urge you not to impose, however unintentionally, substantial health costs at a time when we are all trying to bend that cost curve downward. The FERC, operating under an administration that has successfully begun to drive the health care sector **to focus much more on community health improvement, prevention, and more cost-effective, systemic analysis, cannot and should not ignore such costs and impacts.**

Market forces dictate that if NED and other climate-risky efforts are scaled back, slowed, or rejected in light of such huge risks, production rates will respond.

**We support full and rapid compliance with Massachusetts’ Global Warming Solutions Act, and so assert FERC cannot support NED unless it is able to demonstrate how it can reconcile using more natural gas with GWSA compliance, with respect to both emissions and costs.**

FIGURE 2 below shows the share of New England’s combined annual greenhouse gas ‘budgets’ that emissions from various proposed additional natural gas pipelines would consume. Acadia Center wrote

of their graph

*“These ‘budgets’ represent the greenhouse gas emissions that states can produce and still achieve statutory targets. Current (2013) levels of natural gas combustion for heating, power generation, and industry would produce emissions in excess of the region’s entire greenhouse gas budget in the year 2050. This means that without any increase in pipeline capacity, natural gas alone would eat up the region’s entire greenhouse gas budget, leaving no allowable emissions for transportation, industry, heating oil, or propane. Assuming similar utilization rates for new pipeline capacity, the already approved Algonquin Incremental Market and Tennessee Gas Pipeline expansions due to come online in 2016 would consume a greater portion of this budget. Access Northeast would cause the region to exceed the emissions budget in 2045, and be 42 percent over budget in 2050. If Northeast Energy Direct is also constructed, the total regional greenhouse gas budget would be exhausted in 2039, and emissions from natural gas alone would be 103 percent over the binding targets that states have established.”*

*{graph omitted}*

And, even if compliance can somehow, miraculously, still be achieved without leaving this gas in the ground, Dr. Stanton’s testimony on MA DPU docket #14-86 shows in FIGURE 3 below, it cannot be cost effective compared to many alternatives. Massachusetts marginal abatement cost curve for GWSA compliance in 2030 is:

FIGURE 3

*{graph omitted}*

Stanton’s graph demonstrates not only energy efficiencies’ and renewable energy cost-effectiveness, but as demonstrated above, they are essential to the health and economic well-being of the citizens FERC is sworn to protect, and to health care cost containment.

3) There is much evidence that the ‘need’ for more gas is being overstated by those with undue financial and/or political interests in natural gas infrastructure and sales. FERC needs to consider integrated, longer term regional strategies, especially more cost-effective non-pipe alternatives. **We urge FERC to insist the EIS compare the natural resource and environmental health impacts of NED compared to far more modest pipeline expansion (if any) in light of:**

- a. If it is proven to be truly needed after examining optimization and recognizing the synergies of market reforms’; demand response; energy efficiency’; grid modernization; the winter reliability program; storage; and aggressive, substantial reductions in leaks from existing natural gas extraction and delivery systems, and
- b. If any new infrastructure has been re-sized to meet the region’s long term energy forecast, based on the efforts listed in 3a above, and a thorough, balanced, integrated assessment such as the one scheduled for completion in October by the Analysis Group, under the direction of Massachusetts Attorney General Healey, and
- c. After factoring in the substantial risks inherent in the huge over-estimation of Marcellus shale resources which are projected to peak as soon as 2018, as outlined below, and
- d. Factoring in growth in island-mode-black- start CHP to support greater resilience for critical facilities and district energy systems, and,
- e. If there is no rate-payer tariff covering the risk and enhancing the profit margins of developers, and selfdealing utilities, especially if any portion of the gas is exported, and
- f. The LDC’s are required to re-calculate their petitions based on honest assessments, not inflated and conflated projected demand of unnamed customers, doubling of forecast time period, etc. and
- g. It uses, to the greatest extent possible, existing infrastructure and rights of ways (which NED doesn’t, since transmission line ‘co-location’ has been shown to actually mean significant damage to large, parallel strips of land), rather than building an entirely new pipeline that will devastate more than 100 miles

of MA green space and communities, with much of that land being of irreplaceable value to our communities' economic, social and environmental health, and

h. If Massachusetts and the other New England states can still meet our statutory greenhouse gas emission goals, and if not, demonstrate how quickly and at what cost we would later have to reduce gas usage to meet our increasingly challenging emissions goals, and

1. FERC has rescheduled the EIS comment period to permit adequate time for review and comment on the EIS 6700+ pages, after KM has filled in the 10,000 "TBD's" and other missing information.

**4) We urge the FERC to reject NED and other export-dominated projects due to the lack of price hedge/mitigation, and high costs compared to other strategies.** There are three parts to this argument:

- Exposure to export market's prices will drive up our energy costs and send more money out of state, and ...
- The impacts of reverse flows, from East to West, of Marcellus production in both existing and proposed new pipelines, and ...
- FERC would effectively be denying the region the opportunity to pay for more inexpensive, or even negative energy costs for better alternatives, and thereby would impose on every household, business, municipality and agency in the region far more expensive energy and patient care costs.

It has been estimated as much as 85% of NED gas would likely go to export markets. Any significant exports would expose this region's natural gas prices to global markets, which must result in much higher prices. Pro-gas stakeholders endlessly repeat the mantras of need and lower prices, but there is US government evidence, as well as the success of the Winter Reliability Program experience to demonstrate the contrary.

To quote CommonWealth Magazine” “ ... data from the EIA [FIGURE 4 below] shows that in the winter of 2014, natural gas prices in Pennsylvania - the heart of Marcellus Shale supply- spiked to heights similar to those we saw in New England markets.” No amount of additional pipeline capacity will protect us, not when the government's own evidence shows buyers a stone's throw from the wellhead are not shielded, and not when many market actors have stated they are positioning themselves to export the gas to far more lucrative markets if NED is built. On the contrary, as stated, exposure to global markets will drive up regional natural gas prices.

FIGURE 4

*{graph omitted}*

Finally on this matter, **we point out that energy is much cheaper than medical care per unit of service. The average MA household spends about \$2700/year on building-related energy”, that's less than 1/6th of their employer-based health care premium, if they are lucky enough to have it”.**

The Commonwealth will be far smarter to pay the negative costs of more aggressive, deeper energy efficiency with its 3: 1 cost benefit ratio, or even modest first-cost premium for renewable energy (if any) with their huge lifetime economic, climate, social and health benefits before imposing \$4-6 billion more in tariffs for NED and similar fossil fuel infrastructure that will send even more money out of state, and even out of the US. Energy spending going out of state was over \$22 billion/year in 2008<sup>vi</sup>. A region-wide, World War II level, sustained public awareness campaign to save energy could be funded with pennies on those dollars, and to far greater effect and benefits.

**5) We urge the FERC to ensure the EIS studies the entire route in detail, with on-the-ground surveys because aerial photographs and GIS blocked by tree canopy and other growth have been demonstrated to miss important wetlands and other fragile resources. Ground surveys must assess impacts such as:**

- Wetlands, waterways, aquifers, public and private wells and septic systems,
- Any pollution to air, soil and water from natural gas and/or fracking chemicals, and their proximity and

effects to human, animal and plant populations,

- Any rare or Federally endangered species such as the Northeastern Bulrush, *Scirpus ancistrochaetus*, which is listed as being present in Montague, as well as other “listed,” or exemplary flora, fauna or natural communities,
- Streams and other waterways that support human uses, whether recreational or as drinking water
- Certified and certifiable vernal pools and analysis of the means by which damage would be avoided or mitigated,
- All temporary work zones and staging areas used during construction, the pre-construction condition of these areas and plans for restoration and mitigation of damages incurred during construction,
- Sources of water to be used for hydrostatic testing during the construction process and how such water sources would be replenished or restored, and
- Clean-up of water used in testing, and potential impacts of run-off from the testing process.

**The EIS also needs take into account**, in assessing project construction and operations, the new University of Massachusetts study which determined NED would disproportionately negatively impact Franklin County’s ecosystems. This is not ‘just’ about endangered species and vital habitat; the impacted areas are vital walls of the foundation of our public health. They deserve continued protection, doubly so since the state and others have spent a lot of money and resources to do so! <https://ag.umass.edu/current-issue-reports>

#### **6) We urge FERC not to base decisions on highly inflated, industry and federal assessments of Marcellus shale (and other) production.**

Even US Energy Information Agency staff acknowledged its own over-rosy forecasts in response to the multi-year, multi-million dollar study led by University of Texas <http://www.nature.com/news/natural-gas-the-fracking-fallacy-I.16430>.

Respected energy geologist David Hughes extraordinary publication “Drilling Deeper,” (October, 2014) takes a hard look at shale development prospects nationally and by region, over decades. This careful science that throws serious doubt on the wisdom of building a lot more gas infrastructure: <http://www.postcarbon.org/publications/drillingdeeper/> In addition, Hughes’ latest publication, released in early August, 2015 is “Revisiting the U.S. Department of Energy Play-by-Play Forecasts through 2040 from Annual Energy Outlook 2015” <http://www.postcarbon.org/shale-gas-reality-check1> **Hughes projects Marcellus shale to peak in 2018.** He writes,

*“The EIA’s Annual Energy Outlook 2015 is even more optimistic than the AE02014, which we showed in Drilling Deeper suffered from a great deal of questionable optimism. The AE02015 reference case projection of total shale gas production from 2014 through 2040 is 9%, or 36 tcf, greater than AE02014.*

Cumulative production from the major plays in AE02015, which account for 80% of this production, is 50% higher than Hughes’s “Most Likely” case in Drilling Deeper, and the projected production rate in 2040 is 170% greater. In AE02015, the EIA is counting much more on unnamed plays or ones -like the Utica Shale- that aren’t as yet producing very much shale gas.

