The Open Space Plan lays out methods by which limited resources can be applied to conservation projects to protect and retain the town's rural character. The role of this document is to assist the citizens of Fitzwilliam in achieving its open space protection and conservation goals. The plan should be used as a guidance tool that focuses conservation related actions and decisions in the town.

Specifically this plan provides:

- A Summary of the Fitzwilliam Open Space Land Survey
- The location of special places and scenic areas/vistas identified by community members
- A set of conservation focus areas based on community and resource values
- Goals and Implementation Strategies to aid in protection of identified focus areas

This plan presents the results of efforts to identify and analyze the cultural and natural resources in Fitzwilliam as the basis for prioritizing land areas that should receive encouragement and support for conservation. The Open Space Committee seeks, through this plan and its activities, to:

- Protect the character of the town through strategically conserving lands identified as contributing to the community's rural character
- Further Fitzwilliam conservation goals by reaching out to land owners and providing incentives to encourage conservation of high priority lands
- Broaden the community base of understanding about land conservation: what it is, how it works, and why it's valuable

Eric Tomasi
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Re: PF14-22

Dear Mr. Tomasi,

As you know, the town of Temple, NH abuts the property where Kinder Morgan/TGP proposes to site a 41,000 – 80,000 HP compressor station in New Ipswich for its Northeast Energy Direct pipeline.

As irresponsible and reckless as it was for a US corporation to site a 41,000 HP compressor station a mere 1/2 mile from our elementary school, when Kinder Morgan/TGP recently made an adjustment to its proposed site, they chose to move it even closer. Now it's about a slim 1/4 mile from Temple's Elementary School.

Simultaneously, its new site placed the reservoir, which supplies the school's drinking water as well as the drinking water for the town of Greenville, close to the 1/2 mile "buffer zone" of the compressor station.

Our concerns for our students and staff have grown as more data and research have become available from reputable and qualified public health departments on the health impacts of living or working within a 3 mile radius of 10,000 -12,000 HP compressor stations. Of course, that radius would expand for larger ones.

The 14 + spills, fires, and explosions that have been documented in the past 11 years at US compressor stations is also alarming, and doubly so since our school serves a second function as the town's emergency shelter.

Conversations with FERC and Kinder Morgan staff members over the phone and at Open Houses are of no help. They continually maintain that any emissions and safety concerns we have are unfounded and unreasonable, repeatedly saying that there are no toxic emissions from compressor stations and that they have excellent safety records. Of course, that falls in the face of the facts. Information is readily available from PHMSA regarding Kinder Morgan's and TGP's abysmal safety records of incidents and violations. And compressor station health impacts are increasingly reported with input from top tier universities, including Cornell and Harvard.

We request that FERC provide its commissioners and staff as well as Kinder Morgan's management and staff with in-depth trainings focused on the health hazards posed by the emissions from compressor stations. In particular, they should focus on the vulnerability of children to the harmful effects of toxic pollutants. We request that the training include:

- Wilma Subra's research on the health hazards within a 3 mile radius of compressor stations.
- The Madison County, NY Health Department's report on health impacts from compressor station emissions.
- The Southwest Pennsylvania Environmental Health Project's Summary on Compressor Stations and Health Impacts
- The Minisink Compressor Station report from Minisink, NY by Jessica Cohen, published in the Utne Reader, Fall 2015.
- Mina Hamilton's document, "More than a Pipeline: A Toxic Industrial Infrastructure".

We request an investigation and report to the town of Temple on the effects of compressor station noise and low frequency vibrations on the ability of children and adults to concentrate, plus the short term and long term health impacts of blowdowns, fugitive emissions and other gas releases associated with compressor stations, including the latest data, using continuous monitoring for toxic gas levels rather than yearly averages, with a special concern for kids with asthma.

We also request a pre-construction baseline health assessment of the students and staff at our school and residents living within a 3 mile radius of the proposed compressor station, conducted by professional public health practitioners, approved by the Temple Select Board and paid for by Kinder Morgan, with a commitment to have the children's health profiles professionally monitored for 10 years.

We also request a list of pollutants that will be emitted from the Hillsborough County Compressor Station so our Health Department can evaluate whether it is safe to install in our town.

Clearly, it is NOT a priority of Kinder Morgan to responsibly site their compressor stations and contain or eliminate their emissions of toxic pollutants. When asked about emissions at the New Ipswich Informational Open House, their representatives would not even acknowledge that any pollutants are emitted during blow-downs.

For all of these reasons, plus PHMSA's safety record for Kinder Morgan including "180 incidents of spills, fires, explosions, injuries and fatalities since 2003"; their equipment and materials failures, maintenance failures, poor welds and negligent quality control of their construction process, plus the fact that their newer pipelines have had more incidents than their older pipes; along with their willingness to subject children to the health risks posed by their facilities; and their lack of transparency and honesty, in spite of continually saying that they want to be "good neighbors"... we request:

- A probing, thorough, transparent and immediate investigation of their business and construction practices,
- PHMSA oversight of a list of steps Kinder Morgan will take to correct this history of negligent endangerment of US citizens.

In the meantime, we request answers to these questions:

1. WHY would you allow such a reckless company to continue to potentially endanger more US communities?
2. Where do you draw the line? How irresponsible does a company need to be before FERC disallows their application to continue constructing infrastructure with questionable safety and quality controls in our nation?
3. Aren't the health and safety needs of our children and all US citizens a higher priority to FERC than the financial gains of an irresponsible corporation?
4. Or is FERC similarly irresponsible and reckless with our country's land and the well-being of its citizens?

Since all of the issues raised will not be able to be fully addressed and resolved in the immediate time frame, we emphatically request that FERC not authorize a Certificate of Public Necessity and Convenience for the Northeast Energy Direct pipeline at this time.

Our children deserve better.

Beverly Edwards
Temple, NH 03084

20151016-4032

My name is Dennis Gauvin from New Ipswich

I would like to address my time specifically to the dangers of the compression station sited for New Ipswich and all the surrounding towns where the wind will carry the pollutants that we all know exist.

It's expected that 2 Titan 250 compressors, @20,000 HP each, will be installed. The VOC's or volatile organic compounds estimated to be emitted are around 52 tons. In addition, approximately 36 tons of PM2.5, or fine particulate matter.

Focusing only on the PM2.5

A detailed study by the Southwestern Pennsylvania Environmental Health Project (SWPA-EHP) in Minisink, NY concluded "families living near the compressor station are exposed to elevated levels of PM2.5." "The episodic nature of health symptoms reported by residents is likely associated with the episodic high emissions that come from the compressor station." They have 2 10,000 HP compressors.

SWPA has received grant funding to extend their study into New York State with a focus on conditions near the 22,000 HP Wright, NY Compressor Station. They are currently seeking participants for the study.

Two recent Harvard University studies in December of 2014 and June of 2015 indicate elevations of PM2.5

have a significant effect on mortality in people over 65 and women exposed to high levels during pregnancy, particularly during the third trimester, may face up to twice the risk of having a child with autism than mothers living in areas with low particulate matter.

A further study by SWPA on Compressor Stations and Health Impacts is 36 pages long with 4 Y2 pages of reference data from around the country.

A report from the Environmental Health Journal states

“Congressional exemption of oil and gas operations from provisions of the Clean Air Act, Clean Water Act, Safe Drinking Water Act, Emergency Planning and Community Right-to-Know Act, and other statutes limits data collection on the impacts of oil and gas development.”

After just the little information stated here, it's no wonder Kinder Morgan declined to meet with the Conval school board to discuss emissions and the Temple Elementary schools exposure!

I applaud the Conval school boards request to FERC that the Tennessee Gas Pipeline be denied!

A report in Reviews on Environmental Health states

“Unconventional oil and gas (UOG) operations have the potential to increase air and water pollution in communities located near UOG operations. Every stage of UOG operation from well construction to ~xtraction, operations, transportation, and distribution can lead to air and water contamination. Hundreds of chemicals are associated with the process of unconventional oil and natural gas production.”

20151016-4033

FERC SCOPING STATEMENTS Docket PF14-22 Northeast Energy Direct

9/29/2015 Rindge Scoping Session

My name is Kathleen Gauvin. I live in New Ipswich, NH.

To the F:fc Commissioners, you should be here listening to our voices, you should be here seeing our faces. We are the next sacrificial lambs that will be offered up, all in the name of big corporations and their profit making schemes. It is time that you take notice! When does the issue of what is morally right supersede the issue of passively permitting these contaminating monsters that are ravaging through our country like a cancer in its final stage?

When will you consider the people?

“We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.”

Where in this process does FERC consider We the People? or In order to form a more perfect Union? or Promote the general welfare? or Secure the blessings of liberty to ourselves and our posterity?

As I read the research into the disastrous effects of a 20,00 HP compressor station's emissions in Minisink, NY, I knew that WE THE PEOPLE was not a consideration in the permitting process. Minisink is a difficult article to read; we are now potentially the next Minisink populace. Minisink is a town inhabited by people just like us, wb” were not given the justice that they deserved, their general welfare was not protected, and most certainly, the blessings of liberty were not preserved for themselves and their posterity.

When the permitting of the Minisink, NY pipeline and compressor station was discussed by the FERC Commissioners in 2012, two Commissioners dissented. These Commissioners expressed similar opinions noting that the construction

of the Wagoner Alternative would provide numerous benefit beyond those provided by the Minisink proposal with significantly fewer emissions, thus reducing the effects on the local air quality. The other three Commissioners voted in favor and the permit was granted. The Minisink, NY residents living near the compressor station are now plagued with numerous health ailments and research shows that they are the direct

result of the emissions.

So to you, the FERC Commissioners I ask, “Will you pay attention to the dissenters’ concerns in your midst? Will you look at less harmful alternative routes? Will you make a morally right decision?”

Thank you

20151016-4036

NED Project, Docket # PF14-22

FPU Scoping Sept. 29th:

I’d like to speak about my experience with Compressor Stations:

1. I was first exposed to compressor stations in Bradford, Pennsylvania They are used as gathering points for gas wells in the Marcellus Shale.
2. A compressor station in that environment is about the size of a one car garage, the compressor is driven by a large diesel engine, my guess would be no larger than 500 or 600 horse power, but I’m told they can be as big as 1,500 horse power (increased power means more noise). You can hear the small ones over a mile away.
3. My experience in Bradford, caused me to look into compressor stations as they will be used on the proposed NED pipeline.
4. Kinder Morganffennessee Gas Pipeline, when they were proposing a 36 inch pipeline were talking about a compressor station which would use compressors driven by as much as 98 thousand horse power. Because diesels can’t produce that kind of power, jet engines are used. Then because of the lack of customers in New Hampshire, they dropped the pipe’s diameter to 30 inches, which better than halved the horse power requirements for the New Ipswich compressor station (approximately 43 thousand horse power).
5. What Kinder Morganffennessee Gas Pipeline hasn’t told people here along the pipeline is, once they have their foot in our door, there is no stopping them! Do you know as the demand for gas from the pipeline increases (export demand in Europe), that they will have to add more compressor stations. The next compressor station can well be in your back yard.
6. Assuming that Kinder Morganffennessee Gas Pipeline gets their foot in the door, they will have free reign to add more pipelines “in our” energy corridor, and they can at will change the content of the pipe they have put on your property. Please research Natural Gas Liquids (NGL) on the net. What you will learn will horrify you.
7. Now where are the good guys in all this? The EPA has taken a strong position on compressor stations and how they should be run and maintained, but like the emissions from compressor stations, they have been hamstrung by the petro-dollar funded congress andFERC.
8. The EPA has made recommendations on how compressor stations should be configured, run and maintained. The sites are easily found on the Internet, the key words being EPA and compressor stations.
Please Note: One of the EPA sites identifies gases released from compressor station and Main Line Valves blowdowns and general pipeline leaks. The gases are note worthy: Methane, Benzene, Toluene, Ethylbenzene and Xylene. I’m not a chemist, but I do know that Methane is a worst green house

gas than CO2 and that Benzene is a carcinogen.

9. A gas pipeline watchdog group: Metropolitan Engineering Consulting, Forensics and Environmental Services, has published an article on the Internet, that explains what can be done reduce the emissions produced by compressor stations. The data is interesting and the changes they suggest are very do able, but before I get into that, let me tell you about the volumes of gases released in the “please note” section above:
 1. A single compressor blowdown releases approximately 15,000 cubic feet of the gases noted above.
 2. An emergency blowdown (shutting down an entire compressor station) will release as much as 1.3 million cubic feet of the gases noted above.
 3. Now for the big one, because of Cheshire County’s low density population they will space Main Line Valves 7.5 miles apart! Now picture a cylinder with a 30 inch internal diameter 7.5 miles long, venting into our atmosphere!
 4. The watchdog group’s article can be found by searching for The lowdown on gas compressor blowdown.
10. Given the above information, I felt comfortable having a one on one conversation with a Kinder Morgan representative at the Fitzwilliam’s Kinder Morgan Open House. I walked around and low and behold I found a Kinder Morgan representative who said he was qualified to talk about compressor stations:

My first question was, why do you have to blowdown a compressor when you take a compressor of-
fline? His response was that if they didn’t, it would shorten the life of the dry seals on the compressor shafts.

The next question was, why not feed the gas you would vent into the atmosphere, when you take a compressor offline, into the intake of an online compressor. His response was that would require them to install a pump in the compressor station!

By the way through all this I haven’t mentioned the exhaust of the jet engines. The colocation that Kinder Morgan is so proud of, could reduce emissions, if they used the electric power that they are co-locating with to power the compressor stations!

These are the people that say they are good neighbors! These are the people that place the cost of building and maintaining a compressor station above the our lives, the lives of our children; our live stock; our wild-life and the quality of our organic agricultural products!

As to cost benefit: We the impacted citizens of New Hampshire have to live with the costs, but Kinder Morgan Tennessee Gas Pipeline gets the benefits.

Thank You,

Jan A. Griska

Rindge, New Hampshire

20151016-4037

I am Robert A. Hamilton, a resident and **Chairman of the Board of Selectman of the Town of Rindge**. I am here to testify on behalf of myself and the majority of the residents of Rindge. Our opposition to the Kinder Morgan, Tennessee Gas Pipeline Company’s NED pipeline project is for our concerns about the following:

- Our Wildlife
- Our Wetlands
- Our Streams
- Our Plant life
- Our Ground water

Our Wells
Our Land
Our Air quality
Our Town Roads
Our Highways
Our Scenery
Our Serenity
Our Costs
Our Capabilities
Our Safety
Our Need
Our Benefits
Our Compensation and,
Our Property.

While this may not be a complete list, these are the points that have been brought to my attention. I will just briefly touch upon these concerns as I know that there are more adequately trained individuals that will expand on these topics tonight.

Our Wildlife- The worry of fragmentation of habitats and the protection of some rare and threatened species.

Our Wetlands- Disruption and possible permanent alteration to the land in and around these 17 impacted wetlands.

Our Streams- Erosion and resulting alteration of the stream channels in these 5 impacted streams.

Our Plant life- Invasive species may overwhelm and overtake the impacted native species.

Our Ground water- The risk of contamination.

Our Wells- There is no possible way to guarantee the safety of our wells from damage, pollution or contamination. Pollutants and contaminants will be present during and after the construction project. There has been no assurance that natural gas would be the only product transported in this pipeline. This town is entirely dependent on well water.

Our Land- Mitigation plans and efforts could never return affected lands to their original state.

Our Air quality- During and after construction, there is no question that local air quality will be impacted.

Our Town Roads and Our Highways- Increased traffic flow and transportation of hazardous materials. Damage from heavy construction equipment.

Our Scenery- This speaks for itself. The resulting scar from the construction will never fully heal.

Our Serenity- While already disrupted, the construction period will be a constant headache.

Our Costs- Repairs to our roads and highways, legal bills and extended training for first responders will be just the tip of the iceberg.

Our Capabilities- With a police force of 7, a volunteer fire department and our proximity to rescue and medical services makes us extremely vulnerable. This meeting alone has stressed our capabilities!

Our Safety- I am not even allowed enough time to begin to get into this topic.

Our Need- For Rindge, Our region and the state of New Hampshire there is absolutely no need for this project.

Our Benefits- None

Our Compensation- The promise of local tax payments which will be legally contested by KIM year after year. Beyond that, no compensation ..

OUR PROPERTY- This is Our Property; not Kinder Morgan's, not FERC's and not the US Government's

property and it should stay that way!

This entire process reminds me of what President Reagan said:

“THE NINE MOST TERRIFYING WORDS IN THE ENGLISH LANGUAGE ARE:

‘I’M FROM THE GOVERNMENT AND I’M HERE TO HELP’”

20151016-4038

Jennie L. Hill
32 Cross Road
Richmond, NH 03470

September 29, 2015

Docket #PF 14-22 (Northeast Energy Direct)

My name is Jennie Hill. [live in Richmond NH. Kinter Morgan’s posture has been as if FERC’s approval of the pipeline is just a formality. They have not felt the need to submit accurate or complete information to the Commission in their filings.

Winchester|Richmond NH Town Line

From the first submission modifying the NED route to the “New Hampshire Powerline alternate”, until the present, the town line between Winchester and Richmond, New Hampshire has been plotted incorrectly. Hatch Mott MacDonald December of 14, page 68 and a subsequent Revision dated August 21 show it about 900 feet west of its actual location. Town Line Signs & markers are clearly visible in the vicinity of the proposed route. This calls into question any functions performed by their software.

FERC File 20141208-521729960502

“DRAFT / ENVIRONMENTAL REPORT RESOURCE REPORT..

From the Draft Environment Report of December 2014, another glaring omission is the use of “TBD”, in the text and tables. Areas of pipeline looping and co-location of pipeline facilities are summarized in text form on page 8, in table form on page 27. Any locale where the proposed pipeline is looping or co-located with an existing line or utility corridor, there are detailed project plans and other resources which show slope, depth to bedrock, soil, terrain, etc. Yet when you scroll forward to “rugged topography” Pages 67-70, the Slope Gradient tables are all filled in with TBD.

As special construction techniques and A TWS requirements for Slopes over 30% are cited, this is very relevant when evaluating the merits of this route. All it takes to figure out slope percentages is a topographic map and a ruler or scale. You would think with the technology available and the existing plans mentioned above, Kinder Morgan’s engineering department should be able to do likewise. It again speaks to the assumption that neither FERC nor the public have a need to know this information.

Depth of Pipe Burial

Another concern is the stated intent to bury the pipe no more than 3 feet deep. Given that when the route is not going through bedrock, it will be mainly through unconsolidated glacial till, the pipe will be subjected to freeze/thaw activity. Considering what frost action can do, it seems to me that it should be buried below the frost line.

Endangered Animals in the path of the pipeline.

A Canada lynx has taken up residence in Richmond and Fitzwilliam, having been sighted by at least 3 people I know, since the beginning of the year. Canada lynx are protected by the Endangered Species Act. Bats are also a protected species. They have made homes in numerous buildings near the proposed route. These protected species should be given consideration to minimize disruption to or avoid their habitats altogether.

The burden of proof for all the many questions should be on Kinder Morgan. I am very heartened that FERC has given us this extra time to voice our concerns. It signals to me that this is going to be an open, deliberative, thorough and fair process. I appreciate your time tonight and the efforts of all the many staff members

working on this docket.

{6 maps omitted}

20151016-4039

To Kinder Morgan* and
The Fossil Fuel Industry

Kinder Morgan, let's be frank,
Are you a kinder kind of bank,
Say, like the one they call J.P.,
Adept at fleecing you and me?

Or are you fuelish, fossil-wise,
To lay a pipe of such a size,
And carry all the gas that's fracked,
From states whose country sides get whacked?

You send this gas to far off shores,
And pay the bribes of corporate whores,
Who take the money from the till,
While we the people foot the bill.

Yes, ship the gas to distant shores,
Despite the fact that corporate wars,
Have just acquired lots of oil,
That lurks beneath the Mid-East soil.

You grab oil here, and send gas there,
Kill multitudes, pollute the air,
Inject the earth with deadly stuff,
It's time to say, enough's enough!

Though fossil fuels have served us well,
Their time is over - can't you tell?
So turn your gaze to wind and solar,
And help us save the regions polar.

Save the forests and the oceans,
The life they hold, all living motions.
What good is gold and obscene wealth,
Compared with all creation's health?

Money's not the highest good,
There's life and love, and drink and food,
And laughter in a special place,
That's home for ALL the human race.

*Kinder Morgan is seeking to lay a large gas pipeline through a pristine area of Southern New Hampshire

20151016-4041

Northeast Energy Direct Project
Scoping Meeting September 29, 2015
Docket No. PF14-22-000

Comments By John Kieley
Town of Temple, NH
Temple Adhoc Pipeline Advisory Committee

The 41,000 HP compressor station planned for the Town of New Ipswich would be one-quarter mile from the Town of Temple's Elementary School and in close proximity to dozens of Temple residences, several farms, a large aquifer and the reservoir for the Town of Greenville. At the scoping meeting in Milford many local residents offered comments about the inappropriateness of locating such a facility on this site. Since that scoping session, Kinder Morgan has held information sessions for the public where they unveiled new renderings, which showed the compressor station even closer to our school.

While Kinder Morgan's FERC filings provide no information regarding the types and levels of toxins, carcinogens and particulate matter that this compressor station WILL emit, studies from both Pennsylvania and New York both show that some one hundred and eighty seven different chemicals will be emitted and that the volume will total hundreds of tons per year. The known impacts on human health of these chemicals range from nose bleeds and dizziness to liver damage and various cancers.

It is unacceptable to subject our residents and particularly our school children to known health hazards particularly when these emissions will be regular occurrences from this compressor station.

This project is not about bringing energy to New Hampshire; it is about bringing fracked gas to Maine and the Maritimes for export. It just happens that in order for Kinder Morgan to use eminent domain and be allowed to pollute the air we breath, they need to partner with a distribution company to fabricate local need. They found a willing partner in Liberty Utilities and rewarded them with a \$400 million investment in the project

The residents of Southern New Hampshire are simply "in the way".

FERC needs to view this as the sham it is and deny this application.

20151016-4042

Hand written FERC Comment form: Dr. Catherine Koning, PhD, 250 Summit Rd, Keene, NH 03431: opposing

20151016-4043**Fitzwilliam Conservation Commission**

PO Box 725
Fitzwilliam, NH 03447
Paul M. Kotila, Chair

Northeast Energy Direct (NED) Gas Pipeline Testimony - 29 Sept 2015, FPU, Rindge, NH

I am Paul Kotila, Chair of the Fitzwilliam Conservation Commission. For the record I'd like to note that Dorothy Zug, whose work the Commission greatly appreciates, has not been and is not now the Commission Chair as seems to be the impression of Kinder Morgan.

The mission of the Fitzwilliam Conservation Commission is to protect the natural resources of the Town

of Fitzwilliam, New Hampshire. In regards to this mission, the Fitzwilliam Conservation Commission has several concerns that we feel the environmental impact statement must address, including the following;

1. What are the short-term and long-term impacts of pipeline construction and maintenance on the natural resources of Fitzwilliam, including but not limited to:
 - Terrestrial ecosystems
 - Surface and groundwater supplies and aquifers
 - Aquatic ecosystems, including ponds, streams, wetlands, and vernal pools
 - Air quality
 - Night-time lighting
 - Noise and sound levels
2. The impact study should examine the short and long-term environmental impacts of:
 - Construction activities
 - Road building and maintenance
 - Excavation & blasting
 - Vegetation removal and management (including herbicide use)
 - Inspection and repair activities
 - Future construction or expansion, including additional pressurization stations
 - Releases of potential contaminants into water bodies and the air, including greenhouse gases such as carbon dioxide (CO₂) and methane (CH₄)
 - Possible explosions or fires

In Fitzwilliam, we are particularly concerned about the disruptions to Scott Pond and associated wetlands, the adjacent Gaseau conservation land, and other Focus Areas along the proposed NED route that have been identified in the town's Open Space Plan. All of these have been identified by citizens as parts of town that reflect the value we place on our natural resources and the importance they play in our sense of community.

3. The impact statement should examine the environmental advantages and disadvantages of alternatives to the proposed project, including:
 - Alternative routes
 - Reduction in size of the project
 - Alternative energy sources
 - Not building the project at all

We also request that the impact statement examine the cumulative effects of this and other energy projects on Fitzwilliam's open spaces, scenic views and natural communities, particularly since the town has already experienced considerable disruption due to power line infrastructure.

Finally, we request that the impact statement examine the longterm impacts of continued and expanding reliance on fossil-fuel energy sources in light of undeniable global climate change, which will affect all of us and the natural communities we live in.

Completion of the NED project will ultimately contribute to global warming and may thus prove both unwise and unnecessarily environmentally destructive.

Thank you.

20151016-4044

September 29, 2015

Rindge Seoping Meeting

Hon. Melanie Levesque
2 McDaniel's Dr.
Brookline NH

My name is Melanie Levesque, I am a Brookline resident and served as a representative for 6 years. I have serious concerns about the proposed pipeline. We have come here tonight as citizens of NH who value our conservation land, our homes, and our way of life. We are responsible and resourceful. The great majority of us supplement our energy through sources such as pellet stoves, wood stoves and electric ductless systems that provide cooling and heating but these types of fuels are to provide heating not electricity.

The NED project is advertised as a project that will feed the NE Grid yet all of the customers are heating customers. The NED project is not about electricity it is about heating. It proposes to go through 17 towns most of which cannot use the gas. These towns will bear the burden of a pipeline without any benefit.

The Natural Gas industry has done a very good job of convincing our businesses that they need the gas when through energy efficiency and energy alternatives they can further reduce their costs in a responsible manner.

Our local legislators have listened to the people and for the most part stand with us. Yet we also hear it is a local issue. It is not a local issue when we are engaged with the Federal Energy Regulation Commission to discuss a pipeline running from Pennsylvania to NH, proposed by companies from Texas and Tennessee.

With the Citizens United Decision corporations are considered people and have an equal if not greater voice in our political system and clearly a greater voice when it comes to determining what we can do with our property.

We have heard from the Unions about their need for jobs. I have a difficulty understanding why their temporary jobs are more important than our conservation land and the property my neighbors have built their lives around.

To FERC I ask you to look at this project in its entirety, and work not just for companies to approve their pipelines but determine if this project is truly needed, which it is not. Understand how this project has violated the people of our state, and work to further our energy efficiency and renewable energy goals.

20151016-4045

“Need” for Natural Gas in New England

Until the winter of 2013/2014 there had never been any shortage of natural gas or electricity in New England in the winter. New Englanders know winter is coming, and prepare for it in a number of different ways. Some winters are worse than others, but we're ready for the worst, and flexible about how we deal with it.

So why did things come so close to disaster in 2013/2014? The single biggest difference was that “Independent System Operator-New England” (ISO-NE) the “not for profit corporation” tasked with managing the New England electrical power grid) decided we needed a “Winter Reliability Program”. After the winter, ISO-NE patted themselves on the back for keeping the polar vortex from freezing New England. They implemented a centrally controlled solution to a nonexistent problem. In doing so, they broke the market mechanisms that had been working for many decades, and created the kind of shortages and problems they were claiming to solve.

The “Winter Reliability Program” involved ISO-NE contracting for demand electricity from no more than 200 oil fired and dual (gas/oil) fuel generators.(1 & 3) They refused to contract for winter electricity with gas only generators using LNG. That meant that natural gas only generators were very likely to be idle some part of the coming winter. ISO-NE spent \$66 million of ratepayer's money to pay for the oil for the oil/dual fired generators. Why would electrical generators turn down “free oil” when the alternative would be buying natural gas with their own money, especially when ISO-NE would refuse to buy electricity generated using natural gas from LNG? (The filing says participation would be limited to the 200 selected as-

sets by “implement(ing) the demand response program manually”. That means that LNG fueled generators wouldn’t even be informed that there was demand.)

Both before and after, but not during, the winter of 2013/2014 Liquid Natural Gas (LNG) imports were a significant part of the fuel used for electricity and heating in New England. In 2009/2010 LNG imports were around 51 billion cubic feet, 2010/2011 around 54 Bcf, 2011/2012 around 48 Bcf, 2012/2013 (mild winter) around 21 Bcf, 2013/2014 (severe winter with “Winter Reliability Program”) 18 Bcf, 2014/2015 around 24 Bcf to Everett LNG terminal and additional LNG through other terminals. Looking at the facts, it would appear that the “Winter Reliability Program” was really a “Winter Unreliability Program”.

In September 2013 FERC approved the 2013/2014 “Winter Reliability Program” without LNG, accepting ISO-NE’s false assertion that there wasn’t time to include LNG in the program. ISO-NE says in their filing agreed to by FERC on September 16, 2013: “Under the Winter Reliability Program, ISO-NE will solicit bids only from oil-fired generators, dual-fuel generators, and demand response resources. ISO-NE contends that it could not create a fuel-neutral program for this winter due to the short time frame and the requirement to minimize market distortions, but states that it intends for future winter programs to be fuel-neutral.” (2) You’ll note the “minimize market distortions”. As we all know in 2013/2014 energy markets from wood pellets to oil to natural gas were all distorted far beyond what has ever occurred before or since. One can certainly speculate that removing a large part of the natural gas supply which before and since has come to New England in the form of LNG would likely result in energy market distortions.

The assertion that there wasn’t time is belied by comments from LNG suppliers and Conservation Law Foundation proposing a workable inclusion of LNG in the mix for 2013/2014. That proposal was ‘poo-hooed’ by FERC in Part C of the same ISO-NE filing (3). Neither FERC nor ISO-NE addressed the substance of the LNG proposal.

In the (2013/2014) “Winter Reliability Program” “ISO-NE will solicit bids only from oil-fired generators, dual-fuel generators, and demand response resources.” (4) What they’re saying is that ISO-NE would NOT solicit or accept bids from natural gas fueled generators. The result was that natural gas fueled generation was ‘frozen out’ of the market in 2013/2014. Those generators sat idle while ISO-NE’s preferred generators ran using oil bought by ISO-NE using rate-payers’ \$66 million. (Your “System Benefits” charge at work.) ISO-NE’s conclusion from this was that there wasn’t enough pipeline gas capacity in New England.

In the same filing, ISO-NE says: “ISO-NE asserts that a fuel-neutral program design, or one that includes liquefied natural gas (LNG), is preferable to a more limited program design but would conflict with ISO-NE’s goal to minimize market distortions. ISO-NE states that compensating natural gas resources for incremental natural gas could reduce opportunity costs, and thus wholesale electric prices, at times of high natural gas demand, thereby sending the wrong signal during times of natural gas scarcity. ISO-NE also states that, due to the complexity of the natural gas supply chain, a natural gas solution would pose a risk of unintended consequences. For example, ISO-NE contends that providing incentives for additional LNG supply would reduce natural gas released from other sources or displace use of pipeline natural gas when it is economic.” (5) ISO-NE says their goal was to “minimize market distortions”. That’s a real whopper. How could anyone expect the market NOT to be distorted by ISO-NE’s market manipulation?

In the last sentence, they say: “ISO-NE contends that providing incentives for additional LNG supply would reduce natural gas released from other sources or displace use of pipeline natural gas when it is economic.” In other words readily available LNG would be used instead of pipeline gas when LNG is cheaper. That would be good for consumers, but would require pipeline companies to compete on price with LNG.

In the next to last sentence, ISO-NE says: “... due to the complexity of the natural gas supply chain, a natural gas solution would pose a risk of unintended consequences.” This implies that there were intended consequences. Given everything else in the filing, and the fact that ISO-NE came up with the “need” for a “Winter Reliability Program” seemingly out of thin air, the only conclusion I can make is that the ‘intended consequences’ were to have us here tonight listening to more lies from Kinder Morgan.

Under 717 C of the Natural Gas Act (6), manipulation of natural gas markets is illegal. In this case, rather

than preventing or prosecuting market manipulation by ISO-NE FERC was complicit in that manipulation by approving a plan that manipulated all energy markets in New England from natural gas to electricity to wood pellets.

It's likely ISO-NE will say they weren't a natural gas market manipulator because they didn't actually trade in natural gas. However, as an "entity" manipulating the natural gas market (by their own statements) they are a "person" (7) as defined by the Natural gas act.

The facts make it very clear that there is no need for additional pipeline capacity to New England. The artificially created shortage of natural gas, electricity, and other forms of energy in 2013/2014 was a result of market manipulation by ISO-NE with the complicity and approval of FERC. In winters before and since, there was no shortage of fuel or generating capacity because the market was allowed to operate without manipulation, and energy needs were satisfied. I will encourage Department of Energy's Inspector General to look for coordination and communication between ISO-NE and pipeline companies. It is difficult to believe that this fiasco was solely the result of ISO-NE's incompetence.

I don't ask anyone to take my word for anything. Everything here is verifiable fact. Most of it is from FERC's and ISO-NE's websites and other publicly available sources. Whether it may disappear from those sources is anyone's guess. I've sent copies of this to our federal legislators, the IRS, the Inspector General of DOE and the press.

Subject: Docket #PF14-22: Scoping Meeting Comment - Economic Impact page 1 of 2 Patricia Martin

Dear Ms. Bose,

I would like to draw your attention to the unprecedented plans for financing this pipeline project. don't believe the majority of electric ratepayers In New England are aware of that plan and I wonder how the FERC process will include their interests. Electric ratepayers are being asked to accept a tariff through the utilities to reserve capacity on the pipeline which the utilities "through some mechanism to be determined" will then sell to electric power generators and quite likely to exporters. This contract is expected to extend for 20 years.

The statements by the New England Power Generators Association and Unltil regarding the pipelines are summarized in a report released by the NH PUC staff on Docket IR 15-124, September 14th. The power generators, the folks who will theoretically buy that gas from the utilities, do not support these • proposals. They didn't want to take the risk of buying that gas and they don't think ratepayers should have to either! Currently New England generates over 50% of its electricity with 1 bcf/day of natural gas fired generation. By adding more than 1 bcf/day (and current plans call for adding more than 2 bet/day), New England could

produce 100% of its electricity with natural gas. Think about it! 100% Increase In pipeline capacity to address a 1% supply problem for a single fuel source?

How can this be a good thing for New England's economy? Natural gas will have a monopoly on electricity generation, while ratepayers bear all the risk.

Moreover, the entire electricity pricing crisis has been largely manufactured for the benefit of the pipeline companies and utilities with a financial interest in the pipelines. I mapped the data from the eia.gov website into a graphic representation of New England's "all sectors" retail price versus the US average.

In general, retail prices for electricity have ranged somewhere between 14 and 16 cents per KWH from 2006 through 2014. Note that retail prices in New England have been consistently 40 to 65% higher than the National Average since at least 2001. Where were these pipeline proposals in 2008 when prices peaked?

The danger of lost fuel diversity not only puts us at risk for financial disaster, but also to loss of grid reliability. With all our eggs in one basket, what could possibly go wrong?

The pipeline companies are the only guaranteed winners if these projects go through. Liberty Utilities and Berkshire Gas have also made investments in the pipeline and will share in a steady revenue stream whether or not a single dekatherm of gas is used to generate electricity. All paid for, of course, by New England's ratepayers.

{chart "History of NE retail electricity prices versus US average" omitted}

Thank you very much for the opportunity to comment on a matter of great concern to the people of New England.

Sincerely,

Patricia A. Martin

20151016-4048

Ms. Kimberly D. Bose,
Secretary Federal Energy Regulatory Commission
888 First Street NE
Washington, DC 20426
Docket # PF14-22-000
Scoping Meeting 9.29.15

To remind people here tonight - this meeting is to convey to FERC the consequences of this pipeline and associated compressor stations on the environment.

Environment can be defined as the conditions that all living things in a proscribed area share. Therefore it can be said that the environment that concerns us here is the land and air and water that surrounds the pipeline as it imposes itself across southern New Hampshire and Massachusetts.

How far that surrounding environment stretches away from the pipeline seems to be an expanding envelope. It started that only the towns actually on the route seemed to be aware of the consequences of their misfortune. Now other communities, further away from the route, are realizing the danger of their situation. In the last two weeks both Peterborough and Wilton have voted to come out in opposition to the pipeline and all its downsides and Conservation Commissions across the state have voiced their concerns over the damage.

In fact more and more people are coming to understand that the advertising and propaganda spread by the profiteers in support of the project are lies and designed to misdirect and divert people from the reality of this, for profit, proposal.

People have come to understand that they are suddenly an endangered species. We are in the way of a proj-

ect that would make huge profits for its proponents by destroying all that stands in its path.

What a strange, terrible idea to suddenly have to assimilate. We, the species that always have been the one to do all the damage, are suddenly the ones that are endangered ourselves.

So - here is an interesting situation. Under the definitions above we, as part of the environment, are something that FERC has to take into consideration. What a novel idea!

Let me say, I have already observed the effects of the imminent danger on local people. People are scared, their habitat threatened, the stress of the situation is disrupting families. People are worn and battered by the assault upon them by the twists and turns of a predator that has no sense of the value of each one of us as living beings.

So FERC - please acknowledge that we, the people, are part of the environment that you are charged to assess when Kinder Morgan makes this proposal.

Project Docket PF14-22

Joseph McGuire
339 Nutting Hill Rd,
Mason, NH 03048
NuttingHill@Gmail.com

My name is Joe McGuire -I live in the town of Mason, NH and I am a stakeholder.

New England is a region of the country containing many unique environmental and historic attributes. One of these attributes is the presence throughout the rural countryside of stone walls. There once may have been 250,000 miles of stone walls in America's northeast, stretching farther than the distance to the moon. They took three billion man-hours to build and they contain a magnificent scientific and cultural story, especially about the humans who built them, in many cases as they also fought to build a new country, The United States of America. Stone walls tell nothing less than the story of how New England was formed

These walls have been in place in most cases since the seventeenth, eighteenth & nineteenth centuries as the early American farmers who settled the region moved stones from the productive areas of their fields to the edges. In many cases, and over the course of centuries, these walls came to delineate the boundaries between not only fields but between different property owners. Many deeds still describe property boundaries by referencing stone wall locations and directions. A typical property in rural New Hampshire that has been targeted to receive the NED pipeline, could potentially have a deed that describes its boundaries by the location of a stone wall. In many cases to this day those properties have changed hands over the course of centuries by referencing these boundary walls. In many cases a more accurate survey using modern methods has never been performed.

As NED is planned now, many stone walls will be removed to make way for the pipeline easement and the temporary work-zone easements. Please ensure that all deeds to properties that are crossed by either the NED pipeline or the variety of temporary work-zone easements are checked to see if the work required by NED will disturb a boundary wall referenced in a deed.

In those cases where such a wall will be disturbed, and no modern survey has been performed, a new survey must be performed and the boundaries appropriately flagged in agreement with both abutters to the boundary wall. The survey must include going back to corners on either side of the area where the wall is to be

disturbed in order to perform an accurate survey. This survey results, including the updating of property deeds with this new information and subsequent filing with the registry of deeds must be performed at no cost to the affected property owners and prior to the excavation of any walls.

The loss of these historic walls will also adversely affect the visual appeal of the New Hampshire countryside. Please also ensure that any such walls are replaced and not through the haphazard process of an excavator operator but through a craftsman skilled in restoring these historic features of our state.

20151016-4051

FERC Fiddles While Kinder Morgan's Pants Are On Fire

At a recent scoping meeting hosted by FERC, I asked Mr. Eric Tomasi, FERC's NED project manager, if he had any response to the multitude of lies told to the public by Kinder Morgan. Mr. Tomasi asked that I file any comments regarding Kinder Morgan's misbehavior with FERC so that they are documented. I replied that I had already done so many times.

Mr. Tomasi, the list below provides you with just some of the comments that I have filed with FERC beginning in October of last year. All of these comments include examples of Kinder Morgan's deceit, misdirection and outright lies. The filings are:

1. Why Kinder Morgan Isn't More Forthcoming <http://elibrary.ferc.gov/ldmws/common/opennat.asp?fileID=13657158>
2. Kinder Morgan Continues to Torture the Truth <http://elibrary.ferc.gov/ldmws/common/opennat.asp?fileID=13733951>
3. The Damage Caused By Kinder Morgan's Deliberate Misinformation <http://elibrary.ferc.gov/ldmws/common/opennat.asp?fileID=13789971>
4. How FERC Has Failed the Public on the Northeast Energy Direct Project <http://elibrary.ferc.gov/ldmws/common/opennat.asp?fileID=13941948>
5. Fix FERC First, Chapter 3: FERC Allows The Public To Be Misled <http://elibrary.ferc.gov/ldmws/common/opennat.asp?fileID=13820763>

And if FERC is interested in locating filings from other commenters who also complain about Kinder Morgan's lies and misinformation, I suggest the following: Make use of your own eLibrary search capability in the NED docket using search terms such as "deceptive", "mislead" and "misinform". These three searches will all return multiple comments on Kinder Morgan's deceit.

In a recent FERC filing titled "Open House" meetings - perverted from "obligation to inform" into "opportunity to sell" (<https://elibrary.ferc.gov/ldmws/common/opennat.asp?fileID=13960811>), another commenter has searched your eLibrary using the search term "Open House" and has located 36 separate comments that report Kinder Morgan's continued attempts to mislead the public.

Mr. Tomasi, the information that you requested has long been available in FERC's own repository. But the public is simply not at all sure that you read this information; or that having read it, that you believe it; or that believing it, that you have the slightest inclination to put a stop to it and to remediate the damage that these lies have caused to the public.

Kinder Morgan doesn't want there to be an informed public. An informed public asks hard questions and does not accept vague, misleading answers. Kinder Morgan much prefers a more complacent, ill-informed public. If FERC is unwilling or unable to control the misinformation that this pipeline company spreads or to apply some type of sanction to it, why would Kinder Morgan not continue to lie to the public? Their pants are on fire, but they don't even seem to notice.

How about it, FERC? Do you have any control over the orgy of misinformation that Kinder Morgan supplies? And do you have any intention of remediating the damage that it has already done to the public? Or are we as completely on our own in trying to defend ourselves against Kinder Morgan as we appear to be?

Nick Miller Groton, MA

[Printed copies of this comment and the electronic copy already filed with FERC (<http://elibrary.ferc.gov/idmws!common!OpenNat.asp?file10=13964751>) both contain links to all of the FERC comments that I have referenced above.

I also have extra printed copies if anyone here would like one.]

20151016-4052

My name is Martin Nolan and I have lived in NH most of my life.

As a professional in the energy field I have many concerns with this natural gas pipeline proposal.

• **Leaks; should one occur**

Most home explosions that have occurred have been attributed to natural gas lines in urban areas. The leaking gas from the pipeline, which is under low pressure follows the path of least resistance underground, along other lines buried or even natural cracks through the ground at which point it finds its way into the structure. There is the real possibility that the same thing can happen on the proposed pipeline only on a larger scale. The difference is that this will be under very high pressure. This could very easily travel underground several hundred feet or more before entering a building .. While a leak under low pressure might affect a few residences a leak under or adjacent to high tension power line would have devastating consequences. The destruction would be of a horrific magnitude within the incineration zone of about 1000 feet which is what the company say it will be. The destruction will certainly be several times that area.

Commercial underground fuel tanks, as well as the piping associated with them must be double walled and continuously alarm monitored for a leak. A leak within that inner space allows time to stop pumping and removal of the products, thus protecting the environment from a leak before it hits the atmosphere. If this proposed pipeline were to be built with double walled piping and continuously monitored, while not completely eliminating the possibility of a catastrophic leak, it would surely lower the risk.

• **Need for natural gas**

I see very little need for natural gas through this region. The majority of the users are in the eastern part of NH or south of NH in central and eastern Mass. Much propaganda has been printed about saving the northeast from the high cost of fuel. The fact is most of the proposed route is so rural that there would be little economic value to convert to natural gas. Eversource is stated as being one of the end users even by the PUC; however, they haven't said they are interested. In fact to my knowledge they don't have nor are they planning any natural gas generators in

NH. There are existing pipelines already on the New England coast which if there is a need for more gas can be up graded. The end of this proposed pipeline is to be in Dracut Mass where they will tie into another line with the final point of the line at a seaport where it can be exported overseas. The cost for natural gas will be set by the demand. There seems to be a greater demand in Europe, and as such the price will be the determined by the world demand not simply by local needs. The only economic value in this pipeline as it is will be for Kinder-Morgan to make more profit at the expense of the region.

20151016-4053

My name is Nancy Nye and I have been a resident of Fitzwilliam for over 50 years. It took my husband and me 3 years to find the perfect house and town to raise our children in. In the last year and a half I have put more than \$100,000 into the house. This includes a new roof, bathroom and kitchen.

A few years after we bought our house the Vermont Yankee Atomic power plant took an acre or our land to put their power lines through. There is always a hum and a glow at night around the lines. They really sizzle

when there is any dampness in the air and during electrical storms they draw the lightning towards them. My house is in the direct route of the proposed gas pipeline as it follows the power line. I have been told by Kinder Morgan representatives that they do not take houses. Their solution is that shortly before my house they will jog under the existing powerline and then jog back out after they pass my house. (It was my understanding that the gas pipeline had to be 50' from any electrical power lines.) In the mean time they will have to remove all the organically grown apple and pear trees, the blueberry bushes that my husband has been growing since he was in high school and flower beds that have been existence since before we moved into the house. Not only will all this disappear but my septic and well will also be gone.

So that I will not be disturbed during this process they will build an earthen berm FOUR FEET from my house and down the entire length of it which is approximately 125' long. When construction is over they will replace the berm with a fence. What will that look like? like the fence along 91 down in Connecticut!

I have a letter from a Realtor I would like to read. (Marc's letter)

You have the power to take my house by eminent domain. I ask that there be more environmental studies done or to consider an existing pipeline route or one that does not take privately owned land by eminent domain.

Mrs. Raymond Nye
89 Bowkerville Road
Fitzwilliam, NH 03447

Dear Mrs. Nye,

As you know I inspected your home several months ago in an attempt to establish its Fair Market Value. I was prepared to evaluate it based on the traditional method of comparing it to similar properties that have sold in a recent period of time.

However, we discussed in depth the proposed Kinder Morgan pipeline. As I understand it, their plans in relation to your property, would utilize the existing Public Service of New Hampshire easement and perhaps an expansion of that easement. As I recall, the easement for PSNH literally goes through your property. If you were to put the house on the market you would of course disclose the possibility of the pipeline coming. I'm not sure that anyone knowing that would want to buy your home except for a fire sale price. I know that you have put quite a bit of money into renovations fairly recently but I'm afraid that if the pipeline does come through, you would have a hard time recuperating the costs of the improvements, let alone selling the house.

I'm sorry to be the bearer of bad news. Let me know if I can help further.

Very truly yours,

Marc P. Tieger, President
Tieger Realty Co., Inc.

FERC Public Comment - 9/29/2015

NED Pipeline

My name is Coni Porter and I'm an educator, a professional, and a grandmother from Fitzwilliam. My great fear is a carbon-heavy future that we are not bold enough to address "now". Right now is when we need to change policy direction in every industry that pours carbon emissions into the air. My great frustration is with elected and appointed officials who do not seem to understand that natural gas production and transportation is a heavy land and air polluter. This is by no means a "clean energy" source.

PERC's mandate is to assess the level of "public good" that will allow "eminent domain" in the taking of private property. Who constitutes this "public", and what does "good" mean?

I chanced upon a list compiled by the Pennsylvania Alliance for Clean Water and Air, of entries submitted by individual people who have had documented experience with natural gas production and transportation over the last 4 years. Do these people constitute "the public?" If not them, who? Let me read a short sampling from this list:

The List of the Harmed

First entry:

1. Pam Judy and family from PA. Compressor station 780 feet away. Symptoms: Headaches, fatigue, dizziness, nausea, nosebleeds, blood test show exposure to benzene and other chemicals
2. Darrell Smitsky from PA. Gas well less than 1,000 ft away. Exposure: Water- toluene, acrylonitrile, strontium, barium, manganese. Symptoms: Rashes on legs from showering. Symptoms (animal): Five healthy goats dead; fish in pond showing abnormal scales

Skip ahead:

626. Roy and Amy Heady and children; Glenda, Kirsten and Don Sumler, Terry and Dustin Smith; Bobby and Amanda Smith near Carlsbad, NM. Gas Facility: 30-inch gas pipeline. Explosion. 10 deaths, two injured.

Skip ahead:

6,112. Fort Berthold Reservation, North Dakota. Exposure: Brine pipeline spill, million gallons. Dead trees, dead grasses, dead bushes, dying bushes, spill went undetected for some time.

Last entry to date:

16,712. LaVerne Johnson from IA. He is being forced to allow access to his property. Johnson is opposed to the possible impacts on water and crops. "Do you want to be remembered for making the most money, however you can make it or do you want to be remembered for doing the right thing? I hope I'm remembered for doing the right thing."

I respectfully ask that each FERC Commissioner (Tony Clark, Cheryl Lafleur, Norman Bay, Phillip Moeller, and Collette Honorable) interview these over 16,000 people who have been harmed by the gas industry and FERC's past decisions. And then, do THE RIGHT THING. For the first time in the history of all of your decisions say NO, and look to the future, not the past. It's time to change direction for the sake of our grandchildren's world.

Coni Porter

September 29, 2015

RE: Quicker, cheaper solution to the 50-day winter energy crisis - it is Yankee Ingenuity.

Many propose new gas pipelines will reduce electric and natural gas rates. A few weeks ago, the NH PUC suggested electric ratepayers should have tariffs to pay for all the proposed new pipelines. That same week, a company named Skipping Stone released a report stating no additional pipelines are needed. Moreover, additional pipelines would be not cost effective to ratepayers.

The Skipping Stone report claims, "The most important fact to remember about New England's 'gas problem' is that it is a Deep Winter, peak demand deliverability problem, not a year-round capacity crisis. As a result, building more pipelines. which would provide a year-round supply of gas-whether it is needed or not- and is simply not a cost-effective solution."

The report demonstrates using imported LNG during deep winter peak demand is cheaper for ratepayers building more pipelines, which would provide a year-round supply of gas - whether it is needed or not ... is simply not a cost-effective solution." The report includes all the details supporting this finding and looks out to the year 2030. Their suggested alternative is a "Winter LNG Pipeline" that strategically imports LNG as needed.

Who is Skipping Stone? Although they have offices around the USA and Japan, they are New England based. offering professional services in energy markets. They have done work for hundreds of energy companies such as Exelon. GDF Suez, NRG. Entergy. ConocoPhillips, Duke Energy, Constellation Energy, even FERC (Federal Energy Regulatory Commission).

Anyone can try to solve a problem by simply throwing more resources at it; more money. people and in the case of New England's "winter energy crisis." natural gas. Throwing resources at a problem does not guarantee a good solution; frequently it backfires and wastes those resources. The Skipping Stone Winter LNG pipeline is a true Yankee Ingenuity solution that addresses the problem without increasing rates, adding unnecessary expensive infrastructure, or taking people's private property. We should utilize Stone's Winter LNG Pipeline strategy this winter and put the pipeline projects on hold until proven absolutely necessary.

FERC Scoping hearing 9/29/15

Project PF14-22

My name is Terry Silverman. I am a 30-year member of Fitzwilliam NH Planning Board and current chairman and a member of the NH Municipal Pipeline Coalition

FERC docket # PL99-3-000 issued Sept. 15, 1999, states that the commission's goals are to appropriately consider:

1. Goal 1: The enhancement of competitive alternatives
 - When considering the NED proposal, will FERC take into account no build options such as Portland Natural Gas Transmission System that ends in Dracut MA and achieves the increased supply by increasing compression upstream?
 - When considering the NED proposal, will FERC consider the expansion of the Spectra Line?
2. Goal 2: The possibility of overbuilding of infrastructure
 - Will FERC consider the dwindling resource of the Marcellus Playas outlined by Thomas Stepstone of Oilpro.com that 04 production at the Marcellus is in fact breaking down”?
 - Will FERC consider that the Constitution Pipeline to connect NED to the Marcellus Play has not yet been approved, making this a segmented project?
3. Goal 3: The avoidance of unnecessary disruption of the environment
 - Will FERC question the assumption that NED is collocated when it is in fact a greenfield project?
 - Collocation intends to locate a project along an existing corridor to lessen the environmental impact. How does NEDIKM achieve this given the number of wetlands, private wells, aquifers, vernal pools, streams, rivers and the numerous headwaters it affects?
 - Given the low expectations of FERC for mitigation cited in the Robert Bailey study of 1999, and the lower success rate of those lower standards in projects, how can FERC justify the approval of NEDIKM pipeline?

- Given the geological structure of NH, resting as it does on the African Tectonic plate, which has generous amounts of wetlands and granite, how can FERC oversee and mitigate the problems that the NED project presents?
- NH OEP (Office of Environmental Planning) has requested from the towns a Smart Growth report of how the state is doing implementing the principals outlined in NH RSA 9-B, which states, “Smart Growth also means the development and use of land in such a manner that its physical, visual or audible consequences are appropriate to the traditional and historic NH landscape Smart Growth preserves the integrity of open space in agricultural, forested and undeveloped areas.” How does the NED project adhere to this state law?

4. Goal 4: To prevent the unneeded exercise of eminent domain

- If NED were truly a collocated project, the need for taking of private and public lands would not be necessary. Can FERC justify the taking of so many parcels for a private, for profit use? NH RSA 674:34 outlines codified vested rights.

This NED pipeline, Project PL 14-22 does not come close to meeting any of FERC’s own goals for an appropriate project. No amount of compensation to communities or individuals will make up for the loss of sensible use of local lands and resources. I urge FERC to deny NED project as unnecessary and adverse in its effects.

Southwest Region Planning Commission

37 Ashuelot Street, Keene, NH 03431 603-357-0557 Voice 603-357-7440 Fax

Statement for Federal Energy Regulatory Commission (FERC) Scoping Meeting (PFI4-22)

Northeast Energy Direct (NED) Proposal

Franklin Pierce University

September 29, 2015

The Southwest Region Planning Commission (SWRPC) submits the following initial comments concerning the Northeast Energy Direct project proposed by Kinder Morgan Tennessee Gas Pipeline Company. SWRPC is the regional planning agency serving the 34-town planning district of Southwest New Hampshire. This includes seven towns located directly on the proposed pipeline corridor and two additional towns immediately adjacent and within close proximity to the corridor that will be impacted by the 37 miles of proposed pipeline route through the SWRPC Region. SWRPC is participating in review of the NED proposal in that we have worked to better understand the FERC process, created a sensitive resource inventory along the proposed pipeline corridor, collaborated with regional planning agencies in MA and NH, and intend to sub-

mit additional detailed comments throughout the course of the FERC review process.

The NED proposal represents the largest infrastructure project in Southwest NH in at least several decades and perhaps ever. The project has the potential to undermine the efforts of generations of hard-working volunteers in providing stewardship for and maintaining the quality of life in our relatively rural communities. SWRPC has significant concerns regarding the potential natural and cultural resource impacts of the proposal. Resources that would be most directly impacted include aquifers and surface waters, vegetation, wildlife habitat, conservation lands, air, farmlands, historic resources, roads and bridges, other public infrastructure, and existing and proposed development.

The need for this project must be thoroughly evaluated. Based on agreements with potential customers, only 38% of the 1.3 Bcf/day capacity of the pipeline has been committed. In the absence of a demonstration of need, FERC lacks the authority to approve the project. Furthermore, other proposals for increasing the supply of natural gas in the Northeast U.S. and New England are at various stages of development. One or more of these proposals may represent a less environmentally damaging practicable alternative as espoused by the National Environmental Policy Act than NED, which essentially represents greenfield construction through relatively undisturbed lands. In keeping with the spirit and intent of NEPA, all known proposals to increase the natural gas supply in New England should undergo simultaneous and collective review, rather than being considered individually and in isolation from one another. We ask that FERC include a detailed analysis of these alternative proposals as part of the draft environmental impact statement to be issued for public review and comment. Also with respect to the need for this project, it is prudent that other alternatives to meet electricity generation and natural gas demand be fully explored including energy conservation, renewable energy sources, LNG storage, and improved operational efficiencies of other natural gas pipelines.

Little information has been made available describing the positive impacts associated with the proposal, and that which is available is overly general in nature. We would expect to have access to clear, specific, and quantifiable information regarding the project's benefits including a breakdown for residents and businesses in our state and Southwest NH. Such information should indicate the extent of benefit in terms of dollars saved in household budgets, and specifics related to employment and wages for direct, indirect and induced economic activity. In the absence of such information, we are left with a perception that the negative impacts of the project outweigh its benefits. We also raise the issue of equity as, to our knowledge, none of the seven communities which would serve as host to the pipeline in Southwest NH would receive direct access to the natural gas it transports due to their relatively low development densities.

SWRPC intends to submit additional detailed comments requesting further information in which to adequately assess the impacts of the proposal on the resources of Southwest NH. We have collaborated with other regional planning agencies in MA and NH to develop a joint Request for Further Study and Information which addresses the following areas:

- Water resources
- Wildlife habitat
- Open space and conservation lands
- Air quality
- Agricultural and forested lands
- Roads, bridges and other infrastructure
- Noise
- Archaeological and historical resources
- Public safety and emergency response
- Recreational resources
- Construction impacts
- Invasive species

- Impacts on public and private property
- Fiscal impacts on communities
- Quantification of economic impacts
- Project need

These topics are directly related to the general headings listed in the FERC Notice of Intent dated June 30, 2015 and will provide the level of detail needed for FERC to fully evaluate the impacts of the proposed project on our natural and cultural resources. Since the information submitted by the applicant during the pre-filing period is not sufficiently detailed to allow for a full understanding of project impacts, the intent is that this Request for Further Study and Information will assist in the process of developing a filing in which the public can more fully understand and provide comment.

Finally, we understand that the FERC process is focused on the transport of natural gas and is less concerned with its production and consumption. Monadnock Region Future, the regional plan for Southwest New Hampshire, encourages us to reduce our reliance on fossil fuels and focus more on energy conservation and the use of renewable energy sources. In addition, there are many questions about effects associated with the practice of fracking as used in the Marcellus shale fields where this gas is sourced. It's important that we find a way to make these issues relevant in the FERC process during the continued review of this NED proposal.

Thank you for this opportunity to provide initial comments on the pending development of the environmental impact statement related to the Northeast Energy Direct proposal.

SWPA-EHP

SOUTHWEST PENNSYLVANIA ENVIRONMENTAL HEALTH PROJECT

www.environmentalhealthproject.org

Summary of Minisink Monitoring Results

The Minisink compressor station has been in operation since the summer of 2013. Families living within a few kilometers of the station have been experiencing episodic health symptoms since the station began operation. The facility is a 12,000 horsepower compressor. At the request of the community, EHP placed 5 Speck particulate matter (PM 2.5) monitors near residences from October 19 - December 17, 2014 and collected health information from 8 families living within 1.5 kilometers of the site. Residents also collected air samples of VOCs using Summa canisters on four occasions.

Major Findings

SUMMARY OF HEALTH IMPACTS

EHP collected health information from 35 individuals, 12 of whom are children. A medical professional collected the data. Symptoms that developed after the potential exposure period (beginning summer 2013) or worsening pre-existing symptoms without a more plausible cause were reviewed. The health findings are consistent with information from other research reported in peer-reviewed literature and by other environmental health organizations. The predominant health impacts reported were:

- Respiratory problems (22, includes 6 experiencing nosebleeds)
- Neurological problems, (12, all of whom report headaches)
- Dermatological problems (10, skin rashes)
- Overall physical health self-assessments, when compared to a national standard (SF36), are below normal for 2 out of the 8 individuals who completed the SF36. Overall mental health and wellbeing levels were below normal for half of the respondents.

PM2.5 MONITORING RESULTS

Monitoring of PM2.5 outside residences near the Minisink Compressor station demonstrated the following:

- Four of the 5 Speck monitors recorded elevated PM2.5 baseline values in outside ambient air compared to regional levels of AQI PM2.5 reported from Newburgh, NY Airport. The average hourly AQI for the monitoring period was 6.4 ug/m³. The average hourly values for the Specks ranged from 4 to 20 ug/m³. The Speck monitor that recorded the lowest average PM2.5 value was separated from the compressor station by 2 valleys, likely showing the effect of topography. (Table 1)
- There were times when more than one monitor showed unusually high PM2.5 values. (Table 2)
- All residential 24-hour averages of PM2.5 outside levels were below the EPA level of concern (35ug/m³), with one exception. One home had one 24-hour period with an average of 64ug/m³. This shows how the standard 24-hour averaging time can mask peak exposures.
- Periods of low wind speed and nighttime (especially early morning hours) were found to increase potential exposures to PM2.5 and any associated chemicals at residences near the compressor station.

The Case for an Unconventional Natural Gas Development Health Registry

A White Paper Produced by the
Southwest Pennsylvania Environmental Health Project

Beth Weinberger MPH, PhD

Luke Curtis MD, MS, CIH

Jill Kriesky, PhD

Amy Linnea He, MPH

David Brown, ScD

April 16, 2015

{ Table of Contents omitted }

Executive Summary

The Case for an Unconventional Natural Gas Development Health Registry Unconventional Natural Gas Development (UNGD), which includes hydraulic fracturing along with associated production and transport activity, is occurring in every region of the country. There is a growing body of air emissions data that the UNGD industry has submitted to state regulatory agencies and that researchers have been collecting and modeling. There is also an expanding account of water contaminants released during the UNGD process. It is, therefore, possible to know (or know estimates of) some of what is emitted at most points in the shale gas extraction, production and transport cycle. This is critically important because shale gas drilling, hydraulic fracturing, compressing, and processing are occurring very close to where people live and work and where children go to day care and school.

As shale gas development increases, so do reports of illness. Illnesses or conditions reported may be persistent, transient, intermittent, or potentially chronic. Symptoms such as burning eyes, headaches, rashes, and tingling or numbness in extremities are seen near UNGD sites across the country. Reports of these and many other symptoms have been documented by researchers associated with universities, public agencies and non-profit organizations.

Researchers have established two key components of the health effects landscape: 1) specific emissions that could plausibly be associated with reported health effects; and 2) health symptoms which seem to be relatively consistent across US shale plays. These two areas of research, the paper suggests, justify consideration of a UNGD health registry. A registry related to residents' exposures and/or health effects could inform practical on-the-ground public health interventions as well as serve long-term research and policy ends.

The paper consists of two parts. Part 1 provides a brief summary of the extraction and processing of natural gas. It then presents a discussion of environmental releases from the UNGD process - water contamination and air emissions. The paper then reviews existing research on symptoms reported by individuals and the health consequences of some of the most consistently found UNGD emissions, VOCs and particulate matter. The second half of the paper is devoted to registries. It discusses the benefits of registries generally and it lays out different types of registries that can inform our thinking about a UNGD-related registry. It identifies three relevant types of registry: exposure registry, disease registry and disaster registry. The final section of the paper introduces a set of questions that can serve as a guide to thinking about the development of a UNGD health registry.

RE: DOCKET PF14-22-000

Tennessee Gas Pipeline, 1.1.C. Northeast Energy Direct Pipeline

Dear FERC,

I have been receiving information from Kinder Morgan more than once indicating impurities are removed from the gas in the pipelines such as that being proposed by the NED route.

I have attached a copy of information I took from the internet regarding Dr. Curt Nordgaard's assessment of the health risk from gas compressor station emissions.

I find similar information across the internet and emission and health risk information at the Environmental Protection Agency (EPA) site as well. Also on the EPA site are volumes of regulatory requirements stating restrictions on emissions from compressor stations and pipeline operations, some of which are expressed in tons per year.

I don't understand how Kinder Morgan can state impurities have been removed, including benzene and hazardous air pollutants (HAPs) when other reputable sources state otherwise.

If such impurities have been removed, then why won't Kinder Morgan release reports showing that? I have asked repeatedly for the list of hazardous chemicals from compressor stations and pipeline operations and they have not delivered any lists to me.

I urge the FERC to demand that Kinder Morgan backs up their statements with proof that they are true as thousands of people have been indicating bodily harm and I refuse to be included on the list of the harmed. This harm is torture and Kinder Morgan needs to prove their statements are true.

Sincerely,

Evelyn Taylor

HEALTH RISK from gas compressor by Dr. Curt Nordgaard

The North Weymouth compressor station: An unacceptable health risk

Prepared by Curtis Nordgaard, MD Msc

Resident Pediatrician, Boston Children's Hospital / Boston Medical Center

What health conditions are associated with compressor station emissions?

- Particulate matter 1,2: Asthma, heart attacks, diabetes
- Benzene 3 : Leukemia, bone marrow suppression
- Formaldehyde 4,5: Asthma, several types of cancer
- Nitrogen oxide 6 Produces hazardous ground level ozone, an asthma trigger associated with respiratory tract irritation and infection

Do compressor stations emit dangerous levels of these pollutants?

- Benzene levels have been measured near compressor stations that far exceed cancer-causing Thresholds. Formaldehyde levels can exceed cancer-causing thresholds up to at least a half mile away from compressor stations⁸

Do residents living near compressor stations notice compressor emissions?

- Residents living near compressor stations report severe headaches, sinus problems, and throat irritation more often than residents living further away.

Would additional emissions make a difference?

- Six industries in the Fore River Basin accounted for 84 periods of federal pollution standard violations in the past 3 years, in addition to their baseline operating pollution. -Significant background emissions increase the likelihood that additional emissions will reach toxic or carcinogenic levels

Why haven't we heard more about compressors and health risks before?

- Many compressor stations are built in rural areas near much smaller populations, where fewer people are exposed to the pollutants and the health risks are therefore lower.

What additional health risks will we accept in our communities so that Spectra can build a compressor station?

- A child with leukemia?
- A parent or sibling with a heart attack?
- A neighbor in the Emergency Department with an asthma attack?

If we value the health of our communities, our families, and our children, then we must acknowledge that increased risks of asthma, heart attacks, and cancer are unacceptable.

{ duplicate copy of 20151013-5032 above }

20151016-4072

Thank you for the opportunity to state my concerns with the proposed NED pipeline.

Five different pipeline projects are proposing to nearly double the amount of natural gas coming into New England. By dealing with each project in isolation, FERC risks violating its own rules against segmentation and over-building, causing excessive and unnecessary environmental and socio-economic impacts for redundant infrastructure.

FERC also opens itself up for a legal challenge based on NEPA.

In *Fritiofson v. Alexander*, 772 F.2d 1225 (5th Cir. 1985), the court noted that CEQ scoping regulations require connected, cumulative, and similar actions to be considered together in the same EIS, i.e. where proposals up for decision are functionally or economically related, those proposals must be considered in one EIS. "If proceeding with one project will, because of functional or economic dependence, foreclose options or irretrievably commit resources to future projects, the environmental consequences of the projects should be evaluated together." (40 CFR' 1508.23) Further, with respect to cumulative impacts, the court noted that the CEQ regulations require analysis of direct, indirect, and cumulative impacts and held that in this context, the impacts were not limited to those from actual proposals, but must also include impacts from actions which are merely being contemplated (i.e., are not yet ripe for decision).

Thus, whether or not actual proposals have been submitted from Kinder Morgan, Spectra Energy, Portland Natural Gas, and their various partners, CEQ and NEPA have been interpreted by the courts to require at least a cumulative impact analysis, and, depending on the timing of the proposals, a single EIS covering them all.

More recently, FERC and Tennessee Gas Pipeline were found to have "impermissibly segmented the environmental review in violation of NEPA". *Delaware River Keeper Network v. FERC (TGP Interveners)*, No. 13-1015, June 6, 2014.

Even more recently, the CEQ guidance of December, 2014, was announced that deals with programmatic NEPA reviews, i.e. reviews that are applicable when "Approving Multiple Actions: Decision to proceed with multiple projects that are temporally or spatially connected and that will have a series of associated concurrent or subsequent decisions. Programmatic examples include:

- o Several similar actions or projects in a region or nationwide (e.g., a large scale utility corridor project);
- or

- o A suite of ongoing, proposed or reasonably foreseeable actions that share a common geography or timing, such as multiple activities within a defined boundary (i.e., Federal land or facility)”, and can be used as a way to “avoid • segmenting , the overall program from subsequent individual actions and thereby avoid unreasonably constricting the scope of environmental review.” (December 2014 CEQ Guidance, p.15-16)

The Northeast Gas Association (http://www.northeastgas.org/pdf/system_enhance0715.pdt) provides a list of planned pipeline projects in the northeast including the FERC status of each project:

- * Tennessee Gas/Kinder Morgan CT Expansion - Application filed with FERC
- * Spectra Atlantic Bridge - In FERC pre-filing
- * Tennessee Gas/Kinder Morgan Northeast Energy Direct - In FERC pre-filing
- * Spectra Access Northeast - Open Season 2015
- * Portland Natural Gas “C2C” Project - Open Season 2015

These projects are redundant and cannot be considered independently. These projects constitute alternative solutions to the same potential need and must be reviewed as such under NEPA.

With respect to a cumulative impact analysis, (1) the projects are located in Connecticut, Massachusetts, New Hampshire, Maine, and Rhode Island, in fact all the New England states except Vermont. (2) The impacts of pipeline siting are numerous and well-detailed elsewhere. (3) The New England area is rapidly trending towards reduction in use of electricity by implementing cost-saving techniques; further, the New England area is rapidly trending towards alternative energy solutions. (4) The impacts of the cost-saving techniques and expanded use of alternatives means that load on the electric grid will be reduced over the years, NOT expanded. (5) The overall impact is that there will be a glut of natural gas in New England should all of the proposed pipelines be allowed to proceed. By the time these projects are projected to be completed, the use of energy-saving techniques and alternatives will be the norm rather than the exception, and switching to natural gas will not be an option. The excess gas will have to go somewhere. Possibly, and this is what could be the plan, export.[1] The role of export in any proposed pipeline capacity expansion needs to be explicitly explained. People bearing the impacts and loss of property need to know where the gas is going. If export is identified as a “need” for increasing pipeline capacity to and through New England, an alternative that needs to be considered is serving the export market by sending gas on existing pipelines south to existing export facilities on the Gulf and Mid Atlantic Coasts.

Two offshore LNG “energy bridge” terminals that FERC recently determined were absolutely “necessary” for New England, now sit essentially idle after the costs and environmental impacts associated with their construction have already occurred. If increased natural gas is primarily a bridge fuel as many of the project proponents are claiming, then these projects should be considered only a potential temporary solution. The temporary nature of increased need, if in fact additional pipeline capacity is needed at all, must be taken into account in comparing the permanent loss of critical forested habitat associated with the projects to other short-term solutions, such as increased use of our currently underutilized LNG terminals using existing infrastructure.

[1] THE PLAN THAT DARES NOT SPEAK ITS NAME

20151016-4073

Ms Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First St. NE; Room 1A
Washington Dc 20426
Docket No. PFI4-22-000

In the 19th century , the elite of Scotland devised a scheme to convert the Highlands from subsistence farming to sheep grazing, so that they , the already wealthy, could further profit from the wool supplied to the

growing industrial revolution. To that end, the farming families were driven from their lands, and their farms burned ,in a cruel inhumane exercise that became known as The Highland Clearances. It would be hard to imagine such a crime against humanity in today's world, but the greed that infects the souls of some men knows no restraint, and history repeats itself over, and over again. With this pipeline , the greedy concoct clever false narratives of need, repeated incessantly to our elected officials and the public, in the hopes of building justification for what is essentially an appropriation of private land for the benefit of an already obscenely wealthy elite.

It would be difficult to see what we have here today - in this room - something other than one part of an unjust rigged game - a rigged game which favors the elite over the common man - a rigged game which is an unholy collusion of government and corporate power over the lives and well being of the people. And it would be difficult for history to see the FERC as anything but complicit in perpetrating this injustice against humanity ... complicit in furthering an industry extracting fossil fuels, in this case fracked gas, that is wreaking havoc in the fracking fields to our west ... complicit in the pollution in those fracking fields of the land, air , and water that are the very essentials of life complicit for the cancers, the respiratory problems, and other physical ailments, suffered by those living near the fracking wells and compressor stations ... complicit in endangering the very stability of this planet, with the approval of infrastructure which favors the extraction and burning of dirty fossil fuels over the development of clean renewable energy.

And you, the FERC ,are on the wrong side of history in this fight. Since Kinder Morgan announced the re-routing of the pipeline on December 8th, Quebec has banned the fracking of gas, followed the next day by New York, then New Brunswick, then Scotland, then Wales, then Maryland , then Holland. As the science behind tracking reveals the devastation that this is having in the lives of people and in the environment, state after state, province after province, and country after country is banning this extraordinarily harmful practice

You, the FERC, have a choice to make. You can proceed as usual with the indiscriminate approval of every fossil fuel project put forth by companies run by soulless men whose lust for money blinds them to the suffering and damage they inflict upon our communities and the planet . Or you can do what's right by your fellow man and by the world we all share, a world whose custody is placed in our hands and which we are morally obligated to protect and pass on to those generations yet unborn.

Do What's Right !

Do Not approve this Pipeline !

Kinder Morgan / Tennessee Gas Pipeline Co
Northeast Energy Direct
FERC Docket #PF14-22

VERBAL COMMENTS FOR SCOPING HEARING
Franklin Pierce University; Rindge. NH. September 29.2015

Over the last few months, I've participated in several PERC Seeping Hearings for the Northeast Energy Direct pipeline. Owing these. I've heard not only spot-on technical testimony about the hazards to health, safety, environment and economy, but intense stories about REAL personal impacts to individuals. about loss of insurance coverage should the pipeline be built. about voided mortgage contracts that would require paymen~ once the pipeline was operationatJ. I've heard passionate opposition from elected officials. speaking for hundreds of thousands of constituents, who not only fear for their immediate health and safety. but for the economy of a region that is built on its rich and clean natural resources. and for the health of the larger environment. which cannot bear the brunt of more greenhouse gas emissions; not only those of the CO2 generated when more gas is burned. but the far more potent methane that is emitted from system leaks and from intentional blow downs that are a regular part of pipeline operation.

Because of these concerns, 75 communities so far between NY, MA and NH have passed resolutions banning new pipelines; nearly 2/3 of all landowners along the proposed and ever-shifting "Market Path" pipeline route have refused to allow survey of their property; over 20,000 people have signed petitions against the project, and over 5,200 of the 5,600 comments on the docket so far have been against this project Multiple studies by respected energy analysis firms have shown that there is little to no need for extra gas pipeline capacity in the region. and that the-p~alt demand periods cited as reason for the proposal can be addressed in a variety of less costly, less impactful and by more efficient. scalable and modern ways. The Attorney General of the State of Massachusetts herself has asked that the FERC process be halted while her department awaits results of their own commissioned study - and yet there is no response from FERC.

- How do you define "public interest": when the only obvious benefit of this project would be Kinder Morgan's own. private bottom line?

- How do you hear thousands of solid. well researched arguments against the project and continue proceedings to consider it?

- How do you hear the hundreds of pleas from people whose lives along its route would be ruined and continue the parade to its approval?

- How. when voices like ours are rising up against projects affecting people all across the country, does your agency continue on with business as usual?

- How. when faced with protesters who, in the absence of any dialog from your agency. have taken to fasting at your doorstep. can your Chairman Norman Bay say, directly to their faces. that these are "just pipelines"?

These hearings are not just for pipeline builders to gather information. but for the people to be heard. Please let us know our wishes are being heard and reject the application for Northeast Energy Direct!

Cc: US Senators Elizabeth Warren, Edward Markey, Bernie Sanders
US Representatives Neal, McGovern, Tsongas
President Barack Obama

Faster Ted Glick speaks to FERC Chair Norman Bay while fasting in protest in front of FERC's offices

Ted Glick's personal account:

I spoke to Norman Bay for several minutes today. Day 9 of the 15-day water-only Fast for No New Permits. on the sidewalk in front of FERC. I went up to him when he was seen leaving the building with an assistant I introduced myself and walked next to him. asking if he would come down to receive the five copies of the Pope's encyclical we will be bringing to PERC on September 25th at noon. He said he would consider it

Then he stopped and we looked each other in the eye. He told me that he respected what we were doing with the fast and the commitment it showed as far as our beliefs. He said he felt this type of action was a good type of action.

However, he went on to say that he really had problems with us disrupting their monthly meetings and asked

if we would stop doing that.

I responded: how can we do that when there's no change at FERC as far as permitting gas pipelines and fracking infrastructure, one after the other. with virtually no exceptions.

His response: these are just pipelines. We're a regulatory agency. Blaming us is like blaming the steel companies that make pipes. It's the production of the gas that you need to deal with.

My response: how can you say you have no responsibility for the expansion of fracking? Without pipelines and infrastructure the fracked gas industry couldn't be expanding and the gas wouldn't be sent around the world. And you have a legal responsibility to do environmental impact statements and assessments which address the climate and environmental impacts. You also are supposed to be acting in the public interest, not the interests of the gas industry.

At that point, he checked out on the conversation. said something to the effect of "we should talk more," and he headed off down the sidewalk.

‘I hope my town can help me? Northfield woman says compressor siting effectively condemns her home

By RACHEL RAPKIN, Greenfield Recorder Staff Thursday, June 11, 2015

Like a new car driving off the sales lot. Holly Lovelace’s house value, she claims, has dropped due to Kinder Morgan’s interest in 200 acres for a natural gas pipeline compressor station one-third of a mile away from her home.

“The value of my home was just reduced significantly just because they sent me this letter;’ the Gulf Road resident said about the company’s plans to buy a 242-acre parcel to build an 80,000-horsepower compressor for its planned pipeline. “Tens of thousands of dollars are suddenly gone.”

Lovelace, as well as many other concerned citizens, expressed their feelings about the issue at Tuesday evening’s Selectboard meeting. many asking for the board’s help.

“I don’t have a lot of money to hire a lawyer. I don’t have a lot of skill dealing with giant corporations and I’m really frightened. and I hope my town can help me not lose everything I’ve never made in my life.” she desperately begged the board members.

Lovelace also spoke at a related state Department of Public Utilities hearing Thursday on plans by Berkshire Gas Co. to buy gas from the pipeline if it is built

“Our home has been effectively condemned;’ told the hearing, sobbing. She added that attorneys have told her the home is unsellable and un-insurable. and she and her husband can’t afford to retain a lawyer to help them. so she plans to cash out her retirement account next week.

“I’m begging you: she told the hearing officer. falling to her knees. “I’m begging you.”

Back at Tuesday’s Selectboard meeting. it began as always. with citizens’ concerns, and with so many anxious comments expressed about the pipeline and compressor station. the board diverged from its agenda and discussed the pipeline and the Federal Energy Regulatory Commission. which controls whether it is built between upstate New York and Dracut through Franklin County.

“Well. since everybody anticipates here, regarding pipeline issues. we are going to carry Kinder Morgan pipeline on the agenda every week. whether there’s something to talk about or not;’ Selectboard Chairman Jack Spanbauer said “There are a few things to update people on where we are at and I guess it’s a good time to go through that right now;

During the last Selectboard meeting. a few weeks ago, Selectboard member Jed Proujansky was absent, for he was attending a pipeline meeting at Greenfield Community College. At this particular meeting, Proujansky and the other attendees discussed certain pipeline issues such as how they are put in place. the potential effects of a pipeline and legal recourse that can be taken.

“Should PERC decide to approve the pipeline, and it’s often said that PERC has never met a pipeline that wasn’t approved. the next step is to get eminent domain over that route so they can take land as needed and compensate people for the taking;’ he told the Selectboard meeting attendees.

Proujansky assured the residents. even though they might not think they have any say or power in this decision, that they have made a difference with this issue, which has made it difficult for Kinder Morgan to go about the process.

“Ninety-six percent of the people whose land they’ve asked to survey have refused, and that’s a large number and (Kinder Morgan has) never seen anything like that. It’s thrown them for a loop and that opposition is surprising to them,” he told the citizens. “The amount of negative response has made it very difficult for them to respond to the requested information and all of the demands that people have made of them.”

Proujansky addressed Lovelace’s concern as well, with regards to the use of eminent domain.

“Federal government ruling to take land from an individual is one thing, but to take land from a state is a whole other issue that could be tied up in the courts for a long time,” he said. “The longer things are tied up, the more difficult it is. The more money it is for Kinder Morgan to develop and the less likely - not saying it won’t happen - but the less likely it is for that to go through. There are many things at play that we have to look at”

Lovelace’s residence isn’t the only area affected by the compressor station. There are nearly a half-dozen of other residents who are within the half-mile buffer zone. For 10 years, Lovelace has lived on her land and has spent many of those years paying her mortgage, and is concerned about the effects the compressor station will have on her payments. She told the committee that it’s been her lifelong dream to have a secluded house in the woods, and that “it just fell apart overnight.”

“If it’s too distressing and unpleasant to live there, we would have to just leave and abandon our property, default on our mortgage and declare bankruptcy,” she said. “We won’t ever be able to own a home again and after working your whole life to own a home, we might not have that option again and it’s devastating.”

Spanbauer, with the rest of the Selectmen nodding in agreement, said he understands the feelings surrounding the pipeline and compressor issue, but instead of solely focusing on preventing the construction, citizens should start looking at the situation realistically.

“It’s real clear that this town does not want a pipeline; we have all spoken that loud and clear,” he said. “We need to go to FERC and Kinder Morgan with that message. On the other hand, we have to say, that while we have this position, should it come to pass and there’s a pipeline coming, ‘What are we going to do to mitigate the process!’”

“I knew that this was a possibility, but it seemed like it wasn’t going to happen because there were so many people against it,” Lovelace said. “I didn’t believe it until I got the letter and then I was terrified.”

FERC Comments

Docket #PF14-22-000

September 29, 2015

From: Susan and Tim Wessels

182 Sunridge Road

Rindge, NH 03461

The home we built in 1994 sits on 3 acres of wooded land in Rindge, NH. Almost the entire 3 acres is within the 400’ study zone on Kinder Morgan maps indicating the route of the NED pipeline. We have these questions:

- (1) If our well is destroyed by excavation, is KM required to build us a new well? Are we expected to drink and use water from “pigs” the rest of our lives in this home? What happens if the well is just contaminated vs. destroyed? How far from our house are they allowed to drill through ledge, if necessary?
- (2) IS KM required to provide us with a safe indigenous source of potable water; will they pay to have a new well drilled or would that be at our expense?
- (3) How much time do they have to restore a safe source of water (e.g. a new well) on our land?

- (4) If they clear all the area within the easement, except for the house itself, do they have any responsibility to restore the acre of gardens we spent years cultivating?
- (5) I am a professional photographer and have taken and sold many photos of the gardens surrounding our house. What am I expected to do without this subject matter available throughout spring, summer and fall for my photos?
- (6) Whose responsibility is it to restore the land NOT in the actual easement that is destroyed to some aesthetically pleasing state or is that our responsibility? Would this be allowed under the requirements of the pipeline maintenance?
- (7) There are many all-terrain vehicles, including snow mobiles, that now use the Eversource ROW in the back of our house for recreational riding. They enter onto the ROW from many different places. If the pipeline is buried above the frost line, this recreational use seems very dangerous inasmuch as a snow mobile or other vehicle could hit a pipeline that becomes exposed due to frost heaves, etc. How would the power line ROW be monitored and its use for recreation be prevented given the danger such use would pose? Is the town responsible? At whose cost?
- (8) Who is responsible to keep snow mobiles and other off-road vehicles from using the ROW for recreation? Does the town have to pass ordinances restricting access to the ROW?
- (9) Who is responsible for policing the ROW for traffic? If it is the town, do the taxpayers have to pay for police to monitor ROWs to make sure they are not breached?
- 10) There are wetlands directly behind our home which are habitats for migratory birds, bald eagles, frogs, peepers, wood turtles, spotted salamander, which we understand are endangered. How will KM protect this wetland habitat?
- (11) With all the destruction and danger this pipeline would bring to our home, where are we supposed to go to recover the value of our property?
- 12) Where do we go to get back our peace of mind?

20151016-4076

To Kinder Morgan* and
The Fossil Fuel Industry

Kinder Morgan, let's be frank,
Are you a kinder kind of bank,
Say, like the one they call J.P.,
Adept at fleecing you and me?

Or are you fuelish, fossil-wise,
To lay a pipe of such a size,
And carry all the gas that's fracked,
From states whose country sides get whacked?

You send this gas to far off shores,
And pay the bribes of corporate whores,
Who take the money from the till,
While we the people foot the bill.

Yes, ship the gas to distant shores,
Despite the fact that corporate wars,
Have just acquired lots of oil,
That lurks beneath the Mid-East soil.

You grab oil here, and send gas there,

Kill multitudes, pollute the air,
Inject the earth with deadly stuff,
It's time to say, enough's enough!

Though fossil fuels have served us well,
Their time is over - can't you tell?
So turn your gaze to wind and solar,
And help us save the regions polar.

Save the forests and the oceans,
The life they hold, all living motions.
What good is gold and obscene wealth,
Compared with all creation's health?

Money's not the highest good,
There's life and love, and drink and food,
And laughter in a special place,
That's home for ALL the human race.

·Kinder Morgan is seeking to lay a large gas pipeline through a pristine area of Southern New Hampshire

A Balanced Evaluation of the NED Project Please

Delivered by W Dennis Eklof at FERC Scoping Session PF14-21-000, September 19, 2015

First, let me introduce myself. I am a retired PhD energy economist and consultant. Most of my 45-year career in the energy industry was spent advising corporations and government agencies on energy markets and energy infrastructure development.

I have read and analyzed hundreds of pages of documents on all sides of the NED debate. I won't go into details here, but I will try to put this huge body of information into perspective.

I see the originators of these studies and arguments over NED falling into one of three groups:

- Organizations that stand to reap huge financial gains from the construction of this pipeline.
- Organizations that will profit from this pipeline not being constructed.
- Groups and individuals who question the need for the project and view the construction of this pipeline as having hugely detrimental impacts on our environment and their quality of life.

We are being told by the first group that the NED project will avert an "energy crisis" in New England, reduce our electricity bills, promote our region's economic development, create jobs, and help make America energy independent. This group generally consists of Kinder Morgan and its paid lobbyists, shale gas producers for obvious reasons, gas utilities eager to expand their customer bases, electric power generators for whom managing a gas-based generation system is far easier than a more diverse and environmentally beneficial renewable energy portfolio, and unfortunately our politicians who stand to benefit from tax revenues, political contributions, and the support of voters who buy into the propipeline rhetoric.

Unfortunately this first group has the most money and resources to promote their agenda and sell their siren song.

The second group includes LNG importers and renewable energy producers and their suppliers, all of which seek to profit from growth in their business activities.

The final group spans a broad range of environmental groups, naturalists, conservationists, and home own-

ers who, despite their extremely limited funding, have mounted significant resistance to the NED project. Naturally, the studies carried out by the first group and its surrogates universally conclude that the NED project is needed and will greatly benefit New England residents without undue environmental impacts. But there are two studies I would like to cite specifically. The first was completed in August 2015 by the Bostonbased economic consulting firm Energyzt Advisors, LLC and funded by the owners of the Everett LNG terminal - clearly a member of my second group. That study concluded that existing natural gas infrastructure, along with planned and approved pipeline expansions and renewable energy projects, would be adequate to meet New England energy needs for at least the next decade. It further concluded that if NED is built, there is a real risk that New England electricity rate payers will end up subsidizing the use of the pipeline for exporting gas to Canada and beyond.

The second study I would like to mention was titled “New England’s Energy Future: The Study That Hasn’t Been Done.” I did this study in August 2014, and in it I reached the same basic conclusions as the Energyzt study a year later, a study in which I had no part.

So here we are with carefully crafted so-called facts about the benefits of the NED project to New Englanders being put forth and widely publicized by profit-seeking constituents with large public relations budgets, contrary studies from a much smaller group of corporate opponents, and many individual voices and non-profit organizations opposing NED on a number of grounds ranging from the environmental impacts to questions on the validity of long-term forecasts of abundant supplies of low-cost natural gas.

We can only hope that the Commissioners at FERC can set aside their historic bias toward energy supply infrastructure development and take a more balanced view of the NED project’s overstated benefits and underestimated risks, costs, and environmental impacts.

Dennis Eklof, 31 Ames Road, Groton, MA 01450

20151016-4090

NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION

Division of Environmental Permits & Pollution Prevention

625 Broadway, 4th Floor, Albany, New York 12233-1750

October 16, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

Re: Case No. PF14-22-000/ New York State Department of
Environmental Conservation Comments on the Scope of Environmental
Impact Statement for the Northeast Energy Direct Project.

Dear Secretary Bose,

The New York State Department of Environmental Conservation (NYSDEC) respectfully submits the following comments in response the Federal Energy Regulatory Commission’s (FERC) Notice of Intent to Prepare an Environmental Impact Statement (EIS) for the Planned Northeast Energy Direct Project (Project) proposed by Tennessee Gas Pipeline (TGP) dated June 30, 2015. Because a significant portion of TGP’s Project is proposed to be located in New York State, a thorough evaluation of all impacts, including cumulative impacts to New York’s resources, is warranted. NYSDEC’s comments are provided in order that FERC’s evaluation be as thorough as possible for the purposes of FERC’s decision-making and completion of its environmental impact review pursuant to the National Environmental Policy Act (NEPA).

Project Description

As proposed, the Project would include construction of approximately 412 miles of new natural gas trans-

mission pipeline and associated facilities in Pennsylvania, New York, Massachusetts, New Hampshire, and Connecticut. More than a third of the proposed route (approx. 150 miles) would be located in New York State. Of the 150 miles, approximately 95 miles is proposed to be generally co-located with the FERC-certificated Constitution Pipeline right-of-way (ROW)¹, and 53 miles is proposed to be generally co-located with TGP's existing 200 Line and an existing electrical utility corridor. The Project also includes a number of ancillary facilities, including construction and operation of four new compressor stations in New York State.

NYSDEC Permits and Approvals

Construction of the proposed Project requires NYSDEC to issue a Water Quality Certification (WQC) pursuant to Clean Water Act Section 401 to verify that the proposed construction activity will comply with State water quality standards. NYSDEC must also issue Clean Air Act Title V Air Permits for the proposed compressor stations, and a State Pollution Discharge Elimination System (SPDES) Stormwater Permit for Construction Activities. In addition to these permits, NYSDEC expects that TGP will file applications for State Environmental Conservation Law (ECL) permits related to protected streams, freshwater wetlands, water withdrawal, and state-listed threatened and endangered species.²

Procedures for review and approval of the permit types listed above can be found at 6 New York Codes Rules and Regulations (NYCRR) Part 621, Uniform Procedures Act (UPA).³ UPA provides a standard permit application review process including criteria for complete applications, timeframes for public notices and comment, public hearings and final permit disposition. In cases where it has been determined that the project may have a significant impact on the environment, 6 NYCRR Part 621(a)(7)(iii) requires that an application cannot be considered complete for purposes of public review and comment until a draft environmental impact statement (DEIS) has been accepted by the lead agency. NYSDEC intends to rely upon the Federal DEIS for the Project prepared pursuant to the NEPA to meet this criterion for determination of complete application.

Water Resources, Fisheries, and Wetlands

NYSDEC specific comments related to the SPDES Stormwater General Permit (SPDES GP - GP-0-15-002)⁴ based on review of Resource Report 1:

1. Section 1.2.3 (Access Roads) indicates that new access roads may be constructed as part of the Project. All new, permanent gravel access roads will need to include post-construction stormwater management practices designed in accordance with the NYS Stormwater Management Design Manual (2015 version).⁵ These same criteria will apply to any permanent compressor stations, meter stations and contractor yards constructed as part of the project. See Part III.C. and Appendix B in the SPDES GP.
2. Section 1.2.3 (Access Roads) indicates that the erosion and sediment control practices will be installed in accordance with TGP's Project-specific Environmental Construction Plans (ECPs) for each state. TGP should compare each of the practices in the ECP to NYSDEC's technical standard (i.e. NYS Standards and Specifications for Erosion and Sediment Control – "Blue Book", 2005 version)⁶ and ensure that each of their practices provides equivalent protection to NYSDEC's technical standards. See Part III.B.1. in the SPDES GP.
3. Section 1.3 (Construction Procedures) - see comment 2 above.
4. Section 1.3.1.2 (Erosion and Sediment Control) – see comment 2 above.
5. Section 1.3.2.1 (Rugged Topography) indicates that the Project will include the disturbance of soils on slopes greater than 30 percent. TGP should review the steep slope ineligibility criteria in Part I.F.7. of the SPDES GP and confirm that the Project is eligible for coverage under this general permit. If it is determined that the Project is not eligible for coverage under this general permit, TGP will be required to apply for coverage under an Individual SPDES Permit.
6. If TGP plans to disturb greater than 5 acres at any one time, it will need to submit a 5 acre waiver

request in accordance with Part II.C.3. of the SPDES GP. In addition to the criteria in Part II.C.3, NYSDEC will require TGP to retain an adequate number of dedicated Erosion and Sediment Control (ESC) contractors, in addition to its regular excavation contractor; that will be responsible for the installation, implementation, repair and maintenance of the erosion and sediment controls identified in the Stormwater Pollution Prevention Plan (SWPPP). The dedicated erosion and sediment control contractors must be on site during all soil disturbance activities associated with the construction of the Project.

7. It appears that portions of the Project may be located in municipalities that are subject to NYSDEC's SPDES GP for Stormwater Discharges from Municipal Separate Storm Sewer Systems (i.e. regulated, traditional land use control MS4s). The regulated MS4s are New Scotland and Bethlehem in Albany County and Schodack in Rensselaer County. If this observation is correct, TGP must have each of the regulated MS4s review the SWPPP for the portion of the Project within their municipal boundaries as required by Part II.A.2. of the SPDES GP. Once the MS4s' reviews are complete, they should provide TGP with a completed MS4 SWPPP Acceptance Form that must be submitted to NYSDEC with the Notice of Intent to gain coverage under the SPDES GP.

Stormwater Runoff and Erosion, General Comments

The DEIS must provide detail sufficient for NYSDEC to determine the eligibility of the SPDES GP to the proposed Project, or whether an individual SPDES Permit would be required. In addition to the eligibility criteria described above, the Project would not be eligible for coverage under the SPDES GP if construction activities adversely affect listed, or proposed to be listed, endangered or threatened species or its critical habitat; or adversely affect property listed or eligible for listing on the State or National Registers of Historic Places (including Archeological sites), unless review under Section 106 of the National Historic Preservation Act results in a Memorandum of Agreement to resolve issues related to adverse effects.

Of particular concern in certain areas along the proposed Project route is the existence of karst topography, which warrants additional considerations in preparation of the SWPPP to ensure that by-products of the construction process do not enter karst inlets, including exposed soil, fuel, oil, hydrologic fluids and other construction-related chemicals. Work in and around streams, wetlands and karst inlets (including discharge of water withdrawn from surface water or groundwater for hydrostatic testing) must employ Best Management Practices (BMPs) to ensure that water quality standards are maintained. In these areas, strict attention to proper installation and maintenance of sediment and erosion controls is critical.

The DEIS should discuss and evaluate how the various erosion control techniques described in the SWPPP will be coordinated within the construction schedule to avoid the potential for catastrophic erosion events witnessed by NYSDEC staff in previous pipeline installations. For example, extensive time delays between vegetation clearing/grubbing, initial grading of the right-of-way (ROW) and actual installation of the pipe must be avoided; temporary mulching or the use of wood chips for ROWs should be evaluated. NYSDEC recommends that only a limited length of the Project development area should be opened up at any one time. Where forest cover will be removed, NYSDEC also recommends that stump removal and grubbing not be conducted until installation crews are ready to work in that area.

Water Withdrawals

The DEIS must evaluate the installation of any Project components that have a capacity to withdraw 100,000 gallons per day (gpd) or more, either from surface or groundwater, to ensure that they do not compromise the required bypass flow (the minimum stream flow at any particular stream point necessary to protect fisheries resources). Facilities that exceed this threshold are required to obtain a Water Withdrawal permit from NYSDEC pursuant to ECL Article 15 or the Susquehanna Regional Basin Commission (SRBC) for any withdrawals within that jurisdictional area. If a proposed water withdrawal facility does not exceed the 100,000 gpd threshold, a bypass flow analysis will be required as part of the ECL Article 15 permit and/or WQC.

Wetlands

The DEIS should evaluate wetland impacts (including the State's regulated 100 foot adjacent area) that would result from construction of the proposed and alternate routes, and describe avoidance and minimization measures that were employed to reduce the potential for impacts. If proposed construction in a wetland or adjacent area could result in a significant change in the type of wetland community (such as conversion of forested to nonforested wetland) or a significant loss to the other functions and benefits of the wetland, compensatory mitigation in the form of created wetlands or other acceptable measures will be required. The DEIS should discuss preliminary compensatory mitigation options based upon the analysis of wetland impacts. Further, the DEIS should discuss BMPs proposed to be used during construction activities in wetland areas; specific plans for final grading, soil stabilization, restoration, re-planting with appropriate indigenous species to restore the original cover type, and long-term monitoring and reporting of restoration activities to ensure success of desired vegetation and control of invasive species.

Based on the proposed pipeline route, NYSDEC Division of Fish, Wildlife and Marine Resources staff has compiled a preliminary list of State-regulated wetlands that should be evaluated to determine how impacts to these wetlands may be avoided or minimized; and where unavoidable impacts may occur, to initiate discussions regarding potential mitigative measures. This list of wetlands identified in the list below is not inclusive of all potentially impacted State-regulated wetlands that may be negatively impacted by the pipeline.

Initial List of Wetlands with Project Impact Concern.

Wetland ID	ROW Mile	Description
NS-1	287.3	West of pipeline
D-11	319.3	Within Oquaga Creek state park
D-11	319.7	South of the pipeline
D-13	320.5	Pipeline passes through wetland
S-4 & D-8	323.2-323.8	Pipeline passes between adjacent wetlands
AL-23	356.7-357	Pipeline passes through wetland
AL-26	357.5	Pipeline passes through wetland
C-39	365.6	Pipeline passes through wetland
D-39	373.3	Pipeline passes through wetland
EG-1	274.2-374.4	Hudson River crossing, wetlands east of river
EG-14	377.7	Pipeline passes through wetland
EG-14	377.9	South of the pipeline
EG-12	380.4-380.6	Pipeline passes through wetland
N-20	380.8-381	Pipeline passes between sub wetland parcel
unmapped	382.4-382.5	Pipeline passes through wetland
unmapped	383.2-383.3	Pipeline passes through wetland
SC-10	398.6-398.7	Pipeline passes through wetland

Stream Crossings

The DEIS must describe the classification of all stream segments proposed to be crossed, including alternative segments, and discuss the proposed method for crossing each segment. All waters of the State are provided a class and standard designation based on existing or expected best usage; these classifications include AA, A, B, C(t) and (Ct) which are classified as "protected."⁷ Activities that disturb the bed or banks of streams with these classifications typically require a NYSDEC permit under Article 15, and are subject to a seasonal restriction on disturbance to the bed or banks of the stream from October 1 to June 1. Streams that are not classified as "protected" typically are not subject to ECL Article 15 requirements unless they

also meet the NYSDEC definition of “navigable.”⁸ However, when evaluating this Project, NYSDEC will consider all stream crossings jurisdictional under the WQC, and will apply permitting standards to all stream crossings proposed for the Project.

Stream Crossing Feasibility Analysis

As part of its stream crossings review, NYSDEC will require TGP to prepare a feasibility analysis for all stream crossings to determine the most environmentally protective and feasible crossing method at each stream. It is NYSDEC policy and precedent not to authorize a wet open-cut trench installation; acceptable stream crossings may include a “trenchless” method or a dry open-cut trench method.

Trenchless methods may include, where appropriate and technically feasible, Horizontal Directional Drilling (HDD), Direct Pipe (DP) or Conventional Bore (CB). NYSDEC will require that these trenchless methods be included in a feasibility analysis to determine if one or more trenchless methods is technically feasible. Where it is determined that a trenchless method is technically feasible, and the use of a trenchless method would result in avoidance of adverse impacts at a crossing, NYSDEC will require its use.

Advantages of trenchless methods include minimizing land disturbance, avoiding the need for dewatering of the stream, leaving the immediate stream bed and banks intact, and reducing erosion, sedimentation and project-induced watercourse instabilities. In addition, the section of ROW between the entry and exit points of a trenchless installation may not require a permanently cleared corridor. In forested areas, this can be beneficial in terms of long term water quality, integrity of the stream ecosystem, and limits on unauthorized access by recreational vehicles. Furthermore, trenchless methods are not limited by the seasonal construction limitations placed on NYSDEC-protected streams where the boring pits are placed outside of water resource regulatory boundaries.

As part of the feasibility analysis, TGP should also describe: 1) Measures to ensure that staging areas for trenchless crossings remain outside of regulated boundaries (e.g., State-wetland 100 foot adjacent area and 50 feet from protected streams); 2) Details regarding the typical work area and configuration required for entry and exit pits, including any need for additional access roads; 3) Air and noise impacts that may result from use of boring equipment; 4) Protective measures that will be used to limit runoff of sediment; 5) Disposal of drilling mud and fluids, and; 6) A contingency plan for any drilling failure that results in sediment and/or drilling fluid entering a wetland or stream.

A dry open-cut is an acceptable crossing and installation method if it is determined that a trenchless method is technically infeasible or unwarranted. A dry open-cut can be conducted at an ephemeral stream when no flowing water exists at time of installation. For flowing streams, temporary structures must be installed to redirect stream flow around the work area in order to perform the installation in the dry. The DEIS should describe the various options for this type of installation, including BMPs to be used to maintain surface water flow, allow for passage of water organisms, and avoid siltation. Trenches through streams should be opened for installation and backfilled in one continuous operation. Before trenching through stream banks, upland sections of the trench should be backfilled or plugged to prevent drainage of possible turbid trench water from entering the stream or wetland.

De-watering activities that are necessary to conduct trench work must include BMPs to discharge water at a location at a sufficient distance from waterbodies that water flow does not directly enter the waterbody. These BMPs should include engineering controls to regulate the volume of discharge water flow and filter sediments.

Where a dry open-cut is allowed, NYSDEC will require a “Depth of Pipe under Stream Report” to be prepared that includes a site-specific Vertical Adjustment Potential (VAP) analysis for each stream crossing not located in bedrock to determine the appropriate depth from the top of the pipe to the stream bed sufficient to prevent exposure of the pipe from stream erosion. The report must be conducted and certified by a qualified engineer licensed to work in New York State and must include all calculations associated with the VAP analysis as well as a statement by the engineer indicating that the calculated separation will prevent exposure of the pipe at each stream crossing as a result of down cutting of the stream. The report should also include any

constraints or limitations in completing the VAP analysis posed by a landowner's denial of access. NYSDEC will require installation of the pipe at the minimum depth determined by the VAP analysis.

Restoration

Proposed BMPs to restore the stream bed and adjacent banks following installation should be discussed in the DEIS including: 1) temporary measures to stabilize the stream bed and banks, such as grading, mulching and plantings to minimize erosion, 2) permanent stabilization utilizing appropriate placement of stream and bank materials, 3) and replacement of appropriate vegetation, including trees or shrubs beyond the permanently cleared ROW corridor. Stream restoration should follow the principles of "Natural Stream Design"⁹ instead of extensive use of rip-rap. Many of the structures utilized to stabilize stream banks can also serve to enhance in-stream habitat for fish.

Temporary Stream Crossings

The DEIS should also describe how TGP plans to install temporary stream crossings for passage of construction equipment. NYSDEC will require utilization of free span temporary equipment bridges or culverted temporary bridges for all flowing streams, regardless of classification. Temporary stream crossings would not likely be necessary at crossings where an HDD or DP pipeline installation technique would be used, therefore they would not be authorized under a NYSDEC permit. Note that specifications described in the New York Standards and Specifications for Erosion and Sediment Control, referenced above, are not applicable to crossings regulated under an ECL Article 15 permit or WQC.

For equipment crossings associated with the Project, the following standards would be applied: NYSDEC would require temporary equipment bridges to be placed at bankfull elevation or higher, be able to pass no less than a Q5 flow interval and be capable of withstanding any higher flow intervals likely to be experienced within a specific waterbody without causing damage to the stream bed or banks. Bridges may not be dragged through the stream and must be suitably anchored to prevent downstream transport during a flood. Fill may not be placed within the stream channel below bankfull elevation and placement of abutments or fill is authorized only above and outside bankfull boundaries. Geotextile fabric must be placed below and extending onto the bank; suitable side rails must be built into the bridges to prevent sediment from entering the waterbody.

Bridges with a total length of 20 feet or less must be installed only from one side of the stream. Bridges greater than 20 feet long may be installed with equipment from both sides of the stream. Under such scenarios, only one piece of equipment may cross the stream one time only via a ford located directly over the centerline of the installed pipeline path. Center supports may be used on bridges 30 feet or greater and placed no closer than 15 feet to one another and may use solid materials or a single round culvert.

Culverted temporary bridges can be allowed at streams with a bankfull width of 8 feet or less and may be crossed using a single open bottom arch culvert. Streams with a bankfull width of 4 feet or less may be crossed using a single elliptical culvert with a bottom width spanning from bank-to-bank. All culverted structures must be capable of conveying a Q50 or higher flow interval determined for the specific waterbody in which it is placed and must not be installed in streams with a gradient greater than 3 per cent. Elliptical culverts must be placed so that both the inlet and outlet are flush with the existing stream bed. Mechanical excavation to prepare the bed will not be authorized. Fill may not be placed beneath the culvert and only clean fill with particles greater than 3/4 feet may be placed on top of or used as backfill during installation. Upon removal of culverts, all fill material must be removed from the stream channel without excavating into the original stream bed or banks.