- *The only way to meet projections for most of these plays would be for production to ramp up massively years from now. But because the best wells are drilled first, and decline rates are so steep, this means that the EIA is likely counting on new technologies that aren’t yet proven or even developed.*
- *It’s very difficult to see how unknown new technologies would be brought online, and be sufficient to overcome poorer and poorer quality drilling locations, without the price of natural gas going up well beyond what the EIA forecasts.*
- *As it has acknowledged, the EIA’s track record in estimating resources and projecting future production and prices has historically been poor. Admittedly, forecasting such things is very challenging, especially as it relates to shifting economic and technological realities. But the below-ground-*

*fundamentals- the geology of these plays and how well they are understood don't change wildly from year to year. And yet the AE02015 and AE02014 reference cases have major differences between them; production rates have been revised both down and up by amounts exceeding 40% in some plays. "*

An introduction to Hughes' work is highly relevant:

*"After closely reviewing the Annual Energy Outlook 2015, David Hughes raises some important, substantive questions: Why is there so much difference at the play level between AE02014 and AE02015? Why does Marcellus production surge post-2025, rising to a new all-time high by 2040? Why does Haynesville production surge beginning in 2016, rising to a new high that is triple current production rates in 2038? How can Eagle Ford production reach a plateau in 2021 and remain on it for the next two decades?"*

*America's energy future is largely determined by the assumptions and expectations we have today. And because energy plays such a critical role in the health of our economy, environment, and people, the importance of getting it right on energy can't be overstated."* FIGURE 5 below is from page 5 of "Revisiting ... "

While beyond the scope of this document, we assert it is unwise and immoral to saddle Massachusetts and the region with huge risks and costs on the tenuous assertion that there is so much gas available that exports from NED (and similar) to Europe can weaken Russia and Putin's leverage. Such a strategy ignores key facts: a) the questionable size and availability of the resource, b) as stated above, human society as we know it may be seriously damaged if we don't leave this, and a lot of other carbon, in the ground. --In this case, Putin and Russian hegemony will be the least of our problems, c) the strategy is fraught with serious risks, even likely failure since politics and circumstances can and will change FAR more deeply and rapidly than this export market will develop. We'd be building this capacity 'on a wing and a prayer.'

## 2.1 MARCELLUS PLAY

Figure 4 illustrates the AE020 15 reference case forecast for the Marcellus compared to AE02014 and the "Most Likely" drilling rate from Drilling Deeper. In AE02015, the Marcellus is forecast to produce 32% of all shale gas production from 2014 to 2040,

*{graph omitted}*

Figure 4. Marcellus production for the "Most Likely" drilling rate forecast from Drilling Deeper compared to the EIA's AE02014 and AE02015 forecasts.

Also shown are the cumulative wells that would have to be drilled for the "Most likely" drilling rate.

The AE02015 projection almost perfectly parallels my "Most Likely" forecast until 2023, when it ramps up to a new all-time high. In 2040, Total projected production is up 20% over AE02014 and 22% above my "Most Likely" forecast. Some observations:

- Given that the average well quality in the Marcellus has been shown to be in decline all the sweet spots, as well as in the Marcellus plays as a whole, the AE02015 forecast lacks credibility, especially at the EIA's forecast gas prices.
- The only way production could begin to grow post-2023 is with a massive ramp up in drilling which, given declining well quality, would require much higher prices.
- Drilling rates in my "Most Likely" forecast, which projects a 4-fold increase in producing wells, would see some 25,000 remaining drilling locations by 2040, although these would be the lowest-productivity locations in the play. Ramping up production as projected by AE02015 would see locations exhausted by this time, given the drilling rates required, setting the stage for a production collapse.
- The drop in drill rig counts in the Marcellus (63 in June 2015 vs. 143 in January 2012) has impact-

ed drilling rates, despite greater efficiencies, and hence may cause the Marcellus to peak sooner at a lower rate than my “Most Likely” forecast. A wild card, however, is the large number of drilled but not connected locations. which will provide a buffer from falling rig counts for a few months.

In closing, we add:

**Support for a business-as-usual NED EIS by FERC will amount, at least in part, to condoning a plan to delay and/or discourage many more cost effective solutions for at least 31f2 years, and some indefinitely. This is simply ridiculous.** A realistic EIS cannot support the construction of major new pipeline infrastructure along entirely new routes.

**We have gotten ourselves into the current energy and climate mess by making many, too narrow, siloed decisions that fail to address systemic problems. FERC can do better; we are counting on you to be and act smarter.**

Please avoid repeating prior errors in judgment. **Never forget that it is scientifically and medically impossible to have healthy people and communities if we continue to destroy the foundations of human health --our land, air, water and other natural resources-- however unintentionally or regrettably for short term gains. Please consider the health impacts and costs.**

Please don't hide behind some conveniently narrow interpretation of your jurisdiction and what is considered relevant. FERC must consider other pending related decisions, and NED as a whole. We FERC to oppose NED.

FERC's decisions, in cases like this one and many others, can help all of us make choices that advance the public health, create more local, good paying jobs, help our economy, diversify our energy supply and decrease our energy costs and dependence on fossil fuels. Please make decisions that set the region and the country on a better path. Please insist on a rigorous, comprehensive EIS that includes health and climate impacts.

**Please oppose NED and other new oversized gas pipelines as a first step to a better future. In dozens of coming determinations as well as this one, FERC can help the nation speedily get to a better, more energy efficient, renewable energy future with robust demand response, a modernized grid, and true market reform.**

We assert, regretfully, that anything less constitutes dereliction of duty and a violation of the public trust. Please make this letter part of the official record. Thank you for your time and consideration.

Peter Jeffrey, Groton, MA.

For the record here are my comments from the scoping hearing held in Lunenburg MA on August 12 2015.

While reading you may want to play a stirring rendition of the Battle Hymn of the Republic to fully capture the passion these words convey.

My name is Peter JEFFREY SPELL Groton, MA

Thank you for your service to your country in your role as a FERC employee and for coming here this week to better understand the great number of issues you have heard in these hearings that you need to use to make your decision. To that decision I have a few observations I feel warrant repetition.

First: What is an alternate route?

There are great similarities between the primary and the alternate routes in this application. Every one of the arguments against this application apply to both the primary and alternate routes. Both routes endanger citizens, destroy precious environment, impose a tax to pay for a utility that the payee may never have access to, and take private property for the financial gain of a private, for-profit industrial giant. The only way that the alternative route and primary route are different can be seen in this crowd tonight. If this hearing was held last summer, based on the initial application when the main-line ran directly through the most of the communities in this area, this room would be full of outraged residents very similar to your meeting last night. By calling that route an alternate only the most dedicated opponents understand that your decision could easily make it again a primary route. Thus you only see here tonight the most dedicated opponents to this application who have not been lulled to sleep with a false sense of security. The question is not where this pipeline will go the question is whether this pipeline is needed at all.

Second: Who says we need this pipeline?

You have heard many times in great detail what many people see, including one of the FERC commissioners, one of your bosses, as illegal market price manipulation in the forward facing auction. How can anyone be sure that the data used to justify this pipeline is not corrupted by greed and influence if even a senior FERC leader believed the result was invalid and should not be upheld? It is up to you FERC to expose any possible corruption of this data! I pray you have the guts to do what is right and call for congressional hearings to look into the actions taken by ISO New England, FERC, and industry when market pricing was set for energy in New England in the forward facing auction. That flawed auction is why a large corporation sees an opportunity for huge financial gain by preying on the hopes of the residents of New England that a pipeline would lower the costs of energy and bring jobs into the region. Anyone with a basic understanding of economics would realize immediately that the gas this pipeline could carry would be much more valuable if it reached the Canadian Maritimes. Therefore the idea that this pipeline will drastically reduce the costs of energy is fundamentally flawed. As for jobs unless the region enters into a continuous perpetual cycle of pipeline construction any incremental jobs this application will create will be very short lived which can be seen in the proposed rapid construction schedule. Also the idea that a large number of jobs will employ local workers is flawed. Last month our family traveled cross country with our camper. In every campground

we visited in an area with pipeline construction, we found it was filled with pickups carrying large welding machines pulling fifth wheel trailers all with license plates from either TX, LA, and OK. I invite the union employees here tonight to seriously ask their leaders how many jobs will be offered to local employees and how many will be filled by transient, but more experienced workers, who require less training time and therefore offer a lower cost. It is up to you, the public servants of the citizens of this great country, conceived in this precious and historic region, to stand up to a corporation with unlimited resources and confirm the flaws in this application and make the only logical decision and deny this application.

Northeast Energy Direct Project - PL Alternate I

FERC Docket Number PFI4-22-000 as the Northeast Energy Direct Project

RE: Draft Environmental Report, Resources Report 10, Alternatives

Dear Ms. Bose:

This letter examines statements by Tennessee Gas Pipeline Company, L.L.C. (herein "Tennessee") in its Draft Environmental Report for the Northeast Energy Direct Project (herein "NED"). Tennessee has simply not made a case for necessity based on demand. I urge the FERC not to issue a Certificate of Public Convenience and Necessity required for the project to proceed as this pipeline is not needed.

### ADDRESSING NECESSITY

In late 2013 all six New England Governors and all twelve New England US Senators asked for more energy for New England - please see Annex A for these letters. The emphasis of both letters was on natural gas and electricity. Over the last ten plus years New England has retired numerous coal and coal/oil electricity generators. In some cases these capabilities have been replaced with natural gas as the energy source. This has created stress on the natural gas delivery system in New England particularly in the winter time.

The winter time energy balance in New England is very dynamic. Fortunately, the FERC has provided' a succinct summary of this complex situation. "This slide (please see Figure 1 on page 2) shows monthly natural gas demand for New England since the winter of 2012. with a forecast through the next three winters and the historic seasonal norm. Last winter New England avoided significant spikes in natural gas demand. despite high residential and commercial demand Various other sources of generation including oil and coal. plus power imports. helped reduce natural gas demand from New England power generators by 20%. This in turn reduced total natural gas demand to around the same level as the prior three warm winters of about 3.4 Billion cubic feet per day (Bcfd). This winter natural gas-fired plants will have to make-up for generation lost from the retirement of some non-gas-fired units ."

**{2 pages with graphics + discussion of TENNESSEE SYSTEM ALTERNATIVES not OCR compatible, omitted}**

*{page with graphic + discussion of Alternate Electricity Supplies not OCR compatible, omitted}*

### EXECUTIVE SUMMARY

What is needed in New England is an additional 0.75 Bcfd of natural gas or equivalent. What is coming without the NED is 1.263 Bcfd, almost two times what is needed. Tennessee never discusses the actual de-

mand for the NED which is the heart of necessity.

## CONCLUSION

The most likely natural gas and electricity equivalent demand scenario in New England, as provided by the FERC, is in the range of 0.75 Bcfd. Natural gas and electricity projects that have been approved or are imminent for New England will supply an additional equivalent of 1.263 Bcfd of natural gas. The demand is easily accommodated by the projects spelled out herein by a factor of almost 2. Therefore, the FERC should not issue a Certificate of Public Convenience and Necessity required for the project to proceed as there is no necessity.

Sincerely,

Patrick J. Leary 8/21/2015

1 Winter 2014-15 Energy Market Assessment, Item No. A-3, October 16, 2014.

Northeast Energy Direct Project - PL Alternate 2

FERC Docket Number PFI4-22-000 as the Northeast Energy Direct Project (aka the NED)

RE: Tennessee Gas Pipeline Company FERC filings in support of the NED

Dear Ms. Bose:

This letter examines statements by Tennessee Gas Pipeline Company, L.L.c. (herein "Tennessee") in its Documentation for the Northeast Energy Direct Project (herein "NED"). Tennessee has simply not made a case for necessity based on demand to put a pipeline in New Hampshire. I urge the FERC not to issue a Certificate of Public Convenience and Necessity required for the project to proceed as this pipeline is not needed in New Hampshire. This pipeline is desperately needed in Massachusetts, stick it there.

### ADDRESSING NEED

In late 2013 all six New England Governors and all twelve New England US Senators asked for more energy for New England - please see Annex A for these letters. The emphasis of both letters was on natural gas and electricity.

The winter time energy balance in New England is very dynamic. Fortunately, the FERC has provided] a succinct summary of this complex situation. "This slide (please see Figure 1 on page 2) shows monthly natural gas demand for New England since the winter of 2012, with a forecast through the next three winters and the historic seasonal norm. Last winter New England avoided significant spikes in natural gas demand, despite high residential and commercial demand. Various other sources of generation including oil and coal, plus power imports, helped reduce natural gas demand from New England power generators by 20%. This in turn reduced total natural gas demand to around the same level as the prior three warm winters of about 3.4 Billion cubicfeet per day (Bcfd). This winter natural gas-fired plants will have to make-up for generation lost from the retirement of some non-gas-fired units. "

Washington, D.C. 20426

August 21, 2015

Dear Secretary Bose:

I am submitting this letter of comment as a Montague resident living within several miles of the proposed Kinder Morgan Tennessee Gas Pipeline Company's Northeast Energy Direct (NED) project, No. PF14-22. Though I am sending comments ostensibly within the environmental scoping review process for the NED project. I want to first echo a letter of comment submitted by Elaine Mroz, of Lunenburg, MA, who raises the larger and more important question of where in FERC's public input process affected parties are given an opportunity to submit comments about the "need" for the pipeline and the public impact such a project may have beyond immediate environmental concerns.

I share Ms. Mroz's request that this project be examined in the context of larger concerns, "needs" and impacts. Is the added, cumulative natural gas capacity that NED and other proposed pipelines in Massachusetts and New England necessary? Many analyses suggest that the gas capacity of the NED pipeline alone is much larger than local and regional demand and that the 'proposed cumulative capacity is unnecessary and will have too many negative local and global environmental impacts.

The pipeline is likely to commit communities that receive this 'natural gas' to long-term use of a climate impacting fossil fuel, one that is under increasing scrutiny by the federal government for its methane emissions. In committing Massachusetts residents, businesses and municipalities to expanded and long-term fossil fuel use; the NED may undermine the state's mandated timeline to reach greenhouse gas (GHG) emission goals under the Massachusetts Global Warming Solutions Act and will, at minimum, slow our state's efforts to lower GHG emissions.

In ISO New England's June 2015 discussion paper, The Importance of a Performance-Based Capacity/ Market to Ensure Reliability as the Grid Adapts to a Renewable Energy Future, ISO NE recognizes that, "New England has small, but rapidly growing levels of renewable energy resources—namely wind power and solar power .. In the medium- to long-term, the capacity market will enable the region to achieve necessary levels of resource adequacy and resource performance while transitioning toward a system with greater levels of renewable resources,"

How does the purported need for the NED and other proposed pipelines in the region factor in the rapid growth of renewables and energy efficiency in our state? How does a pipeline that is designed to bring natural gas to our communities for its 50-75 year lifetime meet our state's mandate to reduce our greenhouse gas emissions from fossil fuel use? How does increasing dependence on natural gas, with its inherently volatile pricing, more effectively address the desire for more stable and predictable energy prices than the stable prices provided by enhanced energy efficiency and renewable energy?

Regarding the scoping review, which allows for public input related to environmental impacts, the potential negative impacts of the proposed pipeline are many: the taking, fragmenting, and potential polluting of lands with conservation easements in perpetuity; the disturbance and potential damage to the viability of wetland and public land ecosystems such as the Montague Plains with unique, rare and endangered fauna and flora; the potential impacts of pollutants from drilling and fracking materials on land, including agricultural lands and waterways through which the pipeline would be installed: the potential contamination of one of our

town's public wells and private water sources; the potential damage to septic systems; the potential damage to vernal pool habitats; and the necessary cleanup, restoration and mitigation of the pipeline along its entire route.

In light of the volumes of the extremely overdue draft Environmental Impact Statement (EIS) that Kinder Morgan recently released, the current deadline is inadequate to allow for its thorough review. I support our state and Congressional representatives' call to reschedule or add additional the scoping meetings and extend the scoping deadline for at least several months. Without rescheduling the scoping input deadline, citizens and lawmakers are effectively being denied the right to have input/comment

In addition, Massachusetts' Attorney General Maura Healey is leading a regional energy and gas capacity study, which will be complete in October, 2015, and will address the question of whether more natural gas is needed in the region, and if so, how much more capacity is necessary. There is much evidence that those with financial and/or political interests in gas infrastructure and sales are grossly overstating the 'need' for more gas, perhaps with an eye toward exporting excess supplies to more profitable markets overseas.

FERC scoping hearings should occur only after the AG's report is available, KM has been required to provide important information left blank in its current draft EIS, and citizens and policy-makers have been given adequate time to review the new information.

Before committing our state to the destructive local, environmental and global climate change impacts of a gas pipeline that appears to much exceed demand, alternative approaches to addressing the short-term "need" for additional energy, if there is one, could be used. Alternatives might include Liquefied Natural Gas and market pressures, such as time-of-use rates and demand charges, to address very short-term peak demands and price spikes, as was done successfully this last winter. This could provide a bridge to an energy generation system built on safer, more reliable, and healthier renewables and energy efficiency, which our state is aggressively pursuing as it develops its clean energy economy.

Thank you for this opportunity to submit comments.

Sally Pick

## 20150828-0009

John A. Dingee Jr.  
7 Bemis Rd.  
Pepperell, MA 01463

August 9, 2015

Ms. Kimberly D. Bose, Secretary FERC  
888 First St. NE; Room 1A  
Washington, DC 20426

Dear Ms. Bose,

RE: Docket No. PF14-22-000

As a member of the human race, I am proud that the citizens of New England are standing up to the multi-million no, multi-billion dollar corporations hell bent on destroying our way of life. The watershed aquifers and private lands are far more valuable to us, and, more importantly to future generations.