Air Quality

The DEIS should evaluate the four compressor stations proposed to be constructed in New York State, by providing a full facility description and source information used to calculate the anticipated air emission levels from operation of these facilities. Further, methane emissions from both emissions/leaks from compressor stations and from pipeline leaks should be evaluated and the Project Sponsor should identify measures

that it will employ to ensure minimization of methane emissions.

Air modeling must be conducted to demonstrate that emissions from these facilities will not cause or contribute to a violation of any National Ambient Air Quality Standard (NAAQS). Modeling for projected formaldehyde emissions should be conducted in addition to NAAQS modeling.

Compressor station construction and operation will require NYSDEC permits. The DEIS should include a discussion of the State regulatory requirements that will be used by the NYSDEC Division of Air Resources to review applications for these facilities.

Land Use

State Land

The Project proposes to cross approximately one-third mile of the Melondy Hill State Forest, roughly parallel to the North Sanford Road in the Town of Sanford, Broome County. The Project Sponsor should consult with the NYSDEC Division of Lands and Forests to assess impacts to these State Forest Lands and provide a discussion of impacts in the DEIS. The analysis should include maps, at an appropriate scale, that show any reasonable routing alternatives that would avoid State Forest Lands.

Forest Tax Law Program

The DEIS should evaluate the adverse implications of timber removal along the preferred or alternate routes on land enrolled in the Forest Tax Law Program (Real Property Tax Law 480-a) and outline procedures to ensure that affected landowners will not be inadvertently penalized. Private landowners who are enrolled in the Forest Tax Law Program will be impacted if the Project crosses private lands. Specifically, construction resulting in the removal of timber resources on property enrolled in the program may subject the landowner to violations and penalties if not addressed correctly. As such, landowners must be fully aware of the impacts and process for withdrawing land from the program to avoid any serious tax implications.

ROW Clearing and Disposal Methods

The DEIS should evaluate methods and rationale for cutting and disposition of timber and vegetation, and any use of open burning. Merchantable timber should first be harvested for lumber; secondarily, timber should be harvested for firewood in accordance with NYSDEC's regulations pertaining to the movement of firewood and quarantine areas related to the Emerald Ash Borer infestation. Clearing crews should be trained to identify and report the presence of the Asian Long-horned Beetle, the Emerald Ash Borer, and any other insect that NYSDEC identifies as a potential problem along the proposed route. Further, any use of open burning for disposal of wood waste should be evaluated relative to requirements in 6 NYCRR Part 215 including seasonal prohibitions on all open burning between March 15 and May 15 to limit the risk of wildfires.

Vegetation and Wildlife

Invasive Species

An invasive species control plan should be included within the Project construction/work plan section of the DEIS. To address the potential impacts from invasive species, the plan should document BMPs that will be utilized to prevent the spread of invasive species between work sites, including the potential transport from withdrawal water sources to the receiving water body during hydrostatic testing. The plan should incorporate pre-construction wetland and stream corridor habitat surveys to document population/percentages of invasive species present within the Project ROW. Subsequently, the Project Sponsor should ensure that post-construction monitoring and evaluation of increased populations resulting from Project construction can be accomplished.

Rare, Threatened, and Endangered Species

The DEIS should provide and evaluate general information regarding the presence of any federal or State-

listed rare, threatened or endangered (RTE) species or critical habitat areas, taking into consideration that detailed information about the location of known occurrences of RTE species is likely to be considered privileged and confidential information. Before determining whether any information concerning any sensitive RTE species may be included in the DEIS, TGP should consult with NYSDEC staff and the United States Fish and Wildlife Service (USFWS).

Moreover, the DEIS should include: a description of proposed field surveys for RTE species and/or habitat measures to avoid impacts to RTE species such as rerouting work areas, a discussion of the use of physical barriers such as fencing and warning signs, and seasonal timing of construction work. If RTE species are present and could be permanently impacted, proposed habitat mitigation for these impacts should also be described.

The DEIS should also describe proposed contingency plans to be activated if TGP unexpectedly encounters an RTE species during construction activities. The contingency plans should include training for workers, ensuring proper handling of the RTE species (by properly licensed handlers), reporting to the appropriate resource agencies, and limiting work activities in these areas until issues related to the species are resolved. Further, the DEIS should include records of State or federal agency consultation; including any requests to the New York Natural Heritage Program for RTE information along the proposed and alternate routes; while excluding sensitive, confidential species information.

NYSDEC comments related to Forest/Wildlife Impacts based on review of Resource Report 3:

1. Section 3.2.2.2.1. The Project centerline is within the boundaries of the Cannonsville/Steam Mill Important Bird Area (IBA). RR3 states the line is in the IBA for 4.7 miles, with 4 access roads. This segment of the proposed line would not co-locate with the FERC-certificated Constitution Pipeline through the IBA, but rather follow a separate path through the IBA resulting in two distinct lines bisecting the contiguous forest tract. The DEIS should include an analysis comparing the impacts to interior forests and bird species from the proposed route to a route co-locating with the Constitution Pipeline through this IBA, and other routing options that may avoid this area altogether.
2. Section 3.2.2.6. The amount of forest impacted directly (acres of trees cut) and indirectly (acres of forest within 300 feet from the edge of the ROW) should be calculated and presented for each state. An additional breakdown by acre of direct and indirect impacts in each IBA and State Forest should also be given, as this will assist agencies in evaluating total forest loss in these sensitive areas.
3. Table 3.4-4. In addition to the species listed in this table, the NYS Natural Heritage Program database also shows an historical occurrence of Henslow's sparrow (state threatened) in a Breeding Bird Atlas block crossed by the pipeline in Albany County. The potential for impact to this species should be assessed. Although the proposed centerline follows an existing ROW in this area, it is currently a grassland habitat potentially appropriate for this species.
4. Sections 3.4.2.1.8 and 3.4.2.2.2. This section references grassland habitat construction restrictions, but does not include measures to reduce impacts to forest bird species. Construction time frames for forest bird species would be similar as for bats, i.e. no clearing or cutting of forest during the breeding season. Methods and species described in the Constitution Pipeline January 2015 Migratory Bird and Upland Forest Plan should be used as a reference, and the Project Sponsor should continue to consult with NYSDEC biologists to further refine these measures. The NED Project should develop a pre-construction nest survey and mitigation plan for interior forest birds and forest impacts, and include this as an appendix to the DEIS.
5. Section 3.5.2.2. In addition to providing total acres of habitat types for the entire pipeline, these totals should also be provided by state.
6. Section 3.5.2.3. The second paragraph of this section states "Among the temporary vegetation impacts, the most prominent would be those impacting forested vegetation that is slow to regenerate..." NYSDEC considers the cutting of forest to be a permanent impact to forested habitat, as the time

required for the area to return to a forested state is likely to be longer than the life of the project.

Project Alternatives

NYSDEC supports the policy of co-locating new transmission facilities in existing utility ROW and/or highway corridors. In general, impacts to wetlands, streams, habitat and forest cover from additional placement of facilities in an existing ROW would be expected cause less environmental impacts than from placement of facilities located within a newly-cleared ROW corridor.

TGP proposes to co-locate within existing ROW corridors from Wright, New York to the Massachusetts state line. While consideration of impacts and implementation of BMPs to avoid and minimize impacts will still be necessary in this section of the Project, NYSDEC agrees that this routing alternative is preferable to creating a new ROW.

From the Pennsylvania state line to Wright, New York, however, TGP proposes to co-locate with the Constitution Pipeline Project (CP13-499 and CP-13-502).¹⁰ In light of this, NYSDEC recommends that the Project Sponsor conduct a thorough Alternatives Analysis, including, but not limited to environmental impacts related to:

- How a second pipeline trench, potentially located within 75 feet of a stream bank, would potentially impact completion of ongoing restoration to address construction of a first pipeline (here, the Constitution Pipeline);
- Stream destabilization that may occur following the installation of the Project trench, including liability associated with such destabilization;
- Behavioral barriers for aquatic species created by the potential temperature increases related to a doubling in the loss of canopy, and how might that affect the suite of species common to these waters;
- Additional interior forest impacts to avian species that would occur by increasing the width of the Constitution ROW by 50-100%;
- The creation of an additional ROW corridor partially within the Constitution ROW including impacts on ongoing restoration efforts (planting, monitoring, invasive species management).

NYSDEC previously provided comments to TGP requesting a more comprehensive review of an alternative that would more closely align with Interstate 88 (NYSDEC, April 2, 2015). While NYSDEC recognizes that any alternative presents construction challenges and may result in a variety of environmental impacts, NYSDEC reiterates its request for a DEIS Alternatives Analysis that includes a comparison of environmental impacts of an I-88 alternative with the co-location of the Project along a freshly developed ROW for the Constitution Pipeline.

Additionally, in comments submitted on October 8, 2015, FERC requested that TGP evaluate the feasibility of a single pipeline alternative combining the NED project with the Constitution Pipeline project for the Supply Path Component. NYSDEC requests that this evaluation include consideration of the factors identified above and a comparison of the impacts of this alternative with the proposed Project.

Cumulative Impacts

Finally, the DEIS should describe and evaluate the environmental impacts of the Project if the pipeline supply is available to additional customers along the route and a description of the additional facilities or upgrades needed (i.e., additional compressor stations, metering stations), and whether additional suppliers could be accommodated by this pipeline with and without a need for pipeline upgrades should drilling and production occur in areas serviceable by the pipeline. This discussion should describe the FERG approval process relating to system upgrades or modification such as additional compressor stations, lateral collection and distribution lines.

Thank you for your consideration of these important issues and please contact me if you have any questions or comments.

Sincerely

Stephen Tomasik

RE: EPA Comments in response to FERC Notice of Intent for the Northeast Energy Direct Project, Docket No. PF14-22-000

Dear Ms. Bose:

In accordance with our responsibilities under the National Environmental Policy Act (NEPA) and Section 309 of the Clean Air Act, we submit the following comments as part of the NEPA scoping process for the Federal Energy Regulatory Commission (FERC's) proposed Environmental Impact Statement for the Northeast Energy Direct Project (NED) proposed by Tennessee Gas in Pennsylvania, New York, Connecticut, New Hampshire, and Massachusetts.

Our comments are based on information provided in FERC's June 30, 2015 Notice of Intent (NOI) document for the NED Project and information contained in pre-filing draft resource reports filed by the ap-

plicant. According to that information Tennessee Gas intends to install, operate and maintain 412 miles of natural gas transmission pipeline and associated infrastructure in Pennsylvania, New York, Massachusetts, New Hampshire, and Connecticut. The overall project is intended to provide up to 2.2 billion cubic feet of capacity to transport natural gas to the northeastern United States and Canada. According to the NOI the construction (without impacts from temporary access roads) will disturb about 6,761 acres of land with 82 percent of the proposed alignment parallel to existing pipeline/utility right-of-way areas.

The construction and operation of the NED Project could result in a wide range of direct, indirect and cumulative impacts to resources that are within EPA's areas of jurisdiction and expertise. Based on our review of available information, the NOI has identified many of the potential environmental impacts to fully examine in the EIS. However, we have specific concerns about potential impacts to wetlands, drinking water, groundwater supply, and air quality (during construction and operation of the pipeline). Our attached comments in response to the NOI and the applicant's resource reports provide detail and direction on how to address these issues in the EIS.

Please contact me at 617-918-1025 with any questions regarding our scoping comments.

Sincerely,

Timothy L. Timmermann

Associate Director, Office of Environmental Review

Enclosure

Scoping Comments for Northeast Energy Direct Project

Alternatives

We recommend not limiting the EIS's discussion of alternatives to variations on the preferred route for this line, and including whether the gas demand being addressed by this project could be otherwise met by other currently proposed pipeline expansion projects in the region, existing infrastructure, or alternative sources of energy including renewable sources such as wind and solar. EPA also suggests that the EIS discussion of routing alternatives discuss whether appropriate adjacent sections of the NED and Constitution pipeline through New York can be combined or co-located to further avoid or minimize the total environmental impact from both projects. This is of particular importance as the Constitution pipeline's project has not started construction yet and is awaiting permitting from NYS Department of Environmental Conservation.

Drinking Water Supply

These comments address a number of areas of concern with respect to the planned pipeline construction and operation that could affect public and private drinking water supplies. The majority of our comments are related to the information presented in the Water Use and Quality, Resource Report No.2. Our comments are organized into six categories: Alignment Alternatives; Groundwater Impacts; Crossing Impacts to Rivers, Streams, Reservoirs, and Source Protection Areas; Consultation with State Drinking Water Programs Regarding Impacts to Source Water Protection Areas; Land Conservation; and Request for GIS Information.

Alignment Alternatives

Although the Resource Reports emphasize that Tennessee Gas will implement BMPs to avoid and minimize adverse effects to drinking water sources, we recommend including alternatives presented for avoiding the proposed alignment's crossing of multiple public drinking water supply source water protection areas. We recommend that the FERC EIS consider and present pipeline alignment alternatives that avoid crossing state-defined source or municipality-defined water protection areas, including Wellhead Protection Areas.

Groundwater Impacts

Prevention of negative impacts to aquifers (e.g. creating a preferential flow path for water and/or contami-

nants along alignments) during project construction and other pipeline related activities should be among Tennessee Gas's highest priorities. To prevent impacts to public water supplies, EPA recommends that FERC consider alternative pipeline routes that avoid state-defined Wellhead Protection Areas.

In addition to potential impacts to water resources from construction activities, EPA recommends including prevention and mitigation plans for impacts to water resources from the constructed pipeline itself. Tennessee Gas states that the "... effect on groundwater, surface water, sensitive waters, and wetland resources would be temporary and minor." However, the pipeline has the potential for long-term impacts to the water resources in proximity to the alignment. EPA recognizes the benefits of trenchless construction methods such as Conventional Bore and Horizontal Directional Drilling (HDD) as effective means to minimize and avoid impacts to wetlands and surface waters during construction. Nevertheless, these construction methods, which may be conducted at depths much greater than trench methods, have a potential of creating a groundwater flow pathway that did not exist prior to construction (i.e. a preferential flow pathway). Such a preferential flow pathway has the potential to convey groundwater and/or contaminants from one location to another, thereby spreading contamination or dewatering an aquifer. Excavated and backfilled trenches with pipelines in place below the seasonal high groundwater table may disrupt groundwater flow in this manner as well. EPA recommends that the EIS address this potential impact, and steps identified and required by FERC to prevent water movement along the alignments wherever excavation or trenchless construction methods will be used below the seasonal high water table. We also recommend that areas where alignments will pass in close proximity to groundwater resources, as defined in the Resource Reports, and/or areas near drinking water sources (including private wells) be prioritized for these measures.

For alignments that utilize trenchless construction methods, we recommend that the EIS provide engineering type specifications for the planned construction activities. These specifications, including both map views and cross section views (e.g. distance-depth diagram) of trenchless construction areas, are vital to assess potential impacts to groundwater resources. Cross-sections of trenchless construction areas should include, among other things, aquifer materials and bedrock features (e.g. fractures) which may be intersected by the alignments. These cross-sections and plan views should be readily available for review by stakeholders.

With respect to construction activities, the Water Use and Quality Resource Report states, "In the unlikely event that construction of the Project is determined to have temporarily impacted private or public well/spring quality or yield, Tennessee will provide alternative water sources or other compensation to the well owner(s). In the event that it is determined that permanent impacts have occurred to a well/spring as a result of construction activities, Tennessee will repair, replace or provide alternative sources of potable water." This approach to mitigating impacts is commendable; however, we recommend that FERC provide more clarity and context for the process of evaluating whether or not Tennessee Gas's activities have impacted a well. While Tennessee Gas will offer pre and post-construction "well testing," in cases of reported impacts to wells, well testing alone may be insufficient to determine whether Tennessee Gas's activities have impacted a water supply. A full hydrogeological assessment conducted by a qualified professional may be required. Furthermore, evaluating impacts to water supplies must not be contingent on the well owner(s) participation in Tennessee Gas's own monitoring program, or the impacts being detected during the intended timeline of Tennessee Gas's pre and postconstruction testing. Impacts to wells may occur where Tennessee has not performed this monitoring and over both short and long-term time scales. We recommend that Tennessee be prepared to fairly address these situations, and that the EIS communicate this.

The Water Use and Quality Resource Report correctly identifies blasting as a potential impact on groundwater flow. Specific steps should be outlined in the EIS for contacting well owners (both private and public) in advance of blasting, and for establishing baseline conditions. Blasting near bedrock wells poses a significant risk to the water quality and capacity of those wells. EPA recommends that alternatives to blasting be fully explored, and that the EIS describe how blasting within close proximity to bedrock wells will be avoided.

Crossing Impacts to Rivers, Streams, Reservoirs and Source Protection Areas

The proposed main and lateral pipeline alignments include a high number of crossings over drinking water

supply streams, rivers, reservoirs and source protection areas. While the Resource Reports identify water body crossings, we recommend that consideration also be given to all crossings through state-defined source water protection areas, including recharge to wellhead protection areas, and including this discussion in the EIS.

Activities associated with construction and operation of the pipeline through these critical areas could impact drinking water resources and numerous public water suppliers could be affected by the proposed alignment. For example, the Merrimack River crossing is upstream of several public drinking water suppliers dependent on surface water withdrawal from the river. The Merrimack River is classified as a Class B Waterbody- Useable for a Public Water Supply After Treatment (Water Resources Report, 2.2.11.1.4, pages 2-30, p. 2-113). The proposed alignment also directly crosses the Cheshire Reservoir and crosses within close proximity to the Cleveland Brook Reservoir (Page 2b-29, Table 2.2-6 Water bodies Associated with the Project in Massachusetts). It would also pass within the wellhead protection area for the Lanesborough Village Fire & Water District Gravel Well #1, Bridge Street and the Pennichuck Brook Watershed, which provides the public water supply for various communities within southern New Hampshire (Water Resources Report, 2.2.11.1.4, page 2-47).

We recommend that the EIS address concerns expressed by public drinking water suppliers whose sources of supplies or protection areas may be impacted by the Tennessee Gas's pipeline project. The EIS should include descriptions of site-specific Best Management Practices (BMPs) that will be employed at each water supply area to mitigate any construction or storm water runoff related impacts.

Additionally, we recommend that the EIS identify and address concerns at pipeline crossings. through areas with known or potentially contaminated sediments. For example, the proposed horizontal directional drilling operation is located upstream of public drinking water supply intakes for Methuen, Andover, and Lawrence, Massachusetts. The U.S. Army Corps of Engineers Northeast District completed two (2) assessments of the Lower portion of the Merrimack in 2006 and 2011 which included the Lawrence to Nashua portion of the River. EPA suggests contacting the U.S. Army Corps of Engineers Northeast District Project Manager for this location and other similar locations to attain relevant sediment data. Also, we recommend that State hazardous waste programs be consulted to identify any actual or potential contaminated sites. We recommend that precautions (BMPs) to mitigate sediments that may be suspended during the horizontal directional drilling operations upstream of public drinking water supply intakes be identified in the EIS.

Phone: (978) 318-8238

We recommend that the EIS examine the potential impacts of stormwater discharges from the project. During construction, it is likely that sediment and pollutant laden stormwater could be released into rivers, streams, reservoirs and the drawdown areas for water supply wells. . Although one or more NPDES and state stormwater permits may be required, we recommend that the EIS examine whether the basic requirements of those permits could be enhanced to assure a greater degree of protection.

The discharge of nutrients into many water bodies is a growing concern and new control technologies are being continually developed and we recommend they be examined and discharges to waters with Total Maximum Daily Loads be identified and BMPs adequate to attain applicable load reductions applied.

State Drinking Water Program Contacts for Consultation on Source Water Protection Areas

The Water Use and Quality Resource Report identifies crossings of streams, surface waters and conservation land by the proposed main pipeline and the lateral sections. The Land Use Recreation, and Aesthetics Resource Report indicates that the state environmental agencies have been contacted to determine whether any source water protection areas would be intersected. Additional contact information is provided below for the

states' respective source water programs. We suggest consulting with state source water program contacts and addressing their comments and concerns in the EIS.

Land Conservation

The proposed alignment would cross numerous tracts of conservation land purchased for the protection of drinking water sources and other natural resource protection areas. We recommend that the EIS identify

alternatives to the current alignment to limit the impact to these areas. For example, conservation land purchased by both the NH Conservation Land Stewardship Program and the NH State Drinking Water Revolving Fund for protecting source water protection areas is crossed by the proposed alignment (Refer to Table 8.3-5, pages 8b-250-251). Although the Resource Report states that the majority of the project is co-located within existing utility or energy rights of way, we recommend that the EIS indicate exactly where this land and other conservation lands are crossed.

Request for GIS Information

GIS mapping is an essential part of impact assessment. EPA, and we assume other stakeholders along the proposed project corridor, would benefit from access to GIS data for the proposed alignment that can be easily downloaded or served to a GIS for use and analysis. The Resource Reports include PDF maps of the proposed alignments, many of which are large files and are difficult to work with and view. We recommend that FERC, or the applicant, provide access to online mapping that allows users to interact with the map and map layers. The online mapping would allow stakeholders to view and interact with maps of the proposed alignment locations for the entire project, including choosing which map layers to view at various map scales. All of the layers used to create the PDF maps in the Resource Reports can be made accessible including those for: water (e.g. drinking water protection areas, aquifers, etc.), fish, wildlife, vegetation, cultural resources, socioeconomics, geological resources, soils, land use (e.g. known contamination sites, etc.), recreation and aesthetics; air and noise quality. There are many, readily available, commercial mapping applications that can be used to establish this capability. As one example, EPA offers its NEP Assist tool which facilitates the environmental review process and project planning in relation to environmental considerations.

Wetlands and Other Aquatic Resources

We recommend that the EIS provide a detailed description of the wetlands/water bodies and vernal pools along the route that includes their location as well as an assessment of their functions and values. The EIS should also describe the portions of the pipeline construction work that will involve discharging dredged or fill material in wetlands or other waters of the United States that will be subject to the permit requirements of Section 404 of the Clean Water Act. Discharge activities must comply with EPA's regulations issued under Section 404 (b) (1), referred to as EPA's 404 Guidelines (40 CFR Part 230), which require the following: that there be no practicable, less environmentally damaging practicable alternative to the proposed action; that the activity not cause or contribute to violations of state water quality standards or jeopardize endangered or threatened species; that the activity not cause or contribute to significant degradation of waters of the United States; and that all practicable and appropriate steps be taken to minimize potential adverse impacts to the aquatic ecosystem (Section 230.10). The guidelines further establish a presumption, which the applicant has an opportunity to rebut, that for projects that are not water-dependent, a practicable alternative to the filling of wetlands exists. The EIS should include an evaluation of ways in which each alternative alignment (or compressor station facility and associated infrastructure) can be designed/sited to avoid impacts to wetlands.

Unavoidable impacts to wetlands, surface water resources (impacts to rivers/streams quality and flow), and wildlife should be fully disclosed in the EIS. These impacts include but are not limited to: direct filling of wetland for pipeline construction and/or operation; temporary impacts to wetlands resulting from access to wetland areas for construction purposes; indirect impacts, such as clearing impacts resulting in a change (either permanent or temporary) of cover type within a wetland (e.g. converting a forested wetland to an emergent or scrub/shrub wetland); indirect impacts resulting from erosion or sedimentation into wetlands or waterbodies; and induced growth which can result from construction of the project (i.e. additional development induced by the development of the pipeline). We recommend that the EIS also specifically document mitigation to compensate for unavoidable wetland losses and cover type conversions from construction and operation of the project. In addition, we recommend that all construction practices that will be utilized to minimize impacts be documented. Specifically, we recommend standard conditions to protect wetlands be

documented in addition to steps that may be taken to reduce impacts to particularly sensitive areas such as vernal pools. We recommend that the EIS also provide comprehensive information to explain how stream and river crossings will be conducted to avoid and minimize impacts and similarly how impacts to state and federally listed endangered species will be avoided/addressed. In addition, we recommend that the EIS:

- discuss the advantages and disadvantages associated with each of the alternatives considered (with respect to wetland issues) and the rationale for selecting pipeline alignments and compressor station locations with respect to potential impacts to wetland, stream and vernal pool ecosystems. For all sections of the proposed pipeline that will be on a new alignment, the alternatives analysis should show how the alignment was designed to minimize aquatic impacts. In addition to access to the GIS data layer showing streams and wetlands, photographs and/or aerial photos of the project corridor can be very helpful at this stage. For the MA and NH portions of the alignment, we recommend that MA (Bio Map) and NH Wildlife Action Plan (W AP) information be correlated to project plans/aerial photos as well, in all locations that are on new alignment. We recommend that W AP information also appear on the U~GS maps for use on co-located utility corridors.”
- identify wetlands along the pipeline route (either within the right-of-way or in close proximity) that support rare and exemplary natural communities such as the wetlands, bogs and fens of the Rensselaer Forest Tract, an Audubon Important Bird Area. We recommend that the EIS describe specific mitigative measures to ensure that they will be protected from potential indirect and cumulative impacts associated with the pipeline and compressor stations.
- clearly identify the locations of temporary and permanent access roads and discuss how the wetland ecosystems will be protected from direct and indirect impacts associated with these roads.
- describe the long-term right-of-way maintenance techniques planned for the project. We recommend that the discussion include an analysis of the effects of maintenance techniques on plant life and wildlife habitat and should explain whether herbicides will be used and whether specific buffer zones will be established around wetlands where herbicide application would be prohibited. We recommend that the analysis be expanded to discuss the potential for the introduction of invasive species and methods to control their spread over the life of the project.
- discuss and describe appropriate buffer zones to avoid or reduce indirect effects of construction to streams and wetlands (which may vary depending on the wetland community type described). The EIS should include enough information to show the type and location of wetlands in the project area. This information will help us to assess the potential impacts of the proposed action and to determine the effectiveness of the mitigative measures proposed.
- include a comprehensive discussion of measures to further reduce impacts to water bodies and aquatic organisms along the pipeline routes including the use of directional drilling and time of year restrictions to control instream construction work periods. We recommend that the EIS also provide detailed contingency plans that fully describe the process that will be followed should the chosen construction technique prove unsuitable (for example, failure of the directional drilling). EPA suggest that this process description identify other potential construction techniques and the approvals necessary before a major modification can be made to agreed-upon (and permitted) construction protocols.

Finally, the EIS should also describe a strategy for determining adequate mitigation to compensate for all unavoidable direct, indirect and cumulative wetland impacts from construction and operation of the project as well as impacts to state and federally listed endangered and threatened species. We recommend that this strategy specifically describe the methodology that will be used to determine the amount and type of mitigation that will be necessary to address loss of both wetland acreage and function and the approach that will be used to develop an appropriate mitigation package. In general, we found the description of wetland impacts provided in Table 2.3-8 of the Water Use and Quality Report helpful as it categorizes impacts by wetland type and whether the impact is related to operation or construction.

However, the analysis would better support future mitigation planning and permitting if it includes a clear presentation of the following impacts:

- Direct Impacts (the placement of fill) to wetlands, streams and vernal pools’
- Temporary Impacts (alteration to wetlands, that will grow back to existing form; for example, cutting trees and the use of swamp mats for the construction process) to forested, shrub and emergent plant communities.
- Indirect Impacts including the permanent conversion of forested wetlands to scrub-shrub wetlands; permanent conversion of forested wetlands to emergent wetlands; removal of forested cover (upland or wetland) within 100’ of any vernal pool; and removal of forested cover (upland or wetland) within 100’ of any stream

Air Quality Analysis

General Conformity

The Northeast Energy Direct Project will be located in portions of Pennsylvania, New York, Massachusetts, New Hampshire, and Connecticut. The broad scale project map for New England indicates that the project may be located within a number of carbon monoxide attainment areas with current maintenance plans in place (Hartford-New Britain-Middletown area, Connecticut, and Lowell area, Massachusetts) as well as an ozone nonattainment area (Greater Connecticut 2008 marginal nonattainment Area, Connecticut). Project components located within these areas need to be evaluated for applicability to the Federal General Conformity regulations. (The General Conformity regulations can be found at 40 CFR 93.150 - 165.) Specifically, if the total of direct and indirect emissions of a criteria pollutant or precursor in a nonattainment or maintenance area caused by a Federal action would equal or exceed the applicability thresholds established in 40 CFR 92.153, the requirements of general conformity must be satisfied.

A list of the nonattainment areas and attainment areas with a current maintenance plan in place within Connecticut, Massachusetts, and New Hampshire are identified in the following chart. General conformity is applicable in these areas. Complete air quality classifications can be found in 40 CFR 81 “Designation of Areas for Air Quality Planning Purposes.” New York’s air quality classifications can be found at section 81.333, and Pennsylvania’s air quality classifications can be found at section 81.339. In addition, the chart identifies the general conformity applicability thresholds from 40 CFR 93.153, in tons per year (tpy), for each of these areas:

National Ambient Air Quality Standard (NAAQS)	Name of Area	Air Quality Designation	General Conformity Thresholds (tpy)
<u>Pennsylvania</u>			
2008 ozone NAAQS	Allegheny, Armstrong, Beaver, Berks, Bucks, Butler, Carbon, Chester, Delaware, Fayette, Lancaster, Lehigh, Montgomery, Northampton, Philadelphia, Washington and Westmoreland.	Nonattainment	VOC: 50 NOx: 100
2012 PM Standard Fine	Allegheny, Delaware, Lebanon S02, andNOx	Nonattainment	Direct PM2.s, (unless

Particulate Matter (PM2.s) NAAQS			determined not to be a significant precursor): 100 VOCor ammonia (if determined to be significant precursors): 100
200624-HourPM2.5 NAAQS	Allegheny (Liberty-Clairton), Allegheny (remainder), Armstrong (P), Beaver, Bucks, Butler, Cambria, Chester, Cumberland, Dauphin, Delaware, Greene (P), Indiana (P), Lancaster, Lawrence (P), Lebanon, Lehigh, Montgomery, Northampton, Philadelphia, Washington, Westmoreland and York.	Nonattainment (unless determined to be	Direct PM2.s, S02, andNOx determined not to be a significant precursor): 100 VOC or ammonia (if significant precursors): 100
Carbon Monoxide (CO)	All areas of PA	Attainment	
2010 Sulfur Dioxide NAAQS (S02)	All areas of PA	Attainment	
Connecticut see 40 CFR 81.307			
2008 ozone NAAQS	Greater Connecticut	Marginal Nonattainment	VOC: 50 NOx: 100

2010 Sulfur Dioxide NAAQS (SO ₂)	Central New Hampshire, New Hampshire	Nonattainment	SO ₂ 100

On March 6, 2015 (80 FR 12264), EPA published the Final Rule for “Implementation of the 2008 National Ambient Air Quality Standards for Ozone: State Implementation Plan Requirements.” This final rule revoked the 1997 eight hour ozone National Ambient Air Quality Standard effective April 6, 2015; hence, conformity is no longer applicable to the 1997 eight hour ozone NAAQS, and accordingly, is not addressed in the above chart.

EPA is available to work with the Federal Energy Regulatory Commission (FERC) during the development of the EIS to help address general conformity and insure general conformity is satisfied prior to any trigger of the “take or start Federal action” requirement.

Reducing Diesel Emissions

Given the public health concerns about diesel exhaust from heavy duty diesel trucks and other heavy duty construction equipment, EPA encourages the project proponent to commit to the use of newer vintage diesel engines where possible. Alternatively, we encourage the project proponent to require diesel retrofits where practicable, require the use of cleaner fuels, and institute idle reduction measures to minimize emissions from diesel construction equipment.

Retrofit technologies may include EPA verified emission control technologies and fuels and CARB-verified emission control technologies. A list of these diesel exhaust control technologies can be accessed at <http://epa.gov/cleandiesel/verification/verif-list.html>. In addition, the Northeast Diesel Collaborative has prepared model construction specifications to assist in developing contract specifications that would require construction equipment to be retrofitted with control devices and use clean fuels in order to reduce diesel emissions. The model construction specifications can be found on the Northeast Diesel Collaborative web site at URL address <http://northeastdiesel.org/pdf/NEDC-Construction-Contract-Spec.pdf>. We recommend that FERC identify specific exhaust emission mitigation measures in the EIS and require a binding commitment from the applicant to implement these measures to help reduce and minimize the air quality impacts from construction of the proposed project.

Regional Impacts of the Project

In addition to the typical analysis of air pollution from construction impacts and operation of the project, we suggest that the EIS also include an assessment of the air quality impacts associated with additional natural gas supplies in the region and their potential to offset the combustion of other fossil fuels in both the heating and electric power generation sectors.

State Air Permits and Licensing

New or modified compressor stations may be subject to state air quality permitting or other state air quality emission regulations. We encourage the applicant to coordinate early on with the appropriate State Air Quality Agencies to identify applicable requirements. The EIS should describe these requirements in detail, especially the opportunities for public involvement regarding siting, and mitigation for impacts associated with operations of the compressor station facilities. The EIS would be improved by including in the siting discussion an explanation of . how much flexibility in compressor station siting exists along the pipeline route and whether/how the compressor station locations suggested for the project avoid/minimize community impacts.

Greenhouse Gas Emissions

We recommend that FERC use the Council on Environmental Quality's December 2014 revised draft guidance for Federal agencies' consideration of GHG emissions and climate change impacts in NEPA to help outline the framework for its analysis of these issues. Accordingly, we recommend the EIS include an estimate of the GHG emissions associated with the project, qualitatively describe relevant climate change impacts, and analyze reasonable alternatives and/or practicable mitigation measures to reduce project-related GHG emissions. More specifics on those elements are provided below. In addition, we recommend that the NEPA analysis address the appropriateness of considering changes to the design of the proposal to incorporate GHG reduction measures and resilience to foreseeable climate change. We recommend that the draft and final EIS make clear whether commitments have been made to ensure implementation of design or other measures to reduce GHG emissions or to adapt to climate change impacts.

More specifically, we suggest the following approach:

- Include in the "Affected Environment" section of the EIS a summary discussion of climate change and ongoing and reasonably foreseeable climate change impacts relevant to the project, based on U.S. Global Change Research Program" assessments, to assist with identification of potential project impacts that may be exacerbated by climate change and to inform consideration of measures to adapt to climate change impacts. (Among other things, this will assist in identifying resilience-related changes to the proposal that should be considered).
- Include in the "Environmental Consequences" section of the EIS an estimate of the direct and indirect GHG emissions associated with the proposal and its alternatives. Example tools for estimating and quantifying GHG emissions can be found on CEQ's NEPA.gov website",
- Describe measures to reduce GHG emissions associated with the project, including reasonable alternatives or other practicable mitigation opportunities, and disclose the estimated GHG reductions associated with such measures. The DEIS alternatives analysis should, as appropriate, consider practicable changes to the proposal to make it more resilient to anticipated climate change. EPA further recommends that the FERC certificate requires implementation of reasonable mitigation measures that would reduce or eliminate project-related GHG emissions.

Environmental Justice

Pursuant to Executive Order 12898 - Federal Actions to Address Environmental Justice in Minority and Low-Income Populations, "Each Federal Agency shall analyze the environmental effects, including human health, economic and social effects, of Federal actions, including effects on minority communities and low-income communities, when such analysis is required by NEPA. Mitigation measures outlined or analyzed in an environmental assessment, environmental impact statement, or record of decision, whenever feasible,

should address significant and adverse environmental impacts of proposed Federal actions on minority communities and low-income communities.” We encourage FERC to fully consider environmental justice issues as it prepares the EIS for the project.

Guidance” by CEQ clarifies the terms low-income and minority population (which includes Native Americans) and describes the factors to consider when evaluating disproportionately high and adverse human health effects. The EIS should include an evaluation of environmental justice populations within the geographic scope of the project. Assessment of the project’s impact on minority and low income populations should reflect coordination with those affected populations.

We suggest that census tract level data be used to determine the presence of low-income and minority populations in the project area that may be potentially impacted. We recommend comparing census tract or community level data to state population data in order to ensure that minority and low-income populations are properly identified. Community level data is the most useful in that it captures EJ populations that may be present at the municipal level but not identifiable when the analysis occurs at a broader level. This approach will ensure that the presence of minority and low-income populations are not artificially diluted or inflated and that the characteristics of the potentially affected communities are identified in order to evaluate potential impacts from the proposed action.

EPA’s EJSCREEN is an environmental justice screening and mapping tool that utilizes standard and nationally consistent data to highlight places that may have higher environmental burdens and vulnerable populations. EJSCREEN can be accessed at <http://www2.epa.gov/ejscreen>.

We recommend the EIS also describe outreach and public involvement conducted to all other communities that could be affected by the project, since rural communities may be among the most vulnerable to health risks associated with the project. Please refer to EPA’s EJ website for additional information.

Impacts to Health & Monitoring of Project Impacts

We recommend that the EIS discuss and analyze the potential for health impacts to host communities from compressor station emissions. If this project specific information is not available, EPA recommends that FERC consider requiring that the applicant prepare a compressor station monitoring plan to assess emissions from project compressor stations along the route to address citizen concerns regarding facility emissions over the life of the project. EPA suggests that the EIS also discuss the complete range of mitigation measures/design technologies that will be implemented to reduce emissions from project compressor stations during all phases of project operation.

EPA also suggests that FERC assess potential health impacts stemming from construction and operation of the proposed project. This analysis could include direct, indirect, and cumulative environmental, human health, sociocultural, and economic impacts of the proposed pipeline and associated infrastructure such as compressor stations. The analysis could consider input from stakeholders to determine the potential effects of a proposed project on the health of a population, determine the distribution of those effects within the population, and identify recommendations on monitoring and managing those effects.

Children’s Health Issues

Pursuant to Executive Order 13045 on Children’s Health and Safety, we recommend the EIS identify and assess environmental health and safety risks that may disproportionately affect children. Analysis and disclosure of these potential effects under NEPA is important because some physiological and behavioral traits of children render them more susceptible and vulnerable than adults to health and safety risks. Children may be more highly exposed to contaminants because they generally eat more food, drink more water, and have higher inhalation rates relative to their size. Also, children’s normal activities, such as putting their hands in their mouths or playing on the ground, can result in higher exposures to contaminants as compared with adults. Children may be more vulnerable to the toxic effects of contaminants because their bodies and systems are not fully developed and their growing organs are more easily harmed.

We believe that an analysis of impacts to children from construction and operation of the pipeline should

be included in a NEPA analysis if there is a possibility of disproportionate impact on children related to the proposed action. EPA views childhood as a sequence of lifestages. Therefore, exposures to children at each lifestage, as well as pregnant and nursing women, are relevant and should be considered when addressing health and safety risks for children.

Because children can be more susceptible to noise levels, mobile source air pollution, construction dust, and the chemicals associated with building and construction materials, we recommend that the NEPA analysis specifically address the potential direct, indirect, and cumulative impacts of the proposed project on children's health, including consideration of prenatal exposures (exposures that may be experienced by pregnant women).

For more information on how to characterize and address children's exposures and susceptibilities to pollutants of concern, please see our August 14, 2012 memo "Addressing Children's Health through Reviews Conducted Pursuant to the National Environmental Policy Act and Section 309 of the Clean Air Act. 10

Please contact Kathleen Nagle, EPA New England's Children's Environmental Health . Coordinator at 617-918-1985 with any questions regarding the consideration of Children's Health issues.

Tribal Coordination

The NOI explains that FERC is using the scoping process to solicit the views of interested Indian tribes and the public on the project's potential effects.

Since several federally recognized tribes claim cultural affiliation with at least some of the impacted areas of the proposed area of potential effect, it is recommended that all tribes in the impacted states be invited as a consulting party.

- In New England, this includes the Mashantucket Pequot Tribal Nation, the Mohegan Tribe, the Narragansett Indian Tribe, the Wampanoag tribe of Gay Head (Aquinnah), the Mashpee Wampanoag Tribe, the Penobscot Indian Nation, the Houlton Band of Maliseet Indians, the Aroostook Band of Micmacs, and the Passamaquoddy Tribe. Additionally, the Stockbridge-Munsee Band of Mohican Indians, headquartered in Bowler, Wisconsin, likely claims cultural affiliation with a portion of the area of potential effect (APE) that traverses western Massachusetts, and may be interested as a consulting party.
- In New York, this includes the Oneida Nation, Onondaga Nation, Seneca Nation, Cayuga Nation, Tuscarora Nation and the Shinnecock Nation.
- In Pennsylvania, there are two federally recognized tribes currently residing in Oklahoma that may claim cultural affiliation with the proposed APE, as their ancestral homelands include sections of Pennsylvania. These tribes include the Delaware Tribe of Indians (<http://delawaretribe.org/services-and-programs/historic-preservationstates-and-countiescovered-by-dthpo/>) and the Delaware Nation (<http://delawarenation.com/>).

Pipeline Construction

We recommend the EIS for the NED project specifically address the following issues:

- Pipeline materials and corrosion protection proposed for the pipeline;
- How pipe sections will be joined and how leaks will be detected and addressed;
- Measures to protect the pipeline should it pass under a heavily trafficked road to prevent damage from heavy loads;
- Proposed trench backfill material and a description of precautions to avoid damage to the pipe or its coating.

Analysis of Indirect and Cumulative Impacts

The Council on Environmental Quality's (CEQ) NEPA regulations require EISs to evaluate growth-inducing changes in the pattern of land use, population density or growth rate, and related effects on air and water and

other natural systems that result from the proposed action and alternatives. The regulations define indirect (sometimes called ‘secondary’) effects as those “which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable.” The regulations state that impacts include ecological, aesthetic, historical, cultural, economic, social, or health impacts, whether direct, indirect, or cumulative. The CEQ NEPA regulations define cumulative impacts as “ ... the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.” We also recommend that detailed account of cumulative impacts that will occur due to the construction and operation of both Constitution Pipeline and the NED be included in the EIS. We recommend that other proposed or existing pipeline projects (looping or laterals) that are associated with proposed portions of the NED pipeline be considered in the cumulative impacts analysis.

Footnotes:

- 1 We recommend that the wetland assessment be prepared in a manner consistent with the Army Corps of Engineers New England District (formerly the New England Division) descriptive approach to wetland assessment as presented in The Highway Methodology Workbook Supplement Wetland Functions and Values A Descriptive Approach, NEDEP-360-1-30a, dated November 1995.
- 2 We note that under Section 404 of the Clean Water Act these types of impacts are referred to as “secondary impacts,” but that for clarity and consistency we are using the term “indirect impacts” in this letter.
- 3 The US Army Corps of Engineers (Corps) New England District Compensatory Mitigation Guidance can be found at:
<http://www.nae.usace.army.mil/Missions/Regulatory/Mitigation/CompensatoryMitigationGuidance.aspx>. Also, the EIS should describe how the project will be consistent with the Corps 2008 Mitigation Rule (also discussed in detail at the Corps website).
- 4 It would also be helpful if the EIS discusses and considers the NH Wildlife Action Plan in a similar fashion as the Massachusetts Bio-map, Using the maps entitled, the Highest Ranked Wildlife Habitat by Ecological Condition, should highlight if any new alignment passes through any of the highest ranked habitat in NH (pink color) or the Highest ranked habitat in the biological region (green color). If any new alignments are located in these valuable areas, the EIS should explain why the proposed alignment will be the least damaging alternative.
- 5 We recommend that the EIS identify the number of pools what would be impacted directly by the project (with the number impacted being more important than the total acres of vernal pool impacted). However, secondary impacts to vegetation within 100’ of the vernal pools can remain as a simple total of square feet.

Re: Scoping Period Comments on the Proposed Northeast Energy Direct Project FERC Docket PF-14-22-000, Tennessee Gas Pipeline Company, LLC

Dear Secretary Bose,

Mount Grace Land Conservation Trust (“Mount Grace”) respectfully requests further study and subsequent inclusion of complete, detailed information in the Environmental Impact Statement for the Northeast Energy Direct Gas Pipeline Project proposed by Tennessee Gas Pipeline Company, LLC (“Proposed Pipeline”, “Project”, or liNED”) on the subjects of concern identified below. These comments are made in response to Tennessee Gas Pipeline Company’s (“TGPII) Draft Environmental Resource Reports submitted to the Federal Energy Regulatory Commission (“FERC” or “Commission”) on July 24, 2015 (“Resource Reports” or “RR”).

Mount Grace is a Massachusetts charitable corporation established in 1986 for the purposes outlined in its Articles of Organization: “(a) to preserve, to protect, and to promote for present and future generations the balanced use of the remaining open space lands which contribute to the unique rural quality of western Massachusetts, southern New Hampshire, and southern Vermont; (b) ... ; (c) to assist local governments and citizen organizations to develop the practice of balanced land use that furthers the land planning policies of our area consistent with the above stated goals; and (d) to further develop in our area’s residents, an appreciation and understanding of the inter-relationships between people and their shared environment that must be recognized, established, and maintained to ensure the survival of all species.”

The core geographic region of Mount Grace’s operations includes twenty-three north-central Massachusetts towns in Franklin and Worcester Counties. Mount Grace also operates a statewide AmeriCorps program throughout Massachusetts and holds a conservation easement on land in the New Hampshire towns of Winchester and Hinsdale. Since 1986, Mount Grace has helped permanently protect more than 29,000 acres working with federal, state, municipal, charitable, and private individual partners and funders.

Directly Affected Landowner

Mount Grace is a landowner directly affected by the NED, as we own conservation land on the proposed pipeline route in Erving, MA between mileposts (“MplI) 16 and 17 and adjacent (within .25 mile) to the proposed pipeline route in Warwick, MA near MP 28. Mount Grace also holds conservation easements (synonymous with conservation restrictions under MGL c. 184, s. 31-33) on land adjacent to the proposed pipeline route in Northfield, MA near MP 28 and in Montague, MA near MP12. In addition, Mount Grace has facilitated the conservation of several other permanently protected lands directly affected by the NED in Northfield, MA on the Proposed Pipeline route and adjacent to the planned Compressor Station at MP24, in some instances pre-acquiring and later conveying the land or easement to the Commonwealth of Massachusetts or Town of Northfield explicitly for conservation purposes.

The 23-town primary service area of Mount Grace is well-documented as a highly-intact and threatened landscape that provides extensive environmental, health, recreational, cultural, and economic benefits to local communities and the general public. For example, a 2009 study by the United States Forest Service ranked the Millers River Watershed, which covers nearly half of Mount Grace’s core service area, as one of the nation’s watersheds whose high water quality is most threatened by increased development density on private forest lands.’

Assessing Public Benefits and Adverse Effects

In order for FERC to meet its statutory obligations, a full and complete accounting of adverse impacts (net mitigation) to property rights, the environment, and communities must be made in order to determine that there exists a net public benefit from the NED project.’

Three independent reports compiled since 2003 indicate that of Massachusetts’ five million acres: one million has been developed, one million has been conserved, and a strategically selected half of the remaining three million acres must be conserved to sustain the ecosystem services, biodiversity, food and water sources, and quality of life in the Commonwealth. The NED would diminish both already conserved resources and the quality of other natural resources that have been identified as priorities for future protection. Comprehensive acquisition and replacement costs of lands that will be lost completely and those that will be

Co-location and Relocation to New Hampshire

Mount Grace does not support the Proposed Pipeline, either as proposed in the November 2014 Preliminary Application or as relocated by TGP’s amended preferred route as outlined in a December 8, 2014 filing with FERC. The revised route relies heavily on the broad assumption that co-location, most often parallel and adjacent to electric transmission line easements, inherently reduces environmental impact. This assumption has not yet been explicitly analyzed, compared, or documented. Contrary to public perception, co-location would require as much or more deforestation. TGP has described, and in documented instances demarcated on the ground, that frequently a 100+/- buffer of trees, in forested areas, would exist between the edge of the existing easement clearing and trees cleared in the proposed co-located easement for the NED. Narrow stands of trees suddenly exposed to increased wind are highly susceptible to wind-throw. Such risks must be detailed in the forthcoming draft Environmental Impact Statement (“EIS”).

Of approximately 81 miles of co-location in Massachusetts, only three miles are co-located with an underground pipeline. (TGP RR Table 8.1-3) FERC must require a thorough comparison between co-locating the greenfield NED pipeline along existing overhead transmission line routes and other route alternatives, with particular attention to impacts to wetlands, tree cover, steep slopes, other erosion prone areas, and intact forest blocks.

It is stated by TGPs that the December 2014 reroute will cross fewer Article 976 properties in Massachusetts. However, this is only achieved by moving seventy-seven miles of the pipeline out of Massachusetts altogether and into New Hampshire, a jurisdiction which will receive a disproportionately low amount of any project benefit. Mount Grace is a founding member of the Quabbin to Cardigan (Q2C) Partnership”, a two-state, 100-mile conservation focus area initiative established in 2003 by public and private conservation entities in Massachusetts and New Hampshire. Several affected New Hampshire towns are within the Q2C region. The revised route is equally incompatible with the goals of the Q2C Partnership as the initially filed route.

It is worthwhile noting here that TGP’s July 24, 2015 filing reflects a reduction of the original project size (so-called “benefit”) from 2.2 Bcf/day to 1.3 Bcf/day of gas yet delivers substantially equivalent negative impacts to property rights, terrestrial and aquatic natural resources, and community interests.

Soils and Geologic Resources

Steep slopes with certain soil attributes are evidencing increased landslide occurrences resulting from increased incidences of intense rain events due to increased atmospheric moisture from rising global temperatures. The risk of such events is mapped and documented in a 2013 study” by the Massachusetts State Geologist prepared for the Federal Emergency Management Agency, the Massachusetts Emergency Management Agency, and the Massachusetts Department of Conservation and Recreation. The risks and associated costs of road repair and surface water sedimentation, among other impacts, have not yet been fully or adequately described in TGP’s Resource Reports. Many public (and private) conservation lands impacted by the proposed NED contain such vulnerable steep slopes, for example, Potter Mountain in the Pittsfield State Forest.

Benefits of Conservation Land

In Massachusetts, there remain at least 85 properties subject to Article 97 Constitutional protection, of a total of at least 110 legally conserved properties, directly impacted by the Proposed Pipeline. Massachusetts' public and private lands, and areas subject to conservation and other preservation restrictions (collectively, "Conservation Areas") must be appropriately considered in FERC's review of the costs and benefits of the Project.¹ These Conservation Areas provide important environmental benefits as well as significant economic and other social values to land owners and surrounding communities.

Massachusetts invests upwards of \$30 million dollars of public, tax-payer funds per year in acquiring and otherwise permanently conserving land and easements in order to protect their economic, environmental, health, and social benefits. FERC must, and should, consider the impacts of the Proposed Pipeline on these environmental and economic resources when determining if the Proposed Pipeline serves the public interest. Should FERC proceed with a full National Environmental Policy Act ("NEPA") analysis or issue a Certificate of Public Convenience and Necessity ("Certificate") for the Proposed Pipeline, its determinations of environmental impacts, required mitigation, and Certificate conditions must fully account for the benefits of all public and private Conservation Areas that will be impaired by the Proposed Pipeline. Although the Natural Gas Act ("NGA," 15 U.S.c. § 717 et seq.) may preempt some of the state laws that protect Conservation Areas, FERC's analysis should still be informed by the strong legal system that the Commonwealth has developed to protect the benefits provided by, and public and private investment in, Conservation Areas.

FERC Must Consider the Benefits of Conservation Areas and Mitigate Risks to Such Resources

Should FERC determine, even in the face of lost benefits, that the Project is in the public interest, it must ensure that any such harms are mitigated. Specifically, FERC should consider the impacts to Conservation Areas and the benefits they provide when:

- (1) Balancing the Proposed Pipeline's projected benefits against adverse consequences to determine if the Project is "necessary or desirable in the public interest;"
- (2) Conducting the NEPA analysis of alternatives to the proposed route, including the no action alternative, and developing mitigation measures (if the Commission determines the Proposed Pipeline is in the public interest); and
- (3) Imposing conditions on the Certificate (assuming the Commission determines the Proposed Pipeline is in the public interest and complies with NEPA).

FERC's Public Interest Assessment

Before approving the Proposed Pipeline, FERC must determine that it is "necessary or desirable in the public interest" (15 U.S.c. § 717f (c)). This process includes balancing the Project's projected public benefits against potential adverse consequences; the Commission only proceeds when the benefits outweigh the adverse effects, i.e., when FERC determines that a Proposed Pipeline is in the public interest."

As touched upon more below, the Proposed Pipeline would impair many benefits provided by Conservation Areas. The Commission must adequately account for the specific harms to Conservation Areas and the benefits they provide, including harms to owners of Conservation Areas and surrounding communities, when balancing the Project's projected benefits against potential adverse consequences. The Conservation Areas and related benefits that would be lost due to the Project are resources that cannot be easily replaced, if at all, even with mitigation. In this instance, the impacts on Conservation Areas and the benefits they provide weigh heavily against authorizing the Project."

Conservation Areas provide benefits that have significant direct economic value and contributions to property owners and the Commonwealth's economy. Many omissions of well-established public and private Conservation Areas persist in TGP's recent Resource Reports. These Conservation Areas are a matter of record readily available from numerous sources including official internet services of the Massachusetts Registry of Deeds. To fully weigh the cumulative adverse impacts to Conservation Areas, the draft EIS must include a

full and accurate listing and a description of each Conservation Area parcel adversely affected by the Proposed Pipeline.

Federal Conservation Lands and Interests

Accuracy of all information provided in Resource Reports (RR) by the Project proponent is put into question when omitted or overlooked information includes:

RR 8.3.1.1.1 Numerous federal holdings in lands not outlined in the RR include federal investments and interests in the New England National Scenic Trail, administered, in part, by the National Park Service (NPS), including a hiker's cabin constructed with NPS funds on private land (owned by Richardson in Northfield, MA) conserved with funds from the United States Forest Service (USFS) Forest Legacy Program on June 27, 2011 as recorded at Franklin County Registry of Deeds Book 6034, Page 179. In addition, the United States Department of Agriculture (USDA) holds interests in numerous agricultural easements on the Proposed Pipeline route include the Williams Farm in Deerfield, MA conserved on June 29, 2004 as recorded at Franklin County Registry of Deeds Book 4633, Page 221 and signed by the Natural Resource Conservation Service on behalf of the United States of America at page 39.

Federal Conservation Lands; Sample Published Description Excerpts

Northeastern Area Forest Legacy Program (FLP) The Tract Record

Third Quarter FY 2011

Protecting the New England National Scenic Trail in Massachusetts

Along the New England National Scenic Trail and its viewshed, the Metacomet-Monadnock Forest (MMF) Forest Legacy project continued to conserve land for active forestry and public recreation with three project closings on June 27, 2011. Sam and Barbara Richardson granted a conservation restriction (CR) to the Town of Northfield. The Town's conservation commission will administer and monitor the CR. The 38-acre parcel includes 1,800 feet of the New England National Scenic Trail as well as two spectacular scenic overlooks atop Alexander Hill. The Richardsons sold the CR for the fair market value for \$21,000 in FLP funds

[Another] tract had **Mount Grace Land Conservation Trust** sell a neighboring 123-acre parcel [pre-acquired from **Northfield Mount Hermon School**] to the Town for the appraised value of \$185,000 in FLP funds. The acquisitions are adjacent to the 48-acre Town of Northfield Brush Mountain Conservation Area, which also includes a segment of the New England National Scenic Trail.

Other cost-share was previously acquired through lands previously donated to the Metacomet-Monadnock Forest (MMF) project. These tracts are joined by eight other tracts in the MMF project containing fee and conservation restriction acquisitions and donations that protect a total of 1,052 acres of forests over a several mile-wide expanse and protecting many parts of the New England National Scenic Trail along with other forest values.

Northfield Mount Hermon

Parent Update

January 2012

National Scenic Trail

NMH has helped protect a section of New England's National Scenic Trail by selling 117 acres of land to the Mount Grace Land Conservation Trust, a regional organization that serves 23 towns in Franklin and Worcester counties. Located across from the Northfield Town Forest, the parcel includes part of Northfield's Great Swamp. Mount Grace plans to transfer the property to the Massachusetts Department of Conservation and Recreation (DCR) in 2012, when it will be added to the Northfield State Forest.

FERC's consideration of adverse consequences to a comprehensive list of all federal and other Conservation Areas and the benefits they provide should not be limited to values that are directly quantifiable in monetary terms. Many of the benefits that Conservation Areas provide to property owners and surrounding communities, e.g., better health from cleaner air and water, might not be easily quantified, but avoided costs, like

reduced asthma cases, are economic interests, the impairment of which should be included in FERC's analysis of the Proposed Pipeline's impacts. In addition, as discussed above, Massachusetts' historic economic investment in Conservation Areas, including by direct investments and foregone state (301 CMR 14.00) and federal (26 U.S.c. §170(h) and others) tax revenues (deductions and credits), need

to be weighed against any demonstrated benefits of the proposed Project. All of these investments must be fully accounted for and impacts avoided and minimized to the greatest extent practicable, or fully mitigated.

Eminent Domain

In assessing whether the Proposed Pipeline is in the public interest, FERC must specifically consider the extent to which TGP will exercise eminent domain authority to obtain access to land required for the Proposed Pipeline. (Assuming FERC issues TGP a Certificate, Section 7(h) of the Natural Gas Act grants the company the right to condemn private (and public) property for the Proposed Pipeline as a public use).

According to FERC, the strength of the Project's benefit showing must be proportional to TGP's proposed exercise of eminent domain.1"

A pipeline route that goes through Conservation Areas will require an increased exercise of eminent domain. Many Conservation Areas are subject to restrictions, held either by public agencies or by qualified "nonprofit conservation organizations, that limit the holder's right to grant permission for activities such as drilling or excavation or uses that would conflict with allowed uses and the unique conservation purposes of the particular property. For example, The Commonwealth of MA Executive Office of Energy and Environmental Affairs ("EEA") sample conservation restriction prohibits holders from authorizing any construction or other activity that is inconsistent with the purpose of the restrictions." Even if the holder of a conservation restriction is not contractually prohibited from granting access for a pipeline, providing such authorization might be contrary to an organization's public or charitable purpose, thus preventing it from allowing access to its land absent an eminent domain taking. Likewise, given the number of municipalities that have adopted resolutions against the Proposed Pipeline, TGP would likely need to exercise eminent domain authority to take any municipal land required for the Proposed Pipeline. **FERC should assume that the Proposed Pipeline would require a significant exercise of eminent domain, thus increasing the required level of demonstrated public benefits that the Project must supply in order to be in the public interest.**

Other more reasonable and reasonably-sized proposals to adequately meet the energy needs of the region put forth to date necessitate only a tiny fraction of the amount of eminent domain that would be required by the NED to be exercised against private, municipal, charitable, and state lands.

Eminent domain is recognized as a tool of last resort to be wielded only when it is for a necessary or appropriate purpose.

NEPA Environmental Review Process

The National Environmental Policy Act ("NEPA", 42 U.S.c. §4321 et seq.) requires federal agencies to consider potential environmental impacts of an action or authorization of an action. With respect to the Proposed Pipeline, FERC has stated that it will prepare an Environmental Impact Statement ("EIS") as part of the NEPA process." Should the Commission determine that the Proposed Pipeline would be in the public interest, the EIS must consider the significant environmental value of Conservation Areas that would be impacted by the Proposed Pipeline when evaluating alternatives to TGP's proposed route and when determining mitigation requirements.

Project impacts that must be considered as part of the NEPA analysis include ecological effects, (including on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative." (40 C.F.R. § 1508.8).

In evaluating required mitigation, FERC must consider opportunities for:

- (a) *Avoiding an impact altogether by not taking a certain action or parts of an action.*
- (b) *Minimizing impacts by limiting the degree or magnitude of the action and its implementation.*

(c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.

(d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action. [and]

(e) Compensating for the impact by replacing or providing substitute resources or environments.

40 C.F.R. § 1508.20.

According to the Council on Environmental Quality (“CEQ”) the need to mitigate impacts is not limited to major effects:

Mitigation measures must be considered even for impacts that by themselves would not be considered (significant.’ Once the proposal itself is considered as a whole to have significant effects, all of its specific effects on the environment (whether or not (significant’) must be considered, and mitigation measures must be developed where it is feasible to do so.

46 Fed. Reg. 18,026 (Q. 19a) (March 23, 1981). Thus, even individual or smaller harms to Conservation Areas must be evaluated and mitigated.

A full set of mitigation measures cannot be identified and considered until TGP presents further information about the Project and its impacts. However, by way of example, potential mitigation measures could include requiring TGP to:

- Fund Conservation Area establishment in each of the affected towns, of equivalent size, context, and function.
- Fund the creation of “travellanes or corridors” of sufficient width for animals where habitat is fragmented.

State and Local Plans and Laws

The EIS must address how inconsistencies between the proposed Project and any State or Local plan or law will be reconciled.” Thus, the EIS should examine the Proposed Pipeline’s compliance with state laws, such as, but not limited to, the Massachusetts Wetlands Protection Act (M.G.L. c. 131, § 40), the Massachusetts Rivers Protection Act, Chapter 258 of the Acts of 1996, Endangered Species Act (M.G.L. c.131A), the Global Warming Solutions Act (M.G.L. c. 21N) and Clean Waters Act (M.G.L. c. 21, §§ 26-35), the Public Shade Tree Act (M.G.L. c.87), Taxation of Forest, Agricultural, and Recreation Lands (M.G.L. c. 61, c. 61A, and c. 61B), the Massachusetts Eminent Domain statute (M.G.L. c. 79) and local laws, including, but not limited to, municipal wetlands ordinances and bylaws and regional plans developed with municipalities by Regional Planning Agencies, such as the Franklin Regional Council of Government’s 2014 report, Sustainable Franklin County: A Regional Plan for Sustainable Development.

Conditioning the Certificate of Public Convenience and Necessity

FERC has the authority to issue Certificates with “reasonable terms and conditions as the public convenience and necessity may require” (is U.S.c. § 717{f}(e)). Should FERC issue a Certificate for the Project, we urge the Commission to include conditions to minimize adverse impacts on Conservation Areas and surrounding communities. A full set of conditions cannot be identified until TGP provides thorough information for a complete draft environmental report, but an example of an appropriate condition would be to condition the Certificate on TGP’s compliance with mitigation measures spelled out in the EIS.

In addition, FERC should condition the Certificate on TGP’s compliance with Article 97 of the Massachusetts Constitution. This would be consistent with TGP’s public commitment to seek an Article 97 vote from the Massachusetts legislature.P At a minimum, FERC should condition the Certificate on TGP’s compliance with Massachusetts’ “No Net Loss” policy for Article 97 land. Such a condition would be consistent with FERC’s general expectation that natural gas companies will”comply with state and local requirements, to the extent that doing so does not interfere with actions that the Commission has determined are required by the public convenience and necessity.”?’

Massachusetts Laws and Policies Promote Defense of Conservation Areas

Routing extensive lengths of the NED (currently greater than 25%) through Conservation Areas would directly and egregiously contravene Massachusetts laws and policies that protect and expand Conservation Areas. The Commonwealth's commitment to public lands can, and should, inform FERC's evaluation of the Proposed Pipeline, even if the normal implementation of certain statutory protections is preempted by the Natural Gas Act.²² At a minimum, should FERC issue a Certificate for the Proposed Pipeline, we urge the Commission to implement the Massachusetts Executive Office of Energy and Environmental Affairs' (EEA) policy of "No Net Loss" of Article 97 properties (discussed below), and to apply that objective to all Conservation Areas, public or nonprofit, as a condition of its approval of the Proposed Pipeline.

Accuracy of all information provided in Resource Reports (RR) by the Project proponent is put into question when omitted or overlooked information includes:

RR 8.3.1.1.2 State interests in lands not described or addressed include numerous state investments and interests such as a complete lack of reference to the New England National Scenic Trail passing through the Northfield State Forest and intersecting with the Proposed Pipeline two times north of Alexander Hill Road in the Northfield State Forest.

Article 97 of the Massachusetts Constitution

In Massachusetts, the right to a clean environment and the government's obligation to protect natural resources are embedded in the Constitution, which provides that:

The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose.

Massachusetts Constitution, Art. XCVII (hereinafter, "Article 97") as explained by the Massachusetts Supreme Judicial Court, "conservation and environmental protection are express obligations of the government in Massachusetts."²³

Article 97 enables the Massachusetts legislature to acquire lands and easements, including via takings, in furtherance of the purposes outlined in the provision (Article 97 properties"). Once acquired, these lands are subject to procedural safeguards regarding disposition or change in use. In brief, a two-thirds vote by the Massachusetts legislature is required before any (i) disposition of Article 97 land, i.e. a change in legal or physical control such as easements to private parties, or (ii) change in use, even to another Article 97 use if inconsistent with the prior Article 97 use. According to TGP, the Proposed Pipeline would cross Article 97 lands in a manner that would require a two-thirds vote by the Massachusetts legislature.

EEA's implementation of Article 97 includes an "Article 97 Land Disposition Policy," which iterates that EEA, and its agencies, shall not, as a general rule, "sell, transfer, lease, relinquish, release, alienate, or change the control or use" of any right or interest of the Commonwealth in and to Article 97 properties." A condition for an exception to EEA's general rule of nondisposition is that "real estate of equal or greater fair market value or value in use of proposed use, whichever is greater, and significantly greater resource value as determined by [EEA] and its agencies," must be granted to the party disposing Article 97 property." This "No Net Loss" policy of Article 97 helps protect the constitutional rights of the citizens of Massachusetts." Compliance with the provisions of the "No Net Loss" policy is required by rule and by practice for each individual parcel subject to Article 97.

Release of Public and Charitable Conservation Restrictions, Dedications, and Trusts

The Constitutional right to a clean environment is further reflected in the Commonwealth's laws, which create substantive and procedural protections that may also apply to Article 97 properties and other Conservation Areas, including state and/or municipal-level review and approval of changes in use of such areas. For example, M.G.L. c. 184 § 32 establishes procedural requirements that must be met before the release of

conservation, preservation, or watershed preservation restrictions held by governmental entities, charitable corporations, or trusts. With respect to conservation restrictions, for instance:

- A government-held restriction cannot be released without public notice, hearing and vote by the governmental body holding the restriction;
- A restriction held by a charitable corporation or trust cannot be released without a vote by the relevant mayor, city manager, city councilor town selectmen; and
- A restriction that was initially approved by EEA cannot be released without approval from EEA.

In addition, M.G.L. c. 40 § 15A provides that lands owned by a municipality (excluding land acquired for park purposes) with a designated specific purpose may only be subjected to another purpose upon a two-thirds vote of the city council, with the approval of the city manager or mayor, or a two-thirds vote at a regular or special town meeting. TGP must be required to thoroughly identify all lands subject to public and charitable restrictions and dedications that would be adversely affected by the Proposed Pipeline, as well as the subsequent specific harms which would incur to the public interest in order to provide sufficient cost: benefit analysis and/or mitigation.

Public Trust, Prior Public Use, and Charitable Public Trust

Massachusetts common law also provides procedures that govern changes in use of certain public lands. Specifically, the public trust doctrine and the doctrine of prior public use both offer protections for public lands and certain water resources. In short, the public trust doctrine in Massachusetts provides that navigable waters (e.g., the Connecticut River, which is located in Mount Grace's service area), great ponds (>10 acres), and the lands beneath them are held in trust by the Commonwealth for the benefit of the public." Lands protected under the public trust can be relinquished only by a vote of the legislature in furtherance of a "proper public purpose.t?" The prior public use doctrine applies the concepts of the public trust doctrine from waterways and submerged lands to upland resources, providing that "land devoted to one public use may not be diverted to another inconsistent use without plain and explicit legislation authorizing the diversion."?" TGP must be required to thoroughly identify all public trust and prior public use lands and resources that would be adversely affected, and the subsequent specific harms which would incur to the public interest in order to provide sufficient cost: benefit analysis and/or mitigation.

Fiduciary duties, at both the state and federal level, imposed by explicit and implied Public Charitable Trusts and Charitable Trusts limit decision making latitude in governing bodies of public entities and nonprofits, respectively.'? Charitable trusts In Massachusetts, the Attorney General has an express role by statute in the case of charitable/public trusts." TGP must list parcels covered by charitable and public trust requirements and describe how it will avoid, minimize, or mitigate related negative impacts to the public interests affected. For many parcels along the proposed NED route the publicly recorded deed or conservation easement clearly describes the trust imposed that can only be altered in a judicial cy pres proceeding.

Public Investment and Tax Benefits

The Commonwealth's commitment to the protection of Conservation Areas is reflected in its significant financial investment in the acquisition and preservation of such areas. For example, between 1998 and 2011, Massachusetts funded the conservation of 131,000 acres, including lands protected through conservation easements and direct acquisitions." Federal and charitable funds have also been used in the acquisition or protection of Conservation Areas affected by the Proposed Pipeline.

In addition to directly investing in the protection of these properties, the Commonwealth offers incentives for private landowners to dedicate their properties to conservation purposes, including via a number of tax benefit programs. For example, the Commonwealth Conservation Land Tax Credit grants tax credits of up to \$75,000 for donations of conservation land, (301 C.M.R. 14.00)' and the Massachusetts Current Use Program gives preferential tax treatment to property maintained as open space for the purposes of timber production, agriculture or recreation (M.G.L. c. 61, c. 61A, c. 61B). In some instances, the sale or conversion of land enrolled in such tax programs is subject to a right of first refusal to purchase vested in either

the relevant municipality, Commonwealth, or nonprofit conservation organization (e.g., M.G.L. c. 61, §8). The conversion of land in the Current Use Program triggers a rollback tax payable to the municipality. TGP must calculate all costs associated with the conversion of such land, include increased future tax liabilities to landowners disqualified from the program as a result of the loss of enrolled forest, agricultural, and natural habitat lands.

Negative Impacts on Massachusetts Conservation Areas and the Benefits They Provide

According to TGP's July 2015 Resource Report the revised preferred pipeline route in Massachusetts would alter 8,800 acres during construction and 2,500 acres permanently in the four affected states, and 2,300 acres during construction and 700 acres permanently in Massachusetts." The route of the Proposed Pipeline would traverse several dozen Massachusetts municipalities from the Berkshires to the North Shore.

Conservation restrictions prohibit a wide range of activities, including construction of any conduits, lines or permanent structures, excavation or dredging, activities detrimental to water conservation, water quality, erosion control or soil conservation, stockpiling of soil, cutting or removal of any trees or any other vegetation, or any other uses of the land or activity thereon which is inconsistent with the purposes of the conservation restriction."

Conservation Areas like Mount Grace's Poplar Mountain Conservation Area, Charles C. Morse Memorial Forest, Bitzer and Richardson Conservation Restrictions, Northfield Town Forest, the Montague Plains Wildlife Management Area, and Northfield-Erving-Warwick State Forest complex provide a wide range of economic, public health, and environmental benefits to Massachusetts communities, property owners, economies and ecosystems. The Trust for Public Land estimates that every \$1 invested by the Commonwealth of Massachusetts in land conservation returns \$4 in natural goods and services to the Commonwealth's economy. 35 The environmental benefits of Conservation Areas also contribute to property values in surrounding communities, quality of life, and the scenic beauty of the state, all of which impact the state's ability to attract business, tourism, and labor. Conservation Areas provide a wide range of economic and nonmaterial benefits whose value must be taken into account when evaluating whether projects that would impair such benefits are in the public interest. Economic calculations in the Project EIS must include the following:

Water Use and Quality: Conservation Areas play an important role in providing drinking water and preserving water quality. For instance, forests and wetlands purify water by stabilizing soils and filtering contaminants, which prevents pollutants from developed areas flowing into drinking water sources. This is particularly important in Massachusetts, where approximately 80 percent of the population receives its drinking water from surface water sources." Conservation Areas such as wetlands and other pervious surfaces may also capture and store water, thereby helping to control flooding and regulate supply.

The natural characteristics of Conservation Areas provide a cost effective alternative to expensive water treatment facilities. For example, a study of 27 water supplies found that, "[f]or each 10 percent increase in forest cover on the watershed surrounding a drinking water reservoir, water treatment costs were reduced by 20 percent," and noted that, "while increased treatment costs must be paid each year, the cost of conserving land is a one-time expenditure." 37 Similarly, the Trust for Public Lands calculated that the \$130 million spent on land acquisition by the Massachusetts Department of Conservation and Recreation over a 20 year period resulted in the ability to forego additional filtration and savings of approximately \$200 million."

Flood Control: Conservation Areas with water storage capacity, e.g., wetlands, can reduce flooding and subsequent damages and recovery costs. Maintaining such areas is particularly important in flood prone areas and will become more important as climate change leads to increased precipitation events. For example, a one-acre wetland can typically store about one million gallons of water, and wetland vegetation can slow the speed of floodwaters.

Vegetation and Wildlife: Habitat destruction is a significant threat to species, and the impacts of habitat destruction, even in small amounts, may be exacerbated when the alteration creates fragmentation in habitats, which can interrupt normal animal movement within habitats and isolate species." Large intact ecosystems,

such as wetlands, forests or river networks, “generally support larger populations of native species, a greater number of species, and more intact natural processes than small, isolated examples/”? Connected tracks of land are also better suited to help plants and animals survive the types of extreme conditions that are expected to increase due to climate change.” Impacts to wildlife are not uniform, nor are they uniformly benign. NEPA requires that adverse impacts to specific habitats and species must be quantified based on specific components, structures, and functioning of affected ecosystems.

Air and Noise Quality: Conservation Areas can contribute to the removal of pollutants from the air, including by supporting trees and other plants that filter pollutants through their leaves and diffuse them into their cells. In Massachusetts, five of the counties that the Proposed Pipeline would traverse have yet to reach attainment with the national eight-hour standard for ozone - a pollutant that can interfere with respiratory functions and worsen conditions like asthma, which resulted in hospitalization charges of \$89 million in 2006.⁴²

Socioeconomics and Recreation: Landowners and communities in socially and politically progressive central and western Massachusetts are suffering adverse economic, social, and psychological effects from stress resulting from the prospect of enormous and destructive fossil fuel infrastructure being built and operated in an aesthetically intact New England landscape they know well and love. Homes cannot be sold to get away from the threat because many are of modest means: meaning land rich and cash poor. The attention, energy, and time of community members are being redirected from the notable progress the region has achieved in energy efficiency and renewable energy business development. T6P and FERC must take a hard look at these socioeconomic factors, quantify the cost to public health, and suggest mitigation that will adequately avoid or minimize exacerbation of the opportunity costs and other social costs incurred over the entire duration of the Project.

Conservation Areas are a significant draw for outdoor enthusiasts in Massachusetts and New Hampshire, and are used for activities such as hiking, skiing, biking, fishing, bird watching, swimming and boating. In addition to the personal enjoyment derived from such activities, the money spent on recreational activities, and associated travel, lodging, food and other goods and services, is a direct benefit to the Massachusetts economy. Outdoor recreation generates \$10 billion in consumer spending and \$739 million in state and local tax revenue each year, and supports 90,000 jobs and \$3.5 billion in wages and salaries.”

Cultural Resources: Among others, the affected communities of Deerfield, Montague, and Northfield are of renowned and rich historical significance. Land features most often associated with Native American cultural artifacts are the valleys and hilltops, many of which will be disturbed by the NED. In the course of protecting and stewarding land for conservation purposes, cultural resources are identified and in many instances inadvertently protected. Known and yet to be discovered cultural and archeological resources must be fully accounted for and given the strongest protection afforded by the National Historic Preservation Act. Even when certain benefits of Conservation Areas cannot be easily monetized, they must be considered, singly and cumulatively, in determining the direct and indirect impacts of the Proposed Pipeline and whether, even if serving a public need, the NED Proposed Pipeline design provides a net public benefit.

Reasonable, Available Alternatives to the Northeast Energy Direct Pipeline

The EIS for the NED must contain a full and robust analysis of alternatives to the proposed’ action. Voluminous and detailed studies, information, and comments provided in the record to date give clear indication that reasonable, available alternatives exist that can meet the stated purposes of the NED. At this time of global climate crisis, exacerbated, if not created, by the burning of fossil fuels, in a place like Massachusetts that is successfully working toward corrective policies in part through the MA Global Warming Solutions Act and Regional Greenhouse Gas Initiative and that has a 100+ year history of natural resource protection, greenfield construction of the cumulative magnitude of the Proposed Pipeline with its concomitant short and long term- impacts, including overbuilt infrastructure, does not meet the standard required for granting a Certificate of Public Convenience and Necessity.

Thank you for your consideration of these comments.

The two-state region spans one hundred miles from the Quabbin Reservoir northward to Mount Cardigan and the White Mountain National Forest, and is bounded to the east and west by the Merrimack and Connecticut River Valleys. Encompassing approximately two million acres, the Quabbin to Cardigan region is one of the largest remaining areas of intact, interconnected, ecologically significant forest in central New England, and is a key headwater of the Merrimack and Connecticut rivers. The Q2C region's forests collect and naturally filter drinking water for almost 200 cities and towns including the City of Boston. www.ngpartnership.org.

Paul Schroeder, West Sand Lake, NY.

Dear Sir or Madam- I would like to address a concern I have regarding the proposed NED Pipeline (Kinder Morgan's North East Direct Pipeline). It seems to me one of the greatest potential impacts this pipeline may have is related to its' vulnerability to the exploits of both domestic and international terrorists. It would be a relatively easy task to dig a 3 foot hole and plant a small incendiary device which could lay waste large areas and cause death and destruction. The pipeline would cross hundreds of miles of rural and lowly populated areas making access easy to anybody with a desire to do harm. The pipeline is an attractive nuisance. It also would be a perfect opportunity for anyone with a grudge to call in bomb threats which would have to be taken seriously and could do great harm consuming local police and fire resources as well as causing significant psychological trauma to people who live or work near the pipeline. These threats must be evaluated with an eye to the increasing public anger against the government and hatred from abroad which is evident today. I am uneducated about state of the art security measures which might be implemented to mitigate these risks but, clearly, the onus falls upon Kinder Morgan to ensure that adequate security is provided and that they are contractually committed to compensate local governments and agencies for all costs associated with security breaches and threats.

Sincerely, Paul Schroeder

20151016-5001

Nina Boyle, Antrim, NH.

I work as a School Counselor at Temple Elementary School in Temple NH. A compressor station emitting hundreds of thousands of tons of toxins annually is being considered at a site next to this elementary school. This is a very family and community oriented school that serves the wonderful community of Temple. We still play outdoors and in the wooded area surrounding our school. We play in the sand piles and play games in the grass fields during recess. It is a very healthy and wholesome environment. Kinder Morgan SHOULD NOT BE ALLOWED to place this compressor anywhere near this school. A short distance away is a water reservoir holding the water supply of a local town, Greenville, NH. Another reason why this NOT A GOOD IDEA. Hopefully the welfare of our children, their parents and all community members matter.

Most sincerely,

Nina Boyle
School Counselor
Temple Elementary School

20151016-5002

Vicky Jenkins, Gill, MA.

I have lived in the Connecticut River valley for over 30 years. I chose to settle here with my family because of the undeveloped nature of this area. My family uses a personal well for water, and a septic system for waste. We grow much of our own food while taking extraordinary means to make the smallest imprint possible on the land.

So it pains me to see that Kinder Morgan is proposing a natural gas pipeline that would move through this valley and cause all kinds of environmental damage, light pollution, noise pollution, and chemical pollution from blowdowns. The blowdowns cause release of Ethylbenzene, n-Butane, and n-Hexane as well as a number of other chemicals that have proven to cause health issues.

There are so many concerns about this project that I don't know where to begin. How is the pipeline going to run under the Connecticut River? How are the small towns of MA and NH going to provide emergency support in case of an accident or explosion? How do families who depend on well water not feel threatened by contamination.

There are so many stories that prove that Kinder Morgan and the Tennessee Gas Pipeline Company have not taken precautions to prevent environmental destruction, and facts that prove that the natural gas, pipelines, and compressor stations are bad for the health of people in the area.

Please deny this project. It is not needed, and it is not wanted. Then move to Western Massachusetts and enjoy the most beautiful part of the world.

20151016-5003

jim Ogonowski, Dracut, MA.

Secretary

Federal Energy Regulatory Commission
888 First Street, NE – Room 1A
Washington, DC 20426

Re: Kinder Morgan Proposed Northeast Energy Direct (NED) Project; Docket # PF14-22-000--Written Scoping Comments

Dear Ms. Bose:

This letter provides additional comments from Jim Ogonowski of Dracut, Mass regarding the property at 713 Broadway Road, Dracut Massachusetts with respect to the Federal Energy Regulatory Commission's (FERC) scoping process for the proposed Kinder Morgan/Tennessee Gas Pipeline LLC (KM) Northeast Energy Direct (NED) Project.

As noted at the scoping session held in Nashua, New Hampshire (and incorporated herein), the Ogonowski's family farm ("Farm"), comprised of over 125 acres, will be significantly impacted by the NED Project's multiple pipelines: 2500 feet of 30 inch mainline pipeline and over 5000 feet of pipelines for two laterals--one from Dracut to Lynnfield and one from Dracut to Haverhill. The Farm is proposed to have 7500 feet of pipelines crossing fields, waterways, and clear cutting irreplaceable 100-year old forest land. The land impacts alone may be more than 10 acres. In addition, the Farm is in close proximity to and will be impacted by the Compressor Station proposed for Dracut, also to be located on Broadway Road.

In particular, and as set forth below, I am concerned about impacts to waterways, wetlands, groundwater, farm operation and air quality (during construction and operation) on the Farm.

Wetlands and Aquatic Resources

The Farm property has two ponds, 17 acres of wetlands, and a certified vernal pool. KM should provide a detailed description and map of any wetlands, vernal pools and waterbodies on the Farm that includes their location as well as an assessment of their functions and values. Impacts to wetlands, surface water resources, vernal pools and wildlife should be fully disclosed. Impacts include but are not limited to: filling of wetland's/other resources for pipeline construction and/or operation; temporary impacts to wetlands and vernal pools resulting from access to wetland areas for construction purposes; indirect impacts, such as clearing impacts resulting in a change (either permanent or temporary) of cover type within a wetland; indirect impacts resulting from erosion or sedimentation into wetlands, vernal pools or waterbodies; secondary impacts from construction of the project. If not otherwise provided, KM should also describe whether pipeline construction work will involve discharging dredged or fill material in wetlands. In addition, KM should describe a strategy for determining adequate mitigation to compensate for unavoidable direct, indirect and cumulative wetland impacts from construction and operation, including a description of the methodology to determine the amount and type of mitigation that will be required to address loss of wetland acreage and function. Further, as part of its review, KM should:

- Describe all construction and maintenance practices that will be utilized to minimize impacts, particularly to sensitive areas such as vernal pools.
- Identify wildlife impacts and describe all mitigation measures to protect wildlife.
- Describe the long-term right of way maintenance techniques planned for the project and included an analysis of the effects of maintenance techniques on wetlands and sensitive resources, plant life, habitat and agriculture. Project should explain whether herbicides will be used and describe related no-use buffer zones around wetlands.
- Describe appropriate buffer zones to avoid or reduce indirect effects of construction on wetlands, ponds and vernal pool.

We are concerned that KM's activities on the site will result in the needless destruction of sensitive wetlands and other resources on the Farm.

Impacts on Agriculture and Scenic Vista

The Farm is actively employed in agriculture with seasonal plantings of hay and planned plantings of pumpkins. The Farm is bordered by 100 year old forested woodland that provides protection of farmland (from runoff) and provide a scenic vista at the Farm. KM should provide a detailed description and map of the types of crops, location, planting and harvesting schedules, and agricultural practices employed on the Farm. Impacts on farming and the Farm from construction, maintenance and operation should be fully evaluated and disclosed. Impacts include but are not limited to reduced areas for planting, use of herbicides, right of way maintenance, increases in runoff and storm water, cover/soil modification and loss of acreage for agricultural use. KM should document mitigation to compensate for lose of agricultural use from construction, maintenance and operation. In addition, KM should describe the construction practices and long-term maintenance techniques planned for the project and efforts to reduce construction and maintenance impacts on the agricultural use of the Farm.

Clear Cutting

As noted above, KM plans to clear cut 100 year old forest for the NED Project. The loss of this forested land will deprive the Farm of much needed protection from runoff and storm water, increase the risk of erosion and result in an irreplaceable loss of privacy and scenic beauty at the Farm. The rural character of the Farm will be permanently altered.

KM should describe that portion of the pipeline construction work that will involve clear cutting trees and removal of timber from the Farm. Impacts to the Farm from cutting and removal should be fully evaluated and disclosed. Impacts include but are not limited to: increased runoff and sedimentation, erosion, loss of farmland, and wildlife implications. KM should describe how trees will be cut and removed and the area restored during construction and operation to include a map of all areas to be cut. KM should describe a strategy for determining adequate mitigation to compensate for the loss of trees including any unavoidable direct, indirect and cumulative impacts from construction and operation, including a description of the methodology to determine the amount and type of mitigation (including replanting and reforestation) that will be required to address loss of trees and function. In addition, KM should provide a depiction of the clear-cut site as it may appear following the implementation of all mitigation measures.

Compressor Station

The proposed compressor station is located is approximately 1000 feet from the Farm. It will be seen and heard from the Farm. In addition, emissions from the compressor station will impact the Farm as well. KM should discuss the alternative locations evaluated for the compressor station and given alternatives seek another location with fewer impacts.

With respect to the proposed location, KM should:

- Provide information on the impact of the compressor station on air, water, light and noise pollution for areas within a half-mile, mile and a half and five-mile radius of the site and describe all efforts to mitigate these impacts.
- Provide information on the impact of the compressor station on business and residential property values based on actual property sales near compressor stations and describe all efforts to mitigate these impacts
- Provide information on the impact of the compressor station on the safety of the Farm and residents of Dracut including the abilities of local safety personnel to deal with a pipeline related disaster and describe all efforts to mitigate these impacts.
- Provide information regarding how will fugitive emissions be mitigated and how will they be reported when they occur?
- Describe blowdown procedures including how often will there be blowdowns and when and how will the public be informed of the date and time of blowdowns?
- What percentage of the particulate matter emitted by the blowdowns will be radioactive?
- Describe impacts of blowdowns on compliance with regional ambient air standards and describe how KM will mitigate impacts on ambient air standards.

- Provide a study and analysis of all emissions from the compressor station and any analyses demonstrating that there are no adverse health effects from exposure to emissions. Discuss, if not previously considered, all efforts to mitigate emissions from the compressor station.
- Provide a detailed study on the amount of air and atmospheric pollution that occurs along a 30-inch pipeline with leaks that occur at pigging station locations, valve release stations and compressor stations as well as the ramifications of these emissions.
- Provide an analysis of the noise at the Farm associated with ongoing operations of the proposed compressor station including scheduled blowdowns. Provide information regarding how noise will be mitigated and reduced.
- Describe how the proposed compressor station is consistent with and will comply with all federal, state and local laws and regulations.

Blasting

The Farm has many areas of rock and granite (as is the case throughout New England). Please discuss any plans to blast at the Farm and how those blasting activities will be mitigated. As part of those plans please discuss how structures and wells (see below) will be evaluated pre and post construction and detail the methodology that will be used. Describe post construction follow-up and remediation, including any security or indemnification that may be available to compensate for damage. KM should also discuss how construction and operation would comply with existing or proposed Dracut ordinances.

Water

The Farm has two wells – one is a 300 foot well located approximately 75 feet from the house which provides drinking water to the Farm. Another well, 25 feet in depth, is about 600 feet from the house. This second well is functional but is not presently used. KM should provide a detailed description and map of the wells on the Farm that includes their location as well as an assessment of their construction, depth and operating characteristics. KM should evaluate any possible impacts to the wells and well water as a result of construction and operation of the project and discuss how these impacts will be mitigated or remedied. KM should also address how construction and operation will comply with existing or proposed Dracut ordinances and how the proposed project is consistent with state regulations for protection of ground water drinking supplies.

Thank you for the opportunity to provide scoping comments on the NED project.

Sincerely,

Jim Ogonowski
713 Broadway Rd

Jimogo@comcast.net

20151016-5004

Tom Woytaszek, dunstable, MA.

The proposed pipeline does not benefit the residents Massachusetts.

The pipeline is simply a transport vehicle to pipe gas through Massachusetts and will destroy large parcels of untouched land in the process.

Continued investment in this class of energy does not represent a long-term solution for this country.

Please consider alternative renewable energy initiatives instead.

I am a Massachusetts resident, and strongly oppose this pipeline initiative.

Please do not approve the construction of this unnecessary pipeline.

20151016-5005

Gail Herson, Bloomfield, CT.

Comments (re: Docket # PF14-22-000) to FERC Submitted on Oct 15, 2015.

I attended public hearing in the West Hartford, CT Town Hall on October 7, 2015 where Kinder Morgan presented its plans to expand the Tennessee Gas Pipeline in Connecticut. From this meeting and other investigation I believe the pipeline, as currently designed, should not receive approval from FERC for the following reasons:

1) The proposed route of the pipeline would take it across land owned by the Metropolitan Water District (MDC) on land designated by the State of Connecticut as Class I and Class II land. The MDC CEO Scott Jellison sent a letter (June 26, 2015) to the Secretary of FERC expressing concern that the expansion would “potentially disturb a large area (250 acres or more) on MDC property and encompass a distance of approximately 5 miles running north and south, carving through the watersheds of MDC Reservoirs 2,3,5 and 6. The property that would be potentially impacted is highly regulated by the State Department of Public Safety in order to safeguard the water supply.”

a. The following comes from the Rivers Alliance of Connecticut:

i. Connecticut law provides the highest protections in the nation for drinking water. First, no water body that has received a waste discharge can be used for public supply of potable water. Second, water utility land hydrologically linked to drinking-water reservoirs must be kept as natural open space and cannot be disturbed in any way other than certain limited permitted actions necessary to maintain operations. By statute the protected lands are termed Class I (closest to the source) and Class II (also impacts the source).

ii. Protection of Class I and II lands is the highest priority in our state water policy. To violate this protection would set a precedent that would put at risk Connecticut’s drinking water sources. The state’s standards for drinking water are uniquely high (only Rhode Island has similar standards). These high standards are increasingly justified as science reports document the myriad new pharmaceuticals, plastics, pesticides and other toxins in ordinary wastewater. Existing treatment methods cannot adequately define or manage this array of toxins.

2) The proposed pipeline expansion should not be approved because of Kinder Morgan’s poor safety record.

a. (Sources: www.pushbackthepipeline.org and Wikipedia – Kinder Morgan)

i. In 2011 the Pipeline and Hazardous Materials Safety Administration (PHMSA) cited Kinder Morgan for these safety violations:

1. Failing to maintain update maps showing pipeline locations
2. Failing to test pipeline safety devices
3. Failure to maintain proper firefighting equipment
4. Failing to inspect its pipelines as required
5. Failure to adequately monitor pips’ corrosion levels

ii. In 2013, the investment research firm Hedgeye Risk Management released a report claiming that Kinder Morgan’s business strategy is to starve its pipelines and related infrastructure of routine maintenance to maximize profit.

iii. In Texas from 2003 to 2014, Kinder Morgan experienced 36 “significant incidents”, resulting in fatalities or hospitalization fires, explosions or spills.

iv. Throughout the US since 2003, Kinder Morgan and its subsidiaries pipelines have been responsible for at least 180 spills, evacuations, explosions, fires and fatalities in 24 states. A list of individual accidents is available on Wikipedia – Kinder Morgan.

3) Constructing the proposed gas pipeline across Class I and Class II land, (going through the watersheds

of MDC reservoirs 2, 3, 5 and 6) combined with the rate of accidents puts the drinking water supplied by MDC at great risk. One accident could seriously jeopardize the drinking water of approximately 400,000 people that are served by the MDC.

4) There has been no evidence presented of a quantifiable demand for additional gas in CT. We've been told that 2 companies in CT would like more gas but none of the public forums have included presentations from presentations of the impact of the new pipeline on natural gas availability to consumers in our local towns and state.

Gail Herson
42 Duncaster Rd
Bloomfield, CT 06002

20151016-5006

Cherie Fuller, Londonderry, NH.

I oppose the gas pipeline. It does not belong in Londonderry, NH. The Town Council of Londonderry also opposes the gas pipeline. The town has spoken. NO PIPELINE.

20151016-5008

Mary Fleischli, West Hartford, CT.

I am writing to express my strong disapproval of the Tennessee Gas Pipeline Company's plans to put a gas pipeline through the MDC property in West Hartford.

I cannot think of many worse places to put a pipeline. Who decided it was a good idea to put the pipeline through our public drinking water supply?? Any leaks would pollute our drinking water. The Tennessee Gas Pipeline Company has had leaks before.

The MDC property is a vital resource for our community, particularly because it provides clean drinking water. My family loves to walk through the property because of its natural beauty. We are careful to never leave any trash behind and we would never dare swim in the waters. We understand that this beautiful resource needs to remain unspoiled in order to preserve our clean drinking water. It is clear to me that the proposal is motivated by greed and not common sense or the common good.

I strongly oppose this project.

Thank you for your attention to my concerns.

-Mary Fleischli

20151016-5009

David G. McCarthy, Andover, MA.

I am writing in reference to the potential environmental impact of the proposed Tennessee Gas Pipeline project. As far as I can tell, the proposed pipeline will pass directly through a large vernal pool on the edge of our property located at 91 Bailey Road in Andover, Massachusetts. This vernal pool contains runoff from the land under the adjacent power-lines, and is full of amphibious life in the spring time. During the winter and spring months, water from this vernal pool runs directly into an active brook located just behind my property. This brook runs to the property behind my neighbor's house (at 89 Bailey Road) and feeds water into the artesian well that he relies on for his drinking water. Furthermore, I have observed that this area is full of unusual plant life, including Jack-in-the-Pulpit, which was formerly protected by the State of Massachusetts. Clearly any construction in this area will have an adverse effect on the amphibious life, plant life, and the quality of my neighbor's drinking water.

I have asked the State of Massachusetts Division of Fisheries and Wildlife to investigate and provide their input. I will update you once I receive some information from them.

Sincerely,

David G. McCarthy
91 Bailey Road
Andover, MA 01810

20151016-5011

Janice Hofaker Tighe, Averill Park, NY.
To FERC Representatives,

I am a resident of the Town of Nassau, County of Rensselaer in New York State residing specifically at 854 Burden Lake Rd Averill Park, NY 12018

For the past 26 years we have enjoyed the rural setting and reside here for that reason.

Our futures have a bleak outlook with a proposed Fracked Gas Compressor Station within 1/2 mile from our home.

We are now threatened with the following factual repercussions of living in the “Incineration Zone” of this proposed site.

- 1) Health Concerns due to toxic emissions from the site affecting eyes, ears, nose, throat, lungs etc. These health risks also include kidney, lung, liver brain and nervous system disorders. Not to mention the physical turmoil we are currently experiencing.
- 2) Our properties and value would significantly deteriorate as well as our income from the seasonal rental of our cabins (since 1930). We have already not been able to secure deposits for 2016 season with the treat of the compressor station.
- 3) Our precious lake water quality would be tremendously damaged. We have been taking part in the NYS Federation of Lakes Association program for over 20 years monitoring the lake clarity, temperature and weed population in conjunction with Upstate NY Freshwater Institute. This would all be negate if we are faced with the compressor station.
- 4) The environmental pollution will endanger species of animals taking away fro our natural habitat of Blue Heron, Eagles and various other wildlife.
- 5) The noise of a constant hum and vibration will cause mental anguish of the community.
- 6) The opportunity for Terrorist issues could arise due to the location extremely close to the capital of New York State being Albany, NY

We plead that you put the greed and recklessness of others aside and preserve the future of our planet and the great American life we enjoy.

it appears that government is acting illegally by proposing to place a compressor station in a recreational, rural, lake community.

We urge you to contact the NYS Federation of Lake Associations, Inc
PO Box 84
Lafayette, NY 13084

regarding the oppressive consequences that a compressor imposes on our lake and residents!

20151016-5012

Noreen Cullen, Glastonbury, CT.

This is an outrage. Why would we cut down our precious tress, destroy habitat, AND put the quality of our drinking water at risk for a greenhouse gas project such as this? We have lost our way to even be considering this abominable idea. It should be rejected and quickly.

20151016-5013

Lauren Price, Brooklyn, NY.

October 15, 2015

Kimberly Bose, Secretary
Federal Energy Regulatory Commission

Re: Docket #PF14-22-000

Dear Ms. Bose,

I write to voice my strong opposition to the Northeast Energy Direct Pipeline Project (NED) proposed by the Tennessee Gas Pipeline Company, a subsidiary of Kinder Morgan. Like thousands of American citizens, I feel this project is unnecessary, dangerous, destructive, a threat to the health of the individuals who live in the impacted communities, to the environment and wildlife, and to the beauty of the land and communities in the affected states. The NED pipeline would transport fracked gas from Pennsylvania up through New York, Massachusetts and New Hampshire. As a current resident of New York state, a graduate of Williams College in Williamstown, MA, and a frequent visitor to the Berkshires of Massachusetts, I urge you to oppose the Northeast Energy Direct Pipeline and prevent the project from going forward. There are numerous reasons as to why this project is a significant threat to the impacted areas:

- The chemicals in fracked gas contain carcinogens and neurotoxins which pose a serious threat to the health of the individuals and families that live in the impacted areas.
- The pipeline puts communities at risk for leaks and explosions.
- Compressor stations would be built every 40 to 50 miles along the pipeline, including one in Windsor, MA and one in Northfield, MA. These may be among the largest compressor stations built in the U.S. so far, potentially visible from Mount Greylock, and heard from up to a mile away. Fracked gas compressor stations operate 24 hours a day, are lit throughout the night, are loud, emit toxins, and cause explosions and fires. Some reported side effects from compressor stations include nose bleeds, rashes, headaches, sore throats, dizziness and nausea.
- Studies have shown that there is no need for additional natural gas infrastructure in the area.
- The pipeline and compressor stations would cut through numerous stunningly beautiful rural areas and towns in New York, Massachusetts, and New Hampshire — including the Berkshires - which would destroy their beauty, character, and iconic charm. This would also have a detrimental impact on local tourism.
- The pipeline would go through sensitive ecosystems which poses a grave threat to wildlife and their habitats.
- Leaked methane from fracked gas pipelines accelerates climate change.
- Given our country's commitment to stopping climate change, our resources should not be put into building fracked gas pipelines. Instead they should be directed towards renewable energy sources like wind and solar.

Thank you for your consideration. I urge the Federal Energy Regulatory Commission to conduct a detailed and exhaustive review of the environmental, health, climate, and community impacts of the proposed Northeast Energy Direct Pipeline project, and to deny Kinder Morgan/Tennessee Gas' application.

Sincerely,

Lauren Price
Brooklyn, NY

20151016-5014

Kate Hoff, Bernardston, MA.

The Northeast Energy Direct Project disrupts public conservation land in order to promote a private industry. This private industry claims to support the public by helping to meet peak energy demands in New

England by additional natural gas. This is a fallacy.

We, the public, do not need the additional energy that natural gas would provide. This gas surplus would only serve, for a short time, to keep the price of fuel artificially low. It is unreasonable to consider the only cost of this fuel as the price at purchase. The long-term economic effects of the use of fossil fuels are devastating. We will pay in the rising costs of food, the costs of managing massive superstorms, the costs of cooling ourselves in the heat and heating ourselves in the cold. We are investing in a finite resource and only stalling the amount of time until the supply is extinguished.

It is heartbreaking to see the possibility of such a project, which will destroy the future planet that our grandchildren will inherit.

I believe we can do better. I believe that we can sacrifice our desire to maintain a false sense of security and energy independence, in the interest of a long-term solution that will allow our planet to exist stably and continue to support the human race. It requires government officials to suspend their need to maintain comfort among the people of the States. You, FERC, need to exercise tough love and ask us to do a better job of innovating, a better job of reducing our usage, a better job of planning our energy consumption, and a better job of valuing our planet. You can do this by denying Kinder Morgan's application to open this proceeding.

I am a high school teacher, and long before I started teaching in my current classroom, someone posted a sign which remains there today:

"The hard thing to do, and the right thing to do, are usually the same thing."

Let's do the right thing.

20151016-5015

Rosanna Nadeau, Mason, NH.

Blasting in Mason NH could disrupt or destroy residents' access to well water. All residents rely on private wells for water. In the event that any resident/s should have a disruption or discontinuance of well water, and/or that renders water unsafe to drink, this would be a disaster that could render homes unlivable and non-saleable. We need to know what Kinder Morgan's plan and budget would be, to fully resolve these types of issues effectively both short and long term. The plan needs to include solutions acceptable to individual residents as well as to the entire town as applicable.

20151016-5016

David Strait, Pepperell, MA.

At this point in the review of the Northeast Energy Direct natural gas pipeline project, I would like to raise some issues with the lack of thoroughness FERC has demonstrated on the analysis of environmental impacts of new natural gas pipelines. My basis for these issues is the Final Environmental Impact Statement for the recently FERC approved Constitution pipeline.

Arguably, the most critical issue facing the world today is global warming. For many years climatologists have said that global warming would lead to more extreme weather events occurring with increased frequency. Just look back over the past year or two. Every few days there is a new story of severe weather around the country causing extraordinary property damage and sometimes loss of life.

Nationally, we have seen flooding in Texas described by the governor as the worst ever. Remember the occupied by a family on vacation being swept away?

This year, Alaska could have the worst wildfire season ever recorded. The National Interagency Fire Center reports a total of 5.5 million acres burned nationally this season as of July 23 far above the average of 3.5 million acres per season. Veteran firefighters are reporting wildfires more extreme than they have ever seen and once again we have tragically lost more lives.

Pacific ocean temperatures along much of the west coast are 5 degrees above normal leading to a much

larger and longer lasting areas of toxic algae stretching from California to Alaska. On the East coast lobsters are at an all-time low population level due to warming ocean temperatures. Bumblebees are reported to be disappearing from the warmer parts of their range, again due to rising temperatures. Dolphins are being found in the Arctic where they have never been found before.

California is facing a severe drought which is killing plant and animal life and altering how people live. As a major source of produce for the country this affects us all. Unfortunately, NASA has predicted that the United States from the great plains westward to California will endure mega-droughts this century lasting decades and be far more severe than the current California drought. Both NASA and the state of California realize this is due to greenhouse gas emissions and California is aggressively working to lower its GHG emissions.

In the northeast we have seen a rise in the number of extreme weather events as well. In addition to our snowfall last year a record rainfall occurred in August 2014, Long Island, NY received an incredible 13.26 inches of rain in 9.5 hours, the highest single-day rain total ever in New York State.

Hurricanes Irene and Sandy devastated parts of the area and left extensive destruction in their wake. In the past few days South Carolina has been hit with incredible flooding from a “thousand year storm” with 19 lives lost and many more people losing everything they own.

This winter a “Godzilla” record setting El Nino is expected to form which is sure to bring more catastrophic weather events.

Worldwide, most of the years with the hottest average temperature have occurred within the last 2 decades with 2014 being the hottest ever. 2015 is expected to yet again break the record and July 2015 has already gone down as the hottest month ever recorded.

Collectively, these events illustrate the scientifically predicted impacts of global warming. In all of these events global warming is cited as a magnifying factor.

Now, the National Academy of Sciences has published a report which states that the cities of New Orleans and Miami will be lost to the sea due to greenhouse gas emissions which have already occurred.

FERC’s analysis of Climate Change in the FEIS for Constitution merely states the following rather obvious impacts:

- “more frequent days with temperatures above 90o F;”
- “a longer growing season;” (longer does not equate to better)
- “increased heavy precipitation;”
- “less winter precipitation falling as snow and more as rain;” and
- “rising sea surface temperatures and sea level.”

While these statements are true, they are far from complete and do not assess the repercussions on society such as increased storm damage, impacts to crop yields, property damage, loss of life, etc.

From the same document, “Emissions of GHGs from Constitution’s project would not have any direct impacts on the environment in the area of the projects.” This statement is completely false.

“Currently, there is no standard methodology to determine how the proposed Constitution Pipeline Project’s relatively small incremental contribution to GHGs would translate into physical effects of the global environment.”

FERC should be looking at the current CO2 levels in the atmosphere which rose to 400 PPM for the first time in 2014 and is steadily rising. Since this is well above the 350 PPM limit which many climate scientists consider a safe and sustainable level, FERC needs to compare the TOTAL GHG impact of the proposed pipeline INCLUDING delivered gas, to GHG contributions of the alternative energy sources which would match the energy of the contracted gas capacity of the pipeline. All of the gas will either be leaked or burned and end up in the atmosphere. Comparing an individual project’s impact to the global or national output and concluding that it is inconsequential is the type of flawed logic which will prevent us from effec-

tively mitigating the worst predicted effects of climate change.

This year, MIT issued a report on solar energy and concluded that one of the major problems in ramping up to large scale solar production is government policy. FERC is certainly a problem in this regard, since it rejects the viability of renewable energy sources in favor of fossil fuels such a natural gas.

Finally, FERC must thoroughly address climate change in the FEIS executive summary including a clear statement of the total GHG emissions of this project and all others it has approved on a yearly basis.

20151016-5017

Lori Brown, Bloomfield, CT.

October 16, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE Room 1-A
Washington, DC 20426

PF14-22 - Morgan Kinder, Tennessee Gas Pipeline Proposed Project
Hartford County, Connecticut.

Secretary Bose,

Many citizens in Connecticut are just now hearing about the gas pipeline project proposal by Tennessee Gas. My understanding is that the impacts of this project to the environment, drinking water, conservation lands, wildlife and a host of other possible problems are not being adequately addressed by the applicant.