Having attended many meetings on this proposed pipeline, it makes me proud to see all the resistance to the Kinder Morgan's of this world. They need to be held accountable for their greed at the expense of the little guy. Having attended the FERC meeting at the Radisson Hotel in Nashua, I thought the first portion of the meeting went very well. But the statement portion for the record of FERC was muddied by the once again presence of the 'trade unions. During every meeting I have attended for the last couple of years, these men have stood in the periphery of the audience to intimidate and observe. When it was time for question and answers, the "hired gun" spoke in favor of the project stating employment for their members. I challenge them

to look at the failing infrastructures, i.e., water supply, roads, bridges, etc., the alternative energy, i.e., solar, wind, geothermal, wave power, tidal generators, etc. which can all create far more work for all citizens, union and private workers alike. The Kinder Morgan/TV A's of this world have held the purse strings long enough. It appalls me to see the hard working men and women of the trade unions being taken advantage of by big business interests. It appears that big business is importing union members to do their dirty work and pressuring the good people into submission. Is it the perks or just the pressure of jobs that keeps the blind workers from challenging the ideas of the extremely wealthy greed, rather than using common sense?

To allow the public to speak at the FERC meeting was heart warming in volume and content. The union's voice was also heard by FERC. It scares me to think the ruining of our natural resources isn't and can never be worth the sacrifice of the remaining natural resources, The fossil fuel industry should not be allowed to deplete all the reserves in the name of profits. The future generations need to have access to the same benefits we enjoy now. Clean water, clean air and renewable energies are a must for the future.

At the PERC meeting, the political representatives informed the audience of a new proposal of 6,000 pages, which was presented some 3 days earlier for review by the towns and FERC. It troubles me to think that after the FERC hearings a recommendation will be submitted to a hand full of officials who will decide between action or denial of the pipeline project. This is quietly saying to the concerned citizens of this area that it has already been "rubber stamped."

Please don't give up. We have shown big business and FERC that we are strong.

We can win if we stay united and don't give in to their pressure. Please save the future for our grandchildren and their grandchildren. Kinder Morgan and others like them go home and ruin your own future not ours. We drink our water from the tap, not a truck!!

Re: Project Docket Number PF14-22-000

Dear, Ms. Bose:

I am writing to submit comments/concerns related to the proposed Northeast Energy Direct Project pursuant to the notice announcing the opening of the scoping process that is being used to gather public input for the associated Environmental Impact Statement (EIS) (ref. Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, June 30, 2015). I am submitting comments as an abutter to the proposed MA Lynnfield lateral 63.00 and 77.02 (Map/lot 212-10E & 80-14). My comments/concerns are detailed as an attachment to this letter.

Please feel free to contact me directly if there are any questions, or if there is a need for additional information. I can be reached via e-mail at [zimmerman.ralph@gmail.com](mailto:zimmerman.ralph@gmail.com), or by phone at 978-257-5136.

Thank you for your attention to this matter.

Sincerely,

Attachment

Re: Project Docket Number PF14-22-000

To Whom It May Concern:

I am submitting comments related to the proposed Northeast Energy Direct Project as an abutter to the proposed ll# MA lynnfield lateral 63.00 and 77.02 (Mapllot 212-10E & 80-14).

There are two environmentally significant concerns that I believe should be addressed in the EIS relative to the Market Path represented by the proposed lynnfield lateral in the vicinity of my property, located at 200 Cardigan Road, Tewksbury, MA. Both of these concerns involve the impact of the pipeline project on water runoff, including, but not limited to the impacts of: site preparation, installation, and ongoing pipeline maintenance. The first concern is about the fact that there is a stream bed that runs adjacent to my property line and which is approximately parallel to, or in line with, the path of the proposed pipeline. The second concern is about a water runoff collection system that has been constructed adjacent to my property line on abutting property, and which lies across the path of the proposed pipeline. Disruption to either of these two systems, one natural, and the other manmade, would almost certainly have a negative impact on water runoff, with the very real potential of causing flooding of yards and basements during periods of increased precipitation.

I am formally requesting that the Northeast Expansion Project EIC investigate the potential impact of routing the pipeline near, or through natural or manmade systems that would have a direct impact on water runoff, specifically in the vicinity of Map/lot 212-10E & 80-14. Although the stream bed does not have running water at all times of the year, this feature provides a natural water handling system that protects my property from excessive runoff during times of peak preclpitation (esp. early Spring). In addition, the culvert and water handling system that runs from the base of Deca Circle, Andover, MA, through the adjacent property located at 210 Cardigan Road, Tewksbury, MA, and which is ultimately tied directly into the storm drain system on Cardigan Road, Tewksbury, MA, is critical to handling rain water runoff for the referenced properties. As highlighted above, disruption of either of these systems would have a detrimental effect on the ability to manage water runoff so as to prevent flooding and protect property. Given the potential severity, the impact of the proposed lynnfield lateral on water runoff on and adjacent to the property located at 200 Cardigan Road, Tewksbury, MA, should be appropriately addressed and mitigated as part of the Northeast Energy Direct Project project plan.

Sincerely,

**20150828-0024**

Docket #PF14-22 (Northeast Energy Direct)

August 24, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington DC 20426

Dear Secretary Bose,

Less than 3 weeks ago Kinder Morgan abruptly changed the route of the proposed NED pipeline through the western side of Richmond, NH. The route was changed from going through undeveloped woodland, to going through the front or back yards of my 6 closest neighbors, as well as sensitive local historical and environmental sites; not the least of which is the healthy bat population in some of the older houses. Bats are now a protected species, since nearly 90% of the population was wiped out by a virus during the past decade.

Extend the deadline for public comments: Needless to say, the people directly affected by this sudden re-route and our local officials have been scrambling to provide input to your Commission, prior to the August 31 closing date for public comments. It hardly seems fair that people who will be so adversely affected have less than 4 weeks to voice their opinion. So my first comment is to request that the deadline for public comments be extended.

Require meaningful environment impact studies: A cursory “study” conducted on a parcel of land that is not even going to be part of the route anymore hardly provides a meaningful environmental impact study. There are sensitive wetlands, protected and endangered species (bats, native brook trout), ground water and aquifers in the proposed path. A year long study is absolutely necessary to document seasonal features such as vernal pools and seasonal movements and migrations of animals.

Require meaningful cultural and archeological studies: The pipeline will destroy the value of the homes of the residents in its path, It will destroy the quality of life for their friends and neighbors who are nearby, but not in the “incineration zone”, and it will devalue property and tax bases in Richmond and other towns along the route. Furthermore this route goes within feet of several of the oldest houses in Richmond with some unique architectural features, such as massive central chimneys made with local bricks. Several old cellar holes, again with unique features, will be destroyed. Towns will be forced to bear the cost of devalued tax base, as well as prepare for any emergency response when there is an incident, which seems to be a given, considering Kinder Morgan’s less than stellar safety record.

Require a full disclosure of Kinder Morgan’s finances: Kinder Morgan shifted the proposed route of the NED pipeline in December 2014 from a more or less straight line from the Greenfield, Massachusetts area to Dracut, Massachusetts, north to Winchester, New Hampshire, across southern New Hampshire and back to the south to its terminus in Dracut. A quick “eyeball” estimate suggests that the change, including the Fitchburg feeder line, means 40 to 50 miles of additional pipeline construction. Various estimates using data or formulae available on the internet estimate construction costs for 36” pipe from a low of \$1.193 million per mile (early 2000’s data) to a high of \$7.2 million per mile (2011 data). Does this company really have the financial resources and backing to add a third of a billion dollars (\$7.2 million times 50 miles) to the cost of this project with the flick of the CAD stylus? What gets cut: stockholder dividends, safety? Who is left holding the bag when the money runs out: the stockholders? K-M employees (in the manner of Enron)? the Federal Government? the people along the route who never wanted it in the first place?

These are just a summary of the many, many concerns I and my neighbors have about this project. As I stated before, we have unjustly been given inadequate time to voice our opinions. Again I will request that the Public Comment period be extended. And my thanks to all the hard working employees of FERC who will be doing the due diligence on this approval process. Having worked in a part time capacity for the State of New Hampshire, I have enormous respect for the ethics of the vast majority of government employees.

RE: Docket No: PF 14-22-000

**Environmentally sensitive areas within 361 Michaels Hill Rd. Montrose, PA 18801**

To Kimberly D. Bose, Secretary

I am writing to you today to follow up on the email that I sent to Kimberly D. Bose on 4-23-2015 regarding my property in Dimock Township, which borders the Woodbourne Forest Wildlife Sanctuary (see Figure 1). In this email, I had documented the extensive wetland areas, beaver dams, and large old growth white pines (*Pinus strobus*) that can be found on my property. As you may know, the Northeast Energy Direct Project (NEDP) proposes to run a gas pipeline through my property and potentially impact the sensitive environmental resources that are found therein. After meeting with professional wetland scientists, that surveyed my property for jurisdictional wetlands, and a representative of NEDP, I would like to take this opportunity to add some additional information to your case file that has come to light about my property.

In addition to the old-growth white pines and beaver dam habitat that can be found on my property (see Field 3 on Figure 2), there are also unique vegetative communities that have been identified, namely that of coniferous palustrine forests/bog that contain mature, old-growth stands of hemlock (*Tsuga canadensis*). I believe that, based on discussion with the aforementioned professional wetland scientists, that these bogs should qualify as 'High Priority Bogs' that are afforded protection under Section 14.8 of the Pennsylvania's Wildlife Action Plan. 14.11

As I had mentioned earlier, there are active beaver colonies on my property. These beavers may provide a sensitive and critical habitat for other threatened and endangered species. My property falls within the Atlantic Coast Joint Venture Pennsylvania Waterfowl Focus Area known as the Upper Susquehanna River Focus Area. Preserving as much of my property, especially Field 3, where three recorded State of Pennsylvania specimen white pines can be found, will best serve water quality and wildlife habitat for the area. Furthermore, I intend upon deeding the majority of the natural areas on my property to the Woodbourne Sanctuary in the future. Therefore, I want to conserve and preserve the most ecologically sensitive areas on my property now in order to further increase the ecological functional lift provided by this area to the Woodbourne Sanctuary.

I would also like to note the correspondence I had with Mr. Doug Carey, the land agent for NEDP held over the course of the summer. After discussing the ecological sensitivity of the northern portion of my property and the current proposed pipeline course (see Figure 1), Doug Carey stated that he would direct the course of the pipeline away from this area. He said that he would bring the vector of the pipeline further south 500 feet into my property. While this will still entail wetland impacts, it will avoid high quality wetland impacts, as well as direct impacts to the beaver habitat and the three specimen white pines found in Field 3. I agreed with Doug Carey at that time and Informed him that the revised

route would be acceptable to me. The revised route is now marked with the survey stakes that are 500 feet south of the original proposed line.

I look forward to maintaining a collaborative effort with your office in order to ensure the conservation of the vital natural resources that are found in and adjacent to my property. I look forward to your response to this correspondence.

Sincerely,

John Curry

OUR LADY OF HOPE RETREAT HOUSE

400 Temple Road  
New Ipswich, NH 03071

Mr. Norman C. Bay, Chairman  
Federal Energy Regulatory Commission  
888 First Street NE  
Washington, DC 20426

RE: Docket No. PF14-22-000

Dear Chairman Bay:

I respectfully request that the Federal Energy Regulatory Commission REJECT Tennessee Gas Pipeline Company's proposed Northeast EnergyDirect (NED) Project. I base this request upon the following:

1. The pipeline, which will abut our complex if it follows the pipeline project, and the compressor station are located too close to Our lady of Hope, our religious retreat facility. This high-pressure, high-capacity station will bring significant human safety risks to our Sisters living there and our guests.
2. The pipeline and compressor would also be in close proximity to Lukas Community which is a residential facility for disadvantaged adults.
3. The pipeline and compressor station are located too close to the Temple School whose heating system uses outside air to heat the facility. The high-pressure, high-capacity station will bring significant human safety risks to the teachers and children attending the school.
4. The pipeline and compressor station are located too close to a farm containing Newfoundland ponies, an endangered animal. There are only 250 left on earth.
5. The pipeline and compressor station are located too close to an annual migration path of thousands of raptors. The high-pressure, high-capacity station's exhaust plumes of heated gases will bring significant safety risks to these birds.
6. The pipeline and compressor station are located too close to our water supplies; the towns do not supply town water and all homes must have wells. The pipeline and compressor station are too close to parks and conserved land and will bring significant environmental hazards.
7. FERC has already approved another pipeline to satisfy New England's natural gas-fired electric generation needs on the coldest days of winter. We do not appreciate the need to add more supply especially since, for the most part, the pipeline supply will be shipped to Europe and Asia. OF WHAT FINANCIAL BENEFIT WILL THIS PIPELINE AND COMPRESSOR STATION BE FOR NEW HAMPSHIRE? Add to these negative impacts is the devaluation of property for all homeowners in the affected areas.
8. The towns have volunteer fire departments, limited budgets for police and first responders and emergency management. Who can adequately respond to explosions and fires and who foots these bills in case of explosions and fires? Town taxes will increase and add additional financial burdens to residents.
9. The gas that would be carried in the proposed pipeline is likely to be particularly high in toxins and radiation and the health impact upon our families, animals and plants must be avoided.

10. The proposed pipeline route requires a new right-of-way that would cut through many miles of environmentally sensitive areas and take permanently protected land out of that protection.

11. Some “fracking” compounds and chemicals negatively impact the skin, eyes, sensory organs, the respiratory system, the gastrointestinal system, the liver, the nervous system and are endocrine-disrupting chemicals. Endocrine-disrupting chemicals (EDCs) present unique hazards, particularly during fetal and early childhood growth and development. We do not want to be exposed to any of these chemicals.

I urge you to take all these comments into consideration when making decisions relative to the pipeline and compressor station project.

Thank you.

Respectfully submitted,

Sister Lorraine Trottier

Sister of the Presentation of Mary

Memorandum to Record

To: Docket No. PF14-22-000

From: Eric J. Tomasi

CC:

Date: August 28, 2015

Re: Extension of Comment Period and New Public Meeting – Northeast Energy Direct Project

The Office of Energy Projects is extending the formal comment period for Tennessee Gas Pipeline Company’s (Tennessee Gas) Northeast Energy Direct Project (NED Project) and will be hosting a 14th public comment meeting for the NED Project in Cheshire County, New Hampshire.

Shortly, we will issue a Supplementary Notice that will include the new public meeting date, time, and location, as well as finalize the date for the extended formal comment period.

All environmental comments will be addressed by FERC in the environmental impact statement. Comments filed within the formal comment period would be required to be addressed by Tennessee Gas. As always, we encourage the public to continue to file environmental comments.

GEORGE MESZAROS JR., VAN ETEN, NY.

August 27, 2015

Federal Energy Regulatory Commission

888 First Street, N.E.

Washington, D.C. 20426

Attention: Kimberly D. Bose, Secretary

Reference: Docket No. PF14-22.000

Dear Ms. Bose:

I would like to make the following comment on the above mentioned docket,

## 1) Storm Water Pollution Prevention Plan (SWPPP)

Stormwater is water from rain or melting snow that doesn't soak into the ground but runs off into waterways. As it flows, storm water runoff collects and transports pollutants to surface waters. Although the amount of pollutants from a single residential, commercial, industrial or construction site may seem unimportant, the combined concentrations of contaminants threaten our lakes, rivers, wetlands and other Pollution conveyed by stormwater degrades the quality of drinking water, damages fisheries and habitat of plants and animals that depend on clean water for survival. Pollutants carried by storm water can also affect recreational uses of water bodies by making them unsafe for wading, swimming, boating and fishing. According to an inventory conducted by the United States Environmental Protection Agency (EPA), half of the impaired waterways are affected by urban/suburban and construction sources of stormwater runoff.

### Examples of Pollution in Stormwater

- Nutrients such as phosphorus and nitrogen can promote the overgrowth of algae, deplete oxygen in the waterway and be harmful to other aquatic life.
- Bacteria from animal wastes and illicit connections to sewerage systems can make nearby lakes and bays unsafe for wading, swimming and the propagation of edible shellfish.
- Oil and grease from construction equipment causes sheen and odor and makes transfer of oxygen difficult for aquatic organisms.
- Sediment from construction activities clouds waterways and interferes with the habitat of living things that depend upon those waters.
- Careless application of pesticides, herbicides and fertilizers affect the health of living organisms and cause ecosystem imbalances.
- Litter damages aquatic life, introduces chemical pollution, and diminishes the beauty of our waterways.

The best way to control contamination to stormwater is usually at the source, where the contaminants can be identified, reduced or contained before being conveyed to surface water. More often than not, it's more expensive and difficult to remove the combination of contaminants that are present at the end-of-pipe where stormwater is finally discharged directly to a receiving waterbed

### Regulatory Requirements

The U.S.EPA and NYSDEC are increasing their attention in several ways. There are several State Pollutant Discharge Elimination System (SPDES) general permits required for activities associated stormwater discharges.

- The Multi- Sector General Permit for Stormwater Discharges Associated with Industrial Activities (MSGP) addresses stormwater runoff from certain industrial activities. This permit requires facilities to develop Stormwater Pollution Prevention Plans (SWPPPs) and report the results of industry-specific monitoring to the New York State Department of Environmental Conservation (NYSDEC) on an annual basis.

Construction activities disturbing one or more acres of soil must be authorized under the General Permit for Stormwater Discharges from Construction Activities. Permittees are required to develop a SWPPP to prevent discharges of construction-related pollutants to surface waters.(1)

TGP must submit a complete SWPPP to FERC to be included in DEIS, before the issuance of the EIS, not prior to construction. This plan must also include all water certifications for waterbodies and wetlands that will be directly and indirectly impacted by this project. The SWPPP must include the preferred route, all alternative routes, contractor yards, permanent access roads, temporary access roads and compressor stations that are being considered for this project. This SWPPP must be available for review and comment. All agencies, organizations and individuals, must have the opportunity to review and comment on this vital and critical information.

Sincerely,

George Meszaros Jr.

WWW.dec.ny.gov/stormwater

**20150828-5005**

Robert Sundstrom, Milford, NH.

I am the owner of a 72 acre woodlot in Rindge NH that is directly affected by this project. I purchased this property in 1985 for 2 reasons.

1. To provide wood for my business. I am a logger and firewood vendor.
2. It is my retirement account. I have no additional savings set aside.

This is not idle property but has had several selective harvests over the years. How will this lost present and future income be compensated for.

My circumstances are even more pressing as I am a widower with a child.

This project will go right thru a small cranberry bog which I have found to be a very rare natural occurrence in NH.

Needless to say I am in total opposition to this project as it is slated to take my land and others with little benefit to the citizens of the State of NH.

Thank you,

Robert Sundstrom

**20150828-5006**

Phyllis J Ellefsen, East Greenbush, NY.

I am a resident of Rensselaer County New York and I writing to express my opposition to the proposed gas pipeline called Northeast Energy Direct. My home is located near the area of the proposed compressor.