There appears to be a deliberate paucity of verifiable data on the full impact of this proposal and an effort by the proponents to push the project through without a comprehensive review by the state. I am especially concerned that there has not been adequate effort to notify citizens and communities about a project of this size and magnitude, and therefore not enough time to gather public input and address the issues that are just now surfacing. Stories of the applicant misleading individual property owners about their rights are beginning to circulate as well, which increases the public mistrust of the applicant and the fairness of the process for the public.

I concur fully with the comments of State Representative David Baram in a letter submitted to FERC. Representative Baram has outlined some of the most basic information that is still needed to fully assess the project, and notes in particular the absence of alternative route options that avoid sensitive environmental habitat.

Please accept these comments for the public record, and note our opposition to this project application as proposed.

Lori Brown
Bloomfield

Letter follows from Rep. David Baram submitted to FERC 10-13-15:

Dear Sir,

As State Representative for Bloomfield and Windsor, CT, I am writing to ask that the comment time and investigation period be extended to allow residents, municipalities, and organizations an opportunity to learn more so they can comment intelligently.

I also ask that the Applicant, Tenn. Gas Pipeline Company, LLC and Kinder Morgan be required to submit all applications to the State of CT for a complete review, and to the local municipalities for zoning and wetland permitting.

Furthermore I ask that a complete environmental and toxicological study be conducted to determine any risks to public health and the environment, particularly in light of the fracking extraction that has led to

documented health hazards and detrimental environmental impacts.

It is also requested that information be made public verifying what the capacity is of the existing Tenn. Gas Pipeline in CT, how much is being used, and what the unused capacity consists of that might accommodate expansion without a second pipeline.

All routing and construction plans need to be made subject to local permitting by the applicable zoning and in-land wetland's commissions and the Applicant must obtain building permits. All public safety hazards, road and train crossings, underground and above ground water reservoirs/acquifers, and environmental habitats must be identified and analyzed.

Finally, I ask that Tenn. Gas provide alternate route options that avoid populated areas and sensitive environmental habitats.

The above information is necessary to determine if a Certificate of Need is appropriate and justified. Concerns need to be addressed, and routing should be reviewed to avoid populated areas and protected/sensitive environmental habitats.

At this time, based upon the criterion referenced hereinabove, it does not appear that a Certificate of Need is justified. This project should be carefully scrutinized without regard to timetables established by the Applicant. Much more review and analysis is required. Safety must always be the paramount priority.

David A. Baram
State Representative
15th Assembly District
Bloomfield & Windsor CT

20151016-5018

Tollie Miller, Bloomfield, CT.

To the FERC:

I am writing as a concerned citizen of Bloomfield, CT against the approval of the proposed Kinder Morgan/Tennessee Pipeline Company gas pipeline along Metropolitan-District-Commission (MDC) lands in Bloomfield, CT. The current route crosses highly-protected drinking-water lands, classified as Class I and Class II restricted lands by CT law. This land should in no way be endangered by construction and maintenance of a large gas pipeline. Per CT law, they cannot be legally disturbed other than through limited, permitted actions necessary to maintain operations. Disturbing the hydrology by construction of a 30-36" pipeline and exposing the watershed to potential leakage or contamination is patently unwise. Until or unless alternatives to traversing this section are investigated and approved, this pipeline should NOT be given approval.

20151016-5019

Jeffrey Brockway, Milford, NH.

Regarding the NED pipeline proposal through New England:

DO NOT ALLOW THIS PIPELINE TO BE BUILT

This pipeline will destroy the environment where the gas is extracted, the environment where the pipeline is laid and pollute the environment where the gas is burned. No amount of money will ever fix that. We only get one planet to live on. Would you want a fracking well or a pipeline in your neighborhood or backyard? No. No one does. Not Richard Kinder to be sure. Certainly not me, or my family. We cannot afford to saddle my generation or my children's generation with the aftermath of this short-sited money-grab of an environmental disaster.

A high pressure gas pipeline is a bomb waiting to detonate, every component built by the lowest bidder. A disaster is when and where, not if. They are not safe, period. Numerous gas pipeline incidents in the US every year back this up. There have been at least 23 publicly reported pipeline accidents in 2015 alone, as cited in:

https://en.wikipedia.org/wiki/List_of_pipeline_accidents_in_the_United_States_in_the_21st_century#2015

and expanded upon in:

https://en.wikipedia.org/wiki/List_of_natural_gas_and_oil_production_accidents_in_the_United_States

This pipeline is not being built for the benefit of the public. It is being built purely for private profit, and most of it for export. It will be paid for by electric customers by tariff. This is pure profit extraction and passing the cost on to consumers, who won't in all likelihood even be consumers of the gas carried in the pipeline.

Our country should be spending energy development funds instead on building renewable energy sources and infrastructure. Every joule of energy on this planet originally came from the Sun. It provides all the energy we need. We should be tapping that on roofs, over parking areas, along side roads in the form of solar energy collection, not a one-way pumping of it out of the ground and destroying the very environment we absolutely need to live.

I reiterate: DO NOT ALLOW THIS PIPELINE TO BE BUILT!

Jeffrey C. Brockway
Milford, NH

20151016-5020

Nicolle Souza, Merrimack, NH.

NED is NOT necessary, NOT wanted, NOT in the public interest, NOT safe, NOT socially, economically or environmentally responsible.. It stands to be a huge moneymaker for a private company - paid for by people just struggling to survive.

20151016-5021

Alison Jaskiewicz, Mason, NH.

The July 24, 2015 reports from TN Gas/Kinder Morgan arbitrarily changed the route of the Fitchburg Lateral. The new route impacts our second property lot but we have never received any notification from TN Gas to this effect. Are citizens to be left to ferret out any plans by corporations to impact their lives and properties? Apparently the route can be altered at any time without notification or restarting the clock on the approval/disapproval process even when new individuals are impacted. This is blatantly wrong. Please evaluate the environmental impact of these arbitrary rules allowing corporations to run rough shod over individual citizens lives and properties with no consequences.

20151016-5022

Sharon Lindale, Northfield, MA.

New England should not be building new infrastructure for fossil fuel delivery. We should be fixing the existing infrastructure (a recent study by the Home Energy Efficiency Team claimed as many as 20,000 leaks in Massachusetts pipelines alone*). Rather than investing in fossil fuel infrastructure, we should be investing in solar and wind infrastructure.

In "a 2013 study by Shanna Cleveland of the Conservation Law Foundation estimated that 8-12 billion cubic feet of natural gas was lost to leaks in Massachusetts alone in 2010. Ironically, this is also about 1 percent of New England's annual demand, or enough gas to cover the winter peaking problem."*

We certainly should not be putting people out of their houses and taking over hard-won protected lands to create new pipelines that will leak more gas into our land and waterways.

"This proposed path would run through some of the states' most sensitive eco-systems including conservation lands, wildlife reserves, state parks as well as farmland, towns and even crossing over or under the Connecticut River."**

New England should DEMAND that the owners of the existing pipelines should maintain their existing

lines. Once leaks are fixed, THEN we can determine whether there is a need.

By then, I hope we have come to our senses and support renewable energy. That is what I want and that is what my kids want.

Thank you.

Debra Austin, Averill Park, NY.

October 15, 2015

Regarding: Northeast Energy Direct Docket #PF14-22

Subject: FERC Filing #3, A Modern Day War - NO to Nassau, NY

Compressor Station and NED Pipeline

Thousands of people have invested time and energy into becoming educated on what a compressor station would mean to a residential and recreational community. I will not repeat all of the detrimental impacts this would pose to our climate, environment, health, water, pristine areas, peace of mind, crops, wildlife, property values, future generations, etc. Others have already presented scientific and indisputable evidence to FERC.

There is no 'Public Necessity' for this project and especially no benefit to Nassau, NY. We should not be asked to become a sacrificial zone for the NED Pipeline. In fact, no one should be asked to take on destruction of such magnitude. For the benefit of who? Kinder Morgan's profits?

If FERC decides to go forward with such an ill conceived plan, I ask for the following to be considered:

- 1) I live approximately 1 mile from the proposed compressor station. What evacuation plan is in place for the people? Who pays if we need to stay in a hotel, or worse, lose our home?
- 2) What is the evacuation strategy for evacuating my horses? I do not own a horse trailer. Who pays for them to be boarded elsewhere? Or, do you suggest I leave them to die? How would we be compensated for the loss of our beloved pets? Or, would we stay behind with them and be collateral damage too? Do you realize how spooky horses can be? We are entrusted with their care. It would be so cruel to knowingly leave them in harms way?
- 3) How will we be compensated when our property values decline, insurance rates go up, well water is contaminated, etc., etc.? Really, do you think Kinder Morgan would compensate us? It would be costly and a legal nightmare to attempt to make them do so.
- 4) The size of the NED Pipeline and Compressor Station is 'overkill' for the stated need. Larger pipelines and larger compressor stations mean more of all of the undesirables that go with it. i.e. more danger, more toxic emissions, more noise, etc. etc. Consideration should only be given to U.S. need. The infrastructure should not be on our backs, for their profits!! I'm sure if this were based on need and the pipeline could not be used to export gas, there would be no application right now to build it. Our problem would then go away, wouldn't it?
- 5) Is Fracked Gas something that FERC should be regulating and including as part of the Natural Gas Act? As we know Fracked Gas is nothing like conventional natural gas. The Halliburton loophole (non disclosure of chemicals) is in place to allow a project such as this to go forward. I'm sure without this loophole the merits of such a pipeline would never stand up to the scrutiny and laws in place to protect our air and water.

I've always been thankful to live in the United States and have felt blessed that I did not have to endure war

on our lands, as other people/countries have, during my lifetime. I feel if this is allowed to continue, it is a modern day war we are fighting that may ultimately destroy all life on the planet.

Please take a stand for what is right. You cannot claim to be ignorant of the repercussions any longer. We are all ultimately responsible for our actions!

RE: Northeast Energy Direct

PF14-22-000

We are writing to comment on the proposed NED pipeline and compressor stations that Kinder Morgan/Tennessee Gas is applying to build across Massachusetts and, in particular, in the Town of Windsor. We are residents of East Windsor and live about a mile and a half from the proposed compressor station and pipeline route. Our town voted overwhelmingly at its annual town meeting in May 2014 to oppose this pipeline due to the impact it would have on our entire community. I am a clinical psychologist, and my husband is a mental health clinician on the Berkshire County Crisis Team—both each with at least 25 years' experience providing mental health services in this rural and underserved county—and we can both attest to the very real likelihood that there will be adverse psychological and psychiatric outcomes as a result of the proposed NED pipeline due to the environmental, health, and economic consequences of this project.

There are enormous--and catastrophic--environmental, public health, financial and cultural costs associated with this project that the town of Windsor, in particular, will incur. In fact, all communities along the entire length of this pipeline--especially communities where compressor stations will be located--will face these impacts and costs. We would point out that Kinder Morgan/Tennessee Gas has failed to adequately address these concerns in the EIS (environmental impact statement) that it submitted on July 24, 2015, and it is of vital necessity that the company be required to address the concerns and provide further information before FERC can possibly determine if this project should go forward.

Our biggest concern is that Kinder Morgan/Tennessee Gas is a private, for-profit corporation seeking permission to construct an environmentally disastrous project that appears to be almost entirely for export, which will result in enormous profit and no public benefit. The fact that we have to submit comments for a project that is so demonstrably not for public use and not for the benefit of our citizens is absurd.

- Therefore, our first request is that Kinder Morgan/Tennessee Gas be required to establish a definitive need for this gas in New England. A recent report by ISO New England, a nonprofit corporation that oversees and coordinates the flow of electricity across the six New England states, indicates that the power demand for the past twelve months is at a 14-year low, and the current wholesale prices for electricity in New England are at a 12-year low. Other studies have suggested that the very minimal shortages that we do experience in New England would easily be mitigated by requiring gas companies to fix leaks and practice more efficient conservation methods.

The 8/21/15 issue of the Boston Globe (http://www.bostonglobe.com/metro/2015/08/20/new-law-casts-light-state-natural-gas-leaks/qJJPCjRZITc5ai0JeHNOqO/story.html?s_campaign=email_BG_

Today'sHeadline&s_campaign=) reported that in the state of Massachusetts, there are currently 20,000 potentially dangerous and environmentally damaging leaks (some as old as 29 years!) that are losing enough gas to be costing ratepayers millions of dollars a year. Thanks to a recent state law, utility companies have been required to submit data about the locations and age of known leaks. That data suggests that fixing those leaks would supply more than enough gas to address any power shortages that do arise, and would decrease the damage to the environment, atmosphere (methane is 25 times more potent than carbon dioxide in trapping heat in the atmosphere!), and to human health caused by these leaks. Other sources of evidence about the ways that this problem could be addressed simply by fixing leaks are 1.) a study commissioned by Senator Edward Markey that showed Massachusetts residents paid as much as \$1.5 billion between 2000 and 2011 for gas never used because of leaks and 2.) a Harvard University study released in January 2015 that showed that the number of leaks in the Boston area alone are three times greater than previously estimated and would heat as many as 200,000 homes per year and are valued at \$90 million per year! In the Globe story, the two major gas suppliers said that they had plans to repair the leaks over a 20-25 year period. It is unconscionable that they are allowed to take that long to repair leaks--some of which they've known about for as long as 29 years! If Kinder Morgan says it can build the entire NED pipeline and get it up and running by 2018, then utility companies can surely fix the leaks just as quickly and avert the so-called "need" for the NED pipeline.

New EPA regulations announced just this past week will require that all new construction be equipped to capture methane leaks that heretofore have been allowed to exist and which otherwise would have provided vastly more energy resources, and which have most certainly contributed to exponentially worsened global warming/climate change problems. Does the plan for the NED pipeline conform to these regulations? How will the ventings and blow-downs of compressor stations meet those regulations? How will the process of pigging the lines conform to those regulations? Once those EPA requirements are addressed, how much more power supply will be available through existing supply sources?

Finally, if there is no documented need for this gas in New England, how can a power/energy company be granted permission to build a pipeline almost solely for the purposes of export-for-profit, when it is so harmful to communities, public health, and the environment?

- We submit the quite substantive concern that this project will be enormously costly to towns, communities and citizens, all for the purpose of private gain. It is well-documented that a project like NED will ensure that the property values in the surrounding area will decline—almost certainly between 50 and 100 percent for property directly adjacent to the compressor station, and between 10 and 50 percent for properties nearby to a compressor station or pipeline, depending on how far those properties are from the so-called "incineration zone" or other impacts of a gas pipeline and compressor station.

As property values decline, so do the tax revenues of the town. And then fewer people will move to town, because the properties are worth less, have public health and water concerns, and are not likely to have resale value. In time, towns like Windsor become towns that no one wants to move to, and young people move out of as soon as they are able.

Another financial consideration will be attending to the public health--and individual health--concerns and problems that arise as a result of the toxic emissions from the compressor station and pipeline. It is well-known that the compressor station will emit upwards of a dozen toxic, carcinogen-producing, chemicals that have the potential to generate enormous health effects. People living in Pennsylvania near such facilities (actually, fracking facilities that emit far fewer toxins) have been advised to obtain blood and urine tests to ascertain their level of risk from living so close to these facilities. In a community such as Windsor, which at its elevation and with its geography has a frequency of fog and other factors that will ensure that many if not most of the emitted toxic gases will remain very close to the ground, the public health and environmental consequences will be severe. The emitted toxics will be inhaled by people within the nearest mile, for sure, and probably several miles, and then sink into our soil and groundwater supplies. It must be anticipated that there will be health concerns and deaths as a result of this project. As a clinical psychologist, I can cite many research studies documenting the link between mental illness and those living under economic and

environmental hardship, so we therefore must also anticipate an increase in incidence of mental illness and psychiatric symptoms that will require treatment (and deplete the ability of those suffering to maintain productive lives and healthy families). Is Kinder Morgan being held accountable to pay for the health care costs of these many negative outcomes, or are they and FERC assuming that the health insurance companies, the patients themselves, the health care facilities, and the general public will pay for such costs (diagnostic tests, evaluations, and treatment, as well as maintenance of families under duress)?

We would submit that, before Kinder Morgan/Tennessee Gas is allowed to build the NED pipeline, it be required to draw before-pipeline water samples from both surface and groundwater, as well as nearby wells and any other public drinking water reservoirs) such as Cleveland Reservoir, which is an open-air reservoir supplying water to the City of Pittsfield), as well as soil samples and air samples. Then, after the facility is on-line, and for regular intervals as long as necessary, it should be required to draw the same samples--as well as any requested by any affected party--to determine the public health impact and the exact consequence of the project on public health. Any citizen or business or municipality that requests such testing must be permitted to receive the testing, to be paid for by Kinder Morgan/Tennessee Gas.

- Environmental concerns to animal and plant species are another factor that we are requesting FERC to address. The town of Windsor, as well as many of the western Mass and central Mass communities through which this pipeline is proposed to pass, is located in a boreal environment with little developed land. As a result, the project is likely to negatively impact the land, water, soil, and animal, fish and invertebrate species in the vicinity. The impact of these toxic chemical emissions on the forest, surface and ground water, animal, amphibian, fish and avian species is likely to be devastating. What has FERC required Kinder Morgan/Tennessee Gas to do in terms of protecting endangered species or species of concern? How will the company protect the forest from being destroyed by the construction project and the toxic gases? It is undoubtedly the case that this compressor station and pipeline will pass quite close to and/or destroy vernal pools that form in the spring and host very specific species that breed in those pools. Because the final route for the proposed pipeline and compressor stations was released so recently, there was inadequate time for people to go out into the field to document the existence of vernal pools and the species that propagate in those pools. Kinder Morgan/Tennessee Gas should be required to: 1.) document those vernal pools and their species and 2.) accept comments next spring or summer (2016) documenting such pools and endangered species and 3.) propose a plan to ensure that those species will not be further endangered or even compromised, and have that plan vetted by an independent environmental specialist.

Another environmental--and public health--concern has to do with the effect on the food supply. Many of us who live in rural communities such as Windsor keep gardens in which we grow a certain portion of our yearly food supply. Our garden is organic as are many of our neighbors' gardens. There are also some organic farm operations in our town and surrounding communities. And there are maple syruping, blueberrying, and apple and peach orchards. All of these operations, from home gardens to orchards, would be impacted negatively by toxic emissions from a compressor station and from pigging operations and from accidents. Kinder Morgan has said that no organic farming operations will be negatively impacted by the NED Project. How on earth do they propose to back up that statement? FERC should require Kinder Morgan to test the soil and produce in any organic farm, garden, berry patch, or orchard in any area close enough to receive airborne or water-born chemicals from the pipeline and compressor stations—both before construction begins (to determine a baseline) and after the operation begins and at regular intervals as the years go on. If toxins are found after the operation begins, what will Kinder Morgan's remediation be? They must be required to have a remediation plan!

Yet another environmental/public health concern has to do with the way that the compressor station will generate significant noise that will be audible for miles around each station. Kinder Morgan has failed to specify how many decibels this station will generate and for how many hours per day. We do not know what the effect will be on human beings, the breeding patterns of wildlife in the area, and the growth patterns of trees and plants in the forest surrounding the complex. The research of Bernie Krause, Ph.D., has shown that human-made noise has a documented, negative impact on growth rates of plants and breeding rates of birds,

mammals, amphibians, and rodents. Kinder Morgan should be required to submit detailed studies, confirmed by independent scientists, about the anticipated effects of this project and how the company plans to provide adequate remediation so that the entire boreal eco-system is not destroyed.

Another public health concern has to do with the mental health of citizens living within the area of the compressor station, specifically, and the pipeline in general. Given the negative economic effects of this project on Windsor, and the negative environmental effects generated by the construction of the project as well as the operation of the compressor station, it is likely that there will be mental health complications among people living in the vicinity of the project. The devaluation of property values, concerns about the physical health of their children and grandchildren, and the effects of the toxins on the generation of mental illness, all will contribute to more need for treatment of mental health conditions in our community. In 2007, a study by Sills, Shetterly, Zu, Magid, and Kempe documented the association between parents' depression and the high use of health care services by their children (Sills MR, Shetterly S, Zu S, Magid, D, Kempe, A. 2007. Association between parental depression and children's health care use. *Pediatrics* 119(4) e829-e836). It is likely that as adults struggle with depression around what is happening in their town and on their property, their children will have higher health care needs and expenses, as well as longer term effects. It is also well-documented that exposures to physical and chemical agents will cause disease, disability, medical conditions, and psychiatric conditions (Mental Health and Environmental Exposures, Learning and Developmental Disabilities Initiative, November 2008).

- As for our community and the integrity of its character: The town of Windsor will essentially be destroyed, and the way of life of its people will also be destroyed. Building an industrial complex such as a compressor station in a rural community surrounded by open land and farms will destroy a town where the only businesses are two general stores and some organic farming operations. One may argue that this is not a first. For example, whole towns were destroyed when the Quabbin Reservoir was built to create a public water supply for the city of Boston and surrounding communities. But that was for a clear public use by US citizens, in the Commonwealth of Massachusetts, with an eminent domain plan to compensate each landowner in each town that would be destroyed. But in the proposed NED pipeline plan, there are no such arrangements for whole communities. Only the very small parts of land that are to be used for the pipeline will be compensated through eminent domain (good luck if you own a parcel that will be split in half by the pipeline: the compensation for the very tiny part that will host the pipeline will hardly cover the fact that the rest of your land will be worth nothing!).

We firmly believe that this project should be denied by FERC for all the reasons listed above.

However, if FERC should decide to proceed with the application process, then we ask that FERC must place many requirements upon Kinder Morgan to conduct necessary studies to ascertain the risks on the many fronts listed above and require the company to outline plans for mitigating the effects in a way that the independent scientific community will approve. For the town of Windsor, Kinder Morgan should be required to bury the compressor station so that there is no above-ground plant, any emissions should be captured by state-of-the-art scrubbers, all pigging stations should be completely contained so that no toxins can leach into the ground, and the construction of the pipeline itself should include burying the pipe at least six feet down in order to accommodate the very cold winters that we have in this boreal environment. These measures would, by no means, eliminate all environmental, safety, financial, and public health impacts on the residents of Windsor, but they would act as mitigating factors.

Finally, because Kinder Morgan has such an abysmal record of adhering to safety measures, quality control standards, and the agreements it makes with the communities in which projects are located, we would request that FERC establish a reliable mechanism for monitoring both the construction process and the operation of the NED pipeline and compressor stations once it is on-line, and to issue cease-and-desist orders whenever the permit is violated. To do otherwise is to consign the residents of Windsor, and people in all other communities along the proposed NED pipeline, to lives you would not wish on your worst enemy. Kinder Morgan should also be required to put a large sum of money in escrow for use by our town for damages caused by the NED pipeline project, given that KM may not have the financial resources to provide

such compensation in the future.

Tom Terranova, Lynnfield, MA.
Docet Number PF14-22

Questions for FERC regarding the Kinder Morgan Pipeline running through Lynnfield and many other Towns in Massachusetts:

1. I am adamantly opposed the Kinder Morgan Pipeline as there are many alternative power sources that are created daily to reduce the use of natural gas. The Federal government offers tax credits to homeowners for installing and using various sources of wind and sun, so why force a HIGH PRESSURE GAS PIPELINE ON MANY CITIZENS.
2. Kinder Morgan continues to change the location of the High Pressure Pipe Line running though Lynnfield wetlands, conservation land and Town Wells that supplies our Town drinking water with no explanation as to how they will accomplish this task without any current and long-term effects to Lynnfield wetlands, conservation land and Town Wells that supplies our Town drinking water. I am requesting a detailed plan as to how they will install the High Pressure Pipe Line and maintain the land above the High Pressure Pipeline?
3. The High Pressure Gas Line will be installed on property belonging to homeowners in Lynnfield. What is the procedure that Kinder Morgan must follow to compensate the Homeowners for the devaluation of the home and what government agency controls the prompt payment to the Homeowner? If the Kinder Morgan and the Homeowner cannot agree upon a devaluation dollar amount for the Home, what government agency will assist the Homeowner with resolving the matter?
4. The pipeline would result in major clear-cutting of wooded land in Town wetlands, conservation land and Town Well Lands, 1) presenting visual pollution in a natural, relatively unspoiled area widely enjoyed by the public, 2) possible erosion affecting the wetlands, conservation lands, wildlife, and the potential recreational use, and 3) the potential for serious contamination of the public water supply.
5. Kinder Morgan's record of safety incidents and pipeline spills leads me to believe that allowing them to build a major pipeline through these valuable lands presents a substantial danger to our public drinking water as well as wildlife and the environment.
6. I also object to the manner in which this proposal has been handled with regard to informing the public. There has been a near-complete lack of publicly available information. Only one public hearing that will be held October 29, 2015 in Lynnfield. With so much at risk for so many, the lack of public information and outreach is appalling. It leads me to believe that Kinder Morgan may be interested in keeping this project out of the public eye until it would be too late to take any action in Lynnfield.
7. I am concerned with the carcinogens that are used with Fracking the gas in Pennsylvania. How will the carcinogens be totally eliminated from the High Pressure Pipe Line?
8. How far apart will the shut off valves be installed with this High Pressure Pipeline and will they be automated? Whether the shut of valve is manual or automated, how long will it take to stop the supply of gas in an emergency situation of a gas leak?
9. If there should be a catastrophic situation occurs as a result of a gas leak in the High Pressure Pipeline, how will the People of Lynnfield by protected along with our wetland, conservation land, drinking water

supplied by our wells and Town's future water usage?

10. What law takes precedence Article 97 "Clean Environment" Amendment to the Constitution of Massachusetts or Federal Law as it pertains to the use of conservation land in Massachusetts?

11. Currently the High Pressure Gas Line ends in Beverly Massachusetts with no end user, if this Pipe Line is needed to reduce the cost of gas in the US North Eastern States, what is the identity of the Retail Gas Supplier?

12. I propose that a study be commissioned to compare the potential benefit to society of the gas being supplied to other alternatives that consider alternative uses of the land that will be reserved due to the pipeline as well as alternative means to meet the energy needs of the local society.

20151016-5026

Shawn Collins, Temple, NH.

A compressor station emitting hundreds of thousands of tons of toxins annually next to an elementary school is a really bad idea. There is no proven upside to this project - only damage for the people that live here. I strongly ask you to reject this proposal.

20151016-5028

Rebecca Leonard, Hancock, MA.

27 Potter Mountain Road
Hancock, MA 01237

October 15, 2015

Kimberley Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

Dear Secretary Bose,

I would like to express my grave concern over the proposed Northeast Energy Direct (NED) pipeline which Tennessee Gas Company, a subsidiary of Kinder Morgan (KM), seeks to construct through the states of NY, MA, and NH. First, I address some of the specious arguments currently being made in favor of this pipeline: Demand/Need: Demand in MA has been flat, not approaching the projections touted by KM. The 2.2 billion cubic feet capacity of this pipeline, even if scaled down, dramatically exceeds the NESCOE projection of 0.6 cubic feet of need in MA. With such ridiculously oversized capacity, and a convenient link to Canada's LNG facilities, it is clear that KM has designs on the potentially lucrative export market. It is ludicrous to think that MA ratepayers might be asked to foot the bill for NED when there is no guarantee that they will be the recipients of any of its contents. Furthermore, peak demand days in MA are few. Education could minimize those peaks ("Wait until 8"), as would further diversification of the grid to not rely so heavily on natural gas. There is still much room for efficiency measures, particularly in the commercial sector. Currently leaking pipelines need repair; MA ratepayers paid an estimated 640-1.5 billion for leaked gas between 2000-2011. Let's conserve and fix what we have before we build an oversized pipeline to address a fictitious need.

Green energy can't meet demand: The clean energy sector was, until changes enacted by the recent administration in MA, one of the fastest growing sectors in the Commonwealth's economy, with a 24% growth rate, in contrast to the 3% enjoyed by other sectors. As we speak, new technologies are being unveiled for energy storage and a smarter grid. Added fossil fuel infrastructure is not going to help this country create a newer, better, more resilient economy bolstered by innovation and cutting edge technological advances. The cost of utility-scale solar has dropped 78% in recent years. Pipelines = 19th century technology; we can do better!

Jobs: The approximately 2 billion dollar price tag of this pipeline, if redirected toward green energy/efficiency, could create 24,000 jobs as opposed to 3,000 temporary pipeline jobs.

Economic arguments aside, the environmental impact of this pipeline would be devastating. The amount of conservation land NED is proposed to traverse is astounding. Here in Berkshire and nearby Hampshire counties, our conservation and agricultural land would be disproportionately impacted. Berkshire County, in particular, is an economically disadvantaged region which depends heavily on agriculture and tourism, two sectors which would be squarely compromised by a pipeline.

I hope that FERC will investigate the abovementioned concerns about supposed demand and be circumspect about all KM claims to ultimately provide an economic benefit through rate cuts, jobs, or otherwise. FERC should strongly consider the “no action” alternative rather than green-light this ill-conceived plan.

Other questions to be addressed, in the event that a certificate is granted:

What guarantees would landowners have that their water supply will be monitored before, during, and long after any pipeline construction? What mitigation can be expected for erosion, runoff, and compaction of soils?

What efforts will KM be required to make to recapture gas during blowdowns at compressor stations? What about noise mitigation at these sites?

What will KM be required to do to repair ecological damage, particularly on conservation land such as the Pittsfield State Forest?

On Potter Mountain Road in Hancock, an already decrepit bridge would be traversed by heavy machinery in order to build this pipeline. What recourse does our town have for damage done to town property?

Will FERC conduct a thorough investigation, as required under NEPA, of the “conservation potential of various alternatives and mitigation measures”?

Will FERC allow a lower-grade pipe to traverse rural areas? New Jersey has outlawed this practice, but it is unclear what the plan is for us in Berkshire County, where citizens are very concerned about the potential impact of frost heaves on a lower-grade pipe.

Ms. Bose, residents across the Commonwealth have passed resolutions against this pipeline in what FERC should consider a startling number of towns. This is not a small grass-roots movement. We are a loud and strong majority, from all corners of the state, and we respectfully ask that you take heed.

Sincerely,

Rebecca Leonard

20151016-5029

Lisa Petersen, West Hartford, CT.

I am concerned about the proposed pipeline which would run through the Metropolitan District Commission (MDC) land in West Hartford CT. This pipeline is proposed by Tennessee Gas Pipeline Company / Kinder-Morgan.

The Metropolitan District Commission provides clean water to the Hartford CT area since 1929. The MDC currently provides quality water supply, water pollution control, mapping, and household hazardous waste collection to eight member municipalities: Bloomfield, East Hartford, Hartford, Newington, Rocky Hill, West Hartford, Wethersfield and Windsor. Additionally, the MDC provides drinking water to portions of Farmington, Glastonbury, East Granby and South Windsor, known as the MDC’s non-member towns. (source MDC website <http://www.themdc.com/about-us>) . According to the 2014 population information published on the State of Connecticut website, the combined populations of these towns is approaching one half million people. The watershed area needs to be protected so we continue to have high quality water that is safe.

The MDC property does currently have a pipeline installed in the 1950s. Its presence should not indicate a

new pipeline makes sense. As a country we made a lot of decisions in the 1950s that were not environmentally sound (like using asbestos for example). We need to be cautious in protecting our resources for future generations.

My concern for the water safety is also based on the behavior of Kinder-Morgan / Tennessee Gas Pipeline Company. They have not been forthcoming in sharing information about the pipelines over the past year. They have posted notices in the newspaper and contacted those who have property through which the pipeline will pass. They have not contacted the municipal governing bodies or the local media nor did they contact the water consumers serviced by the MDC. It seems that they are trying to push this through without the informed consent of those affected. Their existing pipelines in other areas have had serious incidents which they downplayed.

Because of the potential impact to the safety of the water supply for the entire region, the proposed route of the pipeline must not be approved.

20151016-5030

shannon lilley, lynnfield, MA.

WE DO NOT WANT KINDER MORGAN OR ANYONE ELSE ON OUR PROPERTY. THE THOUGHT OF THIS SNEAKY COMPANY DESTROYING OUR LAND AND JEPERDIZING THE LIVES OF OUR CHILDREN DISGUST US. THIS PROJECT DOES NOT NEED TO GO THROUGH LYNNFIELD. If they come on my property they will be arrested for trespassing. The police have been notified. This is just another example of big corporations destroying land, and the quality of life just to make money.

20151016-5031

augusta catherin, amherst, MA.

As students in Massachusetts, we're highly concerned with the risks of expanding natural gas infrastructure in Northeast. We hope that as a Regulatory Committee you listen to citizens' voices and reject this project. Not only does it disrupt individual property rights of people living along the route, but everyone since more methane gas emissions will contribute to climate change. I grew up in Boise, Idaho and saw firsthand the devastating consequences of climate change through runaway forest fires. If you're actually reading this call 208-450-9866 for a free Starbucks gift card.

20151016-5032

Katie Bowler, Merrimack, NH.

Please do not approve the Kinder Morgan pipeline that will be built right next to my 2nd grade daughter's elementary school in Merrimack, NH. There have been too many accidents with this company. I hope you will respect the wishes of the people and not big companies. There are existing pathways they can use. Please don't let them do this. Thank you for your time.

20151016-5033

daniel vogel, Amherst, MA.

As students in Massachusetts, we're highly concerned with the risks of expanding natural gas infrastructure in Northeast. We hope that as a Regulatory Committee you listen to citizens' voices and reject this project. Not only does it disrupt individual property rights of people living along the route, but everyone since more methane gas emissions will contribute to climate change. I grew up in Boise, Idaho and saw firsthand the devastating consequences of climate change through runaway forest fires.

Personally I hail from the beautiful state of Oregon in the Pacific Northwest (Cascadia!), which had its largest wildfire season ever in recorded history. Any expansion of infrastructure that contributes to climate change is a decision made understanding that it will create a world with more forest fires and more destruction. Reject this pipeline.

20151016-5034

Aisha Chodat, Amherst, MA.

Dear Commissioners,

I firmly believe that the building of this pipeline is detrimental to life on Earth, both in an immediate and long-term sense. I would like FERC to cancel production for a number of reasons. First of all, I would like to raise children in an environment that allows them clean air, clean water, and clean soil for food. Second of all, I want to know that FERC is regulating energy projects from an environmentally sensible perspective. Lastly, I want to feel secure that this project will not set a dangerous precedent for future destructive energy proposals. If this pipeline were to be denied, I would be immensely grateful. Please consider my note and trust that it comes from my heart.

Sincerely,

Aisha Chodat

20151016-5035

Samara Rosen, Amherst, MA.

Fracking pollutes water. Every being depends on water for survival; it's the number one survival need. Injecting volatile organic compounds (benzene, toluene, ethylbenzene and xylene) contaminates rivers streams and groundwater. These compounds make water hazardous to drink for millions of people. Millions of gallons of water are wasted for basic fracking operations. Meanwhile California is slowly destroying the west coast. We don't have the water resources to support this unsustainable form of energy. Fracking forces a battle of priorities: is energy worth more than people's basic survival need?

It doesn't have to be a battle. I am a student at Hampshire College, currently sitting in a large room packed with peers that are all against this pipeline and writing to say WE OPPOSE THIS PIPELINE AND WE OPPOSE FRACKING. There are other options.

20151016-5036

Victoria Meeder, Amherst, MA.

Dear FERC commissioners,

I am student living in Western Massachusetts avidly opposed to Kinder Morgan's proposal to build the Tennessee Gas Pipeline North East Energy Direct Expansion through Massachusetts and New Hampshire. I respect the necessary role you play in ensuring our country's energy needs are met, in an ethical and safe way. However, regulation is not occurring. Unethical, dangerous, and irresponsible fossil fuel projects are being approved and are threatening our communities, livelihoods, and the survival of our species.

Kinder Morgan and ISO New England have declared an energy shortage on a few days in winter. This pipeline would pump 2.2 billion cubic feet a day across the state. We know that the majority of this gas is going to be exported to European markets at the expense of Massachusetts rate payers by a gas tariff. Those few days in winter can easily be compensated for by local solar projects that cost only a fraction of what the 6 billion dollar proposed pipeline project would. It is unjust for Massachusetts citizens to pay for a multi-national corporation to build a pipeline they will personally profit off of.

The Federal Energy Regulatory Commission is intended to serve the interests and wellbeing of the American people. Presently FERC is not stepping up to its regulatory responsibility. As a passionate student, who is aware of the impacts of climate change I am taking the time to write you because I need you to do your job and regulate. My generation is at risk of not living past 50 if we continue down the road we're on. As young people in this country we are depending on you to ensure our survival and livelihood. Projects like this one are unjust because they threaten land and livelihood of those who live nearby. However, this pipeline also threatens the life and prosperity of all future people on this planet due to the implications it has for raising the global temperature and exacerbating the effects of global climate change.

Sincerely,
Victoria Meeder

20151016-5037

Sylvia Williams, Wilmette, IL.

20151016-5039

Claire Jones, Amherst, MA.

I have some major concerns about the building of the Tennessee Gas Pipeline. As a citizen of Massachusetts I have been angered by the possibility of this destructive and dangerous pipeline. I fear the future of not only the Massachusetts communities this pipeline directly impacts, but the devastating environmental effects that will result. It is well documented that pipelines leak methane gas into our water systems and atmosphere. This significant leakage of methane is not only hazardous it is a waste a resource that is costing the state, community, and environment too much.

For environmental, health, and economic reasons many people in my community, including myself, have chosen to eat local, Massachusetts produce. The proposed pipeline will be built through many farm lands and will have compressor stations dangerously near our food. This will result in toxic produce, inability to buy local food, and will cause farmers to lose their livelihood. This pipeline will negatively impact our state's economy, the public's health, and will further global climate change.

20151016-5040

Daphne Chang, Hadley, MA.

Dunan Herman-Parks, Amherst, MA.

Dear Commissioners,

I firmly believe that the building of this pipeline is detrimental to life on Earth, both in an immediate and long-term sense. I would like FERC to cancel production for a number of reasons. First of all, I would like to raise children in an environment that allows them clean air, clean water, and clean soil for food. Second of all, I want to know that FERC is regulating energy projects from an environmentally sensible perspective. Lastly, I want to feel secure that this project, if it does not get cancelled, will be the very last. If this pipeline were to be denied, I would be immensely grateful. Please consider my note and trust that it comes from my heart.

Sincerely,

Dunan Herman-Parks

20151016-5042

James VanNatta, Northfield, MA.

I wish to state that I am strongly against the building of the NED Pipeline for many reasons but what is of

greatest concern is the taking of public and private lands by eminent domain by a for profit corporation. I feel this it is unfair, in-democratic, and financially burdensome to private land owners whose property is taken or otherwise reduced in value by its proximity to a pipeline or pumping station. The purpose of the NED Pipeline as proposed by Kinder Morgan is a business venture to make money for the Corporation. It is interests of the citizens and towns along the path of the project that should be be honored or at least handsomely compensated for enduring the degrades environment and loss of property value. Thank you for your consideration of this citizens objections.

20151016-5043

Sara Grendon, Amherst, MA.

Dear Commissioners,

I am student living in Western Massachusetts avidly opposed to Kinder Morgan’s proposal to build the Tennessee Gas Pipeline North East Energy Direct Expansion through Massachusetts and New Hampshire. Sara Grendon

20151016-5044

Colleen McKinney, Unadilla, NY.

October 15, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E., Room 1A
Washington, D.C. 20426

Re: Docket number PF14-22-000

Dear Secretary Bose,

My home is in the Town of Sidney, New York. If built, the “Constitution” pipeline (CP) would run ten feet from my property line. Kinder Morgan’s proposed Tennessee Gas Pipeline Northeast Energy Direct (NED) would be located directly next to it.

FERC already knows the negative environmental impacts that the NED pipeline would have on the people,

environment, economy and communities along its route. FERC know this because we told them at scoping hearings and in thousands of comments we submitted to the agency regarding CP.

I ask that FERC include and address ALL comments regarding CP in the docket for NED. I also ask the agency to consider and address the exponential risks that would arise and damages that would be caused by a second massive pipeline (NED) installed mere feet from the first (CP). Two pipelines built one after the other on steep slopes and through hundreds of waterbodies would mean the period of exposed clear-cut ground would last for years. Considering the frequency and intensity of extreme rain events in our region, these bare-ground conditions would very likely result in massive runoff and erosion, scouring at stream crossings, pipe exposure, pipe rupture, severe flood damage, loss of property and devastated wildlife habitat. FERC knows that we in the communities these pipelines would gouge through will assume all of the health and safety risks. We will pay the price of the increased erosion, water runoff and flood damage that will follow in the wake of clear-cutting more than half a million trees for each of these pipelines. We will deal with the contaminated water, decreased property values, and costly road and bridge damage. We will get no rewards.

I've learned something about FERC over the past four years since CP was proposed. I've learned that FERC does not care about us, our livelihoods, our safety, or whether or not our towns thrive. FERC is not in the business of protecting us. FERC is in the business of approving pipelines—no matter what those pipelines might do to us.

Why? Because the salaries of FERC employees are paid by the oil and gas industry.

It's true. On FERC's website, the agency proudly states that FERC is fully funded by "annual charges and filing fees assessed on the industries it regulates."

If you were paid by Big Oil and Gas, what incentive would you have to ever deny your patrons what they want? The answer is none. You would do what they tell you to do—just like FERC does.

Adding insult to injury, FERC is approving and enabling this harm to our land and our communities so that multi-billion-dollar companies can export American gas.

Kinder Morgan and the Constitution Pipeline Company repeatedly tell us they will bring us cheap gas. But to FERC and their investors, they tell the truth, which is this:

More than 75% of the Pennsylvania shale gas in the NED pipeline would be shipped to Canada. From there, the plan is to liquefy and export it to Europe and Asia, where gas sells for two to five times what it sells for here. Why would Kinder Morgan sell gas to us when they can make so much more money exporting it?

Exporting our country's presently abundant gas will raise energy prices here at home, soon, significantly and permanently.

Kinder Morgan's plan is to gouge through our states, clear-cut and dig up our yards, farms and forests, and blast across streams and rivers to bury their huge export pipeline. Where is the benefit to us? The NED pipeline will only compound the damages wrought on us by CP. Nearly 100% of CP's gas is slated for export to Canada, as shown here:

http://www.iroquois.com/project/sono/SoNo_OpenSeasonBrochure_1_12_15.pdf

In order to build its pipelines and other gas-related projects, Kinder Morgan needs from FERC a "Certificate of Public Convenience and Necessity."

But building export pipelines through upstate New York's communities so that wealthy gas corporations can get richer and American families get saddled with higher energy bills does not sound like public convenience or necessity to me. It sounds like the rich getting richer at our expense.

I'm writing to tell FERC and the federal government that they can't keep forcing these dangerous projects on our communities. We all have a right to prosper, but not by damaging and devaluing the land, contaminating the water and air, and hurting our fellow Americans.

I ask that FERC reject the NED pipeline.

Sincerely,
Colleen McKinney

20151016-5045

Raymond E Petersen, West Hartford, CT.
Re: Docket # PF14-22-000

I would like to express my general opposition to the proposed Kinder Morgan / Tennessee Gas Pipeline project in central Connecticut, and my specific opposition to the portion that would pass through property owned by The Metropolitan District Commission (MDC).

The MDC is the primary source for drinking water in central Connecticut, supplying 50 million gallons of water daily to over 400,000 residents in 12 towns.

I understand there is a pipeline through this property already, and has been for over 60 years. Siting a new, higher pressure pipeline in the same area seems to be a recipe for disaster. I know that the soil in New England is constantly shifting, especially during the winter and it is worrisome enough to have the existing pipeline where it is, without introducing a new source of potential problems.

Besides the water source issue, the MDC property is a tremendous natural resource for our area, and many people visit the property for many recreational purposes. I feel the expansion of the pipeline right-of-way would be even more disruptive than the existing one is to this area, and place wildlife habitats in jeopardy.

During a recent presentation that Kinder Morgan held in West Hartford, company officials stated that the pipeline would only contain the same gas that was being delivered to homes and businesses. I have heard from other sources that the gas transported through the pipeline would also be mixed with chemicals resulting from the fracking process. I have also heard that the pipeline would have vents at regular intervals, and that some of the chemicals carried through the pipeline are routinely vented into the air. That does not seem like anything I want in my town or anywhere near the source of my drinking water. And that is only due to normal operations – the potential for greater disaster exists in the event of any kind of accident or intentional interference with the pipeline.

Kinder Morgan's presentation hinges on the "need" for this pipeline in order to provide higher volumes of natural gas at a lower cost to New England. I personally do not, and would never, use natural gas in my home. I would prefer that the fossil fuel industry be constrained from expanding any kind of operations at this time. In my opinion, the greater need is not for cheaper gas and fossil fuels – especially when they are produced with increasingly more dangerous methods. The greater need at this time is the expansion and support for more forms of safer, renewable energy sources.

20151016-5046

Robert Connors, Canaan, NY.
Federal Energy Regulatory Commission,

I hereby request that the Federal Energy Regulatory Commission (FERC) consider Kinder Morgan's subsidiary Tennessee Gas Pipeline not in compliance with the requirement to provide federal in person public scoping sessions for the Northeast Energy Direct Pipeline Project (NED). Indeed, no scoping sessions were held in Albany County, NY at all and the NED route would traverse Albany County, NY.

In Rensselaer County, NY the federal public scoping session was held at Castleton-on-Hudson, NY prior to the issuance of a major draft environmental resource report for its proposed Northeast Energy Direct pipeline project. This report consists of over 6500 pages of data in the form of 79 different volumes published on July 24, 2015. It represents a revision of plans filed March 13.

Many of the NED scoping sessions were already completed or soon would be and the public did not have

adequate time to digest this sketchily written report of July 24, 2015.

On July 14, 2015, I testified at the Castleton-on-Hudson, NY FERC scoping hearing. I did not have the opportunity to see the above-mentioned documents that I was there to provide input on, as Kinder Morgan had not issued it yet. This situation is also true for the other persons who provided comment in other locations in PA, NY and possibly NH, and those in the general public who may not have testified because they did not have access to this major revision to the report detailing the plans.

I hereby request that FERC should consider Kinder Morgan's federal public scoping sessions as incomplete and not in compliance with the letter or intent of federal public scoping sessions. You've got to have the scope published BEFORE the public scoping sessions in order to meet the intent of the sessions.

Kinder Morgan should be required to hold additional public scoping sessions in the areas where the sessions were held prior to the issuance of the environmental resource report revisions on July 24, 2015, and specifically, require Kinder Morgan to hold an additional public scoping session throughout the entire Northeast Pipeline proposed route.

I feel that my rights, and the rights of the others in PA, NY and possibly NH who did testify before the environmental resource report was published, have been violated. In addition, the rights of other PA, NY and possibly NH residents who might have testified had the report been issued prior to their local sessions were also violated.

The only possible remedy is to hold more public scoping sessions for the areas who were deprived of a true opportunity to provide scoping input at a federal scoping session. Certainly we are aware of the extension of the timing for written input. I do not feel that the extension of this date for all input to be received remedies the situation totally, although it does help for those people who prefer the written input mode.

Kinder Morgan plans to submit final filings to FERC on November 20th, 2015. FERC should reject any such filings since Kinder Morgan has not provided the public with a true opportunity to provide in person scoping input based on their plan.

Thank you in advance for following the only legitimate course of action for FERC to take - that being summarily rejecting Kinder Morgan's final filings until the base requirement of obtaining in person public scoping input has been met in all areas affected by the proposed Northeast Energy Direct pipeline project.

Robert Connors
1409 County Route 5
Canaan, NY 12029

20151016-5047

Lisa Martin, West Hartford, CT.

The reason this section of pipeline is being moved is because it costs less money to put it in flat land instead of replacing it in the ridge the existing pipeline is located.

This is short-sighted. The money saved today will be much less than what will be spent if there is a leak into the drinking water.

Haven't we seen enough pollution and its effects?

This is not logical. This is not good reasoning.

This is very poor decision making.

I am against moving the current path of the pipeline.

20151016-5049

Adriane Robbins, Temple, NH.

Building a compressor station emitting hundreds of thousands of tons of toxins annually next to my child's school is a terrible and disgusting thing! Could you please look past the money and realize how bad this

is? Would you allow this next to your own 9 year old child's school? Please don't allow this pipeline to go through New Hampshire! We are counting on you!!!

20151016-5051

John Leoutsacos, Temple, NH.

Compressor stations along the proposed NED pipeline are power generation stations and must be required to be cited, permitted and regulated as such. They have identical fuel & exhaust inputs and outputs as power generation stations sited by these same requirements and in fact compressor stations are undoubtedly far less efficient than combined cycle power generation stations with identical fuel and exhaust paradigms.

The basic formula is 1 horsepower = 745.699 Watts of power, the math is simple so I'll let you figure it out $40,000 + \text{HP} \times 745.669 = ??$.

The compressor stations will be generating their own electricity to provide power distribution for communications, lighting, etc.

Cathode protection systems forcefully distribute power onto a very low impedance (high current flow) pipe and anode / cathode systems generating electricity.

The only logical reason that compressor stations aren't cited and regulated as power generation stations is that FERC is being told what to do by the very industry that they are charged to regulate. This means that companies like Kinder Morgan tell FERC what to do and not the other way around. It also means that FERC is putting our health and safety behind Kinder Morgan's profits.

20151016-5052

Colleen McKinney, Unadilla, NY.

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E., Room 1A
Washington, D.C. 20426

Re: Docket number PF14-22-000

Dear Secretary Bose,

The portion of central New York that Kinder Morgan's NED pipeline is proposed to traverse has seen several devastating 100-year floods in the last ten years, with tremendous economic consequences. Scientists have stated that climate trends will make such flooding more frequent and severe in our region in the future.

As far as we can tell, since Kinder Morgan has yet to share with the public detailed maps of its proposed route, the "supply portion" of the NED would follow much of the same route as the proposed Constitution pipeline. This means the NED would dig and blast up and down miles of forested hillsides and through hundreds of streams, creeks and other sensitive and protected water bodies in New York. It would wreak yet more damage through eastern New York, Massachusetts and New Hampshire.

The right-of-way for the NED pipeline, whatever the route may be, would require the permanent clearing of millions of trees. This would directly follow the clear-cutting of more than half a million trees for the FERC-approved Constitution pipeline, if that project goes forward. Access roads and other attendant infrastructure would require more clearing of trees and vegetation.

Trees and vegetation hold soil in place. They soak up water and, in doing so, play a critical role in helping to prevent erosion and flooding. Any clearing of land, hillside or otherwise, or riparian vegetation will exacerbate erosion and flooding and put the lives and property of central New Yorkers at risk.

The inevitable increase in erosion that would follow the destruction necessary for the NED pipeline is not only a concern in terms of severity of flooding but in terms of the integrity and safety of the pipeline itself.

Pipeline ruptures and explosions are reported in the news on a monthly basis. We watch in horror as pipeline companies pay paltry fines rather than fix leaky pipes or use better quality materials or actually follow their so-called “best practices.” We watch in horror as FERC continues approving projects that put our families and communities at risk.

FERC should thoroughly study how the clearing of land involved for the NED and Constitution pipelines combined would exacerbate future flooding in New York.

FERC should study what negative economic impacts this flooding would have on the state of New York, its citizens and its businesses.

FERC should seriously examine the wisdom of siting a second potentially explosive massive fracked-gas pipeline in an area where severe flooding has happened many times recently and will happen again.

As FERC weighs the benefits of this project (big profits for Kinder Morgan), the agency should remember the consequences: ruining and devaluing our land and communities; creating dangerous flood conditions that will put human lives and property at risk; enabling large-scale export of shale gas from America, which will cause domestic gas prices to rise dramatically.

This pipeline is a bad idea for America.

Sincerely,

Colleen McKinney

John Leoutsacos, Temple, NH.

NEW Ipswich does not want to become another Myersville Maryland

Below are excerpts taken directly from FERC docket # CP15-492-00 and website mercmd.org, that clearly show the original intent of Dominion Transmission Inc and how FERC was (and is) a willing accomplice allowing them to achieve their goals.

Dear Secretary Bose:

By Order dated December 20, 2014, the Federal Energy Regulatory Commission (Commission) authorized Dominion Transmission, Inc. (DTI) to construct, install, own, operate and maintain certain facilities that comprise the Allegheny Storage Project (Project). Dominion Transmission Inc. 141 FERC ¶ 61,240 (the “Order”)

As required under Ordering Paragraph (B)(2) and Section 157.20(c)(2) of the Commission’s regulations, DTI hereby notifies the Commission that on November 1, 2014 the authorized project facilities were placed in-service

Despite repeated assurances from Dominion Transmission that they had no plans to expand the Myersville Compressor Station, they have filed an application with FERC to essentially double the amount of compression at the facility.

South SIX months later, Dominion applied to expand the LEIDY Project.

LEIDY SOUTH PROJECT

Filed: May 15, 2015

Dominion Transmission, Inc. Docket Nos. CP15-492-000

NOTICE OF APPLICATION

(May 27, 2015)

Specifically, DTI proposes to replace two 1,100 horsepower (hp) compressor units with one 10,915 hp unit at the Finnefrock Compressor Station in Clinton County, PA; install one suction filter/separator at the Centre Compressor Station in Centre County, PA; install one 13,220 hp unit at the Chambersburg Compressor Station in Franklin County, PA; install one 15,900 hp unit at the Myersville Compressor Station in Frederick County, MD; install one 8,000 hp unit at the Leesburg Compressor Station in Loudoun County, VA; install a new cooler and filter separator at the Quantico Compressor Station in Fauquier County, VA; and construct a new meter station at the Panda Stonewall Power Project in Loudoun County, VA. The Project will allow DTI to provide an incremental 155 MMcf per day of firm transportation service to three electric power generation facilities. The total cost of the Project will be approximately \$209,657,857. pipeline operating under the Commission's regulations and a Commission approved FERC Gas Tariff.

20151016-5054

Tina Perreault, Temple, NH.

I oppose the building of the pipeline and compressor station. This pipeline will endanger the lives and health of the Temple Elementary School children and the people of our town. The amount of toxins, noise, light and air pollution will destroy our community and quality of life as well as many other communities throughout the state. It will also destroy the local farms that support and feed people in our town, local towns and even across the state. Please oppose the building of the pipeline and compressor station.

20151016-5055

Wendy A Elsing, Temple, NH.

I have great concerns over the environmental damage this pipeline will cause to our well water air and noise pollution release of toxins caused by drilling and blasting of granite devaluation of property use of eminent domain , building compression station so close to school maintains road to said station and security of station gas being used for export not to lower or even benefit NH. I live about 2miles away and will never see gas in my area. I also worry about Kinder Morgan's responsibility to maintain and service long after gas is no longer be shipped. Also what else will they try to pump through pipeline. Our area could never deal with a small failure of pipeline ex. Fire explosion or worse. I also wonder how fern and be a bias commity when by your own admition in Milford meeting you would be overseeing project for at least two years. Does that not produce a conflict of interest. Kinder Morgan also stated at their meet and greet at Hampshire Hills that it is much more dangerous to remove existing pipeline than to build new (in response to why not upgrade existing pipeline in Mass.) What happens then to our environment if repairs or replacement is ever needed. I worry personally about damage to my health living so close to compression station. The ability to sell my house in future to retire. I also have little confidence in fern itself to be objective and concerned as it feels like the decision was already made two years ago whe Kinder Morgan began clearing land on site before anybody even knew about pipeline . Our wildlife landscape water aif health lively hood will all be negatively affected by this pipeline. The only ne to profit will be Kinder Morgan

20151016-5056

Chad Desrosiers, Temple, NH.

I have numerous concerns regarding this project. My house will be about.2 miles from compressor station. Other than obvious noise and safety concerns I am worried about my dug well and its quality after they start messing with the soil. The water table seems really high especially over where they want the compressor station. Most of the time there is actually a small stream right next to the site. In addition I literally just bought this house like 3 months before this nightmare began. I am a struggling college student with heavy student debt and now I have to worry about depreciation on my home due to this project. The loss that I will take on my property value if this goes in will be devastating and lead to me being stuck with a heavy pmi for much much longer. I urge you to consider these issues. Thanks

Robert Douglas, Lynnfield, MA.

I have been a resident of Lynnfield, Massachusetts for most of my life My parents still live on North Hill Drive there with the pipeline directly adjacent to their back yard, so this project will have a direct and devastating effect on the lives of me and my family.

The pipeline will also run through directly through the middle of town of Lynnfield's water shed, which is the largest water shed along the Ipswich River. Our town had a representative from the river protection association come and speak at public meeting to explained all of this. There are actually 3 cities and towns that draw their drinking water from this water shed, including Lynnfield. The town of Lynn, MA also draws it's water from here, this pipeline directly impacts their drinking water quality, but I am sure they have no idea that the project is impacting them. This is how Kinder Morgan works, they have been trying to expedite this pipeline permitting process without allowing the communities it effects to respond. It is also my understanding that there are 12 towns and cities that get their drinking water from the Ipswich River, which is directly endangered by this pipeline.

Here are my concerns.

I have researched the topic and see that studies have shown that on a handful of days in the winter (6 - 12 days at most), there is a need for an additional .6bcf per day of natural gas in New England. Here is the problem with this pipeline. The pipeline is actually sized to carry 2.4 BCF per day of fracked gas per day. I have also read reputable articles that KM has actually reduced the flow of natural gas through the other pipelines in New England to fabricate additional shortage! Why have they been doing this? The TRUE REASON for this pipeline is being withheld by Kinder Morgan, but in all of my research and the research of many people on this pipeline is that it is being built so that Kinder Morgan can export the gas to Europe where they are paying 3 times the price for natural gas from Russia and other suppliers.

In addition to the fact that the pipeline is grossly oversized, this can also be shown to be true because I see on their website that they just awarded a 356 million dollar contract to build ships. A pipeline company from Texas building ships on the east coast? It's not difficult to connect the dots there.

It is also my understanding that the Lynnfield Lateral and Peabody Lateral are the 24" (most of the volume of the gas through the main line to Dracut) are being directed towards the ocean, and they also claim to be tiring the pipeline into the Maritime pipeline in Danvers. This pipeline, which was originally being used to bring natural gas to New England, has been used to send gas in the OPPOSITE direction, sending the gas to Canada for export, so with this in mind, the Lynnfield Lateral and Peabody lateral are the Export branch of the pipeline-

There are already other gas pipelines in place and in planning owned by KM and Spectra that can meet this demand, it's a redundant pipeline, the only rational conclusion is that it's all about getting the gas from the Marcellus Shale field to sea to sell to foreign markets, so don't be fooled by KM's propaganda machine.

The next problem I have is that one pipeline does not change the price of natural gas, the price is dictated by the market, not the pipelines. Ask any expert if one pipe can PROMISE to lower the price, and they will tell you it can't. On the contrary, this pipe will make it so we are competing for the same gas on the global market which will RAISE the price for New England consumers! Next problem: The pipeline will cost over 4 billion dollars, and the Feds will allow them to pass off the price of the construction to New England rate payers in the form of a 'delivery surcharge' which is another name for A TAX. This will ADD to the cost of the gas we already have access to, and THIS PIPE WILL RAISE THE PRICE OF GAS to NE!!

Next problem: I am a petroleum engineer for over 28 years. I have been reading about this for a year and can tell you that KM has been very deceptive and underhanded about this project. Every town in it's path is now AGAINST the pipeline, For instance they have set up an office in NH to supposedly allow residents to come in and get information, which is a crock, one article said the doors were always closed and when they looked in the window they see stacks of lawn signs to support the pipeline. They do not come to each town to ask permission, in Lynnfield MA we found out when they sent surveyors to knock on doors asking to sign

for permission to survey for a pipeline that most likely won't go in. Unsuspecting homeowners had no idea a 24" 1460psi fracked pipeline transmitting 1.3 BCF per day through their yard!

I am also concerned about the fact that a large section of the pipeline is going directly through Article 97 protected wetlands within Massachusetts. It is a shame that the government is considering allowing a Texas based corporation to use their money to rip through the open and protected areas of our beautiful state, causing irreparable damage to our protected spaces when the gas is mainly intended for foreign markets!!

This brings me to my final point: They are taking land from homeowners citing 'eminent domain'. According to the Wikipedia, eminent domain must be land taken for PUBLIC USE. An EXPORT pipeline being disguised by KM as being gas for our use is not PUBLIC USE and therefore taking land from homeowners for this pipeline in my opinion is AGAINST THE UNITED STATES CONSTITUTION. From Wikipedia 'James Madison, who wrote the Fifth Amendment to the United States Constitution, had a more moderate view, and struck a compromise that sought to at least protect property rights somewhat by explicitly mandating compensation and using the term "public use" rather than "public purpose," "public interest", or "public benefit". Exporting of gas is not PUBLIC USE and KM should not be allowed to destroy our land!

20151016-5058

Maria Donjacour, Amherst, MA.

I am a Hampshire, I oppose this pipeline because of it's extreme impact on the environment. Fracked natural gas is not a useful alternative or "bridge" to renewable energy. The extraction devastates the area it is from, the transportation and piping of the gas has causes huge risk for the area around the pipeline and the burning of natural gas contributes strongly to global warming. As a young person looking forward I urge you not to permit this pipeline to be built. Climate change is a real disaster that is happening today and we need to do everything in our power to stop it's progress. Extracting, piping and burning this gas will adversely affect the environment and the climate. It is in your power to stop this project I and I hope this commission can find it's power to shut it down.

20151016-5059

Roy Pincus, Lynnfield, MA.

To the members of FERC, I draw your attention to the below articles which show just how poor a safety record Kinder Morgan has.

<http://www.sightline.org/2013/09/19/wall-street-worries-about-kinder-morgans-safety-record/>

<http://www.sightline.org/2012/04/05/the-facts-about-kinder-morgan/>

Given the lack of transparency Kinder Morgan has demonstrated throughout the entire process thus far in trying to get this pipeline pushed through, I ask you to consider Kinder Morgan's blatant disregard for the environment, our water, the air we breathe, and the damage that will be done and left behind for those of us to have to live with. Clearly, Kinder Morgan puts their bottom line ahead of safety. They only care about their profits.

A pipeline under the kind of pressure which this will be is not needed and would be running through extremely dense populations, especially in Eastern Massachusetts. An explosion could result in a large number of human casualties and enormous damage to property. Just look at the number of pipeline explosions that have occurred just in the last 15 years.

https://en.wikipedia.org/wiki/List_of_pipeline_accidents_in_the_United_States_in_the_21st_century

<http://fracdallas.org/docs/pipelines.html>

<http://thinkprogress.org/climate/2015/01/27/3615805/west-virginia-gas-pipeline-explosion/>

I ask you to not approve this pipeline and tell Kinder Morgan to spend some money and resources on maintaining the pipelines they already have built rather than trying to build this pipeline which would span roughly 200 miles. There is simply no reason for this other than corporate profits. No one should have to

live in fear of a possible catastrophic explosion from a pipeline like this, especially when it would be running right through private properties like mine, under my front yard where I play with children just feet from the front door of my home. Please do not let this happen. It would be irresponsible.

Thank you.

Roy Pincus

20151016-5060

Roy Pincus, Lynnfield, MA.

To the members of FERC, I call your attention to a pair of articles which illustrate the high number of gas leaks that exist in current pipelines in Massachusetts.

<https://www.bostonglobe.com/metro/2015/01/22/natural-gas-leaks-boston-area-are-far-more-extensive-than-thought/5BykQrnaGRr2XLtxpHqLIM/story.html>

<https://www.bostonglobe.com/metro/2015/08/20/new-law-casts-light-state-natural-gas-leaks/qJJPCjRZITc5ai0JeHNOqO/story.html>

Rather than build a new oversized pipeline that would have a planned capacity for 2.2 Bcf/d, way more than our region would ever need, the current leaks should be fixed. The study by Harvard scientists in one of the articles points out that the leaked gas is enough to heat as many as 200,000 homes a year. Isn't this what should be pursued? We should be looking at renewable energy like wind and solar before building this monster of a pipeline that will destroy our environment, wetlands, conservation land, private property, and go right through rivers and nearby water wells, with a high risk of polluting water supplies. The chemicals put in place around the pipeline after it has been installed can be cancer causing toxins and can potentially contaminate our water. The polluting of the air from these greenhouse gases is a major concern for air quality and further weakens the ozone and adds to global warming. The noise from metering stations is just another negative made even worse by the fact that these metering stations will be in heavily populated residential areas.

This pipeline is being rejected by all towns throughout Massachusetts and New Hampshire which have the misfortune of being subjected to it. While our region may be short of natural gas capacity for 5-10 days per year during the coldest of winter days, this pipeline is not the solution. Is it really worth it for 5-10 days a year when there are leaks in the current pipeline infrastructure that fixing would go a long way towards increasing capacity significantly? So why does Kinder Morgan want to do this? Why are they building the Lynnfield Lateral from Dracut, MA to the shoreline? If this is the best solution, why not at least end the pipeline in Dracut, MA? Unless they really just want to get the fracked gas onto ships to export and sell for major profits. That would explain a lot. And that is exactly what they are intending. That is why they want a pipeline large enough for 2.2 Bcf/d.

This needs to be stopped. Kinder Morgan cannot be allowed to do what they want just because they want to. Please listen to the people of Massachusetts and New Hampshire who have expressed overwhelmingly strong opposition to this pipeline. For once, it would be nice to see the concerns and wants of the people ahead of the wants and greed of a corporation, especially one as shady as Kinder Morgan. I have let my elected officials know the same.

Thank you for your attention to this grave matter.

Sincerely,

Roy Pincus

20151016-5061

Rosemary Ostfeld, East Lyme, CT.

This project will destroy the environment in and along the Connecticut River, as well as contribute to more GHG emissions. I strongly oppose it, and believe we should focus our resources on renewable energy, rather

than creating natural gas pipelines.

Rosemary Ostfeld

RE: Docket No. PF14-22-000

I respectfully request that the Federal Energy Regulatory Commission reject Tennessee Gas Pipeline Company's proposed Northeast Energy Direct (NED) Project. I base this request upon the following:

1. The pipeline and compressor station are located too close to Our Lady of Hope, our religious facility. This high-pressure, high-capacity station will bring significant human safety risks to our Sisters living there.
2. The pipeline and compressor station are located too close to a farm containing Newfoundland ponies, an endangered animal. There are only 250 left on earth.
3. The pipeline and compressor station are located too close an annual migration path of thousands of raptors. The high-pressure, high-capacity station's exhaust plumes of heated gases will bring significant safety risks to these birds.
4. The pipeline and compressor station are located too close to a school whose heating system uses outside air to heat the facility. This high-pressure, high-capacity station will bring significant human safety risks to our teachers and children attending the school.
5. The pipeline and compressor station are located too close to our water supplies, parks, and conserved land and will bring significant environmental hazards.
6. FERC has already approved another pipeline enlargement to satisfy New England's natural gas-fired electric generation needs on the coldest days. We don't appreciate the need to add more supply.
7. The proposed pipeline route requires a new right-of-way that would cut through many miles of environmentally sensitive areas and take permanently protected land out of that protection.
8. The particular gas that would be carried in the proposed pipeline is likely to be particularly high in toxins and radiation, and the health impact upon our families, animals and plants must be avoided.
9. Some "fracking" compounds and chemicals negatively impact the skin, eyes, sensory organs, the respiratory system, the gastrointestinal system, the liver; the nervous system; and are candidate endocrine disrupting chemicals. Endocrine disrupting chemicals (EDCs) present unique hazards, particularly during fetal and early childhood growth and development. We do not want to be exposed to any of these chemicals.

Respectfully submitted,

Paul Stevens

RE: Docket No. PF14-22-000

The soils in New Hampshire are prone to slippage and washouts, particularly those within watershed wetlands and aquifers as exist in the towns along the proposed pipeline route.

Would the pipeline have survived the landslide on route 101 in Wilton? (Between mile marker 33-4 and 33-6) This closed the road for a several days a few years back.

Would the pipeline have survived the collapse on High Street in Greenville?

What happens if a roadway pipeline is exposed from storm washout or road collapse?

Does Kinder Morgan fix the road?

Who pays for the repairs?

Who is responsible to take control of this event? Local authorities or Kinder Morgan?

How long would it take for Kinder Morgan to respond and assess the problem?

How should you or I respond if we come upon this situation?

How dangerous is this? How do we determine if the integrity of the pipe is compromised?

Power lines can span across high risk areas; pipelines cannot.

Yet another reason to oppose NED.

Thank you for your consideration.

Paul Stevens

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

Re: PF14-22-000, Northeast Energy Direct Pipeline Scoping

Dear Secretary Bose:

My property in Mason, NH, will be severely impacted by this dangerous project, with the pipeline traversing nearly one mile of the land. Since I will not grant an easement and the pipeline area must be taken by eminent domain, I provide the following issues for inclusion in the scoping of PF14-22-000:

1. The nearly one mile of pipeline will create a magnet for all terrain vehicles, snowmobiles, and other motorized equipment. Not only will the trespass of such equipment on this Kinder Morgan (KM) property create a serious threat to the safety of the pipeline, but it will further, and indubitably, create significant environmental harm for my property through the generation of noise, erosion, and lubricant leakage that could further threaten our water and fishery. KM must be mandated to fund the 24/7 security of this nearly one mile stretch of rural property to prevent what will otherwise be voluminous motorized trespass. Due to the length of the segment, I ask that funding be sufficient to provide two designated security guards under my control, or by control of the Town of Mason, for the life of the pipeline. This is not a “speculative” concern; it will occur unless such steps are funded and taken.
2. Notwithstanding the environmental concerns enumerated above, potable and irrigation water concerns are similarly extant on my property. Given the extent of the pipeline and the geology, I request that FERC mandate KM to provide funding, for the life of the pipeline, for monthly testing of the potable water, the large farm pond water, and the multiple-location testing of the irrigation water.
3. For the financial resources needed to support Items 1 & 2 above, I ask that FERC mandate KM to fund those resources on an actuarial basis and within a trust that will remain accessible and outside of any potential Chapter 11 bankruptcy filing of KM. While it would be relatively easy for KM to jettison liabilities in the event of a costly explosion or financial “accident,” it would be unfair to leave me without the future resources to protect my remaining property. Indeed, the failure to provide such assurance could serve to pierce KM’s assertions of any right to take the property by eminent domain under the auspices of the NGA.
4. For similar reasons as expressed in Item 3 above, I ask that FERC order KM to fund an independent trust created to assure payment for the taking of my property. Given KM’s potential to continue the construction of the project on my property, over years of litigation on eminent domain issues, the intent of Constitutional protections would be thwarted if KM were allowed access to the Chapter 11 bankruptcy process and thence fail to compensate me for the future-best-use of my property. A funded trust is the only way to prevent this from occurring.

Thank you for your consideration.

RE: Docket No. PF14-22-000

Will our towns go bankrupt as people flee?

People don't want the pipeline endangering themselves, their children and their loved ones.

Our property values have fallen in the market place from pure intent of this pipeline.

Each tax payer lost places an additional tax burden on those remaining.

How will we sustain our families with these additional burdens?

Where will we find the money to maintain services, schools, businesses and community medical facilities?

The tax revenue derived from the pipe will be helpful for the first few years, but Kinder Morgan lawyers will re-negotiate every year, claiming depreciation, thus reducing the tax value to almost nothing in a few years.

Another reason to oppose NED.

Thank you

Paul Stevens

RE: Docket No. PF14-22-000

The impact assessment does not include all those impacted.

New Hampshire watersheds spread far beyond the towns targeted to receive the pipeline.

Wilton is not targeted to receive the pipeline. The Monadnock Mountain Spring Water company is in Wilton at the junction of routes 31 and 101. That company relies on the purity of the aquifers and the Souhegan River watershed. Pollution and run off from construction of the pipeline and leaching chemicals and emissions will fall somewhere and likely taint the waters being tapped by this company and resident wells.

Another reason to oppose NED.

Thank you

Paul Stevens

Washington, DC 2042

Dear FERC,

Before FERC grants a permit to build the Northeast Energy Direct Pipeline, the Environmental Impact Study for the NED should be able to prove that:

- there is a public necessity for this pipeline (as defined in the Gas Act “public necessity” means domestic need)
- eminent domain is used truly for the “common good” rather than for private gain.
- the energy shortage in New England has NOT been manufactured by special interests
- there is enough gas in the shale fields to make this pipeline worthwhile
- continued use of fossil fuel is NOT suicide for our planet
- creating another huge natural gas infrastructure will not perpetuate our reliance on fossil fuel and slow our transition to renewable energy
- the leaks and off gassing of methane will not significantly increase our greenhouse gas emissions
- building and maintaining a pipeline will not endanger the drinking water of the properties along the pipeline or aquifers of the communities along the pipeline
- building and maintaining a pipeline will not endanger the quality of the air along the pipeline.
- building and maintaining a pipeline will not endanger the quality of the soil along the pipeline.
- the organic farms along the pipeline will still be able to be certified as organic after the pipeline is installed
- building a pipeline will not endanger the health and safety of people who live near the fracking fields where the gas comes from
- leaks and off gassing from the pipelines will NOT endanger the health and safety of residents along the pipeline
- children and adults with fragile health conditions will not be adversely affected by living near the pipeline
- the cumulative effects of many pipelines and the continuing nature of such effects will not have a deleterious impact on human health.
- property values for houses near the pipeline will not go down
- property owners near the pipeline will not have troubles selling their homes, receiving mortgages or finding insurance
- property owners along the pipeline and compressor stations do not need to worry about explosions
- the noise and lights from compressor stations will not disrupt the peace and quiet people along the pipeline presently enjoy
- the noise and lights from compressor stations will not endanger the plants and animals that currently live near the proposed pipeline route
- building a pipeline near high tension power lines will not make the pipe material corrode more quickly

- towns will not be burdened with unreasonable infrastructure costs (such as rebuilding roads that have been damaged by the heavy trucks used to build and maintain the pipeline) as a result of the pipeline
- town fire and ambulance employees and volunteers will be adequately trained to deal with possible leaks and explosions
- the Pipeline and Hazardous Materials Safety Administration (PHMSA) has sufficient funds to adequately monitor the safety of the pipeline
- all citizens- whether rural or urban- are afforded equal protection from possible dangers of the pipeline
- citizens that are adversely affected by the pipeline have a way to be compensated or the problem remedied
- the pipelines will be built low enough not to be affected by new England frost

RE: Docket No. PF14-22-000

The Clean Water Act Section 303(d) Program is intended to protect our aquifers and watershed.

Our existing clean fresh water supplies are essential to our existence. We have no other fresh water sources available to our rural neighborhoods.

The Clean Water Act Section 303(d) Program includes a ‘Protection Goal’. The intent of the Protection Goal is to encourage a more systematic consideration of management actions to “prevent impairments in healthy waters (i.e., unimpaired waters) in order to maintain water quality or protect existing uses or high quality waters.”

You have a moral duty to uphold the goals of the Clean Water Act Section 303(d) Program and reject the pipeline.

Another reason to oppose NED.

Thank you

Paul Stevens

Washington, DC 20426

Docket #PF14-22-000

Dear Secretary Bose;

A federal water study by the U.S. Geological Survey noted that gas “drilling, extraction, transport via pipelines, and underground storage” could inadvertently introduce methane into drinking water supplies. There is a prevalence of shallow bedrock on the steep mountain slopes in this region, where the pipe may not be buried deep enough to withstand heavy floods. When a pipe is exposed, scouring from the water and sand and debris rushing over it can cause damage to it. This could result in methane leakage, not only into the pristine waters of a trout stream, but into our drinking water aquifers as well.

When the Constitution Pipeline dry trenches its way through most of its almost 300 water crossings, it will be introducing the potential for methane to escape. Constitution is only assuming a 5 year storm event into their engineering calculations for size of pipe flumes in their water crossings. New York has had several 100 year floods and even a 500 year flood in the past 10 years. There is no way to protect NYS water quality through best management practices in a storm event of that size. Silt fences and inadequately sized pipes would be cast aside like a joke. Will the NED Pipeline use more stringent and appropriate guidelines for their storm mitigation plans?

Methane is not the only potential contaminate. The Constitution Pipeline will be clear-cutting 36 miles of Right of Way through New York’s previously un-fragmented forests on steep slopes, inevitably causing mud and sediment to be washed into our streams and watersheds, with flood events destroying communities, wetlands and aquifers. The NED pipeline running along side Constitution will by necessity create an even wider right of way, increasing the volume of toxic run-off. How will this be mitigated?

Sincerely,

Allegra Schecter

Re: Kinder Morgan Northeast Energy Direct Pipeline Project Docket No. PF14-22-00

Cultural Studies under Section 106 of the National Historic Preservation Act and other related Massachusetts and Federal Laws:

Dear Secretary Bose:

Recently Tennessee Gas Pipeline Company, L.L.C. released to the Federal Energy Regulatory Commission (FERC) and the public, an incomplete Environmental Impact Statement (EIS) on the Northeast Energy Direct Project listed above. The Federal Energy Regulatory Commission (FERC) has before it the consideration of this pre-permit application for the Kinder Morgan Northeast Energy Direct (NED) Pipeline Project, to blast, trench, drill and dredge under and in environmentally and culturally sensitive areas to American Indians, the Nolumbeka Project, local historic commissions and others. Without in-depth meaningful research, this project may well destroy or disrupt early historical Colonial and Black settlements, American Indian ceremonial sites, battle sites, burial grounds, planting fields, and stream and river fishing sites covering a historical time frame ranging from pre-contact to present time period, a historical record spanning beyond 9,000 years.

We believe this incomplete (EIS) was submitted to FERC as a testing of the waters or fishing expedition to ascertain the depth and strength of the concerns out here in the Middle Connecticut River Valley surrounding environmental, cultural, public opinion and other important challenges that might exist around this project, and to provide FERC with a form of accounting by Kinder Morgan to these NED project challenges prior to or at the time of the official submitting of the application with the hopes that FERC will fast track this very complicated and important accountability. Should this prove to be true, the Nolumbeka Project believes this pre-application process reflects is a very shallow understanding of real challenges that surround the long and rich American Indian, and later Colonial history that created the cultural and religious antiquities that still exist on and under the ground in the project area.

For a meaningful accounting to these historic cultural assets by KM and FERC to take place under Federal, State and local Law when the real NED application is submitted, the complex nature of this challenge needs to be acknowledged and addressed. Considering the scale of the undertaking and the scope of Federal involvement in the NED project, to address the complex nature of the cultural challenges at risk will require considerable resources, including a sizable force of properly trained personal with tribal oversight, and a great deal more time than this FERC fast track process is suggesting will be allowed.

Pursuant to Section 106 of the National Historic Preservation Act, Indian Historic Preservation Offices need to be engaged to consult and affirm their religious, cultural and Tribal historic concerns on this project now in the early stages of FERC review.

This licensing project is a Federal undertaking, as defined by the National Historic Preservation Act (NHPA).

The Act informs that, “When Indian Tribes... attach religious and cultural significance to historic properties off Tribal lands, section 1019-(d)(6)(B) of the act requires Federal Agencies to consult with such Indian Tribes...” 800.2(c)(ii)(D) And that the Agency (FERC)

“...shall ensure that consultation in the section 106 process provides the Indian Tribe... a reasonable opportunity to identify its concerns about historic properties, advise on the identification and evaluation of historic properties, including those of traditional religious and cultural importance, articulate its views on the undertaking’s effect on such properties, and participate in the resolution of adverse effects.” 800.2©92)(ii)(A)

“The Agency official shall plan consultation appropriate to the scale of the undertaking and the scope of the Federal involvement and coordinate with other requirements of other statutes, as applicable, such as the National Environmental Policy Act, the Native American Graves Protection and Repatriation Act, the American Indian Religious Freedom Act, the Archaeological Resources Protection Act and agency-specific legislation.” 800.2(a)(4)

We understand the Commission will use this Environmental Impact Statement (IES) or a modified version of it in its decision-making process to determine whether the Project is in the public convenience and necessity.

The Nolumbeka Project would like to comment on our areas of experiences and concerns.

We will discuss:

- A brief cultural overview of the Middle Connecticut River Valley. The unique geology and history of the Middle Connecticut River Valley and the direct, indirect and cumulative pipeline and compressor station impacts on sensitive stone ceremonial antiquities and the importance of the use of the water, clear night sky, line of sight and sound resources by the early indigenous peoples associated with those at risk sites. The challenges of preserving Northfield’s and other valley town’s early indigenous and colonial settlement patterns and long prehistoric and post contact history. And what part that history plays in Northfield’s and other’s Master Plan and economic future. The Department of the Interior’s Dec 11, 2008 Determination of Eligibility to the National Register of Historic Places (NRHP) assigned to the Turners Falls Ceremonial Hill District, Turners Falls MA, and what impact that might play in the NED project Cultural Scoping Process.

- Who is best qualified to be making those Ceremonial Stone Landscape identifications, and what resources including how much time might be afforded the tribes and other interested parties to accomplish that mission.
- The challenges of past pipeline project's interpretation and implementation of 36 CFR part 800 also known as 106, Massachusetts Cultural Preservation Laws including CMR 950 and MGL 114 section 17, and the need to slow down the process to insure the application and success of 106 to allow the tribes and others the time to do the essential in depth research needed to identify and take measures to avoid, minimize, or mitigate impacts to tribal, black and colonial historical villages sites and other resources impacted by the NED project prior to FERC's final decision.
- The challenge of the taking of private land for public use that falls under the protection of MGL 114 Section 17
- What part the Nolumbeka Project as a cultural preservation stakeholder might play in assisting the tribes and others as part of the Scoping Process to identify and help resolve cultural preservation issues on the NED project before FERC receives a formal application on this docket.

CULTURAL OVERVIEW

The Middle Connecticut River Valley has a long and vibrant cultural history of continual human presence going back in some areas over ten thousand years with the first peoples to occupy and change this landscape to one that served them well in many ways, which included fishing, farming and hunting, but most especially by native peoples acknowledging and augmenting many parts of the natural landscape and special water resources located there, with a very deep and rich spiritual and ceremonial significance that to this day is still visible and in use by many tribes. Many of the ceremonial activities were worked into the landscape, often in association with fresh water resources, by building and augmenting with stone, a practice that has now been recognized by the Department of the Interior in our area as a "Ceremonial Stone Landscape District".

As many of these sites were used for ceremony, they were often chosen for the very special resources that existed there. These often included clear running water, waterfalls, special geological resources such as the use of quartz and other stone features found in the natural landscape and the natural sound-scape, which might include a amplified environment as in a canyon or stone recess where the sounds of the natural world is expanded and brought to the attention of the participants, and a clear night sky for the use of celestial alignments to celebrate and acknowledge special seasonal and ceremonial events important to the tribes and historically celebrated for millennia before the first Europeans arrived in this valley.

In a ruling brought fourth by the DOI in December of 2008, a Ceremonial Stone Landscape District was created. The (CSL) district has since been extended out to a twenty- mile radius around the Turners Falls Airport (0B5), and has been designated as eligible for listing in the National Register of Historic Places under both criteria A and D. In consideration of this special assignment by the DOI and understanding the tribal responsibilities that go along with it, we see an opportunity for FERC and the proponents to work closely with the tribes and other cultural resource NGO's including the Nolumbeka Project Inc., to become fully educated on this type of cultural landscape and bring to bear the proper resources to support a comprehensive parallel tribal/archeologist assessment of the cultural landscape, perhaps as part of a (TCP) study, with knowledgeable tribal experts judging all "things Indian".

The Town of Northfield MA and other Western Massachusetts Towns, have incorporated into their Master Plans and other economy building strategies, a renewed focus on the long and rich history of our area as an historical tourism and academic research generator fueling their local economies. The story of Northfield Massachusetts and many surrounding Western Mass communities, is the story of the United States from its beginning before contact to the present. The length and depth of this history is rarely repeated anywhere else in the country. Northfield's / Squakheag's story includes peace, war and the forming of a new nation, and is embedded in the land, the waters and in the hills, in the form of old cellar holes, mill sites, trail systems, village sites, burial grounds, battle field sites, streams, brooks, swamps and stone landscapes, many of which

are often misunderstood and overlooked by traditionally trained archaeologist. Not all the sites have been identified but it is already known that a number are near and in the path of this pipeline and its' infrastructure, and are likely to be negatively impacted directly or indirectly by the construction process both in the hills and on the ancient river-bottom terraces. Given the overwhelming number of known and yet to be discovered sites, we feel a weighted consideration must be given to identify and avoid these sensitive historic areas.

The need for an intensive research protocol is most especially called for here in Western Massachusetts where human occupation and traditional cultural practices have been occurring continually for at least nine thousand years. (Dincauze 1976 Northfield Archaeological Field Study Report), and needs to be put in place well ahead of any disruptive activities that might take place. The permitting process needs to slow down to allow enough time to assess the Kinder Morgan EIS and put in place any and all adjustments and alterations on cultural preservation and Traditional Cultural Properties Studies to avoid what happened with the Spectra Pipeline Project.

There are out in the Western Massachusetts area, many hundreds of known, and many more yet to be discovered and listed Ceremonial Stone Landscape sites, perhaps thousands. The Massachusetts Archaeological Society has listed over ten thousand such sites on the east coast. These ceremonial cultural sites are an irreplaceable asset to all indigenous peoples and the state of Massachusetts as they well meet the criteria of a Traditional Cultural Property. As well as having an accountability covered in this CSL district umbrella, there is also the Federal 106 process and Massachusetts CMR 950 and MGL 114 section 17 that will come into play to issue a Certificate of Public Good for the Kinder Morgan NED Project to move forward. All of these accountabilities will require significant resources including time, for meaningful tribal participation to take place. It is very important for the project proponent to first identify all the cultural resources, including the Ceremonial Stone Landscapes, in the path of the project and the construction activities needed to lay the pipe, and find ways to avoid impacting these resources. The best way would be to avoid any and all parts of the landscape that fall under the Ceremonial Stone landscape District protections in our area, and alter the route to avoid such areas. As part of this need, and due to the sensitivity of the cultural properties involved in this project, the Nolumbeka Project is requesting a Traditional Cultural Properties Study (TCP) fully funded to support a parallel tribal assessment. The Nolumbeka Project is making just such a TCP study protocol to forward to FERC at a later date.

Much of the pipeline moving northeast to southwest in the project area in Western Ma, will take place up in the hills on the great rift of the ancient Pangea fault lines created between 300 and 200 million years ago when the super continent of Pangea came together then violently tore itself apart. The ledge on these lines is a complex mix of igneous and volcanic metamorphic rock comprised of granite, gabbro, rhyolite, basalt, metaconglomerate quartzite, slate and marble. The presence of large quantities of quartzite on this mountain range makes for a very strong ceremonial cultural area. This situation will not make for smooth going for the pipeline project, as much of the pipeline right of way will need to be dredged, horizontally drilled and blasted out of the bedrock.

This blast and drill process, has the real potential to threaten the cultural resources we have spoken of, by direct and indirect impacts, including the construction of staging areas, right of way widening and road building activates required to create access for the heavy equipment needed to construct the staging work areas, compressor stations and pipeline trenches, and will put at risk the upland water resources that feed the valleys and our town's drinking water supplies below.

Once more as this process of identifying the cultural resources at risk is going to need much more time than is currently allowed in the suggested fast track licensing process, it is important to slow this project down until meaningful research can be done to identify and protect our environmental and irreplaceable historical and native cultural resources. It has come to the attention of a number of cultural preservation non-profits and other stakeholders, including the Nolumbeka Project, that the FERC licensed Spectra Pipeline Project coming out of New York through Connecticut had a struggle with identifying and clearly understanding the obligations contained in 36 CFR part 800 also known as 106. Those misunderstandings appear to have cre-

ated what in the field became known as the “steamroller” cultural assessment process. As we understand it, the process in place did not allow nearly enough time and resources for a unified understanding and interpretation of 106 with all the interested parties pursuant to FERC and the Advisory Counsel request for clarity with regard to 36 CFR Part 800 and 106 on a number of important questions until well after the construction process was taking place. This left all the cultural preservation people running ahead of the heavy equipment and construction crews in an attempt to identify and flag important cultural sites and resources that should have received a comprehensive study and understanding ahead of the pipeline construction process. We suggest a unified understanding and agreement by all parties may have facilitated the implementation of a preservation or avoidance plan for a number of at risk sites not previously identified before construction began.

We understand that a number of important sites were destroyed as a result of the hasty and incomplete research process. We need not to repeat the missteps of Spectra Project on the NED project, and that will require slowing this process down.

The Nolumbeka Project feels that the discovery of unanticipated cultural resources and human remains need to be addressed by leaving them in place and avoided without project impact. To consider that some of these cultural resources have survived for thousands of years before this project came on the scene, and that the useful life of the NED project is unclear, and many believe out of step with the technology and public support for a clean renewable energy future, to destroy an antiquity for an pipeline infrastructure that may well be gone or shutdown in less than fifty years, seems to be an exercise in unsound judgment, without first getting all the facts on alternative energy and or conservation solutions including repairing all the leaks in the existing lines. There has not to date been transparent access to the data offered to FERC by the proponent of the NED Project or the other utilities who have signed on with KM, to prove their case for this project, that has been allowed to be scrutinized by public officials and independent researchers.

We also have concerns on the unrealistic short timeframes allowed in the NED EIS that mandates tribal consultation within 24 hours of the discovery of human remains after which time non tribal persons have the right to dig up and remove Indian remains. This seems to be out of step with the intent of 106 and a violation of Indian and government agency trust, as well as a violation of MGL 114 c17. With over 400 miles of pipeline on this project it is very possible to discover any number of unanticipated cultural resources and or human remains at the same time and unrealistic to expect that tribal resources could be available in so many potential places at the same time on such short notice.

We would like to ask for clarity around the issue of the taking of private land for a public use and necessity that might prove to be triggered by MGL 114 c17. Many of the section of the pipeline route here in Western MA we suspect to have the real potential to discover unmarked burials in the path of the project. If this were to be the case on a property that was taken by Emanate Domain how would that issue be reconciled when 114 c17 states “A town shall not alienate or appropriate to any other use than that of a burial ground, any tract of land which has been for more than one hundred years used as a burial place; and no portion of such burial ground shall be taken for public use without special authority from the general court. “Burial place”, as referred in this section, shall include unmarked burial grounds known or suspected to contain the remains of one or more American Indian.” As this scenario is likely to play out here in our area, most especially in the Deerfield and Greenfield meadows, the Plains in Montague and hills up and down the valley, we question how a property can be taken for this project that would require a two thirds vote of the general court to appropriate to any other use if that property proves to contain unmarked, Colonial, Black or Indian Burials? These complicated conversations require more time than would be appropriate in this short letter of concern. A fully funded parallel tribal/archaeologist collaboration (TCP) study could go a long way to facilitate this happening.

The Nolumbeka Project operates as a cultural preservation educational non-profit with a focus on the Native American cultural preservation challenges in the northeast and beyond. With our background and understanding of these areas, we can offer to the tribes, our 20 plus years of research archives and field experience to assist the NED Kinder Morgan Project in meeting their obligation under the Federal 106 requirements.

Respectfully,
Joe Graveline
President
The Nolumbeka Project Inc.
oldgraywolf@verizon.net

20151016-5094

Docket: PF14-22-000

RE: Stone Walls and Cultural/Historical Significance

Dear Mr. Tomasi:

The Applicant(s), Tennessee Gas Pipeline Company / Kinder Morgan, is required to inventory and provide considerations for all monuments or stone walls (Stone Walls) that the proposed Northeast Direct (NED) of PF14-22-000 will transverse before approval and construction. Please be advised that many Stone Walls date back to the King of England timeframes in New Hampshire, Massachusetts, Pennsylvania and New York. Many of New Hampshire's towns and Stone Walls are older than the United States of America.

The NED project must be considered as a whole and not the inappropriate segmentation embattled within FERC and public purview, as such these structures do not adhere to all political or proposed segmented boundaries.

Please note that Greenville, NH (next to Temple, New Ipswich and Mason, NH) is only a recently incorporated town due to a succession from Mason, incorporated in 1768; Greenville, NH used to be "downtown" Mason, NH. Some of the towns in NH, being incorporated in the 1600s have celebrated their 350th anniversaries in recent times. The New Hampshire State Constitution predates the United States of America's Constitution by a couple of years.

Please additionally provide report on all historical and cultural ramifications for NED additionally regarding Stone Walls coupled with Susan Williams' comments regardless of district bounds as such New Hampshire (and the Monadnock region) is rife with Revolutionary (and prior) historical and cultural content inclusive of Indigenous motifs. Please note that stone walls by the Nevins family in Hollis, NH also has Revolutionary historical significance where they stopped propping up their stones in the ground and have remained ever since, when asked by the Hollis, NH equivalent of Paul Revere, to join the Revolutionary efforts of this, the Great Land of the United State of America in 1775.

The above is practical experience. Denial of survey (lack of survey permission) or other summarily dismissal, does not render avoidance or exclusion from analysis.

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack
"Davis", NH

20151016-5095

Docket: PF14-22-000

RE: So-called "Smoke and Mirrors"

Dear Mr. Tomasi:

We call your attention, by way of example, to the resource report submitted by Tennessee Gas Pipeline Company, Volume 11, entitled "Safety".

Tennessee Gas Pipeline Company states that Kinder Morgan's safety record is 0.25 incidents per 1000 miles.

Kinder Morgan's Safety Record is irrelevant here.

The Tennessee Gas Pipeline Company is submitting this resource report, will be installing the pipeline, and doing "all the work". Not Kinder Morgan.

And the above statement still comes out to 7 incidents per year on average (almost once every other month) for Kinder Morgan. This is unacceptable at airports when landing planes and using these statistics; how is this acceptable for the transportation of fracked gas?

Tennessee Gas Pipeline's safety record is additionally "abysmal" regardless prima facie it may include Kinder Morgan's known fatalities and convicted felonies in the public record.

While it is unclear if the above disclosure in the Resource Report is due to seemingly outward willful deceit or ineptitude, please be mindful of this "comingling of entities" and other seeming statistical denominator manipulation when vetting these numbers as part of the EIS. The above seeming "bait and switch" paradigm is ostensibly replete in the resource report and still has very little to do with the area proposed for development.

We require a full report on both Kinder Morgan and Tennessee's safety records as part of the Environment Impact Study (EIS); piercing of the corporate veil, so to speak. We require a report on all instances of seemingly manipulative stochastic, partial or inaccurate disclosure especially when contrasted with public record. We can help with this as needed where New England is replete with experts, PhDs and researchers especially where we have Boston University, MIT, Harvard, Dartmouth, UNH et cetera (also as New Hampshire is tied with Florida by average age, and retirement, we have availability).

On a side topic, why do many of the file names for these Tennessee Pipeline Company resource reports include "PUBLIC" and "FINAL"? This seems far from possible with amount of beleaguered TBDs. Thank you for the responses to the Applicant regarding information requested, however, it should be noted that the information is required to describe the area

and impacts before proceeding with filing in the best interest of all stakeholders and especially investors.

It is apparent that Kinder Morgan (or Tennessee Gas Pipeline Company) does not understand their own project, as such how can any Kinder Morgan investor or Tennessee Gas Pipeline Company investor understand this project?

The above is practical experience and empirical evidence of direct impact despite partial disclosure.

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack
"Davis", NH

20151016-5096

Docket: PF14-22-000

RE: Raptors

Dear Mr. Tomasi:

In the flyway area of Rindge, Temple, New Ipswich, Sharon, Peterborough, Mason and Greenville:

{photo omitted}

14,000 Raptors in October (2011) in this area

We require study of how the raptors (including Eagles) that use the "lead line" (the Monadnock mountains and the mountains surrounding the Compressor Station) are affected by the Applicant's proposal. Keep in mind that the raptors also use the adjacent Reservoir next to the Temple Elementary School adjacent to the proposed Compressor Station site in New Ipswich abutting the Temple Beef Farm adjacent to the Temple Elementary School.

We have prior legal opinion and precedent from public proceedings with another energy company that 2-years of study is required. Ultimately that prior energy company abandoned development in New Ipswich and Temple due to the extreme cost and lack of return for their investors to develop our briar patch in the Mo-nadnock region of Southwestern New Hampshire.

The above is practical experience and empirical evidence of direct impact that the Applicant has failed to address in their overbroad resource report filings that actually has little to do with the area proposed for development. The expense of this briar patch for development may be a pitfall for Kinder Morgan's or Tennessee Gas Pipeline Company's investors.

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack

Washington, DC 20426

Docket # PF12-9-000

Dear Secretary Bose,

This area's natural resources include wonderful scenic landscapes of rolling hills and fields, clean air and water. Our mountain slopes are covered with beautiful un-fragmented forests. Thousands of tourists come every year, just to see the brilliant Fall foliage. These trees are not just nice to look at – they are performing an important function of preventing land erosion and absorbing carbon from the atmosphere. This area often has torrential downpours. In fact, we have had 100 and 500 year floods in the span of two weeks! Clear-cutting right of ways on steep slopes will cause significant run-off of mud and silt into our streams, ponds, rivers and lakes. It is a potential environmental disaster. Many of these streams are protected by the New York State Department of Environmental Conservation as trout fishing and spawning areas. How many thousands of acres of trees will be cut down in order to clear the broad expanses required to lay the pipe? How will that run-off affect all the waterways and watersheds downstream from them? This should be studied along the entire route of the proposed pipeline.

Our area is also blessed with many fresh water springs and artesian wells. How will construction of the pipeline interfere and possibly destroy this precious natural resource? There are numerous documented instances of drinking water impacted by simple laying of pipe through springs and streams in Susquehanna County, PA. A small fine after the fact, does not make-up for permanent interruption to these sources of pure clean spring water after the damage has been done.

We are so proud of our clean water, land and air in this part of upstate New York, where the Tennessee Gas Pipeline has proposed its route. It's why most of us have chosen to live here. Schoharie County was known as the Bread Basket of the Revolution in the 1700's and for almost 300 years has managed to maintain its agricultural status. Its fertile valleys produce much of New York's fruits, vegetables and dairy products. It is, in effect, Virgin Territory for this industrial inroad to take place and this proposition should not be taken lightly. Once pipelines and compressor stations are built – it can never be returned to its present state. Its beauty and tranquility will be lost forever to our children and our children's children and generations to fol-

low.

Thank you,

Allegra Schecter

20151016-5098

Docket: PF14-22-000

RE: Noise Study

Dear Mr. Tomasi:

We require, for any filing by the Applicant(s) or EIS purveyors, the inclusion of noise study from the pipeline and compressor stations, not limited to, but especially for the segmented and delineated market path for station #4 in Hillsboro county of NH (currently the New Ipswich, NH / Temple, Greenville, Rindge, and Mason encumbering Compressor Station). Please be advised that noise is defined as an “unwanted” signal or sound.

As such (in the Monadnock region of Southwestern NH) we currently enjoy a severely noise relegated environment approaching 19 dBA when insects are muted during some our seasonal variances. All noise studies shall include 4 studies for each seasonal variance with not more than two studies encompassing any one season for any given annum. The study disclosed to the public for any filing by the Applicant or EIS shall additionally include (but is not limited to) all sources of infrasound acoustics and sound or noise, modeled and measured, inclusive of transfer function measurements or derivation: All acoustic energies in all scales (exempli gratia, dBA, dBC, dBG) shall be simultaneously presented as non-stochastically, unweighted and account for direct conduction, acoustic coupling, with secondary acoustic reradiation and acoustically coupled sources, inclusive of air (with varying densities inclusive of weather, like fog, other chemistry or gasses), water, stone or other media.

Infrasound shall be additionally modeled and studied using the G-weighted scale and not be skewed by masking effects from the dBA (or dBC) region of emphasis. As such masking effects are reduced for folks with hearing deficiencies in the dBA region of emphasis. No masking effects shall be considered due to animal or human population situations.

Studies for transfer functions and reradiation must include residential and especially other structures with natural resonances measured and modeled. Existing structures must be physically visited and studied additionally with infrasound generation perturbation inclusive of situations where structures are compromised by snowpack or snow load of four feet versus non snow load scenarios over all seasonal variations.

Transfer functions shall be derived using appropriate means; however, it is noted with guarded caution that conventional geophones have particular resonances and reduced dynamic range “suckouts” within their spectral responses outside of seismic regions that are within areas of interest. Non conventional technologies or geophones exist with extended functionality and are required for side-by-side analysis by Applicant or EIS purveyors for studies. Studies must include 41,000 horsepower (30.5 megawatts identical) compressor station boilerplate power ratings, more or less, and future “upgrades” that may include, but are not limited to, 80,000 and 120,000 horsepower compressors station scenarios. Please be advised that it has been disclosed by Applicant that they have never built any of these compressor stations this large, as such no prior experience or practicality (notionally of 49 CFR 192) exists, coupled with no prior precedent of any kind, expressed or implied. Studies must include intermodulation from the Passive Intermodulation (PIM) constructs in the area and distortion-based modulation “sum and difference” products included ESPECIALLY from operations of multiple parallel compressors in systems. Monte Carlo analysis or other stochastic, non deterministic (exempli gratia, genetic algorithms) modeling shall additionally be peak searching. This, especially coupled with tonality analysis.

All parameters used to run study simulations must be disclosed with methods used inclusive of model calibration methodologies.

Pure tones and other peak phenomena shall be disclosed and studied for all weather conditions including snowpack and ice with and without sublimation and fog, trees with and without leaves; all seasonal variability and weather conditions over aforementioned annual bases (basis plural) of time due to variations from year-to-year of land water content, frost line, et cetera. Average noise will only be used for baseline motifs and peak phenomena are required for study due to preexisting condition in the area. Please have Applicant or EIS purveyors indicate all stochastic or deterministic methodologies used, especially when coupled with finite element analysis, genetic algorithms, Newtonian method of moments or other paradigms.

All source code for models and compiled executables must be included. Please do not worry; we are rife with licensed engineers, PhDs, doctors and Lawyers in this area of the incomplete and overbroad NED project proposal.

Reports shall include effects to school children education, adrenaline based responses to meat in the woods (hunting as is used for quality of life, socio-economic, cultural and historical human paradigms) and the abutting (possibly soon to be organic) Temple Grass Fed Beef Farm for this and any compressor station, and of course, residents and critters -- endangered or otherwise.

Please be advised that many folks ride horses and we have multiple pony/horse farms (some with endangered species) nearby the proposed Compressor Station in New Ipswich, NH. How do these animals and the riders respond to being "spooked" by a blowdown (or blowoff) in this affected region? To prevent spooking, equestrians have the right-of-way as automobiles do not have such liberty.

We are reminded of the three developmentally disabled adult communities in Temple, NH coupled with Low Frequency Noise (and all other sound or noise) situations:

The above is practical experience and empirical evidence of direct impact that the Applicant has failed to address in their overbroad resource report filings that actually has little to do with the area proposed for development.

If the Applicant, Kinder Morgan or Tennessee Gas Pipeline Company does not know this very basic information about the area they have selected for final approval as "preferred routing", have they wasted and squandered their investors' money?

We are further reminded of intrigues and concerns within FERC public record and comment regarding low frequency sound for the Newtown, CT school tragedy shooting and individuals with sensitivities, for example Mr. Lanza. It has been claimed that Mr. Lanza told his psychiatrist that he was "bedeviled" by vibrations prior to the shooting tragedy. Pipes by Lanza's home are only 1500 feet away; the Temple Elementary School, Beef Farm, Religious Institutions et cetera are closer. Please see also:

20151016-5099

Susan Andersen

Mason Hollow Nursery, LLC

47 Scripps Lane

Mason, NH 03048

October 15, 2015

Federal Energy Regulatory Commission

888 First Street, NE, Room 1A

Washington, DC 20426

After careful consideration, the Andersen family and Mason Hollow Nursery, LLC must formally oppose the proposed lateral extension through Mason, NH to Fitchburg MA. Our analysis does not show a benefit that would outweigh the risks posed to our business, our family and our Mason NH neighbors.

In 1994, the Andersen’s selected their property of approximately 100 acres (which lies between Scripps Lane and Sand Pit Road) due to its pristine habitat condition and abundant, clean surface water. The Andersen’s (Charles & Susan) live on the property and also established a greenhouse and plant nursery on the same property. Mason Hollow Nursery raises rare and unusual native plants and houses a collection of rare orchids. Mason Hollow counts Universities, Botanical Gardens and Private Citizens as its customers. The ability to have access to clean/uncontaminated surface and shallow well water for irrigation is critical to the operation of the business. The Andersen’s also use a shallow well for domestic water use

The lateral extension of the pipeline comes close, not crossing the Andersen’s property, but roughly paralleling it up gradient on the west side of pole hill.

1. This is a significant concern regarding runoff, both during the initial construction and under normal operation. Any contamination of the surface or ground water by oils, volatile organic compounds or herbicides could have significant adverse impact to business and domestic use of water. Not to be forgotten is the potential harm to the wetland ecosystems in this area including an open marsh and a Black Gum swamp (rare in NH).
2. There is also concern about the physical alteration of the natural surface and subsurface water flow, due to the proposed path cutting across pole hill. Potential channeling or interruption of water flow could have unintended consequences

The lateral extension of the pipeline does not roughly parallel the Ever Source electrical power lines as does the main NED pipeline, but travels south through Mason directly through back yards, prime wildlife habitat (one of the only healthy Moose populations in the area) and near homes. This will cause a significant scar and disruption for this quaint, rural New England Town. Several homes will be directly in the incineration zone area and it does not appear that any significant compensation would be available to those affected.

The lateral extension of the pipeline does not seem to have any real benefits to outweigh the risks:

1. There is no energy benefit to Mason (no electricity or heating fuel)
2. There is no published need for the lateral extension. Kinder Morgan representatives indicated at a public hearing that they did not yet have a defined need.