My concerns with this project are as follows:

Leakage from the pipeline containing toxic chemicals would threaten the health of the families living nearby. This leakage would damage our environment. We are a rural neighborhood and obtain our water from individual wells. Damage to our aquifer would be devastating to our families and the streams and rivers nearby. Many of us grow our own food and have animals, so not only would our wells be compromised; but our gardens and animals would be in danger . My family has lived in this home for 35 years. We have grown and preserved our own organic vegetables since living here. We also have chickens raised organically for fresh eggs. We have recently begun raising organic trout in our backyard water system for our own consumption. The chemicals are known to contribute to global warming There are 40-50 children located within 1/2 mile of the site. They are being raised in this area because their families wanted the current environment and lifestyle for them. .

In rural areas, such as our, pipeline safety standards are less stringent than in densely populated areas: thinner pipelines, long distances between shut off valves and the depth of the pipeline is unsafe. The Pipeline and Hazardous Material Safety Administration has found to be inadequate in inspections of the pipelines.

Another concern for my family is the noise factor of the working compressor especially when there is a "blow off" and of the gasses released . The blow offs can last for up to 2 hours and happen at any time day or night. The noise levels are comparable to diesel locomotive engines running 24/7 and commercial jets at takeoff. Noise levels are unacceptable especially the young children in the area. The noise levels are dangerous and can cause hearing impairment, learning disabilities and cardiovascular problems.

This project will reduce our property values . Who would want to buy or build a house or locate a business, or invest in a farm in a town at risk of the dangers caused by this project?

The construction of this site is another concern. Blasting and the heavy machinery require to build the pipeline will damage our towns' infrastructure and who will pay for that? There would be a lot of materials

transported across our area. Our infrastructure cannot accommodate this traffic. This traffic would adversely affect our environment and lifestyle of the area. There would also have to be a huge amount of material storage areas during construction which would only add to the disruption of our lifestyle and environment.

**20150828-5007**

Jean Nigro, Temple, NH.

August 27, 2015

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street, NE, Room 1A  
Washington, DC 20426

Re: Docket PF 14-22

Dear Secretary Bose,

Based on statements made by Eric Tomasi, the FERC must consider the cumulative effect of this project when considering Kinder Morgan's application. I am writing to point out that in addition FERC must consider the cumulative effect of repeated and chronic exposure to emissions of those living, working and playing in close proximity to the planned compressor stations. Cumulative effects of toxic emissions after an initial exposure, compound the impact of the first exposure and, in time, produce negative health effects. Repeated exposures will increase the risk for development of acute and chronic health conditions.

Gas Compressor stations are known to emit a number of toxic chemicals through fugitive emissions, during normal operation, through blowdowns and through accidents.

1. The effects of chronic (long-term) exposure to methylene chloride have a negative impact on the health of the central nervous system (CNS) in humans and animals. Animal studies have shown increases in liver and lung cancer with long term exposure.
2. Formaldehyde targets the lungs and mucous membranes, can cause asthma-like symptoms, coughing, wheezing, and shortness of breath. The World Health Organization classifies it as carcinogenic to humans. It has also been associated with childhood asthma. It has also been linked with adverse pregnancy outcomes and reproductive and developmental toxicity.
3. Polonium and lead are daughter products of radon which accumulates in the gas line and is emitted by compressor stations Polonium in the human blood stream causes genetic damage and early death from diseases such as liver and bladder cancer, stomach ulcer, leukemia, cirrhosis of liver, and cardiovascular diseases.
4. Lead is a known neurotoxin associated with decreased IQ, attention deficit hyperactivity disorder (ADHD) and hearing impairment in children as well as disruptions in balance and impaired peripheral nerve function.
5. Exposure to diesel fumes commonly emitted in high concentrations during construction are is likely to pose a lung cancer risk to humans.
6. Particulate matter combines with these and other chemicals to, in effect, increase the dose of the chemical. Once in the body, the actions between particles and chemicals are synergistic, enhancing or altering the effects of chemicals. In pregnant women exposed to toxic chemicals in combination with particulates, there were higher incidences of endocrine disruption, and impaired oxygen transport across the placenta, all of which can potentially lead to low birth weight and preterm births

Given the potentially deadly conditions associated with compressor station emissions, FERC is holding the health and well-being of New Hampshire residents in its hands. I challenge you to withhold permission of compressor station construction unless Kinder Morgan develops a plan for construction that guarantees to be emission and leak proof.

Sincerely,  
Jean M. Nigro  
241 Hadley Highway  
Temple, NH 03084  
jeenigro@yahoo.com

Where will the power (electricity) come from to power the compressor station 24/7

**20150828-5015**

John Leoutsacos, Temple, NH.

Does it make sense to jeopardize New Hampshire's clean rivers and streams, when it is said that drinkable water will be a primary concern of this planet's inhabitants in the very near future?

**20150828-5016**

John Leoutsacos, Temple, NH.

If built the pipeline will be very susceptible to frost heaves created by our New Hampshire (NOT Texas) winters.

**20150828-5020**

Loren Brown, Nassau, NY.

I write to URGE you to deny approval of the Kinder-Morgan Northeast Energy Direct Pipeline (DOCKET NO. PF14-22-000). I know perfectly well that I do not have to educate you about the perils of approving this pipeline, that you have heard the perils recited over and over again in these e-comments, and that you would not be in the position you are in to read and decide if you were not intimately familiar with all that everyone and the environment stands to lose, as well as the little to nothing all but the corporate interests stand to gain. So I will not recite:

- \* The risks of leaks, ruptures, and explosions that unavoidably come with high-pressure transport of fracked gas through pipelines.
- \* The toxic off-gassing of devastating chemicals both along the pipeline and especially at the compression stations, as well as the intentional release to manage the pressure, which will be but a few miles from me.
- \* That since 2000, there have been 990 and counting significant pipeline accidents in this country with loss of life, life circumstance, injury, etc.
- \* That many will lose their entire life-long investment building a life in pristine and healthy rural country, that their housing resell values will plummet to nothing, and that they will not be able to effectively relocate because of these low resell values.
- \* That the fascist regime of eminent domain is just that: fascist, and has no place in this country for the sake of corporate interests.
- \* That when we should be using our corporate, economic and political power resources to make the transition to renewable and clean energy infrastructure, you can decide to waste incredibly precious time and resources to accelerate our arrival to the tipping point in climate change and environmental damage from

which there will be no return, and that this will be your legacy, UGH!!! And anyone erudite in the politics of fracking would know that this is just a false bubble of hope that does not significantly delay the energy/economic crisis that is just around the corner: as in, we do not have this precious time to waste!

I do not have to regale you with all of the above, because you know all of it. I can only encourage you to do what is right for us, for all the other creatures we share this world with, and for our children, our grandchildren, and that precious seven generations down the line for whom you are making these EPIC decisions.

One last note of a personal nature. I will be devastated by this. I will lose everything. I lived very near the Dewey-Loeffel landfill and became disabled with Multiple Chemical Sensitivity as a result. I am unable to do what most can do, be with people, because of the chemicals in personal care products, detergents etc. Do you think I will be able to survive this pipeline and compression station in my backyard? Honestly? No, I won't survive it, not without being very miserable if I do. You can be sure that I will be one of the sacrifices for the bully powers that be.

I apologize for the emotionality of this comment, and mean no disrespect, but just want to reach your heart and your most generous perspective, perhaps your highest selves as well.

So, thank you for taking this to heart, or at least to some very serious and honest consideration.

Sincerely,

Loren Brown  
151 New Rd  
Nassau, NY 12123

Remember This

Hitler was vegetarian  
and if that isn't poem enough  
consider this:

My chickens roamed unharmed  
until one night  
I was not home  
cagey fox  
how could it know?

And if that is not poem enough  
consider this:

It used to be paved paradise  
we feared the most  
but now we wake  
to roots of evil  
grabbing our feet  
with unadulterated greed  
to take our lands  
and call it need  
to shatter ground  
with tongues like ant eaters  
dripping juices  
killing us.

And if that isn't poem enough  
consider this:

pipelines snake throughout the lands

breathing fires in their wake,  
us little people running round  
to put them out,  
hands tied tight behind our backs  
by corporate Goliathes,  
no water found  
to put them out,  
all in the plan.  
Evicted from the earth  
our home  
with nowhere left to go,  
paradise pillaged,  
left for dead  
and all for what?  
And if this isn't poem enough  
consider this:  
It's our turn now  
in our backyard.  
Sleep well tonight,  
this poem one day  
will be the voice  
of land you once called home.  
Consider this:  
Hitler was vegetarian.

## EXECUTIVE SUMMARY

In New England, significant discussion and analysis has occurred in recent years regarding the reliability of electricity and natural gas markets in the winter. The winters of 2012/13 and 2013/14 experienced extreme weather and a series of transient infrastructure and commercial conditions that caused natural gas prices to soar, establishing new levels of natural gas basis differentials, along with corresponding increases in electricity prices.

In competitive energy markets, such as those that exist in New England, high prices generally indicate a shortage of supply for given demand levels. In keeping with this assumption, certain market participants have advocated for extraordinary government intervention to mandate regulated electric ratepayer funding of a new natural gas pipeline, implicitly claiming that high prices are signaling a shortage of pipeline delivery capability and a failure of the market to respond appropriately. Some have gone as far as to claim that New England gas and electric reliability are at risk. These claims are unsupported.