The risks are high to the Andersen's and the town of Mason in general if lateral extension of the pipeline is built. Mason Hollow Nursery LLC, in particular, could face business viability issues if water disruption or contamination were to occur. Given the lack of significant offsetting benefits, we urge that this portion of the NED project be rejected.

Thank you for your consideration.

Sincerely,

Susan Andersen

20151016-5100

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

October 15, 2015

Docket #PF14-22-000

Dear Secretary Bose;

I am very concerned about the cumulative effects on New York's water resources from having two pipelines - the Constitution and the Tennessee Northeast Energy Direct (NED) projects - in such close proximity to each other. They must be considered together as the Tennessee Gas Pipeline (TGP) has already pre-filed its intent to follow a route right next to Constitution, sometimes as close as 50 feet.

By following right along side Constitution's greenfield path through forested steep slopes, the NED project will be able to say they are following a pre-existing right of way. However, in this case, that does not mean it will have less of an environmental impact. The path of the Constitution Pipeline would cross almost 290 water bodies - at least 80 of them high quality specially protected trout streams. Constitution now says almost all of these would be crossed by digging trenches through them, not by horizontal directional drilling under them as the DEC recommended to FERC. This will increase their turbidity, creating "a substantial visible contrast to natural conditions".

How will this double blow affect our streams and rivers? Will NED be made to bore under streams that Constitution did not? Both pipelines will have to cross through all the same protected trout streams, but they will not be doing this simultaneously. They would by necessity be disturbing each water body during two different construction windows. Any disruption from turbidity to trout habitats that may have already cleared up from Constitution's construction will be disturbed again by TGP. This makes it impossible for the eco-system to regain its integrity.

Two pipelines also increases the probability for mechanical failures during water crossings, resulting in abandoned drill bits and pipe or prolonged and uncontrolled releases of drilling mud, creating permanent damage in a previously pristine trout stream. In addition, the Constitution and TGP would cross over several aquifers and watersheds in New York State alone, and untold numbers of private wells and wetlands. Together, both the construction and right-of-way maintenance for the two pipelines will cause severe negative impacts to water quality, not only in surface waters and wetlands, but also to our drinking water.

The cumulative effects of the two pipelines must be considered in the EIS. This should have been done in a supplemental EIS for Constitution.

Sincerely,

Allegra Schecter

Docket: PF14-22-000

RE: Meteorology, part 2

Dear Mr. Tomasi:

We had an ice storm not too long ago; Samuel Clemens (Mark Twain) in the 1800s has also commented on the beauty of ice storms in New England. Notwithstanding, we had no electricity for 14 days, nor Internet or phone service for 30 days. Cellular towers lost their battery backup after 2 days, thus no cell service for the remainder of the event; it was 1927 all over again!

There was severe community collaboration and celebration amidst this seeming hardship. We had, what many folks refer to as “5-star” meals (as best as could be accommodated), at the Temple Elementary School (Temple’s Emergency Shelter, which also serviced surrounding towns) and the outpouring of residents’ generosity for food and sundries donation was apparent. The National Guard was also impressed, yet we discovered that there were many difficulties with mutual aid for police and fire. This is the third ice storm of similar magnitude We have experienced in recent memory and some of Us are only in our 20s.

While it seemed like 1927 (as the old-timers refer – when Temple first received electricity service), we were reminded that folks have lived here in the Monadnock region (inclusive of Temple and the many towns West of Milford, NH) for centuries, without natural or even fracked gas. Many homes in Temple only just received electricity service in the 1980s. Yet we are not rural despite what US Census data may suggest. As such we have a large contingency of PhDs, engineers, lawyers and business professionals that require the quiet and solitude of this country setting. Many work out of the home nearby, as their only livelihood.

Regardless, any compressor station engineering design, EIS study or Applicant filing, must include these contingencies, of being inaccessible for weeks at a time. It must be designed such that communication outage of 30 days does not preclude proper or safe operation of the same. Dedicated communication towers for compressor station and ancillary equipment is not sufficient as such the compressor station must be designed for dead-man shutdown.

The above is practical experience.

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack

“Davis”, NH

20151016-5103

Docket: PF14-22-000

RE: Meteorology, part 1

Dear Mr. Tomasi:

We were recently prevented from driving during a snow event; it was declared illegal, especially in Massachusetts.

There are several ramifications to perceived mitigations from the Applicant, Tennessee Gas Pipeline Company for the NED project, for affected water wells. For compromised wells, the trucking of water for “pig” containers for affected well owners is impossible in this region for the above reasons (and many other reasons disclosed in other parts).

Hurricane Irene recently devastated the White Mountain National Forest (approximately 2 hours North, by car, of Southern New Hampshire). If a hurricane can make it all the way North to the White Mountains, which they do, it can affect the area where the incompletely specified NED project is proposed. In fact, there have been other hurricanes that have affected, directly, the area of the proposed and incomplete NED project.

However, for hurricane Irene, roads were carved open like a Halloween pumpkin or dissection experiment; stranding folks for weeks and months. Had there been a pipeline adjacent to the road, it would have met its demise and be otherwise inaccessible. New Hampshire has seen its share of weather issues, every year.

Not too far away is our Mount Washington, home of the world's worst weather (231 miles per hour wind world record, other than a cyclone with Doppler radar measured record breaker near Australia in recent times). If you have never visited our Mount Washington weather observatory, it is amazing (redundant heating systems so that folks don't freeze when snowed/iced in). Temperatures of -40 degrees (either oC or oF, it's identical at -40) is not uncommon.

Notwithstanding, with the slopes witnessed, also in New Ipswich, along the proposed path of the incompletely specified NED project, we require study and engineering design to include massive erosion of pipeline underpinnings as would be expected simply from basic weather events, never mind the extreme weather.

Samuel Clemens (Mark Twain) has said in a speech to the New England Society 22 December 1876 (perhaps facetiously, yet with an element of truth per our empirical evidence, practice and experience):

“There is a sumptuous variety about the New-England weather that compels the stranger's admiration—and regret”

“In the Spring I have counted 136 different kinds of weather inside of four and twenty hours”

“Yes, one of the brightest gems in the New-England weather is the dazzling uncertainty of it. There is only one thing certain about it, you are certain there is going to be plenty of weather.. You make up your mind that the earthquake is due; you stand from under and take hold of something to steady yourself, and the first thing you know, you know you get struck by lightning. These are great disappointments. But they can't be helped. The lightning there is peculiar; it is so convincing when it strikes a thing it doesn't leave enough of that thing behind for you to tell whether—well, you'd think it was something valuable, and a Congressman had been there. “

We witness destroyed lightning protection systems. We require above average lightning and cathodic protection systems above those afforded by 49 CFR 192.

We also DO have earthquakes. Have we seen seismic studies and engineering design or the remediation thereof?

The above is practical experience. Regardless of our normally extreme weather destroying a pipeline, does Kinder Morgan et al. self insure or obtain bond/insurance for normal operating conditions of their (not the Federal or public's) infrastructure? How does this affect their investors if an event, regardless of force majeure or terrorism (domestic or foreign) occurs on this unsecure and unguarded pipeline infrastructure?

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack

“Davis”, NH

20151016-5106

Docket: PF14-22-000

RE: Maple Producers and Cultural/Historical Significance

Dear Mr. Tomasi:

We require the Applicant, Tennessee Gas Pipeline / Kinder Morgan to inventory all maple trees slated for demise along the adjacency of the NED pipeline and compressor station(s) construction path.

Maple trees are food source for local folks and a business enterprise for maple producers; inclusive of so-called “back yarders”. We noticed the maple “sugaring house” set back from the road abutting the power

lines and proposed Compressor Station site in New Ipswich, NH. Maple producers do not confine themselves within their own properties, yet they borrow the use of trees from other folk's properties, perhaps in exchange for maple product consideration.

This is because it takes 40 gallons of maple sap to produce 1 gallon of syrup. It is by dint of severe effort and sheer number of trees to collect this sap (some by sled, or tapping system), over uneven and treacherous snowpack multiple feet deep. The season lasts a scant month or so around March or February, and then that's it for the maple producing season of the Northern hemisphere for the year. It is not just a simple matter tapping some trees; there are other concerns to prevent girdling of trees and so on.

Maple products are now known to contain anti-oxidants and several health related compounds unique to maple and maple alone. It is a far more robust choice of sweetener with nutritional value for this region, historically, culturally, and in modern consideration.

Currently there are, on the horizon near our border, other natural enemies of the maple tree, from disease to invasive insects (exempli gratia, the sugar maple borer): Exacerbating this demise with human contrivance of an incompletely specified NED pipeline project only furthers the need for preservation of this tree and its health benefits to humans, and cultural significance (there is an entire Country abutting New Hampshire that also uses the maple leaf as its National Flag -- notwithstanding, maple trees do not adhere to political boundaries).

Maple sugar was originally found historically and culturally with our Indigenous Tribal Stewards of this Great Land (exempli gratia, Indigenous, or Native Americans) before any political boundaries of our current system. Sweetness and nutrition from the maple sugar bush along the power lines (Eversource line 379 in New Hampshire) is known and resides on private lands as Eversource does not own much of the land for their ROW (they are private lands with easements given to PSNH, now Eversource).

The above is practical experience and empirical evidence of direct impact that the Applicant has failed to address in their overbroad resource report filings that actually has little to do with the area proposed for demise.

How does the above, coupled with Applicant(s) incompletely specified NED project affect the 4th largest award winning renowned maple producer in the entire State of New Hampshire living and operating here in Davis, NH? Haven't heard of Davis, NH? The Small Business Administration has declared the towns Temple, Sharon, and New Ipswich New Hampshire as an economically depressed HUB zone and has called this collective of towns, "Davis" New Hampshire; right or wrong.

We require this to be studied for socio-economic (inclusive of smaller operations), cultural and historical impact; We are mindful of Susan Williams' comments regardless of district bounds as such New Hampshire (and the Monadnock region) is rife with Revolutionary (and prior) historical and cultural content inclusive of Indigenous motifs.

As always, please feel free to reach out to us for further questions. Denial of survey (lack of survey permission) or other summarily dismissal, does not render avoidance or exclusion from analysis.

Our Best Thanks,

Chris Mack
"Davis", NH

20151016-5109

Docket: PF14-22-000

RE: Lower energy bills?

Dear Mr. Tomasi:

Please be advised that it is physically impossible for any energy company to describe need based upon financial savings for New Hampshire compared to other states or savings in general. Price equalization does

not quell volatility vis-à-vis savings. Even if the gas were free, New Hampshire has additional financial “drag”, compared to other states, built into their energy costs that have nothing to do with dekatherms or electrons consumed by customers or the cost to provide/generate the same. Couple this with an electricity tariff proposed to fund export and mostly heating gas NED; despite that Kinder Morgan may eluded that they do not “need” said funds from a tariff, they have not to our knowledge entered into legally binding refusal of the same.

Please note that Liberty Utilities in New Hampshire has contracted by precatory situations for less than 3.8 % of the NED capacity. Notwithstanding, about half of the dekatherms requested will be replacement dekatherms as such the change will be stranded costs to consumers in other areas. Further, Liberty Utilities’ own testimony within the New Hampshire Public Utilities Commission hearing under DG14-380, 07-21-15/Day 1, redacted, page 77 §:

Q. Mr. DaFonte, I’m interested to hear from you about this Growth Incentive provision that’s in the Settlement Agreement. You testified earlier that you have been involved in about a dozen precedent agreements over the course of your 30 year career, is that correct?

A. (DaFonte) That’s correct.

Q. Would you give the Commission a sense for this provision that’s in the Settlement of whether this is something that you’ve seen before when you’ve negotiated other precedent agreements?

A. (DaFonte) I have never seen this type of provision in {DG 14-380} [REDACTED - for public use] {07-21-15/Day 1} the past. This is unique. Again, in my 30 years, never have I seen this. But, as part of an overall settlement, you know, the Company agreed to it. It also applies whether the Company has 115,000 Dekatherms or whether it has 100,000 Dekatherms. So, it truly is a, you know, growth incentive, regardless of the ultimate volume commitment by the Company.

Q. Is there a financial aspect to the incentive?

A. (DaFonte) Yes. Yes, there is. There are, you know, what I would consider maybe “disincentives”, if we do not reach specific targets. Specifically, as we measure the actual Customer Growth Target and the actual Dekatherm Target, those averages, which are going to be tracked beginning in 2017, if those averages are below the established targets, which Mr. Clark spoke of, namely, the addition of 2,000 customers or the additional load, annual load of 650,000 Dekatherms, then the Company would be disallowed -- or, would not be allowed to recover certain costs within its Cost of Gas filing.

There are tiers associated with that recovery. If, out of the two benchmarks, either the customer count or the volume addition, whichever one is closest to the target, that percentage, if less than {DG 14-380} [REDACTED - for public use] {07-21-15/Day 1} 80 percent, the Company would not be allowed to recover \$300,000 in its Cost of Gas filing for those costs associated with the NED Pipeline. If the percentage is between 90 percent -- I’m sorry, between 80 percent and 90 percent, then the Company would not be allowed to recover \$225,000 in its Cost of Gas filing. And, then, lastly, if those targets are between 90 percent and less than 100 percent, then the cost recovery would be reduced by 150,000 Dekatherms -- I’m sorry, \$150,000 in its Cost of Gas filing.

Q. This growth target only applies if the NED Pipeline comes on line and the propane plants that you’ve previously described remain on line, correct?

A. (DaFonte) Correct.

...

We require that the EIS, additionally for determining need for NED and especially all impacts for EIS purview coupled with NH PUC proceedings in New Hampshire, provide digest of the entire docket within the New Hampshire PUC docket DG 14-380 and provide the socio-economic impacts and resultant environmental impacts from expert witness testimony and public comment therein.

For your convenience, the docket with all documents pertaining directly to the can be found here: <http://puc>.

nh.gov/Regulatory/Docketbk/2014/14-380.html

It may be best to start with the last three summary statements made by the interveners and Liberty Utilities, coupled with the encumbrance of this proceeding and the NED project.

It should be noted that the SENDOUT analysis performed by Liberty Utilities in this NH PUC as it directly encumbers the NED project is seemingly dubious and biased (possibly GIGO) coupled with infrastructure costs that may not be balanced. There are comments about its accuracy and results that are redacted herein.

New Hampshire's energy bills to consumers are already economically disadvantaged due its infrastructure; yet New Hampshire already exports electricity to other states; some 50% of it, at times.... New Hampshire has 63 power plants for its one-million, or so, inhabitants. Alternatives in the public purview include rerouting the "preferred" pipeline route for NED to the states which will benefit the most, regardless of bereft contemplation by the Applicant. Yet we see a FERC record being broken in the number of public comments opposing this despondently and incompletely specified NED project. If we are so rural and low population, how is this possible when compared to other projects?

Wholesale electricity prices have been the lowest in a decade and demand is down with forecasts to be flat or moderate for the next decades. These facts are beleaguered elsewhere.

New Hampshire has been saddled with disproportionate energy infrastructure costs for an abandoned scrubber project in the \$0.5-Billion range, and also an "insurance" policy of \$4-Billion as part of the divestiture of power generators in New Hampshire. This "insurance" program will give power generators in New Hampshire additional incentive to remain in generation above and beyond their current profit for actually generating electricity. This has insured that some local companies will EACH see an increase in their electric bill of \$1.3 Million dollars, just for "doing business" with New Hampshire utilities, all else kept equal (same prices and rates, no new pipelines needed).

We currently have the BIA (Business Industry Association) in New Hampshire that has seemingly pressured the Governor into apparent one-sided, half true arguments that do not include the issues above. Rightly so, they look for lower energy bills, but this may not be possible in the conflicted and obstreperous New Hampshire infrastructure, both physically and regulatory with human contrived systems in-situ. There is also much confusion between electricity and heating by gas. Notwithstanding We have seen apparent chagrin by BAE systems (operating in very expensive New Hampshire real estate districts) that they have spent \$2Million in gas for heating, yet do their buildings meet modern energy efficiency (exempli gratia, insulation) capabilities?

We have indication that Mr. Allen Fore of Kinder Morgan just espoused 25% energy savings via a "report", if NED is approved. It is very unlikely given the above and it is questioned how Mr. Fore can opine successfully of this topic. Liberty Utilities (owned or controlled some such by Algonquin a Kinder Morgan company) just announced some 40% savings on their rates this winter (seemingly with no new pipelines as of yet). This will most likely be fraught with volatility as we rely more and more on just one fuel, where diversity (just like in a financial portfolio) is better than leaving all eggs in one's basket.

For example, from the ISO-NE website real-time data:

{chart omitted}

The price for electricity around this time was still \$0.33/kWh despite 71% generation by natural gas. However, we sometimes see the price of electricity here, go negative (meaning we are paying market users to use our electricity).

We request, in the EIS, a report with the socio-economic impact of these additional motifs above. Even if the gas were free, New Hampshire would still be economically disadvantaged compared to other states.

Finally, please note that when scoping meetings at town halls in the Western portion of the State of New Hampshire have only hundreds of people, that per-capita, this is a huge percentage of the landscape and representation given New Hampshire's populous around 1 million folks with 1/3 of the population living in

the encumbered region of the incompletely specified NED pipeline project.

The above is practical, and empirical evidence coupled with experience.

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack

“Davis”, NH

20151016-5111

I oppose the NED pipeline because I don't see a clear demand or need for it. This pipeline really won't be built with New England in mind. The size of the pipeline is too large for our current and future energy demands. We don't need that much natural gas. I think this overbuild is important to keep in mind when deciding whether to allow it to progress further, because of the costs a larger pipeline will bring. There's a larger incineration zone, there's more fossil fuel emissions, there's larger compressor stations and larger blow downs than we have to have. It's important for our future economy to be conservative with fossil fuel use because climate change costs us money. A lot of money; as we are already watching infrastructure fail from more and more extreme weather events linked to climate change. So is it really economical to put such a high capacity pipeline through this area, when its overproduction will hurt our economy (and health) in the long term?

It's not just the environmental costs of fossil fuel emissions that concern me and hopefully all of you. There's also the cost of getting it out of the ground. It's a little bit of a horror story, environmentally. The fracking process is exempt from the Safe Drinking Water Act, a number of people living next to fracking sites have to pipe in drinking and bathing water from outside sources, fracking waste (millions of gallons of water) often leaks from the lined waste pits.....I could go on and on. These costs of retrieving natural gas have to be considered when looking at these pipelines that will demand we frack more and more land, and contaminate more and more water supplies. So, again, should we really allow an over production of natural gas, and therefore an over production of fracking, if we don't need it?

Environmental laws were put into place as safeguards for every U.S. citizen. I know this sounds overly simple, but government is for the people. Implement these safeguards to help the people. I certainly don't mind companies, but companies that pollute have to be regulated for overall safety, and this pipeline is asking for too much natural gas production that will hurt more citizens than it will help.

Re: Northeast Energy Direct Project

Tennessee Gas Pipeline Company, L.L.C.

Docket No. PF14-22-000

Comments of FMR LLC

Dear Secretary Bose:

On behalf of FMR LLC, please accept these comments concerning the Northeast Energy Direct Project (“Project”), which is proposed by Tennessee Gas Pipeline Company, L.L.C. (“Tennessee”).¹

On September 15, 2014, Tennessee requested use of the Commission’s pre-filing process for the Project under 18 C.F.R. 157.21. In connection with that process, Tennessee and the Commission engaged in open houses and outreach to various stakeholders. On June 30, 2015, the Commission issued a notice of intent to prepare an Environmental Impact Statement (“EIS”) for the Project, opening the scoping period under the National Environmental Policy Act. On September 3, 2015, the Commission extended the scoping comment period on the EIS to October 16, 2015. Tennessee has indicated that it expects to file an application on November 20, 2015 for Commission authorization to construct the Project.

Background

FMR LLC is the parent company for the various financial services and related businesses more commonly known as “Fidelity Investments.” These comments are provided on behalf of FMR LLC and its related affiliates and subsidiaries (collectively, hereinafter “FMR”).

A subsidiary of FMR owns a 554-acre campus in Merrimack, New Hampshire (the “Merrimack Campus”). At the Merrimack Campus, more than 5,400 FMR employees provide asset management and financial services to various institutional and individual clients, including retirement services and investment and customer support, as well as corporate services to FMR’s enterprise.

Comments

On December 8, 2014, Tennessee proposed to adopt an alternative route for the Project (the so-called “Market Path” component) (depicted by the blue line in Figure 1 below) that would be located entirely outside the boundaries of the Merrimack Campus (depicted as the orange shape in Figure 1). Subsequently, in response to comments from the Town of Amherst, New Hampshire (“Amherst”), Tennessee developed an alternative route, “Amherst Option 1” (depicted by the dashed green line in Figure 1), located along Continental Boulevard, which would run alongside and within the western boundary of the Merrimack Campus.

In a September 24, 2015 submittal to the Commission regarding the Project, Amherst indicated that Tennessee intended to change the proposed route for the Project. Specifically, Amherst’s submittal included maps and minutes from a September 16, 2015 meeting between the Amherst Pipeline Taskforce and representatives from Tennessee. Those materials indicated – for the first time – that Tennessee planned to propose to the Commission a preferred route for the Project – as depicted in Figure 2 below – that would run directly through the Merrimack Campus (depicted as the orange shape in Figure 2).

Routing the Project through the Merrimack Campus could result in catastrophic consequences. The Merrimack Campus houses a data center that contains computer servers and other sensitive equipment whose operation may be severely impacted by blasting or other vibration-causing installation activities that are associated with pipeline construction. Disruption of this data center, or any of the other numerous activities associated with FMR’s asset management, customer service, or fund accounting business units at the Merrimack Campus (where FMR’s Fixed Income Division trades daily on an asset base in the hundreds of billions of dollars) could substantially affect national and international financial markets, particularly if the disruption occurs during the daily pricing of FMR’s funds. Because the Merrimack Campus currently handles, on average, 23,000 customer calls to FMR on a daily basis, any disruption to phone lines or servers would result in a substantial and significant impact to FMR’s customers, including market exposure and financial risk. Simply put, routing the pipeline directly through the Merrimack Campus would present an uncontrollable and, therefore, unacceptable risk to FMR’s continuous Disaster Recovery and Business Continuity planning as well as the nation’s financial markets.

As one of New Hampshire’s largest employers, FMR has, for two decades, become an increasingly sustaining element of the state’s economy. As we submit this letter, FMR was about to embark on a multi-year plan to refurbish 80% of its 1.2 million square feet of office space at the Merrimack Campus. The economic im-

pact of this initiative, and the significance of FMR's reinvestment in its presence in New Hampshire, would be extraordinary. The route shown in Figure 2 would directly impact the portion of the Merrimack Campus that is most suitable for development, and would directly affect the ability of FMR to increase its headcount at the Merrimack Campus in the future. Due to the uncertainties raised by the Project, including its potential to significantly impact FMR's existing operations and future development of the Merrimack Campus, a business decision has been made to put the refurbishment initiative on hold until FMR's legitimate concerns are resolved.

In light of the magnitude of these impacts, upon learning of Amherst's September 24 submittal, FMR promptly contacted Tennessee to discuss the proposed Project route. In meetings with Tennessee on October 7 and 8, FMR explained the aforementioned concerns regarding the substantial impacts that would result from routing the Project directly through the Merrimack Campus. Tennessee acknowledged the legitimacy of those concerns, and on October 8th agreed not to pursue a Project route that ran directly through the Merrimack Campus. Instead, as memorialized in the attached letter (Attachment A), Tennessee has revised the preferred route for the Project so it is now located along the southern and eastern perimeter of the Merrimack Campus, as depicted by the blue line shown in Exhibit A of Attachment A.

While FMR does not endorse or support the Project, FMR nevertheless appreciates Tennessee's willingness to relocate the preferred route of the Project to accommodate FMR's legitimate business concerns. Consistent with these concerns and Tennessee's commitment, FMR is willing to continue to work with Tennessee to further refine the preferred route, if necessary.

FMR appreciates the opportunity to provide comments on the Project. If you have questions or need additional information, please contact me at 617-526-6176 (mark.kalpin@wilmerhale.com) or my colleague David Gold at 617-526-6425 (david.gold@wilmerhale.com).

Respectfully submitted,

Mark C. Kalpin

RE: Docket No. PF14-22-000

What is the "Blast Radius" or "Burn Radius"?

The blast radius is the distance that the fire resulting from the explosion consumes, measured in feet from the epicenter to the outer edge of the burned area.

The Burn Radius has often been underestimated:

An incident involving a 30" pipe near Jackson, Louisiana (1984 NTSB-PAR-86-1) burned an area 1450 feet long by 360 feet wide (furthest fire extent 950 feet) while operating at 1016 PSI which claimed 5 lives

within 65 feet (0 foot offset) and 23 injuries within 800 feet (180 foot offset).

The actual, measured burn radius for this incident is 45.52% greater than the 660 foot burn radius hypothesized by Kinder Morgan.

Reference: <http://nogaspipeline.org/2010-08-19/the-blast-radius>

NED is a comparable pipe and is just as likely to cause this type of damage. Please do not expose the God - fearing, tax - paying citizens of New Hampshire to this unnecessary risk.

Another reason to oppose NED.

Thank you

RE: Docket No. PF14-22-000

New Hampshire Representative Ann Kuster recently visited the New Ipswich compressor site and was very sympathetic to our plight. She recommended a lawyer that we might be able to consult, perhaps even pro bono. Unfortunately, he tells us no. To represent us or to advise us would be a conflict of interest for him. And why's that? Because Kinder Morgan / Tennessee Gas Pipe has already visited him, and paid him for some task.

Looks like KM visits all of the top law firms in the areas they invade and become their client so no one can get local help defending themselves against gigantic Kinder Morgan. Is this practice even legal? Probably? But is it moral? What do you really think?

Does this mean KM anticipates getting sued? Do they plan something so heinous that they assume many people will seek legal action against them? So much so that they feel they must gobble up all the local lawyers in a desperate bid to defend themselves over something they haven't done yet?

They also bought memberships in numerous Chambers of Commerce all around the state. Yet their business is in Texas, far away from any New Hampshire ties. Then we hear the Governor is on the fence, listening to voters on one side and Chambers of Commerce on the other. So why would the Chambers of Commerce suddenly have such of an interest in the pipe and be so influential?

The trade group, America's Natural Gas Alliance has bought hours of advertising air time on NHPR, the local Public Radio station. This may explain why we have heard little or nothing about the pipe from them. Likewise at WMUR the local TV outlet. So much so that at the Milford Scoping meeting, WMUR interviewed only KM representatives and ignored endangered residents. They are not allowing horror stories of afflicted residents be told to the rest of us. All we see on TV are happy folks in advertisements eager for more petrochemical development. Of course you have heard that a Kinder Morgan vice president named Allen Fore feels he needs to be escorted to local public events by two burly body guards. It's sad that he feels threatened, but if he's really not doing anything bad to people's homes and neighborhoods and our environment, then why does he think people will threaten him?

KM has plenty of money to spread around, and they have done this many times when they invade. We are not multi billionaires like Richard Kinder, and we've never had to do anything like this before this before in our lives. So I guess that puts us at a disadvantage, with no one powerful to represent us.

Perhaps if there were a public referendum on the subject, we'd find out how people really feel?

Do we have to remind you that massive gas installations like the compressor station are EXEMPT from the EPA's rules and the Clean Air Act? But samples show that the emissions are full of stuff we don't want our children or our livestock breathing every day. These emissions are measured in TONS!

Because of the "Halliburton Loop Hole" fracking operators can keep the chemical cocktail they inject into the ground to extract shale gas as proprietary information. Naturally, whatever comes out of fracked ground goes right into the pipe. Gas companies regularly do chromatographic analysis on their gas, but of course, that's proprietary too.

A tiny minority of New Hampshire residents use gas, and they won't even benefit from Northeast Export Direct because, despite their denials, the gas is not for us. It's for Europe where they pay 2 to 4 times what we pay. This will only cause domestic prices price to go up.

Thank you for hearing our pleas and for the love of God help us by rejecting NED.

Paul Stevens

20151016-5117

To Whom It May Concern:

The citizens of Merrimack, New Hampshire have sent a clear message that the Northeast Energy Direct project is unsafe, unnecessary, and will damage our quality of life, as gas pipeline projects have done across the country. We cannot trust Kinder Morgan in light of the many route changes that have been presented at the last minute for our Town Council meetings in Merrimack. It is time for our town and state to be heard loud and clear, and to matter. No Northeast Energy Direct pipeline project. This will not bring us real jobs, will not lower costs in the long run, and cannot be guaranteed to be safe from catastrophic accidents. The more we indulge in these projects the more we avoid the more important reality that we MUST conserve now by focusing on renewable energy.

This project does not, in any way, fit FERCs definition of serving "public convenience and necessity." Export for profit of a private corporation does not suit public purpose. I ask that you review the potentially significant local impacts that this pipeline would have on the property and safety of New Hampshire residents and our wildlife. Please help keep our Community safe- PLEASE DO NOT APPROVE THIS PROJECT!

Thank you --

Jeanne Pratt

APPENDIX A: STATEMENT ON THE BERKSHIRE REGIONAL PLANNING COMMISSION 37		

2 INTRODUCTION

The Tennessee Gas Pipeline (TGP) is slated to pass through 4.7 miles of Windsor, Massachusetts, a community of 900 people spread over 32.5 square miles of woods fields, and forest. Over 50% of Windsor's land

is legally protected or restricted, either held in the Commonwealth's State Forest and Park systems, Wildlife Management Areas or in Wildlife Conservation easements, or by The Trustees of Reservations which preserves properties of significant historical or natural value. According to the 2010 Census, the population of Windsor has grown 16.3 % in the decades from 1990 to 2010, in contrast to Berkshire County, which has lost 10% of its' population during the same period. The Town's natural amenities bond community members who seek out the pastoral qualities of life in the hills with daily opportunities to observe nature by day and the stars at night, to farm, garden, hike and snowshoe, hunt and fish out their back doors. Home occupations range from renewable energy, sustainable farming, poultry and live-stock raising, bee-keeping, small batch commercial food preparation, real estate, logging, land clearing and excavation to vocations such as writers, potters, textile artisans, jewelry makers, poets and consultants. Windsorites commute to work in the Pioneer Valley as well as to locations throughout Berkshire County.

Ironically, Windsor's households do not have, and very likely never will have, natural gas service. Residents rely upon oil, biomass (mostly firewood), propane and solar for thermal energy. Photoelectric solar is on the rise with many new net metering home-based systems installed or being installed.

2.1 THE PROPOSED PROJECT

The proposed TGP, Northeast Energy Direct pipeline project, as currently described in TGP's most recent resource reports, will consist of a 30" pipe diameter and 4.7 miles of greenfield pipeline corridor through the town of Windsor. The project, as currently proposed, includes a 40,000HP (30MW) compressor station located off of Peru Road in Windsor. In public statements, TGP has reserved the right to scale throughput to FUTURE subscription levels.

Absent any basis to interpret what this means, our comments are directed toward a proposed 30 inch pipeline project with a compressor station scaled to accommodate the originally proposed 60 MW output but constructed and then expanded in phases, over time.

The choice made by the developer to site a major industrial facility in Windsor elevates the project scope profoundly. The condition that "throughput be scaled to future subscription levels" implies that we really don't know how this project will impact our community.

Nothing in the Town of Windsor's 244-year history rivals this project in scale, scope, and intensity of construction. While the comments that follow assume a compressor station in Windsor the inadequacy of detail and outright obfuscation of intent leaves our comments to FERC based as much on conjecture as on factual information from the developer.

2.2 OUR COMMUNITY

Windsor, MA is a small, rural community and the highest town on the Berkshire Trail. Its 35.2 square miles offers an environment that "is unsurpassed by any other town in the county in its natural scenery and beauty spots. From the top of Windsor Hill on a clear day can be seen to the southwest, the rugged peaks of the Catskills, to the north is Mt. Greylock, standing like a sentinel, guarding the rest of the Berkshire Hills, Going east, one can also see Mount Tom and Mt. Holyoke".'

Residents value the bucolic environment and sense of place that creates a strong affinity between the community members and where they live. They are willing to trade paved roads and high quality infrastructure for fresh, high quality air and low noise levels. They endure rough winters in exchange for starry skies, homegrown organic vegetables, and clean water. Windsor actually exports clean ground water to neighboring downslope communities. As a sustainable community we support the health of those who live here, which means freedom from worry about environmental contamination or crime.

According to the Berkshire Regional Planning Agency's **Sustainable Berkshires: Community Strategies for a Sustainable Future 2014**, Windsor has high social capital, with strong social ties and networks; citizen power and pro activity; volunteerism and participation; feelings of trust, belonging and safety. Our sustainable community is a people friendly place and a safe and healthy space that allows residents to reduce their ecological footprint.

The Town of Windsor, Massachusetts has a single residential/agriculture zoning district. Heavy industry is a prohibited use under the town bylaws. Windsor passed a resolution at the May 2014 Town Meeting to oppose the pipeline. A basis for this opposition lies in the absence of protections against project impacts in our zoning regulations. As the community has come to understand the limits of local, regional, or state authority over the project, apprehension and opposition have only intensified.

Currently, several small businesses operate in town under special permits. The most prominent businesses are two locally owned country stores/gas stations. The impact of a compressor station on the Town of Windsor must be measured against the baseline conditions and the character of is a rural pastoral community.

On the surface it may seem that locating a compressor station in a rural area with low density would have fewer or lesser impacts than a compressor station located in a densely populated area. However, the impacts from constructing a compressor station in the Town of Windsor would not be limited to the site itself or to an area within a certain radius of the station. A compressor station within the Town of Windsor would profoundly change the very nature and identity of the town and devaluing its appeal to current and prospective residential property owners, the foundation of our tax base.

The Town has recently committed to raise substantial bond funds in order to join WiredWest, an initiative to provide high speed internet service to the last 32 towns in the Commonwealth in an effort to preserve real estate values and the quality of life. Windsor, which receives under \$96,000 in aid for state owned land, depends upon its ability to continue to attract residents to preserve the property tax base and the modest level of town services necessary to support a self-reliant population.

In 2003, the Pioneer Valley Planning Commission recommended goals for Windsor in its Westfield River Watershed Open Space and Recreation Plan. These goals provided a template for the future our community. For the past 12 years, we have focused extensively on developing our rural, agricultural, and conservation-based environment and economy. This has included preserving our landscape, promoting agriculture and the Ch61 tax program, developing strategies for maintaining and promoting open spaces, and protecting our wetlands and watersheds.

Windsor's development to date and its plan for the future are severely compromised by the cumulative environmental, health, and economic impacts of the proposed pipeline and the 30MW, or greater, expandable compressor station. The pipeline project and the compressor station located in Windsor will negatively impact the community's ability to prepare for a sustainable future given our current foundation and how seriously off course the pipeline and compressor station takes us.

Given our community character, which relies heavily on a clean and beautiful environment for its economic viability, we are concerned about the socioeconomic impact of the pipeline and the compressor station on our community and its residents. According to Sustainable Berkshires: Community Strategies for a Sustainable Future 2014, the Berkshires and Windsor must compete globally in the new economy relying on its environmental advantage as evidenced by the Berkshire County Visitors Center slogan "Nature, Culture, Harmony". From the Massachusetts Climate Change Adaptation Report "Each acre of forest provides approximately \$1500 annually in economic value from forest products, water filtration, flood control and tourism." Also according to survey conducted by the Berkshire Visitor's Bureau, scenic beauty was the principle reason 88% of all visitors cited for having selected the region as their destination. The areas advantage is a solid combination of culture and rural beauty that attract many types of people. Windsor's rural environment and culture of environmental consciousness and creativity support the town's future economic wellbeing. Economic growth recommendations of green business practices and the expansion of outdoor recreation activities are compromised by the pipeline and compressor station.

As discussed below, Windsor requests that the Commission ensure that: (1) the proposed compressor station be subject to review at the local level in a way that models the process that would transpire if Windsor permitted heavy industrial use. This would include compliance with generally accepted conditions placed on industrial developers by respective boards within the Commonwealth; (2) noise and lighting impacts are limited to the maximum extent practicable based on ambient levels both daytime and evening; (3) alterna-

tive compressor station locations be considered within industrial areas nearby only a short distance from the proposed route; (4) the compressor station in Windsor be eliminated in light of the downscaling of the project.

3 CONCERNS AND INFORMATION REQUESTS

Windsor has many concerns about the pipeline and compressor station proposed for our town. As detailed below, the proposed project will have a significant impact on our town during construction and during operation of the compressor station. This includes impacts on our land, land usage, water, culture, economy, transportation, public safety, noise, air quality, and public health.

The town of Windsor is also concerned that we are unable to evaluate the full impact of the proposed project on critical aspects of our community because of insufficient information provided by TGP. Given this, we have also detailed additional information that we are requesting to determine the full impact of this project on our community and its residents.

3.1 LAND USE, RECREATION, AND VISUAL RESOURCES

The natural landscape of the Berkshires is one of its most defining characteristics and one that greatly contributes to the quality of life and economy of the region. Because of the largely intact, unfragmented forests that stretch from the county westward to the Taconic Range in upstate New York and southward into northwestern Connecticut, this tri-state area has been deemed by The Nature Conservancy (TNC) as one of America's Last Great Places. Referred to by TNC as the Berkshire Taconic Landscape, this area encompasses "more than 155,000 acres and contains one of the most spectacular, healthiest, and most diverse blocks of intact forest in southern New England. It is what spurred naturalists to successfully create the state's first park in 1898 on Mount Greylock"²

In Windsor alone, there are several such expanses of land, including:

Conservation reserves open to public access:

- Notchview, operated by the Trustees of the Reservation, is a 3200-acre property that is an important recreational area for skiing, hiking and nature programs;

Article 97 Lands:

- Windsor State Forest is a 1300-acre property that is used for recreational activities including hiking and snowmobiling.
- Eugene Moran Wildlife Management Area, an 1147 -acre property that has been identified by Mass Audubon as an important birding area.
- Dalton Water District, watershed under conservation easement with Mass Division of Fish and Wildlife (mass DFW), 1500 acres
- Thousands of additional acres also held by Mass Division of Fisheries and Wildlife in the Moran, Savoy, Chalet, Westfield River and Peru Wildlife Management Areas.

The citizens of Windsor and the Commonwealth of Massachusetts have made significant investments in protecting these open spaces in Windsor. Mass DFW and Massachusetts Department of Conservation (Mass DCR), collectively, hold approximately 6000 acres within town. Additionally Mass DFW holds conservation easements on over 1000 acres of private land. Additional private acreage is conserved under Massachusetts General Laws Chapter 61 and 61 A and B which provides tax advantages to the landowner who in return provides public benefits by holding the land as working open space for agriculture or forestry.

Windsor has an agriculture commission and it is a right-to-farm community by law. There are 7 farms plus Chapter 61 forestry lands. Our primary crops include maple sugar, hay, vegetable and livestock. While Windsor does not have any certified organic commercial farms, there are many residents who farm locally and a significant number of abutters who raise livestock and garden in this fashion. Additionally, some residents are beekeepers.

Windsor is a National Wild and Scenic River community and there are high levels of existing ecosystem services largely provided by its many private and public forestlands. In the proposed pipeline and compressor station locations, there are wetlands, vernal pools, and rivers. There are estimated habitats of rare wildlife, priority habitats of rare species, and identified natural communities. Adjacent to the proposed compressor station location are identified ecoregions, and areas of critical environmental concerns in Hinsdale.

The proposed project will result in the clearing of nearly 100 acres of woods along the pipeline route (assuming 100 ft. of additional clearing along utility cleared ROW) and the clearing of approximately 20 acres at the compressor station site. Also most of the Windsor corridor is within the watershed of the Westfield River that is designated as a “Wild and Scenic River” by the National Park Service.

Perennial streams and rivers include the Westfield River, Westfield Brook and Shaw Brook. MA DEP has defined areas within 200 feet of perennial streams and rivers as wetland resource areas and has protected them through enactment of the Rivers Protection Act. These corridors are critical habitat areas.

Together, these properties provide the following public benefits: water quality, air quality and climate moderation, biological diversity, landscape character, recreation, forest products, and social meaning. This intact, forested ecosystem provides a supporting backdrop that contributes significantly to the quality of life in Windsor.

3.1.1 Land Use, Recreation, and Visual Resources Concerns

Windsor is concerned about the impact of the proposed pipeline and compressor station on our land for the following reasons:

- 1) The pipeline will pass through publicly and privately held conservation lands and easements. For publicly held protected open space, both state and municipal, this land is further protected under the Article 97 of the Massachusetts Constitution which disposition requires a 2/3 roll-call vote of both chambers of the General Court.
- 2) Pipeline construction and ongoing maintenance will adversely affect the ecologic function and enjoyment of properties otherwise protected in the public trust for everyone.
- 3) The proposed compressor station will abut properties of the Peru Wildlife Management Area and the pipeline corridor will pass through the Upper Westfield Wildlife Management Area impacting plants and animals living in these areas both during construction and during continued operation of the compressor station. Pollution from sound, lighting and chemical release into the air water and ground has the potential to adversely affect this area.
- 4) It is likely that the proposed compressor station will be visible from significant portions of Notchview Reservation. Notchview is an important winter recreational area and has 12,000 skier visits each winter. This highly scenic area will be negatively impacted by the light, noise and chemical pollution from the compressor station.
- 5) The NED pipeline is proposed to cross the Westfield River. The Westfield River within Windsor has been designated a National Wild and Scenic River due to its natural beauty, clean water, thriving native aquatic ecosystem, and cultural history. A locally based volunteer committee working with the Massachusetts Division of Ecological Restoration and the National Park Service administer this.
- 6) Gravel and secondary and tertiary paved roads within Windsor including Peru Road and River Road are popular locations for recreational runners, walkers, roller skiers, and cyclists. They also provide scenic access ways to Windsor’s conservation lands.
- 7) A strong network of snowmobile trails managed by local snowmobile clubs - the Berkshire Snow Seekers and the Savoy Canary Kats, serves Windsor and surrounding communities. This trail network provides significant recreational and economic benefits to the community. The pipeline and compressor station will impact its extent and continuity.
- 8) A mowed pipeline corridor cutting through Windsor’s intact forested will serve to fragment wildlife

habitat.

- 9) With large and contiguous areas of forest habitat, Windsor's land attract wildlife such as black bear, moose, fisher, and bobcat, that cannot thrive in fragmented ecosystems. Pipeline and compressor station impacts will be hard felt by the very species that are iconic to the forested high hills of Windsor.
- 10) More specifically we are concerned about the impact on endangered and threatened species such as the mourning warbler, golden-winged warbler, mustard white butterfly, Jefferson salamander, endangered Northern long eared bats, snakes and amphibians.
- 11) Vegetation along the existing cleared utility ROW (adjacent to proposed pipeline ROW) is already dominated by invasive species. Any new cleared ROW will immediately attract the same invasive, furthering their spread and impacting our local plant ecology. This will aggravate the continued decline of threatened plants such as Bailey's sedge, crooked stem aster, thread rush, bristly black currant, hooded ladies-tresses, Northern Mountain Ash, Bartram's Shadbush, Leafy White Orchid and woodland millet.
- 12) Construction related, and enduring operational impacts will be felt by the population of pollinating insects, including bees, butterflies, and moths, many of which are under intense strain from adverse, man made impacts.
- 13) The impact of deforesting the pipeline corridor and compressor station will have catastrophic impact on the individual plants and animals within these areas. The severity, beyond the unavoidable impacts of habitat loss, depends greatly on the time of year that the clearing is conducted.

3.1.2 Information Request

As discussed above, Windsor expects this proposed project will have adverse impacts on our land use, recreation, and wildlife. While information has been provided, it is inadequate in some areas. Given this, we are requesting the following additional information:

- 1) Quantify the impacts to conservation and recreation land, important town resources, and devise proper avoidance and mitigation measures.
- 2) Quantify the impact to conservation and recreation land and devise a mitigation plan for both the construction phase and the operational phase, including full light and sound mitigation and including plans for spills or explosions.
- 3) Quantify and specify the construction techniques and mitigation measures to maintain the wild and scenic values of the Westfield River as described in its federal designation both during construction and throughout the operation of the pipeline. These include the prime cold-water fisheries, the unique geologic feature of Windsor Jamb, the beauty of the bordering riverside beach and picnic area and one of the largest roadless tracts in the Commonwealth. These areas offer protected, contiguous corridor passage to bear, moose, otter, fisher, and bobcat, among many others. The river provides clean good quality water to the 250,000 people downstream whose water is stored and filtered by the forests and streams of the Westfield River watershed.
- 4) A plan to restore the pipeline corridor to its original vegetation once the pipeline is no longer used for its deeded purpose and to prevent the incursion of invasive species during its existence.
- 5) A plan must be devised to mitigate the loss of roads and disruption of trails for recreational and scenic use during construction.
- 6) Draft right of way maintenance plans with input from the MassDFW regarding timing and frequency of mowing in the interest of maintaining productive early successional habitat as an ecological counterweight to the effects of habitat fragmentation.

3.2 WATER RESOURCES AND WETLANDS

3.2.1 Water Resources and Wetlands Concerns

- 1) Most of the Windsor corridor is within the watershed of the Westfield River that is designated as a “Wild and Scenic River” by the National Park Service.
- 2) Perennial streams and Rivers include the Westfield River, Westfield Brook and Shaw Brook. Mass Department of Environmental Protection (MA DEP) has defined areas within 200 feet of perennial streams and river as wetland resource areas and has protected them through enactment of the Rivers Protection Act. These corridors are critical habitat areas.
- 3) There are approximately 11 intermittent streams through the Windsor Corridor.
- 4) The area of the proposed pipeline through Westfield Brook has very steep side slopes and also is an area mapped by Mass Natural Heritage Endangered Species Program (MA NHESP) as Priority Habitat.
- 5) Much of the corridor is within soils with a perched water table that will be disturbed by trenching and associated impacts of laying the pipe.
- 6) Windsor has 25 private wells within 1000 feet of the pipeline that have been documented by Berkshire Regional Planning (BRPC) mapping, with 2 located within 300 feet. Fifteen of the Windsor sites are located in areas where the proposed pipeline construction must pass through shallow to ledge conditions within this corridor. Fourteen of these wells are located near to the intersection of High Street Hill and Shaw Road. One is located on Peru Road.
- 7) Extensive use of explosives is expected during pipeline construction. The commonly used oxidant in such explosives has a known tendency to contaminate ground water in areas proximate to blasting. Perchlorate is a likely human carcinogen and an emerging chemical of concern.

3.2.2 Information Request

- 1) Identify intermittent streams to be disturbed and avoided if possible, or reconstructed to duplicate the original conditions post-construction.
- 2) Identify Wetland Resource Areas along the Windsor Route through methodology of MA DEP and USACE.
- 3) Identify the locations of ground water supply and determine the impact of construction activities on well water due to pipeline construction activities, especially blasting.
- 4) Document private spring water sources and the contributing surface water sources.
This must include all water sources within 1000 ft. from the proposed construction sites.
- 5) Provide base line information on the existing wells to verify that the methodology of ledge excavation does not interfere with the adjacent wells.
- 6) Identify all river and stream crossings and determine the impact of construction on these waterways due to pipeline construction activities.
- 7) Determine the impact on the Wild and Scenic Westfield River whose main branch and whose feeder streams will be crossed during construction. One such stream is only .35 miles down slope from the proposed site of the compressor station.

3.3 CULTURAL RESOURCES

3.3.1 Cultural Resources Concerns

Having been founded in 1771, Windsor has a deep and long history reaching back into the Colonial era. While the proposed pipeline route will not directly impact any of our registered historic sites, Windsor’s cultural heritage suffuses our sense of community. Recently an historic monuments project was completed where signs have been placed at twenty-four historic sites, many of which reveal today only scant evidence of their part in Windsor’s past.

Windsor’s forests contain an unspoiled historic record of settlement within the town. Early residents cleared

much of the rocky soils for pasture, hay fields and cropland. Forests were harvested for lumber, bark, and charcoal. Now this early economic activity is largely hidden in a second-growth forest waiting for the observant visitor to discover. Clues exist in soil horizons, stone walls, and the mix of forest species. Pipeline construction and maintenance will forever destroy this cultural record for present and future generations.

All project impacts will sully the perception of a community that honors its historic past. The projects must pay respect to cultural concerns through all of the mitigation actions specifically sited throughout this document.

3.3.2 Information Request

- 1) Record and inventory the historic land use, stone walls, etc. of areas that may be disturbed by the pipeline, access roads, and compressor site.

3.4 SOCIO-ECONOMIC

There will be adverse socio-economic, fiscal, and financial impacts related to the proposed project. The Berkshire economy has, like many other regions across the US, undergone significant economic change over the past several decades. The decline of manufacturing and the changing role of more rural regions in an increasingly global economy have resulted in steady job and population loss for the County since 1970. The contrary trend in Windsor can only be attributed to the unique and defining natural and cultural characteristics of our community.

County wide, natural and cultural resources serve as the basis for the growing tourism and service economy, which brings in \$645 million annually. Degradation of these natural and cultural resources will have a serious impact on the local economy. Moreover, affected Windsor has very limited organizational and financial capacity to handle increased expenditures or mitigate adverse impacts caused by pipeline construction or operation; any costs associated with the proposed pipeline would likely be unbearable by the municipality.

3.4.1 Socio-Economic Impact Concerns

Windsor is specifically concerned with the following socio-economic impacts:

- 1) Impact on Community Quality of Life in Vicinity of Compressor Station: A compressor station is proposed in Windsor, a quiet, rural town with a low population density. Windsor's low ambient noise level makes it one of the quietest places in the state. Tech Environmental estimates that the ambient noise level at the three properties closest to the proposed compressor station in Windsor are at or below 20 dBA. Any increase in noise will be noticeable and will degrade the local quality of life. Changes to the overall quality of life are irreparable. A compressor station in Windsor, with its associated noise and other impacts could change the nature of the town and ultimately affect the salability of properties in the community.
- 2) Short-term impact on Recreational Tourism due to temporary disruption of recreational sites and roadways during construction.
- 3) Long-term Impact on Recreational Tourism due to permanent disruption of recreational sites, physical character of the land, scenic vistas, and liabilities/restrictions on certain activities near the pipeline and compressor station.
- 4) The proposed natural gas pipeline has potential to create long-term disruptions to forestry activities in the ROW. The 2011 Massachusetts Climate Change Adaptation Report, developed by Massachusetts Executive Office of Energy and Environmental Affairs, estimates that each acre of forest in the state provides approximately \$1,500 annually in economic value from forest products, water filtration, flood control and tourism. This suggests that forested land permanently lost due to the pipeline construction would amount to an estimated economic loss of \$150,000 annually. In addition to businesses, the loss of forestry income would affect private landowners and Fire District lands in Windsor.
- 5) Impact on Community Tax Base: In Massachusetts, Municipal revenues that support local spending on education, public safety, physical infrastructure and other public services are obtained through

one of four types of revenue sources, including tax, state aid, local receipts, and other sources. Windsor's budget relies heavily on the property tax levy, which represents 73.2% of our annual \$2.03M revenue. Due to caps on tax rates, Windsor only had \$44,618 in excess levy capacity in FY15. Decreases in property values will have a serious impact on our town financial stability.

- 6) Massachusetts Department of Revenue (MDOR) levies state tax valuation on the assets of the proposed pipeline and compressor station according to a state wide distributed model. DOR determines the annual value of system assets and divides the sum by the system wide length of pipe and distributes valuation back to host towns based on the length of pipeline contained within town limits.
- 7) This model severely under-compensates Windsor given a relatively short span of pipeline, yet a compressor station of perhaps \$100mm in value.
- 8) The presence of the pipeline and compressor station may also increase Windsor's exposure to liability claims arising from any associated accidents or health issues. Gas pipeline line development has the potential to involve municipalities in lawsuits related to the installation and operation of in-ground pipelines.
- 9) Impact on electricity in pipeline/compressor station event. A major east-west transmission line brings electricity into Massachusetts from its western border. This line runs along the same ROW as the proposed pipeline. An electrical substation is located in Hinsdale. An explosion on the pipeline would affect the adjacent transmission line and could potentially cut off electricity to a large area.
- 10) Proximity of residences to the pipeline and compressor station will adversely affect both the appraised values and sales prices of Windsor homes and businesses. While this impact will be greater for homes closer to the pipeline and compressor station, it will likely extend to all residences and businesses to varying degrees. Lower appraised values will negatively affect equity and increase the mortgage costs and, in severe cases, render re-financing impossible. Property owners who succeed in selling will suffer a loss in real wealth due to presence of the pipeline and compressor station.
- 11) Home insurance premiums may increase with proximity to the pipeline and compressor station. In some cases it may be difficult to obtain.
- 12) The presence of the pipeline and compressor station would increase costs of road maintenance, public safety, emergency response, and other activities linked to hosting these facilities.
- 13) Windsor's organizational capacity to mitigate these impacts is very much strained. The Town has no town manager/administrator, no community development or planning staff, and must rely heavily on volunteer-run boards to keep the town functioning.

3.4.2 Information Request

We requesting the following additional information:

- 1) Analysis of socio-economic and financial impacts during construction of the compressor station and pipeline addressing the concerns discussed above.
- 2) Identification of the impacts of soil disturbance, altered drainage patterns, and mitigation activities on the various types of agricultural activities, including disruption of economies of scale.
- 3) Identification of the impacts of the pipeline itself on long-term soil productivity, due to increased temperatures, altered drainage, and/or anticipated maintenance activities (such as applications of herbicides).
- 4) A fiscal impact study showing the value of lost agricultural and forest resource productivity on the local and regional economy, in terms of lost revenue, income, and jobs.
- 5) Assessment of the potential impacts on access to local food for area residents.
- 6) Assessment of impacts on farms that utilize organic practices potentially impacted in the vicinity of the compressor station and along the pipeline route. While they may not be certified commercial organic farms, their ability to raise uncontaminated crops and livestock with compressor station emis-

sions is questionable.

- 7) Assessment of the impacts of the compressor station on local pollinator populations, including bees and honey production. Ensure that honey produced is not compromised by herbicides, blow-off events.
- 8) An inventory of heritage and recreational sites in Windsor, including their locations and extents. Determine whether a site's operations will be disrupted as a result of permanent installation of a natural gas pipeline and compressor station, its associated facilities, or its rights of way. Determine the occupancy of recreational and heritage sites throughout the year, and during appropriate peak times where number of visitors and human impacts on an area may be significantly higher than normal.
- 9) Summary of the acreage of heritage and recreational land that will be permanently impacted by the proposed facilities.
- 10) Assessment of how the operation of heritage and recreational sites will be disrupted as a result of permanent construction impacts through a fiscal impact analysis.
- 11) Plan for traffic flow that documents resident and visitor impact during construction.
- 12) Given the state of municipal finances, we request a study of the impact of the compressor station and pipeline on future property tax revenues and residential property values in Windsor. This should include a thorough explanation of the methodology for arriving at the calculations.
- 13) Evaluation of the liability exposure and determine municipalities affected by the proposed project, including abutting communities.
- 14) Information on the insurance coverage carried by TGP and any exposure that Windsor may have related to the pipeline and compressor station.

3.5 TRANSPORTATION AND PUBLIC SAFETY

This section sets forth the adverse impacts of the NED Project on Windsor's roads and public safety. The transportation infrastructure in Windsor consists of two, two lane highways, 8A and 9, and local gravel and lightly paved narrow and often steep roads. Many of these roads cross culverts or bridge streams. The load limits on few, if any, of these roads, culverts and bridges are adequate to support the transport of heavy construction vehicles or trucks carrying pipe sections. Residents prize the rural nature of their community, the intimacy of its country roads with tree lines and field edges and the appropriate infrastructure for public safety given our low intensity current use.

Interstate natural gas pipelines can have considerable impacts on public safety and potentially to public health, both during construction and over the years of operation. The proposed compressor station in Windsor amplifies all aspects of pipeline public safety concerns. The pipeline corridor through the small rural town of Windsor, consisting largely of forestland, farmland and non-agricultural open space, is relatively inaccessible and contains much steep terrain. The existing development pattern is scattered rural homes with some rural development already existing along considerable portions of the route and homes in extremely close proximity in a number of instances, including homes quite close to the proposed compressor station site. With the developers stated intention to expand capacity to match future subscription levels, we can only surmise that additional construction will occur in proximity to the pipeline over its period of multiple decades of operation.

3.5.1 Transportation Concerns

There is much concern; not only about possible damage to existing infrastructure, but as a result of the developers intentions to implement inalterably changed to accommodate the long term, expanding industrialization of our agricultural/residential community. The access road to the proposed compressor site is a narrow road, part of which is lightly paved, that crosses wetlands and culverts. Many of the roads, such as Peru Road, that will be used to transport pipe sections to pipe yards have only one access and no area in which a large truck can be turned around. They also are narrow and have intersections and curves with small turning

radii that would not accommodate long trucks. River Road and Windsor Bush Road are two examples of this challenge. Our specific concerns:

- 1) Portions of Windsor will be inaccessible during the construction period of the compressor station and pipelines. This will be prolonged and intensely disruptive to area travel.
- 2) If any roads have to be closed temporarily during construction due to damage or the need to reconstruct the road, alternative access for many families, where it exists at all, is extremely circuitous.
- 3) Because Windsor experiences severe winter weather conditions, including deep and wind drifted snow, and penetrating frosts, winter access to valves and other infrastructure is difficult, and possible pipeline damage from heaving is possible. As the pipeline crosses several roads, including Route 9 twice, there is concern about pipe damage from vibrations and heavy traffic.

3.5.2 Transportation Information Request

As discussed above, Windsor expects this proposed project would have adverse impacts on our infrastructure, including transportation. Given this we are requesting additional information related to our concerns:

- 1) A study of road and infrastructure impacts during construction. This analysis should include the impact on existing infrastructure during construction, determine the need for significant reconstruction of roads to accommodate construction, determine the impact on access and transportation during construction, and determine the need for remediation to maintain the rural nature of Windsor's infrastructure after construction.
- 2) Inventory of the load limits for all roads, culverts and bridges in Windsor to be used to transport materials or machinery for the construction project. This information must be obtained from the Massachusetts Department of Transportation
- 3) Identification of those residences that would have limited or no access to their homes during construction. Since many alternate access roads are not maintained in winter, this assessment needs to be done for winter construction if that is contemplated. Determine school bus routes and commuter routes both eastbound and westbound for each road in Windsor caused by pipeline construction maintenance or operation, including construction at the Dalton crossing of Route 9 and calculate the additional time using detours during particular weather seasons, including snow and mud, and determine compensation for any detour lasting more than fifteen minutes Meet all such costs, including those of school transportation vehicles.
- 4) Identification of all roads to be used to access construction sites that could not accommodate the wide turning radius of a truck hauling pipe sections.
- 5) Identification of all roads on which there are homes for which the only access is across the pipeline route.
- 6) Analysis of the traffic impact on Peru Road of operation of the compressor station.
- 7) Analysis of the winter access to all valves and pipeline sections as well as the compressor station.
- 8) Identification of all road, river and stream crossings of the pipeline route.
- 9) A study of road and infrastructure impacts during construction. This analysis should include the impact on existing infrastructure during construction, determine the need for significant reconstruction of roads to accommodate construction, determine the impact on access and transportation during construction, and determine the need for remediation to maintain the rural nature of Windsor's infrastructure after construction.
- 10) Inventory of the load limits for all roads, culvers and bridges in Windsor to be used to transport materials or machinery for the construction project. This information must be obtained from the Massachusetts Department of Transportation.
- 11) Identification of all residences that would have limited or no access to their homes during construction that temporarily closed a road.

3.5.3 Public Safety Concerns

Our concerns directly relate to the impact of the proposed compressor station and the pipeline on the public safety of our residents. Specifically:

- 1) Windsor's fire department is a small all-volunteer operation with only fifteen members, and limited equipment and supplies. Our forest fire response is through cooperative agreements with adjoining small volunteer departments with support from State agencies. There is no public water system to provide fire protection, only the river and several ponds to fill pumper trucks. EMS services are very limited with a handful of volunteers with only spotty availability. The Windsor volunteer fire department and EMS services have limited training and equipment. Turnover in membership necessitates ongoing training and there is a constant need for replacement of out-of-date specialized supplies and equipment. The adequacy of volunteer-based emergency response will potentially dramatically decrease over the decades that the pipeline is in operation due to the rapid aging of current volunteers and the lack of younger replacements. Our local elementary school was closed this past fall due to inadequate enrollment that reflects the fact that Windsor's population is aging out of residents in childbearing years, which are typically the years in which volunteers participate.
- 2) Local town law enforcement is also limited, with a three person, part time police force, which is already working at capacity. Long distance utility corridors currently are used, sometimes illegally, for recreational use, particularly involving All-Terrain ORVs and snowmobiles, increasing the demand on public safety responders.
- 3) Windsor's road network consists of rural two lane highways 8A and 9, and narrow, sometimes gravel, local roads with limited means of access. Closure or blockage of any road may increase emergency response times significantly or even preclude any ability to respond. The proposed access road to the compressor site is a narrow gravel road, which is accessible for emergency vehicles only from route 9. Any blockage during construction or due a later negative event would make emergency access to many homes impossible. High Street Hill and Windsor Bush Road are examples of other single route access roads crossed by the pipeline.

3.5.4 Public Safety Information Request

As discussed above, Windsor expects this proposed project will have adverse impacts on public safety. Given this we request the following additional information related to public safety infrastructure concerns:

- 1) Analysis of public safety impacts during construction. The goals of this analysis would be to determine the level of impact of construction activities on emergency response times in and around the project area and to determine and quantify potential threats to public safety and health due to construction activity.
- 2) Analysis of the roads, which will be impacted directly, requiring partial or complete temporary closure, by construction activity with particular attention to single access roads. Determine the amount of delay or additional travel time and distance created for each impacted road for emergency vehicles, both primary and secondary to respond to incidents, assuming that certain vehicles will need to pass through Dalton or Hinsdale.
- 3) Analysis of the impact of construction related activity on each impacted road's condition and its ability to continue to serve local emergency management vehicles responding to emergencies due to the impact of construction related activity on the road's surface, structure, culverts and bridges. Quantify the "worst case" impacts on emergency response times if the road condition deteriorates to a level which makes it impassable for emergency response vehicles including plans for alternative emergency access where such a closure makes emergency access by road impossible.
- 4) Assessment of the capacity of local fire department to respond to wildfires created by construction activities. Capacity should include assessment of staffing levels, training, materials and supplies, and equipment.

- 5) Determination and specification of the hazardous materials and petroleum products used during construction and generated or utilized during operation, with the threats to public health and safety created by them. In addition, we request an assessment of the current capability of the local hazardous materials response team to respond to any incidents involving hazardous materials and petroleum products.
- 6) Analysis of the impact of blasting necessary to remove rock for the construction project. Clearly identify areas that will be subject to blasting. Determine the area of potential concern regarding rock throw and seismic impacts due to blasting activities. Determine the people, structures, public infrastructure, public use areas, and other facilities that are located within that area of concern.
- 7) Clear identification of the location and safety risks associated with all proposed pipeline above-ground facilities including valve stations, main line valves, and pig launchers and receivers. A detailed explanation of the measures that will be taken to protect against safety risks must be provided. The station would be so remote that it must be manned locally in order to quickly access valves in case of an emergency
- 8) A detailed assessment of the ability of local emergency responders to respond to incidents involving above ground facilities and mitigation plans to keep their training, supplies and equipment at an adequate response standard at no expense to the Town.
- 9) Clear identification of the protocols for inspection of welds during construction. Radiological testing shall be done on all pipe welds.
- 10) Gas line ruptures, when they occur, usually involve unauthorized excavation activities. Since much of the pipeline route through Windsor can be accessed via the adjacent utility ROW, clearly identify how unauthorized equipment access will be prevented. What monitoring protocols will be used?
- 11) Clear identification of the potential impact radius for potential explosions for the entire pipeline infrastructure, based on the proposed size and pressure of the pipeline, including the pipe, the compressor station, each main line valve, and any potential blast hazard at pig launchers and receivers. Document the High Consequence Areas and the method used to determine them. Identify all structures including their use, public facilities, and areas commonly used by the public (trails, playfields, camping and picnic areas, etc.) within the potential impact radius.
- 12) Clear identification of the proposed distance between valves and indicate precisely which valves will be manually, remotely, or automatically operated in the case of a pipeline system failure. Document how much fuel would be released given the type of valve and resulting time required to shut the valve off and the distance between valves in the case of a failure. The use of manual valves should be avoided, as access in winter months would be impossible in many locations.
- 13) Clear layout of the ongoing inspection protocols for the pipeline and compressor station once in operation. This should include: frequency of monitoring for methane, location of where natural gas will be odorized, frequency of internal inspection for corrosion or other damage to the pipeline.
- 14) Specify standards and timeframe for further investigation and repair if inspections reveal potential issues.
- 15) Clear layout of the protocols for the ongoing inspection of the condition of the cathodic protection used. Specify the standards and timeframe for when inspections reveal potential issues for further investigation and repair.
- 16) Since much of the pipeline is proposed to be in proximity to high voltage electric transmission lines and overhead (as well as underground) power lines can induce harmful disturbances on nearby metallic pipelines, assess the:
 - a. Capacitive coupling disturbances for any above ground sections of pipeline that are electrically isolated from the ground. The evaluation of this disturbance should be performed for steady-state operation condition of the power line, assuming the line operates at its maximum operational

voltage.

- b. Inductive coupling disturbances for any pipelines facilities, which are located, below ground. This disturbance should be evaluated taking into account the maximum anticipated levels of steady state and short-circuit currents.
 - c. Conductive coupling disturbances for underground sections of the pipeline and for any grounded above ground sections of the pipeline. This evaluation should be performed only for short-circuit condition of the power line and taking into account the maximum anticipated level of short-circuit current.
 - d. Under short-circuit condition, the disturbances due to inductive and conductive coupling occur simultaneously.
- 17) Assessment of the adequacy of proposed cathodic protection against corrosion given current research, as traditional pipe-to-soil potential measurements do not guarantee efficient protection.’
 - 18) Analysis of the appropriate depth to which the pipeline should be buried to minimize the potential of a pipeline failure based on the extreme winter climate conditions in Windsor. As outlined in Table 1.3-1 of Resource Report 1 (Page 1- 60) only 36” of cover will be used in normal soil conditions or 24 inches in areas of consolidated rock. This depth is well above the frost line in Windsor and a significant portion of the pipeline will be above the frost line.
 - 19) Summary and analysis of the safety record of interstate gas pipelines located under transmission lines for a period of at least 30 years. Provide examples of at least 10 interstate gas pipelines constructed within 100 feet of an electric transmission line and include their safety record.
 - 20) Assessment of the training, supplies and equipment for public safety personnel Windsor to respond to catastrophic pipeline failure.
 - 21) Assessment of the ability of local public safety personnel to respond to public safety issues that may be created due to access by third parties along the pipeline route, such as use by all-terrain vehicles and snowmobiles. Assess their training, equipment and equipment for their ability to respond to incidents, which may occur in remote sections of the pipeline, as well as in close proximity to homes and businesses.
 - 22) Assessment of the ability of local land use controls to reduce future increases in risk of potential failure due to future development along the pipeline route.
 - 23) The proposed compressor station in Windsor amplifies all aspects of pipeline emergency response. Catastrophic failure probabilities and expected consequences must be clearly specified.
 - 24) Assessment of the potential safety risks of trenches and the measures to be used to ensure compliance with, at a minimum, the Massachusetts Excavation & Trench Safety Regulation (Iaclyn’s Law).
 - 25) Assessment of areas of steep slope for slope failure potential during construction. Determine all areas potentially impacted by slope failure and identify risks to the public using those areas for a variety of purposes. All structures and other facilities or areas used by the public or by private property owners in such areas should be identified.
 - 26) An operational plan that identifies risks to include possibility of a catastrophic failure of the pipeline or related facilities (compressor station, and main line valves), the risk to the public resulting from catastrophic failure, and the adequacy and appropriateness of emergency response to incidents.

3.6 PROJECT WIDE NOISE AND VIBRATION

Windsor expects there will be adverse noise and vibration impacts of the proposed pipeline and compressor station. Project-related noise and vibration, during construction and that which is directly associated with the compressor station, will be emitted into a low-level ambient noise environment. This is critical in the context of regulations set forth by the Massachusetts Department of Environmental Protection (MassDEP).

The MassDEP Noise Policy states:

- (1) No person owning, leasing, or controlling a source of sound shall willfully, negligently, or through failure to provide necessary equipment, service, or maintenance or to take necessary precautions cause, suffer, allow, or permit unnecessary emissions from said source of sound that may cause noise.
- (2) 310 CMR 7.10(1) shall pertain to, but shall not be limited to, prolonged unattended sounding of burglar alarms, construction and demolition equipment which characteristically emit sound but which may be fitted and accommodated with equipment such as enclosures to suppress sound or may be operated in a manner so as to suppress sound, suppressible and preventable industrial and commercial sources of sound, and other man-made sounds that cause noise.
- (4) 310 CMR 7.10(1) is subject to the enforcement provisions specified in 310 CMR 7.52.

MassDEP also requires a comprehensive noise impact analysis with acoustic modeling as part of an air permit application. That analysis begins with a full week of 1-hour L90 ambient sound level measurements at each nearby residential property, and the selection of the lowest measured 1-hour L90 level as the “ambient level” at each location. Given the very quiet rural location of the Market Path Mid Station 2 in Windsor, MA, we expect the ambient level at the three nearby residences (NSA-1 through NSA-3) are no higher than 20 dBA, and possibly lower. This compressor station is on the north side of the Peru Wildlife Management Area. Ambient sound measurements made for a renewable energy project on the south side of that same Wildlife Management Area recorded 1-hour L90 levels in the 17 to 20 dBA range at night. Thus, the controlling sound limit at Market Path Mid Station 2 in Windsor, MA most certainly will not be the FERC criterion of 55 dBA Ldn (equivalent to 48.6 dBA Leq), but instead it will be the DEP Noise Policy limit of somewhere in the range of 27 to 30 dBA L90 for continuous facility noise.

The DEP enforces an Lmax limit of ambient L90 plus 10 dBA for impulse noises, such as blowdown events for a compressor station. The proposed project will have to demonstrate compliance with that stringent sound limit which likely will be in the range of 27 to 30 Lmax. Finally, as part of the noise analysis for a new facility, MDEP requires the applicant to perform a Best Available Noise Control Analysis (BANCT) and to implement all cost feasible sound mitigation measures for each noise source at the facility.

3.6.1 Project Wide Noise and Vibration Concerns

The Town of Windsor is concerned that the proposed pipeline construction and compressor station operation will not adhere to MassDEP regulations. Our specific concerns:

- 1) Given the shallow soils and bedrock only inches below the surface throughout most of the proposed route in Windsor, blasting and hammering will be the norm. Noise associated with rock hammering and blasting will be heard both by residents in the immediate vicinity and by those miles away. There will literally be no escape from it. Blasting and rock-hammering, combined with the noise of equipment and materials being moved to and from the pipeline construction site, means that large parts of Windsor will be virtually unlivable during operating hours.
- 2) Pipeline compressor stations generate significant noise and vibration in the normal course of operations, and periodically create exceptionally high levels of noise. Excessive noise levels have well-documented impacts and are exacerbated in our rural community by the absence of ambient noise levels that would partially mask those associated with the pipeline and compressor station.
- 3) Given the prolonged construction period for a compressor station, construction activities at the site itself, along the country road that provides access, and during likely reconstruction of that road itself, impacts will be felt profoundly.
- 4) Our wildlife will be impacted by noise and vibration levels during construction and during compressor station operation.

3.6.2 Information Request

Given the concerns noted, we are requesting the following additional information:

- 1) A noise impact analysis of construction and operational activities of the compressor station and the pipeline in Windsor.
 - a. This analysis should include an assessment of these levels against State and local noise regulatory standards and properly measured base noise levels on adjoining property lines.
 - b. The existing ambient noise levels should be measured along the construction path for both day-time and nighttime with no wind or precipitation, at a location sufficiently back from all roads to eliminate traffic noise and when insect noise (crickets, cicadas) is not present and tree frogs or peepers are not singing. One week of continuous 1-hour L90 measurements must be taken at each of the three nearby residential properties (NSA-1 through NSA- 3) during a week with calm winds to document the lowest 1-hour L90 level at each receptor.
 - c. There should be quantified assessments of the expected increases in noise and the potential public health impacts resulting from the increases in noise.
 - d. This should be analyzed for operation of machinery used for clearing and construction, for mechanical fracturing of rock, and for blasting necessary to remove rock.
 - e. This should include the noise impact of the operation of the compressor station noise.
- 2) An analysis of the effects of noise pollution on wildlife, including the impact on reproduction, anti-predator behavior, and foraging.

3.7 PROJECT WIDE AIR QUALITY

In addition to the federal New Source Performance Standards (NSPS) and Best Available Control Technology (BACT) for each regulated air pollutant, the compressor stations in Massachusetts are subject to more stringent turbine emission limits in Massachusetts Air Pollution Control Regulation 310 CMR 7.26(43). The Operational Emissions must include not only combustion equipment emissions, but also gas blowdown emissions that will occur on a regular basis during pipeline and compressor maintenance and for compressor starts, and gas-condensate emissions during pipeline pigging.

Air dispersion modeling for compressor stations in Massachusetts requires the preparation and presentation of a modeling protocol to the Department of Environmental Protection. The Department of Environmental Protection must approve such protocol prior to performing dispersion modeling. In addition, compliance with State and National Ambient Air Quality Standards (NAAQS) must be demonstrated on the entire property line for the compressor station, as well as on lands outside the station parcels. Hazardous Air Pollutants (HAPs) must be analyzed as part of the air permit application in Massachusetts. As part of a Massachusetts air permit application, dispersion modeling must show compliance with Acceptable Ambient Level (AAL) and Threshold Exposure Limit (TEL) air concentration limits for HAPs. EPA's AP-42 emission factor database lists 11 HAPs emitted by a gas-fired turbine, including formaldehyde, PAH and benzene. The emissions inventory for stationary fuel-combustion sources (turbines, gas heaters, emergency generators) must include a HAPs emissions inventory, and dispersion modeling needs to demonstrate compliance with the State HAPs limits.

Additionally, since Berkshire County, MA is a Nonattainment Area for the 1997 federal ozone standard, any new major source of NOx emissions (which may include the Market Path Mid Station 2 in Windsor, MA) is subject to the provisions of Non-Attainment New Source Review. If applicable, the applicant will have to demonstrate through air dispersion modeling that the cumulative impact of all stationary source NOx emissions will comply with the EPA Significant Impact Level (SIL) of 1 µg/m³ for N02 on an annual basis to demonstrate that the facility will not contribute to an existing violation of the ozone regional air quality standard.

3.7.1 Project Wide Air Quality Concerns

These standards are critically important to our community and we are concerned about the following impacts:

- 1) The proposed pipeline corridor itself is far from construction friendly with steep slopes, fragile soils, and abundant wetlands. Material- and equipment- intensive construction techniques will be required throughout. Without knowing how equipment and materials will gain access to the pipeline corridor, it is difficult to be explicit regarding local air quality impacts but proposed pipe yard locations suggest highly intense use of roads for access with residences located in close proximity, therefore the impact of construction on air quality is noted as a concern.
- 2) The local impact of Diesel equipment emissions on air quality must be considered in light of the intensity of use. Respirable particle emissions from diesel engines are known for short and long term exposure-related health impacts.
- 3) Air quality during blowdown cycles in light of the findings of the Environmental Health Project.

3.7.2 Information Request

Additional information is requested to adequately address air quality concerns. Specifically:

- 1) A detailed speck air assessment that is methodologically consistent with research projects completed by Environmental Health Project. This assessment needs to include information on air quality 15 minutes after a blowdown event. It should also include the impact of severe weather including heavy snow, rain, and fog.

3.8 PUBLIC HEALTH

There are a multitude of public health concerns related to the construction and operations phases of the proposed pipeline and compressor station in Windsor.

3.8.1 Public Health Concerns

Our concerns directly relate to the impact of the proposed compressor station and the pipeline on the public health of our residents. Specifically:

- 1) Liquid separation and filtering at compressor stations pose potential hazardous with regard to the transport and disposal of hazardous byproducts. Compressor stations typically include scrubbers, strainers or filter separators, which remove liquids, dirt, particles, and other impurities from the natural gas. Research being conducted by the Environmental Health Project shows significant health impacts of compressor stations. This is primary due to the immediate impacts of blowdown events.
- 2) The concern about the health impact of blow down events is compounded in Windsor due to extreme weather conditions, such as heavy fog and snow in the area of the compressor station. Blowdown events release such substantial volumes of gas that the FAA has issued flight restrictions over the nearby Agawam, MA compressor station due to concerns that the density of gas can alter aircraft engine performance and under certain conditions become ignitable by aircraft at or below 1000ft.
- 3) Residents of Windsor rely entirely on wells for their potable water. Any contamination of wells due to blasting and related release of chemicals such as perchlorate would make the homes uninhabitable.
- 4) Excessive noise levels have well-documented health impacts. Construction activities, particularly operation of heavy machinery, blasting, and mechanical rock fracturing, have significant noise impacts. Additionally, the pipeline compressor station will generate noise as a regular part of operations; periodically it will create exceptionally high levels of noise.
- 5) The safety of construction areas and facilities. Unfortunately, construction areas can be “attractive nuisances” and fatalities have occurred due to people falling into open trenches. Due to these occurrences, trench safety laws, such as Massachusetts’ “[a]clyn’s Law”, have been enacted to try to prevent these accidents.
- 6) Given the steep topography in Windsor crossed by the proposed pipeline, and the high precipitation amounts in this area, as well as the increased frequency of micro-bursts of very concentrated rainfall, significant erosion, wash-outs and slope failures are a real threat. This can be even more extreme in

areas with highly erodible soil.

- 7) The impact of disturbing soil potentially tainted by hazardous chemicals during construction.

3.8.2 Information Request

Given the overlap in prior sections, we have no further information request related to public health.

3.9 CUMULATIVE IMPACT

Overall Windsor expects a negative cumulative impact of the proposed pipeline and compressor station on our town. We also expect that this proposed project will have negative implications for our future. While the above addresses specific concerns and requests for information, the whole is greater than the sum of its parts.

3.9.1 Information Request

Given the concern about cumulative impact, we are requesting:

- 1) A study of the cumulative impact of a compressor station and a pipeline in the Town of Windsor. This should include an assessment of the combined effect of changes in air quality, water quality, noise pollution, light pollution, and economic impact on our Town. This should include a plan for how the cumulative impacts will be mitigated. This should also include thorough documentation of how information was derived.
- 2) While the compressor station has decreased in size compared to the original proposal, we are requesting information on what would happen “if” this station were to be expanded.

4 PRELIMINARY MITIGATION REQUESTS

The preliminary mitigation requests below are based upon the information we have been provided to date. Absent clarification of full project details, it is difficult, if not impossible, for us to thoroughly assess the impact of the project on the health and safety of our residents, on the environment and on the rural nature of our community.

Regarding the comments to follow, we have prefaced this mitigation section with the word “preliminary” because of the insufficient information about the project, especially the compressor station and its impacts, to comment in a way that fully addresses community concerns. For the town to provide comprehensive comments technical expertise will be required to assist this effort. It is our expectation that our requests for remediation will become much more explicate and measurable as the town gains access to better information from the developer and engages technical professionals to interpret this information.

The preliminary mitigation requests below, to be supplemented as noted above, are part of what is necessary for the Commission to ensure that TGP avoid, minimize, and mitigate, to the fullest extent practical, the impacts of the proposed compressor station and pipeline, in construction, operation and decommissioning stages of this project across all areas of concern.

We request that the Commission not tolerate or accept non-specific responses on the part of TGP, such as those made after the comments of FERC staff regarding the Resource Reports in the May 15 Response to Comments on Draft Resource Reports.

4.1 LAND USE, RECREATION, AND VISUAL RESOURCES MITIGATION

As discussed in 3.1 above, Windsor expects this proposed project will have adverse impacts on our land use, recreation, and wildlife management. Given this we are proposing the following preliminary mitigation measures:

- 1) All lands previously open for hunting remain open and loss of forested habitat due to the corridor, the compressor site, and impact area shall be offset by the purchase of an equivalent amount of contiguous forestland within existing wildlife corridors.
- 2) Compensatory lands shall be deeded to an appropriate organization/entity such as state conservation

based agencies or to the town.

- 3) Negative effects of the compressor station shall be mitigated such that they have no visual or audible effect on the recreational use of Notchview Reservation, particularly contamination of the dark sky with light pollution.
- 4) As the largest employer and site that brings 12,000 recreational visits per year, Notchview Reservation must be protected from negative effects that the compressor station will have on the recreational/commercial use of this property.
- 5) Negative effects due to loss of roads and disruption of trails for recreation and scenic use shall be mitigated such that they have no effect on use.
- 6) Ensure local snowmobile clubs have uninterrupted access to landowner approved trails both during the construction and management phases.
- 7) Require restoration of pipeline corridor to pre-construction state.
- 8) Require full reparation of pipeline corridor if the pipeline becomes obsolete.
- 9) Require minimization of impact on recreational properties during construction and operations.
- 10) Require full mitigation of impact to conservation land and scenic environment during construction and operation.
- 11) Land clearing methodology shall be designed to minimize the disturbance to the environment.
- 12) Erosion Controls shall be implemented and maintained throughout the pipeline corridor, at staging area and construction storage facilities and along access roadways. The Erosion Controls shall be reviewed and approved by MassDEP and Windsor Conservation Commission or approved representative.
- 13) Erosion control materials and temporary structures and devices shall not be permitted to introduce invasive seed stock.
- 14) Timber mats shall be used as required to avoid disturbing soft soils and shall be treated to mitigate invasive species transfer.

4.2 WATER RESOURCES AND WETLANDS MITIGATION

As discussed in section 3.2 above, Windsor expects the proposed project will have adverse impacts on our agricultural environment, ecology and water supplies. Given this we are proposing the following preliminary mitigation measures:

- 1) Require that Wetland Resource Areas along the Windsor Route through methodology of MA DEP and USACE be reviewed and approved by Windsor or designated representative.
- 2) Develop construction design and methodology to avoid these areas or minimize disturbance of these areas. Crossing methodology must be reviewed for minimization of impacts. Chosen methodology shall be adapted for suitability to the specific crossing. Construction methodology should minimize disturbance time in these areas.
- 3) Construction methodology shall minimize disturbance time in these areas.
- 4) Wetland Resource Area Disturbance shall be avoided or minimized. Wetland Replication shall be completed at 120% of disturbed area and within two months of covering of the completed pipeline construction, in the immediate vicinity. Off site replication for proposed permanent wetland resource replication must be done prior to the pipeline construction.
- 5) All attempts shall be made to reconstruct the soil profile to the existing conditions to minimize disturbance of the perched water table characteristics.
- 6) Secondary impacts to water resources, such as along existing roadways and proposed access routes as well as staging areas shall be identified.

- 7) Impacts to water resources for access road construction and reconstruction shall be identified and avoided or mitigated.
- 8) Plan for immediate mitigation of impact on any drinking water source for humans, animals, crops, or gardens. Mitigation shall be equivalent in water quality and convenience.
- 9) All construction methodology must be developed to avoid any alteration to the existing local aquifers to the private well systems, including but not limited to, fluid leak prevention for vehicles related to pipeline construction throughout the town. Refueling must be performed according to best practices related to spill prevention.
- 10) Windsor shall have an independent Environmental Construction Monitor (ECM) having access to all sites and through the Windsor corridor and the compressor station site. ECM must have clear access to proposed situation specific methodology to resolve deficiencies. ECM must also have a devoted workspace with communication devices, heat and other related office supplies.
- 11) The proposed compressor station shall require benching the existing side slopes of the proposed area. Ground water encountered during construction shall be minimized and controlled. Construction shall meet MassDEP Storm Water Standards.
- 12) Any water discharges from the compressor station shall meet MassDEP ground water discharge standards.
- 13) TGP plans to engage in compaction prevention techniques, topsoil segregation practices, drainage/erosion issues, and prevention of bedrock migrating to topsoil. Despite these mitigation activities, it is important to provide an analysis of potentially lost agricultural land [i.e, pipeline ROW located amid other active crops) and to evaluate the impact of the lost acreage on the viability and economy of scale of agricultural crops. Long-term crop-specific impacts of the pipeline and related activities that will impact the productivity of agricultural lands should be understood. For example, mature orchard trees lost to construction or ROW may not be replaced, despite achieving restored soil conditions.
- 14) Provide the Windsor Select Board with detailed plans for review and approval to protect well and river water supply infrastructure from damage or contamination due to pipeline construction and detailed erosion and slope stabilization control plans for all pipeline construction activities.

4.3 CULTURAL RESOURCES MITIGATION

Within the area disturbed by construction, other than the immediate pipeline 50ft ROW and compressor station operating footprint, avoid disturbance of cultural heritage such as stonewalls cellar holes or other indicators of the historic past. As regards temporary access roads and alterations of existing access, restore such structures as stonewalls to the condition preexisting prior to the start of the project.

4.4 SOCIO-ECONOMIC MITIGATION

As discussed in Section 3.4 above, Windsor expects this proposed project would have adverse socio-economic impacts and adverse impacts on our quality of life. Given this we are proposing preliminary mitigation measures. In particular, we are requesting that the Commission ensure: (1) TGP avoid, minimize, and mitigate to the fullest extent practical impacts of the proposed compressor station and pipeline and its operations on the local economy, including agricultural, natural heritage/recreational, forestry and lodging businesses; and (2) TGP avoid, minimize, and mitigate to the fullest extent the risk to the public resulting from changes in the municipal tax base or liability exposure. Given this we make the following requests:

- 1) Require TGP to maximize use of local labor force, contractors, and suppliers in all cases where neither specialized equipment nor unique certifications exclude this workforce.
- 2) Require TGP to reimburse Windsor for any and all town related costs associated with pipeline project and compressor station. These costs will include expenditures of money and time associated with project preparedness, for example the costs to produce this document.

- 3) Mass DOR pipeline system tax assessment practices deprive Windsor of its fair assessment as the host of a compressor station. Accordingly, TGP shall make a Payment in Lieu of Taxes (PILOT) to the Town of Windsor. The PILOT payment shall be based upon the real property and contents value of the facility at full value. And shall not be less than \$2 million annually. In addition TGP will fully fund all ongoing costs to the Town of Windsor arising from the construction and operation and maintenance of the pipeline and compressor station system and provide a policy of liability insurance satisfactory to town counsel to be renewed at TGP's sole expense naming the Town of Windsor, its agents employees and servants as additional insured to indemnify those named above against all claims that might arise from any occurrences or accidents linked to the project, including pollution claims.
- 4) Should the presence of the proposed pipeline and compressor station adversely affect Windsor's bond rating, TGP should provide underwriting to Windsor's bond issues sufficient to offset any negative and business owners for the increase in premiums for homeowners, tenants' personal property and automobile and excess liability general liability, workers compensation, loss of business and excess liability insurance policies associated with proximity to the pipeline and compressor station as they occur. An escrow account should be established and funded by Kinder Morgan for this purpose and administered by an independent agent.
- 5) Require TGP to provide a mitigation plan for recreational sites to address potential losses in views, changes to the physical character of the land, and any potential hazards due to pipeline activities. Address impacts on the safety of visitors to each recreational facility, and to assets of the facility, including insurances, emergency preparedness, and increased liabilities associated with the proposed facilities. For example, the town park with its ball fields and playground are in close proximity Peru Rd. The minimal setback reflects the relatively modest hazard that this rural country road represents to park users, most of them children. This rural road will be fundamentally altered as access to an industrial site and catastrophically so during construction. Appropriate mitigation for construction phase and long term impacts will be sought.
- 6) Require TGP to reimburse forestry businesses and farms for lost revenue associated with the proposed pipeline.
- 7) Establish redundancies in case of accident, including any resulting in major high voltage electric transmission line failure. Establish a reimbursement mechanism for any lost revenue.
- 8) Require TGP to provide insurance to cover every home along the proposed pipeline route within 1,000ft

4.5 TRANSPORTATION AND PUBLIC SAFETY MITIGATION

Due to the concerns noted in 3.5 above, Windsor expects this proposed project would have adverse impacts on transportation and public safety. Given these adverse impacts we are requesting that the Commission ensure the proposed project avoids, minimizes, and mitigates to the fullest extent practical impacts of the proposed compressor station and pipeline and its operations through preliminary mitigation measures related to transportation and public safety.

4.5.1 Preliminary Transportation Mitigation Request

- 1) TGP shall provide a \$5 million bond to ensure that the town of Windsor will not bear the costs of repairs to roads and infrastructure resulting from construction activities by TGP.
- 2) Repair, replace or reconstruct all bridges or culverts to be crossed by trucks or equipment during construction.
- 3) Repair, replace or reconstruct all roads to be used by trucks or equipment during construction to meet the load requirements of those trucks and equipment.
- 4) Strictly monitor and adhere to load limits on all roads and structures during construction. A fine

schedule will be agreed to in advance for violations.

- 5) Detail the fashion in which at all times during pipeline construction, emergency access to all residences will be ensured. Provide not only for response by Windsor fire trucks and ambulances, but the paramedic ambulance from Pittsfield, and for mutual aid from departments such as Cummington, Dalton, Peru, and Hinsdale.
- 6) Provide the Windsor Select Board and Highway Department with a listing of all roads to be used during construction of the pipeline and the time frame in which they will be so in use. Provide the
- 7) Provide the Windsor Select Board and Highway department with a listing of any intersections or curves in roads that challenge the turning radius of large trucks.
- 8) Provide the Windsor Select Board and highway department with a schedule of road and infrastructure improvements and repairs.
- 9) Limit all work on roads and infrastructure to the hours of 7 AM and 7 PM, or sunrise to sunset, whichever is less, Monday through Friday.
- 10) Develop a traffic plan that minimizes detours.
- 11) Minimize the removal of trees along roads being repaired or reconstructed
- 12) Adhere to all local permitting regulations regarding trenching and construction, including those regarding wetlands.
- 13) Where road reconstruction is required, minimize the impact on the rural nature of the roads.
- 14) Where roads are reconstructed, ensure proper drainage, paying particular care to runoff to surrounding wetlands
- 15) After road construction, properly seed embankments to minimize erosion with non-invasive species approved by the Town.
- 16) After the completion of construction, any roads or intersections that were modified to accommodate wide turning radius vehicles will be returned to their prior state and any trees that had to be removed shall be replaced.
- 17) For the duration of the operation of the compressor station and during decommissioning, TGP shall bear the costs of repair and maintenance of Peru road as the access road to the compressor station site.
- 18) The pipeline will be sleeved at all road, stream and river crossings
- 19) After construction, TGP will post a \$5 million bond to ensure that the Town of Windsor shall not bear the costs of repair of damage to roads caused by the operation of the pipeline or compressor station or by TGP's failure to perform mitigations previously agreed to.

4.5.2 Preliminary Public Safety Mitigation Request

The Town of Windsor requests that the Commission ensure that (1) while construction is occurring, full access for emergency response is fully maintained with no decrease in response times, (2) TGP would conduct a full assessment of the training, equipment and supplies needed for emergency response to incidents involving the NED Project, during construction and continued operations of the pipeline and compressor station, as part of the NEPA process, and (3) that all impacted emergency responders have the capacity to respond appropriately to pipeline related incidents which might be reasonably expected. To this end, we request the following preliminary mitigation:

- 1) Require TGP to apply for and receive local permits for construction on in local roads.
- 2) Minimize use of open cut construction across public roadways.
- 3) Clearly identify any proposed locations where construction activities will potentially negatively impact emergency responses; specify whether impact is to constrict or to block access and the duration of such impact. Develop and implement a plan, agreeable to local emergency responders, to maintain

current emergency response levels of service during such constriction or closure. Provide an alternative emergency response plan for single access roads that must be closed during construction.

- 4) Meet with Emergency Responders in Windsor at least two weeks prior to commencement of any construction activity in the town to review plans and the construction schedule in order to coordinate responses; meet at least every two weeks with Emergency Responders while construction is occurring in Windsor to determine if there are adjustments which should be made.
- 5) Provide training and equipment to the Windsor Fire Department for responses to fires created by construction activities, assess existing materials and equipment available for them to respond to such incidents.
- 6) Provide the local fire department and regional Hazard Response Teams with list of hazardous materials which will be present during construction and operations; provide training to them on appropriate responses to incidents involving those hazardous materials; provide additional material or equipment necessary for them to appropriately and safely respond.
- 7) Require TGP to apply for and receive any local, county or state permits required for blasting or trenching.
- 8) Provide the Windsor Select Board with detailed plans for review and approval to protect well and river water supply infrastructure from damage or contamination due to pipeline construction and detailed erosion and slope stabilization control plans for all pipeline construction activities.
- 9) Require TGP to comply with local noise protection bylaws/ordinances and with State noise standards. Require TGP to monitor noise during construction measured from the nearest sensitive receptors and to immediately adjust construction operations as necessary to comply with approved standards with agreed upon fines and penalties at least equal to those of Mass. state regulations and statutes M.G.L.c 111§142B, 310 CMR §§.
- 10) Require TGP to comply with adopted Trench Safety requirements and permitting regulations.
- 11) Require TGP to provide detailed construction plans and specifications for all areas identified as being at-risk of slope failure during construction to the Windsor Town Select Board for review and approval prior to the commencement of construction.
- 12) Provide Windsor with funding to hire on-site construction inspectors to insure that all locally approved permits, plans and conditions are being met during construction and develop written agreements which give those inspectors the legal ability to enforce those permits, plans and conditions immediately.
- 13) Require TGP to enter into binding hold harmless agreements to protect the municipality from damages resulting from pipeline construction activities.
- 14) Require TGP to obtain load limits for all roads to be used during construction ensure that those limits are adhered to during construction.
- 15) Provide incident response plans and protocols to local and regional emergency responders for incidents that may require a response during operations for review and approval. Update those plans and protocols on no less than a five-year basis or more frequently if conditions or new information warrant such update.
- 16) Provide a binding protocol of inspections of signage and other measures to ensure that unauthorized construction or land disturbance activities do not take place in the pipeline corridor.
- 17) Require that TGP provide resources to Windsor to develop, on a voluntary basis, appropriate land use regulatory tools to reduce future land use and potential safety impacts within High Consequence Areas along the corridor. These might include modification of zoning regulations to restrict development areas within the pipeline right-of-way, or other appropriate measures.
- 18) Provide training to the Windsor volunteer fire department for responses to fires created by operation

activities, assess materials and equipment available for them to respond to such incidents, and provide training, materials and equipment which they lack which are needed to respond. This training and assessment should be conducted no less often than every three years.

- 19) Provide the Windsor fire department and the regional Hazard Response Teams with list of hazardous materials which will be present during operations of the pipeline and compressor station or as a result of pipeline cleaning or other activities; provide training to them on appropriate responses to incidents involving those hazardous materials; and provide additional material or equipment necessary for them to appropriately and safely respond. This training and assessment should be conducted no less often than every three years.
- 20) Require TGP to relocate public use areas and facilities from High Consequence Areas if requested to do so by the Windsor Select Board.
- 21) Provide local police and environmental police with training, equipment and supplies to respond to increased vehicular trespass from all-terrain vehicle and snowmobile use outside of landowner approved trails and pipeline crossing points and to enforce trespassing laws along the corridor.
- 22) Provide a binding protocol of inspections for slope failure and erosion along the corridor on an ongoing basis. Require TGP to reimburse any municipal expense needed to inspect, enforce and, if necessary mitigate or correct failures when creating an imminent threat or in the case of actual failure.
- 23) Require TGP to enter into binding hold harmless agreements with Windsor to protect the municipality from damages resulting from pipeline operations and potential incidents.
- 24) Require TGP to commit to staffing the compressor station 24 hours a day, 365 days a year to mitigate the issue of proposed driving time from the proposed monitoring location.
- 25) Require a maintenance plan that eliminates the threat of fatigue failure.
- 26) Require evacuation routes and emergency response plans for all roads crossed by the pipeline and potentially impacted by the compressor station.
- 27) Require an operational plan to reduce the possibility of a catastrophic failure of the pipeline or related facilities (compressor station, and main line valves), to minimize risk to the public resulting from catastrophic failure, and to ensure the adequacy and appropriateness of emergency responses to incidents.

4.6 PROJECT WIDE NOISE AND VIBRATION MITIGATION

As discussed in 3.6 above, Windsor expects this proposed project would have adverse impacts on noise and vibration levels. Given these adverse impacts we are requesting that the Commission ensure the proposed project avoids, minimizes, and mitigates to the fullest extent practical impacts of the compressor station and pipeline and its operations through the following preliminary requests:

- 1) Require monitoring of ambient noise for at the closest residential property line by an independent third party. This consultant would collect a week of L90 background levels at two of the residential locations during a period when we expect very light winds and low nighttime sound levels.
- 2) Using the ambient limit determined by the consultant as the baseline for construction and operation of the pipeline and compressor station.
- 3) For TGP acoustical analysis, require TGP to include a color-coded decibel contour map for the compressor station to determine the estimated compressor station noise contribution at each noise sensitive area.
- 4) Whereas construction activity can create high levels of noise, the Project should commit to only daytime, weekday construction, or if construction is done after 7 p.m. on weekdays, or at any time on Saturday or Sunday, that any construction activity must meet the operational noise limits set forth by the Commission and MassDEP.
- 5) Require TGP to comply with all local and state noise protection bylaws/ordinances. Require TGP to

monitor noise during construction measured from the nearest sensitive receptors and to immediately adjust construction operations as necessary to comply with approved standards. Any violation of ordinances will be met with a fine payable to the Town of Windsor within thirty days.

- 6) Monitor operational noise and vibration at the compressor station site. Minimization of noise and vibration to the maximum extent practical during operation. Immediately adjust operations as necessary to comply with approved standards.

4.7 PROJECT WIDE AIR QUALITY MITIGATION

As discussed in 3.7 above, Windsor expects the proposed project would have adverse impacts on the air quality during construction and during compressor station operation. Given our concerns about air quality, our preliminary request includes the following:

- 1) Require TGP to fully comply with the Massachusetts Clean Air Act (M.G.L. c. 111, §142A - §142M), Air Pollution Control Regulations (310 CMR 7.00) and receive all required permits.
- 2) Require all project related diesel equipment to meet current EPA Tier 2, 3 or 4 emission standards for new equipment, as applicable for each type of construction equipment and diesel particulate filters should be installed on all diesel-powered construction equipment to minimize inhalable particulates.
- 3) Monitor and manage construction related dust where it impacts residential areas.
- 4) Require TGP to fully comply with the Massachusetts Clean Air Act (M.G.L. c. 111, §142A - §142M), and Air Pollution Control Regulations (310 CMR 7.00) and receive all required permits.
- 5) During construction the Project shall be required to meet current EPA Tier 2, 3 or 4 emission standards for new equipment, as applicable for each type of construction equipment. In addition, the Project shall be required to install diesel particulate filters on all diesel-powered construction equipment to minimize inhalable PM.
- 6) All project-related diesel equipment shall be required to meet current EPA Tier 2, 3 or 4 emission standards for new equipment, as applicable for each type of construction equipment, and diesel particulate filters should be installed on all diesel-powered construction equipment to minimize inhalable particulates.

4.8 PUBLIC HEALTH MITIGATION

There are a multitude of public health concerns related to the construction and operations phases of the proposed pipeline and compressor station in Windsor. Many of the mitigation preliminary requests overlap with prior noted components. As previously stated and worth repeating, we are requesting that the Commission ensure that TGP avoid, minimize, and mitigate to the fullest extent practical impacts of the compressor station and pipeline and its operations on the health of Windsor residents and visitors. In particular, we are requesting that the Commission ensure: (1) TGP avoid, minimize, and mitigate to the fullest extent practical impacts of the compressor station and pipeline and its operations on the health of Windsor residents and visitors. This includes:

- 1) Establishing a protocol for blasting notification with agreed sanctions for failure to adhere to agreed protocol.
- 2) Establishing protocol for public and town-wide blowdown event notification with agreed sanctions for failure to adhere to agreed protocol.

4.9 CUMULATIVE IMPACT MITIGATION

As stated in 3.9 above, Windsor expects a negative cumulative impact of the proposed pipeline and compressor station that will have negative implications for our future. Given the concern about cumulative impact, we are proposing the following preliminary mitigation requests:

- 1) Windsor is committed to renewable energy. As such, we are requesting no lock out on renewable energy sources. Also in order to offset the negative impact of the compressor station and the pipeline

on the environment, we are requesting the establishment of a Windsor Green Energy Fund to be used to enhance renewable energy commitments as determined by the Town.

- 2) Post bond not only for typical construction risks, but in particular impact on drinking water, proper completion of road construction and for TGP's maintenance responsibilities during operation, right-sizing of roads oversized for the purposes of TGP construction unrelated to town needs, decommissioning of compressor station, and costs arising from environmentally damaging leaks or releases, fires, health expenses, or catastrophic failure of line or compressor station or of the power lines occupying the adjacent corridor.
- 3) Due to the expected cumulative effects, require TGP to conduct an alternative site analysis for the compressor station, preferably in industrially zoned sites or sites within a community that has existing industry and industrially zoned land. Ambient noise levels within the Town of Windsor are likely to be no higher than 20 dBA. Based on Massachusetts' laws and regulations, it is therefore anticipated that the Project will have to demonstrate compliance with a sound limit likely in the range of 27 to 30 Lmax. Further, it is anticipated that it may not be feasible to operate a compressor station of the proposed size with a sound limit of 27 to 30 Lmax. Alternative locations with higher ambient noise levels should be considered in order to comply with state laws and regulations.
- 4) If the compressor station is to be located and constructed within the Town of Windsor, it is imperative that the compressor station be constructed in such a way as to have the least impact as possible to the Town, its residents and visitors. Considerations should include:
 - a. The location of the compressor station, its profile within the surrounding landscape, its profile as regards wildlife impacts, animal and bird movement and behavior. Preferably, the facility will be not only completely enclosed, but largely below grade and bermed. Best practices in low impact facilities siting and construction should be drawn from general industry not just those used within the oil and gas sector.
 - b. The facility itself, its access roads, its security related structures, and its buffer should be landscaped so as to blend and meld with the facilities' natural surroundings.
 - c. Visual screening and sound dampening berms should, as well, be designed to meld with surroundings.
 - d. Eliminate or minimize the use of visible light in providing facility security. Best available shielded lighting to minimize blue light emissions or low light should be designed into the facility.
 - e. Minimization of noise and vibration to the maximum extent practical.
- 5) If the proposed compressor station or pipeline were expensed, we recognize that the impact may be greater. Given this we are requesting that in the event of expansion to the compressor the Town of Windsor enter into additional mitigation discussions with TGP.

Sincerely,

Town of Windsor Board Select Board

Timothy Crane

Douglas McNally

Appendix A: Statement on the Berkshire Regional Planning Commission

Town of Windsor Select Board 1890 Route 9 Windsor, Ma. 01270

In addition to the comments submitted herein, the Town of Windsor, Ma. has participated in the Pipeline Working Group. Through the coordination of the Berkshire Regional Planning Commission, the Pipeline Working Group, which consists of representatives from the City of Pittsfield, Massachusetts, the Towns of Cheshire, Dalton, Hinsdale, Lanesborough, Lenox, Pittsfield, Richmond, Washington and Windsor, Massachusetts, the Dalton Fire District, the Lanesborough Village Fire and Water District, Rensselaer County, New York, and the Towns of Nassau, Stephentown, and Schodack, New York has identified common impacts and requested mitigation measures related to the proposed pipeline. Those items are specified in comments submitted by the Berkshire Regional Planning Commission, letter dated October 15, 2015. The Windsor Massachusetts select board endorses and incorporates hereinby reference, the comments submitted by the Berkshire Regional Planning Commission.

RE: Docket No. PF14-22-000

Did you know that 850 New Ipswich residents signed a petition requiring our reticent Board of Selectmen to officially oppose NED? 850 is about how many residents typically turn out for a National Election!

We understand that FERC’s charter does not allow for American-style democratic participation in the petrochemical events that occur in their states and towns but you must regard that Kinder Morgan’s will opposes that of a clear majority. Since no one allows us a vote to govern our own destiny, please deny NED.

Thank you

Paul Stevens

20151016-5121

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First St. NE - Room 1A
Washington, DC 20426

October 15, 2015

Re: Docket No. PF14-22

Dear Secretary Bose,

Greenville NH, while geographically one of the smallest towns in the State, has a relatively large population (over 2100) relative to its size. It developed as an industrial village centered around the textile mills that proliferated throughout the northeast in the 1800's. As such, the housing is tightly clustered within the village district with a large majority of the population living within this area. The densely settled village district begins at the northwestern corner of the town slightly over one half mile downwind in a southeasterly direction from the proposed Kinder Morgan Market Path Mid-Station 4 compressor station off of Route 45 . The heart of the village district lies approximately one mile from the proposed compressor station; in this area lies a mix of closely spaced residences, businesses, churches , town offices , police, fire, and school district department buildings , as well as the large Greenville Falls housing complex for the elderly and disabled which serves the needs of not just Greenville , but the entire region as well .

The dense housing and business in Greenville precludes the possibility of private wells and septic systems , and these necessities are provided by the Town with a sewage treatment plant, and a reservoir situated in the Town of Temple. Greenville is unique in this regard in relation to the neighboring towns of Temple, New Ipswich and Mason which are not so densely settled and can rely on both private wells and septic systems.