The proposed electricity ratepayer funding of additional gas pipeline capacity is an expensive and dangerous proposition in terms of ratepayer cost and healthy market function in New England. Energyzt's review and analysis of recent events and future gas and electric market conditions in New England, embodied in this report, support the following conclusions:

1. Existing infrastructure is more than adequate. Existing pipeline, pipeline expansions already underway and other natural gas supply infrastructure is more than adequate to meet winter peaking needs. In fact, the electricity system has maintained required reserve margins during some of the most extreme conditions over the past three winters despite numerous force majeure challenges. The issue is not lack of infrastructure, but insufficient commercial contracts to access existing energy infrastructure.<sup>1</sup> Winter 2014/15 illustrates the positive impact of utilizing existing infrastructure.
2. Winter prices reflected a transient peaking problem. High prices from the winters of 2012/13 and 2013/14 reflect a peaking problem and lack of commercial arrangements with existing infrastructure, not a baseload issue that justifies new pipeline capacity. High basis differentials for natural gas in New England during the past three winters occurred during only a few of the highest peak demand days of the year (when incremental delivery infrastructure was available but had not been arranged for in advance to ensure commercial availability at a price certain).
3. The market is responding with dual-fuel capability and LNG contracts. This past winter 2014/15 has demonstrated the powerful ability of competitive natural gas and electricity markets to respond to price signals. Dual-fuel units providing up to 6,000 MW (700 to 900 million cubic feet per day) of gas demand reduction on an as-needed basis already have been recommissioned, and gas distribution companies have entered into new long-term contracts for LNG imports. As a result, realized basis differentials this past winter were roughly half of what they were in Winter 2013/14 and are expected to reduce even

further as existing infrastructure is contracted and otherwise made available. ISO-NE's Payfor- Performance program also could motivate innovative, market-based solutions to winter reliability, including potential conversion of additional gas-fired units to dual-fuel capability.

4. New Pipeline Capacity already is being built. The Atlantic Bridge Project, Spectra's Algonquin Incremental Market (AIM) Project, and other expansion projects are expected to increase pipeline delivery capacity by around 600 million cubic feet per day by winter 2017/18. This new pipeline capacity needs to be included in any assessment of costs and benefits of an additional pipeline

5. Public policy does not support new pipeline infrastructure. Federal and state policies are promoting non-gas-fired generation such as renewables, low load growth from energy efficiency and demand response, and market-based performance incentives in New England competitive capacity markets to ensure electric generation capacity is available when it is needed most. These programs are projected to flatten if not decrease natural gas consumption from the electric generation sector. Emerging technologies such as distributed generation and battery storage are likely to further moderate peak demand. Government intervention to build a new gas pipeline to supply future natural gas demand from the power sector is inconsistent with these programs.

6. A new pipeline subsidized by electric ratepayers violates the beneficiary pays principle. Given existing energy infrastructure, expansions already underway, and other market responses to winter peak prices, a new pipeline subsidized by electricity ratepayers will overserve the New England market, resulting in a glut of natural gas throughout the year that is likely to flow to markets outside of New England into Canada and overseas. This would leave New England ratepayers paying for the cost of building a new pipeline for twelve months of the year, and reselling back unused capacity at a lower rate for at least nine months to natural gas shippers selling into other markets.

The lowest cost and lowest risk way to meet power generation demand and reduce natural gas prices in the New England market in the near to medium term is to contract with existing infrastructure, including LNG imports and dualfuel capability, that can provide peaking response at little to no capital cost and without ratepayer commitment. With existing infrastructure and projected needs over the next ten years, there is plenty of time to monitor how existing policy initiatives, infrastructure availability, market response and therefore new pipeline infrastructure needs evolve over the long-term. The solution is contracting, not construction.

-----  
1 In addition to this report, Energyzt performed an analysis focused explicitly on the adequacy of existing infrastructure on behalf of the New England Power Generator's Association, "Report: Winter Reliability Analysis of New England Energy Markets," October 2014,

**20150828-5047**

Dear Commissioner's,

I live at 149 Clarks Chapel Road, Nassau, NY. This pipeline and specifically the Mid Market path 1 compressor station will pose grave consequences to my land, business and family. We own a 100 acre farm from 1777 located across the street from the proposed compressor station. The farm has currently been undergoing review to be classified as a historic farm homestead. It once use to be part of 384 Acres owned by Abner Newton in the late 1700's, many of the outbuildings which were located on the land of the compressor station have been taken and restored at the Cooperstown Farmers Museum and also the house has been restored in Austerlitz, NY at the Old Austerlitz museum, it is now known as the Morey-Devereaux house. Our land use to be part of what is now slated for the compressor station site back when all of the buildings on that

property were built in the late 1700's. The land for the compressor station site is listed in the resource report for July as potentially being historic. With My farm now under review for a historic status, and industrial structure located next to it could take away from the noise criteria of the review process. Since this farm has been here for almost 240 years, placing of such an industrial structure next to something that has been meticulously maintained for almost 240 years is a travesty. Not to mention we are still a working farm. We have invested thousands of dollars in equipment, cattle, repairs and redoing the hay fields to make the farm a business and source of revenue after just investing in the purchase of the farm in 2013 and an additional 58 acres in 2014. We operate organically and have customers who only want meet, eggs, maple syrup, honey and Christmas trees from a source that does not use chemicals. We have gone to great measures to meet these standards. Placing an industrial compressor station across the street from my working farm will hinder our ability to sell our products. We also have thousands of Christmas tree customers from November- December who come to the farm for the ambiance. Please explain the economic loss I will sustain from the compressor station being located across the street from my farm.

Another major concern over our economic loss, is the health of us and the large population of children that live next to this site. There are 15 children who literally will be living on top of this site since our property's border the compressor station site (many more children live well within a very close proximity). After all this is a residential neighborhood. My two children and wife suffer from a gene disorder that does not allow them to process toxins like the average person. Nitrous oxide can be deadly with this condition. My wife has gone through great medial expense and personal expense to ensure our children eat organically (all of our meat is produced on this farm as well as vegetables, honey and maple syrup). The air we breathe is currently not located next to any major sources of pollutants. Our water is from the well which contains no chlorine, fluoride or other chemicals that could hinder the detox process in my wife and kids since they lack the ability to detox ingested toxins by air and mouth. We do not use any harsh chemicals in the house. If this compressor station is allowed to be built across the street from my house my wife and children will be subject to the toxins 24/7 since the farm is my wife's full time job along with raising our two sons. We will inhale the toxins and consume them since our food is raised on site. FERC needs to evaluate the effects of being exposed to the toxins not only in the air we will breathe but in the animals and produce that is raised on this farm that is consumed. Our one son also has a learning disorder and border line autistic, please include in the EIS how the noise generated from the compressor station will impact an autistic child living across the street from the site. In case the point is not coming across, our children are placed where they are for a reason. Having established ourselves in a residential zoning we are protecting our children from the medical conditions that hinder them. Kinder Morgan setting up a toxic noisy compressor station is a complete and total injustice to this entire neighborhood.

FERC needs to do a long term comprehensive study on the impacts of living next to a compressor station. It needs to include the disruption of life for the residents, acute and long term health effects on adults and children. It needs to include long term air surveillance at the site and local houses. It needs to include water and soil sampling from the site and nearby residences. It should also incorporate the disruption in the wildlife, local livestock and domestic pets. This also needs to be performed at a compressor station of equal value to the one proposed for the area.

This EIS should be a study that encompass at least two years. These neighborhoods have taken hundreds of years to establish, Kinder Morgan would like to plow through in the matter of a year. How can all the information presented be researched thoroughly in such a short period of time. FERC please listen to the people; understand this pipeline is not for the good of the people. It is merely to satisfy the private corporation's lust for more money and power using hard working American's at their expense. The people will put up a fight, we know FERC does hold more power then they should, we the citizens of the United States will use our freedom of speech to protest this 412 miles of unnecessary pipeline.

As the Union workers would say we live here, we work here, we raise our families here, but we also eat the food we grow here, so how will this pipeline and specifically the compressor station going to effect and alter the lives we have grown to love here. Please answer that in your EIS statement.