The above mentioned reservoir is located approximately one half mile downwind in a northeasterly direction from the proposed compressor station. Moreover, the compressor station sits on land elevated above this reservoir, and which drains in several directions into streams which feed into the water supply. As mentioned previously, this reservoir supplies the only source of water for most of the Greenville residents and businesses, as well as the Temple Elementary School.

The densely populated areas of Greenville, as well as the municipal water supply, both located in close proximity to, and downwind from (the prevailing westerly winds that blow over) the compressor station , place Greenville at greater risk than surrounding communities from the toxic emissions. The less densely populated village districts of Temple and New Ipswich would be similarly affected when the winds shift to the south [for Temple] and the northeast [for New Ipswich] , a far less common occurrence .

In Summary,

The FERC should deny the placement of the Market Path Mid-Station 4 compressor station as sited by Kinder Morgan for the following reasons:

- 1) The compressor station location poses an inordinate amount of health risk to the most densely populated community along the pipeline route in this region. The thickly settled sections of Greenville are located approximately one half mile at the nearest point , to approximately one mile at the very center of the village to the proposed compressor station. This district contains a tight mix residences, businesses, churches , municipal offices (town hall , police, fire, district school dept. buildings) , as well as the large Greenville Falls Elderly Housing facility which serves the needs of the elderly and disabled throughout the region. The location of this district downwind from the prevailing westerly winds of this region places Greenville in a very vulnerable situation from the toxic emissions of the compressor station .
- 2) The location of the Greenville municipal water reservoir a mere one half mile downwind from the prevailing westerly winds , places what is the only source of water for the majority of both residences and businesses in Greenville (as well as the Temple Elementary School) at high risk from both air and surface contamination (the Temple Elementary School is also at great risk here from air contamination) . Moreover, the placement of the compressor station on land elevated above the reservoir, and which drains into streams feeding the reservoir, greatly enhances the danger of contamination of this water supply.

The Kinder Morgan Market Path Mid-Station 4 compressor station poses an unreasonable risk to the community of Greenville, and it would be irresponsible, and indeed unjust, for the FERC to approve its siting in light of the above mentioned conditions.

Sincerely,

Henri Vaillancourt
Greenville NH

RE: Docket No. PF14-22-000

It might interest you to know that the proposed Tennessee Gas / Kinder Morgan, New England Energy Direct (NED) pipe may not be so good for New Hampshire after all and here's why.

It was never intended for New Hampshire. It was intended for Massachusetts, but due to opposition, KM moved it north. So if it was not good for Massachusetts, why should it be good for New Hampshire?

We were told it will bring jobs. True, a pipeline will bring jobs to the region, but KM's claim of 3,000 jobs is a bit exaggerated. It's 3,000 jobs during peak construction, approx. 18-24 months

However, a good portion of them will go to specialized workers, like pipeline welding crews from Oklahoma. Alternatively, dollar for dollar, jobs in efficiency and clean energy could provide 36,000 jobs for the same investment. LiUNA union workers are trained for clean energy and weatherization jobs as well. Some have stated they would rather work in these fields if more of them were available.

We were told the gas is for New Hampshire, but if that were true, why was the pipe planned for Massachusetts? KM states that they have 0.5 Bcf/day in contracts, but the pipeline capacity is 2.2 Bcf/day, leaving 1.7 Bcf/day extra. So where is all that extra going? They do NOT deny that they will take export contracts and new export terminals are coming online in Canada. Furthermore, the only stated contracts in New Hampshire are with Liberty, a KM subsidiary. So is it right for KM to use eminent domain to take New Hampshire residents' land away (when most New Hampshire residents do not use gas) just so one company can sell that gas to foreign powers?

We are told that the pipe will lower domestic gas prices. However, the European market pays 2-4 times as much as US customers, and the Asian market pays 3-5 times as much. This can only drive up domestic prices.

We are told that new pipelines and gas-fired electricity plants are needed to replace the 8,300 MW of electric generation capacity that is being retired in the next few years. Ending the reign of nuclear, coal, and oil plants is a positive step, but replacing them with natural gas perpetuates dependency on fossil fuels and only gets in the way of renewables. Also, not all of the capacity retiring needs to be replaced with power plants. The cost of utility-scale solar has dropped 78% in the past five years, and renewables are now becoming economically competitive with gas.

Please, if you agree with the truth about the pipe, deny NED.

Thank you for your consideration

Thank you

Paul Stevens

RE: Docket No. PF14-22-000

Last December Kinder Morgan moved the Northeast Export Direct pipeline from a route planned through Massachusetts, up into New Hampshire.

They assumed that the level of opposition here would not be the same as in Massachusetts and forcing it through us would be quick and easy. They were wrong. The level of popular opposition has been higher than anyone ever imagined. Eric Tomasi of the Federal Energy Regulatory Commission admitted that the NED project has set a FERC record for the number of electronic comment filings and they have only begun to assess the number of conventional mailings, all against the pipe. This is more significant when you consider the fact that the electronic filing process on FERC's website is complicated and confusing and requires strict adherence to a 26 step procedure. It is not at all similar to posting something on Facebook or Twitter and requires a fair bit of computer savvy! It should also be noted that at one point, a FERC official actually suggested to opposition leaders that they stop filing comments for a while so that FERC staff can catch up!

We also noted that at a recent FERC "Scoping" meeting, a Kinder Morgan vice president, Allen Fore was seen with two rather burly and aggressive looking body guards. Yet at earlier meetings, he was unaccompanied. It is regrettable that he feels insecure, but clearly this too is indicative of the intense level of opposition NED and its sponsors are now facing. We are not surprised since so many people now fear for their own health with the thought of high pressure, explosive gas buried only three feet down throughout their neighborhoods. Just as bad, the compressor stations emit poorly regulated toxins and carcinogens into their otherwise clean New Hampshire air. Not to mention the continuous noise, light pollution and disconcerting, deliberate releases of precious gas during so called "blowdowns". A cynic could shrug and suggest that if they don't like it they should just leave, but with property values dropping precipitously, homeowners feel trapped.

The big issue is eminent domain. Most New Hampshire citizens, whether they believe in a marketed "energy crisis" or not, don't go along with the idea of the Federal Government usurping states rights, and taking people's hard-won land for a project that has little or no benefit for New Hampshire residents. Has anyone looked at our license plates recently?

Deny NED on popular and moral grounds.

Thank you

Paul Stevens

RE: Docket No. PF14-22-000

It is essential that citizens have a right and an opportunity to respond to this imposition upon our communi-

ties and to this insult to our self-determination.

We are told it will bring jobs. Northeast Energy Direct will bring some temporary jobs to the region, but Kinder Morgan's claim of 3,000 is exaggerated. Maximum jobs will be during peak construction, approx. 18-24 months. However, a good portion of them will go to specialized workers, like pipeline welding crews from Oklahoma. There will be one or two permanent jobs.

We were told the gas is for New Hampshire, but if that were true, why was the pipe originally planned for Massachusetts? KM states that they have 0.5 Bcf/day in contracts (which is questionable), but the pipeline capacity is 2.2 Bcf/day, leaving 1.7 Bcf/day extra. So where is all that extra going? They do NOT deny that they will take export contracts and new export terminals are coming online in Canada. Furthermore, the only stated contracts in New Hampshire are with Liberty, a KM subsidiary. So is it right for KM to use eminent domain to take New Hampshire residents' land away (when most New Hampshire residents do not use gas) just so one company can sell that gas to foreign powers?

We are told that it is a good idea that the pipeline should leave Massachusetts, enter New Hampshire for 70 miles then return to Massachusetts when New Hampshire uses 4% of gas in New England and Massachusetts uses 61%.

We are told this is a "brownfield" development. Kinder Morgan claims the pipe is "co-located" or "under" existing power lines. In reality, a 100 foot swath of forest, 70 miles (1500 acres) long will be clear cut alongside the power lines' right of way, doubling the width of the existing scar. Contrary to popular belief, families live year-round along this route and their wells will be adversely affected by all that blasting though the "Granite State". The power lines will provide a convenient ignition source for any leaks in the 30" dia, 1460 PSI pipe.

We are told that the pipe will lower domestic gas prices. However, the European market pays 2-4 times as much as US customers, and the Asian market pays 3-5 times as much. Demand from these markets can only drive up domestic prices.

We are told that a new pipeline and gas-fired electricity plants are needed to replace the 8,300 MW of electric generation capacity that is being retired in the next few years. Ending the reign of nuclear, coal, and oil plants is a positive step, but replacing them with natural gas perpetuates dependency on fossil fuels and only gets in the way of renewables. Also, not all of the capacity retiring needs to be replaced with power plants. The cost of utility-scale solar has dropped 78% in the past five years, making renewables economically competitive with gas.

We are often told gas is "clean" but natural gas is primarily methane and when burned, it still produces CO₂, albeit less than coal or oil. However, when released directly in to the atmosphere as in a compressor station "blow down", methane is 86 times a more "powerful" a greenhouse gas than CO₂.

Kinder Morgan, is a Huston based company, but has purchased memberships in various New Hampshire Chambers of Commerce in an effort to gain undue influence here.

Please do the right thing and deny NED.

Thank you

Paul Stevens

RE: Docket No. PF14-22-000

Good New Hampshire people do not use political clout to be exempt from the Clean Air Act. If my car fails an emissions test, I can't drive it until I abide.

I'm not allowed to dump benzene, toluene, and hundreds of other toxic chemicals into the ecosystem.

I'm not allowed to partake in an action that repeatedly makes people sick or cause them to die.

I'm not allowed to disturb the peace with a noisy party day and night.

You know the noise this equipment makes. You know the pollution and destruction and illness and death pipeline activities cause. Kinder Morgan stood before the Town of New Ipswich and said they cannot guarantee the safety of the pipeline and that accidents will continue to occur, including those that cause death. You have no right to expose me to that. Most large corporations no longer allow smokers to expose us to those hazards. Why do you think you can expose us to known carcinogens, neurological harm and other illnesses?

We saw videos of people who live near far smaller compressor stations than that proposed for New Ipswich and they say they have no peace day or night. They cannot use their yards and homes in a normal way. They cannot sell to move away from your destruction as the properties have no buyers. You know this, you know this, you know this, but you still continue to destroy and harm and even kill people through stress, illness and accidents. You take away their right to live a peaceful and happy life. That's a right. You have no right to take that away.

It is unconscionable to construct a compressor station next to that lovely Temple elementary school where the out-gassing will fall upon small children and their families. That school is also the emergency shelter for the Town of Temple. Is Kinder Morgan going to relocate the school? Is Kinder Morgan going to build an alternate emergency shelter for the residents of Temple? Or is Kinder Morgan and FERC going to move "forward" and put those children in harm's way?

The good people of New Hampshire don't deliberately put children in harm's way for the sake of profits. How can you think it's your right to destroy and confiscate what you want from others whenever and wherever you choose? Our ancestors did that to Native Americans. I thought we all agreed it was wrong to do that.

Massachusetts sent Kinder Morgan away so you just bumped the path up into New Hampshire and then stood before us and said you selected this path because it was in the best interest of the people of New Hampshire. Who writes these fairy tales? Kinder Morgan stood in the New Ipswich high school and told us NO ONE along the Southern New Hampshire pipeline route will get any of this gas. NO ONE. NO ONE. NO ONE. So it is not in the best interest of New Hampshire. The path was bumped up into New Hampshire for one reason: Massachusetts had the money and influences to kick you out of their state.

I have spent much of my life working very hard to keep the peace of my home and you have no right to stomp upon me and decide I am not worthy or entitled to keep what I have earned.

Kinder Morgan and Tennessee Gas look upon us as disposable pawns in the way of your search for a path of least resistance. We are not in your privileged circle of influence. We are a statistic --- you even told us because there is a lesser population density here you will be using a thinner pipe. You are not concerned with protecting us. You are seeking another way to increase corporate profits. If you were concerned, the quality of pipe would be determined by its use and the terrain and forces upon it, not how many people will be surrounding it. Stripping a path through Southern New Hampshire will alter the ecosystems and wetlands, exposing them to drought, encouraging forest fires, damaging our limited fresh water supplies, and essentially, destroying all we and those before us have struggled to protect and preserve for hundreds of years. Long before you gouged the earth for your private interests, smarter people chose to live with less to preserve and protect for future generations.

Draining our precious U.S. non-renewable energy reserves with such carelessness and recklessness is be-

yond reason. Selling off our resources and lives to overseas markets; that's what this is. HOW ROTTEN a thing to do.

Don't do this to good people - deny NED!

Thank you

Paul Stevens

20151016-5130

Ken Ziobrowski, Averill Park, NY.

I would like to take this moment to express my concerns about the proposed gas pipeline to be constructed across New York State but primarily in the Capital District. We currently live approximately 1 mile from the proposed site of a compressor station to be constructed in the Town of Nassau which is near Burden Lake. We have learned from attending informational sessions that there are serious health risks to individuals who live near a compressor station and the pipeline. The blasting involved with laying the pipeline can impact the drinking water that residents use from their wells and the gas that goes airborne from normal operation of the system which enters the soil and area lakes and streams. We strongly encourage FERC to disallow this gas pipeline as it poses significant risk to thousands of residents's health.

RE: Docket No. PF14-22-000

SAN BRUNO, CALIFORNIA:

On September 9, 2010 at 6:11 PM a 30 inch diameter buried natural gas pipeline operating at a pressure of 400 psia ruptured and burned in a single family estate home residential area in San Bruno, California. San Bruno is a southern suburb of San Francisco, about 2 miles from the San Francisco airport. The homes near the rupture location each had lot sizes in excess of one acre. San Bruno had the benefit of probably the best available municipal fire fighting capacity in North America.

There was a modest delayed ignition explosion followed by a large natural gas fire that persisted for more than two hours. Secondary fires continued for more than eight further hours. The fire scene was attended by 67 fire trucks, 4 fixed wing aerial water bombers and 1 fire fighting helicopter.

Aerial photographs showing the area that burned were compared to distance calibrated Google maps. In spite of the large amount of immediately available fire fighting equipment almost all the homes (38) within a 150 m radius damage circle were completely destroyed. A further 17 homes were severely damaged and a further 53 homes sustained lesser damage."

Why do you want this to happen to us?

Please deny NED

Thank you

Paul Stevens

RE: Docket No. PF14-22-000

The big issue is eminent domain. Most New Hampshire citizens, whether they believe in a marketed “energy crisis” or not, don’t go along with the idea of the Federal Government usurping states rights, and taking people’s hard-won land for a project that has little or no benefit for New Hampshire residents.

Another reason to oppose NED.

Thank you

Paul Stevens

20151016-5137

I am writing to register my strong opposition to the proposed Pipeline through Southern NH. How can it be allowed to take someone’s land? How can it be allowed to take Conservation land? I cannot believe this can happen here in our country and in our State of NH. This project will cause much harm to the people and to the environment. Please think of the lives, think of the years of people tending their land, think of the many people who have worked so hard and sacrificed so much to ensure areas of conservation. That this project can even be considered to be so crucial as to use Eminent Domain is insulting to all who will be affected. And the ability to disregard current Environmental regulations if they are a hardship to Kinder Morgan is unacceptable. Please do not allow this to happen. Come and visit this place and talk to the people and see the land. I implore you to say no to this project. You have the power to stand up for the rights of the people who cannot fight such a big corporation.. You have the power to save peoples homes, land, wildlife, and the ability to stop the constant destruction of our beautiful planet. May the goodness in you use that power to say no to this project.

Thank you

Judith Driscoll

20151016-5138

Clarks Chapel Road, Nassau NY

I live in a house built in 1850 on Clarks Chapel Road, Nassau NY.

I am submitting a comparison between two locations. The first location is Clarks Chapel Road, Nassau, NY. I have included pictures to demonstrate why Clarks Chapel is not a suitable location for the proposed Market Path Mid-Station 1 Compressor Station. The second site location is at Route 9 in Schodack, NY where the land parcel that is currently for sale, is significantly more suitable for the proposed Northeast Direct (NED) high pressure natural gas compression station proposed by Tennessee Gas Pipeline.

Proposed site at Clarks Chapel Road, Nassau NY:

Description of neighborhood character.

Narrow two lane road. Very narrow in parts.

Sharp blind Curves and rolling hills.

Large trees and wide variety of migratory birds, land and water wildlife.

The road is posted with a10 ton weight capacity.

Speed limit 40 MPH except where posted “Speed limit - Children at Play - 20 MPH.”

Existing Setting:

1. The area is Extremely Quiet at night – reflecting the Rural (NOT SUBURBAN) character.
2. The area has a Very Dark Night Sky. Houses or town roads DO NOT have significant levels of night lighting.
3. Air quality is very high and is not compromised by emissions from any industrial or commercial uses or activities.
4. This is a Historic neighborhood – several houses date from late 18th – to mid-19th century; and the Clarks Chapel Cemetery dates to this period.

Land use and zoning:

1. Zoning is “Rural Residential” – single-family residential and agricultural uses are allowed, and Industrial Uses like the proposed 41,000 horsepower gas compressor station are prohibited by Town of Nassau Zoning regulations.
2. Clarks Chapel is the home of small family farms with domestic animals, and organic homestead gardening.

Recreation Considerations:

1. Clarks Chapel Road is a principle component of regularly used touring routes of several Bicycle Clubs frequently involving dozens to over one hundred riders per day, due to the scenic character, lack of truck traffic, and low posted speed limit which creates safe riding conditions on Clarks Chapel Road. As referenced in the Town of Nassau Comprehensive Plan.
2. Clarks Chapel Road is a frequently enjoyed by pedestrians - walkers, joggers, including by groups of children, adults, and families including the elderly. The road is also enjoyed by groups of horseback riders. Heavy construction traffic and large vehicles associated with compressor station operation and maintenance activities are not compatible with these uses and activities.

Public Services:

1. Volunteer Fire Dept. – served by Hoags Corners Volunteer Fire Dept., station located several miles to the east.
2. No Town of Nassau police.
3. No public water supply- no fire hydrants.

Local Area Photo Documentation

Clarks Chapel Road - Saturday morning August 29, 2015. Heading East, in the order as the properties appear, starting at the Clarks Chapel Cemetery on Burden Lake Road Schodack for 0.3 miles to Clarks Chapel Road at the Town of Nassau line (proceeding 1.1 miles to end at Rensselaer County Route 15.

{photos omitted}

Local Community response:

- .03 miles from Burden Lake Road from Clarks Chapel Cemetery to Nassau Town Boundary
- 5 houses, 1 cemetery, and land parcels.
- 5 posted protest Signs against NED pipeline and compressor station.
- 1.1 miles Clarks Chapel Road beginning at Posted sign to juncture at Route 15.
- 15 houses + land parcels.
- 17 SIGNS POSTED IN OPPOSITION TO PIPELINE AND COMPRESSOR STATION.

It should be clear that the residents of the community most affected by the proposed compressor station are unanimous in their opposition to the unsuitable siting of this non conforming use, out-of-scale and noise and toxic substance-emitting facility in a quiet, rural, historic residential neighborhood setting.

{photos omitted}

The Rural Residential Setting of Clarks Chapel Road in Nassau should be compared to the suburban, highway commercial setting of alternate compressor station site located at US Route 9 in Schodack.

As noted in comments submitted August 29, 2015 by the Town of Nassau Natural Resource Committee:

“One potential area for siting a gas compressor station for the Market Path Mid- Station facility is in the vicinity of Market Path milepost 32.8 east of US Route 9. North of the existing TGPL 200 line there is a vacant, 60+ acre ‘Highway- Commercial’ zoned property (tax parcel 200.-9-6.11) currently available for sale with limited natural resource or land use constraints in an area that currently experiences significant noise and traffic levels due to nearby highways (I-90 corridor a short distance west; and with ready access from 1560 feet of site frontage on US Route 9). South of the existing TGPL 200 pipelines there is a reclaimed gravel quarry and apparently vacant area east of the existing gravel sorting and mixing facilities. Siting the compressor station at this location would not have land use impacts or require development of heavy access roads for construction and equipment deliveries, and existing noise levels are affected by traffic at NYS Route 9 and Interstate Route 90. Neither location in this vicinity is co-located with high voltage electric transmission lines. Both of these locations are near fire, EMT and police stations. And both of these locations would support development of TGPL pipeline on either the existing TGPL “200”-line right-of-way (the “New York Alternative”) or on the proposed electric transmission line route. These areas should be evaluated as suitable alternatives for siting of the proposed Market Path Mid-Station Compressor Station.”

The real estate listing for the Route 9 parcel notes the following: “Prime land for development - 62 acres, over 1500 of frontage - highly traveled road.”

Route 9 is a five-lane highway with 55 MPH speed limit posted, which is heavily travelled, as noted. The setting is affected by the noise of traffic on both Route 9, as well as traffic on nearby I-90, also heavily travelled. The nearby location of police and fire protection agencies makes this a significantly more secure and safe location in terms of th Zoning at the Route 9 sites is for Highway-Commercial: this represents a more suitable site in terms of land use and zoning compatibility. The FERC should require that these locations be compared in the Environmental Impact Statement.

{photos omitted}

The compressor station is only suitable at a industrial, commercial, or similar setting.

The EIS cannot find the proposed Market Path Mid-Station to be compatible in the Rural Residential Area at the proposed site on Clarks Chapel Road in the town of Nassau for all the reasons stated above and in the comments of the Town of Nassau and other residents of the area.

C. L. Niedringhaus

20151016-5139

October 15th, 2015

Docket #: PF14-22-000

To The FERC,

I would like to specifically know how the 30” high pressured fracked natural gas pipeline, being proposed by the Tennessee Gas Company, is going to address any energy crisis needs specifically of the residents in the New Hampshire towns that it will trample through. I am a resident of Merrimack New Hampshire, with no access to natural gas. Even if my home was heated through natural gas, this pipeline would be of no use to me, or anyone else in the town who even had natural gas. The reason being is that there is no infrastructure for it.

The Kinder Morgan representatives who have reluctantly and sparsely shown their faces in town meetings, have told the townspeople that our electric bills will be reduced significantly with the construction of this project, albeit with no proof or numbers to back any of their claims up. This seems like a blatant lie. They keep mentioning that Liberty Utilities, who is connected to KM financially down the line, is a buyer of some of the gas through the proposed line. I don’t see how that can positively effect our electric bill as almost all of our town, and the other towns that the pipeline are proposed to run, through get their electric

from Eversource. They have also mentioned that no one has even bought enough natural gas from the line, which in my mind questions why it would even be constructed. If there truly was an energy shortage, why isn't every drop of it sold and put to use here in the United States?

The representatives from Kinder Morgan have showed little respect to the people and the process from what I have seen at these meetings. They will laugh at comments, shrug and shake their heads, and then lie right to our faces and tell us that everything they want to do is to help us. They show up to meetings with completely changed maps, without notifying town officials. How can any residents react to the proposed changes when things are changed so swiftly without notice? At the last meeting they told us that even though the comment filing period with FERC ends October 16th, they plan to file after that. What kind of process is that to allow filing after the commenting period, to leave individuals and business with no voice to be heard.

Who deemed that there is an energy crisis for New England anyway? If there truly is a period of 2 weeks that we require more energy, who made the decision that fracked natural gas is the ultimate solution? I see more and more homes, commercial properties, and government buildings equipped with solar panels. These are becoming so much more available and efficient than building a pipeline. What happens when the number of people using this technology increases to the point where our electric needs are better met? With this solar market expanding and other renewable energy sources getting us to a point where a 14 day period during the winter deemed an "energy crisis" is no longer there, where will all the unused natural gas go?

Why would FERC allow a corporation like Tennessee Gas Company to take our land, use it for this private venture, so that they can export their product directly overseas? If the Tennessee Gas Company wants to get their natural gas to Europe so badly, let them do it through trucks and tankers. Just not at the expense of hard working, tax paying, American citizens' land. Allowing them to build this infrastructure, giving them permission to do whatever they want with it after they are done with natural gas through their eminent domain is crazy. In 50 years this infrastructure that will absolutely be outdated and then what? Who knows that else they will put through and with no one to hold them accountable for upkeep over that time.

The environmental impacts are overwhelming. Anyone with a watershed map can quickly identify that this proposed route is in direct conflict with an aquifer that supplies most of our town with their clean drinking water. For Kinder Morgan representatives to act like they didn't know this information and will have their people look into it is insulting. Any individual can access this information from a simple internet search. If they are not lying and they truly are unaware, then I cannot imagine the ineptitude of the supervisors and project managers on this project. This water is too valuable to our health to risk any unnecessary contamination through construction and transporting of this gas, that is loaded with unknown and unpublished proprietary chemicals. In addition when something happens, why is Kinder Morgan not legally forced to mitigate any problems? In addition to the water, there is air pollution emitted from meter stations, and compression stations. Who will be required to monitor this?

I do not see a need for this project to move forward. I would respectfully ask the commission to revisit every minor detail of this proposed project and ask, is this the right thing for the citizens of our country, region, and individual homeowners who will be the most affected. Let us move forward instead with energy sources that will truly enhance our way of life, and not detract from it.

Sincerely

Bert Priddle

Merrimack NH

Docket: PF14-22-000

RE: Aquifers

Dear Mr. Tomasi:

We require study of the aquifers affected, not just wells and springs merely within a certain number of feet from the pipeline, aquifers and compressor stations. It is well known that aquifers do not adhere to political, construction or property owner's boundaries for contamination kinetics of which we require study for the EIS or any filings by the Applicant.

An assumed mitigation by the Applicant to provide water "pigs" or tankards is useless in this area because of the extreme situations encountered. These situations include extended time of road closures ("the mountain" is also closed many times), and freezing conditions for water deliveries. The best scenario is a well and a well pump (either manual or electrical with backup generation -- some of Us have both) with a non-compromised well. Any mitigation of this type would be required to emulate the seemingly "infinite" water supply of a well under full discharge testing.

We require disclosure of all design inputs (well depths, topography, steep slopes, stereo aerial photography study of aquifers, ground penetrating radar, hydro studies, seasonal high water tables et cetera), measurement methodologies, outputs, models, source code, simulations et cetera, as the entire project directly encumbers the safety, socio-economic, real estate values and viability of the project. We require all of the above to be presented as part of the EIS or any filing from the Applicant.

If someone were to install a septic system, they would be required to dig a test pit to measure phenomena like seasonal high water, especially if near (or worse, in) an aquifer. Why does a pipeline project not comply with this basic need for study a-priori? Pipelines are known to artificially carry contamination or to connect disparate watersheds.

Please EXPLICITLY define in reports how compromised aquifers, private citizen's wells, municipal Reservoirs, School Children, Religious Institutions et cetera, benefits or is otherwise in the balance for the convenience (and seeming public "need") of someone in a far remote city to turn on their "gas log" installed in their fireplace, by flick of switch, that ultimately sucks more heat out of the domicile in exchange for ambiance... This creates demand despite squandering of gas. Some towns in Massachusetts are known to have 30 year-old leaks not fixed.

The above is practical experience and empirical evidence of direct impact that the Applicant has failed to address in their overbroad resource report filings that actually has little to do with the area proposed for development. If the Applicant (Kinder Morgan or Tennessee Gas Pipeline Company) knows so little about the area of development and so little about their own project, then how can their investors be certain of a return?

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack
"Davis", NH

20151016-5141

Docket: PF14-22-000

RE: Corrosion Protection Systems

Dear Mr. Tomasi:

While some of this may fall under the DOT or 49 CFR 192, it is highly suspect, if not illegal that activity related to the NED project would test some "driveway plow sand" that melted from a snow bank at the end of a driveway to determine soil conductivity for possible representational design of any cathodic protection system.

Yes, we have witnessed apparent field studies where probes were used at the end of a driveway to measure soil properties (and not near or in the actual so-called "co-location" are for the NED project). Please note

that this is a perfect way for entities to lose their licensure. We are concerned for these entities and Kinder Morgan (or Tennessee Gas Pipeline Company).

Notwithstanding, we require a study and report of how the Applicant arrives at their design for cathodic protection (amongst other TBDs) before this project can be convenient or satisfy any alleged need, given all design inputs, soil measurements and their methodologies, other measurement methodologies, outputs, models, fall of potentials, impedance measurements, system proposals including rectifier amperages (inclusive of electrical noise signals), spacing for test coupons, source code, simulations, inductive and capacitive coupling, MSDS of conductive coke, maintenance plans with measurement methodologies, et cetera, as the entire project directly encumbers the safety, socio-economic, and viability of the project for investors. Denial of survey is not an enabler for any exclusion.

Also, please be advised that the electricity utility company in New Hampshire does not own much of the property that their power lines run over; they have easements given by the private citizen land owners from “back in the day” (the 1960s) of which many of the current land owners may not have been the originators of such easements given.

Many of the utility poles adjacent to the incompletely specified NED project are buried down to SEVEN feet below grade (frost line considerations), yet 49 CFR 192 or other sentiment from the Applicant does not include these basic requirements for the region, which contradicts by law LICENSED professional engineering REQUIREMENTS (licensed for liability and protection of public safety, engineering fiduciary economic success for project longevity and investor’s return on investment). Regardless if the pipeline is “warm” or even “hot”, any outage or blowdown/blowoff (adiabatic cooling) would allow cooling and frost heaving to compromise and undermine outer coatings and cathodic protection. In other words, 49 CFR 192 in its current form, cannot contemplate the requirements that are preempted by law of licensed professional engineering coupled with the unique requirements of New Hampshire (and aspolitical boundaries do not yield to nature or physics, many parts of Massachusetts and New York are also included with these scenarios).

The above is practical experience and empirical evidence of direct impact that the Applicant has failed to address in their overbroad resource report filings that has little to do with the actual area proposed for development.

If the Applicant (Kinder Morgan or Tennessee Gas Pipeline Company or their agents, representatives, assigns or contractors) cannot measure soils properly, nor do they know much about their own project, how can they ensure their own project success for their investors and the public convenience to satisfy any conflated or erroneous need?

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack
“Davis”, NH

20151016-5142

Docket: PF14-22-000

RE: High Consequence Area in New Hampshire

Dear Mr. Tomasi:

The pipeline as proposed by Tennessee Gas Pipeline Company is slated to be the “thinner” schedule of pipe for a low area of consequence as allowable in a rural area. As such, if there is an “incident” there will be, alleged, low collateral damage and fatalities due to lack of households nearby, coupled with economy and cost savings for the purveyor of the pipeline construction and convenience, despite close proximity to homes.

However, one overlooked fact: Power line 379 for purported and alleged “co-location” by the Applicant in New Hampshire, connects 100,000s of people, merely tens of feet away from an incident zone, to electricity service in New England and New Hampshire specifically. This is a single point failure with a double failure

(double jeopardy) if there is a gas pipeline “incident”. In aeronautical engineering (or any other engineering), single point failures with this amount of double jeopardy is a SEVERE risk despite business objectives and simplistic views of “drawing a crayon mark” on a map seemingly “willie nillie” under the guise of “co-location”.

This line 379, is one of only three major transmission power lines for the entire Western portion of the State of New Hampshire and the New England Grid for Vermont and Western Massachusetts. Grid simulations show obsolescence with massive demise and failure of model convergence (blackouts), perhaps given reactive loads and lack of capability for ring loops for scenarios with this transmission line. Current utility upgrades on this line are irrelevant and does not preclude this adjacency (or alleged and erroneous motif of “co-location”) from single point failure conflict. More apropos alternatives and their analysis is required and to be included in any future filing by the Applicant.

This area is not low consequence!

It is a high consequence area by proxy, and by wire, merely feet away. As such, failing any alternative routes, the pipeline Purveyor is REQUIRED to install the most robust, high consequence area pipe schedule available for the ENTIRE run of the incomplete NED project in New Hampshire where the Applicant has specified erroneous co-location.

US Census data may indicate this area of the Monadnock region of Southwestern New Hampshire to be rural, especially when considering very little “boots on the ground” (rather mostly desktop endeavors apparently executed by the Applicant); think of the area as a large subdivision with larger road frontages and houses set back from the road with still many conveniences in short driving distance.

Indeed a nearby “incident” in the Monadnock region of New Hampshire would wreak havoc to many of the cultural, historical, infrastructure, family economic and religious centers of this area.

Since Eversource (formerly New Hampshire’s Public Service) does not own most of the property that the line 379 and 380 traverses, it would not be available other than through eminent domain taking of the private land.

Regardless of rural thresholds by seemingly what We may consider inaccurate Federal classifications, it is still only a 27 second walk to borrow a cup of sugar from a neighbor to bake delectable cookies, buns and muffins in some of our wood-fired ovens, but only due to road frontages measured in hundreds of feet betwixt driveways. It would seem that Federal classification for “rural” overlooks this basic community closeness. It is amazing that We have lived here for centuries without natural gas or need thereof... Interesting the fact: that some of our towns in New Hampshire are older than the United States of America, and before the advent of pipelines.

If we are so rural, how is it that public comment for this project has exceeded prior FERC public response records? Per capita, it would seem that this is significant compared to other projects FERC has contemplated in the past...

The above is practical experience and empirical evidence. While Kinder Morgan SEC (Securities and Exchange Commission) and investor statements (forward looking or otherwise) note that Kinder Morgan may be sued from time to time it is questioned: how does a single point failure listed above with double jeopardy destroy investors’ return on investment?

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack
“Davis”, NH

20151016-5143

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission

October, 15, 2015

888 First Street, NE, Room 1A
Washington, DC 20426

RE: Tennessee Gas Pipeline Company, LLC, Docket # PF14-22-000 NED Project

Dear Ms. Bose,

I am a resident of West Townsend, Massachusetts, directly on the path of the current, so-called 12” Fitchburg Lateral (Tennessee Gas/Kinder Morgan Northeast Energy Direct, PF14-22) and on the previously preferred path of the main, high-pressure pipeline and compressor station site. I am opposed to the building of NED and urge a NO BUILD decision because:

- Need has not been demonstrated
- A number of other alternatives including conservation, leak remediation, and both fossil-fuel based and renewables can address infrequent, seasonal capacity short-falls
- The potential for unprecedented destruction of waterways, state forests, farmland, private wells, personal property in the name of gas, the majority of which will be exported, can hardly be considered for the “public good.”

I urge FERC to consider the following inputs, which I would hope would lead FERC to conclude that the NED project should receive a NO BUILD decision:

- Combine review of the 5 currently separate projects bringing natural gas to New England to ensure that there is no redundancy – Tennessee Gas/Kinder Morgan, CT Expansion, Tennessee Gas/Kinder Morgan Northeast Energy Direct, Spectra Atlantic Bridge, Spectra Access Northeast, and Portland Natural Gas C2C Project
- Consider the results of Massachusetts Attorney General Maura Healey’s study to quantify how much gas capacity is needed for electricity generation through 2030 which should further demonstrate whether new pipeline capacity is needed or not.
- Consider whether additional investments in repairing widespread and long-standing distribution system leaks would affect gas capacity need.

Should FERC green light the NED project, I request that FERC require Kinder Morgan to address all of my concerns regarding the project’s impacts to the environment and the monetary impact to my private property in the draft (DEIS) and final Environmental Impact Statements (EIS).

Air Quality

Please require a comprehensive assessment of the air quality baseline pre-construction and impacts from the operation post-construction of the NED pipeline. This assessment should be conducted from multiple locations in Townsend, which is directly on the pipeline route, as well as from all towns in Massachusetts, as we know that gas emissions are not restricted to the initial points of emission. These assessments should include data on:

- The composition of the natural gas that will flow through both the main pipeline and the Fitchburg lateral pipeline
- Data on the frequency and duration of blow-down events – accidental, emergency, and scheduled as part of maintenance events
- As noted above, the study should include a comprehensive dispersion modeling study to demonstrate potential air quality impacts prior to construction and observed air quality impacts post construction for locations “downwind” of the main pipeline and Fitchburg lateral. This study should consider prevailing wind directions in each of the 4 seasons, different times of day, and all types of typical meteorological conditions such as rain, inversions, hurricanes, etc.
- Impact of heavy construction equipment emissions/dust and plans to remediate both during construction phase and any access needed for preventive maintenance

- Please also address, through quantitative data, how construction and operation of the NED main pipeline and Fitchburg lateral will adhere to Greenhouse Gas Emissions regulations.

Odor impacts

Similarly, please require release of information regarding anticipated odors (nuisance or otherwise) that are anticipated during construction, operation, and blow-down events. Please require a comprehensive baseline assessment of odors pre-construction and impacts post-construction of the NED pipeline due to pipeline operation as well as that caused by heavy equipment usage.

Noise impacts

Please require a comprehensive assessment of the noise quality baseline pre-construction and impacts from the operation post-construction of the NED main pipeline and Fitchburg lateral. This assessment should be conducted from multiple locations in Townsend, which is directly on the pipeline route. These assessments should include data on noise levels:

- During construction including truck and other equipment traveling on Townsend roads
- During normal operation
- During preventive maintenance and blow-down events
- During accidental releases
- During emergencies

Water impacts

The Fitchburg Lateral will require drilling and construction in close proximity to the Vinton Pond and Willard Brook state forests as well as the Townsend public water supply and numerous residential private wells. Please require a comprehensive assessment of the water quality and quantity/flow baseline pre-construction and impacts from the operation post-construction of the NED main pipeline and Fitchburg lateral. This assessment should be conducted from the municipal water supply, all private wells within 5 miles of the pipeline, and the State Forest waterways. Post-construction assessments should be conducted on a quarterly basis to ensure that our water supplies remain unaffected and uncontaminated.

Should post-construction testing indicate contamination, Kinder Morgan should describe in detail how they will eliminate the contamination and allow residents to once again use their wells. Periodically trucking in bottles of water should not constitute acceptable remediation.

In addition, KM must provide details on the sources and volume of water to be used for hydrostatic pressure testing of the pipeline as well as means for water disposal and quality testing to determine how the water has been contaminated.

Property Value Impact

Studies have shown negative impacts to property values, difficulty in selling, and difficulty in getting/keeping property insurance for residents located near pipelines. Kinder Morgan should be required to provide fair market value compensation to property owners in Townsend within 5 miles of the pipeline for all of these downstream consequences.

Protected Open Space, Wetlands, and Endangered Species Impact

The Fitchburg lateral will impact significant environmental resources including farm land and protected state forests. Please consider the cumulative effects of construction and post-construction damage to permanently protected open space, rare and endangered species and their habitat, and natural and cultural resource areas.

Thank you for the opportunity to share my views and for FERC's thorough consideration of my concerns and issues with the NED project.

Sincerely,
Laura Holly
14 Old Battery Road
West Townsend, MA 01474

20151016-5144

Susan C Murray, East Hartland, CT.

As a resident of Hartland, CT I strongly oppose the TN Gas/Kinder Morgan proposed installation of a natural gas pipeline through the MDC Class I and Class II watershed lands and private lands.

At this point of time, while early in the review, deeper study should be focused the necessity of the entire project, if Class I and II watershed land can be taken by eminent domain and future impacts of setting this precedence and if there may be alternates with lesser impacts.

I believe high quality drinking water is the most important service for the people of this country and should not be mitigated or at risk for a new pipeline.

I appreciate greatly FERC review of comments and holding off approving the current proposal.

20151016-5145

Docket: PF14-22-000

RE: Compressor stations with horsepower ratings are power generators

Dear Mr. Tomasi:

Please note: Compressor Stations proposed by the Applicant are power generation stations. They generate horsepower in which 1 horsepower is 745.69987158 Watts of power (about 746 Watts of power).

For example, a 746 Watt (electric) toaster oven would be a 1 horsepower toaster oven. A 200 horsepower car in America, identically sold in Europe would be required to be stated as a 149,139 Watt (149 kilowatt) car; only recently has Europe allowed horsepower to be listed as an ancillary unit of identical measure for power. A 746 Watt solar photovoltaic electric generation panel IS a 1 horsepower solar panel.

This is identical power: 41,000 horsepower is 30.5 megawatts.

This is also identical power: 80,000 horsepower is 59.7 megawatts.

As such, all compressor stations must be required to be sited and permitted as they are power generation stations. They have identical fuel and exhaust inputs and outputs as a power generation station sited by these same requirements. In fact compressor stations (as proposed herein) are undoubtedly worse in efficiency than more efficient “combined cycle” (like Organic Rankine cycle or other Carnot cycles) power generation stations with identical fuel and exhaust paradigms.

Notwithstanding, compressor stations that will be generating their own electricity to provide power distribution for communications, lighting, or active cathodic protection devices are power generators. Compressor station powered cathodic protection systems forcefully distribute power (power distribution) onto the very low impedance (high current flow and significant power) pipe and anode/cathode systems; as such they generate electricity.

The above is practical experience. For your convenience, the word power has been underlined for reference. Power is a known physical quantification in physics and engineering and is useful.

Please indicate to the Applicant or EIS purveyors that study of a power generator at their proposed locations is required, coupled with all EPA, EIS discovery of ramifications to safety, environmental impact, with surrounding socio-economic issues of reduced real estate value, businesses being put out of business (see also FERC accession number 20150831-0052), et cetera.

As always, please feel free to reach out to us for further questions.

Our Best Thanks,
Chris Mack
“Davis”, NH

20151016-5146

Docket: PF14-22-000

RE: Economic HUB Zone

Dear Mr. Tomasi:

The Federal Small Business Administration (SBA) has recently declared the towns of Sharon, Temple and New Ipswich, all within New Hampshire as an economically disadvantaged HUB Zone.

This HUB Zone is listed under the town of “Davis” New Hampshire, which may be clerical error, however, there is a Davis Village section of New Ipswich in this greater area and “Davis” is listed within New Ipswich town maps just outside the door of the New Ipswich Board of Selectmen’s meeting that We attended recently. Notwithstanding, the SBA map clearly indicates Temple, Sharon and New Ipswich as this HUB Zone.

We require for study, presented within the EIS, the socio-economic impact (and safety) of a Pipeline and Compressor Station within this already economically depressed and impacted HUB Zone.

New Hampshire is UNIQUE in that does not have an income tax, nor a sales tax when compared to many other states (we do have a room and meals tax however, mostly for tourist business income motifs for the State, coupled with other basic business and payroll taxes). This provides different socio-economic analysis paradigms indeed!

Correspondingly, New Hampshire’s income is mostly concerned with real estate tax based upon the value of the home or building, which is disproportionately high -- to wit, the tiny town of Greenville, NH (used to be “downtown” Mason, NH) next to New Ipswich and Temple, NH, up until a few years ago, had THE HIGHEST REAL ESTATE TAX RATE IN THE ENTIRE UNITED STATES OF AMERICA!

When a real property decreases in value for New Hampshire, it DIRECTLY means less revenue to the town, and ultimately to the county and to the State of New Hampshire. While the purveyors of pipelines tout that they have not seen decrease in real estate values, there is now precedent in New York of this very scenario in plethora.

When there is less revenue in a town, the tax rate should (or will) go up inclusive of assessment differentials betwixt proximity bound real property to compensate for loss of revenue (schools and towns need their budgets satisfied), especially for other properties not directly encumbered by a location in proximity to a pipeline or compressor station. The pipeline or compressor station could make prices go up! This is common sense yet is profoundly contrarian to current marketing (yes, marketing and sales material) mantra by Applicant(s).

It is further known that apparent eminent domain takings are possibly fraught with nondisclosure agreements to seemingly hide decreased value in real estate due to pipeline purveyance.

It may be of interest to folks like Kinder Morgan or Tennessee Gas Pipeline that the information of property bought and sold in New Hampshire has its price fully disclosed in the public purview by way of the tax stamps, which appear on every deed of real property sold in the State of New Hampshire. The purchase or sale price cannot be occluded from the public regardless of nondisclosure agreement.

This pipeline, if foisted upon New Hampshire despite lack of apparent need, should have massive economic impacts for revenue to the State in the Counties where more than 1/3 of the population lives.

Perhaps an overly simplistic model can be shown below (yet allowances for accuracy increase are demonstrated and available):

From The New Hampshire Public Utilities presenting before Docket DG 14-380: because the NED pipeline

is directly and explicitly encumbered by Liberty Utilities' Settlement Agreement before the PUC, we present another way to approach a calculation of how the Liberty Request affects NH... Kinder Morgan / Tennessee Gas Pipeline (KM/TGP) references US Census data in their recent resource report. The US Census data median household price for Hillsborough and Cheshire county in New Hampshire (the Counties), where 1/3 of NH's population lives is: \$249,900 and \$195,400 respectively, averaging out to be \$ 222,650.00 per household across the Counties. The KM/TGP NED pipeline project has 235 property owners, in July (Source: FERC), using denial of survey (despite there may be some 820+ properties needed by eminent domain and proposed agreement). Denial of survey is used by New Hampshire (and Massachusetts) property owners to prevent KM/TGP from collecting property survey data including trespassing (which has been anecdotally violated numerous times to date; hence the seemingly erroneous responses of so-called eco-terrorism in the region). This typically renders the property as a candidate for eminent domain condemnation for new ROWs (there is no "co-location" as conflated by KM/TGP) if the property owner is unwilling to negotiate with TGP/KM; as is self-evident for denial of survey. This does not account for all properties indirectly affected. However, for sake of argument:

235 properties x \$ 222,650.00 (median household price) = \$ 52,322,750.00 of encumbered real estate median value, instantaneously. Over a 24-year period, as used by Liberty for their analysis purposes: \$ 52,322,750.00 x 24 years = \$ 1,255,746,000.00 of perpetual encumbered real estate median value (about \$ 1.3 Billion; neglecting time-value of money) There is new precedent that will most likely parallel case law, where real estate can lose up to 50% value due to compressor stations or pipelines. KM/TGP will argue that there is no loss in real estate value due to their infrastructure, yet the precedent has already been set as described. Let us assume a 40% real estate value loss (instead of the 50% above), to be conservative and to the benefit of Liberty and NED pipeline project: \$ 1,255,746,000.00 x 40% = \$627,873,000.00in lost median real estate value for the directly encumbered New Hampshire properties due to pipeline or compressor station implementation in this model. This does not include peripheral and collateral real estate losses in towns or properties not directly encumbered, but are in abutting or adjacent proximity to, the pipeline or compressor station within the so-called incineration zone. Incineration zones, pollution, noise, or areas of consequence do not adhere to political boundaries. Also, using the same model above, but with median family income from US Census data for the Counties renders \$ 955,375,747.20 of encumbered median family income over 24 years. These encumbered families' homes will typically be "under water" (if they are not already). Residents have expressed exact sentiment to walk away from their mortgages and property, if the NED pipeline is approved (of which Liberty could surreptitiously have a hand in doing so with this Agreement). This could remove \$955,375,747.20 from the local economy (or even if a significant percentage thereof) for abandoned property in the so-called incineration zone and further; with a makeup of increased taxes for other non-encumbered properties, elsewhere in the towns due to minimum tax base requirements to support the schools, bonds, town services et cetera. This resident exodus sentiment has been beleaguered on WMUR and NH1 news media

outlets. Let us also consider this model: Kinder Morgan / Tennessee Gas Pipeline Company could typically offer about \$1 per inch diameter per linear foot of pipeline imposed upon a landowner's property. So, about \$30 per linear foot... as run over, say, 50 feet of property, the burdened landowner would receive a one-time payment of \$1,500 in this example. This is considered income, that the landowner must pay taxes upon, coupled with the burden of still paying property tax for precluded property in their ownership while the Pipeline Company reaps profit and benefits; in perpetuity for this model. Additionally, it is in every business' best interest to lower their costs and reduce tax payments, especially when beholden to their investors. As such, it is typical that pipeline companies file for, and typically win, a tax abatement. Also, infrastructure assets depreciate, reducing the amount of tax revenue for a town (and county, and state), every year. The loss in local economy and tax revenue to the towns due to real estate and pipeline abatement losses, then the remaining tax portion contributions to the Counties, and ultimately the State would be immediate for the first year and perpetually diminished thereafter. Because the State of New Hampshire is sometimes characterized as being "broke" this could potentially trigger the immediate need for a broad-based income and sales tax to account

for the shortfall; and political suicide. The above, while simplistically calculated, outweighs the so-called “[unneeded] NED [export pipeline] is cheaper by \$537M than any other [forceful taking of massive amounts of land] competing project” motif denoted by Liberty following similar methodologies from the seemingly incomplete Liberty SENDOUT analysis compiled over the 24 years.... Even if numbers presented herein are factored by large percentages to sway results in either direction (to simulate a more precise modeling contingency), the socio-economic trend is still alarming! Coupling this, with the knowledge about the other pipeline expansions and projects available today or soon, it renders the NED pipeline as superfluous and unneeded but still at rate payers’ risk (whether through electrical bill tariff, export global market competition, or over-provisioning / surplus gas with infrastructure and stranded costs, and so-on).

Please note that the Temple Elementary School is part of 9 towns that are not directly encumbered by the proposed NED Project (except that the ENTIRE State is likely encumbered by proxy). However, whatever financial situations happen for nearby Temple tax or revenue concerns likely will severely impact these 9 other towns and the school system; inclusive of EIS socio-economic situations for study. As such, the purview of the EIS must be expanded to include this scenario. Please be advised that the Conval school district spends about \$17,000 (more or less) per student, even though we may be so-called rural, perhaps it could be considered that we are affluent as well (and the Temple Elementary School has obtained some of the highest NECAP test score in recent times regardless – we have sharp kids that know HOW TO READ and understand the issues confronting them). We require further study including financial ramifications for the 9 towns of Conval (far away from the pipeline). It is interesting to note that \$17,000 per student (every year in Conval) is almost half of the average student debt for a 4-year college degree in New Hampshire.

The Northeast, especially New Hampshire is already economically disadvantaged due socio-economic issues NOT related to energy. Younger generations are leaving New Hampshire in droves, due to the expensive real estate costs. Businesses are closing because they cannot find qualified workers and the average commute may be an hour or more also due in part to lack of affordable workforce housing (an issue that will be massively problematic for pipeline construction). This is data compiled by statisticians for our State and is known. Please be advised that pipeline construction typically does not create many local jobs, despite recent developments of Kinder Morgan with a local union far away from Western New Hampshire. We are supposed to be “rural” after all, which means very few people are available for (skilled or otherwise) work, especially given that local companies have closed (for example in Weare, NH) due to these socio-economic and real estate issues with lack of workers living nearby... Unfortunately, many pipeline jobs are flash-in-the-pan temporary, as such, many are imported due to skills required that are massively-in-proportion not available here; we do not have many skilled pipeline workers here in our (rural or otherwise) area(s) apparently.

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack

“Davis”, NH

{graphic omitted}

New Hampshire’s businesses are leaving due to other pressures not related to the cost of electricity; New Hampshire’s industry is not steadily increasing. While wholesale electricity costs have gone down, electric bills have skyrocketed with failed infrastructure project costs and other financial wrangling being foisted onto customers.

20151016-5147

Docket: PF14-22-000

RE: Electromagnetic Spectrum Study

Dear Mr. Tomasi:

We require a study of the effects of the incompletely proposed NED compressor stations (especially for, but not limited to, New Ipswich, NH) and pipeline with the electromagnetic spectrum in our areas of proposed operation.

JUSTIFICATION: For the same basic physics, it is well known phenomena where electromagnetic spectrum is affected by dissimilar densities of air caused by heat, exhaust, or methane (and other chemicals) which is also identical for compressor stations and pipeline operations if not exacerbated further due to the massive size of compressor stations proposed by Applicant(s). Further the issue is aggravated for plasmatic incidents or “fire balls”, for example also during nontraditional events or incidents (exempli gratia, during a gas release or fire scenario; regardless if force majeure).

By way of example (but not limited to), during our last ice storm, with 14 days of no electricity service, We relied on television (and a backup generator, including for well pumping of water) as our means of emergency situational awareness and communication. During this time we received a class B NTSC signal due to adverse propagation effects in the affected area; the area surrounding the proposed New Ipswich Compressor Station.

Of course, NTSC has been supplanted with vestigial sideband of an 8 pattern constellation, i.e., digital TV VSB-8. VSB-8 is extremely sensitive to multipath phenomena, in Our personal and professional experience, as is additionally found empirically with weather (and especially causes listed above) in our practical experience.

Mitigations of installing cable TV service for the entire town(s) is deprecated as such, the entire cable TV physical plant (and Ma Bell copper phone plant) on utility poles was relegated to the forest floor and inoperable during the recent ice storms, in some areas for 30 days (of no cable TV, telephone or cellular telephone service -- cell towers lost their battery backups after 2 days).

The above is practical, experience and empirical evidence. We require the Applicant or EIS purveyor to study the issues presented herein in their engineering design, Applicant filings and the EIS with resulting impact for public safety or other impacts. The above, happens with significant frequency and has been our experience three times in recent memory.

Please include all source code, modeling and measurements with methodologies employed. Please provide model calibration techniques where appropriate. Please indicate modeling

methodologies employed, exempli gratia, stochastic non-deterministic algorithms or genetic algorithms, Newtonian methods of moments, finite element analysis et cetera.

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack
“Davis”, NH

20151016-5148

Docket: PF14-22-000

RE: Inversions

Dear Mr. Tomasi:

We spoke once recently of Inversions in the atmosphere in Temple and New Ipswich, NH (part of the Monadnock region of Southwestern NH). Inversions are empirically observed frequently due to our topography in the entire Monadnock region (towns West of Milford, NH and Wilton, NH in the purview of the encumbered and deficiently specified NED project).

Per the requirements of, “Comments on the July 24, 2015 Draft Resource Reports” from the Federal Energy Regulatory Commission, Office of Energy Projects, Question 19, (Table) “Air Quality - Operation”:

Provide an inventory of proposed and reasonable foreseeable air emission sources within 50 kilometers

of the compressor stations, documenting their location, distance from the proposed project, estimated or permitted emissions for each criteria pollutant in tons per year and identify the potential incremental cumulative impacts of the Project. This does not include greenhouse gas emissions.

Empirical observation includes smoke “hanging” in the air approximately 35 feet above ground for the myriad of wood and pellet stoves in use for the Monadnock region (emission sources within 50km) during frequent times of inversion. It is required that wood pellet stoves have far less particulate matter than any compressor station known to date.

If this smoke (from emission sources) can hang in the air, then down the street from these households, a compressor station, next to the previously discovered and disclosed Reservoir, Religious Institution quiet retreat house, Temple (grass fed, to be organic) Beef Farm, Temple Elementary School, et cetera, would be deleterious... We require study of this; we do not have the resources to study these deleterious effects. We require the children in Temple Elementary and surrounding towns to be baselined for study, inclusive of distraction (e.g., noise from a compressor station, inclusive of infrasound), educational baseline performance, and health baselines previously described.

Please indicate methodologies for modeling and model calibration, correlated with past performance using baseline measurements in the area for all seasonal and intra-seasonal variances. Baseline measurements must be completed for three years as is also, by way of example, Kinder Morgan’s safety record also compiled over three years.

Tennessee Gas Pipeline Company states in their resource report, that any gas (or perhaps even exhaust) released into the atmosphere dissipates quickly. In a perfect world perhaps, but the briar patch of the Monadnock region is far from a perfect world.

This issue will be massively exacerbated by the tons of exhaust, or particulate matter, Hazardous Air Pollutants (HAPs), et cetera, from a compressor station. This renders the requirement (whether through FERC precatory language, DOT, EPA or other agency) for any compressor station to shut down (inclusive of blowdowns or blowoffs) and cease distribution of fracked gas until the inversion for these frequent events (that can last up to 3 days) abates. We are aware of control systems alleviating some issues, however, this is no guarantee of any satisfactory operation in practice due to control system/sensor outages and other paradigms.

We have air quality monitors very nearby and just over the Temple, NH border. It is questioned as part of the study whether this instrument’s dynamic range will be compromised in conflict with other Federal agency operations due to a compressor station in Hillsborough County of New Hampshire nearby; the instruments also operate under other Federal and University programs and agencies. As such these instruments currently detect commuting traffic pollution from New York City, Massachusetts, and other areas with the apropos time delay from the actual event over time and distance.

We additionally require more instruments of similar capacity for the Temple Elementary School (one of the higher performing NECAP scores for New England), Temple Beef Farm, Reservoir and the area surrounding the compressor station, to include downwind fallout governed by particle density and kinetics of settling out of the atmosphere, coupled with kinetic trajectory.

The Temple Elementary School is required to infiltrate outside air for its HVAC systems, by law, for its inhabitants. Regardless of the law, the outside activities for recess are directly encumbered by the Applicant(s).

Please note: busses are not allowed to idle outside of the Temple Elementary School. How would a compressor station be able to compete with this? Oh, by the way, the busses are quiet “clean burning” propane fuel powered.

During a recent visit to the Temple Elementary School, We were be able to sense an undertone of “scents” of the (desiring to be organically certified with organic motifs already in place) farm across the street from the Temple Elementary School, abutting the proposed Compressor Station site. We are reminded that the

farm has been in business by the Salisbury family since 1941 (see comments on PF14-22-000: FERC accession number 20150831-0052 from Mark Salisbury received 2015 AUG 31) and is the current occupant's only source of income and livelihood skill; the compressor station will put this farm out of business without recourse inclusive of customer sentiment. We require this to be studied and included in the EIS

additionally as a socio-economic impact, public safety inclusive of food supply SECURITY, but also a cultural and historical heritage of New Hampshire (which is also sometimes called "Cow Hampshire").

If one can detect that natural olfactory bouquet from the farm (which We have during empirical recent visits), the compressor station would be severely prominent in this regard.

There is no precedent for a compressor station this close to a school; despite that the Applicant may argue there is precedent in that they have a 6130 horsepower next to a high school in the Windham / Pelham, since the 1960s. Yet Kinder Morgan has purported and conflated their statements in this regard; they were only incorporated in 1997 after Enron. This is misleading the public further compounded by their incessant and erroneous (668% in error; originally 1305% in error for the 80,000 compressor station) use of a photo of an outbuilding for this 6,130 horsepower so-called "tinker toy" of a compressor station in their open-houses to educate the public of what compressor station might look like in the case of New Ipswich, NH.

Please note that Kinder Morgan has disclosed to Us (the public during their open houses) that they have never built a compressor station of this size, thusly there IS NO PRECEDENT.

The above is practical, experience and empirical evidence.

As always, please feel free to reach out to us for further questions.

Our Best Thanks,

Chris Mack

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20216

Re: Docket No. PF14-22, TGP Northeast Energy Direct – Scoping; Alternatives

Dear Secretary Bose:

We write to request more detailed analysis of viable, targeted modifications to the Tennessee Gas Pipeline ("TGP") system, as a preferable alternative means to serve the stated purpose of the proposed Northeast Energy Direct pipeline ("NED").¹ Specifically, "lift-and-lay" expansions of existing laterals (and perhaps of the TGP 200 line), should be prioritized to meet any expansion of the TGP system. Minimizing the disturbance of additional land for gas infrastructure (by increasing the diameter of existing pipelines) would greatly reduce the NED proposal's conflicts with local, state, and regional policy priorities.

To date, capacity contracts for a total of 417,262 Dth/day have been approved at the state level. Please note that only 271,462 Dth/day of this amount is for new capacity; the other 145,800 Dth/day would replace capacity contracts on existing pipelines. Please also note that each of the state orders approving NED precedent agreements with local distribution companies ("LDCs") have been or are anticipated to be appealed (the recent New Hampshire Public Utilities Commission order approving the precedent agreement with Liberty Utilities (EnergyNorth Natural Gas) Corp. ("Liberty Utilities") has not yet been appealed as of this

filing; orders of the Massachusetts Department of Public Utilities have been appealed by multiple parties regarding the precedent agreements with The Berkshire Gas Company, Bay State Gas Company d/b/a Columbia Gas of Massachusetts (“Columbia Gas”), and Boston Gas Company d/b/a National Grid (“National Grid”).

Whatever capacity increases are ultimately determined to be prudent and in the public interest, if any, we ask the Commission for an analysis focused on targeted expansion of existing laterals that could (and we strongly believe should) be pursued by TGP as alternative means to meet the contractual capacity requirements of subscribers to NED.

Concord Lateral Alternative in New Hampshire

Please conduct an independent evaluation of modifications to the Concord Lateral that would be necessary to provide additional capacity of 65,000 Dth/d to the Liberty Utilities distribution system. (While the Liberty Utilities NED contract is for up to 115,000 Dth/d, 50,000 of that would be to replace an existing contract which could be renewed using existing capacity.) Please also evaluate non-pipeline alternatives for fulfilling this contract, such as upgrading and/or expanding propane and liquefied natural gas (“LNG”) storage facilities, or increased use of compressed natural gas (“CNG”). Liberty Utilities has just initiated a proceeding² that includes testimony that suggests that LNG or CNG, coupled with expansion of the Liberty Utilities distribution system, could be a viable alternative for at least some of the company’s expansion plans.

Alternatives Expanding Massachusetts Laterals

Please similarly evaluate lateral-based alternatives for fulfilling the capacity requirements of the Massachusetts LDCs. National Grid and Columbia Gas are served off of several laterals in eastern Massachusetts which should be studied for expansion options. The Northampton and North Adams Laterals in western Massachusetts are reported to be at or near capacity. The moratoria imposed by Berkshire Gas and Columbia Gas, prohibiting any new or expanded service along the Northampton Lateral, raise serious economic development concerns for communities in the Pioneer Valley.³ These communities seek an immediate resolution to the moratoria – which NED cannot possibly provide. Instead, the NED proposal is impeding more expeditious, smaller-scale solutions. It should be noted that Berkshire Gas received authority several years ago to install five LNG storage tanks in Whatley, Massachusetts, near the Northampton Lateral, and the company has chosen to install only two. Columbia Gas, for its part, has reportedly said that NED would not resolve its capacity problems,⁴ implying that even without NED as proposed, modifications to the Northampton Lateral or the LDC distribution systems are required.

These targeted expansions should be solutions of first resort if any additional pipeline capacity is needed.

Respectfully submitted,

Kathryn R. Eiseman, President
Pipe Line Awareness Network for the Northeast, Inc.

ate-president-stanleyrosenberg-calls-on-berkshire-gas-to-lift-moratorium) (“[Columbia Gas Spokeswoman Sheila] Doiron said the Kinder Morgan pipeline is not a solution for Columbia Gas[.]. Even if the controversial pipeline were ready tomorrow, Doiron said it would not affect the moratoriums.”).

20151016-5151

Anna C Hanchett, Plainfield, MA.

These are scoping items to be addressed when considering approval of the pipeyard proposed for Plainfield, Hampshire County, Massachusetts, submitted by the Plainfield Agricultural Commission.

1. This pipeyard is to be located on a 300 acre piece of land classified as “prime farmland” which is delegated for agricultural use exclusively under the Massachusetts Agricultural Preservation Restriction. The Natural Resources Conservation Service (NRCS, a federal agency) and the U.S. Department of Agriculture state:

“Prime farmland” is of major importance in meeting the Nation’s short- and long-range needs for food and fiber. Because the supply of high-quality farmland is limited, the U.S. Department of Agriculture recognizes that responsible levels of government, as well as individuals, should encourage and facilitate the wise use of our Nation’s prime farmland.

Prime farmland, as defined by the U.S. Department of Agriculture, is land that has the best combination of physical and chemical characteristics for producing food, feed, forage, fiber, and oilseed crops and is available for these uses. It could be cultivated land, pastureland, forestland, or other land, but it is not urban or built-up land or water areas. The soil quality, growing season, and moisture supply are those needed for the soil to economically produce sustained high yields of crops when proper management, including water management, and acceptable farming methods are applied.

These lands should not be used for a pipeyard which would involve irreversible compaction of these delicate soils by the heavy equipment involved with using the pipeyard.

2. The land would also most assuredly be contaminated by diesel fuel and other liquids used in machinery such as hydraulic fluid. This would make it unusable for agriculture for many years to come.

IF FERC approves the use of this property for a pipeyard the following procedures should be observed:

1. If the pipeyard is approved for this property, refueling or filling of liquids while machinery and trucks are on the land should be prohibited.
2. Any spills or leaking of petroleum or other chemicals should be properly cleaned up in accordance with rules for removing toxic substances.

20151016-5152

Dean Lotito, Dunstable, MA.

There is no need for this pipeline project. The only ones who will benefit from it will be Kinder Morgan’s shareholders. There are at least two other pipeline companies who can bring in the “extra gas,” if it is indeed “needed,” without having to take huge easements on our conservation land or from private homeowners. Kinder Morgan will trample on our State Constitution (Article 97) in order to build this pipeline. Although Kinder Morgan has said that they will be paying to build the pipeline, they are actually going to try to get reimbursed by everyone in New England who uses electricity, through a surcharge on our electric bills.

I do believe that their goal is to trample our conservation land in order to allow them to export natural gas to other countries. I also believe additional gas pipelines only encourage environmentally damaging fracking to be more profitable and attractive. Another natural gas pipeline is not the answer.

The market need was fabricated, and the cost to our property and our wallets is not acceptable.

Thank you,

Dean Lotito

20151016-5153

Jeff Corser, Stephentown, NY.

Dear FERC:

The citizens of the State of New York have overwhelmingly and stridently opposed the construction of an industrial fracking infrastructure in our state by banning it. To have this pipeline infrastructure imposed on us by the Federal government when it is clear that we have opposed it is an obscene over-reach of governmental authority.

If you know loud and clear that New York has rejected this industrialization of our rural areas by out-of-state fossil fuel Corps., why would you intend to stir up a whole bunch of resentment? These southerners and their industrialization will not be at all welcome here.

Not only do I live very near this proposed pipeline, but I am a professional wildlife biologist who has worked extensively in the Pennsylvania gas fields. This type of activity is wholly at odds with a rural life-style and is drastically damaging to natural ecosystems--I've seen it first-hand and the damage is radical and lasting. It may be somewhat appropriate in flat deserts out west but is was not designed for mountainous forested areas and will damage them beyond repair.

New York is headed down a much more sustainable path and the Federal Government should support us in this--not impose an industry that we have clearly stated is not welcome here. Their criminal record is appalling--they are outlaws who have no intention of following any laws--you know this. The records of their law-breaking are public for all to see.

Please keep this criminal gang out of our state.

Sincerely, Jeff Corser

Hollis, NH 03049

October 16, 2015

Norman C. Bay, Chairman

Federal Energy Regulatory Commission

Dear Chairman Bay:

I wish to take this opportunity to add new comments on the Northeast Energy Direct pipeline proposed by Kinder Morgan/Tennessee Gas Pipeline, and also to put on the record a list of questions I asked at the scoping meeting in Nashua, New Hampshire, this past summer. I submitted a written copy of those questions to a FERC staffer at the meeting, but as far as I am aware that document has not been published on the docket.

Allen Fore of Kinder Morgan tells us that the pipeline "could" save New England residents 25 percent on their energy bills. Leaving aside a number of challenges to this assertion—notably, that Allen Fore is in no position to make it credibly, that any percentage of current bills is essentially meaningless in the context of the lifetime of the pipeline and that of most of its users, and that the pipeline "could" just as plausibly cause energy bills to rise dramatically by the time market factors and the costs of construction have taken hold—let us accept it, for the purpose of evaluating the costs and benefits, as fact. So, arguing in favor of NED is the fact that it might save consumers some money. Arguing against NED is the fact that without question, building the pipeline would:

- Necessitate the taking by eminent domain of easements on the property of thousands of private citizens, organizations, and municipalities against their will.
- Act as an impediment to the essential transition to clean, renewable energy technologies.
- Cause extensive, permanent damage to the ecosystem in four states.

- Add substantially to air, water, noise, and light pollution.
- Result in increased fracking, even as public and scientific opposition to the practice steadily increases.
- Expose hundreds of communities to the danger of catastrophic accidents.
- Diminish the aesthetic appeal of large areas that are economically reliant on tourism and the appeal of a rural environment.
- Accelerate the rate of global warming, in the face of urgent warnings by the scientific community and the steadily increasing incidence and severity of weather-related disasters consistent with predictions by that community.

The list of questions I read in Nashua in July, which I believe all concerned with energy policy have a civic and moral duty to answer, is appended to this letter.

Do not approve the Northeast Energy Direct project.

Sincerely,

Stephen J. Spaulding

Cc: Governor Margaret Hassan
 Senator Kelly Ayotte
 Senator Jeanne Shaheen
 Congressman Frank Guinta
 Congresswoman Ann Kuster

The following questions pertain to the Northeast Energy Direct (NED) pipeline proposed by Kinder Morgan and Tennessee Gas Pipeline (KM/TGP).

Energy policy: Expansion of our natural gas infrastructure has serious implications for the overall approach to meeting our energy needs.

Do you support implementation of policies designed to promote development and use of clean, sustainable energy technologies? YES NO

Do you support implementation of policies designed to promote conservation and greater efficiency in energy usage? YES NO

Do you believe that policy should favor non-polluting and renewable energy technologies over fossil-fuel-based technologies? YES NO

Do you consider natural gas a sustainable energy source, given that the supply is finite? YES NO

Do you consider natural gas a clean energy source, after taking into account its full environmental impact at all stages from extraction to combustion? YES NO

Given the scale of the NED project, its environmental and aesthetic impact, and the need to grant powers of eminent domain for the taking of private and public land, do you feel that the project should be allowed to proceed only if it is clearly demonstrated to be the best way to address the region's energy needs? YES NO

Do you believe that the NED project has been clearly demonstrated to be the best way to address the region's energy needs? YES NO

Climate science: Global temperatures are rising, with many results that are already observable and many others predicted by scientific modeling.

Do you accept the near-unanimous judgment of the scientific community that climate change is occurring, is caused by human activities, and is an imminent, serious threat to the well-being of human beings and other species? YES NO

Do you agree with the scientific consensus that moving away from reliance on fossil fuels is essential if

we are to avoid the worst impacts of climate change? YES NO

Methane, the principal component of natural gas, is known to be an extremely potent greenhouse gas (many times more so than carbon dioxide). Do you support increased government regulation of methane emissions? YES NO

Leaks from natural gas infrastructure introduce large quantities of methane into the atmosphere (69 billion cubic feet in 2011—more than 30 times the daily capacity of the proposed NED pipeline—according to figures provided by gas distribution companies). Do you support requiring the owners and operators of existing pipeline infrastructure to repair these leaks? YES NO

Energy prices: Elected officials, regulators, KM/TGP, and various utility companies state that the NED project is needed in order to lower energy prices in New England.

Many project opponents believe that much of the gas would be destined for the export market, where prices are several times higher than domestic prices, and that New England consumers would see little benefit. Do you believe that a guarantee of reduced electric rates for energy consumers in New England, many of whom are unlikely in the foreseeable future to have the option of using natural gas for heating and cooking, should be a prerequisite for approval of the NED project? YES NO

Do you believe that alternative approaches, such as conservation, grid modernization, and increased exploitation of renewable sources, offer the promise of lowering energy prices? YES NO

If the NED pipeline were to fulfill the stated objective of lowering energy prices for New Hampshire consumers, do you believe this outcome would impede development of clean, sustainable energy technologies and encourage increased consumption of natural gas? YES NO

Even if the NED project is approved and completed without delay, it will bring no gas to New England until late 2018. In many parts of the United States and the world, energy from renewable sources is already cost-competitive with natural gas. Do you believe that advances in other technologies during the interim might make natural gas relatively less advantageous from a cost standpoint? YES NO

If the price of fossil fuels reflected the true costs of the environmental damage they cause, do you believe such fuels would remain economically competitive? YES NO

Throughout the world, demands are mounting for action on halting climate change and on curbing the extraction, transmission, and consumption of fossil fuels. Do you think that this political opposition will result in delays and increased costs (ultimately to be borne by consumers) in construction of natural gas infrastructure? YES NO

Are you confident that the economic benefits promised by the project's advocates outweigh the environmental, social, and opportunity costs of completing it? YES NO

Fracking: Support for expanding the natural gas infrastructure strongly implies support for increased hydraulic fracturing, or fracking, as the means of extracting the fuel. The fracking process injects as many as 600 chemicals into the ground, including numerous known carcinogens and other toxins. It also consumes between one and eight million gallons of water per well.

Many studies suggest that in the vicinity of fracking sites, water and soil are contaminated, seismic activity increases, and residents suffer elevated rates of cancer and other diseases. Do you believe that fracking poses a threat to public health? YES NO

Fracking companies are exempt from the provisions of the Safe Drinking Water Act, and in many cases are not required to disclose the chemicals that they are using. Do you think fracking is adequately regulated? YES NO

Do you support the right of states, counties, and municipalities to ban fracking within their borders? YES NO

If industry scientists were to discover commercially viable shale deposits in New England, would you

support allowing fracking to proceed in those locations? YES NO

20151016-5157

Diana Hughes, Bloomfield, CT.

I recognize that there is a greater demand for natural gas. However, I would urge you to include the new pipeline closer to the original one in the area of the Metropolitan District. There is a lot of ledge in the area and I am concerned that blasting will disrupt the aquifers that feed the reservoir as well as our wells. I have a well that I am concerned about. I would hope that the new pipeline could be closer to the older one so as prevent less disruption to the area.

Thank you.

Diana Hughes

16 October 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission (FERC)
888 First Street, NE
Room 1A
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Dear Ms. Bose,

The Pepperell Conservation Commission appreciates the opportunity to comment on the proposed Northeast Energy Direct (NED) Kinder Morgan pipeline.

While the town of Pepperell is no longer directly impacted by the currently proposed preferred route, we would like to comment on the impacts this pipeline will have on the future of land protection, the potential precedent setting means for the taking of Article 97 lands for easements to construct pipelines, and the long-term environmental impacts from the installation, mitigation, and operation of this project.

Land protection organizations across Massachusetts are being asked why land protected in perpetuity is being used for the siting of a natural gas pipeline. While the Natural Gas Act may allow this, the number of properties targeted, some of the most environmentally sensitive areas in the Commonwealth, may impact whether landowners donate their "legacy" to their local land trust, conservation commission, or other land protection organizations. With so many protected properties impacted, especially corridors for wildlife and trail systems for people, it makes those involved in land protection question whether their past actions have been in vain.

In addition, over 100 conservation properties will be impacted, 85 of which are protected by Article 97 of the Massachusetts Constitution. Article 97 of the Massachusetts Constitution states:

"The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose. The general court shall have the power

to enact legislation necessary or expedient to protect such rights”. Representatives of Kinder Morgan have said they will seek the required 2/3 vote from the House and Senate to dispose of Article 97 properties for an easement for their proposed pipeline. Kinder Morgan representatives are one step ahead of the process by stating they will work with municipalities to mitigate the impacts of the project on our Article 97 properties regardless of the outcome of any vote in the Massachusetts legislature. FERC representatives, at a recent scoping hearing, assured those in attendance that FERC will insure mitigation is appropriate. FERC’s assurance of assisting with mitigation is critical because there

are many small, directly-impacted communities who will become overwhelmed if the support necessary to address mitigation is not provided. How will communities mitigate a 100’ clearing through a town forest or other forested open space? How will communities mitigate a 100’ clearing through an Agricultural Preservation Restriction property while the farmer waits for the disturbed soils that have been removed for construction to revert back to soils compatible for growing crops? How will communities mitigate the impacts of horizontal directional drilling if the drill rig surfaces mid river or the slurry used to lubricate the drill is not contained in the drill pit? Will local communities receive guidance and assistance from FERC to address these issues? Will FERC insure on-going support if mitigation is not carried out accordingly?

Of greatest concern, the incomplete Resource Reports, which were prepared to identify the impacts to alternative routes, did not use readily available information to evaluate the important characteristics of the lands and waters that will be crossed. Resource Report criteria should not be a list of the number of wetlands or stream crossings but should include a rating that identifies their ecological importance by using tools available, such as BioMap2. The use of BioMap2, a document readily available on line, that provides guidance by identifying the most critical areas within the Commonwealth, should have been consulted. A river crossing can have significant impacts but a river crossing when endangered mussels or other state-listed species are present, requires extra efforts that must be considered.

Those of us involved in land protection and wetland resource protection have concerns with the proposed project. We ask FERC to insure that if this project is fully permitted, environmental impacts to wetlands as well as financial impacts are thoroughly analyzed and evaluated.

Our efforts to review the Resource Reports have been time intensive. Portions of the route have been provided on maps that are dated and structures are missing. Impacts to developed areas cannot be evaluated when the maps are incomplete and route changes are being proposed. This could push the proposed route closer to wetland resource areas, which have not been evaluated and onto properties of newly-impacted landowners who have not had an opportunity to communicate their concerns.

We ask that FERC make their decisions on a complete application. We ask for a thorough, transparent review for this project.

If you have any questions, please do not hesitate to contact us.

Sincerely yours,

Pepperell Conservation Commission

20151016-5165

Thomas Vaillancourt, Merrimack, NH.

I am a resident of Merrimack NH. For the better part of a year the town and its residents have organized to understand the impact of the original proposed route, to be run along side existing power lines. The town has hired biologists to study the impact on conservation areas and hydrologists on the impact of the water supply. We’ve tried to cooperate with KM on surveys but KM would not agree to allow town representatives to be present during the surveying. Many questions have been sent and asked of KM and FERC all of which have gone unanswered.

Now at the eleventh hour the route has changed away from the co-location into yet another route “option 7”. This route also crosses well head areas and runs directly through one of the busiest sections of town. In

a telling example of the absurdity of the process, the alternate route goes by Fidelity, a Merrimack business. Once Fidelity was aware of the new alternate route, it was only a matter of weeks before KM and Fidelity met and had the route changed away from the business and into other neighborhoods and sensitive areas. One can therefore conclude that large companies determine where the route goes. Ordinary citizens are simply ignored. I do have one right remaining. I will exercise my vote and let my elected officials know we have not been represented in this process.

20151016-5166

Darrell Scott, Mason, NH.

Regarding the NED pipeline in New Hampshire, I am concerned about pipeline corrosion due to the combined effects of:

1. Co-location of a HVAC power line.
2. Rocky terrain with high probability of damaging pipeline coating.
3. Steep terrain that will be difficult to control soil erosion without large rocks and rip-rap.
4. Kinder-Morgan statements of using thin walled pipe in rural areas.
5. Difficulty of maintaining and monitoring a complicated DC decoupling and AC grounding system.

I request a detailed report be submitted to each local township in NH describing the AC computer modeling to demonstrate the corrosion protection system will maintain industry standards of AC current densities less than 100A/square meter above which AC corrosion occurs and voltages less than 1000-3000V above which coating damage occurs. This report needs to account for soil conditions, power line alignment, grounding design and peak loading within each town.

Also, a report needs to be submitted detailing what monitoring will be in place to ensure the protection systems have not been compromised.

I would like to remind FERC that the existing HVAC line crosses over Kidder mountain in New Ipswich NH, over Fletcher Granite Quarry in Mason NH, and over abandoned granite quarries in Brookline NH.

I request construction techniques to prevent damage to pipeline coatings in the steep rocky terrain of New Hampshire be detailed in full in a report to each local township in NH. If the NED pipeline is to pass thru NH, due to NH's unique geography, additional precautions need to be followed to ensure the safety of the pipeline.

Ref: FERC Docket No. PF14-22-000

Dear Ms. Bose:

I am writing to state my opposition to FERC conferring eminent domain privileges to Tennessee Pipeline LLC/Kinder Morgan in the Northeast region of our country. Alternate routes should be provided, as unwilling landowners are being forced to donate their land to this proposed pipeline expansion.

I am also vehemently opposed to the proposed "Overriding" of Connecticut STATE LAW protecting Class I & Class II drinking water watershed lands. What would happen if there were a gas leak that contaminated our drinking water? Would the US Government have to step in and provide clean water to the taxpaying citizens affected, because the Tennessee Gas Pipeline LLC/Kinder Morgan is a LIMITED LIABILITY CORPORATION?

Sincerely,

Elaine McKinney

20151016-5170

Virginia Lee Miller, Peterborough, NH.

Commissioners:

You have a grave responsibility regarding the siting of the proposed Kinder Morgan NEC pipeline in southern New Hampshire. Since I am assuming that you are not familiar with our area let me tell you something about it.

We are known as the "Quiet Corner" or the "Currier and Ives" region of New England, with good reason. This is a physically beautiful area with a landscape of rocky hills and mountains, numerous small lakes, ponds, streams, rivers and heavily many trees, both deciduous and evergreen. Our villages are situated about 7 miles apart and are often cited as being examples of small town America at its best with "proper" locally owned shops, not chain store outlets or franchises. Our air and water quality is excellent and our habitat supports an amazing variety of wildlife from moose to mice plus hundreds of bird species. Many people have contributed both their land and money to create large areas of conservation land to help preserve this bounty. All of this is now at risk with the proposed pipeline.

The farmer from whom I buy my vegetables has not used any chemicals on his crops for over 30 years and his produce is amazing in quality, taste and variety. His farm is within 1/2 mile of the pipeline's route and compressor station as is the Temple Elementary School. How can you allow these to be put in harm's way?

I fear for the destruction of our precious environment. Kinder Morgan's track record of pipeline safety is not good. While we are proud of our well-trained first responders, we know they would be unable to handle a rupture or explosion which is a significant risk. And what about out-gassing from the compressor station? How can our area survive toxic fumes belching into our air? What guarantees can be made that our ground water and wells won't be affected both in the drilling process and future failures of the pipes?

Taking the required land including conservation property by eminent domain should only be done for the public good and not just for the financial benefit of a huge corporation. We, the people of southern New Hampshire stand to gain nothing from this project. Rather, we will lose what we love – the peace, tranquility, health and safety of our life here in this beautiful area.

I urge you to think very carefully about your decision and remember the harm that will surely result from allowing this project to proceed.

20151016-5171

ARTHUR KARIS, STEPHENTOWN, NY.

The proposed pipeline route is through the groundwater aquifer on the flanks of Johnson Hill in Stephentown, NY. This aquifer feeds my shallow well at 34 Griffin Road and the shallow well of my neighbor on Firetower Road. This has been verified by a qualified professional hydrologist. I would like to know how Kinder Morgan will prevent permanent changes to the groundwater flow and its effect on my water supply. Because the pipeline route is through a large amount of Graywacke rock just below the surface, how will Kinder Morgan prevent contamination of the groundwater by the perchlorate residue from blasting?

20151016-5174

Tamara Adams, Tyngsborough, MA.

I am strongly opposed to this pipeline. There is no need for this greenfield pipeline project. The only ones who will benefit from it will be Kinder Morgan's shareholders. There are at least two other pipeline companies who can bring in the "extra gas," if it is indeed "needed," without having to take huge easements on our conservation land or from private homeowners. Kinder Morgan will trample on our State Constitution (Article 97) in order to build this pipeline. Although Kinder Morgan has said that they will be paying to build the pipeline, they are actually going to try to get reimbursed by everyone in New England who uses electricity, through a surcharge on our electric bills. This is unacceptable.

20151016-5175

October 15, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE Room 1A
Washington, DC 20426

Re: Scoping Comments, Town of Fitzwilliam, New Hampshire, Tennessee Gas Pipeline Company, LLC, Docket No. PF14-22-000, Proposed Northeast Energy Direct (NED) pipeline.

Dear Ms. Bose:

1. The Tennessee Gas Pipeline Company, LLC, (TGP) has failed to address the impacts that the NED project will have on the Town of Fitzwilliam, therefore, the October 16, 2015, scoping comment deadline established by the Federal Energy Regulatory Commission (Commission) is premature, arbitrary and capricious.

Scoping History:

On December 8, 2014, TGP filed a letter in the captioned docket styled "Supplemental Filing-Adoption of Alternative Route a Part of Proposed Route (Wright, New York to Dracut, Massachusetts Pipeline Segment)". The letter announced that TGP was abandoning the Massachusetts Pipeline Segment in favor of the New Hampshire Powerline Alternative. The TGP rationale was that the Massachusetts route was too controversial.'

On January 16, 2015, the Town of Fitzwilliam filed comments in this docket requesting that TGP address Town concerns about the precise location of the pipeline; the environmental impacts on the Town; safety concerns; and, proposed construction plans and techniques.

The Town requested that TGP respond to the identified concerns within 90 days of the January 16, 2015, letter.

TGP did not respond.

On July 24, 2015, TGP filed its second Draft Environmental Report and Project Scope Update (Report) with the Commission.

1 TOP letter, page 2: "... This type of significant revision to the proposed Project in order to address numerous concerns with the original proposed route is a text book example of the merits of the Commission's pre-filing and certificate procedures".

On September 1, 2015, TGP sent a form letter signed by Allen Fore of Kinder Morgan to the Town requesting a meeting with Town representatives to discuss "potential local mitigation opportunities". Mr. Fore

requested that the Town respond by September 24, 2015.²

On September 24, 2015, the Town sent Mr. Fore a letter detailing the Town's specific concerns. (Exhibit 1 attached hereto). The Town letter addressed five matters of specific concern³:

1. Scott Pond.
2. The Town owned Gaseau conservation property.
3. Town historic homes and properties.
4. The 35 Town homes and properties located within 200 feet of the proposed pipeline and vulnerable to the construction and operation of the pipeline.”
5. List of safety and health concerns detailed by Select Board Chair and Fire Department Chief Nancy Carney.

Each of these Town concerns demand careful analysis and exacting responses from TGP.

2. A review of the July 24, 2015, Draft Environmental Report and Project Scope Update demonstrates that TGP has not satisfied its statutory pre-filing obligations under the National Environmental Policy Act (NEPA). 42 USC 4331-4335.40 CFR 1501.01-08.

- a. NEPA requires that each Town concern as detailed in the September 24, 2015, letter to Allen Fore be addressed in detail by TGP before the seeping process can be legally compliant with the law. 40 CFR 1501.1-2.
- b. NEPA requires that TGP provide a scoping process that ensures appropriate consideration of NEPA policies in order to eliminate delay and encourages consultation among agencies with jurisdiction over the project rather than the submission of adversary comments on a completed document. 40 CFR 1501.1 (b).
- c. NEPA requires that TGP engage the relevant state agencies and town agencies in the seeping process, particularly the New Hampshire Department of Environmental Services and the Town of Fitzwilliam Blasting Administrator and Town Planning Board.⁵ 40 CFR 1501.2(d)(2), 40 CFR 1501.6.
- d. NEPA requires that TGP study, develop and describe appropriate alternatives to its proposed route. 40 CFR 1501.2(c).

3. TGP has not addressed specific concerns of the Town of Fitzwilliam as required by NEPA.

- a. The July 24, 2015, TGP Draft Environmental Report provides only a generic description of construction and operation processes that the company may use to avoid impacts to the Town of Fitzwilliam.

The Report does not identify Town of Fitzwilliam streets and roads it expects to use in the construction and operation of the project. The Report does not describe how it will prevent damage to streets and roads. The Report does not describe how compensation will be guaranteed for damage to streets and roads caused by TGP and its contractors.

- b. The Report does not discuss Scott Pond, waterbody listed on the New Hampshire Department of Environmental Services, Consolidated List of Waterbodies Subject to RSA 483-B, the Shoreland Water Quality Protection Act.

- c. The Report does not discuss the Gaseau conservation property, a Town owned wetland and recreational area.

The Report does not provide site specific plans for the construction and operation of the pipeline through these Town resources.”

The lack of details regarding these valuable Town assets makes it impossible to me scoping comments adequate to inform the Commission of the impacts of the project.

- d. The Report does not discuss the historic character of the Town and its historic homes and properties located within one-half mile of the pipeline as required by NEPA and the National Historic Preservation Act, 16 USC 470.

e. The Report does not list any of the fifty-four (54) Fitzwilliam homes and properties located within 200 feet of the pipeline.’

The Report’s lack of details regarding the impacts on these homes and properties is fatal to the scoping process. The Town cannot file seeping comments about the adequacy of a Report that does not provide site specific information.

Of particular concern to the Town is the presence of ledge. Ledge will require significant blasting. Blasting has consequences for the structural integrity of homes and buildings. Blasting has consequences for water quality and quantity. Blasting can damage aquifers. Blasting compounds and emulsions can pollute ground water with dangerous contaminants,

The Report does not include site specific blasting plans. The Report contains only generalized information about blasting and blasting plans. The Report, at Appendix M8-3, acknowledges that a blasting plan has not yet been developed and that it will be a “Contractors” responsibility to prepare a site specific blasting plan. The lack of site specific plan to deal with ledge and the consequences of blasting in Fitzwilliam is a breach of TGP’s legal responsibilities.

f The Report acknowledges that TGP has had only introductory conversations with New Hampshire regulatory agencies. The Report, at page 140, notes that it had introductory meetings with the New Hampshire Department of Environmental Services, Alteration of Terrain and the New Hampshire State Historic Preservation Office on June 17,2015.

NEPA requires active engagement with state and local regulatory bodies. The engagement with state and local regulatory bodies provides a developer with the specifics of the critical steps necessary to proceed with a project safely with minimal impacts 011 the environment and local resources.

g. The Report, at pages 1-127-128, sets forth a time table for permits, licenses, approvals and certificates required for the construction, operation and maintenance of the project.

For example, TGP states that it will file an Application for a Certificate of Site and Facility (Application) ‘with the New Hampshire Site Evaluation Committee (SEC) in December, 2015. TGP also states that applications for a Clean Water Act 401 water Quality Certificate, a Dredge and Fill Permit, a Shoreland Permit and an Alteration of Terrain permit will be filed in December, 2015.

RSA Chapter 162-H, the New Hampshire statute governing the siting of energy facilities, at RSA 162-H: 7, IV requires that an application for a site certificate include sufficient information to satisfy the application requirements of each agency having project jurisdiction. The application must include each agency’s completed application form. A review of the July 24,2015, Report shows that TGP cannot satisfy this requirement.

TGP cannot satisfy the technical requirements imposed the New Hampshire environmental permit processes when the Report demonstrates that it has not developed site specific plans for any of the proposed pipeline route, e.g., Scott Pond and the Gaseau conservation area.

Further. and importantly, the SEC Rules will require TGP to demonstrate that it has a right of way before an application can be accepted by the SECs

TGP cannot meet the timeline it outlines in the Report. TGP cannot satisfy the application requirements required by RSA 162-H: 7, IV.

Summary

The permitting timeline set forth in the TGP Report at pages 1-127-128 is an artificial construct calculated to impermissibly rush the scoping process. The Report is legally and [actually deficient and cannot be a predicate for scoping comments.

Until such time as TGP files a legally sufficient Environmental Report no seeping comment deadlines should be imposed on the Town of Fitzwilliam or other Town or property owner that will be impacted by the NED project.

Until such time as TGP prepares and files a legally sufficient Environmental Report no further action of any nature should be undertaken by the Commission,

Please address filings, communications and correspondence to the undersigned and to Sandra Tillis, PO Box 725, Fitzwilliam, NH 03447, 603-585-9119, fitzlanduse@wivalley.net

Respectfully submitted,

Arthur B. Cunningham,
Attorney for the Town of Fitzwilliam
PO Box 511, 79 Checkerberry Lane
Hopkinton, NH 03229
603-746-2196 (O); 603-219-6991 (C)

FERC ID # F291489

Footnotes:

- 1 TOP letter, page 2: “ ... This type of significant revision to the proposed Project in order to address numerous concerns with the original proposed route is a text book example of the merits of the Commission’s pre-filing and certificate procedures”.
- 2 The Fore letter is calculated to permit TOP to jump over its NEPA scoping obligations by offering “mitigation opportunities” before the company satisfies its statutory duties.
- 3 The Town’s detailed requests are contained in Exhibit I and need not be repeated here.
- 4 The Southwest Regional Planning Commission has identified 19 additional Fitzwilliam homes within 200 feet of the pipeline making a total of 54 homes. (Attached as Exhibit 2).
- 5 TGP must obtain an alteration of terrain permit and dredge and fill permit to construct the pipeline through Scott Pond and the Gaseau conservation area. Thirty-five (35) town homes lie within 200 feet of the project and rely on wells for water. TOP must provide detailed studies of the hydro-geology that may impact these homes and blasting plans to the Town Blasting Administrator and town planning Board.
- 6 The TOP Report offers, at pages 1-91-92 and at M-85-1 07 only a general description of the techniques it may use to cross water bodies and wetlands.
- 7 Report Appendix, M-49 lists just 14 properties with private wells in Cheshire County within 200 feet of the pipeline, none in Fitzwilliam.
- 8 Final Proposal, SEC Rule, Site 303.02(c) (6) requires that an applicant have a current legal right to construct a facility.

Via email

Re: Northeast Energy Direct Project

Dear Mr. Fore:

Thank you for your letter of September 1, 2015, to Dorothy Zug, Chair, Conservation Commission, Town of Fitzwilliam, New Hampshire, regarding the potential for compensatory mitigation of project impacts to

streams and wetlands.

Your enquiry is premature.

One, the Town of Fitzwilliam, by the vote of Town citizens at the regular Town meeting, opposes the project and will, in accordance with that vote, oppose the project in all appropriate venues.

Two, the Town has significant concerns about project impacts that Kinder-Morgan must immediately address before consideration can be given any mitigation proposals', including:

1. Scott Pond.

Scott Pond is listed on the New Hampshire Department of Environmental Services, Consolidated List of Water bodies Subject to RSA 483-B, the Shoreland Water Quality Protection Act.

The designation will require Kinder-Morgan to obtain a permit pursuant to Chapter 483-B, the Shoreland Water Quality Protection Act. The designation will require Kinder-Morgan to obtain an Alteration of Terrain Permit pursuant to Chapter 485-A, the Water Pollution and Waste Disposal. Kinder-Morgan will be required to obtain a Fill and Dredge Permit pursuant to Chapter 482, Fill and Dredge in Wetlands.

Kinder-Morgan must provide the Town the engineering plans and specifications, construction plans", including the construction equipment and construction materials to be staged and used to traverse Scott Pond. Kinder-Morgan must also identify which roads, together with anticipated haul loads, the company expects to use to construct the Scott Pond section of the pipe line.

Also, in order for any meeting, as proposed in your letter of September 1, 2015, to be productive, Kinder-Morgan must provide, at minimum, draft copies of the necessary permit applications required by New Hampshire and Town law.

2. The Gaseau conservation property.

The Town owns a property in fee known as the Gaseau conservation area.' The property contains approximately 120 acres of wetlands and borders Scott Brook. The deed conveying the property to the Town limits the use of the property to hiking, cross-country skiing and recreational uses. The deed specifically bars motorized vehicles such as motorcycles, snow mobiles, motor bikes and ski tows.

The deed requires that the Town hold the property as open space and that no buildings or other structures be erected thereon, except a suitable plaque in memory of Ann K. Gaseau.

Kinder-Morgan must provide the Town the engineering plans and specifications, construction plans", including the construction equipment and construction materials to be staged and used to traverse the Gaseau property. Kinder-Morgan must also identify which roads, together with anticipated haul loads, the company expects to use to construct the Gaseau property section of the pipe line.

Kinder-Morgan will be required to obtain an Alteration of Terrain Permit pursuant to Chapter 485-1\, the Water Pollution and Waste Disposal. Kinder-Morgan will be required to obtain a Fill and Dredge Permit pursuant to Chapter 482, Fill and Dredge in Wetlands.

Also, in order for any meeting, as proposed in your letter of September 1, 2015, to be productive, Kinder-Morgan must provide, at minimum, draft copies of the necessary permit applications required by New Hampshire and Town law.

3. Many Town of Fitzwilliam historic homes and properties will be impacted which will adversely impact the historic character of the Town and the Town tax base.

The Town of Fitzwilliam is a unique and historic village. The project will impact 20 historic homes and properties situated within Vz mile of the project. Each property has specific characteristics vulnerable to the construction and operation of this project. (See attached)

The market and assessed value of each property will be impacted. The project is a threat to the historic character of the Town and its tax base.

In order to have a productive meeting, Kinder-Morgan must provide the Town with specific details how the

company plans to comply with the 36 CFR Part 800, Section 106 review for each historic property.

4. 35 Town homes and properties are located within 200 feet of the proposed pipeline centerline rendering them vulnerable to the construction and operation of the pipeline. (See attached).

The Town is concerned about water quality impacts on private wells and septic systems of these and other properties.

The Town is concerned about the impact of blasting on the structural integrity of these properties.

Please provide each and every study and assessment that Kinder-Morgan has done regarding the geology, hydro-geology and ground water aquifers in the area of the properties that have the potential to be impacted by the construction and operation of the pipeline.

Please also provide detailed plans how the company plans to deal with the potential impacts to these properties. The plans must include details regarding pre-blast inspections, blast vibration monitoring, water quality monitoring (pre-blast and post-blast) and blast chemicals, protocols and methodologies.

The company must identify proposed access to the properties for equipment and supplies.

In order to ensure that the properties of concern are protected, the company must provide, at minimum, a draft application that comports with Town Ordinance Section 127.

5. Town Select Board Chair and Town Fire Chief Nancy Carney has prepared a carefully detailed list of concerns regarding the health and safety of Town residents and visitors and properties. (See attached).

The Company is strongly urged to examine Chief Carney's lists of concerns and to be prepared to fully answer each question before any meeting.

Town officials will meet with Kinder-Morgan representatives as you request, provided, however, that the meeting includes the requested details about the projects plans and specifications about the outlined concerns and precisely how the company will comply with its State of New Hampshire and Town permitting obligations. The representatives must include planning and engineering decision makers authorized to speak to these issues.

The company should also have a representative at the meeting prepared to address Chief Carney's concerns. The representative must have the authority to make the requested commitments.

Please provide dates and times. The Town also requests that such a meeting be held sufficiently in advance of the October 16, 2015, scoping comment deadline that the meeting agenda and outcome can be included in the scoping comments.

Very truly yours,

Arthur B. Cunningham

Footnotes:

- 1 The Town of Fitzwilliam assumes that Kinder-Morgan will comply with Chapter ISS-E, Local Regulation Excavations.
- 2 The plans and specifications should include blasting information in sufficient detail to ensure compliance with Article 127, the Town of Fitzwilliam blasting ordinance.
- 3 Kinder-Morgan must precisely describe how much of the Gaseau property it intends to impact. Eminent domain for private projects is barred the New Hampshire Constitution 12-a
- 4 The plans and specifications should include blasting information in sufficient detail to ensure compliance with Article 127, the Town of Fitzwilliam blasting ordinance.

Guthrie Sayen, Bloomfield, CT.

I own, with my wife, the property at 27 Rundelane, Bloomfield, CT.

Running a gas pipeline near our community well could endanger the quality of our drinking water. If our well is polluted, it is likely the water for the Metropolitan District Commission will also be polluted, leaving us without good drinking water or a backup plan for potable water. This would critically impact the value our property and negatively affect our retirement. (We are both in late 60s.)

Will there be a fund for reimbursing property owners whose properties are devalued by the pipeline? How long will that fund be available; it could be years before we know about water contamination. The adverse effects could be both on potable water and on the beauty of our neighborhood, which borders the area of the proposed pipeline.

Thank you for considering my concerns.

Guthrie Sayen

20151016-5177

Kimberly D. Bose, Secretary • Federal Energy Regulatory Commission 888 First Street, NE • Room 1A • Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000 Northeast Energy Direct Project

Dear Ms. Bose:

Though I entirely agree with the inappropriateness of allowing all the environmental risks that have been thoroughly enumerated, I'd like to bring out some considerations of impact that has been given little attention, thus far.

One of the touted advantages of this pipeline proposal is to facilitate local business development through excess energy availability. The specifics used as examples are dubious at best. What is absolutely clear and evident at each of these public events as well as the firestorm of social media, is the earnest efforts of average citizens, taking literally hundreds of thousands of hours away from their normal pursuits to become educated and proactive about the implications of such a project. Specifically with regard to regional eco-

conomic development, such misdirection of public focus has an extremely negative impact. What is the overall impact of distracting thousands of motivated Citizens for months/years from their own economic agendas. While FERC is evaluating the Public Good of this project, how is this impact entered into the equation?

Now once again, to put those same hundreds of thousands of hours of public concern and attention in another light, it can be seen that there is an enormous level of stress involved. It is no mere speculation that sustained stress is a health risk. So this impact has already occurred and will continue for months to come as the Regulatory Process continues. While the precision of such an accounting may only be estimated and quantitatively debated, the negative aspect overall, of chronic, high level stress cannot be denied.

While any large-scale project could be expected to generate local concerns and stress, how has the NED pipeline initiative attempted to mitigate such impacts. I suggest that Public Hearings and PR Campaigns which promote misleading partial truths, circular non-answers, and some could well say, outright lies, together with extreme delays and spotty response to official governmental inquiries, instead, exacerbate the problem further.

Lastly, I would suggest that perhaps the most damaging implication of the entire process is the loss of public faith in the rule of law. The disrespect of the average citizen, in a “going through the motions”, approach to regulatory procedures in the face of overwhelming disapproval of a by now, well educated and informed, dramatically impacted public, will show effects in future elections and hopefully legislative initiatives. Short of that, it is FERC’s responsibility to actually consider ALL of the competing implications of this project with an eye to Truth, Comprehensiveness, and Private Sanctity.

Most sincerely,

Richard Mellor

Washington, DC 20426

Re: NED docket number, PF14-22.

Dear Ms. Bose,

My name is Janice Kurkoski. I chair the **Warwick Buildings and Energy Committee**. Our comments are aimed at the perceived need for additional fossil fuel infrastructure, particularly the proposed NED pipeline project.

In the TGP Resource Report, RR-10, Section 10.1.1, TGP says, ... “implementation of sufficient energy conservation measures to eliminate the need for the proposed project is not feasible in the short term.”

Our Committee has had a much different experience and this is not simply our opinion - we have proved that conservation is the most practical, effective, and least costly method to insure against rising energy costs, pre-mature building failure, resource depletion, and climate change.

The town of Warwick has dramatically reduced energy use in some of its town buildings over the last 8 years. Our Town Hall oil use is down over 60%, our school oil use is down almost 50%, without switching fuels (see attached Warwick town buildings oil use 2005 to 2015). These numbers include the two most recent winters - the coldest winters in the last 10 years.

The majority of the savings resulted from “fixing the leaks” in the buildings, using low cost weatherization measures, local labor, and common sense. Our fixes created jobs and set an example for our citizens to take the techniques we used into their own homes. The money spent to do this stayed in the local economy, and the savings stayed and will continue to stay in the taxpayer’s pockets.

Conservation is cumulative in its energy savings. Each year’s conservation activities add to conservation

done in prior years so there is a cumulative savings, like compound interest. At the end of 20 years the conservation done in the first year will still be contributing savings.

The situation with a gas pipeline is quite different. The gas gets burned and it is gone (except for the pollution it caused). There is no carry over benefit from one year to the next. At the end of 20 years, or 40 years or whatever is the useful life of the pipeline, you are left with a depleted gas resource and an old, leaky, dangerous pipe, which is more of a hazard than an asset.

The projected 5 Billion dollars to construct the proposed NED pipeline (which was only 2.7 Billion in May of 2014) would buy a heck of allot of insulation, create a whole army of jobs, and save struggling homeowners and businesses from everyrising energy costs. 5 Billion dollars could also pay up front, without incentives, for 300,000 residential-sized solar systems, generating 324 Million dollars worth of electricity per year.

One very large and looming omission in your upcoming EIR is the way in which the burning of natural gas is measured, i.e., only atthe “chimney”. When measured this way, it does indeed look favorable to the burning of coal or oil.

However, when the extraction and transmission methods (and leaks) are taken into account, it is no longer as clean as it appears. New fossil fuel infrastructures such as this pipeline will lock us into an energy future, which we need desperately to analyze NOW, using a whole systems approach, and then address with forwardthinking solutions

Grid operators will need to innovate. Utility companies will need to change the way they do business, but building a costly, publicly funded, privately operated infrastructure, plowing through farm field and forest, based a “promise” of cheap fossil fuel that uses dubious extraction methods, and ultimately continuing to use the atmosphere as an open sewer, is definitely NOT in the public interest.

Please use this opportunity to get our energy infrastructure on a track to a better business model that embraces conservation, efficiency, and renewables before anything else. This is not only “feasible in the short term” - it is terribly urgent.

Thank you,

Janice Kurkoski, Chair
Warwick Buildings and Energy Committee

20151016-5188

Benjamin M Baker, Branford, CT.

Dear FERC,

Drinking water reservoirs need healthy lands around them to filter and protect the water our families use. Clear-cutting and digging a trench 90 feet wide, 5.5 feet deep, and 5.7 miles long through land that protects drinking water and that of hundreds of thousands of people is a bad idea! Natural gas pipelines nationwide have suffered alarming failures that pollute water and soil, and put people at risk. Kinder Morgan should find another place for its pipelineâ€”or better yet, invest in renewables and stop wasting money on outdated fossil fuel infrastructure.

Sincerely yours,

Benjamin M. Baker

20151016-5192

Jane Biral, Bloomfield, CT.

October 15, 2015

Kimberly D. Bose,

Secretary Federal Energy Regulatory Commission

888 First Street, NE, Room IA

Washington, DC 20426

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/ Kinder Morgan (FERC Docket No. PF14-22-000)

We are landowners in Bloomfield, CT affected by the proposed Kinder Morgan/Tennessee Gas pipeline. We are opposed to the pipeline based on answers to the following four questions.

1. HOW SAFE WILL OUR DRINKING WATER BE IF THE PIPELINE IS BUILT? According to the MDC, which provides drinking water to the Hartford region, in a letter sent to you on June 26, 2015, the proposed pipeline will cross “Class I and Class II water company land whose use is highly regulated.” The MDC also took exception to the first drafts of the Environmental Reports (ERs) noting that they are “lacking in critical resource information — including...consideration of the existence of our public water supply reservoirs and watershed lands in the area of the proposed expansion.” The MDC points to a specific report (Environmental Resource Report #2) that, in their view, makes the false claim that “the project area is not located within any public drinking water or aquifer protection area.

2. DO OUR TOWN OFFICIALS SUPPORT THE PROPOSED PIPELINE? According to a letter sent to you by the Conservation, Energy and Environmental Committee for the Town of Bloomfield “portions of the route [Kinder Morgan/TGP pipeline] cross highly protected drinking water sources...CT law further identifies these lands as Class I and Class II restricted lands that cannot be disturbed...other than to maintain operations.

3. DO WE NEED ANOTHER GAS PIPELINE? According to data supplied by Bloomberg News, by November 1st 2015, the start of the heating season, gas inventories could reach new highs. Bloomberg News explains “If injections for the rest of this year track 2014 levels, storage may come close to 4.3 trillion cubic feet, more than 300 billion cubic feet above earlier highs.”

4. HOW HAS TGP PERFORMED ON SIMILAR PROJECTS? As a corporate citizen, Kinder Morgan/Tennessee Gas leaves a lot to be desired. In the last eight years, TGP has had 92 major pipeline accidents causing \$88 million in property damages and 19 federal enforcement actions. Their track record in CT is hardly more inspiring. According to the CT DEEP and the CT DPUC in partnership with PHMSA, there were 30 probable gas pipeline violations in CT in 2001 as compared to an eye-popping 238 in 2014.

It is our contention, supported by other non-profit environmental agencies and local officials in numerous CT towns, that supply issues do not always have to be solved by constructing yet another pipeline when smarter energy management — using what we have more efficiently and focusing our efforts on the development of a renewable energy grid can solve our energy problems cheaper and more efficiently.

GENE C GREGORY, MILFORD, NH.

To whom it may concern,

Oct. 15, 2015

Writing you today concerning the Northeast Energy Direct Project (NED), especially that section in southwest New Hampshire. It has been demonstrated by various organizations, to include a report by the Public

Utilities Commission of New Hampshire, that the pipeline is not really needed in New Hampshire and that the main beneficiary is the metro Boston area. According to Kinder Morgan figures provided at one of their open houses, some 50-55% percent of the gas is going to metro Boston while about 1-2% is scheduled for Nashua, Manchester and Concord areas through Liberty Utilities (Kinder Morgan subsidiary). With these numbers I fail to see how taking land in southwest New Hampshire by eminent domain is for the public good. Towns in southwest New Hampshire where the current pipeline route is now planned will never receive any gas from the project where as metro Boston and northern Connecticut aren't being required to accept any disruption of life style, reduction in land values or loss of land by eminent domain. New Hampshire already has more energy than it needs, and in fact exports a large amount of power to other states.

With the current route, the pipeline is going through Rhododendron State Park in Fitzwilliam (shameful), near a hazardous waste site in Troy (scary) and near Indian sites in New Ipswich (an injustice). Additionally it will pass near an elementary or church schools in Mason and Merrimack and the Town of Greenville's reservoir. Also The Society for the Protection of New Hampshire Forests indicated some six protected locations will have to accept the pipeline. In Milford we have had to deal with two superfund sites, with one involving the loss of town wells. Milford does not need to deal with the possibility of a third site.

Our own residential property is located about 400 feet from the proposed pipeline, not sure exact distance at this time as it seems to be one of some 10,000 TBD issues at this time. My concern is when they start blasting, and they will as the entire area is all granite, who is going to replace my artesian well. At this time it is my understanding that Kinder Morgan is only going out 200 feet from the pipeline to pre and post test and replace wells. Can you tell me why we will probably have to suffer a monetary burden of losing our well from possible pollution or going dry? I'm also concerned about damage to our septic system.

In closing please do not allow this pipeline to run along the current route, let those receiving the vast majority of gas accept the obligation of having to deal with it's infrastructure, loss of property values and damage to the environment. Please note that Kinder Morgan/Tennessee Gas Pipeline Company is already surveying near our property and is using survey crews from Massachusetts - feels like a done deal. One final thought, please remember we all count equally or none of us count and I'm feeling with this project those in southwest New Hampshire do not count.

Thank you for your time and consideration,

Gene Gregory

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. The north parcel is primarily a wood lot used for hunting and wood harvesting. Our home including two barns and six other out buildings are located in the southern portion where not only do we live but we raise most of the meat, vegetables and fruit that our family uses. Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. In rural New Hampshire our income is comprised of many components. One of them is from the collection of maple sugar from a sugar bush, and the processing of that sap into maple syrup, a primary agricultural product in New Hampshire. A sugar bush is a contiguous grouping of Sugar Maples, (*Acer Saccharum*). On the south side of the power line easement our family owns, maintains and

operates a small sugar bush from the approximately 300 contiguous sugar maples that grow there. The proposed NED study corridor would contain approximately 1/3 of these trees. If they are destroyed by Kinder Morgan they can not be replaced, not only depriving us of access to this valuable product, but in all likelihood reducing the size of the remaining sugar bush to be small enough to no longer be cost effective to operate as a viable agricultural entity.

Kinder Morgan asserts that they will replant any “crop plants” that they destroy during the clearing needed for their pipeline. This is an absurd statement as a Sugar Maple can live for up to 400 years. Our sugar bush was planted in the 1930’s or 1940’s, meaning that most of the mature trees are only 80 years old and will provide sugar for at least the next two centuries. If they are cut and replanted they will not be mature enough to harvest for at least the next 35 to 40 years.

Not only will our sugarbush be rendered economically unviable, but all the investment we have made in it over the years will be lost. This includes a complete replacing of the infrastructure of the sugar bush that was lost during the ice storm of 2008.

20151016-5195

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. The north parcel is primarily a wood lot used for hunting and wood harvesting. Our home including two barns and six other out buildings are located in the southern portion where not only do we live but we raise most of the meat, vegetables and fruit that our family uses. Kinder Morgan’s plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. We have denied access to Kinder Morgan to survey our property and will not negotiate to allow them entry to the southern parcel due to impact on our quality of life; including but not limited to the destruction of an operating sugarbush, the destruction of a fresh water spring, the location of a family pet cemetery, the location of historical artifacts, destruction of a natural barrier that currently prevents our family from viewing the ugly power lines from our family home, increased safety risk associated with the location of a barn used by the local boy scout troop to conduct their meetings and store their equipment, destruction of the natural beauty of the area, the location of four wells within 750 feet of the proposed pipeline, the destruction of historically significant stone walls, some of which are used as boundary markers, and the list goes on and on.

In fact this NED pipeline as it exists on the maps today as filed with FERC by Kinder Morgan, our family’s position is that our quality of life would be so severely impacted that we would no longer be able to live on this property. Accordingly if Kinder Morgan proceeds with its plans to construct the NED pipeline on the south side of the power line right of way they will be required to take our property through eminent domain proceedings.

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. The north parcel is primarily a wood lot used for hunting and wood

harvesting. Our home including two barns and six other out buildings are located in the southern portion where not only do we live but we raise most of the meat, vegetables and fruit that our family uses. Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. We have four wells located in the southern portion of the property. A dug well used by a livestock barn, a second dug well used by a sugaring barn, a third dug well used for our gardening and a drilled well used by the house. Our farm is located near the top of a hill at approximately 1000 feet in elevation, on the northeast slope of the hill. The formation of the land is all granite, with thin top soil, interspersed with wetlands; a typical landscape for the area.

How Kinder Morgan intends to bury their 30" or 36" pipe below the frost line in solid granite suggest that there will be extensive blasting. Since our drilled well is drawing water from an existing fissure in the granite ledge, and, blasting will cause permanent changes to the fissures in the granite, the performance of our family's well will be potentially adversely affected.

Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. When our family moved to this location in 2000, it was in part due to the situation of our home in a beautiful section of the great northern forest, primarily in a crescent of sugar maples planted for its maple sugar production, along with mature hemlocks, ash & oak. These trees screen our home from the view of the power lines.

If Kinder Morgan proceeds with its plans to construct the NED pipeline on the southern side of the power line easement, they will remove the trees that are acting as a natural barrier to a view of the power lines. In our view the removal of this visual screen will dramatically reduce the value of our property as the aesthetic value of the farm will be largely lost. Kinder Morgan needs to be held responsible for the irreparable harm this will cause our family.

20151016-5198

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. The north parcel is primarily a wood lot used for hunting and wood harvesting. Our home including two barns and six other out buildings are located in the southern portion where not only do we live but we raise most of the meat, vegetables and fruit that our family uses. Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. This farm has been an operating farm for probably over 200 years. The landscape is replete with artifacts of those farmers. The farmhouse was built in 1850 on the cellar hole of a house that existed at this location prior to that.

If Kinder Morgan proceeds with their plans to construct the NED pipeline on the south side of the power lines, they will wipe out a natural fresh water spring that bubbles up out of the ground. The old pipes that were just recently exposed by the heavy rains we've had this year suggest it was once used by prior occupants of the land to draw water from this spring for their purposes. The location of this spring is approximately at 42 degrees, 46'59.90" N 71 degrees 46'51.05" W elevation 945 ft.

20151016-5199

Diane Nassif, Petersham, MA.

I am writing as a resident in a town in north central Massachusetts where the pipeline will cross through many public and permanently-conserved lands as it brings fracked gas from Pennsylvania to the coast. The proposed pipeline and its companion compressor stations will wreak havoc on our natural resources including water, land, clean air, and darkness. It will be a hazard to those living near it due to leaks of major and minor proportions.

What is worse, there is little evidence that this pipeline is necessary for the people of Massachusetts. The gas is intended for export and to line the pockets of those who are already rich from exploiting the world's natural resources in support of the fossil fuel industry. Repairs to the aging gas pipeline infrastructure in eastern Massachusetts would be sufficient to ensure that gas is available until the change to non-fossil fuel based resources can be made.

Finally, this pipeline is in support of an infrastructure that is no longer viable in a world in which climate change is our biggest threat, worldwide. The investment in this pipeline should instead be made in energy efficiency, solar, wind, and hydro-electric power. It will be a disaster, not just locally, if FERC continues to bow to the interests of the oil and gas industry instead of taking a serious look at the needs of future generations for clean energy.

20151016-5200

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. The north parcel is primarily a wood lot used for hunting and wood harvesting. Our home including two barns and six other out buildings are located in the southern portion where not only do we live but we raise most of the meat, vegetables and fruit that our family uses. Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. This farm has been an operating farm for probably over 200 years. The landscape is replete with artifacts of those farmers including miles of stone walls.

Farmers in this area had a tough job as they had to clear the fields of rocks to provide areas suitable for grazing livestock or tilling the soil. These stones were carried to the edge of the fields and fashioned into walls that divided the fields, Now, centuries later, some of these walls have become the deeded markers of boundaries between parcels of land. Such is the case for our farm. When Kinder Morgan destroys these walls as they must if they are to construct the NED pipeline as the plans they have on file with FERC indicate they must, they must be required to carry out complete land surveys, establishing new boundaries as agreed to by

all abutting land owners.

Following the removal of the stone walls the walls will need to be replaced in the exact manner they are now. When a stone wall stands in the forest for centuries, the sides of the rocks that are exposed to the air grow thick covers of lichen and a particular patina due to weathering that enhances their beauty. If walls are disturbed they will need to be carefully reconstructed so that their weathered and lichen covered surfaces continue to face the outside of the wall. Additionally they need to be removed carefully by excavators with thumb attachments as to minimize scarring of these exterior surfaces. If these stone walls are replaced merely by haphazardly restaking the stones, the complete aesthetic nature of the beauty of these walls will be lost and our farms property value will be dramatically diminished.

In addition there are historical components to these walls that cannot be overlooked. As they sit, the farmers of centuries gone by who built these walls with their bare hands also participated in the formation of this very country under whose laws Kinder Morgan and FERC now have the hubris to take by eminent domain for the benefit of a private corporation.

These walls were assembled by human hands that also marched off to the battle of Concord and Lexington, the battle of Bunker Hill and the Civil War. In the Town of Mason, where Samuel Wilson lived as a child, the son of a local farmer, before he moved to Troy NY to become the man now known as Uncle Sam, he undoubtedly as part of his youthful chores spent hundreds of hours piling stones up on the edge of fields. It is awe inspiring to stand in our local woodlands and beautiful pastoral settings and look at the walls and understand the historical significance the hands that assembled them played in the founding of The United States of America. It is simply unpatriotic that Kinder Morgan would choose to destroy these century old artifacts for their short term private profits.

Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. The land between these two sections of land divided by the power line easement has two truck roads connecting the two sides that is the only manner in which logging trucks can access the north parcel. If either of these truck roads are destroyed by the construction of the NED pipeline as planned by Kinder Morgan, they will diminish the economic viability of the wood lot by limiting my access to it.

20151016-5202

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. Kinder

Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to the local youth who use this location as they participate in the Boy Scouts of America program, Mason NH Troop 264. Since 2000 the local boy scout troop has been using a barn on this property with our permission to hold their regular meetings and store their equipment. They use the access to the outdoors for all kinds of training from camping skills to search and rescue training. In the past fifteen years this Boy Scout troop has produced 9 eagle scouts. If Kinder Morgan proceeds with their plans to construct the NED pipeline on the southern side of the power lines the boy scouts will elect to move from this location so as not to be put in harm's way by the potential risk associated with this very large, very high pressure pipeline. Kinder Morgan will have deliberately greatly diminished the quality of life for many future young men and probable future civic leaders.

20151016-5203

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. The north parcel is primarily a wood lot used for hunting and wood harvesting. Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. Our family moved to this location to engage in a deliberate and intentional lifestyle where we raise much of our own food and enjoy a very high quality of life that is inextricably linked to the outdoors. Whether we tend gardens or livestock, cut wood for heat, tap sugar maples for a cash crop, spin wool for wool products or very busy lives are untypically centered on the outdoors where the sustenance of our lives is harvested from the land in many ways.

If Kinder Morgan is to construct the NED pipeline on the southern side of the power lines right of way it will diminish the quality of our lives greatly. It is very hard to put a price tag on the destruction that will cause us as we experience interruptions to our agricultural activities, and permanently diminished land values due to aesthetic changes, increased pollution, and increased risk of great if not lethal harm associated with pipeline failures.

While FERC operates in combination with Kinder Morgan let me remind you of a short passage from one of my favorite documents, the Declaration of Independence. We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness. The construction of this pipeline will cause my family great injury as it destroys one of our very American "unalienable rights", the right to the "Pursuit of Happiness". All the work we undertake to lead a happy life here in Mason, which has a cumulative effect, will have to be started over somewhere else, causing a loss of the cumulative efforts of the past 15 years, and another 15 years of rebuilding somewhere else, which are harder as the rigors of age detrimentally accumulate to produce diminished output from the same personal energy spent.

FERC has conspired with Kinder Morgan to destroy the American Dream for our family.

20151016-5204

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. The north parcel is primarily a wood lot used for hunting and wood harvesting. Our home including two barns and six other out buildings are located in the southern portion where not only do we live but we raise most of the meat, vegetables and fruit that our family uses. Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. From their very opening letter to me, Kinder Morgan (operating as Tennessee Gas Pipeline Co) threatened the use of eminent domain to take our land should we not willfully agree to sell them an easement over our property.

The Supreme Court has held that the federal government has the power of eminent domain—the power to take private property for “public use”, further requiring that “just compensation” (fair market value) be paid. The federal courts, however, have determined that to demonstrate “public use”, the property need not actually be used by the public; rather, it must be used or disposed of in such a manner as to benefit the public welfare or public interest.

The federal courts have not restrained governments from seizing privately owned land for private commercial development on behalf of private developers, like Kinder Morgan. This was upheld on June 23, 2005, when the Supreme Court issued its opinion in *Kelo v. City of New London* in a 5–4 decision. The majority opinion, by Justice Stevens, found that it was appropriate to defer to the city's decision that the development plan had a public purpose, saying that “the city has carefully formulated a development plan that it believes will provide appreciable benefits to the community, including, but not limited to, new jobs and increased tax revenue.” In the dissent, Justice Sandra Day O'Connor argued that this decision would allow the rich to benefit at the expense of the poor, asserting that “Any property may now be taken for the benefit of another private party, but the fallout from this decision will not be random. The beneficiaries are likely to be those citizens with disproportionate influence and power in the political process, including large corporations and development firms.” (Like Kinder Morgan). She argued that the decision eliminates “any distinction between private and public use of property—and thereby effectively delete[s] the words ‘for public use’ from the Takings Clause of the Fifth Amendment”.

The NH Constitution, which is subservient to the federal constitution, is divided into two parts. The Bill of Rights and The Form of Government. In 2006, following the Federal Court decision in *Kelo v. City of New London* (to which NH's David Souter voted with the majority) the NH legislature ratified article 12-A of the NH Bill of Rights: 12-a. [Power to Take Property Limited.] No part of a person's property shall be taken by eminent domain and transferred, directly or indirectly, to another person if the taking is for the purpose of private development or other private use of the property.

The taking of property by eminent domain in my opinion is the result of a subversion of our American constitution, a process that FERC is complicit with and in conflict with New Hampshire's state constitution.

20151016-5206

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of

the power lines, and one on the north. The north parcel is primarily a wood lot used for hunting and wood harvesting. Our home including two barns and six other out buildings are located in the southern portion where not only do we live but we raise most of the meat, vegetables and fruit that our family uses. Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. Kinder Morgan's Vice President Allen Fore said that the reason this pipeline was moved from its original route through Massachusetts to New Hampshire is because Kinder Morgan is able to co-locate the pipeline with electric transmission line right of ways. But in fact that is not true as the maps Kinder Morgan has on file with FERC show the new pipeline route to be parallel to the southern boundary of the power line right of way, in fact with some extra land as a "buffer" between the two easements. A "buffer" as defined by Dictionary.com is; "any intermediate or intervening shield or device reducing the danger of interaction between two machines, chemicals, electronic components, etc." so the presence of this barrier serves to prove that the new taking of land for the pipeline is in fact a separate taking of land and co-location merely refers to it's geographic proximity to other but unrelated energy transmission easements.

As Kinder Morgan has been scrambling to demonstrate that there was a New Hampshire need for this gas, which also in fact does not exist, it becomes clear that they relocated the pipeline to New Hampshire and then set about to "find the need". "Co-Location" is the surface excuse that belies the true reason for the relocation of the NED pipeline, which has not yet been made clear by Kinder Morgan.

At an open house Kinder Morgan recently held in Milford, NH I had the opportunity to challenge this assertion with a Mr. Michael Lennon, an employee of Kinder Morgan. To the great surprise of myself and my neighbor who he was addressing at the same time, Mr. Lennon sought to correct my understanding of co-location saying that it would be possible for Kinder Morgan to use the available portion of the power line right of way and perhaps only cut as much as five feet on the north side of the power lines. Subsequently, on October 2 of this year, a Mr. John Proulx, Kinder Morgan's land agent along with two engineers Larry Franks (sp?) of Hohenwald, TN and Duane (last name unknown) of Alabama walked the area of our farm and said that moving the pipeline to the north side of the power lines would be no problem, that its easy to do and that they can go to the north, the south, the north again, whatever they had to do to make it easier on the property owner. These comments were couched with the caveats that they would have to make a study of the land to determine if in fact they could change the route, but in all likelihood it would be a possibility. John Proulx promised that he would make the changes on an "MOC" and be back in touch with us (my neighbor and myself) when he was ready to show us a map of the changes. To date I have not heard back from Mr. Proulx.

Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. This farm has been an operating farm for probably over 200 years. The landscape is replete with artifacts of those farmers. In this case the area identified by Kinder Morgan as being part of the 400 foot survey area and also within the 150' future easement area subject to clear cutting con-

tains a midden which has produced many old bottles and other artifacts left over by the previous inhabitants of this land. In addition this area contains the filled in cellar hole of a previous dwelling long abandoned but no doubt replete with a variety of antique artifacts.

If Kinder Morgan proceeds with their plans to build the NED pipeline on the southern side of the power line right of way they need to excavate these s area areas with great care so that none of the historical objects, which include many old bottles, are damaged so that their historical significance will not be lost. While most artifacts also represent nominal value there is likelihood that a small percentage of these artifacts could represent relatively higher value.

20151016-5208

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family as this area contains the pet cemetery for the family dogs we have buried over the course of the past 15 years.

This land part of the land represents a very special and sacred place for our family. When you commit the remains of your loved family dog to the earth, it is a special memorable occasion of deep personal and family significance. In the grave you put in a favorite toy, or blanket, a collar, and you make an agreement that this place will be a special spot of remembrance of the "best dog ever". (Of course they're all the "best dogs ever" at that moment, but we try not to rub that in the noses of the pre-deceased.)

So for our family this little spot, at the shaded quiet edge of the sugar bush, near a runoff stream where the digging is easy, is a sacred spot that Kinder Morgan has filed plans with FERC to completely destroy as part of their quest for greater profits. It seems absurdly unreasonable that my family should be subjected to this great an injury.

20151016-5209

Joseph W McGuire, Mason, NH.

I am a property owner on the route of the proposed NED pipeline living in the town of Mason, in Hillsborough County, NH. Our property is an approximately 70 acre parcel, roughly in the shape of a square. Our property has an existing power line right of way that transects the property from the northwest corner of the property, to the southeast corner, roughly dividing the property into two triangles, one on the south side of the power lines, and one on the north. The north parcel is primarily a wood lot used for hunting and wood harvesting. Our home including two barns and six other out buildings are located in the southern portion where not only do we live but we raise most of the meat, vegetables and fruit that our family uses. Kinder Morgan's plans are to route the NED pipeline parallel to the power line right of way on the south side of the power lines.

If the NED pipeline is built and follows the south side of the power line right of way it will cause great injury to me and my family. Through hearsay only, Kinder Morgan is offering easement values of \$1 per diameter inch of pipeline per 1 foot of length of easement. So a 1600' easement across our land of the 30" pipeline is worth \$48,000, a paltry amount compared to the amount of damage our family will suffer as a re-

sult of the construction of the NED pipeline on the south side of the existing electric transmission line right of way.

All of the stakeholders in Mason believe that these easements will dramatically and negatively affect property values. It is precisely because this is rural New Hampshire is what makes this statement true. Our rural towns have not recovered from the housing market collapse of the last seven or eight years. The housing collapse was followed by the job market collapse and while the total quantity of jobs has come back, the wages for jobs have not. This also holds more true for rural areas.

As people move to sell their properties and relocate from their homes for any reason, whether to escape the risk of living next to the pipeline, a risk that didn't exist prior, potential buyers for their properties have the choice of buying one of several properties, undoubtedly choices that include properties not in proximity to buried high pressure gas lines, especially in this area of long sales cycles and high inventory. To counter this negative selling attribute introduced by the pipeline the only option available to sellers are to move lower on price.

Kinder Morgan advertises they have independent reports that demonstrate there is only a negligible difference in the value of such properties. Maybe in markets where there is no excess inventory, that scenario could possibly be true, but in rural New Hampshire, with lots of excess inventory, depressed housing prices, and lower wages, this response defies common sense.

The location of the NED pipeline on our property, especially on the south side of the power line easement, will spell economic disaster for our family in addition to destruction of a lifestyle we hold as core personal values. Following the real estate collapse and the downturns in jobs and wages, the loss of home equity value is the knockout punch.

20151016-5210

Colin McAlpine, New Ipswich, NH.

No pipeline! I submitted a nice long thought out comment but conveniently there was an error.

20151016-5214

Kathleen Gauvin, New Ipswich, NH.

We request that the FERC require Tennessee Gas to conduct a noise study throughout the pipeline areas and compressor station sites prior to construction. In particular, noise levels for the pipeline and compressor station #4 in the New Ipswich with the surrounding towns of Temple, Greenville, Rindge and Mason in the Hillsborough County of New Hampshire shall be studied. This noise pollution study shall be conducted during each season for several years and must be conducted prior to construction. These noise pollution model studies are requested to include the 41,000 horsepower boilerplate power ratings and any upgrades that may be introduced in the future including 80,000 -100,000 horsepower compressor stations. Lack of experience with compressor stations of this abnormally huge size and located in forested areas, limit any prior knowledge based on factual data. Noise is being defined here as clamor or racket, the lack of silence. We currently enjoy a lack of clamor and racket here in the Monadnock region.

All parameters used to run study simulations must be disclosed with methods used inclusive of model calibration methodologies. Pure tones and other peak phenomena shall be disclosed and studied for all weather conditions including snowpack and ice with and without sublimation and fog, trees with and without leaves; all seasonal variability and weather conditions over aforementioned annual bases (basis plural) of time due to variations from year-to-year in the water levels and weather conditions. The study report shall include effects of noise levels to citizens, farm animals, wildlife, and to the education of school children. How do these horses and ponies and their riders respond to sudden, loud blowdown racket? How do school children react to this sudden, loud blowdown racket? How will their attention to task and occurring redirecting attention to tasks affect their learning over a school year?

Currently in New Ipswich Zoning Ordinances prohibit large industry. As a result we have not enacted large

industry ordinances. We do have a noise ordinance in force from 10pm and 7am. We would therefore request that Tennessee Gas look at these time constraints. We also have a guide for inaudible, audible, low frequency, and vibration level noise. This guide was developed as a Large Wind Energy Systems Requirement Ordinance. The Compressor station noise pollution needs to be addressed. We request that this noise pollution level would be studied in accurate modeling with accurate levels that would be produced during blowdowns as well.

WE WILL NOT BE THE NEXT MINISINK!

20151016-5219

Lisa Wood, Greenfield, NH.

As a resident of Greenfield, NH, I oppose this pipeline.

While my viewpoint mostly falls into a “Not In My Backyard” scope, I do believe that the Consumer Advocates for the New Hampshire Public Utilities Commission have a valid point. New Hampshire doesn’t need all the natural gas that is being allocated to Liberty Utilities. Furthermore, it doesn’t need it for the next 30 years. And since Liberty Utilities is a subsidiary of a Canadian company which is a partner in the pipeline construction. That certainly seems like a conflict of interest to me.

I have heard from a Boston-area friend that Boston needs the natural gas in order to prevent their electrical power prices from rising too much. Yet this pipeline was first proposed for Massachusetts and their state officials rose the occasion and the pipeline was moved to New Hampshire. New Hampshire state officials have been lukewarm at best. Too bad we can’t elect new ones before this is settled.

We won’t see the natural gas impacting New Hampshire residents in a positive way. Our property values will plummet. Would you want to buy a house in a school district with a school in the blast zone for the compressor station? I wouldn’t. Our small businesses will shut. Would you want to buy beef from a farm near the compressor station with it’s toxic waste of airborne pollutants? I wouldn’t.

Our small communities connect us and make us a positive place to live. Seen against the backdrop of so much violence in America, our little towns where people work together are a treasure. Unfortunately, we don’t have the numbers or the dollars to fight back like a more populated area. Please don’t let Kinder Morgan and it’s partners take advantage of us. We’re valuable too. Boston and Europe can pay a premium for natural gas. We shouldn’t have to pay for it with sick people. damaged land and destroyed businesses.

Please deny this.

Benevento Companies

“Since 1934”

October 16, 2015

Kimberly D. Bose Secretary
Federal Energy Regulatory Commission
888 First Street, NE - Room 1A
Washington, DC 20426

Re: Kinder Morgan Proposed Northeast Energy Direct (NED) Project; Docket # PF14-22-000--Written Scoping Comments

Dear Ms. Bose:

This letter provides comments from the Benevento Companies (Benevento or the Company) regarding the property at 900 Salem Street, Wilmington Massachusetts (Quarry Site) with respect to the Federal Energy Regulatory Commission’s (FERC) scoping process for the proposed Kinder Morgan/Tennessee Gas Pipeline LLC (KM) Northeast Energy Direct (NED) Project.

Benevento is a family owned and operated aggregate-based material supply company started by Michael Benevento in 1934. The Company operates with locations in Wilmington MA (headquarters), Georgetown, MA as well as Plaistow, NH and provides integrated aggregate, asphalt, ready mixed concrete, and recycling services to numerous customers in New England. The Quarry Site location consists of 350 acres and employs over 120 people.

As noted in its previous comments at the scoping session held on August 11, 2105 and incorporated herein, the Quarry Site is an active quarry (since 1950) and produces the stone that the Company requires in order to operate its asphalt and ready mix concrete facilities. A power line corridor that the NED Project intends to use bisects the Quarry Site. The Quarry Site is also proposed to be a staging area for NED Project construction.

The production of stone is done by the daily drilling and blasting of granite. The blasting takes place approximately 250 feet from the power line easement that is the proposed route for the NED pipeline. An average blast fractures 16,000 tons of rock in less than 3 seconds. The hazardous process creates significant vibration and safety is obviously a paramount concern.

As noted below, any consideration of the NED Project requires a detailed and site-specific geological evaluation and an analysis of the seismic activity related to the blasting process. It seems obvious that there are important safety questions and concerns with the placement of a high-pressure natural gas in close proximity to an active blasting quarry. We are concerned that the placement of this NED pipeline on or adjacent to the Quarry Site will compromise the safe operation of the quarry and result in a reduction of our operations and/or some risk of closure of our facilities.

In addition, the operations of our quarry depends upon the unimpeded functioning of a drainage pond, the use of two other ponds, irrigation wells, equipment and infrastructure, and compliance with state and local permits. As noted below, the construction and operation of NED cannot interfere with our operation of our ponds and with state and local requirements and permits.

Wetlands and Aquatic Resources

There are significant wetlands to the northwest of the NED pipeline/power line right-of-way that feed into Martin Brook (which bisects the Quarry Site). The pipeline will impact the wetland and cross Martin Brook. In addition, there is a drainage pond for quarry dewatering on the Quarry Site. The drainage pond functions to filter solids that result from quarry operations. The pond rests on fractured granite and we have concerns that construction, maintenance and operation of the pipeline would allow water from other areas to drain into the pond and/or water in the pond to drain into the quarry. The Quarry Site also has two ponds on southwest side of Martin Brook used for stone washing, where suspended solids from stone are allowed to settle out and be removed by a drag line. The drainage pond and other two ponds (referenced below as Quarry Ponds) are integral components of the day-to-day operations of the quarry. The quarry operation and associated discharges and runoff are regulated by and subject to Storm Water and NPDES permits.

KM should provide a detailed description and map of any wetlands, the Quarry Ponds, and waterbodies on the Quarry Site that includes their location and an assessment of their functions and values. Impacts to wetlands, surface water resources, Quarry Ponds and wildlife should be fully disclosed. Impacts include but are not limited to: filling of wetlands/other resources for pipeline construction and/or operation; temporary impacts to wetlands and Quarry Ponds resulting from access to wetland areas for construction purposes; indirect impacts, such as clearing impacts resulting in a change (either permanent or temporary) of cover type within a wetland and/or damage to or sedimentation in Quarry Pond; indirect impacts resulting from erosion or sedimentation into wetlands, Quarry Ponds or waterbodies; secondary impacts from construction of the project. If not otherwise provided, KM should also describe whether pipeline construction work would involve discharging dredged or fill material into wetlands and/or onto the Quarry Site. In addition, KM should describe a strategy for determining adequate mitigation to compensate for unavoidable direct, indirect and cumulative wetland and Quarry Pond impacts from construction and operation, including a description of the methodology to determine the amount and type of mitigation that will be required to address loss of wet-

land acreage and function and damage to any Quarry Pond. Further, as part of its review, KM should:

- Describe all construction and maintenance practices that will be utilized to minimize impacts, particularly to sensitive areas such as Quarry Ponds.
- Identify wildlife impacts and describe all mitigation measures to protect wildlife.
- Describe the long-term right of way maintenance techniques planned for the project and included an analysis of the effects of maintenance techniques on wetlands and sensitive resources, plant life, habitat and agriculture. NED should explain whether herbicides will be used and describe related no-use buffer zones around wetlands.
- Describe appropriate buffer zones to avoid or reduce indirect effects of construction on wetlands and Quarry Pond.

Unless we have detailed information to the contrary, we are concerned that KM's activities on the Quarry Site will inhibit or constrain the operation of the quarry.

Quarry Operational Impacts on Pipeline

The quarry (by definition) has many areas of rock and granite in close proximity to the planned route. KM should undertake a site-specific geological study as well as other appropriate studies with respect to the Quarry Site that includes but is not limited to soil types, subsoil, strata and other geological characteristics to evaluate impacts from quarry operational blasting on the pipeline. Impacts include but are not limited to vibration, debris, and substrata movement. In addition, KM should evaluate all federal, state and local ordinances that implicate or relate to blasting by a working quarry in close proximity to a pipeline and demonstrate how the NED project's proposed location and operation will be in compliance with those requirements while the quarry is operating and blasting.

NED Project Blasting and Construction Impacts on Quarry Operation

KM should evaluate and identify any construction work that involves blasting at the Quarry Site. In the event KM has plans to blast at the site as part of its construction activities, KM should undertake a site-specific geological study as well as other appropriate studies with respect to the Quarry Site that includes but is not limited to soil types, subsoil, strata and other geological characteristics to evaluate impacts on the Quarry Site from its construction related blasting activity. Impacts include but are not limited to vibration, debris, and substrata movement and impact to Quarry Site structures and infrastructure, Quarry Ponds, irrigation wells, and operation. In addition, KM should evaluate all federal, state and local ordinances that implicate or relate to construction blasting in close proximity to a working quarry and demonstrate how the NED project's construction activities will be in compliance with those requirements while the quarry is operating and blasting. KM should address how structures, infrastructure, Quarry Ponds, and irrigation wells will be evaluated pre and post construction and detail the methodology that will be used. KM should also describe post construction follow-up and remediation, including any security or indemnification that may be posted to compensate for damage. KM should provide, among other things, a description of measures to be used to avoid or minimize blasting impacts and identify and discuss the feasibility and comparative impacts of non-blasting construction alternatives, including tunneling.

Construction and Operation

As noted above, the Quarry Site is an active operational quarry employing hundreds of people undertaking industrial activities related to extraction, production and processing of granite, gravel and asphalt. At any given time, the site is filled with trucks, numerous third party contractors and vendors. The Quarry Site serves as an important regional resource of asphalt, concrete, gravel and sand (among other products) and is relied upon by numerous cities and towns, state governments, and residential, commercial and industrial entities as a source of raw materials and finished products. Benevento has an important role in the regional economy. KM should provide an analysis and document and confirm that its construction, operation and maintenance activities (and its proposed use of the site as a staging area as noted below) will not interfere in

any way with commercial activities of Benevento Companies at the Quarry Site and/or to the extent that those activities may be impacted address how this impacts will be avoided, mitigated or remedied.

Staging Area Impacts

KM proposes, based upon information presented in the most recent Resource Report Map, to establish a staging area on or in close proximity to the Quarry Site. To the extent not previously provided above, KM should provide a detailed description and map of the staging area location and discuss its specific operation and requirements to include but not limited to, the nature of ongoing staging activities and tasks and an associated schedule. KM should evaluate any possible impacts of the staging area activities on the operations at the Quarry Site and provide, among other things, a description of measures to be used to avoid or minimize all impacts from staging area related activities.

Thank you for the opportunity to provide scoping comments on the NED project.

Sincerely,

Charles Benevento
President
Benevento Companies

Re: Docket No. PF14-22-000 - Tennessee Gas Pipeline Company, L.L.C., Northeast Energy Direct Project

Dear Secretary Bose,

The Millers River Watershed Council (MRWC) was founded in 1970, with the mission to protect the health of the watershed and its inhabitants. The “NED” project, as currently proposed, would pass through an extensive portion of the largely rural and forested western watershed in Franklin County, as well a smaller portion of its headwaters in southern New Hampshire. Having conducted extensive study of the proposed project over the last eighteen months (including the original route proposed to pass additionally through much of the largely rural and forested eastern watershed in Worcester County), MRWC concludes that there is no environmentally acceptable version of the proposed project. We therefore request that the EIS emphasize and fully analyze the no-build alternative.

As part of that analysis, MRWC requests that FERC identify a representative number of completed pipeline projects of similar (or smaller) scale for the transport of natural gas from the Marcellus Shale formation and, for those projects, assess the effectiveness of the numerous mitigation measures that were employed along their entire lengths in maintaining and protecting fundamental environmental features, their baseline conditions and their continued ecological functioning. MRWC further requests that the results of such assessments be made available in some form in the EIS, enabling independent researchers to verify those findings.

For example, in their 2012 legal intervention against the Tennessee Gas Pipeline Co.’s Northeast Energy Upgrade Project (NEUP), brought before the Pennsylvania Environmental Hearing Board (EHB Docket # 2012-196), the Delaware Riverkeeper Network based its arguments in part on impacts observed by experts

along TGP's similar "300 Line Upgrade Project". Here is one brief selection from their key findings:

The "improper approval of TGP's activities will result in the irreversible discharge of sediment into the tributaries of the Delaware River; the improper destruction of mature trees that prevent sediment from flowing into these tributaries and provide shading to regulate temperatures in streams and wetlands; long-lasting damage and even permanent destruction of Exceptional Value wetlands; and the disruption of macroinvertebrate populations." Severe and irreversible soil compaction was also observed to be widespread.

MRWC further requests that FERC include in its analysis of the no-build alternative a detailed summary of the violations issued by regulatory bodies during and after construction of such similar projects, and the ultimate resolution of those violations.

For example, in Pennsylvania, a November, 27, 2012 article in the Pocono Record reported that, over a year after the Tennessee Gas Pipeline Co. put the 300 Line Upgrade pipeline in service, PADEP had initiated an enforcement action against TGP and was in the process of reviewing between "500 and 600 violations" that TGP had accumulated. Cumulatively, the nature and outcome of these violations speaks directly to the potentially massive and unacceptable environmental impacts to be expected from the proposed "NED" project. The information requested above would be very helpful in the event FERC finds that the environmental impacts expected from the proposed "NED" project are reasonable and can be mitigated without undue and irreversible harm to the environment, local communities and wildlife.

Finally, MRWC requests that FERC's analysis of the no-build alternative include the potentially disastrous impacts of widespread hydrogeological disruptions and alterations that could result from the proposed pipeline's construction. The Town of Northfield, MA, for example, is known to have extensive areas of very shallow bedrock, which would require extensive blasting that could cause extensive fracturing and irreversible hydrogeological changes.

Given the prevailing north-south drainage patterns of much of the region along the proposed route, including the Millers River watershed and areas to the west, significant potential exists for pipeline construction activities to create voluminous new interconnections between currently distinct groundwater channels. In addition to wrecking havoc with surface water drainage patterns and drinking water wells on which much of the local population depends, such interconnections could also become pathways for the dissemination not only of natural gas and other chemicals that leak at various points along the pipeline route, but for naturally occurring deposits of arsenic and radium shown on U.S. Geologic Survey maps.

As a postscript, MRWC requests that FERC's analysis of the no-build alternative take serious stock of the overwhelming lack of support and stated opposition (in over 75 municipal "resolutions") by the dozens of communities that would be affected by the proposed "NED" project. Like many in these communities, MRWC has, after a close reading of the available evidence, come to the unshakeable conclusion that the "NED" pipeline is simply not needed and, further, would not substantially benefit those who live and work in our region--it would, in fact, have quite the opposite effect. The interests and concerns of these local communities should be foremost in FERC's deliberations.

Sincerely,

Ivan Ussach

Ivan Ussach, Director

Millers River Watershed Council

Richard J Goettle, IV, Fitzwilliam, NH.

Kinder Morgan's (KM's) commissioned analysis by ICF, Inc. (<http://www.kindermorgan.com/content/docs/>

NED_CapacityOutlook.pdf) claims the presence of the Northeast Energy Direct (NED) Project's pipeline would have saved New England (NE) consumers of natural gas and electricity \$3.7 billion dollars had it been in place during the "Polar Vortex" winter of 2013-2014. The analysis also claims cost savings between \$2.1 and \$2.8 billion over the first 10 years of operation, 2019-2028. These savings are said to benefit NE gas consumers and electric generators as a consequence of lower natural gas prices and their reduced volatility. These assertions are empirically without merit. First, the extreme NE winter weather conditions of 2013-2014 and 2014-2015 were shared by a significant portion of the US. Additional pipeline capacity to NE would not have prevented spot market prices for natural gas and electricity from rising sharply from widespread competition for scarce resources. Better planning, use and contracting arrangements for existing energy assets would have been far more beneficial. Second, the natural gas price shocks that occurred in these winters affected electric power producers coincidentally. City-gate prices that are most important to local distribution companies (LDC's) and, in turn, residential, commercial and industrial customers did not follow this pattern but rather experienced their normal late-spring-summer-early-fall increases. Since the NED Project, as advertised, serves LDC's and not power producers whose supply chain greatly differs, both physically and contractually, NED's indirect benefit to NE's electricity consumers is most likely to be very limited. Third, and most important, there is counter evidence that NE pipeline expansions lead to lower and less volatile natural gas prices for its consumer, including the power sector. The US Energy Information Administration's (EIA's) series on pipeline capacity shows two significant increases in net inflow capacity into NE – 0.585 billion cubic feet per day (bcf/d) in 1998 and 0.748 bcf/d in 2008; the latter coincides with the origins of the shale gas boom. If the KM-ICF claims were accurate then one would expect the premium that NE pays for natural gas relative to the US average to shrink and that its volatility would dampen. Actual data do not support this hypothesis. Indeed, following the 2008 expansion, both the premium and its amplitude increased suggesting that more capacity potentially exposes NE to more risk by increasing its exposure to the domestic gas market while remaining inexorably and proverbially at the end-of-the-pipeline. It is true the NE's premium for electricity relative to the US declined following this expansion (though not its volatility) but this decline is not explained by natural gas prices. Similarly, neither is the recent 2013-2015 increase in NE's electricity price premium well-connected to NE's natural gas markets. In short, KM's contentions that NE's gas and electricity consumers will benefit from the NED Project prove false under empirical scrutiny; there is little evidence that its capacity will lower prices or dampen their fluctuations. Again, better and more systematic planning, use and contracting arrangements for existing energy assets will prove far more beneficial to New England and its residents.

Re: Kinder Morgan Proposed Northeast Energy Direct (NED) Project Docket # PF14-22-000

Written Scoping Comments

Dear Ms. Bose:

This letter provides the written scoping submission from the 15 communities in

the NH Municipal Pipeline Coalition for the project noted above. The first portion provides comments directed to FERC while the second portion includes specific requests for the project applicant to address.

GENERAL COMMENTS TO FERC

Need

FERC has a significant process in place for the assessment of NED's environmental impact through the development of an Environmental Impact Statement. This process allows for substantial public input and places significant requirements on Kinder Morgan to address concerns. Furthermore, the process is highly transparent.

We are troubled that there is not a similarly transparent process in place for FERC, and the public, to assess the need of the NED pipeline. We believe it is important to confirm the "need" for a pipeline before evaluating its "environmental impact". There should be 110 environmental impact if there is 110 need.

Based on the limited long-term contracts currently subscribed for on NED, the existence of more environmentally friendly pipeline alternatives, and existing LNG infrastructure in place to address the region's peak winter heating and electricity demands, we fail to see a need for NED and urge FERC to specifically address the "need" for this particular pipeline, in a public fashion, should this project continue through the permitting process.

FERC's Project Review (PL99-3-000)

Issued Sept. 15, 1999, PL99-3-000 states that the Commission's goals are to appropriately consider:

- *Goal 1: The enhancement of competitive alternatives.* When considering the NED proposal, we request FERC take into account no build options such as Portland Natural Gas Transmission System that ends in Dracut, MA and achieves the increased supply by increasing compression upstream. When considering the NED proposal, we request that FERC consider the expansion of the Spectra Line to avoid NED's greenfield project.
- *Goal 2: The possibility of overbuilding of infrastructure.* We request FERC consider the dwindling resource of the Marcellus Playas outlined by Thomas Stepstone of Oil pro. com that "production at the Marcellus is in fact breaking down". We request FERC consider that the Constitution Pipeline to connect NED to the Marcellus Play has not yet been approved, making this a "segmented" project.
- *Goal 3: The avoidance of unnecessary disruption of the environment.* We request FERC question the assumption that NED is collocated when it is in fact a greenfield project. In fact, NED is not collocated and its assertions to the contrary are false and misleading. FERC should fully evaluate the project as a greenfield project and clarify that the project is not a collocated project. In addition, we request that FERC evaluate and require the applicant to evaluate NED impacts on the unique geological structure of New Hampshire, resting as it does on the African Tectonic plate, with significant wetlands, aquifer and granite implications. Please explain how FERC will oversee and mitigate the problems that the NED project presents? Further, the NH OEP (Office of Environmental Planning) has requested from the NH towns a Smart Growth Report of how the state is doing at implementing the principals outlined in NH RSA 9-B, which states, "Smart Growth also means the development and use of land in such a manner that its physical, visual or audible consequences are appropriate to the traditional and historic NH landscape Smart Growth preserves the integrity of open space in agricultural, forested and undeveloped areas." How does the NED project adhere to this state law?
- *Goal 4: To prevent the unneeded exercise of eminent domain.* If NED were truly a collocated project, the need for taking of private and public lands would not be necessary. Can FERC justify the taking of so many parcels for a private, for profit use? NED should not be able to circumvent the important state procedures as set forth in NH RSA Chapter 674 (planning and regulatory powers) of municipalities through its use (and threatened use) of eminent domain.

SPECIFIC REQUESTS FOR THE PROJECT APPLICANT

Wetlands

The proposed route of the NED pipeline suggests that construction, maintenance and the pipeline itself will affect numerous wetlands. The specific intent of NH RSA 674:17 and RSA 482-A is to protect wetlands values such as:

- Ground water quality and quantity
- Surface water quality and quantity
- Storm-water runoff quality and quantity
- Flood control, erosion and sediment control
- Wild flora and fauna
- Recreational aesthetics

We request FERC require the project applicant to address the following:

- Will the project result in the conversion of wetlands from one type to another, and how can this be avoided /minimized?
- How much wetlands will be permanently lost? Can this be mitigated?
- Even if temporary disturbance is “mitigated” or “minimized” how will soil compaction from construction affect the wetlands function?
- How will the pH change in soil due to the rotation of removed and replaced earth? How will this change affect wetland and water quality?
- How will the destruction of vernal pools be avoided since many of these, though important for the health of the watershed and wetlands, are not mapped?
- Wildlife are dependent on wetlands and can be negatively impacted through loss of habitats. What will be done to mitigate this impact?
- Permanent loss of wetlands will result when those lands are replaced with fill. What will be done to alleviate this impact?
- What are the detrimental effects on wildlife during and post construction due to the loss of native vegetation and plant diversity? We understand wetland and waterbody construction and mitigation procedures only require 80% native vegetation and 50% plant diversity differential from pre-construction levels. (1994 FERC procedures).
- A study done by Robert G. Bailey of U.S. Forest Service for FERC studied 960 sites and found that wetlands greater than 20% surface rock or open waters, shallow bedrock soils or those dominated by annual plant species had a low mitigation success rate from preconstruction levels. The Adirondack-New England mixed forest eco-region along with the proliferation of granite that defines N.H. makes these wetlands common. The success of mitigation is not high. How would this be more successfully mitigated?
- What will be the effect of the additional non-permeable surfaces in construction sites, additional work areas, and access roads (temporary and permanent)? How will this be mitigated?

Roadways

The proposed pipeline would cross a variety of types of roadways, including unmaintained “Class VI” roads. While “Class VI” roads in New Hampshire are not maintained, it is critical that they not be viewed as “not used”. Any roadways in NH, including those classified as “Class VI” can be used in some cases are regularly - used by fully-loaded logging trucks which are of substantial weight.

We request FERC require the project applicant to address the following:

- Use construction techniques across all roadways in New Hampshire, including all unmaintained “Class VI” roads, which will account for the heavy loads presented by logging trucks. We ask that, at a minimum, this includes using pipe under all roadways consistent with that required of a state road.

Right of Refusal for All Landowners: Use of Cut Trees

Trees that are cut within either temporary or permanent easement areas may be of value to the individual landowner. Many NH residents use wood as an alternative source to heat their homes, for example.

We request FERC require the project applicant to address the following:

- Provide all landowners with the right of first refusal for any cut trees on their property, in excess of three inches in diameter.
- Execute a waiver of this right before Kinder Morgan or its subcontractors may remove any such trees from private or public property even in the case of eminent domain.
- If a landowner wants the trees, we request that Kinder Morgan be required to coordinate the location for piling of de-limbed trees with the landowner prior to the cutting of the trees.

Safety - Installment of the Pipeline Itself

The information provided from Kinder Morgan indicated that the pipe may not be buried fully below the frostline. In short, the pipeline could be affected by frost heaves and other ground related distortions during and after the winter months that could cause a failure of the pipeline. This is the “Granite State”, so ground movement and ground distortions during the winter months is common.

We request FERC require the project applicant to address the following:

- How does Kinder Morgan plan to protect the pipe from this concern and what research and field studies are being done to determine if the practice is safe and appropriate?

Safety - Third Party Interference

70% of all pipeline malfunctions are a result of third party interference. The powerline utility right-of-way is used as the maintenance access roads for the power companies and the use of heavy machinery and construction vehicles is prevalent. If the pipeline begins crossing back and forth and back again underneath the right of way, the chances for third party interference by the power company subcontractors is significantly enhanced.

We request FERC require the project applicant to address the following:

- Is the defacto maintenance road for a different company really the best environment for the placement of a large gas pipeline?

Safety - Large Scale Construction Projects Competing For Space

In the Towns of Londonderry, Hudson, Windham and Pelham, the Merrimack Valley Reliability Project is a transmission line upgrade taking the towers of the centerline and moving them out to the far edge of the existing right of way, along the same route Kinder Morgan maps have their pipeline depicted. In its place National Grid is erecting a new set of towers to hold a 345 kilovolt transmission line. Kinder Morgan has hired a survey company to perform induction of current studies field tests. We are unclear as to how those studies are valid without the new overhead power line in place.

We request FERC require the project applicant to address the following:

- Provide an in-depth explanation about what the induction of current study entails, whether they are supposed to be performed exactly where the pipe is intended to be placed or in the center of the right of way, and why they should not be postponed until after the new transmission line is installed.
- Provide the results of said study to the public and communities along the pipeline route to ensure this new line will not cause a failure of the pipeline in the future prior to any FERC/PUC approval.

- Evaluate the safety of the pipeline given the planned (alleged) close proximity to the electric power line.

Co-location

When Kinder Morgan moved the proposed pipeline route into New Hampshire, it noted the opportunity for “co-location” with an existing utility right of way as a key selling point for the change.

The towns of the NH Municipal Pipeline Coalition do not believe “co-location” is an accurate representation of this project in NH. We are aware of other pipeline projects that have been termed “co-location”, but have actually resulted in the pipeline being constructed parallel to the utility right-of-way. In one particular case an area up to 150 feet wide had to be cleared to make way for the pipeline.

The Coalition towns believe the reality of this project is that it is largely a “greenfield” project, especially given Kinder Morgan continually refers to talks with Eversource to share its right-of-way as “ongoing” and in many cases Eversource does not own the land over which its power lines travel and therefore could not grant an easement.

We request FERC require the project applicant to address the following:

- Calculate the total acreage, by NH town, that will be impacted (both temporary and permanent) within the existing, cleared utility right-of-way and the total impacted acreage, by NH town, that will be outside of the existing, cleared right of way (both temporary and permanent).
- Show the route as it relates specifically to existing utility rights of way.

Regional Need

On July 16, 2015 Kinder Morgan announced that the Northeast Energy Direct (NED) project’s market path segment would be reduced from a 36” diameter and 2.2Bcf/d pipeline to a 30” diameter and 1.3Bcf/d pipeline. In the announcement, they stated that NED “will serve the commitments we have received from New England local gas distribution companies (LDCs) and commitments we expect to receive from other LDCs and electric distribution companies (EDCs) to provide domestic, low cost and environmentally cleaner natural gas for New England’s residential and industrial consumers, and to meet New England’s existing and anticipated gas-fired electricity generation demand.” While the diameter reduction is welcome news, the troubling part of the announcement is that at this late stage KM is announcing commitments they expect to receive.

We understand that:

- o The electric grid is shared regionally in New England.
- o New Hampshire has 63 operating power plants, including Seabrook nuclear plant.
- o New Hampshire is a net exporter of electricity to the region.
- o NED provides very little benefit to New Hampshire for the enormous impact.
 - o 71 mile “greenfield” project entering New Hampshire from Massachusetts only to return to Massachusetts.
 - o Liberty Utilities, the only LDC signed onto NED from NH, reduced their commitment from 115,000 Dth/d to 100,000 Dth/d and only 50% of that commitment represents incremental capacity or growth. The incremental/growth volume represents less than 4% of the reduced 30” diameter pipeline capacity.
 - o No EDCs from NH have made a commitment to NED.

We request FERC require the project applicant to address the following:

1. Detail the commitments from all LDCs and EDCs.
2. Ensure a full analysis of “need” by identifying replacement gas currently delivered to customers on existing pipelines and real incremental/growth gas for each LDC and EDC.

3. Quantify expected commitments from LDCs and EDCs and explain to FERC why these should be included in the project evaluation.
4. Quantify the amount of gas delivered by KMITGP to EDCs in New England for the past five years.
5. Require Liberty Utilities detail plans for their NED commitment to show communities that will be served and when.
6. Compare competing pipeline plans to determine least and best cost solutions.
7. Quantify the amount of gas lost in current transmission and distribution pipelines in New England.

Blasting

Knowledge of the land over which the pipeline is proposed suggests extensive blasting will be required in many towns in order to bury the pipeline. FERC must be mindful that New Hampshire is known as the “Granite State” for a well-founded reason; burying a pipeline will not be an easy task in our communities.

It is also worth noting that New Hampshire is also known for high levels of arsenic and radon in well water. A 2010 New Hampshire Department of Environmental Services report (entitled “Rock Blasting and Water Quality Measures That Can be Taken to Protect Water Quality and Mitigate Impacts”) identified the risks of rock blasting on groundwater in New Hampshire. It identified materials such as detonators and explosives, which are not entirely combusted during blasting, leaching into the groundwater. This has resulted in the detection of nitrates and nitrites in groundwater. Additionally, the report found that blasting can cause silt, sand, rock particles, and chemical precipitates that line fracture surfaces to loosen and increase the turbidity, or cloudiness, of well water. High turbidity can damage household equipment and fixtures, be aesthetically unpleasing to drink, and increase concentrations of metals and other contaminants.

NHDES has encouraged municipalities to enact blasting ordinances that not only focus on pre- and post-blast inspection of nearby structures, but also pre- and post-blast testing of private wells for both water quality and yield. These tests are critical to identifying any adverse impacts resulting from blasting activities.

The following towns currently have Blasting Ordinances in place: Brookline, Fitzwilliam, Merrimack, Milford, Pelham, and Windham.

We request FERC require the project applicant to address the following:

1. Fully adhere to the existing Blasting Ordinances in all towns that have them at the time of construction (and any other applicable state or federal rules);
2. Pay for pre- and post-blast water testing for any private or public wells located within at least 500 feet of any blasting. The water testing shall include a standard well water test, plus tests for arsenic, minerals, metals, pH, perchlorate, nitrate, bacteria, volatile organic compounds including MtBE and benzene, and radiological analysis for uranium and radon gas and water yield (gallons per minute) both before blasting, within two weeks of the completion of blasting and quarterly until a year after blasting has concluded.
3. Provide a detailed plan for providing bottled water to any and all impacted property owners, at no cost to them, until the property’s water quality and yield is returned to pre-blast levels. All cost to be borne by the applicant.
4. Avoid any blasting within 1,000 feet of any contaminated soil sites.
5. Submit an Alteration of Terrain Permit to NHDES and follow the permitting requirements in order to enhance the protection of groundwater both during and after construction.
6. Analyze tunneling in New Hampshire as an alternative to blasting.

Water

We are also concerned about the issues of water resources, plant and animal life, watersheds, and the basic need for clean water that we need to survive. Water is an equally important resource as fuel, and is integral

to communities. Once contaminated, it can have devastating consequences for all - individuals, communities, businesses, and tourism.

The NED pipeline will cross the following water resources multiple times in its route across NH and potentially compromise:

- Souhegan River, which it will cross six times
- Brooks and streams (22 in 15 towns)
- Aquifers (13, one very large)
- Ponds/lakes (11, largest, Scott Pond, is 134 acres)
- Wetlands (over 27, numerous vernal pools)
- Municipal water systems (serving over 500 people, including the Temple Elementary School)
- Private wells (serving in excess of 600 people)
- Numerous watersheds, including the headwaters of Tully Brook, East Asheulot, Miller River, and Middle Connecticut

We request FERC require the project applicant to address the following:

- How will contaminated well water be remediated?
- How will contaminated groundwater be addressed?
- Will the delicate ecosystems of headwaters be impacted? How many? How severely?
- How will rivers, ponds, aquifers, brooks and streams be affected by horizontal drilling? Have these impacts been studied and quantified?
- Rivers/Brook/Stream banks/riparian zones often contain wetlands that can be severely impacted via disturbance.
- How will this disturbance be minimized and mitigated?
- How banks will be restored to pre-construction conditions
- Use of specialists for work, not general contractors, using the most current and site-specific methods.
- How the release of natural gas or product will affect water ecosystems, including wetlands and groundwater?
- How big of an area could be affected and how many people would be affected?
- How would you compensate or mitigate for an accidental release?
- How will the aquifers along the route be impacted by construction? Have the impacts been studied and quantified? How will these impacts be minimized or mitigated?

Compressor Stations - General

This proposed project would have dramatic impacts on the quality of life in towns around the compressor station, including the air we breathe, the water we drink, our rural tranquility and even our ability to educate our children.

Even in such an important area as air pollution, the most recent Resources Report filed by Kinder Morgan still shows it as a "TBD" item. We feel that it is inappropriate to schedule scoping sessions when the report we are supposed to be commenting on is still incomplete.

We request FERC require the project applicant to address the following:

- Provide information on the impact of the compressor station on air, water, light and noise pollution for areas within a half-mile, mile and a half and five mile radius of the site
- Provide information on the impact of the compressor station on the largest and most important fly-way in the northeast for the twice-a-year migration of more than 10,000 raptors, including bald and golden eagles

- Provide information on the impact of the compressor station on the Lukas Community, which provides the required tranquil environment for twenty developmentally disabled adults many of whom have lived there for decades.
- Provide information on the impact of the compressor station on business and residential property values based on actual property sales near compressor stations
- Provide information on the impact of the compressor station on the safety of our residents including the abilities of our local safety personnel to deal with a pipeline related disaster.
- Provide information on the impact of the compressor station on Temple, NH's ability to safely operate its elementary school, including the Town's ability to use it as an emergency shelter in the event of a catastrophic event at the compressor station.
- Provide information on the impact of the compressor station on the EPA brownfield site that the proposed compressor station would be built on including the release of lead and other toxins into our water supply during blasting and construction.

Compressor Station - Toxic Emissions

We request FERC require the project applicant to address the following:

- How will fugitive emissions be mitigated and how will they be reported when they occur?
- How often will there be blowdowns? When and how will the public be informed of the date and time of blow downs?
- What percentage of the particulate matter emitted by the blowdowns will be radioactive?
- According to the Southwest P A Environmental Project, studies show that the current protocols for assessing compliance with ambient air standards do not adequately determine the intensity, frequency or duration of actual human exposure to toxins. How will KinderMorgan address this?
- Reference standards are based on discrete emissions, not on the cumulative impact- of many toxins together. Kinder Morgan needs to provide unbiased studies proving that there are no adverse health effects from this type of exposure.
- Require Kinder-Morgan accept liability for adverse health effects on pregnant women and their fetuses/ children due to the exposure to toxins?
- Require Kinder-Morgan accept liability for the increased cost to the community in terms of special education and health needs caused by exposure to the toxic chemicals released by the compressor station?
- Require Kinder-Morgan provide the Coalition towns with a longitudinal study on the health effects to children ages 5-12 exposed to compressor station of at least 40,000 horse power located within a two mile radius of a school.

In 2012 regulators believed that emissions from the production, transmission and distribution of natural gas accounted for approximately 398.3 billion cubic feet (Bcf). To put that into perspective it would be like leaving one end of the proposed NED pipeline completely open for 361 days to spill out into the atmosphere.

We request FERC require the project applicant to address the following:

- Provide a detailed study on the amount of air and atmospheric pollution that occurs along a 30-inch pipeline with leaks that occur at pigging station locations, valve release stations and compressor stations as well as the ramifications of these emissions.

Aside from production leaks and catastrophic accidents, the largest single and intentional emission occurs at the compressor station with the compressor blowdowns. These events can be scheduled or accidental and release gases through the blowdown valve and create a plume that extends to a height of 100 - 200 feet and that can last up to three hours. One venting can vent, on average, 15 million cubic feet of whatever gases are

in the pipeline. This would include various organic and inorganic compounds, as well as radioactive materials, particulate matter and unknown compounds, that are forcefully pushed up 200 feet and carried in any direction by the wind for miles and landing on anyone or anything. We are concerned that it is a variable shower of toxic and cancer producing contaminants that will have various short and long term health implications on anyone in its path.

There are also emissions from the all of the varied operational activities of the compressor stations that are occurring 24 hours a day. They include but are not limited to: filter separators / scrubbers, compressor turbines, gas cooling system, lube oil system, exhaust silencers, fuel gas systems pneumatic systems and backup generators.

The emissions can contain the following chemicals in varying amounts:

- Methane (CH₄) is the principal component and is a potent greenhouse with a warming potential 25 times that of carbon dioxide (CO₂) over the long term (100-year time horizon) and 72 times over the short term (20-year time horizon). CH₄ contributes to higher global background levels of ozone pollution.
- Carbon dioxide, Butane, ethyl benzene, ethane, pentane, etc.
- Volatile Organic Compounds (VOCs) and oxides of nitrogen are also emitted and are precursors to ground level ozone. In areas of concentrated activity, as are compressor stations, the emissions can be substantial.
- Hazardous air pollutants (HAPs) include hydrogen sulfide and certain hydrocarbons such as benzene, a known human carcinogen. Formaldehyde is a HAP found in the exhaust of compressor engines.

There is a growing complaint of short-term health concerns associated with compressor stations including respiratory and skin irritation, nosebleeds, neurological problems, dizziness, fatigue, loss of coordination, nausea and headaches.

The long term effects have yet to be learned but with known VOCs and known carcinogens being emitted, we can expect to see loss of coordination and damage to nervous system as well as an elevated incidence of cancer.

Compressor Station - Construction Impacts

The proposed site of the New Ipswich compressor station is on the SKAT land property; at the corner of New Ipswich, Temple and Greenville. The SKAT land is between Route 45 and old Temple Road; uphill from either road. The land is a big, steep hill of granite. If they need the compressor station on level ground, it would require significant blasting on the SKAT land. Nearby residents with bedrock wells are at higher risk due to additional blasting for compressor station area.

More sensitive are those that are dependent on surface water. The Kinder Morgan maps show one small wetland on the map for the compressor station but that map doesn't show the large hydric soil area it will be sitting on. A few hundred feet from the compressor station site is a pond that is wet 12 months of the year. That pond is part of a series of larger ponds, which is one of three main tributaries to the town of Greenville reservoir. There are nearby farms that irrigate from surface ponds. The area is part of the Souhegan River watershed.

Residents surrounding the SKAT land have dug wells. Our dug wells have extremely clean water because the land around us is extremely clean. The SKAT land is uphill from us. Every time there is a heavy rain or snow melt water runs from the direction of SKAT land through our land, towards the tributaries to the Greenville reservoir behind our houses. Any contaminating substances from the compressor station will percolate down-hill like a funnel and the local residents will be consuming them.

It was noted at the Scoping Session in Nashua that heavy molecule substances such as radon, polonium and other radioactive isotopes could get into soil and groundwater. Those substances are heavy and will drop quickly in the adjacent lands and waters during blowdowns.

We request FERC require the project applicant to address the following:

- Identify how many 41,000 HP fracked gas compressor stations are sited on hydric soil that are up hill from stratified drift aquifers and ponds less than 1,000 feet away
- Identify studies near compressor stations that have researched contamination of surface water and dug wells. If they do not exist, require the applicant to fund a study on the impacts over a 12-month period prior to permitting this project.
- Determine if there are seasonal impacts on ground water and wells. Is contamination greater in spring thaw due to contamination being trapped in the snow? Is the contamination greater in the drier fall season when the stratified drift aquifers have naturally lower water levels and contamination could be concentrated?
- If existing studies are available, require the applicant to conduct updated surface water and well tests at the locations to see if results have changed since the prior studies results were made available.

Compressor Station - Noise Impacts

Federal guidelines establish a maximum day-night average noise level for compressor stations of 55 dB at the closest noise-sensitive area. However, averages can be misleading. Peak noise levels are a more relevant and important metric because the loudest noises at compressor stations occur sporadically such as during blow downs, not continually.

Peak noise levels of 100 dB have been measured in the vicinity of compressor stations. For comparison, the nominal requirement of 55 dB is roughly equivalent to the sound produced by a modern dishwasher. In contrast, 100 dB is about as loud as a jackhammer.

Noise alone is sufficient to cause health problems including hearing impairment, cardiovascular and other physiological effects, mental health effects, and sleep disturbance. Compressor stations operate 24 hours a day. Nighttime sleep disruption during blow downs is likely. Inadequate sleep is proven to cause many health problems. Chronic sleep loss has serious consequences for health, performance, and safety.

Kinder Morgan's own measurements found that the selected noise sensitive areas near the compressor station site have estimated nighttime sound levels from 41 to 44 dB. A nighttime noise caused by a blowdown of 100 dB would be jarring indeed (being perceived as roughly 90 times louder than the background noise) and is easily loud enough to disturb sleep in most people.

Also of concern is the low-frequency noise produced by compressor stations. Low-frequency noise (below 100 Hz) has been linked to numerous psychological, emotional, and physiological complaints. Low-frequency noise can be worse than noise at higher frequencies. It doesn't need to be considered "loud" to cause annoyance and irritation. Low-frequency noise is found to be more difficult to ignore than higher frequency noise.

Wildlife will also be adversely affected by loud noise. Laboratory experiments show reactions in some animals similar to those of humans after prolonged exposure to loud noise. Other studies show that anthropogenic noise can interfere with vocalization and communication in some species, leading one author to conclude that "The inability of creatures to successfully communicate or otherwise employ their auditory senses is detrimental to the long-term survival of these displaced creatures and the overall biological integrity of the environment."

We request PERC require the project applicant to address the following:

- Provide a study showing no human health effects from the noise associated with ongoing operations of a large 41,000 HP compressor stations, including occasional blowdowns. If none is available, require such a study be completed prior to issuing a permit for this project.
- Provide a study showing no human health effects from continual low frequency noise similar to that of the compressor station.
- Provide a study on the noise effects on echo locating bats.

- Provide a study on the effects of compressor station noise on local wildlife.

Compressor Station - Impacts on Greenville's Water Supply

The Town of Greenville (population 2,105) has a town-owned water plant that is physically located on Route 45 in Temple and draws its water from the Tobey Reservoir, also in Temple.

The Greenville Water Department has approximately 356 water connections, one of which services a 190 unit mobile home park. The water service includes all the downtown businesses, one of which is a manufacturing facility that produces vinegar and mustard, as well as restaurants, convenient stores, a bakery, etc. In addition, the Greenville Water Plant provides the water for the Temple Elementary School in Temple, as well as, the water for pressurized fire hydrants in that area of Route 45 in Temple.

The proposed Compressor Station for the NED project will be approximately 7/10th of a mile from the Greenville Water Plant. Since the Greenville Water Plant provides water to approximately 65% of our population, we have grave concerns regarding any type of pollution of the Tobey Reservoir, as well as any underground disruption of source waters of the Tobey Reservoir.

We request PERC require the project applicant to address the following:

- Provide environmental studies showing that the blowdowns and general operations of the proposed compressor station will have no impact whatsoever on the volume or purity of the Tobey Reservoir and that it will not adversely affect water department operations.

Compressor Station -Impact on Temple Elementary SchoolEmergency Shelter

We fail to understand why any corporation would make the decision to construct a 41,000 horse power compressor station a mere 1/2 mile from an elementary school. Similarly, we do not understand why they would place such a facility where its emissions can pollute the nearby reservoir which supplies the school's drinking water.

This is Kinder Morgan's plan for its Hillsborough County Compressor Station in New Ipswich, NH. We are very concerned about the welfare of the children and staff of Temple's Elementary School, and for any other school placed in such a situation in our country.

Schools are not just where kids go to class, it's where they play outside at recess, have lunch, have indoor and outdoor afterschool activities, and where they wait in line to get on their buses to go home.

We request FERC require the project applicant to address the following:

- Provide in-depth training for the decision makers at Kinder Morgan focused on the particular vulnerability of children to the harmful effects of toxic pollutants, and we request that the training include:
 - o Wilma Subra's research on the health hazards within a 2 mile radius of compressor stations;
 - o The Madison County, NY Health Department's report on health impacts from compressor station emissions;
 - o The Southwest Pennsylvania Environmental Health Project's Summary on Compressor Stations and Health Impacts; and
 - o Mina Hamilton's document, "More than a Pipeline: A Toxic Industrial Infrastructure".
- An investigation and report to the town of Temple on the effects of compressor station noise and low frequency vibrations on the ability of children and adults to concentrate, plus the short term and long term health impacts of blow downs, fugitive emissions and other gas releases associated with compressor stations, including the latest data, using continuous monitoring for toxic gas levels rather than yearly averages, with a special concern for kids with asthma.
- A pre-construction baseline health survey of the students and staff at our school conducted by professional public health practitioners and paid for by Kinder Morgan, with a commitment to have the children's health profiles professionally monitored for 10 years.

Clearly, it is NOT a priority of Kinder Morgan's to responsibly site their compressor stations and contain or eliminate their emissions of toxic pollutants. When asked about emissions at the New Ipswich Informational Open House, they would not even acknowledge toxic pollutants being emitted from their stacks during blowdowns.

It is further alarming to learn about Kinder Morgan's safety record as well as that of compressor stations throughout the US, which have had 11 spills, fires, and explosions in the past 11 years. As Kinder Morgan reported in their SEC 10K filing: "From time to time, despite our best efforts, our pipelines experience leaks and ruptures which may cause explosions, fire, and damage to the environment, damage to property and/or personal injury or death"

Furthermore, their actual accident record, as reported by the Pipeline and Hazardous Material Safety Administration (PHMSA) states that just since 2003 they have had "180 incidents of spills, fires, explosions, injuries and fatalities"

Compressor Station - Most Recent Resource Report

Kinder Morgan's most recent Resource Report is incomplete, insufficient in scope, and is not sufficiently protective of the health, safety, and welfare of the public and the environment. The Report states clearly that the public safety is ensured based upon "empirical information." The overly simplistic use of empirical data does not include the unique features of our environment. The Report also states "the greatest hazard of a natural gas transmission line is a pipeline rupture that results in a fire or explosion." Yet the report does not consider that New Hampshire is the second most densely forested state in the continental u.s. and that many of its potentially impacted towns are heavily forested communities. The report does not mention that many towns have all-volunteer fire departments and it does not address the towns' ability to contain and limit the growth of a fire-related incident during periods of dry weather.

The report does not refer to the existing Emergency Plan of the NH towns along the pipeline. The report does not note that many communities may have only one or two policemen on duty at a time (and in limited cases none). The Report does not acknowledge the location of the Temple police station being situated two towns south of Temple, in the Town of Greenville. This detail is unique to Temple. The Report does not address the possibility that the police travelling from Greenville to Temple in response to a reported pipeline or compressor station hazard need to access the one or two roads that may be impassable in the event of a fire or rupture. Both roads are adjacent to the compressor station. Thus, a hazard may at times prevent the Temple police from beginning the evacuation of the citizens to minimize the loss of life.

These concerns are not unprecedented and are well documented. Although not one NTSB Pipeline Accident Briefing is referred to in the Report, we note the May 2009 briefing entitled "Rupture of Florida Gas Transmission Pipeline and release of Natural Gas". This report describes the closure of a highway due to a pipeline rupture. It further describes the evacuation of a local school to prevent injury. In this case there were three injuries including a first responder. The Tennessee Gas Pipeline Report does not indicate that the Town's only school is located about two thousand feet from the proposed pipeline and compressor station. It does not address the means by which the school can transport the children to a safe zone. In Temple, the school busses do not remain at the school during school hours and are often in use during school hours. The current school evacuation plan has the children crossing Route 45 and being secured within a wooden barn. An alternate plan will be needed.

The Report does not consider the fact that the school is also the only emergency shelter in the Town of Temple. This emergency shelter has provided housing for residents during past and recent declared emergencies. This emergency shelter's ventilation system requires the use of outdoor ambient air which is subject to any emissions received from the proposed site of the compressor station.

The report fails to address compressor station hazards that occur during declared emergencies. It does not mention the twelve-day emergency that began on December 11th, 2008. The Governor signed the Emergency Declaration on December 13th as the residents of Temple were beginning to occupy the emergency shelter. These residents had nowhere else to go; entry and egress to and from the Town was prevented by

the massive amount of fallen trees and power lines on the ground and crossing almost every road and street. Although this disaster lasted over a week, the adjacent Towns were not able to provide mutual aid because they too were in distress.

The Report also failed to consider all other types of natural disasters that have been declared in Temple. Some claim the worst natural disaster was the 1993 snow storm, It has been called the storm of the century by some. TIIIS storm was huge and affected 26 states as well as most of eastern Canada. The storm came with cold Arctic air, heavy snow and hurricane force winds. The storm left 10 million people without power, 310 people lost their lives and the storm cost \$6.6 billion in damages.

Other notable disasters include the 1940 New Hampshire earthquake. On December 20, 1940, New Hampshire had a 5.5 magnitude earthquake with the epicenter in Ossipee. The effects of the earthquake were felt in Montreal and Quebec, Canada as well as Maine, New Jersey, New York, Pennsylvania, Delaware, Massachusetts, Vermont and Rhode Island. Damages from the storm included broken pipes, furniture and walls as well as several damaged chimneys and water wells.

Clearly the Tennessee Report admits the use of “empirical information.” However, the type of information referenced does not well address our environment and the many potential hazards associated the proposed pipeline and compressor station locations. The Tennessee Report claims compliance with the Pipeline and Hazardous Materials Safety Administration (“PHMSA”) 49, CFR Part 192. We submit that they are grossly misrepresenting the situation, and as proposed, significantly violate many requirements including “the availability of personnel, equipment, tools, and materials, as needed at the scene of an emergency, and the “making safe any actual or potential hazard to life.” Without a hazard analysis the Report’s claim remain unsubstantiated.

We are greatly concerned the Tennessee draft Report seems to ignore the lessons learned within documented NTSB reports. It also does not consider a local and occupied religious facility, called Our Lady of Hope. This facility is located just across the street from the proposed compressor station and the pipeline is located under or next to their land. Why is this facility not considered in the federally-mandated risk assessment?

In addition to inadequately assessing public safety, the Draft Environmental Report does not even mention the precious raptors and eagles. Ignored entirely is the extremely important migration route for raptors. Temple is part of and contiguous to one of the few pathways for the twice-yearly migration of rap tors which is federally recognized. Thousands are recorded each year on Pack Monadnock as they begin their flight south (toward the compressor station) in the fall, and often times over ten thousand are reported and counted. The site is one of approximately 169 consistently reporting North American watch sites, all of which enter their daily observations into a database administered by the Hawk Migration Association of North America (HMANA). Audubon employs a naturalist to record raptor migrations in Temple during the period from August to November each year, supported by volunteers who, in 2012 “logged 600 observation hours over 85 days”. The proposed location for the compressor station in New Ipswich is on the lead line of this very special migration. What assessments have been made for the compressor station’s heat plumes, drafts, blow-downs, noise and light? There are none mentioned in the Environmental Draft Report.

We request FERC require the project applicant to address the following:

- A comprehensive hazard analysis report written by an independent Professional Engineer with significant expertise to identify all potential impacts and hazards to the local environment resulting from the proposed compressor station. The analysis is to include the probability of occurrence and the severity of hazards assuming multiple scenarios.
- A comprehensive analysis written by a Professional Engineer or PhD with significant expertise to address all potential hazards to the local bird species, including all recorded migratory birds, resulting from the proposed location of the compressor station. The analysis is to include the probability of occurrence and the severity of hazard assuming multiple compressor station hazard scenarios.

Compressor Station - Light Pollution

The towns of the NH Municipal Pipeline Coalition request that the preservation of dark skies be included as an environmental factor in evaluating the proposed KM pipeline and its location of the metering and compressor stations. Dark skies are a gift of nature, along with clean water, clean air, and freedom from excessive noise. It affects the very quality of our lives. Night light also has a serious effect on our wildlife and trees.

All over the world scientists are discovering damage to the ecosystem from artificial lighting. Migrating birds tend to travel at night when there is less risk of predators and winds subside. Artificial light sources are disorienting to birds, bats, turtles and even to trees that in turn host a variety of insects and wildlife. Many of our towns have passed Dark Sky Ordinances to halt the growth of indiscriminate lighting.

Without regulation of its lighting, the proposed compressor station may become a small city needlessly polluting our skies and destroying the very special gift of being able to see the night sky. In addition, station blowdowns will release both light and heat, to say nothing of the toxins, threatening our migrating birds, bats, and especially raptors.

The nearby Wapack Trail will be affected and is an important nesting ground for a number of threatened species of birds. Night light also affects adversely the breeding habits of turtles and frogs.

We acknowledge that light is necessary for safety, but at the same time we request that FERC require Kinder Morgan to specify details of the lighting at the compressor and other stations along the pipeline path that will:

- Embody the latest scientific research on wave-length characteristics to avoid harming wildlife.
- Minimize the angles of illumination and intensity of light to protect our dark skies and wildlife.
- Limit blowdowns to daylight hours to minimize the released heat and light that harms our wildlife.
- Include study of bird, especially raptor migration, to show that the pipeline and its stations will not adversely affect these flyways.
- Follow any existing dark sky/lighting ordinances that have been adopted by any impacted NH towns

For reference, we provide below the ordinance from Temple, NH:

TOWN OF TEMPLE, NH - ZONING ORDINANCE

(As amended through March 31, 2013)

SECTION 30: (2013) LIGHTING/DARK SKY PROTECTION

Outdoor lighting installed in the Town of Temple shall comply with the requirements specified below.

I. AUTHORITY

This ordinance is adopted pursuant to the enabling provisions of RSA 674:16 and 674:21 relative to innovative land use controls.

II. PURPOSE

The intent of this ordinance is to maintain the rural character of Temple, in part by preserving the visibility of night-time skies. This ordinance recognizes the importance of lighting for safety and security while encouraging energy efficiency, and promotes good neighborly relations by preventing glare from outdoor lights from intruding on nearby properties or posing a hazard to pedestrians or drivers.

III. DEFINITIONS

Direct Light: Light emitted directly from the lamp, off of the reflector or reflector diffuser, or through the refractor or diffuser lens, of a luminaire.

Fixture: The assembly that houses the lamp or lamps and can include all or some of the following parts: housing, mounting bracket or pole socket, lamp holder, ballast, reflector or mirror, and/or refractor or lens.

Lamp: The component of a luminaire that produces the actual light.

Luminaire: A complete lighting assembly that includes the fixture and its lamp or lamps. **Flood or Spot-light:** Any light fixture or lamp that incorporates a reflector or a refractor to concentrate the light output into a directed beam in a particular direction.

Glare: Light emitting from a luminaire with intensity great enough to reduce a viewer's ability to see and, in extreme cases, causing momentary blindness.

Height of Luminaire: The height of a luminaire shall be the vertical distance from the ground directly below the centerline of the luminaire to the lowest direct-light-emitting part of the luminaire.

Indirect Light: Direct light that has been reflected or has scattered off of other surfaces.

Light Trespass: The shining of light produced by a luminaire beyond the boundaries of the property on which it is located.

Lumen: A unit of luminous flux. One foot candle is one lumen per square foot. For the purposes of this ordinance, the lumen-output values shall be the initial lumen output rating of a lamp.

Outdoor Lighting: The night-time illumination of an outside area or object by any manmade device located outdoors that produces light by any means.

Temporary Outdoor Lighting: The specific illumination of an outside area or object by any manmade device located outdoors that produces light by any means for a period of less than seven days with at least 180 days passing before being used again.

III. OUTDOOR LIGHTING DESIGN

A. Any luminaire emitting more than 1800 lumens (with 1,700 lumens being the typical output of a 100-watt incandescent bulb) shall be fully shielded so as to produce no light above a horizontal plane through the lowest direct light-emitting part of the luminaire. (Such fixtures usually are labeled Dark Sky Certified or Compliant.)

B. Any luminaire with a lamp or lamps rated at a total of more than 1800 lumens, and all flood or spot lights with a lamp or lamps rated at a total of more than 900 lumens, shall be mounted at a height equal to or less than the value $3 + (D/3)$ where D is the distance in feet to the nearest property boundary. The maximum height of the luminaire shall not exceed 40 feet.

C. Any luminaire with a lamp or lamps rated at 1800 lumens or less, and all flood or spot lights with a lamp or lamps rated at 900 lumens or less, may be used without restriction to light distribution or mounting height, except that, to prevent light trespass, if any flood or spot light is aimed or toward residential buildings on adjacent or nearby land, or to create glare perceptible to pedestrians or persons operating motor vehicles on public ways, the luminaire shall be redirected, or its light output reduced or shielded, as necessary to eliminate such conditions.

D. Moving, fluttering, blinking, or flashing, neon or tubular lights or signs shall not be permitted, except as temporary seasonal holiday decorations. Signs may be illuminated only by continuous direct white light with illumination confined to the area of the sign and directed downward.

E. Luminaires mounted on a canopy shall be recessed in the ceiling of the canopy so that the lens cover is recessed or mounted flush with the ceiling of the canopy and fully shielded. Luminaires shall not be mounted on the sides or top of the canopy, and the sides of the canopy shall not be illuminated.

F. When aviation lighting is required, the latest technologies shall be employed in order to minimize the visual impact of such lighting.

G. The Planning Board requests that lighting controlled by the Town of Temple or other controlling agencies take advantage of the latest technologies in order to satisfy the intent of this ordinance.

IV. EXEMPTIONS

A. Public-roadway illumination, emergency lighting, and vehicular luminaires shall be exempt.

B. Seasonal holiday lighting and illumination of the American and state flags shall be exempt from the

requirements of this ordinance, providing that such lighting does not produce glare on roadways and neighboring residential properties.

C. Installations existing prior to the enactment of this ordinance are exempt from its requirements. However, any changes to an existing lighting system, fixture replacements, or any grandfathered lighting system that is moved, must meet these standards.

V. TEMPORARY LIGHTING

Any temporary outdoor lighting for construction or other purposes that does not conform to the requirements of this article may be permitted by the planning board after considering:

- A. The public and/or private benefits that will result from the temporary lighting.
- B. Any annoyance or safety problems that may result from the use of the temporary lighting.
- C. The duration of the temporary non-conforming lighting.

Fault

A fault named the Triassic border fault (also called the Warwick fault) does exist in the SW corner of New Hampshire located on the NH/MA state line, where it dips down into Massachusetts for some distance.

New Hampshire lies entirely within the Appalachian Highlands, which extend northeasterly from Alabama to Newfoundland. Geologically, New Hampshire is in the midst of the Appalachian Province, halfway between the pre-Cambrian metamorphic and igneous rocks of the foreland, exposed in the Adirondack Mountains of New York and the Canadian Shield, and the Cretaceous and Cenozoic sediments of the Coastal Plain.

Cutting diagonally across the trend of the Appalachians, New Hampshire offers an opportunity to study the deeply eroded core of a mountain system that first formed hundreds of millions of years ago. Here we find folded and faulted Paleozoic sedimentary and volcanic rocks that have been thoroughly metamorphosed and penetrated by large and small bodies of plutonic rocks. It is in regions such as this that geologists hope to find some of the more significant clues to the causes of mountain building.

Most of the known normal faults are confined to a belt 12 miles wide in the extreme western part of the state, between Enfield and the Massachusetts border, a distance of 65 miles.

The Triassic border fault exists in the extreme southwest corner of the state; a fault that bounds the Kinsman quartz Mennonite on the southeast. This fault is called the Triassic border fault in section PF' because further south in Massachusetts it borders the Triassic rocks on the east (Emerson, 1917).

The truncation of the structures along this fault is readily apparent on the geological map. The dip cannot be determined in New Hampshire, but in Massachusetts, 10 miles south of the state line, the fault dips 60 degrees W. in one exposure and 35 degrees NW in the other.

In southwestern New Hampshire (Winchester & Richmond), the block on the northwest side has been down dropped 15,000 to 20,000 feet.

We request FERC require the project applicant to address the following:

- Describe the impact of a significant nearby earthquake on a 3D-inch, high pressure gas pipeline. Describe the worst case scenario resulting from a significant earthquake in the area of Richmond, NH on the pipeline, its valves, and the compressor station.
- Identify what damages could potentially occur if blasting is incorporated along the edges of what we historically have thought of as “the Warwick Fault”, located along the state line between Winchester & Richmond, NH and Warwick, MA.

Impact on Property Values

Kinder Morgan has repeatedly stated that the proposed pipeline and compressor station will not impact property values of nearby residences and, therefore, no additional compensation is due to those property

owners.

We are already seeing that properties for sale along the pipeline, particularly those in close proximity to the proposed compressor station, are being shunned by those seeking to buy properties locally.

We request FERC require the project applicant to address the following:

- Commission a study by independent experts to determine what the impact on property values actually is within proximity to a high pressure transmission pipeline as well as near a similarly sized compressor station.

We refer you to a 2014 Fremont Center NY study by a certified real estate appraiser that determined homes close to a compressor station should be reduced by 25% to 50%. Further, that study's compressor station is approximately one-third the size of the proposed New Ipswich station. The appraisers' rationale included safety hazards substantiated by a middle of the night evacuation, air pollution and noxious odors, persistent vibration and noise, damage from construction and increased truck traffic.

Further, we request FERC require the project applicant to address the following:

- The study include the impact of pipelines/compressor stations on the tax rates in those affected communities.

An analysis within the Town of Temple shows that the pipeline/compressor station will reduce the value of those houses in close proximity. This will then cause notable increases in taxes to other property owners in Temple to cover the loss of value and taxes from houses near the pipeline/compressor station. Similarly, property owners in the other eight ConVal towns will experience an increase in their taxes as the costs of the consolidated school is shifted to those communities.

Respect for New Hampshire Processes

State and Local Regulatory Requirements

- In its recent Resource Report 1, Table 1.6-1, Kinder Morgan identifies at least eleven (11) state or federal permits, licenses, approvals, or certificates required for construction, operation or maintenance of the NED project in New Hampshire.
- New Hampshire Site Evaluation Committee, RSA 162-H, relative to siting energy facilities.
- Clean Water Act 401 Water Quality Certificate
- NH Dredge and Fill Permit (NH RSA 482-A, Dredge & Fill in Wetlands)
- Shoreland Permit (NH RSA 483-B, Shoreland Protection Act (applies to oceans, rivers, lakes & large ponds).
- National Pollution Elimination System "Construction General Permit". (US Clean Water Act)
- NH Department of Environmental Services "Air Emissions Permit"
- State Species Consultations with NH Fish & Game and NH Department of Resources and Economic Development.
- Historic Preservation Act review with NH Division of Historical Resources.
- Large Groundwater Withdrawal Permit (NH-DES Watershed Management Bureau)
- Surface Water Use Registration (NH-DES Watershed Management Bureau)
- Alteration of Terrain (NH-DES)
- NH-DOT Driveway Permit (not included on Kinder Morgan's list)

All these permits are important and are mandated by existing statutes.

We request FERC require the project applicant to address the following:

- Complete all state regulatory requirements that Kinder Morgan itself has identified in Resource Report 1, by making approval (if any) contingent on its adhering to the regulatory requirements that it has

identified.

- Follow all zoning ordinances and a site plan review requirements in any impacted NH town. It is through zoning ordinances, subdivision regulations, and site plan review, that the people of New Hampshire govern land use at the local level. Each of these towns have a master plan setting out the vision of land use in their town, and over the years each town has crafted ordinances consistent with their master plan.
- By way of additional specifics, require the applicant follow all town aquifer protection ordinances, wetlands protection ordinances, and/or stormwater management ordinances, either built into their zoning ordinances or as stand-alone ordinances. Some town ordinances include regulation of nuisance, noise and outdoor lighting, which we request also be followed.
- Compliance with any town excavation ordinances.
- We ask FERC to discourage the use of Federal preemption to avoid the state regulatory scheme, and to demand that Tennessee disclose which, if any, of the permits and processes it listed in Resource Report 1, Table 1.6-1 that it believes may be preempted by Federal law.

Local ordinances typically represent many years of hard work by dedicated volunteers who care deeply about where they live. Zoning ordinances must be enacted by majority vote at a Town Meeting or by ballot on an election day. The zoning ordinance is a direct reflection of the will of the people as to what their town should look like, what quality of life means to the voters, how the people believe the land should be used.

Blasting and excavation ordinances are enacted for the safety of the community and to ensure that construction or industrial activities do not obliterate the quiet enjoyment of neighboring properties or the towns in general.

Now one knows better than the residents of a community what kind of law and regulation is needed to preserve and enhance the values of that community. Respect for local ordinances equals respect for the people of the community.

A spreadsheet is attached, which summarizes the New Hampshire regulatory process, the administering agency, and the statutory authorization for each.

Easement Language

We are concerned that, if approved, the proposed pipeline could, in the future, not be needed to transport dry natural gas and would then be available for the transportation of other liquids. Some such liquids could be hazardous. In order to protect the impacted NH communities,

We request FERC require the project applicant to:

- Include language in any and all easements within NH that strictly limits the easement for the use of “dry natural gas” in the pipeline.

Emergency Response - During Construction and Operations

Many of the NH communities that the pipeline would cross have fire and ambulance departments that are served solely by volunteer, “on call” individuals. Comments for the sections on “Emergency Response” were collected from meetings with area fire chiefs and emergency coordinators.

We request FERC require the project applicant to fully address the following questions:

- What is your emergency response plan? When will we receive a copy of it?
- Will Kinder Morgan be installing an Active (CO₂) or a passive fire suppression system?
- Will Kinder Morgan Install gas leak detectors at the Compression station if one is installed in the town?
- Will KM provide and pay for initial and ongoing Training for all first responders (police, fire, ambulance, emergency management and highway)? How often will training take place? Is there a point at

which training would end? If so, what is that point?

- Will Kinder Morgan supply emergency responding personnel with Pipeline Safety Education to the level of Technician? Training in accordance to meet or exceed OSHA 1910.120.
- Will KM provide Trench Rescue and Confined Space rescue training for all personnel along the pipeline corridor? Is there a maximum number of personnel that KM will train or will all currently employed and/or volunteer workers be trained?
- What kind of special protective gear is needed for first responders at an incident? Please list any and all specific equipment. Will Kinder Morgan provide and maintain it or replace if damaged, as long as it is needed?
- How many personnel will respond from Kinder Morgan in case of an incident?
- What security monitoring will be implemented during the construction along the length of the pipeline (alarms, fences, manpower, cameras, and patrols)? How many systems? Who will monitor them? Where will tapes and images be kept? How long will they be kept? Who will assess them? Will information be available to all departments?
- What access will the Emergency Responder's have to the pipeline and compression stations? Will they have access 24 hours a day seven days a week? If not, how will access be conducted and by whom? Who will be the immediate contact?
- Will Kinder Morgan provide an A TV or like vehicle for access to the pipeline by emergency responders? Will we have keys to unlock newly installed gates or other restrictions at the Eversource r-o-w and Kinder Morgan r-o-w to have emergency access?
- Will evacuation routes be maintained during construction?
- How often will meetings with compressor pipeline operator or designee be held?
- How often will KM supply a detailed site plan?
- Will Kinder Morgan provide Medical equipment for a mass casualty incident?
- What is the plan to protect the pipeline from a Soft Terrorism threat?
- Will Kinder Morgan provide a messaging system for notification of an incident or training (including message boards)?
- How is the lack of 24 hour police coverage going to be addressed in those communities that do not have it?
- Many fire department and EMS services are "on call" departments with minimal manpower during the daytime. How will this be addressed to ensure sufficient personnel are available in the event of a significant weekday emergency?
- Will Kinder Morgan maintain road access to the compression stations and pipeline? This would include snow removal and roadway maintenance and upkeep so that emergency vehicles can respond.
- What will the state involvement be in an incident? Who will be contacting the state departments in case of an incident?
- Where is the closest service field representative located? What is their response time to any individual town?
- What are the plans for a wide spread emergency affecting more than one town at the same time?
- Where does funding come from to reimburse for emergency response (including alarm activations and full blown incidents) and how soon is it available?
- Will Kinder Morgan be paying for security details for surveyors and workers during the initial phases of the project?
- How are warning systems activated? What is the time lapse for activation?

- With both the primary and secondary Emergency Shelters being within the hot zone in case of an incident, what will Kinder Morgan do to mitigate the situation and relocate the shelter out of the hot zone.

Emergency Plans - Contingencies

We are concerned about streets that would be cut-off from emergency services in the event of a pipeline incident. They may be dead-end streets that are bisected by the pipeline or streets that are located on the other side of the pipeline from fire, ambulance or police stations.

While the probabilities of an event may be small, it is critical that we plan for the worst.

We request FERC require the project applicant to:

- Develop plans with the emergency services departments of any NH town with roads that could be cut-off from responding emergency vehicles in the event of a pipeline-related incident. The Plan in each town will detail how residents will be reached and evacuated in the event of such an incident where the existing road to them is impassable.

Decommissioning

We request FERC require the project applicant to answer the following:

- What is the time frame for the use of the pipeline and what is the process of decommissioning the pipeline.
- What are the phases of decommissioning the pipeline and the time frame for each phase?
- What are the long-term environmental emergencies for the decommissioning of the pipeline?
- What happens to the pipeline and all equipment following the decommissioning?
- What type of security will be required (bond or deposit) for decommissioning?

We have serious concerns about the proposed project and expect FERC to ensure all of the above concerns and requests are fully addressed by the applicant.

Sincerely,

October 16, 2015

Re: Tennessee Gas Pipeline Company, LLC
Docket No. PF14-22-000
Northeast Energy Direct Project

Dear Secretary Bose,

Below are the comments I wish to submit to the FERC Commissioners:

In May of last year I stood up at the first Pipeline meeting in Pepperell and spoke about MY shareholders, those that I answer to - my children. Pepperell was on the “preferred path” at that time, and the pipe was passing within about 100 feet of my kids bedroom windows. We were in the “Incineration Zone”.

FERC Commissioners, I will tell you, once the pipeline comes into your life, there is no peace. Gone are nights of restful sleep. Gone is free relaxation time. Gone is the sense of happiness and wellbeing. My spouse and I would pass each other during the night, taking turns reading documents online. Midnight, 2am, 4am. We were run down, and burnt out. Our kids paid the price, and continue to - free time doesn't go to them, it goes to the second job known as STOP THE PIPELINE.

My husband and I try to assure our children that they are “safe”. But how to do that when we don't feel safe? Our feeling of safety was removed last January when Kinder Morgan came to our door and informed us that they were going to put a pipeline through our yard. How do we feel safe when helicopters fly repeatedly over our property?

I have attended meetings where others speak about proposed paths that lead up to their houses. They don't feel safe. How can they? They don't feel safe about what will happen to their water when drilling impacts aquifers. In New Ipswich NH a Compressor station is planned near a school. To any logical mind, this seems criminal. I work at a school, and the safety of children is of the utmost importance. Why subject them, purposefully, to hazards of impure air and water?

FERC Commissioners hear me: You have no right to authorize the use of eminent domain by a \$100 Billion dollar corporation to forcibly build a pipeline through the home and land of any citizen and ratepayer. Especially when the need is not justified, and case for need is cleverly manipulated to veil the real objective of this project: to enable the export of natural gas to markets overseas. The use of eminent domain on this pretext is reprehensible and violates every tenet upon which this country was founded.

You have a real leadership opportunity before you, The opportunity to demonstrate that your Commission, FERC, is indeed a regulatory body that is vigilant in safeguarding the interests of homeowners and families just like your own. Put down the rubber-stamp and take a close look at this project. As my daughter McKenna testified at the Dracut scoping session on August 11, 2015, with great power comes great responsibility. Take ownership of the responsibility before you and ultimately deny this application.

My children, and all children have the right to clean water and air in their future. Review the case for need carefully. They do not need to be burdened with debt for a project that is obsolete before construction, as it

ties us down to fossil fuel-based power generation of the past instead of renewable-based, sustainable generation of the future.

FERC Commissioners, I am raising my son to be a Boy Scout, teaching him about truth, dignity and honesty. As I drove him through along the roads of potentially impacted towns such as Townsend, Temple and New Ipswich, we passed beautiful areas. You need to know these areas and the people to know the collateral damage you are suggesting to impose for the “greater good”. Think carefully, and choose the right path. Make the right decision. One that is based on need, not greed.

Respectfully Submitted,

Denene Premus
43 Elm Street
Pepperell MA 01463

20151016-5240

Subject: Docket #PF14-22: page 1 of 2 Patricia Martin

Dear Ms. Bose,

I have learned so much during this last year! Just a few months ago, I’d never heard the expression, “Regulatory Capture.” I have put hours into writing comments for this docket, NH PUC dockets related to this project and testimony before legislative committees regarding our energy future. I’ve also written to all my elected representatives and letters to the newspapers about what a terrible idea this pipeline is for New Hampshire. In fact, I do not support any pipeline projects built at ELECTRIC ratepayer expense nor do I support this massive influx of fossil fuels into New England at a time when we should be transitioning away from them.

I would like to draw your attention once again to the unprecedented plans for financing this pipeline project. It is abundantly clear that the majority of the pipeline capacity will be used to expand the market for the LDCs supplying natural gas for thermal loads, yet the expense for building these pipelines rest squarely on the shoulders of electric ratepayers.

The NH PUC Staff issued a report on Docket IR 15-124 on September 15th. The purpose of the docket was to investigate high winter electricity prices and solicit proposals for addressing the problem. For most of the PUC staff, utility company executives and lawyers, and the pipeline companies there was only one answer; not enough pipeline capacity during the coldest winter days.

Instead of looking into the need for greater fuel diversity for our electricity suppliers, which could “uncouple” our electric supply from weather conditions and thermal load competition; docket participants simply “doubled down” on the amount of natural gas flowing into New England.

They, and apparently FERC too, are willing to commit consumers to a course of action that will last twenty years. And yet, very little discussion was had about what our electric grid might look like in 20 years or what might happen in terms of the impact environmental regulations or global demand will have on natural gas prices over even the next few years!

Below is the text of my comments to the NH PUC regarding the report issued by PUC Staff on IR15-124. I maintain that it is imprudent to use public funds intended to:

- 1.) Combat greenhouse gases and
 - 2.) Maintain a sustainable grid,
- as a means to transition from one fossil fuel to another.

In New England where we already generate 52% of our electricity from natural gas and generate less than 7% with oil and coal fired sources combined, natural gas is not a bridge fuel, but a gangplank.

Thank you for the opportunity to comment. My remarks to the NH PUC follow.

Debra A. Howland
Executive Director
New Hampshire Public Utilities Commission
21 S. Fruit Street, Suite 10
Concord, NH 03301

Response to Staff Report on IR15-124, dated September 15, 2015

Dear Ms. Howland,

Thank you for the opportunity to provide a response to the PUC Staff Report on IR15-124. As a consumer and active member of a town energy commission, I appreciate the chance to weigh in on the momentous decisions being made regarding our economic and energy future.

My comments are my own opinion. I represent no organization, company, lobbying group, party or special interest. While I belong to many energy related volunteer organizations and may reference published materials from such organizations; I do so without their endorsement.

1.) My first concern with the PUC Staff report is the discussion surrounding use of the Request For Proposal (RFP) process as described on pages 46 and 47 for EDCs contracting capacity.

“As long as a significant number of the New England EDCs are affiliated with the sponsors of one of the competing pipeline projects, we believe it will be difficult if not impossible for EDCs to make a convincing case that pipeline open seasons qualify as fair, open and transparent competitive processes. For this reason, we believe it is imperative that the states develop and post for comment an alternative competitive solicitation process (i.e., Request for Proposals (“RFP”)) much like the three southern New England states did when they developed a joint Clean Energy RFP.”

An RFP process that results in 20 year firm contracts for capacity on one or more of the pipeline projects is unlikely to result in competitive pricing or consumer protections over the long run. The competitiveness is confined to a single point in time at the beginning of the 20 year contract. As a consumer, it is incredibly distressing to know that companies like Liberty Utilities, which have a financial interest in pipeline construction and operation, are willing to allow electricity consumers to bear all the risk, while their shareholders will enjoy a steady revenue stream whether or not a single dekatherm is shipped to a power generator.

Moreover, the basis or evaluation criteria tied to the delivered price of gas is highly speculative by its very nature. Proposed pipeline buildouts to other States from the Marcellus Shale can, and likely will, create new upward pressure on gas prices. From page 47 of the report,

“Gas infrastructure projects, whether pipeline or LNG based, should be graded primarily on the basis of the delivered price of gas. This, however, raises the difficult question of how to determine in the context of an RFP the average price of gas at a specific receipt point over a 15- to 20-year contract term. While current market conditions may indicate some receipt points can access lower cost gas than others, those conditions are likely to change over time making such comparisons unreliable.” In summary, the RFP process is proposed not to protect ratepayers, but to give assurances to the EDCs that no one company will be given advantage over another.

2.) Who are the customers for this gas?

On page 41, the PUC Staff reports,

“In the event the states chose to go ahead with a region-wide solution and purchase pipeline capacity under long term contracts with EDCs, Unitil declined to directly answer the question of whether it would voluntarily agree to pay a portion of such capacity costs even if it were not required to contract for capacity. The most Unitil would say was that “it would seem feasible to allocate a share of net capacity costs from an EDC who does contract for pipeline capacity to an EDC that does not.” In contrast, Liberty Utilities states that it “would be willing to pay its portion of any region-wide solution that may be implemented provided such costs would be fully recoverable from all of its customers during the period Liberty is obligated to pay for such costs.” As an investor in the project, Liberty Utilities has nothing to lose here.

New England Power Generators Association, which represents 80% of the electricity suppliers/power generators in New England, opposes the plan to build pipelines at ratepayer expense as summarized in the report on page 39,

“NEPGA urges the Commission not to intervene in the competitive energy marketplace in support of out-of-market energy infrastructure initiatives that seek to subsidize interstate natural gas pipeline expansion projects and large-scale hydroelectric and wind energy purchases via the construction of high voltage transmission lines. NEPGA’s principal argument in support of its recommendation is that New England’s electricity and fuel supply markets are performing efficiently as evidenced by the significant investments being made in new power plants, the development of new pipelines, and the implementation of new and creative concepts to increase energy supplies, all without consumers bearing the risks associated with those investments. Undercutting those efforts through subsidized out-of-market initiatives could have significant unintended consequences for the power system and electricity consumers, according to NEPGA.”

With an entire utility and 80% of the intended customers for these pipeline projects resisting the plan, how will electric ratepayers recover costs?

Also, in an October 5th presentation at the NH Energy Summit, Attorney Anthony Buxton, representing the Coalition to Lower Energy Costs (CLEC), described the situation as follows,

New England produces 52% of its electricity with natural gas, using 1 bcf/day

Pipeline Capacity into New England = 3.6 bcf/day *Note

Thermal load on an average day in Winter is 3.4 bcf/day + 1 bcf/day electricity generation

Thermal load on a very cold day in Winter is 4.5 bcf/day + 1 bcf/day electricity generation

So, our Winter gas demand is between 4.4 to 5.5 bcf/day

*Note I don’t know if Attorney Buxton was including AIM and Atlantic Bridge in this number as the number I’ve seen for existing pipeline capacity is 3.4 bcf/day?

Attorney Buxton then asserted that the goal, after all the pipeline projects are built, is to commit 38 to 40% of that capacity to electricity generation.

If both the NED and Access Northeast pipelines are built, our capacity increases by 2.1 bcf/day (1.2 +.9) from 3.6 bcf/day to 5.7 bcf/day.

40% of 5.7 bcf/day is 2.28 bcf/day for electricity generation. Since New England produces over 50% of its electricity with 1 bcf/day of natural gas, the new pipeline capacity would bring New England to over 110% of its electricity production from natural gas. How is that possible...or desirable?

Moreover, 60% of 5.7 bcf/day is only 3.4 bcf/day. That is the amount currently available to LDCs during the winter when, as Attorney Buxton noted, they need 4.5 bcf/day on very cold days.

If the 500K Dekatherms that the LDCs have already contracted for on the NED reflect market growth, won’t the peak winter demand be 5 bcf/day; leaving only .7 bcf/day for electricity generators?

If instead, Attorney Buxton meant that 38 to 40% of new capacity would be used for electricity generation (40% of 2.1 bcf/day or .84 bcf/day) that would drop generation of electricity from natural gas to 42% of total.

If electricity generation will only use .84 bcf/day or 15% of total pipeline capacity, why are electric ratepayers being asked to underwrite expansion of the natural gas market?

3) Cost to ratepayers

From page 5 of the PUC Staff Report,

“(6) Based on these savings and cost estimates, Staff estimates the benefit to cost ratio for the Access Northeast project to be in the range of 1.3 to 2.0. Further, in order to allow such a cost-effective project to proceed, we estimate that the Commission would need to approve a distribution surcharge on all New Hampshire electricity consumers of about 4.8 mills per kWh. Revenues received from the release of the pipeline capacity to gas generators or to secondary market participants could result in a lower distribution

surcharge.”