Sincerely,  
Scott Reilly

Ashfield, MA 01330

August 27, 2015

Kimbery D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First St. NE  
Washington, DC 20426

Dear Secretary Bose:

We are writing to implore you consider the breadth of public statements from concerned citizens, businesses, and other organizations, as well as town resolutions, peer-reviewed research, and industry reports, that strongly oppose the construction of the Northeast Energy Direct (NED) project. Specifically, we ask you to consider the following:

1. No documented need: The purported justifications for the NED project are dubious at best. There are a plethora of reports that show Tennessee Gas Pipeline, Co. (TGP) statement of demand in the Northeast is inflated' and instead the pipeline is being constructed to provide a supply path for the foreign export of gas'.
2. Seriously Consider Pipeline Alternatives: There are many proposed alternatives to this project that will have substantially reduced harmful impacts on our natural resources and communities. As opposed to the disastrous impacts of NED, some of these alternatives will have a net positive effect! For example, there are numerous studies that show that existing pipeline infrastructure suffers from large amount of gas leakages". Fixing these would provide the region with substantially more gas, improve safety, lessen the environmental impacts leaked gas, and create jobs.
3. What is the justification for eminent domain? Eminent domain allows for the seizure of private property for projects of public use and public benefit. Neither of these are present in the case of NED! How can FERC permit the seizure of private property to support corporate interests in the foreign export of natural gas?
4. What kind of pipeline is TGP planning to build? Horror stories of natural gas pipeline explosions abound". Pipeline leaks are also a critical environmental concern. New research suggests methane leaks are grossly underestimated across the pipeline industry", which has serious consequences as methane has powerful atmospheric heating effects and is a substantial contributor to the larger process of climate change. If the NED project is approved, it is essential that FERC requires TGP to use only the highest quality of pipeline infrastructure that minimizes leakages, rather than cutting corners with substandard infrastructure to save on costs.
5. Consider how NED will destroy pristine and protected open space: The proposed route for NED crosses numerous Massachusetts Department of Energy and Environmental Affairs identified priority habitat areas for rare and endangered species", The route also crosses land that has been put into permanent environmental conservation, with the specific purpose of creating a legal means to protect land from future human development". The construction and maintenance of this pipeline is a mockery of the hard work, financial investment, and ecological priorities of our communities.
6. Require comprehensive studies on the environmental impact: Currently there is a dearth of information available on the environmental impacts of the NED pipeline. How will the pipeline effect subsoil layers of bedrock and aquifers? What are the long term impacts on water quality and air quality? What drilling methods will be used? What kind of contaminants will be released through the construction and maintenance of

the pipeline? None of this is available in any TGP documentation. FERC should require a comprehensive town-by-town study of the myriad of environmental concerns so decision makers are not working from pseudo-science and speculation.

7. Let's get real: You know just as well as we do that NED is motivated by the corporate interests of Kinder Morgan and their associates, not by a concern for the energy needs of the Northeast. Just for a moment, I wonder if you can step back and imagine yourself in the shoes of someone living along the pipeline route. Imagine if the home you cherished, that you have poured your heart and soul into conserving, that you plan to pass along to your children, was about to be upended by the pipeline construction of a multinational company. Imagine if the hiking trails your community joined together to protect which and which you walk on daily were about to be destroyed by a compressor station. What would you do in this situation? Who would you turn to? Secretary Bose, please hold yourself accountable to mission of your agency. Don't be a rubber stamp for the gas industry. You, the commissioners, and all of the agency staff have the opportunity to stop this harmful pipeline project dead in its tracks and instead become environmental champions helping to lead the way towards a prosperous and environmentally sound energy future for our country.

Sincerely,

Peter Corens

Gabriel Corens

## 20150828-5049

This information pertains to the compressor station proposed for Nassau, NY.

The deed attached is the agreement between Tomas Hanson who is selling the 142 acres of land for the compressor station site in the Town of Nassau, NY. It states a schedule "A", this schedule should be made public. My land shares borders with the portion of property across the street from where they are proposing the site. It also states parcel 1 being the same premises conveyed by deed dated December 6, 1999. If it is that same deed then it would entail the land on both sides of the road and not just the land on the compressor station side as highlighted on Kinder Morgan's map. Please make Schedule "A" available for review, if Kinder Morgan obtains more than the one side of the road it will open up ample space for additional structures in the future.

Also this deed was made between a holding company that was just formed May 6, 2015.

It was also signed on the same day decibel meter readings were being conducted, and Mr. Hanson had workers generating as much noise as possible that day. I am requesting a new Decidable reading test to be conducted for the Clarks Chapel Road Compressor Station. How can a 24 hour test determine the neighborhood? It should be in place for at least a month. Plus there are seasons; I request a test to be done in January when all is extremely quiet outside and no leaves on the trees since they believe that will "buffer" the noise. Yes, I am still outside for a great period of time this time of year, and I will hear the compressor station when there are no wild animals to hinder the humming of the engines. The first test conducted was not accurate. The owner of the compressor station site had dump trucks idling all day while he hauled gravel from the pit. I also was planting Christmas trees with a tractor and a garden that was right near the testing box. Due to the fact that this area does have a farm next to where the decibel readings were being taken, things that are done a few times a year such as planting Christmas

trees, haying the fields or the neighbor hauling gravel all day can generate noise for a majority of the day since we don't have a 9-5 work schedule, but it is not an operation that is a 24/7 noise. Even a neighbor mowing the lawn can be a whole day event with the size of lawns in this area. Also were wind speeds taken into account when the readings were done? May 21 was a windy day. If a 24 hour test is being conducted, weather conditions need to be taken into account. The Town of Nassau resource committee conducted their own testing, showing a drastic difference in readings. This is an extremely quiet neighborhood no one agrees with Kinder Morgan's results. We need a new test conducted by a third party that is not hired by Kinder Morgan. The testing box that was located next to the road indicated the testing was being done by HFP Acoustical and not SLR as indicated in the July RR. I contacted the testing company directly after seeing the box chained to a telephone pole on the side of the road. I explained to the lady the noise levels had been elevated and new testing should be conducted. The worker who was in the area doing the testing was supposed to contact me and never did. I think another true test would be to place something in the location of the compressor station of equal value to the compressor station and then take a reading at the local houses, see how the noise will radiate to the extremely close households. Wait, that test was conducted, when The owner of the site was hauling gravel all day from the same location of where the compressor station will be located, what was the reading on the report, 56, at my location but the other three locations that had more buffers registered 44.. So how is Kinder Morgan going to keep the noise from radiating in such a quiet neighborhood? I want better and longer acoustical readings done throughout the year, which will determine the true decibel reading of a neighborhood. It is still an injustice to place an industrial infrastructure in a rural residential neighborhood. Our towns placed zoning rules for a reason, to protect the residents. Now the Federal Government can override a town. A town has a reason why those rules were put in place, not the Federal Government. THERE SHOULD BE NO EXCEPTIONS TO THE RULE!

Sincerely,  
Libby Reilly

## 20150828-5052

Suzanne E Gray, Fitzwilliam, NH.

Dear Commissioners Bay, Moeller, LaFleur, Honorable and Clark:

I have served on the Fitzwilliam, NH Planning Board for 13 years and am **Chair of the Fitzwilliam Economic Development Committee**.

While I understand and respect the need to supply the Northeast with adequate energy resources, I ask that you consider all issues in front of you, including those listed below, prior to rendering your decision on the NED project.

I have reviewed the Environmental Report dated July 24, 2015 submitted by Tennessee Gas Pipeline, LLC a Kinder Morgan Company, Volume 1, Section Five "Socioeconomics".

Section 5.10.2.9 "Project Economic Benefits" refers to impact on affected towns. Fitzwilliam is a small rural town, year round population of 2,396. In summer our population grows as we welcome tourists and summer residents with houses and cabins along our lakes, ponds and streams.

The business revenue is derived primarily from tourism. We are eight miles from the most climbed mountain in North America, Mt Monadnock. The mountain is within the view shed from many locations in town. Fitzwilliam has many antiques shops, inns and B&B establishments. The tourists and summer residents provide significant revenue to Fitzwilliam and the surrounding towns. Fitzwilliam is known as the "antique mecca" for the entire state of New Hampshire.

The towns of Fitzwilliam and Troy share Rhododendron State Park, a 2,723 acre park which attracts many to this area.

The proposed pipeline runs through Rhododendron State Park, New Hampshire's only designated botanical park, and home to "The Old Patch Place" an historic home on the National Register of Historic Places. This park is visited by thousands every year. There is hiking, picnicking and bird/wildlife watching in the warm months and cross country skiing and snow shoeing the winter months. [https://en.wikipedia.org/wiki/Rhododendron\\_State\\_Park](https://en.wikipedia.org/wiki/Rhododendron_State_Park)

The proposed NED Pipeline would clear cut a hundred foot wide swath through this region. Construction is expected to last for a year to a year and a half. During that time, many tourists who would typically visit this area for a peaceful, rural get-away, will go elsewhere. There is nothing rural or peaceful about the type of destruction this construction necessitates and it will cause irreparable damage to our tourism industry. The economic benefits listed in section 5.10.2.9 "Project Economic Benefits" fails to properly study the immediate and long term adverse impact of the pipeline on tourism and our businesses.

#### REQUESTS OF FERC

- Please study the long term economic effects of construction of and existence of a 30-36" pipeline in rural towns which depend on tourism as the primary source of business revenue. How will the businesses be compensated for the initial and subsequent loss of tourism revenue?
- How will TGP avoid or mitigate impacts to regional tourism, negatively affecting both businesses and state parks/forests, as well as private recreational areas?
- Please study the true effect of property valuations due to the proximity of a 30 or 36 inch pipeline in rural areas where people desire a quiet, peaceful and safe environment. Note: The following link is listed in Section 5.11 "REFERENCES" as a source for property valuations is not currently active. [http://www.palomargas.com/docs/resources/Pipeline\\_Impact\\_on\\_Property\\_Values.pdf](http://www.palomargas.com/docs/resources/Pipeline_Impact_on_Property_Values.pdf)
- Please communicate and solicit feedback from other permitting agencies such as the EPA and DES regarding their analysis of the pipeline's initial and residual effects of the route through natural resources such as Rhododendron State Park.
- Please communicate with NH Park System regarding the fragility of the ecosystem in and around Rhododendron State Park. How can impacts to these and other natural resources along the route be avoided or fully mitigated? How will the pipeline construction be minimized to avoid disruption to the State Park?
- The Troy Superfund site is literally within feet of the proposed pipeline route. Please ask the EPA to comment on concerns with disruption of that site.
- Please request reports from the EPA, DES, NH Park System and land conservation groups to consider