And from page 6 of the PUC Staff Report,

“11) Based on the above savings and cost estimates, we estimate the benefit to cost ratio for the NED project to be in the range 5.25 to 7.0 not including the value of enhanced electric grid reliability and the investment cost to provide enhanced transportation services. Further, in order to allow such a cost-effective project to proceed, we estimate that the Commission would have to approve a distribution surcharge on all New Hampshire electricity consumers of about 3.3 mills per kWh. Revenues received from the release of the pipeline capacity to gas generators or to secondary market participants would further lower the distribution surcharge”

A little farther on into the Staff Report, on page 21,

“Based on a \$600 million levelized annual cost for the project and assuming only Eversource and National Grid EDCs choosing to enter contracts with project sponsors, New Hampshire’s Eversource affiliate Public Service Company of New Hampshire (PSNH) would be allocated 9% of the total capacity of the project at an annual cost of \$54 million.⁴¹ If this cost is recovered from all PSNH customers via a per kWh distribution surcharge, we estimate the surcharge would be about \$0.0068 per kWh or 6.8 mills per kWh. To put this surcharge in context, this is 106% higher than New Hampshire System Benefit Charge (SBC). However, we consider 6.8 mills per kWh to be a worst case outcome assuming of course the \$600 million annual cost estimate is reasonable. If all other EDCs in the region (including the region’s consumer-owned municipal and cooperative utilities) agreed to shoulder their load ratio shares of project costs, then the size of the surcharge could be reduced. However, because the Eversource and National Grid affiliated EDCs account for approximately 71% of all retail sales by EDCs in New England, the surcharge would not fall below 4.8 mills per kWh.”

On page 29 of the Staff Report,

“Based on a \$400 million levelized annual cost for the electric portion of the NED project and the assumption that only Eversource and National Grid EDCs choose to enter contracts with TGP, New Hampshire’s Eversource affiliate PSNH would be allocated 9% of the total capacity of the project at an annual cost of \$36.0 million.⁵⁹ If this cost is recovered from all PSNH customers via a per kWh distribution surcharge, we estimate the surcharge would be about \$0.0046 per kWh or 4.6 mills per kWh. For context, this is about 40% higher than the New Hampshire System Benefit Charge (SBC). If all other EDCs in the region (including the region’s consumer-owned municipal and cooperative utilities) agreed to shoulder their load ratio shares of project costs, we calculate the size of the distribution surcharge could be reduced to about 3.3 mills per kWh.”

Staff advocates for more pipelines on the basis that the more capacity we build, the lower prices will be. Again, this is highly speculative and, at this point, all we can assume are the costs. Based on the Staff Report,

Access Northeast charges will range from 4.8 to 6.8 mills per kWh

NED charges will range from 3.3 to 4.6 mills per kWh

If both projects are built, the combined cost will be 8.1 to 11.4 mills per kWh

The Systems Benefit Charge (SBC) is about 3.2 mills per kWh

Assume an average customer uses 500 kWh per month

Monthly SBC charge = 500 kWh * \$0.0032/kWh = \$1.60/month

Monthly Access Northeast charge = 500 kWh * \$0.0048/kWh = \$2.40 Minimum

Monthly NED charge = 500 kWh * \$0.0033/kWh = \$1.65 Minimum

The maximum charge for the two projects = 500 kWh * \$0.0114 = \$5.70 per month

Staff should solicit input from the utilities on how much energy efficiency and weatherization could be accomplished if we added a minimum of \$4.05 to the SBC charge on average bills instead of building pipelines.

Weatherization and energy efficiency return immediate value to ratepayers, is the “least cost” option for addressing high winter fuel costs, and reduces our carbon emissions with every MWh/BTU conserved.

The Governor, the RSAs and the experts all assert that energy efficiency should be the first fuel of choice. Since the utilities are also the gatekeepers for energy efficiency programs in New Hampshire, an energy efficiency solution must come through them in order to adequately fund the necessary research.

4) LNG Storage

At least three parties to the discussion (NEPGA, PLAN, and CLF) in IR15-124 maintain that LNG Storage and the issue of addressing a “Deliverability Problem” be considered as better solutions than building pipelines. Staff has dismissed such suggestions as unreliable and expensive.

LNG Storage is a normal and necessary element in a gas distribution system. In fact, generators operating “quick start” depend on them. This is evidenced by the marketing efforts of both Spectra and Kinder Morgan to attract generators with the Spectra “ERS” and Kinder Morgan “Power Serve” programs which allow generators to contract for storage.

On page 15, Staff reports,

“As noted, Access Northeast also includes new LNG storage facilities with a combined usable capacity of 6.0 Bcf, which when combined with liquefaction and vaporization equipment will deliver up to 0.4 Bcf/day of gas on peak winter days.”

Then there is this puzzling statement on page 20,

“Under the with Access Northeast scenario, ICF assumes the project will add 0.6 Bcf/day of incremental capacity comprising 0.5 Bcf/day of new pipeline capacity and 0.1 Bcf/day of LNG storage capacity.³⁶ The incremental capacity reduces January gas prices by about \$3/MMBtu on average, which together with even smaller average price reductions in other months translates to an annual average wholesale energy...” with the added note,

“³⁶ The assumed incremental LNG capacity is less than 0.4 Bcf/day because the stored LNG must be managed judiciously given that abnormal weather conditions can occur at any time during the coldest winter months. “

If the LNG storage facility has a capacity of 6 Bcf, it would take 15 days to fill it at .4 bcf/day. After the facility is filled, that .4 bcf/day should be released to the system. And, even if we reduce the allowed output from LNG Storage to .1 bcf/day, the total impact once the storage facility is full is to provide the full .9 bcf/day plus .1 bcf/day from storage when needed.

Excluding the .4 bcf/day used to serve LNG Storage from the total pipeline capacity feeding New England is illogical. A total of .9 bcf/day is being moved into the system; putting some of it into storage does not make it disappear.

If it is the case that ICF assumed only .6 bcf/day as the contribution from the Access Northeast pipeline proposal, then the study should be considered flawed and the models relatively useless.

5.) Fuel Diversity will suffer

Vermont Yankee, Brayton Point, and now Pilgrim Nuclear Power plants should all be considered casualties of a purportedly “least cost” strategy that will have negative impacts on consumer price protections and meeting carbon goals.

New England generates approximately 30% of its electricity with nuclear power. Nuclear power plants emit no carbon. The current rating from the EPA for NH is 918 pounds of CO₂/ MWh. The goal by 2030, according to the EPA's Clean Power Plan, is 771 pounds of CO₂/MWh. Perhaps, not so coincidentally, that is also the emission rate for the newest combined cycle natural gas plant design. Is the plan to convert every power generation source to natural gas by 2030? Please explain to the people what the strategy is here. Recent actions by the PUC, ISO-NE and state leadership seem to be in direct conflict with the goals of the NH 10 Year State Energy Strategy.

Replacing nuclear power plants and small hydro with natural gas fired plants will actually INCREASE our CO2 load by 771 pounds of CO2 for every MW replaced.

In my original comments, I noted that a lack of fuel diversity caused the spikes in winter prices. This remains true. As I mentioned, the evidence exists with Eversource actually having a profitable season because they had hydro and were able to burn coal and oil in their own plants. Eversource was not locked into contracts with independent generators for their default customers as the other utilities were.

And while fuel diversity clearly physically exists, only Eversource was able to take advantage of it during the winter of 2013-2014. Why was that?

There are clearly times when prices for LNG, oil, coal, wind and hydro are lower per MWh than natural gas. Why were alternate generators not ready to be dispatched when prices for natural gas reached levels that made them competitive? In testimony for IR 14-338, Briar Hydro complained about not being able to sell into the local grid during the pricing crisis in 2013-2014. The PUC refused to consider their complaint.

I cannot even pretend to understand the mechanisms of Forward Capacity Markets, the contracts and the auctions. I suspect only a few people do. The experts from NEPGA are among those people and they have advised against this reckless course of action regarding building pipelines at ratepayer expense. They have recommended the PUC to wait until ISO-NE's Pay For Performance rules kick in before saddling ratepayers with a tariff for pipelines.

Fossil fuels are prone to volatile pricing. New emphasis on the harmful climate effects of methane emissions in the production and transportation of natural gas will likely lead to higher prices at the wellhead for recovery equipment. The fossil fuel industry is in a slide and it's not coming back. Entire nations and many states are beginning to ban fracking. Given the global push to leave 80% of fossil fuels in the ground, isn't the PUC endorsing a welfare package for the fossil fuel industry that will leave New England ratepayers hostage to a dying industry for the next twenty years?

The latest EIA report shows that production at the Marcellus Shale is in decline because of fewer rigs being deployed. Is the PUC willing to bet that the trend will reverse before prices begin to climb? <http://www.eia.gov/petroleum/drilling/pdf/marcellus.pdf>

6. Regulatory Capture/Summary

One of my greatest concerns is that our state has taken the position that it makes sense to replace fossil fuel oil heating systems with fossil fuel natural gas systems. We not only encourage it in many energy strategy chapters for Master Plans across the state, we subsidize it with money intended to fight greenhouse gases in our atmosphere.

This needs to stop.

Since the bulk of the pipeline commitments will go to LDCs to support market growth, we will shortly find ourselves running out of capacity for electricity generation again. Only today I learned of PUC docket DG 15-442 wherein Liberty Utilities asks for franchises in several Cheshire County towns. While I suspect that this is merely a marketing ploy to try to garner support for the NED pipeline in those affected communities, I sincerely hope that Liberty will be required to thoroughly explain the investment required by homeowner to make such conversions.

The emphasis for the PUC should be on supporting the LDCs in reducing heating loads through weatherization programs so that they can direct the saved quantities to new customers.

As I explained in section 2 of this response, it is unclear how much of the proposed 2.1 bcf/day of additional pipeline capacity will benefit electric generators. So far, these projects are clearly of great benefit to some of the LDCs both in terms of growing their market at electric ratepayer expense and return on the investments they are making in the pipeline projects. The pipeline companies, of course, have nothing to risk with a captive customer base of ratepayers underwriting their investment and providing a steady revenue stream for the next twenty years.

Considering how the scrubber on the Merrimack coal plant went from \$250 Million to \$500 Million, the

costs to build these pipelines are probably underestimated. Based on the numbers provided by the PUC Staff Report, I explain in section 3 that at approximately \$5.00/month on the average electric bill, ratepayers will be on the hook for about \$1200 each over 20 years.

In section 2 I also explain that the intended customers for these pipeline projects are resistant to the very idea of this level of market interference and will not commit to purchasing gas through the EDCs.

Unfortunately, I have little hope that anything I say will change the outcome of the “pipeline story” in New England. The Office of Consumer Advocate litigator, Attorney Susan W. Chamberlin, will be gone as of November 5th. Even though the Residential Ratepayers Advisory Board voted not to reappoint OCA Chamberlin on July 27th, ratepayers only found out about it at the end of September. Her reputation is being attacked as “not understanding energy issues,” which is also designed to reinforce the notion that she is wrong in opposing the pipeline projects being funded at ratepayer expense. This is a huge blow to ratepayer interests. I feel it says everything that needs to be said about what is going on in New Hampshire.

The amounts of money spent on lawyers, advertising and lobbying by the energy companies in this state are stark in comparison with a state like Vermont. Front groups for the energy industry, masquerading as “consumer” or “ratepayer” representatives don’t even have to hide the fact that their leadership and funding come from companies like Kinder Morgan and their law firms. How can anyone come to any other conclusion than New England, and especially New Hampshire, is in a state of Regulatory Capture?

Upton Sinclair, author of “The Jungle” and “Oil!” is famously quoted,

“It is difficult to get a man to understand something, when his salary depends upon his not understanding it!”

My final recommendation is that PUC Staff request an interview with the New Hampshire Center for Public Policy Studies. Kinder Morgan originally contracted with them for a “benefit” study. That contract was terminated in April because the parties couldn’t come to an understanding. The fact that the PUC is relying so heavily on the ICF studies is of great concern, since ICF did not adequately take into account reductions in demand from energy efficiency nor the actual quantities of gas that will be added to the system, as noted in section 4 of this response.

Participating in this docket has been a wonderful learning experience for me as an engineer and as a consumer. Thank you for your consideration of my comments.

Sincerely,

Patricia A Martin

20151016-5241

Frank Barrus, New Ipswich, NH.

I am writing concerning the compressor station coming to New Ipswich, NH. How will FERC ensure that the emissions coming from the combustion of gas, the planned or unplanned release of gas, or any other activity at the compressor station, does not in any way endanger the health of the residents, animals, or plants that border the site, or in the greater surrounding area? There are many documented cases of toxic gasses released from other compressor stations. How will this one be different, in order to ensure that no toxic chemicals or other poisonous materials are released into the air, or into the surrounding waterways? (streams, aquifers, wells, etc). The minimal government regulations for checking the safety appear to only include a tiny subset of the possible emissions, and are far too infrequent. Many of the toxins can have long-term health effects that are not immediately noticeable. So bringing this industrial complex and its toxins into our region is essentially contaminating the area and jeopardizing the health of all those around. A vast majority of the people living here chose this area for the clean safe air and water and tranquil non-

industrial surroundings. How will FERC ensure that if the compressor station is allowed to be sited here, the air and water are kept clean? If the public need for the NED Pipeline cannot be shown to outweigh the health risks, it should be denied.

20151016-5243

Rishi Kumar, Nassau, NY.

Fracking and transportation of fracked gas is a relatively new venture. We did not always understand as a society how dangerous oil operations were yet we forged ahead. We are now paying the price for that in terms of its negative effects on our environment. NYS and other states are putting more money and attention toward renewables like solar and wind. The process for approval of fracked gas projects and the transportation of that gas seems far too rushed when we are talking about a process we are just now learning more about through the increasing amounts of studies being done across the country. It is what we DO NOT still know that should be just as concerning to everyone involved. The negative outcomes of transporting fracked gas cannot be undone easily. We are once again learning that with the oil business. Some of the studies that have been done regarding fracked gas, transportation of it, and the construction and operation of compressor sites are showing possible effects on groundwater including water sources for livestock of which Nassau and surrounding towns rely upon for business and food sources, leaking of toxins into the air, neurological effects on residents close to compressor stations to name only a few. These are all things which cannot be undone. Approvals to Kinder Morgan or any other company for these types of projects set a precedent. The more approvals given, the easier it would seem to become. What is worse is that it seems as though all these large companies have to do is simply say they'll address any concern or issue. But I'm not seeing any strong evidence across the country where this is also occurring that they are ever really held accountable. Please stop setting the example that it is okay to continue fracking or transporting fracked gas when we are not clear on the long term outcomes of all of this. Just because natural gas is deemed safer than other fossil fuels does NOT mean it is SAFE! Please do not allow this to continue happening. These companies that are drilling for gas and moving it across the country really only seem to be looking at profit and staying in business. I understand that and I'm not suggesting we put people out of business. Sooner or later, they'll need to start diversifying as everyone else is beginning to do or at least consider doing. We need to continue to be cautious regarding the use of fossil fuels and their rapid negative effects on our environment. Please stop the speedy and what seems careless expansion of these projects. Nassau and its surrounding communities cannot survive this. Please do not approve the NED project through our state and our beautiful community.

Sincerely,

Rishi Kumar

David F Fleming, JR, Nassau, NY.

In addition to comments submitted previously by the Town of Nassau, the Town also endorses the comments prepared and submitted by the Berkshire Regional Planning Commission on October 15, 2015.

The Town would like to point out that several alternatives and issues of concern were addressed in our Natural Resources Committee report to FERC previously submitted and on file with the application. This comprehensive review includes impacts to be considered and mitigated. These impacts should be thoroughly reviewed. Thus far, in FERC comments, these items of concern have not been addressed or have not been directed to the applicants attention.

The alternative highway route (88, I-90, Mass Pike) should be comprehensively reviewed. FERC or the

applicant has expressed some concerns regarding deep valleys along this route but FERC nor the applicant has addressed the massive rock outcroppings and hollows with sensitive habitat within Rensselaer County and the Town of Nassau in particular. It is hypocritical to suggest addressing concerns in Massachusetts and ignoring the concerns of New York residents. It is also unacceptable to consider one Massachusetts city as the basis for rejection of such a route while ignoring the concerns and impacts in our community. Urban residents have no more rights in the process than rural residents in New York. Federal environmental and economic justice guidelines should not be ignored in this NED application.

Additionally, the position of the Town of Nassau remains clear. The location of an industrial compressor station in the Clarks Chapel/Burden Lake area of the Town of Nassau is unacceptable in total in that it violates zoning, development guidelines and puts an industrial facility in a residential area. The location of such a facility may be located in an industrial district of which we have provided alternatives. The Town firmly opposes the proposed violations of our zoning and the impacts to large numbers of families by pursuing such short-sighted proposals included in this application. Further, the areas of direct impacts to residences should be mitigated by any pipeline placement which appears to completely ignore the impacts on Town of Nassau residents by placing the pipeline adjacent to the homes.

There is no indication of public need for this project in Rensselaer County. We will receive no gas service and our residents will be required to accept all the risks. Documents submitted by the applicant point out that this gas product will be transported out of the country. Therefore, there is no Rensselaer County, New York public necessity with this application.

The Town would also like to point out that should any portion of this pipeline eventually be located in our community, the thickness of the pipeline, valve shutoffs and emergency training should be the same in our community as in any urban area. The lives of our residents are worth as much as those in other areas.

In conclusion, the previous comments and studies presented by the Town of Nassau need to be fully reviewed and addressed by the applicant and FERC before any planning continues. Mitigation of impacts on the communities unwillingly involved in this project should be implemented without delay.

David F. Fleming, Jr.
Town Supervisor
Town of Nassau

20151016-5247

Kathleen Gauvin, New Ipswich, NH.

We have been told that the quality of the pipe used in rural areas, "High Consequence Areas" is thinner than the thicker pipe used in city areas. Use of this lesser quality pipe needs to be studied. The movement and rupture of this area's pipeline during the freezing weather often below zero, the January thaws, the repeated below freezing temperatures of February will put huge stress on this pipeline. The structure of our rock makes it susceptible to jarring during earthquakes, though typically small in seismic measurement. This type of rock and its movement with a thinner "high consequence area" pipe is just enough to move pipeline and cause leaks.

The seepage of gas through any of these weakened areas will cause contamination to the soil and in turn to our private wells. We do not have a public water system. Many of our private wells are dug wells. What also happens to the farm stock, organic gardens, endangered species, and pets whose ground and water becomes polluted, never mind the people of all ages living in the area!

The stated use of herbicides along the pipeline route is also unacceptable. We all know the toxins that are contained in herbicides. The leaching of these toxins into the soil, then into water via aquifers, springs, wetlands, wells and reservoirs will additionally pollute our water supplies.

WE WILL NOT BE THE NEXT MINISINK!

20151016-5248

Jennifer Beck, Wilton, NH.

The re-routing of the proposed pipeline through NH wilderness, sparsely populated, pristine towns of retirees, young families and small farms is purely political. NH doesn't need the energy - we export energy. But you can see the rationale. Let's run the thing through a few quiet towns of a thousand or so people cause they can't scream as loud as major cities in Mass. So I can only appeal to my own federal government's ability to "do the right thing" for us. Our local reps have their own agenda. It's up to you to make this right. This is when state politics need to get shoved aside by the federal government who can look at the bigger picture. Please find a way to carve that pipe along highways, industrialized centers, noisy and lit up corridors where we've already scared off the wildlife and blotted out the stars. This is all about money. And NH is willing to pay the price to protect our blessed clean air, quiet woods and abundant wildlife. Double my energy costs. Happy to pay the fee. But the FERC needs to protect the few of us who can't swing political pressures. Before you make your decision, come walk the trail up one of our mountains and breathe deeply. Come stay at my house, a few miles from the proposed compressor station, sit on my back deck and watch the red-bellied woodpeckers feed their young. See the wild turkey flock march down the road and gather under the blue spruce for cracked corn. Slip through misty waters in my kayak one morning and watch the turtles sunning themselves, and the beavers building for winter fishing. Take a motorcycle ride up Temple Mtn where we felt so strongly about development, private citizens bought the old ski hill and returned it to the wild. Take a poll. Ask us if we're willing to pay higher prices for energy or do we want a pipeline. That's the real question, isn't it? It should be our choice. But no one but you can give us that choice. Just don't screw up the American communities that still think their children should play outside rather than be glued to a digital device. These Southern NH towns - villages really - still have pumpkin festivals and 4-H fairs where kids learn to care for their environment, where people start and run family-owned small businesses, where hard working retired citizens have sought out peace and clean air and water where we can still eat the fish we catch. Take your industry where we already have industry. I'm a research fellow, not a crazy tree-hugger. I know what this is really about. It's about our government institutions like the FERC that we must trust to balance long term vision with short term heart and reason. We're depending on you to preserve both our independence and our chosen way of life. Get out of Washington and leave the environmental impact studies, big energy company bullshit, and the politicians behind for a few days — and come visit us. See the reality of what this pipeline means to rural communities. Then return to the math and science and find another way.

Respectfully,

A Tax paying American

20151016-5249

Steve M Roberto, Northfield, MA.

Good morning,

My family lives in Northfield, MA. We are downhill & downwind of the proposed NED pipeline & Compressor Station. I am deeply concerned about this project not only from a health & safety standpoint, but also from a question of need. My comments are not meant to be complete since a very important document called for by the Mass. Attorney General, M. Healy, may likely demonstrate findings that do not support the need for additional Frak (not natural) gas thru New England & especially Northfield, expected to be released in October 2015.

As an important Federal review agency, please consider factual statements to this proposal from the hundreds of agencies & groups; hundreds of doctors with peer reviewed science; & the will of the people of Massachusetts & New Hampshire. I do not have the exact numbers but believe over 80 towns along the proposed pipeline path have passed resolutions against the TGP/NED/KM proposal.

Over 90% of affected & near affected landowners have refused survey rights to Kinder Morgan. What do we

as good citizens of New England know that may not be registering with this federal process?

It is my feeling that this company has done a horrible job presenting itself to our towns. We feel we have been treated as “collateral damage” in their equation. Despite gas companies many gag orders/attempts, we find volumes of information streaming to us from Pennsylvania & Virginia on the harmful affects of frak gas, exhaust, operation & maintenance, customer relations with land owners, sickness, illness, allergies & sudden deaths reported. None of this material is made up. It is real.

We matter. Please put the full weight of this fact onto the NED project review.

Regards,

Steve Roberto

20151016-5250

Andre Wood, Greenfield, NH.

The Northeast Energy Direct (NED) pipeline (PF14-22) proposal is clearly an attempt by an commercial entity (Kinder Morgan) to manipulate the FREC into overriding the local towns objections to the projects destruction of those town’s health & safety, environment, property values, and more.

The stated goals of “meet peak requirements in New England” do not agree with Kinder Morgan’s partner Liberty, a Canadian company, of desiring access to a shipping terminal, to allow export.

The State of New Hampshire, and especially the effected towns, get no benefit from this project, and bear the direct and tangible risks to their lives, their children’s lives, and their property values.

Additionally, the current easements that the project seems to want to use, are for the power lines, not for a gas pipeline and it’s imposed risks to the local environment.

I strongly recommend that you do not approve this proposal.

20151016-5251

Carole Osborn, Winsted, CT.

Dear FERC,

As a very concerned citizen, I agree with Jack Looney, attorney for CFE/Save the Sound, who said “There’s always alternative routes for gas pipelines but there’s no alternative to clean drinking water for the population in Hartford”.

Drinking water reservoirs need healthy lands around them to filter and protect the water our families use. Clear-cutting and digging a trench 90 feet wide, 5.5 feet deep, and 5.7 miles long through land that protects my drinking water and that of hundreds of thousands of my neighbors is a bad idea! Natural gas pipelines nationwide have suffered alarming failures that pollute water and soil, and put people at risk. Kinder Morgan should invest in renewables and stop wasting money on outdated fossil fuel infrastructure.

Sincerely yours,

Carole Osborn

20151016-5253

Elizabeth Gara, West Hartford, CT.

October 16, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE, Room IA
Washington, DC 20426

Re: FERC PF 14-22-000; Proposed Northeast Energy Direct (NED) Pipeline Project, Tennessee Gas Pipeline/Kinder Morgan

The **Connecticut Water Works Association, Inc. (CWWA)** is an association of private, municipal and regional public water supply utilities serving more than 500,000 customers, or population of about 21/2 million people, located throughout Connecticut. As purveyors of public water to customers and communities across the state, we consider the protection of public water supply sources to be of the utmost importance.

As such, we are interested and concerned regarding the gas pipeline expansion proposed on the watershed land of the Metropolitan District Commission. We are not going to comment on the merits of the specific proposal, but want to go on record to urge the Commission to be aware of and adhere to the Department of Public Health's permitting requirements pursuant to Connecticut General Statutes Sections 25-32 through 25-37 regarding any change in use on water company class I or II lands.

Under this statute, no water company shall sell, lease, assign or otherwise change the use of any watershed land without a permit from the Commission of Public Health which may only be granted if the applicant can demonstrate that, "...such change will not have a significant adverse impact upon the present and future purity and adequacy of the public drinking water supply..." Further, the statute allows the Commissioner to grant a permit, "... subject to any conditions or restrictions which the commission may deem necessary to maintain the purity and adequacy of the public water supply..." This review is done even on relatively minor projects proposed by water companies that relate to their own uses of the property and should be applied to any other proposed activities on such lands.

It is vitally important that these statutory provisions be considered before any change to the proposed use on the watershed land is allowed that might adversely impact the purity of the public water supply. We are also concerned about the possible use of eminent domain to take water company lands and/or bypass the Department of Public Health's legal requirements and would want to be sure that the environmental impact of the changes to the pipeline or any such project on water company lands be fully evaluated.

Very truly yours,

Elizabeth (Betsy) Gara
Executive Director
CWWA

20151016-5255

Frank Barrus, New Ipswich, NH.

I am writing concerning the sound impact of the compressor station coming to New Ipswich. How will FERC ensure that the sound coming from the compressor station and its turbines, as well as the occasional planned or unplanned release of gas (blow downs), does not have a negative impact on the quality of life in the surrounding area, or an impact on wildlife?

The limits I've heard of 55dB at the fenceline are nowhere near acceptable for a quiet rural area like New Ipswich and the neighboring town of Temple. That may be barely considered by some standard to be "quiet" in an urban or even suburban area, near factories, highways, and other loud continuous sources of industrial noise. But New Ipswich doesn't have those noise sources. To be clear, there isn't even a highway here, so there are no constant highway sounds, and rarely any car sounds at all. at night. In quiet peaceful New Ipswich, especially at night, the background noise can be down near the 20dB range outdoors when the silence is not broken by the pleasant rural sounds of spring peepers, rustling leaves, a gentle breeze, or a babbling brook. This is especially true in winter. This is something not experienced by people living in urban, suburban, or industrialized areas. It's not even experienced in rural areas that have highways nearby. But it's something rare and beautiful we have in this region, and it's very important to the people here and those who visit, but the compressor station takes that away.

This new compressor station will be running 24x7, making a constant industrial noise through the night. It may not be loud enough to interrupt outdoor conversations away from the site, but it's not what people visit the Monadnock region to hear, and it's certainly not what people living here came to hear all day and night. A point source of 55dB can drop in intensity fairly rapidly, but something as loud as a compressor

station, which only gets down to 55dB by the wide perimeter of the fenceline around the property, will carry for great distances with much less attenuation. Trees and the hilly landscape can certainly help reduce the sound in some directions, but there are also line of sight views, and thus non-blocked sounds, from many currently quiet and peaceful hiking trails and outdoor areas, including parts of the Wapack Trail and Kidder Mountain Trail.

Even if other sounds are louder, the distinct difference in frequencies and pattern from an industrial noise will stand out against the normal rural ambient sounds, as an undesirable disturbance. For those closer to the site, such as the Temple Elementary School, this could even have an effect on the learning of the children there, if they're constantly exposed to industrial background noise outside, and sometimes the extremely loud and interruptive/distracting/disturbing sounds from blowdowns .

The sound from this compressor station has no place in rural southern NH, and certainly not in New Ipswich or Temple. This is effectively destroying the way of life that most people came to this region for. How will FERC ensure that if the compressor station is allowed to be sited here, the sound levels are kept significantly lower than the 55dB level at the fenceline? It should be well below 30dB at all audible frequencies by the time it reaches any surrounding properties, and even that will be noticeable during quiet nights or in winter, when it is not only more quiet here, but the leaves are down.

If the public need for the NED Pipeline cannot be proven to outweigh this impact on the quality of life in this region it should be denied.

20151016-5261

Roy Pincus, Lynnfield, MA.

To the members of FERC:

I call your attention to the article in the below link which points out how Massachusetts electric customers would be the ones footing the bill for this pipeline.

<http://www.ecori.org/renewable-energy/2015/10/8/consumers-to-pay-for-more-miles-of-massachusetts-pipeline>

This would just be adding insult to injury. Not only do the citizens of Massachusetts not want this pipeline, to ask us to have to pay for it would be the ultimate slap in the face. We don't want it, we don't need it, and we certainly should not have to pay for it. This is flat out wrong!

Thank you for your attention.

Sincerely,

Roy Pincus

20151016-5262

Richard J Goettle, IV, Fitzwilliam, NH.

The New Hampshire Public Utility Commission (NH-PUC) recently approved a 20-year agreement between Kinder Morgan's (KM's) Tennessee Gas Pipeline (TGP) Company, LLC and Liberty Utilities-EnergyNorth Natural Gas Company in which Kinder Morgan has an indirect interest (NH-PUC DG14-380 Order No. 25,822). This settlement affirms delivery of 115,000 dekatherms per day (dth/d) from the Northeast Energy Direct (NED) Project pipeline to Dracut, MA for distribution to New Hampshire southeastern and central customers. Of the 115,000 dth/d, 50,000 dth/d is replacement gas in the TGP network and 65,000 dth/d is new gas. The 65,000 dth/d is only 10-15% of New Hampshire's highest annual consumption amounts in selected years over the past decade. It is irresponsible to subject southwestern and southcentral New Hampshire to the many burdens the NED Project imposes for an incremental gas supply that could be provided more efficiently, economically and environmentally sound through existing (e.g., Distrigas' LNG facility in Everett, MA) and other newly proposed (e.g. Spectra Energy's AIM, Access Northeast and Atlantic Bridge Projects) pathways. Please deny KM's NED Project application as in the interest of neither the nation, the

New England region, nor the states within it, especially, New Hampshire.

Testimony of State Representative John Hampton, 16th District

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/ Kinder Morgan (FERC Docket No. PF14-22-000)

I submit this testimony in strong opposition to the Tennessee Gas/Kinder Morgan proposal to install a natural gas pipeline through the Class I and Class II watershed land owned by the Metropolitan District Commission (MDC). A gas pipeline installation on this land has the potential to impact a high quality drinking water source and the Farmington River. I believe allowing for the installation of this pipeline through this environmentally sensitive area would undermine some of the protections Connecticut has put forth to protect these precious natural resources and clean drinking water.

As I understand it, 25-32 of the general statutes requires a change of use permit from the CT Department of Public Health for these types of projects. The existing gas pipeline and easement on the Metropolitan District Commission (MDC) property existed before this statute was adopted. This proposal to install new pipeline and enlarge the permanent right-of-way, is inconsistent with the intent of CGS 25-32.

Allowing for an exception to this statute would set a dangerous precedent and open the door for other future encroachments on water supply land. In the past, Connecticut has set high standards for protecting environmentally sensitive habitats, natural resources and clean drinking water. We must use caution and extreme care whenever we make important decisions on these types of projects. Once we allow a company to break ground and encroach upon such habitats such as the Farmington River Valley there is no going back. All potential negative consequences must strongly be considered.

As a solution, I strongly encourage that Tennessee Gas/Kinder Morgan be required to consider and submit all alternative and less invasive paths for this pipeline other than the route that goes through MDC land, which has Class I and II watershed land.

Thank you again for the opportunity to submit testimony here today on behalf of my constituents, residents of the Farmington Valley and the State of Connecticut regarding this very important environmental, public health and quality of life issue.

Respectfully submitted,

John K. Hampton

20151016-5268

Frank Barrus, New Ipswich, NH.

How is it morally and ethically acceptable to approve a project that effectively forces this pipeline and compressor station and all the associated destruction, health hazards, and risks upon a series of towns and an entire region, and its people? Those towns and people have all spoken out against it and made it clear they do not want it nor need it, and have nothing to gain from it, but much to lose, including their health, safety, and quality of life. That should be enough to clearly say “NO”.

If FERC is truly a government regulatory agency with the best interests of the people in mind, it will deny the NED project. Otherwise, it will be clear that corporate interests and profits have prevailed in influencing the decision.

20151016-5269

David F Fleming, JR, Nassau, NY.

The **Town of Nassau Natural Resource Committee** submits the following Scoping Comments for the Northeast Energy Direct Pipeline Project as supplements to previously filed comments dated August 28, 2015.

Alternative Routing: An additional alternative routing segment for the Market Path section that provides a link between the proposed Market Path alignment and the I-90 alternative alignment is identified in the map figure 1 below. This alignment would deviate south from the Market Path alignment at approximate Mile Post 33.8 in the Town of Schodack, NY, and follow the National Grid electric transmission line right-of-way southerly for approximately 2.6 miles to the transmission line’s intersection with the Interstate Route 90 corridor in the Town of Schodack. This route variation would then follow the I-90 alternative route easterly into Massachusetts. The Town of Nassau Natural Resource Committee requests that this routing variation be addressed in the analysis of alternative routing in the Environmental Impact Statement for the NED Project.

Water Resources and Aquifer Protection: In earlier comments, the Town of Nassau Natural Resource Committee indicated that the Environmental Report consideration of groundwater and aquifers did not identify resources identified by the Town of Nassau in local plans and land use regulations. Figure 2 provided below indicates the location of designated groundwater and aquifer protection areas and buffer areas in relation to the proposed NED Project corridor. This resource protection area and associated local regulations should be addressed in the Environmental Impact Statement for the NED Project.

Figure 1 – Alternate Route to link Market Path to I-90 Alternate

Figure 2 – Town of Nassau NY Aquifer Protection areas along Market Path route

Washington, DC 20426

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/Kinder Morgan
(FERC Docket No. PF14-22-000)

Dear Ms. Bose:

The South Central Connecticut Regional Water Authority (RWA) is a non-profit, public corporation and political subdivision of the state. Our mission is to provide our customers with high quality water at a reasonable cost while promoting the preservation of watershed land and aquifers. We provide approximately 45 million gallons of water per day to some 430,000 consumers in 15 communities in our region. The source of this water is a system of watershed and aquifer areas that cover about 120 square miles within 24 municipalities. Much of our 27,000 acres of land is managed for watershed protection, timber resource conservation, wildlife habitat, open space, education, and research.

The RWA has been alerted to the NED Tennessee Gas/Kinder Morgan pipeline proposal that is expected to cross Metropolitan District (MDC) property in West Hartford and Bloomfield. The proposal calls for the pipeline to cross Class I and Class II public water supply watershed land. The Connecticut Department of Public Health (DPH) classifies Class I and Class II lands as being on the watershed of a public drinking water supply reservoir. The class designation is in place to protect the quality and adequacy of Connecticut's public drinking water supplies.

While the proposal does not directly impact the RWA's land, we are concerned about the precedent that might be set if this proposal is approved by FERC. First, we understand that the current project may not fit within an existing right-of-way easement. If this is the case, it would require an enlargement of the easement which is a transfer of interest in real estate. Any such transfers are subject to permitting by the DPH per CGS 25-32. Second, any change in use of that land is also subject to review and permitting by the DPH.

The RWA wants to be sure that any and all such projects that affect Class I and Class II water company lands in Connecticut are duly and fully reviewed, and approved if warranted, by the DPH. The loss of control over public drinking water supply watershed land and the actual disturbance that such a project would entail are issues that concern us. The protection of the public water supply is our highest priority.

Sincerely,

Larry L. Bingaman
President & Chief Executive Officer

20151016-5273

Tyler W Seppala, Rindge, NH.
Docket PF14-22

Tyler Seppala
37 Delton, Drive
Rindge, NH 03461

I'm a landowner that currently has this pipeline proposed to go through my property and here is some of the concerns I have with this route.

1.) FERC should look at all the New England pipeline proposals collectively instead of looking at each project individually. Other pipeline proposals that are not "Greenfield" projects like the NED project should be considered before this project. The deceptive concept of co-location that the applicant likes to spew couldn't be further from the truth as the pipe isn't proposed to be installed in the existing utility corridors and instead involves major deforestation and a whole new corridor being built. If all these projects are approved New England is going to receive a glut of gas that could never be used domestically. Even the NED Pipeline capacity alone has more capacity than New England will ever use. How much gas does Kinder Morgan anticipate either going to Atlantic Canadian customers and for export?

2.) Maps of my specific property do not show my home or my neighbors. The maps Kinder Morgan has submitted also has an incorrect road name for our road. When can we expect updated maps? This would be helpful in truly seeing the extent of the damages being proposed for our properties. I would like a detailed map of my home showing the extent of the construction zone with dimensions so we can see how close to the septic system, our underground drainage pipes and our well this occurs or goes through.

- 3.) If ledge is encountered we would like to request that no blasting is done as our homes are so close. We would request instead that a cut and chisel approach is used to prevent damage to our wells, foundations and septic systems. Please describe methods for installing the pipe if ledge is found behind our properties and what mitigation plans they have in place for homes less than 200' away.
- 4.) What efforts are being made by the applicant to mitigate the deforestation of maple trees that are being cleared per the current route behind our homes on Delton Drive and the land owned by our neighbors on the other side of the Tarbell Wetland complex where the pipe is proposed to cross? Currently there is a couple hundred maple trees tapped for syrup on our properties in the Delton Drive Area and this construction project is threatening to destroy a good number of them. How does the applicant intend to minimize this and how is compensation addressed for this loss of future revenue? As of now the applicant has refused to address any of these issues with us landowners.
- 5.) Some of us landowners will be losing every tree we own in between our homes and the existing utility corridors which were left up as a buffer. As our homes will now be exposed to these wide open powerline corridors what effects will this now have on our homes in regards to increased heating and cooling costs on all homes where this will occur? We would like a study done to calculate added heating fuel costs to heat our homes and added electrical costs to cool our homes as we will be exposed out in the open with no buffer tree protections anymore.
- 6.) Please explain what the plan is for re-planting of new "Adult" trees to replace the removed ones outside of the permanent easement. We would like a detailed plan on what trees will be removed and the reforestation plan to replace them.
- 7.) We would like a detailed emergency evacuation plan for Delton Drive since our cul-de-sac is being crossed by the NED pipeline leaving our subdivision with no secondary means of egress. Why hasn't Kinder Morgan taken steps to avoid crossing our cul-de-sac?
- 8.) We would like to know how we will get paid for the damages caused to our private road? Who makes sure we are paid for damages caused to our road? After looking at the practices of this applicant it looks like this will definitely be a problem.
- 9.) What construction methods will be used to cross Delton Drive? This road cannot be shut down as again we have no secondary mean of egress. We want to confirm that no "Open Cut Road Crossing" methods will be considered to cross Delton Drive. We cannot accept this method with a pavement patch on our soon be paved road as an acceptable fix. We request that the crossing of our private road be avoided at all costs and if we are refused this request that the pipe be installed underneath the road utilizing a drilling technique.
- 10.) We have (2) utility corridors behind our home. The spacing between the two sets of lines is approximately 170 lineal feet which is separated by a buffer zone of trees. Why isn't the pipeline being proposed to go in between the (2) corridors where it impacts the least amount of people? This seems to be the most ideal spot but Kinder Morgan has ignored every plea we have made in regards to this. Our home is situated between MP 20.2 and 21.2 but this condition occurs along many miles. We currently have hundreds of feet in easements on our property and they want to install the pipeline in virgin land instead of using this current easement which has plenty of space.
- 11.) The pipeline crosses the Tarbell Wetland Complex right behind our homes. This area consists of Tarbell Brook and a vast complex area of wetlands which is part of the Millers River Watershed. The Wetlands is also a Stratified Drift Aquifer supplying many of our homes with drinking water. What steps were taken by the applicant to avoid going straight through this vital water source? I don't believe it has been avoided at all and going straight through aquifers should be avoided at all costs.
- 12.) How often and for how long will Kinder Morgan be required to test our private wells? The before and after testing for the blasting of ledge is not enough. The potential of leaks into the aquifer should make testing mandatory by the applicant on an annual or bi-annual basis for the entire lifecycle of this pipeline at a minimum.

- 13.) If the pipe leaks and releases natural gas into this aquifer how big of an area could be affected and how many people's drinking water will be affected? How would Kinder Morgan compensate or mitigate for such a release?
- 14.) What construction technique will be used to install the pipeline over this waterbody? Horizontal drilling should be the only technique considered in lieu of "Dry Crossing" techniques that would have serious environmental impacts to this area.
- 15.) Dry Crossing techniques would seriously impact the wetlands ability to work properly as construction equipment will compact the soil and the construction equipment has the potential to leak fluids into the aquifer. The loss of habitat/vegetation and soil disruption would be immense as the pipeline is currently slated to go through the widest part of this waterbody.
- 16.) KM should explain the mitigation measures for the riparian buffer zones that will be removed on both side of this waterbody. As of now they will be totally clear-cut and removed. What steps have the applicant taken to avoid this? What will be done to replace them? What measure will be taken to stop erosion from running into the wetlands after these are removed?
- 17.) We would like a study done on what endangered and threatened species call this waterbody home. Blanding's Turtles for one have been found in other locations in Rindge and there is a very high chance they are also located in this waterbody.

October 16, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission (FERC)
888 First Street, NE
Room 1A
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000, Northeast Energy Direct Project and Docket No. CP14-529-000 Connecticut Expansion Project

Dear Secretary Bose:

The following comments are submitted in response to FERC's June 30, 2015 Notice of Intent to Prepare an Environmental Impact Statement (EIS) for the planned Northeast Energy Direct Project (NED) and the September 3, 2015 Supplemental Notice extending the comment period until October 16, 2015. Mass Audubon appreciates FERC responding to requests for an extension of the comment deadline. These comments are also being submitted pursuant to Docket No. CP14-529-000, the Connecticut Expansion Project (CEP). It appears that these two projects are parts of a single program to increase gas supply from Tennessee Gas Pipeline Company (TGP) (a subsidiary of Kinder Morgan) into New England. We request that FERC consider comments regarding potential improper segmentation of review of these projects.

Mass Audubon has submitted comments to FERC previously under these dockets (Docket PF14-22-000: October 6, 2014, January 15, 2015, July 22, 2015, and September 10, 2015; Docket CP14-529-000: September 4, 2014, November 7, 2014, and April 10, 2015). We request that the following comments be considered in addition to previously filed comments.

Mass Audubon is a directly affected landowner, as the proposed NED project corridor crosses four parcels it holds for conservation purposes in Plainfield (Municipal Map/Block/Lot #s 19/0/1, 20/0/3, 25/0/3, and

20/0/1). Numerous other lands held by public and private entities for permanent conservation purposes will also be impacted, along with extensive areas of sensitive land and water resources. Mass Audubon also played a direct role in assisting the Massachusetts Department of Conservation and Recreation in protecting lands at Otis State Forest around Lower Spectacle Pond that are proposed to be impacted by the CEP.

The Scope of review for these projects should be thorough and complete, including:

- evaluation of the need for increased gas transmission capacity in the region;
- alternatives to meet energy needs while minimizing environmental impacts;
- analysis of the full life-cycle greenhouse gas (GHG) impacts of gas production and transmission through the proposed pipelines and associated equipment, and burning by the end users;
- site-specific evaluation of impacts to land and water resources;
- evaluation of alternatives to avoid impacts to protected private and public conservation lands, sensitive habitats on lands under any ownership, farmlands, wetlands and water resources, and other impacts to environmental and public health and well-being;
- detailed site-specific mitigation plans for any unavoidable impacts;
- compensation for unavoidable impacts to conservation lands, including protection of specific lands of equal or greater conservation value; and
- plans and commitments for ongoing monitoring and maintenance including habitat-based vegetation management and invasive species control on a continuing basis for the life of the project

All information should be presented on maps as well as in narrative form that is easily found and understood by the reader based on each specific affected location.

The EIS should fully employ use of all reasonably reliable available sources of information such as Mass-GIS datalayers and the UMass Conservation Assessment and Prioritization System.[1] Analysis of impacts and mitigation should also be based on actual site-specific conditions, not generic procedures e.g. standard procedures for crossing all types of wetlands or streams.

Project Need and Alternatives

The need for alternatives to the project must be more fully and objectively analyzed, before any further steps are taken toward proceeding with this massive, expensive, and environmentally destructive project. This should include consideration of the study that Massachusetts Attorney General Maura Healey has commissioned on electricity reliability needs in the New England region through 2030 and the options for meeting those needs. This study, conducted by the Analysis Group and Raab Associates, will fill a pressing need for analysis of the costs and benefits of various alternatives including energy efficiency, demand response, renewables, natural gas, and oil. The study is expected to be completed this fall. It is vitally important from both an economic and environmental perspective to consider the results of this study before advancing environmental review of the proposed gas transmission infrastructure being proposed in the NED project as well as the Algonquin/Spectra Access Northeast Project.

Through the *Massachusetts Global Warming Solutions Act of 2008*, the Massachusetts legislature and Executive Branch set ambitious targets for reductions of GHG emissions by 25 percent by 2020 and 80 percent by 2050. This law and the *Massachusetts Green Communities Act* have catalyzed rapid progress in energy efficiency and development of renewable energysources, both of which are making important contributions to our economy and environmental health. For the past four consecutive years, Massachusetts ranked 1st in the nation in American Council for an Energy-Efficient Economy's scorecard of the states.[2] Meanwhile, a recent report indicates that as a result of the Regional Greenhouse Gas Initiative (RGGI), in which Massachusetts participates, nine states in New England and the Mid-Atlantic region have gained \$1.3 billion in economic benefits and saved electric ratepayers \$460 million while reducing carbon emissions by 15 percent.[3] The clean energy economy (renewables and energy efficiency) in Massachusetts has added more than 28,000 jobs since 2010 and is now a \$10 billion industry sector.[4] The NED project is incompatible

with national, regional, and state policies and goals for GHG reductions, and comes with enormous, long term, avoidable environmental and economic consequences. Major new pipelines increasing our dependence on natural gas will make it more difficult, not less, to meet GHG reduction goals over both the short and longer term. Life-cycle emissions from gas often exceed that of other fossil fuels they replace, while also causing other major environmental impacts that can be avoided through greater emphasis on energy efficiency and renewables.[5] Furthermore, if gas is exported through the proposed pipeline, the purported energy price benefits to consumers in New England will most likely evaporate, since gas prices are much higher in global markets.

Project Scope and Impacts; Segmentation of NED and Connecticut Expansion

TGP has recently announced significant changes to the NED project, including the elimination of several laterals and the reduction of the diameter of the main line from 36” to 30”. While these may somewhat reduce the environmental impacts of the project, those impacts remain at an unprecedented scale. Meanwhile, it also is proposing the Connecticut Expansion project, which is directly connected with components of the NED project. A federal court ruling last year (*Delaware Riverkeeper Network v. FERC*, 753 F.3d 1304 (D.C. Cir. 2014)) found that FERC may not segment review under the National Environmental Policy Act when “it divides connected, cumulative or similar federal actions into separate projects and thereby fails to address the true scope and impact of the activities that should be under consideration.”

The Final Environmental Impact Report (FEIR) filed with the Massachusetts Environmental Policy Act office this year on the Connecticut Expansion project contains contradictory statements claiming on the one hand that it is a stand-alone project serving only three specific customers in Connecticut, but then also stating:

The northeast, including Massachusetts and Connecticut, has the “highest natural gas prices” and price volatility in the United States because of a significant lack of pipeline capacity. The rise in natural gas prices experienced in the New England region over the past two winters “suggest a natural gas delivery system that is stretched significantly” and is inadequate to meet the growing demand in the New England region; gas prices in New England are the highest in the United States. MADOER’s Low Demand Study/ Report dated January 7, 2015 acknowledged that the Northeast’s natural gas infrastructure is stressed during peak winter periods and that there is insufficient natural gas capacity for the electricity sector which has contributed to high prices.

(Purpose and Need Statement, CEP FEIR, March, 2014)

Setting aside for the moment the fact that we believe that this statement exaggerates the extent and impact of any short term gas “shortages” and price spikes, it is clear that the company sees the CEP as part of its larger scheme to increase gas transmission capacity to the region.

Conservation Lands Impacted

More than one hundred parcels of “permanently protected” lands conserved by public and private entities will be impacted by this project. Massachusetts has a long history of thoughtful land and water conservation based on scientifically-based priorities. This carefully constructed matrix of protected lands encompasses 25 percent of the state. These lands are protected by Article 97 of the State Constitution and/or are held in public trust by charitable land trusts. It is ironic that a private, out-of-state company now views these areas as convenient for the construction of energy infrastructure at an unprecedented scale. A 2013 report on *The Return on Investment in Parks and Open Space in Massachusetts* found that every dollar invested in land conservation returned \$4 in natural goods and services to the Massachusetts economy, including clean air and water, recreation and tourism, and fish and wildlife habitat.[6] The Massachusetts Supreme Judicial Court has also recognized that lands held in conservation use by charitable trusts support a wide range of public benefits.[7] Before any further consideration of impacts to valuable conservation lands is considered, alternative means of meeting state and regional energy needs must be considered.

Article 97 states that:

The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose.

The construction, operation, and maintenance of a gas pipeline and associated structures including compressor stations on or adjacent to conservation lands will clearly impact the natural, scenic, historic, and aesthetic values of those lands, and interfere with the public's enjoyment of associated natural resources.

The conversion of lands held for permanent conservation purposes under Article 97 of the State Constitution and/or public charitable trust provisions is a serious matter that must only be considered in unusual circumstances where there is a clear showing of a lack of alternatives to address an important public interest. In this case, both the need for the pipeline and potential alternative alignments must be analyzed in relation to each specific conservation parcel impacted.

Mass Audubon acquired and holds land at West Mountain Wildlife Sanctuary in Plainfield for conservation purposes. The proposed gas pipeline project is not compatible with our mission as a charitable trust of protecting and maintaining natural habitats for the benefit of people and wildlife. Nor is it consistent with our commitment to Mass Audubon's supporters and the many generous individuals who donate land or interests in land with the expectation that the natural characteristics of the land will be permanently protected.

The specific areas at West Mountain Wildlife Sanctuary in question contain mature, diverse forests with complex structural habitat features. The area also is characterized by steep topographic relief with exposed ledges and boulders as well as groundwater seeps and other microhabitat features. Blasting would be required. The forest habitat and supporting geology of the proposed pipeline corridor would be permanently and irreparably altered and degraded by the project. Even portions of the corridor termed "temporary" impact by the company would result in removal of the mature forest which would require more than a century to recover, if at all. Soil erosion and sedimentation, and alterations of ground and surface water flow patterns, water quality impacts, and temperature changes will occur even with the company's proposed environmental construction and restoration practices. Disturbed areas are also highly vulnerable to the spread of invasive species, the control of which is a costly and long-term endeavor.

Each parcel of land impacted by the proposed project, whether under public or private ownership, has its own unique attributes which must be carefully and separately considered.

Failure to Use Publicly Available Resource Data in Draft Resource Reports

Massachusetts has an extensive, advanced land use and environmental database with information publicly available through MassGIS. Mass Audubon met with representatives of Kinder Morgan/TGP as early as April 28, 2014, and communicated to the company at that time about the wealth of natural resources data available that could assist in analyzing impacts of the proposed project and how to minimize those impacts. We also attended other meetings in 2014 with company representatives hosted by state agencies, and are aware of several communications from agencies and other environmental groups to the company informing them of these resources and how to utilize them. This information was not in fact employed as it could and should have been in the Resource Reports. Datalayers are available including BioMap2 and Priority Habitat maps documenting the most ecologically sensitive locations in the state, along with associated information explaining each of the features in those maps including the natural communities and species associated with them. The failure to utilize the available, scientifically-based resource information is a deficiency resulting in incomplete and superficial analysis of the potential significant impacts of the project.

Mass Audubon respectfully requests that FERC require, through its scoping and review of these projects, that best available data be utilized in preparing the EIS. We are also concerned that much of the information presented to date regarding proposed construction methods and follow-up monitoring and maintenance are generic in nature and not tailored to each specific site and the associated resources located there. The EIS should address each specific location, not generic resource categories.

Protection of the Environment to Massachusetts Standards

Massachusetts has long been a leader in environmental protection. Its citizens are fortunate to have an environment protected by state laws including but not limited to the Massachusetts Wetlands Protection Act, Massachusetts Endangered Species Act, and Global Warming Solutions Act. The EIS should evaluate each element of the project in relation to state as well as federal standards, and the state standards should be upheld to the fullest extent possible. While we understand that interstate gas pipelines may be subject to federal preemption, this authority should be exercised in a limited manner and only when and where it is essential for an overriding public interest. Many other corporations operate on a regular basis in full compliance with these rules, and we expect the same from energy companies.

Sincerely,

Gary R. Clayton

RE: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000
Statement read by Commissioner Veronica Kell at the FERC Scoping Meeting, Lunenburg HS,

August 12, 2015 with additional comments

Dear Secretary Bose:

The Townsend Conservation Commission stands in opposition to the proposed Northeast Energy Direct pipeline, and we very much appreciate this opportunity to share our concerns about the proposed project. We look to you, the Federal Energy Regulatory Commission, because in these scoping meetings you are charged with assessing the effects of this pipeline on the environment. We look to you to require that Kinder Morgan quantify the impact of this pipeline on our natural resources and ask you to weigh them against its benefits. We believe the facts will lead you to conclude that the benefits are dwarfed by the negative environmental impacts.

We were disappointed that FERC held only one additional scoping meeting, despite the numerous requests of the public for additional scoping meetings after Kinder Morgan delayed the release of their updated Reports. Yet when Kinder Morgan filed their reports on July 24th, a month late, they were allowed the extra time. The public interest should not suffer because of the applicant's delay. The people of the Commonwealth need to see that FERC responds to them, not just to the gas companies.

Furthermore, how do the people and communities impacted by this pipeline, and their elected and appointed representatives, formulate constructive comments when the Resource Reports available provided little information? Conservation Commissions in Massachusetts are charged with the responsibility of open space and natural resource protection in our communities, and they, as well as other local boards, hold hearings on applications on a regular basis. They require a complete application before they hear it and before they expect the public to listen and comment. They do not hear applications with only "To Be Determined" for required information. How can a resident comment on "To Be Determined"? The scoping meetings should not have been scheduled with incomplete reports and the public shouldn't be expected to read voluminous reports released immediately prior to the few remaining meetings.

The people whose property this pipeline may cross do not stand to benefit from it, but they certainly stand to lose. The people of Townsend have spent many years and fought many political battles to protect their natural resources and drinking water supply. The battle is fought every day by conservation minded people who are willing to risk friendships and face the criticism of neighbors in order to preserve those resources for future generations. Townsend's Conservation Commission has been in existence for almost 50 years, and during that time bylaws, rules, regulations and protective designations were fought for and won. We are home to an Area of Critical Environmental Concern, our waters are Outstanding Resource Waters and Cold Water Fisheries, we now have TWO large state Wildlife Management Areas, a state park, TWO state forests and a 290 acre woodland purchased with the help of the state. We have the Squannacook River Sanctuary Act that protects within 300 feet of the banks of the Squannacook River and its tributaries and prohibits any new discharge into the river. To protect our drinking water supply we have Aquifer and Groundwater Protection Overlay Districts. We are home to significant Priority Habitat for endangered species and BioMap2 Core Habitat and Critical Natural Landscape, including interior forest. A Wild and Scenic Study Committee has been established to determine whether the Squannacook River from its headwaters at Ash Swamp would qualify as a federally designated Wild and Scenic River. It is an impressive list of environmental protections. Kinder Morgan's pipeline would cross all of the headwaters of the Squannacook River, clearing at least a 100 ft. wide construction corridor across each one of them. An undetermined number of trees would be cleared in that corridor, and a 50 ft. wide permanent easement without any tree canopy would be required. Please consider the impact of blasting through ledge on our public and private wells if this pipeline is constructed. Consider the impact of opening up interior forest on the species that require it for survival, and the increase of water temperature on our Cold Water streams from cutting trees and removing the canopy. What are the effects on surface water temperatures with a permanent open canopy? How will opportunistic invasive species filling in that void be treated other than with herbicides? Consider the impact of sediment when putting this pipeline through and under our streams and through our wetlands. Consider the impact from the loss of riparian buffers that generations have worked long and hard to protect, and taxpayers have paid

handsomely to protect..

Of the 27,560 linear feet of pipeline proposed in Townsend, 81% of the pipeline crosses the Aquifer Protection District, the source of Townsend's water supply, and 20% is over the High Yield Aquifer. Twenty-five percent (25%) is in DEP Water Supply Zone II. One hundred percent (100%) of the proposed pipeline route is in the Squannassit Area of Critical Environmental Concern! Fifty-two percent (52%) of it is located in the Priority Habitat of the Massachusetts Endangered Species Act. Eleven percent (11%) traverses through intact forest cores. A substantial portion of the pipeline path is through Article 97 protected open space. It would cross five of the six streams that form the headwaters of the Squannacook River, thereby heavily, and hopefully not fatally, impacting the future of the river's Wild and Scenic Designation. All five of those streams are Outstanding Resource Waters and Cold Water Fisheries. Please analyze and quantify the long term effect that the pipeline will have on these resources, and explain how these effects will be mitigated by Kinder Morgan.

Assurances that there will be no effect on surface or groundwater of a 6 ft deep open cut trench through Outstanding Resource Waters are easy to make, but the damage done can be irreparable. We have yet to be shown that there will be no negative effect on groundwater of blasting a trench through bedrock. There are more than 50 homeowners along the proposed pipeline route who have private wells. All of the 65+ homes along the path have private septic systems. How will drilling and blasting impact those wells and systems? All of this adds up to a community that has cared about its environment for a long time, and has been willing to put in long, hard hours to protect it and to stand up to those who would threaten it. We are but one small town of only 9,000 people, but we do not want to see either a 30" pipeline or a 12" lateral cross through these precious resources. We do not believe that this pipeline is for the public necessity and convenience. We believe it is for Kinder Morgan's necessity and convenience.

Why do we think so? Consider just a few of the headlines of recent articles concerning the Marcellus shale play in Pennsylvania:

Two large pipeline projects aimed at alleviating a glut of natural gas coming from the Marcellus shale moved ahead in the federal permitting process this week. (Pittsburgh Tribune-Review, 9/25/15)

Task force to plot ways of easing gas glut in Pennsylvania via pipelines. (Pittsburgh Tribune-Review, 5/27/15)

The industry is planning to build thousands of miles of pipelines to transport shale gas to markets. A glut of gas and limited pipelines to get the commodity to markets where it is needed have combined to depress prices. (Pittsburgh Tribune-Review, 7/8/15)

America's Biggest Shale Gas Field Is Choking on Its Own Supply (BloombergBusiness, 10/14/15)

Clearly the driving force is economic, but only for the gas industry. If there is insufficient demand locally to increase prices and make drilling profitable, find other markets and pipe it elsewhere to reduce supply. Consequently there are FIVE new proposed pipeline projects for the New England area. The volume of gas those pipelines can carry speak to the fact that the final market is export. Local demand a few days a year for natural gas at peak times cannot account for the billions of cubic feet proposed to enter this region. FERC must avoid segmented review and over-building. We join with many of our colleagues in Massachusetts and New Hampshire who have requested that all of the proposed pipeline proposals be combined into one single regional Environmental Impact Statement and one coordinated FERC process.

Kinder Morgan fails to address the no-action alternatives for the proposed laterals. Please require Kinder Morgan to provide specific information on the contract commitments for the proposed Fitchburg lateral. Please also require them to quantify the contribution to supply that would result from fixing natural gas pipeline leaks throughout the distribution system.

Townsend held a Special Town Meeting in July 2014 and unanimously opposed the pipeline. Our residents have long recognized what they have, and they know that it is worth protecting. FERC's statement of policy (Docket # PL 99-3-000) states that Certificate policy "should be designed to foster competitive markets, pro-

tect captive customers and avoid unnecessary environmental and community impacts while serving increasing demands for natural gas.” In determining whether to issue a Certificate, please consider other existing supply options, as they will by definition have less impact on the environment.

We ask the Commission to give serious consideration to all of the testimony received at the scoping meetings before determining that there is an overriding need for additional gas pipeline infrastructure in Massachusetts. The overwhelming public consensus is that FERC will listen, but there is no point to disputing the Northeast Energy Direct project because FERC will still rubber stamp it. There is no point in arguing that we urgently need an energy policy that focuses on renewables and conservation, and not more fossil fuels. There is no point in saying that until that policy is in place, why allow this albatross to be constructed? Please prove the disenchanting wrong.

Sincerely,

Townsend Conservation Commission

Northeast Energy Direct Docket #PF14-22

Previously we thought of Kinder Morgan as a large company that would do the right thing to create a balance between business needs, community needs and the environment. At this time when we review the proposed plans for the gas pipeline, the environmental upheaval that would take place, the potential of endangerment to precious natural resources - both land and water - we are not sure Kinder Morgan is thinking of anything but getting their product to market. After viewing the documentary film, “Mass Extinction: Life at the Brink” produced by Sarah Holt with collaboration from Stanford University scientist Jonathan Payne, PhD - recently screened at the Museum of Science in Boston - we have come to realize that humans are thinking of their own current needs and not the sustainability of the planet as a whole. Will this pipeline project speed up extinction? It will certainly speed up the destruction of conservation lands and green spaces to keep its path clear. It can damage the infrastructure of the earth which carries precious potable water to an area far greater than the immediate area of the Ipswich River watershed. Water is a resource that is already under strict conservation in this area. In Lynnfield a main water source is town wells. We do not want to have further limitations as suffered in the Western part of the country and around various nuclear power plants when contaminated water is accidentally released into rivers or streams. What will be the toxic toll on humans to maintain the vegetation in the pipeline corridor at a low level? Why does business want to make a new path where one already exists? Just because the pipeline will carry more volume it does not mean there will be more customers. Should this be built so gas can be exported at some point in the future? Does the end result justify the cost to the people, land and waterways in its path? Why should the costs of the pipeline be shouldered by consumers as an added charge on their electric bill?

We are opposed to this project being built in neighborhoods, near water resources, near conservation lands. We must care for the earth - there are no duplicates. We have also looked at the materials Kinder Morgan

has developed for this project. The materials promote jobs and lower energy costs as huge benefits which are true, but at the expense of something which cannot be replaced if something goes wrong.

George and Perry Hayden

20151016-5278

The Town of Nassau Natural Resource Committee submits the following Scoping Comments for the North-east Energy Direct Pipeline Project as supplements to previously filed comments dated August 28, 2015.

Alternative Routing: An additional alternative routing segment for the Market Path section that provides a link between the proposed Market Path alignment and the I-90 alternative alignment is identified in the map figure below. This alignment would deviate south from the Market Path alignment at approximate Mile Post 33.8 in the Town of Schodack, NY, and follow the National Grid electric transmission line right-of-way southerly for approximately 2.6 miles to the transmission line's intersection with the Interstate Route 90 corridor in the Town of Schodack. This route variation would then follow the I-90 alternative route easterly into Massachusetts.

The Town of Nassau Natural Resource Committee requests that this routing variation be addressed in the analysis of alternative routing in the Environmental Impact Statement for the NED Project.

{map omitted}

Water Resources and Aquifer Protection: In earlier comments, the Town of Nassau Natural Resource Committee indicated that the Environmental Report consideration of groundwater and aquifers did not identify resources identified by the Town of Nassau in local plans and land use regulations. The figure provided below indicates the location of designated groundwater and aquifer protection areas and buffer areas in relation to the proposed NED Project corridor.

{map omitted}

20151016-5282

richard szmauz, New Ipswich, NH.

A the scoping period ends for NED I would encourage you to carefully consider other alternative routes for this project, such as the Mass Pike route, which would keep NED in the state that would actually able to use and need the natural gas, as well as other energy supply proects. NH will get little to no benefit from NED, while KM/TGP will be able to use this transmission line to export gas, using our land by eminent domain for corporate gain in a large way. The % used by the only NH agreement is NOT enough to allow this project to devastate the Monadnock Region.

KM indicated part of reasoning for moving NED's route to NH was to avoid conservation land, when in fact according to tallies by The Monadnock Conservancy, using NHGrant data (which does not even include 1/2 mile of "private" conservation land directly impacted in New Ipswich not included in their list) that of the 71 miles of NED in NH, 8.3 miles are directly through conservation land, which is over 10% of route. Also of severe concern is the impact on wells and aquifers, especially considering the levels of naturally occurring arsenic that WILL be disturbed in NH. (The Granite State)Others have commented on this at scoping sessions.

On another note regarding the compressor station slated for New Ipswich. I have grave concerns regarding emissions at this "industrial infrastructure" and cannot understand why a town that will not even be able to use any of the gas processed here would have to bear the brunt of this unwanted plant. New federal guidelines for individual burning devices in the home limit particulate matter emissions to 4.5 grams/hour. Compressor stations emitting tons of PM per year translates to hundred to thousands of grams per hour of PM emissions. Why allow this double standard in a town NOT EVEN ABLE TO ACCESS ANY GAS???

KM is using the "ruse" of colocation with hi voltage lines for this project, when we know much greenfield land is ABSOLUTELY required, even in many places where the ONLY existing tree buffer will be ELIMI-

NATED, (all by eminent domain) MAKE THEM USE THE ELECTRICITY AVAILABLE TO RUN ELECTRIC COMPRESSORS, NOT GAS FIRED -thereby eliminating continuous toxic emissions, if this project is approved, which it should not be.

OTHER pipelines and energy projects are already in the works that would supply all future need for 20 years or so. PLEASE CONSIDER ALL AREA PROJECTS AS A WHOLE and do not allow overbuilding of ratepayer funded infrastructure that will soon be overbuild and possibly abandoned, at the expense of our environment and rights as citizens to NOT have our land taken by eminent domain for unnecessary projects and corporate gain.

Richard Szmauz, Jessica Anne Cormier, Eric Cormier,
New Ipswich, NH

In short NED should not be allowed in NH! Please say no build.

20151016-5287

Michael L Locke, Merrimack, NH.

As a resident of MMK community, we know there is no need for the Morgan/TGP's Northeast Energy Direct transmission gas pipeline. So that No need = No Certificate of Public Convenience and Necessary. We are very concerned about the safety of our water supply so near to our home as well as the safety if there is an issue. Thanks.

20151016-5288

Frances Riggs, New Ipswich, NH.
October 16, 2015

Dear Secretary Bose,

I have heard and read , FERC has heard and read so much of the documented evidence that a pipeline through New Hampshire and a compressor station in New Ipswich will lead to health issues for people who live nearby as well as those farther away by air contamination and possible water contamination. I urge you to care. I urge you to go beyond your connection to the big gas companies and stand up for the rights of the thousands of people who will be adversely affected if the pipeline goes through.

Sincerely,

Frances Riggs
201 Temple Road
New Ipswich, NH 03071

20151016-5293

Mark Getty, Pelham, NH.

Let it be part of this record that I do not want this pipeline anywhere near my property. This is a dangerous project that benefits others at my expense and without any respect for my interests.

The home that I have worked to build for over 20 years is about to be maimed by the Northeast Energy Direct project and its principals Tennessee Gas Pipeline and Kinder Morgan. My property, located in Pelham, New Hampshire has an existing easement with the electric company which runs right through it. The NED project intends to route the pipeline within or adjacent to this easement and in doing so threatens my property. It is difficult to see my interests set aside for what is said to be a greater public interest. It is even more difficult to see that my interests aren't recognized at all by TGP, KM or the FERC. I recently attended a Kinder Morgan open house in Salem, New Hampshire. There I learned that neither I nor my neighbors who have that same easement through their properties are listed as abutters to the project. How can claims that the impact to abutters is minimized along the planned route if the number and identity of the actual abutters is not known?

I am an abutter and I'd like my interests and concerns to be known, respected, and accommodated. I am concerned about the safety of the project and the short and long term threat to the aquifer that is my water supply.

The proposed pipeline is meant to move high volume of gas from the shale fields of Pennsylvania to eastern Massachusetts for coastal distribution and export. Once the pipe is buried nature will persistently act on it and wear it away. The ultimate failure of the pipe is an inevitable matter of time. Representatives of TGP and KM have assured me that they monitor their pipelines and that they do not leak. They claim to have a great safety record but their actual record tells another story. There have been many incidents of pipes failing due to corrosion that then resulted in spectacular explosive events.

<http://nhpipelineawareness.org/wp-content/uploads/2014/05/Kinder-Morgan-Accidents.pdf>

I don't want to have to live with the prospect that my home and my family might simply blow up one day and if I have to move away to avoid that I would have to sell a home severely devalued by the pipeline. The pipeline route should revert back to the original planned path along already existing pipelines in Massachusetts so as to minimize the propagation of the explosive threat in northern New England.

The NED project represents a threat to my household water supply during the construction of the pipeline. The necessary blasting to cut through granite will fracture my well bore and cause iron and other mineral deposits to leach into the water making it unfit to drink or to clean cloths and causing damage to household plumbing and fixtures. We have experienced this in the past with adjacent residential construction. The scale of the pipeline project will have a far greater impact. Should my water supply be damaged by the project it would be up to me to privately pursue the recovery of damages within the legal system. TGP and KM should be compelled to address their potential impact to any and all water wells within one thousand feet of the construction route. They should identify all such wells. Baseline water quality should be measured before and after the construction by an independent third party and TGP and KM should be compelled to remediate any impact.

Proponents of the NED project point to gas as a cheap clean alternative energy source. A substantial portion of the cost of gas must be the cost of building the pipeline that would bring the gas from the shale fields to the consumer. If the gas is so inherently cheap to produce then there should be enough room in the pricing of the gas to cover the cost and maintenance of the pipeline. The NED project proposes to shift this cost away from the project. The cost will be borne by electric rate payers in the form of a surcharge. This is very unfair for those of us that will never be gas consumers. This is misleading and misrepresents the cost/benefits of natural gas distribution. The price of gas should be clarified to include the cost of the pipeline. That cost should be borne by gas rate payers and not electric rate payers. In anticipation of gas rate payers, Kinder Morgan should be able to capitalize the project on its own without subsidy. If and when the pipeline is built and customers become piped in and captive then the gas companies will be free to charge whatever is needed to recover the cost of construction.

It is unlikely that I my household would ever benefit from gas service at our door. If a pump off point were established in town then the town would still have to pay to build street to street distribution. The cost would be a million dollars a mile to be funded through local taxation. Then the homeowners would bear the cost to bring gas from the street to the building and to convert their heating systems to gas. If, and it is a big if, any of this were to occur we won't have saved anything at all. We will have paid dearly.

Live free...

Frances Riggs, New Ipswich, NH.
10/16/2015

Dear Secretary Bose,

As an abutter to the proposed NED Pipeline and Compressor Station in New Ipswich NH., it is a deep concern to me (a US citizen), that you show an understanding of the huge ramifications a 40,000 hp compressor station would have on the surrounding neighborhoods and environment. Please follow your moral compass when making your decision for all those who would be affected if this pipeline and compressor station were to be granted permission to proceed.

Sincerely,

Frances Riggs
201 Temple Road
New Ipswich, NH 03071

20151016-5296

Jeffrey Daniels, West Hartford, CT.

Hi.

As a resident of West Hartford, CT I am quite familiar with the site of a proposed ROW to install this gas pipeline. This is a near-pristine piece of property, protected on behalf of the public for both water supply purposes, and low-impact recreation.

It is a regional treasure. It is also worth noting that some 35 years ago, there were efforts to build a large interstate circumferential, called I-291, across the same route proposed now. After many hearings, and a major groundswell from the public, this proposed interstate was totally scrapped.

The people of this region have a proud history of choosing protection of our valuable natural resources, and being opposed to short-term economic and financial gains in the name of energy.

As Teddy Roosevelt opined some 110 years ago, it is the job of all of us, including government, to protect our natural environment, not for me, not for you, but for our future generations and all of the people of this country.

Please reject permission to build this pipeline through the MDC property.

Jeffrey Daniels

20151016-5298

Diane K Hewitt, Groton, MA.

October 16, 2015

Kimberly Bose, Secretary
Federal Energy Regulatory Commission
Washington, DC

Dear Ms. Bose,

Major projects, such as the NED Pipeline, inevitably, produce unintended consequences. I would like FERC to study the impact of taking public lands by eminent domain on future conservation land donations and purchases. New England has a long history of land conservation that spans several centuries and includes the founding of the Audubon Society and the Appalachian Mountain Club, among others. Most of the protected lands in New England are the result of private landowner donations and voter-approved town purchases. A significant portion of New Hampshire and Massachusetts land has been preserved and protected forever. Or so we thought!

Now we learn that a private company, using a public utility loophole, plans to take public and private land for a pipeline, which based on its size, far exceeds that amount of natural gas needed in New England and, leads to the obvious conclusion that most of the gas is intended for export. As we all know, exported gas sells for much more, hence, greater profits. This is Eminent Domain for Corporate Gain. There are several other natural gas options that can address the region's needs without such a massive overbuild that requires

that taking of hundreds of public spaces and thousands of homeowners property.

My specific concern is that this taking of public lands will negatively impact future land conservation efforts if citizens know that the lands they donate or vote to spend their tax dollars on may not, in fact, be protecting and conserving the land, but may only be “holding” it for some future utility to come in and take at will for their profits. Has this concern been taken into consideration? This is a very important regional matter, as unlike the west where there are huge tracts held by the federal government, most protected land in New England is the result of the accumulation of thousands of smaller donations and purchases. The taking of conservation lands given or purchased in good faith is not only contrary to the New England character, but it also violates Commonwealth of Massachusetts state constitution. (Kinder-Morgan representatives have told Massachusetts state representative Sheila Harrington that they would abide by Article 97 of the Mass. constitution that only allows non-conservation use of these lands with a 2/3 majority of the state House of Representatives and the State Senate. Will you hold them to their word on this?) What will happen to future NE conservation land acquisition efforts as a result of this policy?

In a related matter, I would also ask FERC to consider if Kinder-Morgan will be fairly compensating private landowners and towns. Kinder-Morgan’s absurd claim that the pipeline will not negatively impact property values cannot be accepted at face value. (Given two identical houses, one with a massive pipeline and one without, which would you choose?) Kinder-Morgan’s taking of “Easements” across public and private lands means that private landowners are stuck to bear the tax liability on property they can neither build nor plant on in perpetuity! Additionally, taking private land for commercial purposes is in violation of the New Hampshire state constitution.

How can this be fair? Combined with Kinder-Morgan’s practice of minimally compensating landowners, this is truly adding “insult to injury” as whatever meager compensation the land owner receives, it will more than all be eaten up paying property tax for Kinder-Morgan’s easement land leaving the landowner to continually lose money paying taxes on land he cannot use. Kinder-Morgan should be required to consider all of these factors as well as environmental impacts when determining fair market compensation to private landowners.

Lastly, I would like to raise concerns about the lack of due process afforded citizens throughout the FERC process. The FERC created timeline gives citizens a one year window to submit comments and concerns for a submitted application. Due to the fact that FERC decided to accept the woefully incomplete NED in spite of the fact that it contained over 23,000 “TBDs”. (Is there any minimum standards at FERC for what constitutes a legitimate application with regard to the number of TBDs contained?) How can a rational person be expected to respond to such an incomplete application in a responsible way? To date, there are still over 11,000 TBDs contained in the latest application filing and the finished product won’t be submitted until the comment period is closed. I believe this process of only allowing comments on an incomplete proposal with route changes still under consideration amounts to a denial of our due process rights.

Sincerely,

Richard and Diane Hewitt
Groton, MA

20151016-5300

John Leoutsacos, Temple, NH.

The similarities between fracked gas and cigarettes

There are several harmful chemicals found in both, but as of yet ONLY cigarettes have been federally regulated and publicly BANNED.

I know that FERC has little control over the fracking process but it MUST have some kind of regulatory ability over the PRODUCT(S) that are transported in the pipelines that they are in charged to oversee.

Below is an article from the website priceofoil.org

As so often in the past, where the tobacco industry leads, the oil / Gas industry follows.

There is now a huge amount of documented evidence showing how the oil / Gas industry – desperate to delay regulatory action on climate change – has used the same tactics as Big Tobacco in order to avoid regulatory oversight.

Often both industries have used what is seen as the most effective public relations strategy called the Third Party Technique, which is essentially getting others to speak on your behalf.

For decades, the tobacco industry mastered the technique, using a whole raft of supposedly independent people to speak on their behalf to try and sow doubt on the link between smoking and ill-health.

In the denial campaign, the tobacco industry enlisted one key third party: Academics and scientists who could offer tobacco industry science a veneer of respectability.

“Who better to serve as an expert than an actual scientist”, note Naomi Oreskes and Erik Conway in their ground-breaking book “Merchants of Doubt” which compares the tobacco industry tactics with that of the oil / Gas industry.

For example, in the late 1990s, Philip Morris, working with its lawyers Covington and Burling, outlined a covert pan-European plan to use supposedly independent scientists in their fight against regulations on second-hand smoke. It was known as “Project Whitecoat”.

Whitecoat’s goal was to “resist and roll back smoking restrictions” but also to “restore social acceptability of smoking”. One way of achieving this was to do what the industry had always done best: to “sustain controversy.”

Philip Morris International (PMI) and the tobacco industry are still using the tactic to this day. Just on Sunday the Observer newspaper reported how “a bitter academic row has triggered calls for a leading university to withdraw two key scientific papers sponsored by ‘big tobacco’ and used to make the case against the introduction of selling cigarettes in plain packets.”

PMI funded two academics whose research was published by the University of Zurich. But critics have now asked the University to withdraw the papers arguing they are flawed, although this is naturally denied by the scientists at the center of the row.

Where Big Tobacco leads, the oil / Gas industry follows, but not just on climate change, but also increasingly on fracking.

Public Accountability issued a report on “frackademia,” and what they find is deeply troubling.

They started investigating the issue after several universities issued industry-friendly fracking studies that “bore the hallmarks of an industry effort to manipulate and corrupt the scientific debate around fracking, much like the tobacco industry manipulated the scientific debate around the dangers associated with smoking. “

Their investigation reveals that pro-fracking studies “are often industry-tied and lacking in scientific rigor.”

Analyzing some 130 studies compiled by an oil and gas industry group, Energy in Depth (EID), to try and prove fracking was “fit for public consumption” and that proves the issue around fracking is settled, they found that over three quarters – some 76 per cent – were connected to the industry.

Of the 137 unique studies on EID’s list that they could locate, 56 had strong ties to the oil and gas industry.

Another 35 had industry ties that Public Accountability classified as medium, and 13 studies had other industry ties that were present, but relatively weak.

The vast majority of studies had not been peer-reviewed, seen as the benchmark for academic rigor. Of these 137 studies, only 19 were peer-reviewed equating to just 14 per cent.

As Public Accountability argue “This suggests that there is a significant shortage of serious scholarly research supporting the case for fracking”.

Drilling into the data further is even more worrying as there was only one peer-reviewed study that dealt

specifically with public health concerns, and that was industry-funded.

But it gets even worse. The list even included retracted and discredited studies, including studies that made “false” claims of peer review.

Finally it is not surprising that prominent industry associations, such as our old friends at the American Petroleum Institute, funded and issued numerous studies.

So next time you read something that says that fracking is harmless have a look to see who funded it. Just look for the hidden hand of the oil / Gas industry.

20151016-5301

John Leoutsacos, Temple, NH.

Below is an article by The Sightline Institute telling in plain English what kind of ENRONIC people ferc has proven to jump into bed with.

Energy giant Kinder Morgan has big ambitions. The firm aspires to multiply its coal export capacity in the Gulf Coast region even as it seeks permission to build a huge new oil pipeline in the Pacific Northwest. These projects could boost Kinder Morgan’s profits, but they also raise serious questions about what the projects might cost neighboring communities.

Today, Sightline Institute is publishing a new report, “The Facts about Kinder Morgan,” that examines the facts about the company’s behavior. The report reveals that the company’s track record is one of pollution, law-breaking, and cover-ups.

In public Kinder Morgan points out that it is already operating coal export facilities in Virginia, South Carolina, Louisiana, and Texas. Or, as the company’s spokesperson said when the firm was pushing a failed coal export plan in Oregon, “What we’re proposing is not something we don’t already do.” And that’s exactly the problem.

The truth is that Kinder Morgan’s existing operations are well known for blighting neighborhoods and fouling rivers. Here are the facts:

- In Louisiana, Kinder Morgan’s terminal spills coal directly into the Mississippi River and nearby wetlands. The pollution is so heavy that satellite photos show coal-polluted water spreading from the facility in black plumes. The same site generates so much wind-blown coal dust that nearby residents won a settlement from Kinder Morgan because their homes and belongings were so often covered in coal dust.
- In Houston, Kinder Morgan’s terminal operators leave coal and petcoke, a highly toxic byproduct of oil refining, in uncovered piles several stories high. The company’s petcoke operations are so dirty that even the firm’s promotional literature shows plumes of black dust blowing off its equipment.
- In South Carolina, coal dust from Kinder Morgan’s terminal contaminates the bay’s oysters, pilings, and boats. Locals have videotaped the company washing coal directly into sensitive waterways.
- In Virginia, Kinder Morgan’s coal export terminal is an open sore on the neighborhood, coating nearby homes in dust so frequently that the mayor has spoken out about the problem.

20151016-5302

Emily Moss, Bethel, CT.

Dear FERC,

Drinking water reservoirs need healthy lands around them to filter and protect the water our families use. Clear-cutting and digging a trench 90 feet wide, 5.5 feet deep, and 5.7 miles long through land that protects my drinking water and that of hundreds of thousands of my neighbors is a bad idea! Natural gas pipelines nationwide have suffered alarming failures that pollute water and soil, and put people at risk. Kinder Morgan should find another place for its pipeline—or better yet, invest in renewables and stop wasting money on outdated fossil fuel infrastructure.

Sincerely yours,
Emily Moss

20151016-5307

Elizabeth Reilly, Nassau, NY.

Please note the below is taken from a letter from FERC to Tennessee Gas to provide further details. The home of Libby Reilly listed would be impacted by the compressor station to be located on Clarks Chapel Road in the town of Nassau. The response should include how the compressor station and the pipeline will impact the historic value of the farm homestead and not just the pipeline. The property is in the name of Scott and Elizabeth Reilly.

Re: Comments on the July 24, 2015 Draft Resource Reports

1. The following people stated that they reside in historic houses near the pipeline route: Lawrence DeVito of Mason, New Hampshire; Kathleen Rose of Merrimack, New Hampshire; Kaela Law of Pelham, New Hampshire; Lester Garvin of Ashfield, Massachusetts; Tina Hanson of Rindge, New Hampshire; Libby Reilly of Nassau, New York; Robert Borden of Fitzwilliam, New Hampshire; Elizabeth Tatro of Lanesborough, Massachusetts; Peter LeCount of Mason, New Hampshire; Barbara Markessinis of Hancock, Massachusetts; Holly Woodward of Fitzwilliam, New Hampshire; John Angleman of Ashfield, Massachusetts; and Peter Cottrell of Stephentown, New York. Indicate if the Project would affect those houses, including the distance from the edge of the construction work area to each building, and discuss any necessary measures to avoid or minimize impacts.

20151016-5308

Linda Bevilacqua, Franklin, NY.

I am vehemently opposed to the proposed pipeline by Tennessee Gas Pipeline Company. There are currently 750,000 miles of pipeline in the U.S., and 2 1/2 million miles of distribution lines. How many pipelines do these companies need? They threaten the environment and human health. All for the profits of these giant energy companies. This product is eventually going to be exported overseas, thus negating the lies that this gas is for us. Subsequently, we will be paying higher prices for a commodity that will reap higher profits elsewhere, in the meantime jeopardizing our health and that of further generations. The area of NY where I live has seen 100 year floods every 5 years, thus putting residents here in extreme danger. The VOC's, poisonous gas, will be detrimental to the air we breathe. We are stewards of the earth that God created- created for us to enjoy and appreciate, not exploit. We need to make this world a better place, and the creation that these industries want to bring will only damage our precious world.

20151016-5309

Elizabeth Reilly, Nassau, NY.

The foundation of my farmhouse from 1777 and the other farmhouses and houses that line the compressor station site could suffer great damage if blasting takes place and from general construction of the compressor station site. Tamping has been proven to vibrate and radiate the ground for distances, for construction of such an industrial facility the local houses could suffer damage. How will Kinder Morgan ensure our houses will not receive damage from any construction? If we do sustain damage how will we be compensated? We would like a pre-construction engineer evaluation with pictures taken as well as a post evaluation done on the houses located in the "1/2 mile buffer zone" of the compressor station.

20151016-5311

Elizabeth Reilly, Nassau, NY.

How will my well water be protected? We utilize the water on a daily basis for the house and livestock.

In the event of contamination from daily operations, leakage, accident, construction, or blasting how will Kinder Morgan ensure I still receive a large supply of fresh quality water on a daily basis? I do not want to be subject to a hideous tank outside of my house that gets filled up by a tanker. My son can not consume water treated with chlorine and other chemicals on a daily basis due to his medical condition. We only consume pure spring water. Living right next to the compressor station on Clarks Chapel Road in the town of Nassau will drastically increase our chances of having contamination.

20151016-5313

October 16, 2015

PF14-22-000

Dear Secretary Bose,

Have you visited Franklin, New York? I urge you to do so and imagine the impact of the proposed Constitution Pipeline, the proposed NED, and a compressor station in the midst of a gorgeous, historic Victorian town and farming community of 1,500 residents. Deep forests house bald eagles; springs and streams surround Franklin and feed the Susquehanna River and the Chesapeake Watershed. The proposed pipelines will clear cut those wooded hillsides and run through Franklin's springs. Visit and think about the impact.

The two pipelines and NED compressor station proposed for Franklin present profound social, environmental, and health challenges to our upstate community. As is already evidenced in Hancock and Minisink, compressor stations produce emissions which include neurotoxins, carcinogens, and mutagens which are enormous health hazards for residents and animal species. Children are particularly affected. The gas is not needed, not wanted, not for the public good, and is not meant to supply domestic energy needs but is intended for international export for the profit of a private corporation. New York State citizens, communities, animal species, and environments will pay the health, environmental, climate, and economic price for short term corporate profit.

I urge you to undertake a serious environmental review of cumulative effects (segmentation) and to deny the permit for the NED and associated infrastructure. Thus far, despite comprehensive scientific analysis, research, and citizen comment, FERC has not acknowledged irreversible, adverse environmental, health, financial, and community impacts of a gas infrastructure build out in our region.

FERC, consider the public good. Franklin, in Delaware County, N.Y., and all communities affected by pipeline infrastructure, are at the epicenter of the current failure of our nation to create a life-sustaining energy plan based on renewable energies. Stopping the NED will be part of that solution.

Sincerely,

Dr. Katherine O'Donnell

TOWN OF MERRIMACK, NH

6 BABOOSIC LAKE ROAD · MERRIMACK, NH 03054 • WWW.MERRIMACKNH.GOV

October 15, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission 888 First Street, N .E.

Washington, DC 20426

RE: Tennessee Gas Pipeline Company, LLC; Federal Energy Regulatory Commission (“Commission”)
Docket No. PFI4-22-000

Dear Secretary Bose:

The Town of Merrimack (“Town”) respectfully requests that the Federal Energy Regulatory Commission (“Commission”) consider, and require that Tennessee Gas Pipeline Company LLC (“TGP”) respond to, the Town’s comments regarding newly proposed routing changes through Town (as shown on enclosed letter and map) (“Alternative Route”). Unfortunately, the Town received notice of these changes on the evening of October 8, 2015 and is not aware of whether these changes have been made in the Commission Docket for this matter.

As a result of TGP’s late notice of the Alternative Route and in light of the fact that it will impact a host of new properties and resources, the Town also respectfully requests an additional extension of the scoping period through the end of 2015 in order to allow impacted citizens, businesses and groups to comment on those impacts. Please note that Allen Fore, the Vice President of Public Affairs for Kinder Morgan (of which TGP is a subsidiary), suggested such an extension request in the cover letter notifying the Town of the Alternative Route.

The route changes significantly alter impacts to the Town as discussed in greater detail below. The Town will likely have additional comments regarding this route change as more members of the community are notified of the new route, but the Town wished to submit the comments available at this time in advance of close of the current scoping period.

1. The latest Alternative Route from its entry into Town from the Town of Hollis, New Hampshire up to Industrial Drive runs within 1100 feet of the Thornton’s Ferry Elementary School Building. The playground for this school is approximately 100 feet from the school building and thus the pipeline route is within 1000 feet of the playground. The route is also within 750 feet of the South Merrimack Christian Academy.
2. The latest Alternative Route runs within 200-300 feet of some large residential neighborhoods including:
Whittier Place
Camp Sargent Acres
Tinker Road
Thornton Road West
Other impacted neighborhoods include:
Cambridge Drive/Wethersfield
Holts Landing
Castleton Ridge
Eric and Greenleaf Streets
3. The Community Hospice House facility off Continental Boulevard is within a few hundred feet of the latest Alternative Route.
4. Numerous significant commercial and retail properties will be impacted by the latest Alternative Route including those listed below. It is estimated that these businesses and retail properties employ over 10,000 people. These impacts are likely to negatively impact valuable commercial and retail properties in Town thereby decreasing employment opportunities and tax revenue to the Town.
PC Connection
Dunkin Donuts
Pizza Hut
Home Depot
Merrimack Historical Society Building
O’Reilly Auto Parts/VIP Tire and Service

Auto Fair - VW, including current construction of a rental car business and additional vehicle storage
Pennichuck Square retail area with multiple retail businesses
Innovations Salon and Spa
Site proposed for new fire station
Current location of Merrimack South Fire Station
Fidelity Investments
Merrimack Premium Outlets including a proposed upscale mixed use complex and additional 100,000 sq ft of retail space
Elbit Systems LTD and tenants
All Basics Stove Shop (the attached former Abbie Griffin house is an occupied residence)
Meineke Car Care Center
Merrimack Veterinary Hospital
Anheuser- Busch (a proposed 50,000 square foot expansion has been delayed)
And other active and vacant business locations

5. The latest Alternative Route traverses directly across Town Conservation property. Habitats in the Town are scored as part of the Highest Ranked Habitat in New Hampshire. High Scoring Habitat located on Town Conservation property is directly impacted by the latest Alternative Route. As indicated in the October 9, 2015 letter to the Commission from the New Hampshire Attorney General's Office in its role as the New Hampshire Director of Charitable Trusts, certain of these conservation properties include deed restrictions limiting change of use. TGP must delineate and address these restrictions.
6. In general, the latest Alternative Route along Continental Boulevard is situated within wetlands and wetland uplands. These lands require significant surveying to ensure all potential plant, insect, and animal species of concern are noted.
7. The latest Alternative Route is slated to directly cross Penni chuck Water watershed properties that border Continental Boulevard.
8. Most of the land impacted by the latest Alternative Route in Town is part of a wetland system and the Naticook Brook Aquifer that serves to provide water for the Town's Merrimack Village District ("MVD") wells. The latest Alternative Route impacts an additional third wellhead protection area, MVD well and water treatment facility planned for near term construction. In short, the latest Alternative Route jeopardizes the entirety of the Town's public water supply.

In short, this new Alternative Route has been adjusted in such a manner that it impacts numerous highly sensitive receptors of the type which TGP has shifted the route to AVOID in other communities. However, with each re-routing TGP appears to add additional such impacts in Town. We respectfully request adjustment of the route to address issues such as those listed above.

Thank you for your assistance with this matter.

Sincerely,

Eileen Cabanel

Town Manager on behalf of the Town Council for the Town of Merrimack, NH

KINDER MORGAN

October 13, 2015

Town of Merrimack
6 Baboosic Lake Road
Merrimack, NH 03054

Attn: Nancy Harrington, Chair, Town Council

RE: Tennessee Gas Pipeline Company Northeast Energy Direct Project

Dear Ms. Harrington:

Thank you for the opportunity to meet with the Town Council on October 8, 2015 regarding Tennessee Gas Pipeline Company's (TGP) Northeast Energy Direct Project (Project). During the meeting, there were questions raised regarding the Federal Energy Regulatory Commission's (FERC) pre-filing and certificate processes and the opportunities for concerned citizens to provide comments regarding TGP's Project. As you are aware, the scoping period for the Project, which was originally scheduled to end on August 30, 2015, was extended by the FERC to end on October 16, 2015. The Town of Merrimack (Town) may request an additional extension of the scoping period from FERC; any extension to the scoping period would be at the discretion of the FERC. The Town and residents will have opportunities to submit comments to the FERC during the certificate application process as well.

With regards to Project routing, TGP continues to review route alternatives and make appropriate adjustments as we continue through the FERC pre-filing and certificate processes. In evaluating route alternatives, TGP evaluates and balances stakeholder requests and environmental impacts. The re-route that was discussed at the October 8 meeting located along the south property line of Fidelity's property and along the west side of the Everett Turnpike will be the proposed route that TGP intends to file as part of the certificate application. As TGP looks to refine and adjust its route through the Town, please provide us with the name and contact information of a Town representative that TGP could communicate with as we explore additional routing options.

Thank you again for allowing us the opportunity to meet with the Town Council. We look forward to our continued communication as we move forward.

Please feel free to contact me if you have any additional questions.

Allen Fore
Vice President, Public Affairs

31 Old Nashua Rd, #8, Amherst, NH 03031

20151016-5316

Elizabeth Reilly, Nassau, NY.

I am also requesting a new Decidable reading test to be conducted for the Clarks Chapel Road Compressor Station. How can a 24 hour test determine the neighborhood? It should be in place for at least a month. Plus there are seasons; I request a test to be done in January when all is extremely quiet outside and no leaves are on the trees since they believe that will “buffer” the noise. Yes, I am still outside for a great period of time this time of year, and I will hear the compressor station when there are no wild animals to hinder the humming of the engines. The first test conducted was not accurate. The owner of the compressor station site had dump trucks idling all day while he hauled gravel from the pit. I also was planting Christmas trees with a tractor and a garden that was right near the testing box. Due to the fact that this area does have a farm next to where the decibel readings were being taken, things that are done a few times a year such as planting Christmas trees, haying the fields or the neighbor hauling gravel all day can generate noise for a majority of the day since we don’t have a 9-5 work schedule, but it is not an operation that is a 24/7 noise. Even a neighbor mowing the lawn can be a whole day event with the size of lawns in this area. Also were wind speeds taken into account when the readings were done? If a 24 hour test is being conducted, weather conditions need to be taken into account. The Town of Nassau resource committee conducted their own testing, showing a drastic difference in readings. This is an extremely quiet neighborhood no one agrees with Kinder Morgan’s results. We need a new test conducted by a third party that is not hired by Kinder Morgan. The testing box that was located next to the road indicated the testing was being done by HFP Acoustical and not SLR as indicated in the July RR. I contacted the testing company directly after seeing the box chained to a telephone pole on the side of the road. I explained to the lady the noise levels had been elevated and new testing should be conducted. The worker who was in the area doing the testing was supposed to contact me and never did. I think another true test would to be place something in the location of the compressor station of equal value to the compressor station and then take a reading at the local houses, see how the noise will radiate to the extremely close households. I want better and longer acoustical readings done throughout the year, which will determine the true decibel reading of a neighborhood. Regardless of the outcome it is still an injustice to place an industrial infrastructure in a rural residential neighborhood. Our towns placed zoning rules for a reason, to protect the residents. Now the Federal Government can override a town. A town has a reason why those rules were put in place, not the Federal Government. **THERE SHOULD BE NO EXCEPTIONS TO THE RULE!**

CLF

conservation law foundation

October 16, 2015

VIA DOCKET EFILING

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, LLC, Northeast Energy Direct Project, Docket No. PF14-22-000

Dear Secretary Bose:

The Conservation Law Foundation (“CLF”) appreciates the opportunity to provide scoping comments to the Federal Energy Regulatory Commission (“the Commission”) during the pre-filing phase of the proceeding for docket PF 14-22-000, Tennessee Gas Pipeline Company’s (“Tennessee Gas,” “TGP,” or “the Company”) proposed Northeast Energy Direct Project (“NED” or “proposed project”). CLF offers these comments without prejudice to any and all legal rights CLF may have, which are hereby expressly reserved.

Founded in 1966, CLF is a non-profit advocacy organization with members across New England, including over 2,000 members in Massachusetts and approximately 500 in New Hampshire. CLF works to solve the environmental problems threatening the people, natural resources, and communities of New England. CLF’s advocates use law, economics and science to design and implement strategies that conserve natural resources, protect public health, and promote vital communities in our region.

CLF has serious concerns about the overall scope of the Commission’s review of this proposed project, the greenhouse gas and other environmental impacts of the proposed project, and the accuracy of the information before the Commission regarding the economic need for the proposed project. Importantly, in light of numerous proposals in the region to construct new or expanded gas pipeline infrastructure, and the complex ways in which those proposals will interact with one another and with regional energy planning, CLF respectfully requests that the Commission stay this proceeding and perform a comprehensive programmatic Environmental Impact Statement (“EIS”) for natural gas pipeline projects in the Northeast. As part of a programmatic EIS, and /or as part of any assessment of the proposed project, the Commission must 1) study all reasonable alternatives to the proposed project— including siting and routing alternatives and the no-action alternative—and provide a wellsupported rationale for excluding any alternatives from detailed review; 2) ensure that the “purpose and need” of the review is not defined too narrowly, to facilitate an adequately broad alternatives analysis and consideration of available alternatives that may run counter to the interests of the project proponent; 3) comprehensively assess the greenhouse gas impacts of the proposed project and alternatives; and 4) comprehensively assess the indirect, secondary and cumulative impacts of the proposed project and alternatives.

I. The Commission Should Prepare a Programmatic EIS.

This proposed 1.3 Billion Cubic Feet (Bcf) natural gas pipeline is just one among a number of proposed natural gas pipeline expansion projects into New England. TGP’s own listing of Projects Potentially Contributing to Cumulative Impacts includes numerous other pipeline expansion projects. See Draft Resource Report 1, Attachment 1b, Table 1.9-2. In particular, the number and size of competing pipeline projects meant to deliver natural gas to New England squarely raise the question of whether and how much additional natural gas pipeline capacity is in the best interests of the New England region. In the interests of efficient use of agency resources, considering the number of current and future natural gas pipeline expansion projects the Commission is and will be reviewing, we urge the Commission to stay this proceeding and instead initiate a broad, comprehensive EIS to study (a) the nature and extent of New England’s need for additional natural gas pipeline capacity, taking into account the New England states’ energy policies and goals, including those related to legally mandated greenhouse gas reductions, and (b) the most efficient, least impactful means of meeting the region’s natural gas deliverability needs. Such a study would function as a programmatic EIS for natural gas pipeline capacity in New England.

Given the complexity of assessing the cumulative impacts of separate project proposals, as well as potential redundancy, and in light of the need to assess whether each or any of the project proposals are in the best interests of New England, this broader, more comprehensive approach makes far more sense (and will result in far superior decision-making) than responding to individual projects in piecemeal fashion, as proposed by individual private entities, absent the broader context. Indeed, the Council on Environmental Quality (“CEQ”) has strongly acknowledged the value and benefit of such an approach, stating:

The preparation of an area-wide or overview EIS may be particularly useful when similar actions, viewed with other reasonably foreseeable or proposed agency actions, share common timing or geography. For example, when a variety of energy projects may be located in a single watershed. . . the over-

view or area-wide EIS would serve as a valuable and necessary analysis of the affected environment and the potential cumulative impacts of the reasonably foreseeable actions under that program or within that geographical area.

See Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations, 46 Fed. Reg. 18,026, 18,033 (Mar. 23, 1981) ("Forty Questions").

CLF strongly urges the Commission to seize the opportunity to analyze TGP's proposed project and other pipeline projects with a comprehensive geographic and policy approach, enabling a more efficient, better-informed decision-making process.

II. The Commission Must Conduct a Robust Alternatives Analysis.

Whether as part of a Programmatic EIS or a project-specific EIS, the Commission must conduct a thorough analysis and comparison of all reasonable alternatives and their impacts. The Commission's analysis of alternatives to the proposal is "the heart of the environmental impact statement," and "should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public." 40 C.F.R. § 1502.14.

CEQ regulations make clear that the Commission must "rigorously explore and objectively evaluate all reasonable alternatives. . . . devot[ing] substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits." 40 C.F.R. §§ 1502.14(a)-(b) (emphasis added). The Commission must consider the "no action" alternative and all reasonable alternatives, including those that are not within the Commission's or the applicant's capabilities or jurisdiction. See 40 C.F.R. § 1502.14(c)-(d); Forty Questions, *supra* ("In determining the scope of alternatives to be considered, the emphasis is on what is 'reasonable' rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant" (emphasis added)). The Commission's alternatives analysis must also include any "appropriate mitigation" that has not yet been proposed. See 40 C.F.R. § 1502.14(f).

The Commission's alternatives analysis must include, at a minimum, the following categories of reasonable alternatives to the proposed project: (a) alternative means of providing the end use energy resources, (b) alternative routes and sites for the proposed project, and (c) no action. CLF also notes the Commission's obligations to justify—as supported by independent, expert analysis—the exclusion of any of these alternatives from detailed analysis in the EIS, and to provide a detailed and holistic comparison of the impacts and benefits of the analyzed alternatives, which must guide the Commission's ultimate determination.

(a) Alternative Means of Providing Resources

To conduct an alternatives analysis that does not begin with the construction of the proposed project as a foregone conclusion, the Commission must assess the potential end uses for the pipeline's capacity and alternative means to serve those end uses. One example of evidence of direct alternatives to the proposed project is a white paper by Skipping Stone, LLC, attached as Exhibit A to these comments. The white paper, *Solving New England's Gas Deliverability Problem Using LNG Storage and Market Incentives* (Skipping Stone, LLC, 2015), analyzes natural gas utility sendout and electric market data in New England, concluding that the fabled "constrained pipeline capacity" issue in New England is in fact a very specific and targeted winter peak deliverability issue, which can be addressed at lower cost using existing pipeline and LNG infrastructure in the region. Additionally, this white paper indicates a lack of actual need for the quantities of gas capacity contracted for by the Massachusetts gas utilities, which calls into question the economic need for this specific pipeline to be investigated in the Commission's Natural Gas Act review.

Ample resource alternatives are available for the end users of the proposed project's intended pipeline capacity, including the LNG solution described above, increased deployment of distributed generation, and ISO-NE electric market reforms like the Pay for Performance program and the interim Winter Reliability

Program. Additionally, the Commission must also consider increased deployment of non-generation alternatives like energy efficiency and demand response. These alternatives should be considered separately and in combination, and should also be assessed as a means of reducing the capacity of the proposed project, which may facilitate, or improve the technical feasibility of, utilizing one or more alternative routes, configurations, and designs.

(b) Alternative Routes and Sites

The Commission must consider not only the route alternatives provided in the Company's Draft Resource Reports, but all other potential reasonable routes and configurations for the proposed project. To achieve this analysis, the Commission must obtain and analyze all routes considered and rejected by TGP. The Commission must independently review these potential routes, with the goal of identifying the route with the least environmental, cultural, and socio-economic impacts. In particular, the Commission should consider all route alternatives that avoid or minimize impacts to wetlands, drinking water aquifers, protected conservation lands under state, local, or private ownership, and historic and culturally significant sites. When assessing currently proposed route segments or alternatives that are colocated with existing utility rights of way, the Commission should pay special attention to the difference in nature and scale between the land use requirements and restrictions placed upon existing utility rights of way and those that would be placed upon the rights of way for a pipeline of this size. For example, the impacts on soil erosion and sedimentation will be different for a natural gas pipeline corridor and an overhead electric line crossing steep slopes. In addition, it is not yet clear whether "co-location" with existing utility corridors entails sharing the exact width of the corridor, additional clearing outside of an existing corridor, or an additional corridor somewhere in the vicinity of the existing corridor.

(c) No Action

The Commission also must provide a fair and objective analysis of the "no action" alternative. While the proposed project has clear financial benefits to the Company and other stakeholders, it remains to be established what other interests are at stake, including the welfare of communities in path of the proposed pipeline, the interests of environmental protection and the reduction of greenhouse gases, and impacts on consumers. Until the Commission has identified each of the relevant interests and conducted a rigorous analysis as to how the proposed Project will impact the "public interest," the Commission cannot reasonably foreclose the "no action" alternative. The Commission should be open to deciding in the EIS that the impacts of the proposed project and other reasonable "action alternatives" are unacceptably significant and that the no-action alternative is the preferred alternative.

The National Environmental Policy Act ("NEPA") requires the Commission to perform a robust and impartial assessment of the environmental, cultural, and socio-economic implications of simply denying the Company's Petition. See, e.g., *Pit River Tribe v. U.S. Forest Service*, 469 F. 3d 768, 786 (9th Cir. 2006) (EIS inadequate for failure to consider no-action alternative); *Bob Marshall Alliance v. Hodel*, 852 F. 2d 1223, 1228 (9th Cir. 1988) (NEPA alternatives analysis requires "agency decisionmakers '[have] before [them] and take[] into proper account all possible approaches to a particular project (including total abandonment of the project) which would alter the environmental impact and the cost-benefit balance").

III. The Commission Must Not Improperly Constrain "Purpose and Need."

NEPA regulations require an EIS to "specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action." 40 C.F.R. § 1502.13. Simply adopting the purpose and need stated by the Company in its Resource Reports cannot substitute for the agency's independent obligation to set the scope of its review broadly enough to encompass alternatives that are not preferable to the Company, or may not involve the Company at all. Otherwise, the alternatives analysis will be purposeless.

IV. The Commission Must Conduct a Comprehensive and Rigorous Assessment of the Impacts of the

Proposed Project and Alternatives.

NEPA requires a comprehensive assessment of the environmental impacts of the proposed project, and alternatives, including those discussed above. The EIS must provide a “full and fair discussion” of these impacts that will serve as the “scientific and analytic basis” for meaningful and technically sound comparisons of alternatives. See 40 C.F.R. § 1502.16.

It is imperative that the Commission consider all relevant impacts associated with the proposed project, including direct, indirect, and cumulative impacts, whether they be local, regional, or national, including the environmental impacts of the natural gas extraction practices that will supply the natural gas to be carried by this proposed project. See *id.* Below, we briefly discuss certain environmental and other impacts that the Commission must address in the EIS. Our comments are not intended as an exclusive or exhaustive list; the Commission is obligated to consider all relevant impacts raised by other commenters or that emerge during the Commission’s independent study of the proposed project.

a) Greenhouse Gas Emissions Impacts

The proposed project’s Market Path is a new construction pipeline project that will bring up to 1.3 Billion cubic feet (“Bcf”) per day of natural gas capacity into New England. Draft Report Transmittal Letter at 2 (July 24, 2015), available at <http://elibrary.ferc.gov/idmws/common/OpenNat.asp?fileID=13939499>. Natural gas is composed primarily of methane, an extremely potent greenhouse gas.² According to the International Panel on Climate Change (“IPCC”), methane gas is 34 times more potent than carbon dioxide on a 100 year time frame and 70 times more potent than carbon dioxide on a 20 year time frame.³

One major area of environmental impact not explicitly contemplated by the Commission’s Notice of Intent to Prepare an Environmental Impact Statement for the Planned NED Project, 80 Fed. Reg. 39,095 (July 8, 2015) (“EIS NOI”) is the impact of the proposed project and alternatives on greenhouse gas emissions, specifically direct emissions from the diverse array of greenhouse gas sources associated with the proposed project and alternatives. These sources include but are not limited to leaks and other emission points on the proposed project pipeline itself, leaks in the end distribution system for natural gas into which the proposed project will feed, production activities for the increased volumes of natural gas to be carried by the proposed project pipeline, and space heating and generating facilities utilizing the natural gas to be provided by the proposed project. The Air Quality and Noise section of the Draft Report mentions greenhouse gas emissions only with regard to the proposed compressor stations, which fall under the first of these categories (emissions points on the proposed pipeline itself). Draft Report at 9-18, § 9.1.2.4. It is silent as to the other, more significant, sources of greenhouse gas emissions listed above.

The Draft Resource Report also mentions greenhouse gas emissions to suggest, without economic or scientific basis, that the proposed project will reduce greenhouse gas emissions by displacing coal and oil-fired generation. Draft Report at 1-11. This unsupported and self-serving statement is factually incorrect; New England’s system-wide average greenhouse gas emissions are already lower than the emissions from the most efficient new natural gas plant.⁴ New England’s coal fleet is largely displaced already, and New England’s oil units are of limited utility. New natural gas units will increasingly be displacing older natural gas units and represent de minimis GHG reductions. More importantly, excessive natural gas supply will impact the market for the cleaner resources that are critical to achieving GHG targets and mandates. A massive infusion of natural gas capacity in New England will have the effect of incentivizing the construction of additional natural gas-fired generating facilities, when the system has already moved well beyond needing natural gas generation to lower emissions from relatively higher-emitting sources.

A detailed and comprehensive assessment of greenhouse gas emissions impacts in an EIS is required under NEPA because greenhouse gas emissions from the production and transmission of natural gas are significant, electricity generation is among the most significant sources of greenhouse gas emissions, and the Project has critically important implications for electric systems in New England.⁵

b) Energy Resources Impacts

CEQ regulations emphasize the importance, in all EISs, of describing the proposed action's energy implications, see 40 C.F.R. § 1502.16(e), and that task is especially crucial in the context of a natural gas pipeline project, and in the context of a proposed project of this size. As the exclusive federal regulator of interstate natural gas pipelines, the Commission has special responsibility to employ its technical expertise and resources in this review, while taking into account other federal, regional, and state policies. The EIS must comprehensively address impacts on energy resources, use, markets, reliability, and prices. In particular, the Commission must analyze the effects of the proposed project and all reasonable alternatives on renewable generation and non-generation resources, while accurately and thoroughly accounting for the potential to displace older fossil fuel generation.

A new pipeline project of this size will have profound effects on the development and maintenance of domestic energy resources, including new renewables such as solar, wind, efficient low-emitting biomass, and small-scale hydroelectric facilities. Federal and state public policies, including federal and state tax incentives and renewable portfolio requirements, promote new and continuing development of these resources. CLF has strongly advocated and supported these policies as critical to creating a clean energy future for New England and the nation that will move us away from reliance on inefficient and dirty power plants that contribute to climate change and threaten public health, including those that burn natural gas.

Similarly, the proposed project is likely to have significant impacts on non-generation energy resources like demand management, demand response, energy efficiency, and conservation. All of these resources reflect avoided energy use, with the unassailable benefit of reducing utilization of existing, polluting resources and virtually no adverse environmental impacts. The Commission should address, in detail, how substantial new pipeline capacity into the New England region may diminish the economic incentive for these resources to continue to grow — and the value of the many federal, state, local, and utility investments promoting them. As discussed above, non-generation alternatives that the Commission must consider in the EIS would have vastly different effects on these resources, which must also be quantified and described.

As described in Section IV(a) above, TGP's Resource Reports make self-serving and unsubstantiated statements about the proposed project's ability to facilitate the displacement of older fossil fuel generation sources. In order to include this possibility in its review of the proposed project's impacts, the Commission must accurately assess the impact that this pipeline could have in displacing older fossil fuel generation separately from the market dynamics that are already having this effect. The study currently being conducted by the Analysis Group for Massachusetts Attorney General Maura Healey and scheduled to be completed on October 31, 2015, will likely be valuable to the Commission's analysis of this dynamic in New England.

c) Impacts of Natural Gas Extraction Practices

All impacts associated with the source of the natural gas that would be conveyed by the proposed project are relevant, and indeed crucial, to a valid and complete impact assessment. The Commission does not conduct separate analyses of the physical pipeline and the supply resources for the pipeline; thus, the analysis of the former must include the latter. In addition to the greenhouse gas impacts of natural gas extraction in the supply region for the proposed project, discussed above, hydraulic fracturing in the Marcellus Shale has serious and sometimes catastrophic impacts on land, air, water, and local residents at the site of extraction.

As the CEQ has definitively stated, such an evaluation is a core and unambiguous requirement of NEPA. Indeed, the geographic scope of the potential impacts to be analyzed has been extended even beyond national boundaries. In this context, analysis of the impacts on an adjoining region of the United States is amply covered by this requirement. See CEQ, *Guidance on NEPA Analyses for Transboundary Impacts* (July 1, 1997). Citing both federal case law and policy considerations, CEQ guidance states:

Neither NEPA nor [CEQ] regulations implementing the procedural provisions of NEPA define agencies' obligations to analyze effects of actions by administrative boundaries. Rather, the entire body of NEPA law directs federal agencies to analyze the effects of proposed actions to the extent they are reasonably foreseeable consequences of the proposed action, regardless of where those impacts might occur. Agencies must analyze indirect effects, which are caused by the action, are later in time or farther removed

in distance, but are still reasonably foreseeable, including growth-inducing effects and related effects on the ecosystem, as well as cumulative effects. Case law interpreting NEPA has reinforced the need to analyze impacts regardless of geographic boundaries within the United States

Id. (citing, inter alia, *Swinomish Tribal Cmty. v. FERC*, 627 F.2d 499 (D.C. Cir. 1980); *Wilderness Soc’y v. Morton*, 463 F.2d 1261 (D.C. Cir. 1972)) (emphasis added). Any decision by the Commission to exclude hydraulic fracturing impacts from its environmental review would be erroneous as a matter of law and subject to reversal to ensure compliance with NEPA.

d) Secondary, Indirect, and Cumulative Impacts

Pipeline construction and maintenance, especially in wetlands and across conservation lands, is likely to result in impacts beyond so-called direct impacts: namely, secondary, indirect and cumulative impacts. Indeed, the secondary impacts of activities – impacts such as fragmentation of wildlife habitat, flooding, and the degradation of water quality caused by stormwater runoff from cleared earth or the use of herbicides to maintain the pipeline corridor, to name a few – can sometimes be more significant and more harmful than the direct impact associated with construction and maintenance practices themselves. CEQ regulations specifically require the consideration of indirect impacts and their significance. 40 C.F.R. § 1502.16(b). As the Commission’s own staff comments exhaustively catalogue, the current Draft Resource Reports provided by the Company lack adequate information and detail upon which this analysis can be conducted. FERC Staff Comments on the July 24, 2015 Draft Resource Reports (Oct. 8, 2015). In order to provide adequate opportunity for stakeholders and the public to review and respond to this crucial missing information, the Commission must ensure that each piece of missing information is supplied before issuing a draft EIS.

Executive Summary

For 50 days a year, New England has a gas problem – not enough natural gas is available to meet demand. In the winter of 2013-14 this problem led to dramatic spikes in the price of natural gas and the cost of electricity. How to solve that problem has been the source of political, economic and environmental debate over the past 2 years. One proposed solution is to “flood the market” with new gas via one or more new pipelines, with the multi-billion dollar cost to be borne by electric ratepayers. The other solution, one that the Conservation Law Foundation has promoted, is to maximize the use of existing infrastructure in both the delivery and storage of natural gas. This solution addresses the supply problem during that limited 50 day period in the winter, saves industrial, commercial and residential customers millions of dollars and avoids the need for costly and enormously inefficient infrastructure that will ultimately undermine efforts to meet the challenge of climate change.

As currently managed, New England’s natural gas delivery system – its pipelines, storage and import facilities do not deliver sufficient quantities of natural gas to meet demand during the limited winter peak period. During these peak periods of demand, when high volumes of gas are consumed to simultaneously meet the region’s heating and electric power generation needs, management and operation of the current system fails to make the necessary gas deliverable. Numerous corporate and governmental entities are urging a large infrastructure solution: building more pipelines into and across New England to increase regional pipeline capacity. New pipelines, they argue, are needed to address a structural problem of constrained gas supply and the high wholesale energy prices experienced during the winter of 2013-14.

But New England does not have a structural pipeline capacity problem, and not only are new pipelines not the only solution – they are also the least cost-effective one. For the majority of the year, the region’s natural gas system of pipelines and LNG deliverability already operate at less than 50% capacity. On those portions of the 50 coldest winter days each year when the near-simultaneous and high demands of regional heating and electric generation loads are not being met efficiently, New England has what in the natural gas industry is considered to be an issue of “deliverability,” or the ability to provide a certain quantity of gas to a certain location at a certain time.

Once New England’s current “gas problem” is properly understood as one of deliverability, rather than insufficient pipeline “capacity,” the solution that most efficiently and cost-effectively enhances deliverability in New England would be increased use of the region’s existing LNG infrastructure.

We reach this conclusion based upon the “cost of use” of each alternative. That is, the cost of new pipeline capacity in an area like New England, with a peak-only supply deficiency and where other peak-only supply alternatives already exist must be analyzed on the basis of use. So when additional deliverability of gas is needed over discrete days of the year rather than on a year-round basis, the overall cost of the pipeline should be measured as a cost on only the days during which it will actually be used to serve the residences and businesses who will pay for it through their gas or electric bills, rather than measuring that cost as artificially spread out across the entire year – the vast majority of which it would not be used or, if used, will cause another existing asset to go unused.

A cost of use comparison demonstrates that adding additional pipeline capacity is the most expensive and least effective means of addressing New England winter-peak deliverability. The process of building new gas pipelines takes years and does nothing to help us address winter deliverability in the interim. There is also substantial risk that a new pipeline built today will become the ratepayer-funded, stranded cost of tomorrow. Moreover, investing in a new pipeline is unlikely to produce the assumed lower gas prices, as currently stranded Marcellus/Utica gas supply and its artificially low existing prices will more likely rise as numerous planned pipelines to other regions and for export move those prices to that of the Henry Hub. Finally, environmental regulatory regimes, such as the federal Clean Power Plan and existing New England state mandates to aggressively reduce greenhouse gas emissions, create a strong disincentive for any significant increase in natural gas consumption.

For New England, the best means of solving the winter gas issue from a cost of use approach is better utilization of existing natural gas infrastructure and specifically, existing LNG infrastructure. We call this the

Winter-Only LNG “Pipeline” approach. This approach suffers from none of the weaknesses of a year-round pipeline capacity solution.

New England has both LNG vaporization capacity from large import terminals as well as from LNG storage facilities owned by the local gas distribution utilities, or “LDCs.” If LDCs were to contract for a baseload level of LNG vaporization during the December 15 - March 15 winter period, and for more frequent truck refills of their existing LNG storage facilities, local gas reliability could be maintained while freeing up existing pipeline capacity for sale on the secondary market to power plants.

Not only is this approach technically feasible, a Winter-Only LNG “Pipeline” strategy would provide LNG deliverability throughout New England that would save LDCs and their ratepayers initially over \$340 Million a year and as much as \$4.4 Billion over twenty years, as compared to a new pipeline proposal, while providing peak deliverability that will lower winter wholesale electricity prices on a scale comparable to new pipeline capacity additions. As outlined more fully in Appendix E to this paper, the role that LNG can play in ensuring gas deliverability and driving down spot market gas prices was meaningfully demonstrated in New England in the winter of 2014-2015, when a 4% increase in total gas deliverability from LNG reduced spot gas prices by 43%.

For these reasons, the Winter-Only LNG “Pipeline” outlined in this paper would be less costly and more effective than new gas pipeline capacity. Such an approach requires a break from the currently prevailing pipeline-centric management and regulation of New England’s gas transmission and distribution system. Our alternative approach has the promise to address immediately the problem at hand, and to do so efficiently, effectively, and without complex regulation. Consequently, state regulators should direct LDCs to implement the Winter-Only LNG “Pipeline” option immediately. Thereafter, relatively small adjustments can be made to the market incentives and associated reimbursement rules regarding LNG storage and resale – distinguishing the winter period from the rest of the year – in order to make the LNG solution a permanent feature of the New England energy market.

Laura Mazur, Peterborough, NH.

My family and I do not support the Kinder-Morgan PF14-22 pipeline project in southern New Hampshire! The communities surrounding this project are being bullied and our voices are not being heard. The land is mostly wild and much of it is wetlands. How is it that this company can come in to our state and devastate the environment and its people? I have heard little about this and now I find out that it’s almost a done-deal. This area is pristine and very special. My understanding of why the pipeline route has changed from Massachusetts to New Hampshire is that wealthy landowners in western Massachusetts used their leverage and now it’s in our beautiful New Hampshire! Well, we don’t want that pipeline shoved down our throats! It offers little but devastation and few jobs it may offer are not worth the huge cost to humans, animals, and the wilderness. I am extremely disappointed in my state and federal government for not doing a better job of listening to its people on important issues such as this. FERC do your job!

Laura Mazur

Peterborough, NH

20151016-5331

October 16, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission (FERC)

888 First Street NE
Room 1A
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Dear Secretary Bose,

The **Ashby Conservation Commission** submits the following additional comments regarding the proposed Kinder Morgan Tennessee Gas Pipeline (TGP) Northeast Energy Direct (NED) project described in Docket No. PF14-22. We are still awaiting response to our previously submitted comments¹. FERC's letter to Kinder Morgan of May 15, 2015² requested a response from TGP to our comments but those answers have not yet arrived.

As a Commission, we remain deeply troubled by the risks to our way of life, our natural environment, and our life sustaining resources of clean air and water, imposed by Kinder Morgan's proposed project. This includes risks both as a whole and as locally from the primary and alternate mainline paths, Fitchburg Lateral and New Ipswich compressor station. Although Ashby is now considered a "non-impacted" town, infrastructure of the NED project is currently proposed less than half a mile outside our political boundary. In some manner or other, everyone in the region is impacted by this proposal.

The project is absolutely wrong in every aspect for the future of our town, our Commonwealth, New England and the entire Northeast region impacted by this overbuild of fossil fuel infrastructure.

The destructive activities for the construction and future operation of an infrastructure which both leaks and releases methane as a matter of standard operation procedures, all add up to far too great a risk to everyday life and our planet's very survival. Activities such as blasting through ledge and granite, clearcutting 100' minimum swaths through greenfield or alongside existing utility corridors, trenching through and drilling under wetland resources areas large and small, and segmenting intact wildlife areas have long-term negative consequences. We feel that the only viable outcome of your review must be the "No Action Alternative" to "avoid the temporary and permanent environmental impacts associated with construction and operation of the currently proposed Project³."

Both the Ashby Conservation Commission and Board of Health⁴, along with many others, have commented on the risks to drinking water that construction and operation of this proposed project present. Whether aquifer, private well, or public water supply, blasting and trenching are not compatible activities with the protection of these irreplaceable water resources. Please scope how you will ensure zero (0) risk to this life-supporting resource.

Both the Ashby Conservation Commission and Board of Health, among many others, have commented about the risks to clean breathable air that construction and operation of this proposed project present. The emissions of fracked gas during its extraction, transport, and consumption are too great a risk to everyday life and to our local and global environment. Methane is released into the atmosphere as a matter of standard operating practice where pressure is adjusted and it enters the atmosphere through leaks at all points from drill bit to burner tip. Please scope how you will ensure zero (0) risk to this life-supporting resource. Please scope how you will ensure the project's 100% compliance with new EPA rules restricting methane release⁵.

We, and others, have also commented on the negative impact of the increase in methane emission from the project to curbing global climate change. The Commonwealth of Massachusetts has committed to reductions in greenhouse gas (GHG) emissions defined by our Global Warming Solutions Act (GWSA)⁶. Those GHG reductions are required to be 25% of 1990 baseline levels by 2020 and 80% by 2050. Please scope how you will guarantee that the increased GHG emissions resulting from the fossil fuel product of this pipeline project will have no negative impact on our Commonwealth's ability to achieve the reductions we have committed to in our GWSA.

The introduction of increased fees for infrastructure paid for on the backs of ratepayers will decrease the monies available for both residential and commercial energy efficiency efforts. The Commonwealth of Mas-

sachusetts has been first in the nation⁷ for energy efficiency for the last 4 years. Please scope how you will ensure that our energy efficiency efforts, our ‘first-priority’ energy resource⁸, will not in any way be negatively impacted by this proposed project.

This project continues to imperil public lands believed to be protected into perpetuity by Article 979 of the Amendments to the Massachusetts Constitution, and by Conservation and Agricultural Restrictions placed on lands by private citizens and public land trusts. The other States impacted by this proposed project have comparable protections of their own public lands also now at risk. In Massachusetts alone over 100 conservation parcels, at least 85 of which are protected by Article 97, are threatened by this proposed project. The Ashby Conservation Commission has provided¹⁰ requested information regarding Article 97 to help educate FERC staff. Please scope how taking these public lands by eminent domain for the private profit of a commercial entity, in violation of the public and charitable trust, can possibly be in the public good.

The impacts of the Fitchburg Lateral on local sensitive environmental resource areas that we share with our neighbor to the east, Townsend, include the entire north-south reaches of the Squannassit Area of Critical Environmental Concern¹¹, Natural Heritage and Endangered Species Program (NHESP) Priority Habitats of Rare Species area PHP 1477, NHESP Estimated Habitat of Rare Wildlife area EH 959, BioMap² Critical Natural Landscape areas 1308 and 1274, BioMap² Core Habitat 2791, and Willard Brook State Forest. Please scope how you will ensure zero (0) negative impacts on these sensitive ecological areas themselves and the wildlife that inhabit them.

The Town of Ashby resolved on August 12, 2015 to file for Intervenor Status if and when Kinder Morgan files a formal application for the NED project. We are joined by many other Towns who have also taken this preparatory step. We, the Conservation Commission, as the municipal focal point for environmental protection, will do what is necessary to protect our town. We urge you to see, as we have, that the “No Action Alternative” is not only the best, but the sole possible valid outcome of your tasked Environmental Impact Study.

Respectfully,

The Ashby Conservation Commission
George A. Bauman, Chairman
Robert F. Leary, Vice Chairman
Roberta Flashman, Secretary
Cathy Kristofferson, Treasurer

20151016-5332

Process Adherence in Support of the Public Interest

When Kinder Morgan made a voluntary election to use FERC's pre-filing process, it made a commitment under 18 CFR 157.21(d)(10) to file both a complete set of Resource Reports as required in 18 CFR 380.12 and a complete application at the time of filing. FERC must hold Kinder Morgan to its commitment. The Resource Reports submitted by Kinder Morgan to date suggest that Kinder Morgan will test the limits of FERC's minimum standards for acceptability when it submits its application, which KM has stated will be filed on November 20, 2015. FERC must ensure that KM's submissions meet or exceed FERC's standards as defined in the regulations.

It appears that Kinder Morgan did not take the FERC pre-filing process seriously. The Resource Reports which Kinder Morgan has already submitted are not designed to facilitate appropriate review of a proposal with such extensive impacts. The data are incomplete and sometimes misleading. They are provided in a format that appears designed for public confusion vs. public understanding. Government entities which must review the project are burdened by incomplete and confusing information. This essentially shifts the cost of analysis from the Kinder Morgan to the public and taxpayers. I respectfully request that Kinder Morgan show its good faith by holding itself to a higher standard in its application than that which it has demonstrated to date in its pre-filing submissions.

The Resource Reports already presented are cumbersome to navigate either physically or digitally. Tables of contents for future reports should include specific pdf page numbers and hyperlinks rather than simply refer to a page number within a section, so that basic digital navigation is possible. Large sections of these reports contain no data. FERC has addressed this recently in a 30 page letter to Kinder Morgan requesting additional information, repeating many earlier requests to KM. Under KM's commitment in the pre-filing process, the Resource Reports submitted with the application will of course have no missing data.

Every reference provided by Kinder Morgan should provide an appropriate hyperlink to a digital source. If a digital source did not previously exist, KM should digitize the source document and post it to a webpage, providing a direct hyperlink. References which lead to nowhere are time-consuming, frustrating and useless. The burden should be on Kinder Morgan to provide legitimate sources which are easy to retrieve and review. KM's failure to perform this basic task requires both the public and FERC reviewers to waste time and public money.

The references Kinder Morgan has provided often don't prove their points, as I've illustrated in my earlier comments regarding Resource Report 5. The tendency of a casual reviewer is to assume they are correct, leading to false conclusions which have significant implications when assessing public necessity vs. cost. This is intellectually dishonest and cannot be tolerated when so much is at stake.

To facilitate better public understanding and review, maps must include current information with existing structures clearly identifiable. Larger scale maps should be included to provide context. North should be at the top.

Kinder Morgan has shown a lack of attention to detail throughout the process. Although Kinder Morgan provided updated resource reports in July, it frequently repeated language from previous reports, without providing obvious updates. For example, in Appendix D filed in July 2015, it speaks of already completed open houses in the future tense: "...the expectation is to complete several open houses beginning in February 2015 (D-3)."

In the last year, Kinder Morgan has missed deadline after deadline. Just this week, it announced it is delaying its application filing by a month. Yet, despite all its self-imposed delays, and despite the significant route changes it adopted well after public announcement of the proposal, Kinder Morgan insists it will meet its originally predicted date to have the pipeline in service. This leaves the public to wonder what other shortcuts Kinder Morgan would take with pipeline design, construction and operation, let alone with the FERC process.

FERC has the authority and the responsibility to protect the public interest in the certificate process. Kinder Morgan's lack of consideration for the process, its lack of attention to detail, its failure to provide references which validate its arguments, and its seemingly unchallenged arrogance increase public mistrust of the

FERC process. FERC must act to ensure that Kinder Morgan follow the law as it continues the certificate review so that the public interest is both respected and protected.

The FERC process excludes public discussion of perceived necessity. It focuses public disclosure exclusively on environmental impacts vs. economic impacts. It is imperative that the review process disclose all information pertinent to the decision.

It is important for the public to know what percentage of pipeline capacity is subscribed by customers who are also investors in the pipeline through themselves or their subsidiaries and partners. The dual roles of companies as investors and customers enable such entities to game the system. There should be a presumption of an arm's length transaction for subscribed capacity. When this is not the case, issuance of a FERC certificate of necessity and convenience essentially guarantees these companies interests are protected at the expense of the public interest. This of a key concern not just for the environmental damage that these projects will cause, but also for the rights of public citizens who would lose their property to these companies via eminent domain authority.

It is further critical to understand the proponent's plan for scaling up the capacity of the pipeline over time. It is apparent that KM scaled back its proposal because of lack of interest, yet it now suggests it will pursue a somewhat larger capacity, with the ability to scale more in the future. There is every expectation that the proponent will attempt to sell future capacity for LNG for overseas sales. This is an extremely costly proposition to American citizens and businesses and must be addressed in an open process as part of the current review process.

Thank you for the opportunity to comment.

20151016-5339

Sally Catlett, Nassau, NY.

October 16, 2015

FERC Docket # PF12-22

First Street NE, Room1A

Washington, DC 20426

My name is Sally Catlett and I am a resident of Nassau NY in Rensselaer County. Over the past year I have become aware of the severity of the Tennessee Gas Pipeline/ KinderMorgan project that is proposed for my area. Two existing pipelines lie right behind my property. Kinder Morgan is proposing the installation of a new, high pressure pipeline that would carry hydrofracked fuels along this same route. This new pipeline would have a great impact on our home values, our safety and our health. Some of the known facts about this pipeline, I wanted to re-emphasize with you so you will understand the implications of this project if it gets approved. Of greatest concern to me was:

1. This new pipeline will be 30- 36 inches in diameter and carry "fracked" gas at 1460 lbs. per square inch, significantly larger and much more pressurized than the current pipeline in place now. Any house that lies within 900 feet of the gas pipeline is considered to be within the "incineration zone", indicating that if the pipe were to have a leak and explode (which happens more frequently with these pressurized pipelines), the house would be completely destroyed, along with anything on the property. My house is 926 feet from this pipeline. There have been over 990 accidents involving natural gas transmission including 137 injuries and 34 deaths since 2003.

2. With this high pressure pipeline comes compressor stations. They will be built every 40-60miles along this pipeline. Since the proposed pipeline is so large in scale and more pressurized, it requires a significantly larger compressor station. It will span 30-40 acres of land, be very loud and have lights on 24/7. A compressor station of this magnitude will also emit large amounts of CO₂, methane and nitrogen oxide, contributing to poor air quality around our homes. They will also release harmful carcinogens into the air, such a toluene, benzene and formaldehyde. Citizens who live within 1500ft of these compressor stations in other areas have complained of nosebleeds, headaches, sore throats, dizziness and nausea. There have also been numerous

explosions at other compressor stations causing evacuation of nearby residents within a one-mile radius.

3. Our property values will significantly decrease and insurance may increase. The Schodack/ Nassau area is a small one, we need to attract to more people to live in this community, not drive them away. I would consider moving out of this area if this pipeline does get approved for installation. It is simply making this community an unhealthy place to live.

This pipeline would not be bringing fuel to our homes, or anyone in the area, it is strictly a transmission line to bring the fuel to Dracut, Ma. Please help protect the health and safety of our families and our environment. There are cleaner fuel alternatives available that would not subject innocent people to harm. Fracked gas extraction has been banned in the state of New York, why should its residents be subjected to the hazards of transporting this fuel through our backyards?

Thank you. Your consideration is appreciated,

Sally Catlett

October 16, 2015

Honorable Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C. Docket No. PF14-22-000

Comments on Environmental Issues for the Planned Northeast Energy Direct Project

Dear Secretary Bose,

The Connecticut River Watershed Council, Inc. (CRWC) hereby submit these comments in response to FERC's "Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings" dated June 30, 2015. CRWC has reviewed portions of Northeast Energy Direct Project's revised "Draft Resource Reports and Appendices" prepared by Kinder Morgan, owner of the Tennessee Gas Pipeline Company, dated July 24, 2015.

CRWC is a nonprofit citizen group that was established in 1952 to advocate for the protection, restoration, and sustainable use of the Connecticut River and its four-state watershed. The interests and goals represented by CRWC include, but are not limited to, improving water quality; enhancing habitat for fish and other aquatic biota; safeguarding and improving wildlife habitat; protecting threatened and endangered species; protecting wetlands; preserving undeveloped shore lands; enhancing public recreation and promoting recreational safety; protecting aesthetic values; protecting archeological, cultural, and historical resources; fostering sustainable economic development, energy production, and preserving the local tax base along the Connecticut River and its tributaries.

The Connecticut River watershed boundaries encompass the Silvio O. Conte National Fish and Wildlife Refuge, which was designated in 1991 as the first watershed-wide refuge of its kind in the country. The Connecticut River was named one of just 14 American Heritage Rivers by President Clinton in 1998, due to its historic and cultural significance to the nation. It also became the first National Blueway, designated by Secretary of Interior Ken Salazar, in 2012 due to the collaboration of the over 40 partner organizations working in our watershed.

The Northeast Energy Direct project would involve the construction and operation of approximately 418 miles of new pipeline, pipeline looping and laterals in Pennsylvania, New York, Massachusetts, New Hampshire and Connecticut. Based on our review of the materials presented in the July 24, 2015 resource reports¹, we believe the following elements of the project lie within the Connecticut River watershed and are of interest to us:

Massachusetts part of Connecticut River watershed:

- Wright to Dracut Pipeline Segments, some of G and all of H
- Two compressor stations: Market Path Mid Stations 2 (Windsor, MA) and 3 (Northfield, MA)
- Two meter stations: West Greenfield (Deerfield, MA) and Longmeadow, MA
- Mainline valves and blowoffs, access roads, and contractor yards associated with segments G and H of the pipeline

New Hampshire part of Connecticut River watershed:

- Wright to Dracut Pipeline Segment I and a small part of J
- Mainline valves and blowoffs, access roads, and contractor yards associated with segments I and J of the pipeline

Connecticut part of Connecticut River watershed:

- 300 Line Connecticut Loop, Segment S
- Mainline valves and blowoffs, access roads, and contractor yards associated with segment S

As FERC noted in their comments on the July 24, 2015 Draft Resource Reports dated October 8, 2015, there are many details that are still listed as “TBD” in the resource reports. CRWC is unable to formulate scoping comments on missing information. We request that FERC require the applicant to complete those sections and that they be published and noticed by FERC with a public comment period.

Alternatives Analysis

There are a large number of alternatives that should be evaluated as part of the EIR, including the following:

- No build alternative. FERC should fully consider whether there is truly a public need for this project. Many doubts have been raised about the need. Given the extremely large impact this project will have on resources in the project area, the bar to determine a public need should be set very high.
- Routing alternatives. Should the need for a pipeline be established, we request that routing alternatives, both large and small-scale, be fully explored. The EIS must include a detailed alternative routing analysis to avoid sensitive areas. For example, access roads and contractor yards should only be built in areas where wetland and stream impacts are avoided.
- Construction alternatives: There are many construction alternatives that can be considered in certain areas of the project. Overall, we recommend that the draft EIS contain an analysis of smaller rights-of-ways such as a 50-foot right of way.

Impacts to Wetlands and Waterways

Resource Report 2 describes generally the proposed methods that will be used for stream crossings. Our interest is in the construction-related and long-term impacts to the Connecticut River and the many tributaries and wetlands impacted by this project.

According to Table 2.2-6, we believe there are 45 stream crossings (and more than 50 wetland crossings) proposed in the Massachusetts part of the Connecticut River watershed, 24 stream crossings in Connecticut, and 46 in the New Hampshire part of the watershed. The majority of river crossings are in coldwater fisheries or high quality waters in Massachusetts and New Hampshire. In Connecticut, most of the waterbody crossings affect Class A and AA waters. Stream crossing methods are listed for each crossing, but the ratio-

nale for each crossing is not given.

We are not sure why the proposed crossing method for the Westfield and Millers Rivers are type II (Dry crossing Method including Flume and Dam and Pump). The Westfield River is part of the National Wild & Scenic River system. Any impact to this river and its tributaries should be avoided or minimized. In New Hampshire, the 800-foot crossing of Scott Pond in Fitzwilliam, is proposed to have a type II crossing as well. CRWC recommends that any crossing of a lake not be subject to dry crossing.

Multiple crossings to the same river should be either avoided or minimized. For example, Table 2.2-6 indicates that the Bear River, a coldwater tributary to the Deerfield River in Massachusetts, will be crossed in four separate locations by the pipeline. Moreover, the Bear River will be crossed once for an access road. Five crossings of the same small tributary will have a high impact on this stream. The Deerfield River will be crossed twice, with a total of crossing length of 565 feet.

The proposed pipeline will cross many headwater streams. For example, in New Hampshire, the pipeline will cross several tributaries of the Ashuelot River including Snow Brook, Mirey Brook, Roaring Brook, Rice Brook and the headwaters of the South Branch. The applicant should clarify how they will approach these important headwater streams. Seasonally, streams such as those mentioned in the Ashuelot watershed, provide spawning habitat for native species. In addition, the timing of the disturbance will affect the success or failure of the spawn during the construction year. FERC has requested information on timing and we concur that this is an important detail to review.

CRWC recommends that FERC require the Applicant to document how pre-construction conditions will be restored at each stream crossing location and how pre- and post-construction conditions will be monitored. Stream restoration activities should ensure that the Applicant is taking appropriate measures to avoid and/or reduce short-term and long-term impacts to stream morphology and hydrology.

Protection of Drinking Watershed Lands in Connecticut

A portion of the 300 Line Connecticut Loop will impact over 250 acres of public drinking water supply land owned by the Metropolitan District Commission. This land is classified as Class I and Class II water company land and is protected and preserved by Connecticut state statute to protect the state's water resources. There was neither an alternative proposed to this route nor was the permit required according to CGS 25-32 listed in Table 1.6-1.

Impacts to endangered species

The U.S. Fish and Wildlife Service has identified the Ashuelot River as one of the four most important refuges for the federally-endangered dwarf wedgemussel (*Alasmidonta heterodon*). Although the dwarf wedgemussel is listed in Table 3.4-1, it was not listed in Table 3.4-6, which lists species in the vicinity of the project in NH. If dwarf wedgemussel are not in the vicinity of the planned pipeline, impacts to this species during and after construction of the pipeline because of disturbance to upstream tributaries should still be evaluated.

Cumulative impacts

Tributaries to the Connecticut River support coldwater fisheries. This habitat is maintained in part by shading provided by tree cover. The proposed construction and maintenance of the pipeline right of way will require that the pipeline route be kept clear of tree cover. The cumulative impact of construction and permanent right of way maintenance on cold water habitat must be fully evaluated and mitigated.

The proposed route will create a permanently cleared swath through forest habitats, and this will have a detrimental effect on interior forest species. Pipeline corridors can act as gateways for the spread of invasive species which will have a negative impact on native flora and fauna, and biodiversity. The EIS must evaluate the cumulative impact on interior-dependent species as well as the impact on the spread of invasive species. The proposed route should attempt to avoid interior forest habitats.

Mitigation options

This is a very large project that covers a wide swath of our watershed. Under typical conditions, each stream crossing for a project would get detailed scrutiny by state and local resource agencies and boards. Due to the magnitude of the project, there is no way each impact is going to be carefully considered and mitigated. We believe there is no way to properly mitigate the impacts of this project. Certainly, any mitigations options offered by the proponent should be on a large enough scale that real benefits can happen.

Agency Contacts

The Ashuelot River is an enrolled river in the NH Rivers Management and Protection Program (RMPP). As such, it has special status under New Hampshire law and is specifically empowered to review proposals to NH DES that impact the river and its orderly development. Under the NH program, a Local River Advisory Committee (LRAC) comprised of citizens appointed by the selectboards of all the towns through which the Ashuelot River watershed flows is established. Appendix A of the resource reports indicates that the proponent has contacted the Rivers Coordinator for NH Department of Environmental Services. If the applicant has not also contacted the Ashuelot River Local River Advisory Committee, CRWC recommends that they do so. No group of people in the Ashuelot watershed knows the intimate details of the river like the members of the Advisory Group.

We appreciate the opportunity to provide scoping comments. We can be reached by email at adonlon@ctriver.org (Massachusetts), ddeen@ctriver.org (New Hampshire), and acharamut@ctriver.org (Connecticut).

Sincerely,

Andrea F. Donlon

RE: Northeast Energy Direct – Docket No. PF14-22-000

Dear Secretary Bose:

The Dalton Fire District submits the following comments on the proposed Kinder Morgan Tennessee Gas

Pipeline (TGP) Northeast Energy Direct (NED) pipeline project (PF14-22). The proposed NED project would have significant impacts on the natural resources, public infrastructure, socio-economics, and the public health and safety within the region. The proposed NED project crosses through the Town of Dalton on Dalton Fire District lands and would impact the District as well as the Town. Through the coordination of the Berkshire Regional Planning Commission, the Dalton Fire District has joined with the City of Pittsfield, Massachusetts, the Towns of Cheshire, Dalton, Hinsdale, Lanesborough, Lenox, Richmond, Washington and Windsor, Massachusetts, the Lanesborough Village Fire and Water District, Rensselaer County, New York, and the Towns of Nassau, Stephentown, and Schodack, New York to identify common impacts and requested mitigation measures. Those items are specified in comments submitted by the Berkshire Regional Planning Commission; letter dated October 15, 2015. The Dalton Fire District endorses and incorporated herein by reference, the comments submitted by the Berkshire Regional Planning Commission.

The Sloppiness of Kinder Morgan's "Arguments"

Summary

I have spent some time examining the most recent Kinder Morgan Resource Reports for the Northeast Energy Direct (NED) project. I am very much underwhelmed by the sloppiness of many of the arguments that they put forth to support their interpretation of the need for their proposed pipeline and their claims of the relatively small impact that they claim the pipeline would have on those directly affected by its construction and operation. Below I detail two especially egregious examples of this sloppiness and what FERC should do to combat it.

Specific Objections

These are two specific objections to the sloppiness of Kinder Morgan's "logic" as presented in their Resource Reports:

1. Narration without citation is not a valid argument – at best, it expresses an opinion. If a report declares that something is a fact but doesn't back that declaration with actual data and citations of the work of others, then it has not made a valid argument. And that lack of data and citations might even cause the careful reader to wonder at their absence and of the veracity of the arguments being made. If supporting data and studies are available, why not cite them?

Here is an example of Kinder Morgan substituting narration for valid argument. This is section 10.1.2.10 from Resource Report 10, Alternatives:

10.1.2.10 Other Energy Sources

Alternative fuel sources available include using liquefied natural gas ("LNG") and propane/air storage and vaporization. Although both alternatives have the potential to meet the Project objectives, Tennessee determined that these alternatives were not viable due to such factors as siting constraints, increased environmental impacts, and the time required to develop them. Therefore, supplying adequate volumes of natural gas through the construction of the proposed Project is the preferred alternative.

There are studies available that claim there is little if any need for the NED project at all because of the potential of more fully utilizing existing pipelines and LNG import facilities. The most recent study is

Analysis of Alternative Winter Reliability Solutions for New England Energy Markets, available here: <http://tinyurl.com/p9marv1>. For Kinder Morgan to assert that LNG is not a viable alternative - basically because they say so - is ludicrous. As if they could wish away this alternative in one short paragraph that includes no data or citations – by simply stating that they have determined that this is so. Why are they not willing to share the information that they used to determine that the LNG alternative is not viable? Why would a careful reader of this report accept this “argument” as being true?

2. Whenever an outside study is referenced, it simply must be properly cited – and in an electronic document such as the Resource Reports, it should have a working hyperlink. Lack of such proper citations and links is completely unacceptable in any document that is to be taken seriously. And again, the very lack of a these items might cause the careful reader to wonder why they weren’t supplied.

This is an example of Kinder Morgan referencing studies without citing them. It comes from Resource Report 5, Section 5.6, Property Values:

Other studies have reached similar conclusions: PGP Valuation, Inc. (2008) for Palomar Gas Transmission Inc.; Ecowest (Fruits 2008) for the Oregon liquefied natural gas (“LNG”) Project; Diskin et al. (2011); and Hansen et al. (2006).

Requests to FERC

Given the above objections to the Kinder Morgan Resource Reports, I request that FERC take the following steps:

1. Be aware of the instances where Kinder Morgan is substituting simple narration for valid argument. Narration without the citation of data and references is simply that – narration. Anyone can write an opinion piece stating their position without backing it up with actual data. Please disregard any such unsubstantiated “arguments” put forth by Kinder Morgan – just as a thoughtful reader of any type of report should do. Or alternatively, require that Kinder Morgan back up its assertions or remove them from the report.
2. Be aware of instances where Kinder Morgan references (presumably) existing studies, but fails to provide actual citations to these studies. The reader is then left to either accept Kinder Morgan’s assertions about these studies or to embark upon a research project of their own to locate the referenced study. No middle school teacher would accept this type of sloppy writing on a report turned in by one of their students – and neither should FERC. Rather, FERC should insist on being supplied with actual citations for any study referenced, ideally accompanied by a working hyperlink to the study - the same type of citation that any author writing any serious report would supply as a matter of course.

It is telling to me that this type of basic information is not automatically supplied by any pipeline applicant that is attempting to provide critical information to FERC and to the public. Such critical information should automatically be required by FERC for all Resource Reports. Any report lacking it is incomplete and should not be accepted by FERC or by the public.

RE: Project docket number: PF14-22-000

Dear Ms. Bose:

Please accept this correspondence related to the Northeast Energy Direct (NED) proposal which would impact Southwest New Hampshire and several communities in the planning district served by the Southwest Region Planning Commission (SWRPC). Attached are comments prepared by SWRPC to assist in your agency's review of the NED proposal. These comments are organized by subject matter and are formatted to provide context, articulate concerns, and identify additional information needs to better understand and assess potential impacts associated with the proposal. SWRPC has collaborated with other regional planning agencies in MA and NH to develop a joint Request for Further Study and Information which you will also find attached. In addition, SWRPC provided initial written comments to FERC dated 9/29/15.

It should be noted that the NED proposal as it may impact Southwest New Hampshire came unexpectedly and out of the blue. SWRPC has no experience in reviewing a natural gas infrastructure siting proposal which, as we have learned during the pre-filing phase, is extremely complex. Nor has SWRPC been provided with dedicated resources sufficient to offset the cost of its professional staff to participate in the review of the proposal. From my perspective, this is a flaw in the process.

In the initial stages of pre-filing, the importance of the proposed project was continually stressed as critical to addressing our future energy needs, reducing our energy costs, and providing a low-cost energy source which would provide us with the means to become more competitive from an economic development standpoint. Yet, ironically, approximately one year later, we are left with little if any clear and quantifiable data which would allow us to adequately assess the positive aspects of the proposal. The information which has been made available suggests a multitude of concerns, many of which have been expressed within the comments contained in this submittal.

Thank you for the opportunity to provide comment. Please feel free to contact me if you have questions.

Sincerely,

Tim Murphy

INTRODUCTION

The Southwest Region Planning Commission (SWRPC) provides the comments contained in this submittal concerning the Northeast Energy Direct project (NED) proposed by Kinder Morgan Tennessee Gas Pipeline Company. SWRPC is the regional planning agency serving the 34-town planning district of Southwest New Hampshire. This includes seven towns located directly on the proposed pipeline corridor and two additional towns immediately adjacent and within close proximity to the corridor that will be impacted by the 37 miles of proposed pipeline route through the SWRPC Region and the Mid-Station 4 compressor station. SWRPC is participating in review of the NED proposal in that we have worked to better understand the FERC process, created a sensitive resource inventory along the proposed pipeline corridor, collaborated with regional planning agencies in MA and NH, provided initial comments during the FERC-sponsored scoping meeting of 9/29/15, developed the comments contained within this submittal, and intend to continue participation and to provide additional comments throughout the course of the FERC review process.

The NED proposal represents the largest infrastructure project in Southwest NH in at least several decades and perhaps ever. The communities of Southwest NH have evolved and continue to develop as a result of hundreds of years of growth and change supplemented by conscious visioning efforts, master plans, land use regulations, zoning ordinances, land conservation activities, political structure, and awareness and protection of the significant features that define the very character of individual towns and the Region. SWRPC is concerned that the nature and scale of the proposed NED project has the potential to undermine the efforts of generations of hard-working volunteers in providing stewardship for and maintaining the quality of life in our Region and several communities in which we serve. SWRPC has significant concerns regarding the potential natural and cultural resource impacts associated with the proposal. Resources that would be most directly impacted include aquifers and surface waters, vegetation, wildlife habitat, conservation lands, air, farmlands, historic resources, roads and bridges, other public infrastructure, and existing and proposed development. We are also concerned with the impacts that the proposed project could have on property values, local taxes, public safety, environmental justice, recreation and tourism, business activity, and the orderly development of the Region.

It is no secret that New Hampshire and New England have some of the highest electricity costs in the nation making it a challenge to compete economically. A clear connection exists between higher energy costs and our ability to attract economic development activity and grow our regional economy. Because of these realities, we are faced with difficult challenges about our energy future in order to stay economically viable and maintain our quality of life. Yet, an excerpt from the vision statement of the Comprehensive Economic Development Strategy for Southwest New Hampshire (CEDS) states the following:

Private and public activity will foster equally economic enterprise, environmental protection, and conservation of our local heritage – not seeking to transform the landscape, but preserve our greatest assets.

This excerpt acknowledges that our environment and heritage are vital to the Region and therefore should not be unduly compromised in the pursuit of addressing our economic needs. This represents just one example of a theme repeated in numerous other publications about the importance of these assets to the very identity of Southwest New Hampshire and the Monadnock Region. It is perhaps noteworthy in this instance that this theme is contained within the vision statement of the CEDS document – an on-going initiative focused on the economic health and well-being of Southwest NH.

SWRPC has collaborated with other regional planning agencies in MA and NH to develop a joint *Request for Further Study and Information* {see below} which will be submitted separately. In addition, SWRPC

provided initial written comments to FERC dated 9/29/15.

The information provided by the applicant during the pre-filing period are not sufficient to fully understand and assess the impacts of the proposed project on our natural and cultural resources. The comments contained in this submittal along with SWRPC's initial comments and the joint Request for Further Study and Information are intended to assist in the process of developing a filing in which SWRPC, individual communities and the public can more fully understand and provide comment

WATER USE AND QUALITY

Introduction

The project and its proposed facilities will have significant temporary and permanent impacts on water resources in Southwest NH. Information provided during the pre-filing stage is insufficient to adequately assess impacts of the proposed project. Following are several comments which describe concerns and identify information needs.

Comments

- Context: Surface water is a vital resource in the Southwest Region of New Hampshire, as is water quality. Communities rely on maintaining the water quality for drinking water, local recreation, and attracting visitors. There are many volunteers that contribute countless number of hours as stewards to ensure that the water quality remains in a healthy status. The major contributor to water quality degradation is non-point source pollution that is carried with stormwater into surface waterbodies.

Concern(s): During construction, the natural and existing flow of stormwater is likely to be rerouted. Unmanaged stormwater during construction will result in erosion and can carry material into watersheds causing a degradation of water quality.

Information Request(s): The application should include a stormwater management plan showing proposed methods of protecting watersheds and waterbodies. The plan should include methods of handling stormwater during construction and post-construction.
- Context: Natural vegetated riparian buffers are the most effective protection for the Region's surface waters. They reduce runoff, filter pollutants and provide transitional zones between aquatic habitat and human land use. Depending on the width of buffers and the vegetation in place, 50-100% of the sediments and nutrients from runoff can settle out or be absorbed by the buffer.

Concern(s): The loss of mature vegetation within the riparian buffers will have a negative impact on water quality and can increase the potential for erosion.

Information Request(s): Information is needed on the riparian buffers that will be impacted as a result of construction activity. This should include a planting, restoration, and maintenance plan. The plan should indicate the types and size of plantings, and planting distances. All plantings must be non-invasive species. Plantings and locations must be sufficient to serve the functions that were previously established by the existing buffer. A maintenance plan is needed until the vegetation is well-established.
- Context: According to NH DES, the fifth most common impairment to aquatic life for lakes in the Region is aquatic plants. Invasive aquatic species are easily spread through machinery and equipment from one location to another. Invasive aquatic plants, fish, and invertebrates cause an imbalance to the health and natural habitat of waterbodies and impairs the water quality and viability of native aquatic species.

Concern(s): Spread of invasive aquatic species, including zebra mussels and milfoil, as a result of construction activities and the wetland mitigation restoration process.

Information Request(s): Information should be submitted to demonstrate the protection against the spread of invasive aquatic species during construction activities and wetland mitigation.
- Context: Southwest NH is reliant on privately owned and maintained water supplies. Approximately

98% of the region's population is dependent on groundwater for drinking water supplies. The majority of residents (56%) rely on private wells to access water. Maintaining the high quality and availability of groundwater is important to protect public health and the environment. The current proposed pipeline route will impact a variety of aquifers across the Southwest Region. The proposed route will affect at least eight aquifers within six towns in the Region.

Concern(s): Contamination of aquifers and springs during construction. Private water supplies may be compromised due to blasting and other construction activities. Arsenic, Radon, and other issues are common. There currently is no complete inventory of these wells.

Information Request(s): The application should include a plan delineating the aquifers and wellhead protection areas located within construction areas, staging/storage areas, and accessways. Information in the plan should follow the New Hampshire 2015 Model Groundwater Protection Ordinance or local ordinance if it is more stringent. Determine the number of wells that could be potentially harmed through contamination or loss of function as a result of NED construction. Provide a schedule of testing that will be provided to each of the landowners in these areas. Conduct baseline tests for arsenic and radon in private wells in case of future problems. Provide information on measures that will be used to ensure private water supplies are returned to previous capacity in the event of damage caused by construction.

5. Context: Since approximately 98% of the region's population is dependent on groundwater for their drinking water supplies, water usage can become an issue during periods of drought or near drought conditions. Hydrostatic testing of a completed natural gas pipeline requires a large water withdrawal. There is also a significant amount of wastewater disposal.

Concern(s): The source of water needed for hydrostatic testing could deplete local water supplies to dangerous levels. The improper discharge of the wastewater could cause contamination of water resources and cause erosion and water quality issues.

Information Request(s): A water usage plan should be included as part of the application to show the source and amount of water needed during construction and post construction including evidence that the amount needed will not deplete the current needs for drinking, farming, and support of aquatic life. Detailed information is needed to determine the potential impact of the discharge of water used in hydrostatic testing. This includes location, temperature of discharged water, and potential contaminants.

6. Context: Surface waters are important resources for both people and wildlife and are protected under the Clean Water Act. The Monadnock Region has numerous lakes, ponds, and waterways. The current proposed pipeline route will impact a variety of surface waters and watersheds including various rivers, streams, lakes, and ponds in Southwest NH. At least 37 streams/rivers and five lakes/ponds within seven towns in the Region will be directly affected. Non-point source pollution contributes to over 90% of water pollution in New Hampshire. Contaminants can have harmful effects on drinking water supplies, recreation, fisheries and wildlife. Any activity that affects water quality, quantity or flow rate in one part of a watershed may affect locations downstream.

Concern(s): Pollutants from construction activities can have detrimental impacts within watersheds, thereby impacting water resources downstream.

Information Request(s): Information should be submitted to delineate entire watersheds within construction areas, staging areas, and accessways to determine the potential for contamination downstream of proposed facilities. A plan is needed for each watershed to indicate the protection methods proposed. Information is needed detailing the effects and procedures used by the applicant during HDD (horizontal drilling) and the protocols regarding the release of drilling fluids into local aquifers, wetlands, and surface waters.

7. Context: The Clean Water Act emphasizes the importance of wetlands and regulations regarding their protection. Wetlands provide a vast array of ecological functions and societal values. Approximately

5% (32,370 acres) of the Region is classified as wetlands by the National Wetland Inventory of the U.S. Fish and Wildlife Service. These wetlands perform important ecosystem functions including water purification, sediment trapping, flood protection, shoreline stabilization, and recharge for both groundwater and surface water. They also provide food and shelter for a variety of aquatic and upland plants and animals. A variety of wetlands outlined by the National Wetlands Inventory (NWI) will be affected by the current proposed pipeline route. Over 39 wetlands have been identified within the proposed pipeline route and numerous additional wetlands exist in the Region that have not been mapped as part of the NWI. Therefore, the total number of wetlands as well as the total area of potential impacts are unknown.

Concern(s): Any activity that disturbs a waterbody will disrupt the natural processes that occur and can have a lasting impact on wildlife habitat, water quality, and flood storage capabilities that a healthy wetland performs.

Information Request(s): Wetland areas must be delineated in the application. Wetland acreage being effected (temporarily and permanently), loss compensation, quality of water discharge resulting from pipeline contact and chemicals used, information regarding waste products and disposal methods should be identified. Information is needed on the water quality of each waterbody prior to any activity including tree cutting, blasting and land disturbance. The application should demonstrate that best methods will be used to mitigate disturbances to each waterbody. Any proposed alteration of a wetland should include appropriate mitigation methods to restore the affected wetland to its pre-construction state.

8. Context: The Clean Water Act outlines the importance of maintaining and preserving clean drinking water. Many communities rely on stratified drift aquifers for a source of clean and reliable drinking water. The proposed route crosses a number of high transmissivity stratified drift aquifers. Each community along the proposed route in Southwest NH is impacted by at least one crossing.

Concern(s): Activities related to the construction and operation of the proposed project cross many stratified drift aquifers. Groundwater and the water table can be sensitive to changes in overburdened soils and sediment, or to the removal of large amounts of water. Land developed for use by proposed facilities detracts from favorable areas to site new public and private wells.

Information Request(s): The application should include a plan that describes the potential impacts of drilling and pipeline construction on groundwater resources, including flow amounts and directions. Provide information about how impacts to the aquifers will be avoided during construction and post-construction. Provide details on how conditions of municipal groundwater or aquifer protection districts, overlays, or other areas will be addressed in the project review process.

FISH, WILDLIFE, AND VEGETATION

Introduction

The project and its proposed facilities will have significant temporary and permanent impacts on fish, wildlife, and vegetation in Southwest NH. Information provided during the pre-filing stage is insufficient to adequately assess impacts on these resources. Following are several comments which describe concerns and identify information needs.

Comments

1. Context: Between 2010 and 2025, Cheshire County is projected to lose 2% of its forest cover. This decline is due largely to the conversion and fragmentation of forestlands as a result of population growth and development. The loss of large, un-fragmented blocks of productive forest to development can have significant long-term ecological and economic consequences. Five hundred acres of intact forest canopy can provide adequate habitat for some species, protect water quality, allow for sustainable forest management and offer opportunities for outdoor recreation. Larger parcels of productive forest lands are important to ensure the economic viability of forest management and com-

mercial forest interests in the Region.

Concern(s): The proposed project will subvert the efforts of those who have assembled large tracts of land for conservation to create unfragmented forests.

Information Request(s): Describe the effects on ecological integrity, vegetation, threatened/endangered species, and water quality as the proposed project runs through treasured locations such as Rhododendron State Park and Little Monadnock. Describe the impact of construction activities during peak usage times in the parks and methods to mitigate the effects experienced by visitors.

2. Context: Invasive plants are easily spread by cutting and land clearing during the construction phase of the proposed project.

Concern(s): The spread of invasive species on land by cutting and improper disposal of existing invasive plants is a serious concern.

Information Request(s): The application should include a list of invasive plants within any proposed areas of disturbance, including construction areas, staging areas, and accessways. Information supplied should also include the proposed method and proper disposal of invasive plants.

3. Context: Invasive aquatic species are easily spread through machinery and equipment from one location to another. Invasive aquatic plants, fish, and invertebrates cause an imbalance to the health and natural habitat of waterbodies and impairs the water quality and viability of native aquatic species.

Concern(s): Spread of invasive aquatic species through the pipeline installation and the wetland mitigation restoration process.

Information Request(s): Information should be submitted to demonstrate the methods that will be used for the protection against the spread of invasive aquatic species during construction activities and wetland mitigation.

4. Context: In the Southwest Region, forestlands are a defining feature of the landscape and an asset for economic development and tourism. Covering approximately 83% of the Region's land area, they play an important role in providing clean air, clean water, and essential habitat for plants and animals. Other roles of forestlands include protecting watersheds, reducing the impacts of floods, and storing carbon from the atmosphere.

Concern(s): The amount of trees removed during construction activities will have a significant negative impact on tourism, air and water quality, and animal habitat.

Information Request(s): Information is needed to demonstrate the method proposed to mitigate the negative impacts of tree removal both locally and regionally. A plan must be provided which demonstrates that tree removal will be minimized and that best management practices will be used. The plan shall include an inventory of species and size classes, location of critical wildlife habitats, notable areas (historic sites, scenic vistas, trails, etc.), soil types (including areas of compaction and erosion), and goals and objectives. The plan must include sound forest management to keep forest ecosystems healthy and resilient.

5. Context: Damage to the protective cover of tree bark from equipment (e.g., chain saws, graders) can leave trees vulnerable to insects and diseases that can significantly impact an entire species.

Concern(s): The damage caused to trees that are not being removed during construction activities may invite insects or diseases and weaken or devastate the tree or entire species.

Information Request(s): Information is needed to show the methods that will be used to protect trees that are not within the tree removal plan, but are vulnerable to damage caused by equipment construction areas, staging areas, and accessways.

6. Context: Threatened, endangered, and species of special concern have been identified at or in the vicinity of the proposed project. However, no comprehensive inventory of these natural communities is available.

Concern(s): Disturbance of habitat will have a serious and significant impact on threatened, endangered, and species of special concern that have been identified in or near the proposed project. Any disruption to the habitat will further endanger the existence of these species.

Information Request(s): Provide information about how and when rare, threatened, or endangered communities will be identified and how impacts to these and other natural communities will be mitigated.

7. Context: The loss of habitat due to the conversion of land to other uses is one of the greatest threats to wildlife in the state. Activities associated with development activities can result in the loss or fragmentation of habitats, wildlife mortality, nonpoint source pollution, introduced (and invasive) species, etc. The stages of development for breeding, nesting and early development vary depending on the time of the year. In addition, deer wintering areas and hibernation areas will likely be impacted as a result of the proposed project. The NH Wildlife Action Plan (WAP) has identified and mapped a variety of significant habitats that are important for many species of wildlife, including species of conservation concern.

Winchester: The proposed project area crosses priority wildlife habitat including highest in state, highest in biological region and supporting landscape. Habitat types being affected include grassland, hemlock-hardwood-pine, marshland, and peatland.

Richmond: The proposed project area crosses priority wildlife habitat including highest in state, highest in biological region and supporting landscape. Habitat types being affected include grassland, hemlock-hardwood-pine, northern hardwood-conifer, and peatland.

Troy: The proposed project area crosses priority wildlife habitat including highest in state, highest in biological region and supporting landscape. Habitat types being affected include grassland, hemlock-hardwood-pine, northern hardwood-conifer, and lowland-spruce-fir.

Fitzwilliam: The proposed project area crosses priority wildlife habitat including highest in state, highest in biological region and supporting landscape. Habitat types being affected include grassland, hemlock-hardwood-pine, lowland-spruce-fir and marshland.

Rindge: The proposed project area crosses priority wildlife habitats including highest in biological region and supporting landscapes. Habitat types being affected include grassland, hemlock-hardwood-pine, lowland-spruce-fir and marshland, and peatland.

New Ipswich: The proposed project area crosses priority wildlife habitat including highest in biological region and supporting landscape. Habitat types being affected include grassland, hemlock-hardwood-pine, marshland, peatland, and lowland-spruce-fir.

Greenville: The proposed project area crosses priority wildlife habitat including highest in biological region. Habitat types being affected include Floodplain Forest, Hemlock-Hardwood-Pine and marshland

Concern(s): Disturbance of natural habitat for wildlife, breeding/nesting, deer wintering areas, and hibernation areas will have a serious impact on existing wildlife. The proposed project through Southwest NH will directly impact a variety of significant wildlife habitat outlined by the NH Wildlife Action Plan and other conservation plans such as the Silvio O. Conte National Fish & Wildlife Refuge Comprehensive Conservation Plan (specifically the proposed Sprague Brook Conservation Focus Area), the Quabbin to Cardigan Conservation Plan by the Society for the Protection of NH Forests, and the Ashuelot River Watershed Plan. Disturbance of particularly sensitive areas such as vernal pools can be critical during certain months of the year.

Information Request(s): Detailed information is needed to determine the potential impact to existing wildlife population in and adjacent to construction activities and impacts to nearby wildlife corridors. The information needed to fully understand the impacts includes a survey of existing wildlife and vegetation during all seasons. This should include the impacts and evaluation on wildlife corri-

dors and pathways and methods proposed to minimize these impacts. Identify all vernal pools within 150 feet of proposed areas of disturbance, including construction areas, staging areas, and accessways. Describe how vernal pools will be documented and avoided in each instance. A construction schedule is needed to show seasons and timelines of each phase of construction.

8. Context: The Connecticut River, Wapack Mountain Range, and other areas serve as major migration corridors for migratory bird species.

Concern(s): The siting of the proposed NED project will interfere with the migration of a variety of bird species.

Information Request(s): Provide information about migratory species that may be negatively impacted by the proposed project and how impacts will be mitigated.

9. Context: The NH Natural Heritage Bureau (NHNHB) maintains a database of known rare species occurrences throughout the state. Many rare species are known to occur in the Monadnock Region. However, a thorough inventory of rare species has not been conducted in the Region, and therefore the current distribution of rare species is inadequate to fully understand potential impacts.

Concern(s): A variety of threatened and endangered species have been identified as being potentially impacted by the proposed project. However, additional rare species may exist beyond the known locations found in the NHNHB database.

Information Request(s): The application should include information that identifies all threatened/endangered, rare, or exemplary natural communities in the vicinity of the pipeline, their locations, and how impacts to these communities will be mitigated during construction and operation of the proposed project.

10. Context: The NHNHB maintains a database of known rare and exemplary natural communities throughout the state. Many rare and exemplary natural communities are known to occur in the Monadnock Region. However, a thorough inventory of rare and exemplary natural communities has not been conducted in the Region, and therefore the current distribution is inadequate to understand potential impacts.

Concern(s): The proposed project will impact a variety of vegetative communities in Southwestern NH, including those identified as rare and exemplary natural communities by the NHNHB.

Information Request(s): A thorough inventory of rare and exemplary natural communities should be conducted in the proposed project area. Information on the effects of clear cutting near these rare and exemplary natural communities is needed.

HISTORICAL RESOURCES

Introduction

Along and in proximity to the proposed pipeline route are numerous historic structures, cellar holes, potential archeological sites, burial grounds, and other features that define the historic character of the region. Towns in Southwest NH have many historic structure and sites that appear in both the NH and federal register, but there is no comprehensive database for this information. Following are comments which describe concerns and identify information needs.

Comments

1. Context: Southwest New Hampshire is rich in documented and undocumented historical resources due in part to the influence of Native Americans and relatively early European settlement. Every community nearby to the proposed facilities has a number of state-listed culturally or historically significant sites.

Concern(s): Local officials, committees, and state agencies do not maintain a comprehensive list of historical sites, structures, or districts.

Information Request(s): Document historical assets within and adjacent to the proposed project area,

temporary workspaces, and contractor yards. Identify and map all historic properties and structures within 1/4 mile of the proposed pipeline route including stone walls, archeological sites, historical sites, and other features specific to each town. Describe how historical sites will be protected during construction. Identify and map historic areas and views subject to construction-related and permanent impacts of the proposed project.

2. Context: Stone arch, dry-fit stone, and similar stream, highway, or other road, stream, and railway crossings not only serve as vital infrastructure for the passage of people and vehicles; they also provide highly valued historical character to Southwest NH.

Concern(s): These structures are susceptible to damage during construction. Preserving both their structural integrity and historical attributes will require consultation with New Hampshire Department of Transportation (NHDOT), New Hampshire Division of Historical Resources (NHDHR), local road agents, and others. Preventing damage by over loading presents a challenge to owners since load rating and weight limit posting is not required in most cases and determining load limits in advance of damage is a difficult and somewhat subjective exercise.

Information Request(s): Identify transportation routes for vehicles and equipment within the proximity of any historic features. Identify structures and preservation or maintenance strategies to ensure their structural integrity is maintained.

3. Context: Stone walls are ubiquitous to Southwest NH and are susceptible to damage as a result of construction activities associated with the proposed project. Once a method to clear fields and contain livestock, they are today a key symbol of New England's agricultural history. Today, many of these structures are obscured by the growth of forest and there is no comprehensive inventory of their locations. They are a defining attribute of the Region's rural character and landscape.

Concern(s): The proposed project may damage or otherwise negatively impact historic stone wall features.

Information Request(s): Identify all stone walls within and adjacent to the project area and provide a mitigation plan to ensure that they are not damaged by construction activities.

4. Context: The Southwest Region is rich in historical resources that vary dramatically in terms of age and type.

Concern(s): The visible proximity of the proposed project to some of these resources may detract from their value.

Information Request(s): Provide a plan describing how historical sites and resources in the vicinity of the proposed project will be visually screened from the project.

SOCIOECONOMICS

Introduction

The proposed project could have significant economic impacts in Southwest New Hampshire. These impacts are likely to be both positive and negative in nature. Information provided during the pre-filing stage is insufficient to adequately assess economic impacts. Following are several comments which describe concerns and identify information needs.

Comments

1. Context: A premise in the FERC process is the applicant's demonstration of need for the project.

Concern(s): At the present time, the applicant has commitments for the purchase of 38% and 23% of the natural gas capacity of a 30" and 36" diameter pipeline, respectively. It would be expected that there would be substantial demonstration of project need at this point in time to justify the time and expense in application preparation, the review and assessment of the proposal by impacted communities and agencies, and in undertaking the FERC process itself.

Information Request(s): Clearly describe the methodology used to determine and document need for

the project. Indicate what the applicant intends to do to adequately document need for the NED proposal in a timely manner to justify continued application preparation and review and in undertaking the FERC process. Indicate the prognosis for adequately doing so.

2. Context: There is significant confusion related to the purpose of NED. On the one hand, we are told that without it, we risk a continuation of some of the highest electricity costs in the nation and the potential for interruptions in future energy supply availability. On the other hand, there are allegations that NED and other pipelines are being proposed to maximize on the ample supply of natural gas being produced in the Marcellus shale fields for export from ports located on the east coast of the U.S. and Canada.

Concern(s): NED would result in significant impacts to resources in Southwest NH. To rationalize and consider justifying these impacts, having a clear understanding of the project's purpose and beneficiaries is certainly appropriate.

Information Request(s): Clearly document the purpose of NED and indicate the breakdown of beneficiaries. In doing so, provide data which indicates the number and location of beneficiaries. Indicate why NED represents required infrastructure to meet the energy needs of NH.

3. Context: The NED proposal represents the largest infrastructure project in Southwest New Hampshire in at least the past several decades and perhaps ever. Accordingly, the impacts that the project would have on our communities and region are profound. Presumably this would include both positive and negative impacts.

Concern(s): Very little information has been made available describing the positive impacts associated with NED. That which is available is overly general in nature.

Information Request(s): Provide clear, specific, and quantifiable information regarding the benefits of NED including a breakdown as to how the project will benefit residents and businesses of NH and Southwest NH. Such information should indicate the extent of benefit in terms of dollars saved in household budgets, specifics related to employment, wages, etc. for direct, indirect and induced economic activity. To supplement this information, provide examples of how projects similar to NED have benefitted local and regional economies over time in regions similar to Southwest NH. Again, it is important for such information to be specific and quantifiable rather than the overly general information which has been made available regarding the project to-date.

4. Context: There are several natural gas pipeline infrastructure projects designed to increase supply in the northeast U.S. and New England that are in various stages of development and review. In addition to NED, some of these include Access Northeast (Spectra, Eversource, and National Grid), Algonquin Incremental Market (AIM), Portland Natural Gas Transmission System (PNGTS) Expansion, and others. To increase supplies, Access Northeast and AIM significantly rely on upsizing existing pipeline infrastructure while PNGTS plans to increase compression in its existing system. On the other hand, NED proposes a new pipeline corridor through "greenfield" areas and, in many cases, undisturbed lands.

Concern(s): It is unclear how the FERC process will consider and otherwise account for the full set of proposals designed to increase natural gas supplies to the northeast U.S. and New England. If there are alternatives which make use of existing pipeline corridors to address demand, these would likely be less environmentally intrusive than constructing a new pipeline through greenfield areas. Furthermore, some of these proposals may compete for market share from a business feasibility standpoint, suggesting that environmental impacts should take on an even more enhanced profile than it might otherwise. If the FERC review process does not consider the full range of proposals to increase demand in the Northeast/New England in its efforts to identify the least environmentally damaging practicable alternative as required by the federal National Environmental Policy Act, then it would appear that the process is somehow flawed.

Information Request(s):

- a. In light of the concern raised above, provide a full and complete explanation as to how all proposals which are at various stages in their development to address demand over the coming years will be reviewed and considered as part of the FERC process. Does a project such as NED get reviewed in isolation of alternative proposals as a result of its application being submitted ahead of others?
 - b. Indicate the metrics used in evaluating, comparing and contrasting aspects of proposals such as upsizing existing infrastructure and increasing compression of already operating facilities versus installing new infrastructure where none currently exists.
 - c. Describe the relationship among various alternative proposals from a business competition standpoint. Could a more environmentally damaging alternative be issued a certificate to proceed simply due to its “place in line” in the chronology of various alternatives of the FERC review process when a less environmentally damaging alternative is just around the corner in terms of the timing of its review?
 - d. Does the FERC process look at proposals of technically viable alternatives in isolation of others, finding ways in which environmental impacts can be minimized and issuing certificates of public convenience and necessity with the assumption that the free market will determine which alternatives actually move toward implementation? or, Does the process compare, contrast and otherwise consider all past, current and anticipated pending proposals in making “least environmentally damaging practicable alternative” determinations and issuing certificates of public convenience and necessity?
5. Context: According to Census Data from the American Community Survey 2009-2013, communities located along the proposed pipeline corridor in Southwest NH are economically disadvantaged. Their residents struggle with high poverty, high unemployment, and low per capita incomes as compared to the rest of NH. For example, the Town of Winchester’s percent of residents living in poverty is more than double that of the State. The towns of Rindge and Greenville also show significantly high percentages of people living in poverty. The towns of Winchester, Rindge, and Greenville show high unemployment percentages, in one case double that of the State of NH. All seven of the communities have per capita incomes below the average for the State.

Town	% Living in Poverty	% Unemployment	Income Per Capita
Winchester	18.5%	15.5%	\$22,312
Richmond	5.5%	6.7%	\$30,404
Troy	6.2%	5.3%	\$27,913
Fitzwilliam	5.5%	6.7%	\$30,404
Rindge	16.7%	11.0%	\$25,058
New Ipswich	5.6%	6.4%	\$32,515
Greenville	10.4%	12.7%	\$23,435
State of NH	8.67%	6.96%	\$33,134

Concern(s): The proposed pipeline has the potential to negatively impact economically distressed populations. This evidence suggests that the NED proposal should be considered from an environmental justice perspective. These residents would have fewer resources available to adequately assess impacts of the proposal as well as options to protect their best interests. These economically disadvantaged residents are being subjected to the economic and environmental burden of the proposed pipeline while receiving no measurable benefit that has been clearly demonstrated to-date. In addition, the cost-benefit analysis methodology that has led the applicant to propose a thinner-walled pipeline through these communities does not afford these rural, disadvantaged residents the same degree of protection from environmental, health and safety hazards that is afforded to residents in

more populated areas. This also calls into question whether the timeframe of this proposal and comment process allows these residents adequate time to provide for fair and meaningful participation in environmental decision-making processes surrounding the proposal.

Information Request(s):

- a. Provide a socioeconomic and demographic study of the residents both in the towns that the proposed pipeline would travel through, and within the direct vicinity of the proposed pipeline corridor. This study should discuss any environmental justice issues that could occur, and discuss mitigation options. Provide a plan for engaging those populations in the discussion to include the involvement of all people regardless of race, color, national origin, or income.
 - b. Clearly describe how the NED proposal is fully compliant with Executive Order 12898 with a purpose to focus federal attention on the environmental and human health effects of federal actions on minority and low-income populations with the goal of achieving environmental protection for all communities.
6. Context: Southwest NH has experienced a net job loss over the last ten years decreasing from 42,841 jobs in 2005 to 40,340 jobs in 2014 even though the size of the labor force has increased from 53,729 workers to 54,873 workers. Since 2012, several area large employers have cut jobs (e.g., C & S Wholesalers, Timken, Vermont Yankee, Corning Inc., Eastern Mountain Sports, Liberty Mutual, Franklin Pierce University, and TD Bank), moved operations (e.g., Hubbard LLC and Eastern Mountain Sports) or shut down (e.g., Findings Inc. and Kingsbury Inc).

Concern(s): The concern is that the NED proposal will not create many new jobs for people residing in the Southwest Region. Most of the jobs—construction jobs—will be temporary. Furthermore, there is a concern that these construction jobs will be largely filled by workers that reside outside the Region and outside the State. Therefore, not only will construction job earnings go to outside residents, but their consumer spending and tax monies will be spent largely outside of the Region. Another concern is that permanent jobs created by the NED proposal will be minimal therefore doing little to contribute to job growth in the area. The job multiplier effect of the NED proposal is unknown, but is also expected to be minimal.

Information Request(s):

- a. Provide an economic impact study reporting on how the proposed NED pipeline will create new jobs (direct and indirect) for Southwest Region residents. For direct employment, the study will provide information about the different job classifications, temporary and permanent, that would be created by the NED pipeline. This information will include pay grade and benefits information for each job classification and the number of new jobs created for each job classification. For indirect employment, quantify anticipated impacts by the proposed pipeline project. Explain plans for hiring local subcontractors or plans to purchase goods from local manufacturers to build or maintain the pipeline.
 - b. Provide a plan for recruiting workers from the Region and any skills training opportunities that will be made available to train needed workers.
7. Context: The Southwest Region’s residents have an expectation that companies handling volatile and potentially dangerous materials, such as the former Vermont Yankee nuclear plant, will assist in mitigating potential impacts by engaging with and investing in the community through “good neighbor” activities such as sponsorships, scholarships, grants, equipment donations, etc.

Concern(s): The proposed NED pipeline will permanently impact the land in the Southwest Region and transport a volatile and potentially dangerous commodity through the Region, but the applicant has yet to indicate that it will employ “good neighbor” activities. A concern is that the applicant may not employ such “good neighbor” activities because it will not have much of an active presence in the area. This could result in the applicant not engaging with and investing in Southwest Region

communities to support socioeconomic stability in the Region.

Information Request(s):

- a. Provide summaries of the applicant's "good neighbor" activities track record.
 - b. Provide a proposed plan of "good neighbor" activities for the NED proposal and explain how the Southwest Region and its communities would benefit.
8. Context: Residents along the proposed NED pipeline enjoy the benefit of properties whose value is largely determined by their proximity to undisturbed wilderness.
- Concern(s): The proposed NED pipeline will devalue homes and properties.
- Information Request(s): Provide a study looking at homes within 1/4 mile of natural gas pipelines within the last ten years and the changes to resale value before and after the pipeline.
9. Context: Towns along the proposed NED pipeline enjoy the benefit of properties whose assessed value is largely determined by their proximity to undisturbed wilderness.
- Concern(s): The proposed NED pipeline will decrease the assessed value of nearby land.
- Information Request(s): Provide a study looking at assessed value of properties within 1/4 mile of natural gas pipelines within the last ten years and changes to assessed value before and after the pipeline.
10. Context: Businesses and institutions in the Southwest Region could be adversely impacted due to disruption of travel ways, noise, dust, construction vehicles, road closings, detours, and delays.
- Concern(s): Access to local business operations, forced closures and cancellations due to activities at highway crossings and commercial areas may inhibit businesses with potential for loss of revenue and reduction of employment opportunities.
- Information Request(s): Identify the location and duration of road closures and other disruptive activities during the proposed construction process. Provide a schedule of project development in each town along the proposed route. Describe measures to be taken to mitigate potential losses and/or disruptions of revenue and employment as a result of the NED proposal.
11. Context: Southwest Region communities are reliant on local property tax revenues for conducting business and meeting obligations.
- Concern(s): Property values not only along the proposed pipeline route but within entire towns could be detrimentally affected due to identification with the pipeline and inherent negative perceptions. Devaluation of properties may reduce tax revenues. At the same time, addition of the proposed pipeline's value could increase town-wide assessments resulting in a higher tax rate established by New Hampshire Department of Revenue Administration and counties along the corridor.
- Information Request(s): Under the New Hampshire property taxation system, estimate assessed value of the proposed NED project through each corridor town and the anticipated short, intermediate, and long term impact on the town wide property assessment.
12. Context: The Southwest Region is dependent on tourism throughout the year which could be adversely impacted due to disruption of travel ways, noise, dust, construction vehicles, road closings, detours, and delays.
- Concern(s): Access to tourism-based operations, forced closures and cancellations due to activities at highway crossings and commercial areas may inhibit activities with potential for loss of revenue and reduction of employment opportunities.
- Information Request(s): Identify potential travel impacts and other disruptions which could potentially impact seasonal tourism activities including Spring maple sap harvesting, kayak and white water rafting; Summer boating, fishing, hiking, biking trails, festivals, holiday activities; Fall foliage tours, harvest festivals, town wide events, hunting seasons; Winter ski season, hunting, snowmobile

trails, ice fishing, and holiday celebrations. Describe measures to be taken to mitigate potential losses and/or disruptions to recreational activities and tourism-related revenue and employment as a result of the NED proposal

GEOLOGICAL RESOURCES AND SOILS

Introduction

The project and its proposed facilities will have significant impacts to farmland soils and geological resources due to temporary and permanent alteration of terrain. Information provided during the pre-filing stage is insufficient to adequately assess impacts to these resources. Following are several comments which describe concerns and identify information needs.

Comments

1. Context: Southwest NH is known for long and cold winters followed each spring by periods of freeze and thaw that cause havoc on infrastructure such as roads and culverts as well as water and sewer lines. Furthermore, the Region is characterized by significant areas of very shallow soils in terms of depth to bedrock.

Concern(s): How will NED facilities be installed so as to not be similarly impacted by episodes of repeated freeze and thaw? Can the proposed pipeline be installed at depths sufficient to be protected from freeze and thaw activities?

Information Request(s): Provide a thorough description of design guidelines, best management practices and other measures to be taken to address these concerns.
2. Context: Significant portions of the proposed pipeline in Southwest NH are in areas characterized by shallow depth to bedrock. This will require extensive blasting and drilling activities to achieve the required depth for pipeline installation.

Concern(s): Blasting can be disruptive to nearby residents and development in terms of noise, ground shaking, etc. and can also potentially cause damage to buildings and foundations, water supply wells, septic systems, and other infrastructure such as roads and bridges. Furthermore, substances used in blasting and drilling processes as well as material that may be displaced through these activities may represent potential contaminants to nearby and “downstream” properties, wells, surface waters, etc.

Information Request(s): Provide a thorough description of design guidelines, best management practices and other measures to be taken to address these concerns.
3. Context: Significant portions of the proposed project in Southwest NH are in areas characterized by steep slopes.

Concern(s): Excavation and disruption of ground cover associated with pipeline installation activities can result in extensive soil erosion and compromise slope stability during construction and beyond.

Information Request(s): Provide a thorough description of design guidelines, best management practices and other measures to be taken to address these concerns.
4. Context: The act of drilling can create an excess of drilling mud, soil, and/or stone.

Concern(s): The proper disposal of drilling mud, soil, and/or stone that is removed through the drilling process is a concern. The improper disposal of large amounts of this material could cause runoff issues or permanent significant changes to the landscape. Additionally, any additives included during the drilling process may have harmful environmental effects.

Information Request(s): Provide a thorough description of the drilling process that will be utilized, including the types of equipment, processes, and materials that will be used.
5. Context: Southwest NH has a rich geologic history that is visible in both its bedrock geology, geomorphology, and glacial relicts.

Concern(s): Prime examples of these geological resources could be damaged or destroyed by the proposed project.

Information Request(s): Provide a study of the proposed project route that describes geologic areas of interest along the route that could be potentially damaged.

6. Context: Southwest NH has areas of valuable farmland soils that are critical to the production of local food.

Concern(s): The proposed project could eliminate or compromise valuable farmland.

Information Request(s): Provide a soils analysis along the length of the proposed project corridor, highlighting areas with important farmland soils.

LAND USE

Introduction

The project and its proposed facilities will have significant temporary and permanent impacts to the physical character influence future use of land. Information provided during the pre-filing stage is insufficient to adequately assess these impacts. Following are several comments which describe concerns and identify information needs.

Comments

1. Context: The proposed compressor station is not compatible with existing land uses. In addition to safety concerns, the noise and odors from generators and other equipment will have a negative effect on abutting properties and wildlife habitat.

Concern(s): There will be an undue burden on abutting properties as a result of the noise, odors and safety that extend beyond the compressor station and pipeline area. There may also be issues with lighting used in conjunction with the compressor station. These issues can also have negative impacts on the breeding and nesting areas for wildlife.

Information Request(s): Additional information is needed to determine the impact to abutting properties and wildlife from the equipment and lighting at the proposed compressor station. This includes a lighting plan and noise analysis for compressor station operation and generator use. In addition, information is needed specific to generator testing including frequency, time of day, etc.

2. Context: The proposal calls for the use of eminent domain to obtain property if necessary. The requirements needed for the use of eminent domain is that the property is taken for public use and with just compensation. However, of the 1.3 to 2.2 Bcf/day to be transported through the NED pipeline in NH, the proposal calls for only 115,000 Dth/day to be used in the State.

Concern(s): The use of Eminent Domain should only be used for the public benefit. A public benefit significant enough to warrant the use of eminent domain has not been adequately demonstrated.

Information Request(s): The applicant must show how the public is benefitting from this proposal. This would include providing information on specific and quantifiable benefits to residents of NH and the Southwest Region to justify the use of eminent domain.

3. Context: The proposed project will require construction staging areas for temporary storage of materials, equipment, parking, etc., as well as accessways to construction areas. The use of heavy equipment, blasting, chippers, chainsaws, generators, etc. add noise, odors and safety concerns that go beyond the boundaries of the proposed pipeline corridor.

Concern(s): The locations chosen for the temporary construction staging areas are likely to impact abutting properties and wildlife habitat.

Information Request(s): The identification of construction staging areas including equipment storage areas, parking areas, and accessways (temporary and permanent) should be delineated in the application. Information should include the type of material and equipment that will be stored, num-

ber of parking spaces, restoration and revegetation plans, and activities that will occur within these areas. The application should demonstrate that consideration has been given to impacts on the built and natural environment for the locations chosen for the temporary construction staging areas, with sensitivity to the existing natural and built environment and not simply for the convenience of the project.

4. Context: The proposed project area traverses through communities that exhibit the rural character of Southwestern New Hampshire.

Concern(s): The proposed project, including the compressor station, will disrupt the rural character that has been established and maintained throughout the Region.

Information Request(s): Detailed plans are needed to determine the compatibility of the proposed project, including the compressor station with existing development and the natural environment. Specific to the proposed compressor station, these plans should address landscaping, proposed fencing, ingress/egress, lighting, noise, air quality, etc.

5. Context: Communities in the Region have a great deal of development with short building setbacks from existing roads, making houses, commercial buildings and other structures vulnerable to vibration from truck traffic. Historic buildings, which were designed and built without consideration of heavy truck vibrations, are particularly vulnerable to structural stressors like vibrations.

Concern(s): Truck traffic associated with the proposed project will diminish structural integrity of buildings, particularly those with short building setbacks on NED trucking routes.

Information Request(s):

- a. Provide information about all trucking routes for project construction activities in the Southwest Region.
 - b. Identify structures that have a 25 foot or shorter building setback from these proposed trucking routes.
 - c. Identify structures built before 1950 and provide date or circa date for each structure.
6. Context: Many private landowners and land trusts have been protecting the natural resources of Southwest NH for several decades by the way of formal conservation easements. The protection of these various natural resources is a voluntary effort to help maintain the rural character of the Region while providing habitats for plants and wildlife, as well as recreational opportunities that define the Region.
- Concern(s): The proposed project will impact a variety of conservation lands, open space, properties with current use designations, and other natural areas throughout Southwest NH. The proposed project is in direct conflict with many of the management goals of properties that have been set aside for conservation purposes.
- Information Request(s): Provide information about the project's ability to comply with deed restrictions and management plans on these properties. Provide information about how management plans and the conditions of a current use designation will be resolved during the application process.

RECREATION AND AESTHETICS

Introduction

The project and its proposed facilities will have significant temporary and permanent impacts on recreational and aesthetic attributes of Southwest NH. Much of the Region is dependent on tourism throughout the year which could be adversely impacted. Information provided during the pre-filing stage is insufficient to adequately assess these impacts. Following are several comments which describe concerns and identify information needs.

Comments

- Context: A viewshed is the geographical area that is visible from a location. It includes all surrounding points that are in line-of-sight with that location and excludes points that are beyond the horizon or obstructed by terrain and other features (e.g., buildings, trees). The Region has a number of recreational areas with popular viewsheds within sight distance of the proposed project area. These areas, including views of and views from Mount Monadnock – the second most hiked Mountain in the world – are treasures appreciated by local residents and tourists alike.

Concern(s): Prized natural and rural viewsheds will be disturbed by the proposed project including a widened treeless utility corridor right of way and compressor station.

Information Request(s): Provide a plan for preserving viewsheds both during and after construction.
- Context: The proposed project corridor will pass through a number of public parks and other recreation/conservation areas that were set aside with the express purpose of preserving regional and local landscapes for residents and tourists to enjoy for passive recreation activities. Examples include Rhododendron Park, Souhegan River Wildlife Management Area, Goss Woods, the Moore Property, and the Heald Tract.

Concern(s): The proposed project corridor would undermine the purpose of the historically established parks and town forests as well diminish the experience people have in the parks and town forests.

Information Request(s): Require a plan for mitigating disturbances to parks and other recreation/conservation areas.
- Context: Southwest NH has a number of recreational corridors that are important assets to promote tourism, as well as being important to local residents because they provide access to natural beauty and wildlife. Examples of these recreational corridors are the Metacomet to Monadnock trail (part of the New England National Scenic Trail), the Wapack Trail, the Cheshire Rail Trail, and the Monadnock Rail Trail, in addition to several snowmobile trails.

Concern(s): The proposed project corridor could diminish the experience people have in the wilderness walking, hiking, biking, horseback riding, cross country skiing, or snowmobiling on any number of trails that the corridor may cross.

Information Request(s): Require a plan for preserving trail conditions, viewsheds, wildlife and habitat, etc. on recreational corridors encountered by the proposed project corridor.
- Context: The Region's residents and tourists are very involved in outdoor ATV and snowmobile recreation, and often utilize class 6 roads, rail trails, power line corridors, and private land trails. Many trails rely on the ability to crossing areas that could be occupied by the proposed facilities.

Concern(s): The access roads and proposed project corridor are likely to draw new traffic from ATV/snowmobile riders, against the wishes of abutting easement owners.

Information Request(s): Require a plan that shows the proposed project corridor, all access roads, and intersections of the corridor and access roads with existing ATV/snowmobile trails

AIR AND NOISE

Introduction

The project and its proposed facilities will have significant temporary and permanent impacts on air and noise pollution, particularly at the site of the proposed Mid-Station 4 compressor station. Information provided during the pre-filing stage is insufficient to adequately assess these impacts. Following are comments which describe concerns and identify information needs.

Comments

- Context: Southwest NH is a mountainous area with relatively good air quality. Cheshire County is currently in attainment for all Environmental Protection Agency (EPA) National Ambient Air Quality Standards (NAAQS). However, a combination of wintertime atmospheric inversions and the com-

bustion of biomass can elevate small particulate matter concentrations to unhealthy levels in certain communities. Goffstown, in Hillsborough County, although outside of Southwest NH, is currently designated in non-attainment of the Sulfur Dioxide criteria (2010). The proposed project will involve the combustion of fossil fuels before and after construction, and natural gas leaks due to the age, construction, and maintenance of the proposed pipeline. There is a lack of comprehensive air quality monitoring near the proposed facilities.

Concern(s): Air emissions due to combustion of fossil fuels during construction and during operation of the proposed Mid-Station 4 compressor station may contribute to elevated levels of EPA criteria air pollutants.

Information Request(s): Identify all air quality standards that must be complied with during construction and operation of the proposed facilities and provide information about how air quality will be monitored throughout the lifetime of the proposed facilities. Evaluate the impacts of both natural gas and electric power options for operating the compressor station.

2. Context: Natural gas is known to be a potent greenhouse gas. Natural gas will be released as a result of maintenance, operation, and so called “blow downs”, and leaks in the proposed pipeline.

Concern(s): Natural gas and other emissions due to leaks in the proposed pipeline and its associated facilities result in exposure to humans, wildlife, and the environment.

Information Request(s): Determine how leaks will be identified, reported, and resolved. Provide details of substances present in leaks or that become airborne during maintenance activities, and their long-term health risks to humans and wildlife.

3. Context: Southwest NH is predominantly rural. This includes relatively low population density and dispersed development patterns. Large areas of forests, undeveloped conservation land, and other natural areas are typical. The setting results in low ambient noise levels besides highways. Areas of Southwest NH that may appear undeveloped or seldom-visited have a very high value to residents and visitors due in part due to the lack of noise. These characteristics are vital to the value of property values and attractiveness to visitors.

Concern(s): Construction impacts including blasting, excavation, heavy machinery, and increased traffic will result in elevated noise levels disruptive to the tranquility and expectations of residents, tourists, and wildlife.

Information Request(s): The application should identify the locations and durations of blasting activities along the proposed route, and a plan to communicate these activities, and proposed mitigation strategies, to landowners and local officials.

4. Context: Southwest NH communities lack a comprehensive understanding of the noise impacts of the Mid-Station 4 compressor station.

Concern(s): Permanent impacts of the proposed Mid-Station 4 compressor station in New Ipswich will result in elevated noise levels disruptive to residents, tourists, recreational users, and wildlife.

Information Request(s):

- a. Establish, pre-construction baseline noise levels for the proposed pipeline and its associated facilities including the proposed compressor station prior to construction. The studies should include all structures in proximity to proposed facilities as well as developable land, trails, rights of way, or other areas of access that may be negatively impacted by increases in noise levels. A study or model of noise from the proposed facilities should account for changes in pipeline gas pressure, throughput, vegetation, topography, time of year, and variety of compression options that are being considered.
- b. Provide an evaluation of technologies being considered to mitigate noise impacts from the Mid-Station 4 compressor station and other facilities along the proposed route. Describe how the performance of these countermeasures will be monitored and maintained.

- c. Similar to the information request in comment 1 above, evaluate the impacts of both natural gas and electric power options for operating the compressor station.

RELIABILITY AND SAFETY

Introduction

The project and its proposed facilities pose an additional burden to regional emergency service providers. Many towns do not have the financial resources to maintain full time emergency response staff and towns in the Region are heavily dependent on volunteer fire and rescue teams. Furthermore, local emergency response capabilities may or may not be sufficient to address the full range of potential emergency situations associated with the proposed project. Information provided during the pre-filing stage is insufficient to adequately assess these impacts. Following are several comments which describe concerns and identify information needs.

Comments

1. Context: The Southwest Region does not currently host to natural gas infrastructure. If the proposed project were to move forward, emergency services personnel would require resources and skills to effectively respond to incidents.

Concern(s): Fire and safety personnel must be able to obtain and maintain the training and equipment needed for an emergency involving the proposed project including the pipeline and compressor station. Many of the Region's communities lack the funding and manpower needed to develop and maintain emergency plans and training related to the hazards involving the proposed project. A burden would be placed on communities to properly train fire and safety personnel and purchase appropriate equipment for these types of emergency situations.

Information Request(s): Require the applicant to provide information regarding training that is needed for a leak or explosion involving the proposed project including the pipeline and compressor station. Define any specialized equipment and personal protective gear requirements. Provide a description of equipment needed and associated costs. Identify potential health impacts that may occur from exposure to fumes, smoke, materials, and chemicals that may be released into the environment during an emergency situation or equipment failure requiring the assistance of local responders. Describe the means of testing and treating personnel exposed to contamination from any hazardous substances and the means for monitoring long term health effects.

2. Context: Emergency responders are mostly volunteer and often work out-of-town during the work week. Communities along the proposed project corridor rely on neighboring towns and more populous communities to cover gaps in service.

Concern(s): In the event of a fire or explosion related to the proposed project, a procedure for notifying local emergency responders has not been developed.

Information Request(s): Explain the role of responders in an emergency related to the proposed project and how notification will be provided. List potential hazards, failures, and other situations requiring emergency response. Provide a comprehensive list of emergency response plans, mitigation plans, etc. relating to similar sized natural gas pipelines and compressor stations that other host communities have adopted. Include an estimate of the number of personnel and equipment that would potentially be needed for various scenarios. Define any evacuation requirements that may be needed to address an emergency related to the proposed project including the pipeline and compressor station.

3. Context: Related to projects such as the NED proposal, many of the inspection protocols are based on the pipeline class location. These class locations are determined by the density of houses within a certain distance of the pipeline. The class then determines the pipeline standards and frequency of inspections.

Concern(s): Pipeline class location guidelines allow for reduced inspection requirements in a rural

area when compared to urban areas.

Information Request(s): Provide information about the safety considerations and other standards being proposed for this project. This should include: pipe wall thickness, material used, depth, coverage, inspections, etc.

4. Context: The proposed project corridor extends through many acres of forested land which is susceptible to natural disasters such as lightning strikes and forest fires. Recent ice storms and heavy wind events have caused an increase in the amount of downed timber which could serve as fuel for a fire. Existing hazard mitigation plans maintained by all Southwest Region towns have identified forest fires as a concern. The soil temperature created by a forest fire varies depending on factors such as soil moisture, compaction, and other conditions.

Concern(s): Protection of the proposed project including the pipeline and compressor station from vandalism, or natural disaster such as forest fire is a concern. A forest fire may increase the soil temperature to a dangerous level for the pipeline. Many remote areas do not have sufficient sources of water for adequate protection to suppress forest fire quickly.

Information Request(s): Provide information about the response of safety personnel during a forest fire. To be prepared for fire emergencies, describe the appropriate size and locations of fire ponds and access to them as well as the equipment needed. Information should also include the methods of protection proposed for the compressor station to prevent vandalism or natural disaster from causing damage, explosion or other emergency situation. Provide a plan for the ongoing maintenance of any access roads that may need to be developed.

5. Context: According to Weston Observatory at Boston College, The State of New Hampshire has experienced 13 small earthquakes in a one year period (10/3/14 to 9/9/15). Although these are small in nature, ranging from 1.5 to 2.3 on the Richter scale, larger earthquakes have occurred in Northern New England within the past 5 years (3.4 on 9/26/10 in Concord, NH and 4.0 in Gorham, Maine on 10/16/12). On a broader scale, there have been approximately 118 earthquakes in New England, between 1/1/15 and 9/9/15. According to the State of New Hampshire Multi-Hazard Mitigation Plan Update 2013, “. . . during a damaging earthquake (magnitude 5 or greater), it can be expected that there is widespread damage due to the historically built environment. There are a large number of un-reinforced masonry structures still in use and much of our infrastructure, including bridges and many of our gas and waterlines, are very vulnerable to seismic forces”. In the past 5 years, there have been two earthquakes at or above 5.0 magnitude with epicenters that were close enough to be felt in this Region (a 5.0 earthquake on 6/23/10 on the Ontario/Quebec border, and a 5.8 earthquake on 8/23/11 in Virginia).

Concern(s): The frequency of earthquakes leaves concern for the structural integrity of the proposed project including the pipeline and compressor station. Movements in the earth can cause shifts in the granite or in the pipeline itself thereby creating weakness and potential ruptures and/or leaks in the pipe and joints.

Information Request(s): Provide information about the proposed project that indicates its ability to withstand earthquakes. Provide information minor and major earthquakes as it relates to similar type projects. Describe construction practices for the proposed project which address these concerns.

6. Context: The proposed project serves a specific purpose - the transportation of natural gas. However, the supply of gas will eventually be depleted and/or the project will no longer serve its intended purpose.

Concern(s): At the point that the proposed project extends beyond its intended purpose and function the infrastructure could 1) be in need of removal, or 2) potentially be used for purposes that may have a different set of impacts and concerns.

Information Request(s): Additional information is needed to determine the best approach to poten-

tial abandonment of the proposed project including the pipeline and compressor station. All possible alternatives need to be clearly stated and evaluated. A bond amount should be calculated for removal of the infrastructure if that is determined to be the best alternative.

7. Context: Development pressures affect the flood storage benefit that wetlands provide. Wetlands that have been filled in or altered will reduce flood storage capabilities. The increase in the frequency and magnitude of severe storm events magnifies the need to protect these areas.

Concern(s): The potential for flooding and its associated threat to life and property will be increased with the modification to and loss of flood storage areas.

Information Request(s): Information is needed to show the flood storage areas within the proposed area of activity. Any areas that may be affected should show mitigation methods proposed to handle the additional flow during storm events and spring thaw.

8. Context: The development of the proposed project will require both temporary construction sites and permanent equipment to be installed along the length of the corridor.

Concern: Temporary construction sites and permanent equipment may result in acts of trespass and/or vandalism. This creates safety concerns as well as the need for increased vigilance on the part of local law enforcement departments.

Information Request(s): Provide a plan for the security of temporary and permanent sites along the pipeline corridor. This plan should discuss potential security challenges and threats, as well as mitigation strategies. Additionally, the plan should highlight how local law enforcement departments will be impacted by the need for security at these locations.

INFRASTRUCTURE

Introduction

The project and its proposed facilities will have significant temporary and permanent impacts on to the public and private transportation, water supply, and utility infrastructure of Southwest NH. Information provided during the pre-filing stage is insufficient to adequately assess these impacts. Following are comments which describe several concerns and identify information needs.

Comments

1. Context: The base and subbase of most municipal roads were not designed or built to accommodate heavy loads. Pavement conditions on most municipal roads were not built to accommodate heavy loads nor were they designed to accommodate moderate to high volumes of traffic (over 400 vehicles per day). Current revenue streams for paving, rehabilitating and rebuilding municipal roads are consistently inadequate, resulting in roads that are vulnerable to damage from increased traffic volume and/or weight.

Concern(s): Many municipal roads in the project area will be used to build and maintain the proposed pipeline. Construction and post-construction activities could damage municipal roads' base, subbase and pavement, as well as accelerate road deterioration already happening.

Information Request(s):

- a. Provide a table listing all municipally owned roads that are proposed for use, including the municipality in which the roads are located, the road names, location by milepost, surface type (paved or unpaved), geometrics of the road (lane, shoulder, clear zone and right of way), and the type of modification required on existing roads in order to accommodate pipeline construction and maintenance. This should include all roads that are NH legislative class IV, V and VI in the vicinity of the proposed project area of the Southwest Region.
- b. Provide a map and geodata indicating the same information for 1a above.
- c. For each road identified in 1a above, indicate the maximum weight, height, width and length of vehicles and their loads which may use any municipal roads during and after construction

activities.

- d. Provide a table showing the estimated daily number of project-related vehicle trips on each road identified in 1a above.
 - e. Provide information from an engineering study evaluating the existing condition of municipal roads identified in 1a above, including but not limited to assessments of pavement, the road's base and subbase to help better determine the existing conditions of the highway and evaluate the adequate conditions necessary to handle NED construction traffic without further damaging each municipal road.
 - f. Provide a descriptive summary of municipal road improvements that the applicant has participated in when conducting similar projects in the last ten years. For each project, indicate the miles of road paved, rehabilitated or reconstructed for each project as well as the dollar amount contributed by the applicant for each category of improvement (paving, rehabilitation, reconstruction). Describe the range of arrangements that the applicant has had with municipalities or counties to address similar-type project impacts to municipal or county roads.
2. Context: In the Southwest Region, state roads are Tier II, III and IV highways with the NED proposal mostly situated near Tier III and IV highways. According to NHDOT, most Tier III and IV highways were not built to endure heavy truck loads. Furthermore, pavement conditions on most Tier III and IV highways are in poor or very poor condition, according to NHDOT's latest International Roughness Index calculations. Revenue for paving Tier III and IV roads has not kept pace with NHDOT's target schedule for maintaining all state roads. Meanwhile, rehabilitation and reconstruction of Tier III and IV roads has been virtually non-existent. The result is that state roads are extremely vulnerable to new traffic pressures.

Concern(s): Many state roads in the Region will be used to build and maintain the proposed project. The concern is that additional traffic and heavy loads associated with construction and post-construction activities will damage state roads, particularly Tier III and IV highways. Today the State is losing ground maintaining Tier III and IV highways in particular, resulting in an increasing number of roads that are falling further into disrepair. Vehicle traffic from construction and maintenance activities will expose already vulnerable roads to more and heavier vehicles, potentially accelerating road deterioration. Increased road deterioration will place the State in an even more precarious situation, requiring even more investment to return roads back to manageable conditions.

Information Request(s):

- a. Provide a table listing of all state owned roads that are proposed for use, including the municipality in which the roads are located, the road names (or route numbers if applicable), location by milepost, geometrics of the road (lane, shoulder, clear zone and right of way), and the type of modification required on existing roads in order to accommodate pipeline construction and maintenance. This should include all roads that are NH legislative class I, II, III and IV in the SWRPC Region.
- b. Provide a map and geodata indicating the same information for 2a above.
- c. For each road identified in 2a above, indicate the maximum weight, height, width and length of vehicles and their loads which may use any state roads during and after construction activities.
- d. Provide a table showing the estimated daily number of project-related vehicle trips on each road identified in 2a above.
- e. Provide information from an engineering study evaluating the existing condition of state roads listed in 2a above, including but not limited to assessments of pavement, the road's base and subbase to help better determine the existing conditions of the highway and evaluate conditions necessary to adequately handle NED pipeline traffic without further damaging each

state road.

- f. Provide a descriptive summary of state road improvements that the applicant has participated in when conducting pipeline projects in the last ten years. For each project, indicate the miles of road paved, rehabilitated or reconstructed for each project as well as the dollar amount contributed by the applicant for each category of improvement (paving, rehabilitation, reconstruction). Describe the range of arrangements that applicant has had with states to address pipeline project impacts to state roads.

3. Context: For decades, it has been very unusual for NHDOT, state agencies with responsibilities for state-owned park or recreational roads, or municipalities to build new roads in the Monadnock Region. This is partly because population growth has slowed in the area so there is not much demand for new roads, but also because of the cost of building and maintaining new roads. In cases where new roads have been built, municipalities have elected to leave road construction to private entities and then take over the road's maintenance responsibilities. Other towns, wanting to avoid long term maintenance costs, have left roads private. Either way, many towns struggle with the costs and management challenges of new roads such as serving the road with police, fire or ambulance services, or water and sewer services.

Concern(s): The costs and management responsibilities associated with new roads such as maintenance, police, fire, ambulance, water and sewer if new roads are proposed to serve the proposed pipeline and its associated facilities.

Information Request(s):

- a. Provide a table listing of all new proposed roads including the municipality in which the roads are located, the planned location, the planned geometrics of the road (lane, shoulder, clear zone and right of way), a construction plan for each road, and whether the proposed road would be private, municipal or state owned.
 - b. Provide a map and geodata indicating the locations of the road.
 - c. For each road identified in 3a above, indicate the maximum weight, height, width and length of vehicles and their loads which may use these roads during and after construction activities.
 - d. Provide a table showing the estimated daily number of project-related vehicle trips on each road identified in 3a above.
 - e. Provide a descriptive summary of new roads that the applicant has participated in when conducting pipeline projects in the last ten years and impacts on municipal or state government such as maintenance, police, fire, ambulance or water/sewer infrastructure costs.
4. Context: In the Southwest Region, there are 272 bridges currently owned by municipalities. Seventy-two of these bridges are considered red list bridges, which is a state definition that means that at least one of three bridge components (deck, substructure or superstructure) is considered "poor" or worse. There are 103 E2 bridges owned by municipalities, some of which are among the red list bridges mentioned above. E2 designated bridges exclude all combination and single unit certified vehicles (heavy loads requiring permits) from crossing a bridge. Thirty-one additional bridges are weight limit restricted. These bridges restrict weights ranging from three tons to 15 tons. There are also seven municipal bridges that have less than ideal height allowances ranging from 7'2" to 13'9".

Concern(s): Traffic related to the proposed project may damage municipal bridges during and after pipeline construction.

Information Request(s):

- a. Provide a table listing of all municipally owned bridges that are proposed for use, including the municipality in which the bridges are located, the road names, location by milepost, surface type (paved or unpaved), geometrics of the bridge (lane, shoulder, clear zone and right

of way), and the type of modification required on existing bridges in order to accommodate pipeline construction and maintenance.

- b. Provide a map and geodata indicating the same information for 4a above.
- c. For each bridge identified in 4a above, indicate the maximum weight, height, width and length of vehicles and their loads which may use any municipal bridge during and after construction activities.
- d. Provide a table showing the estimated daily number of project-related vehicle trips on each bridge identified in 4a above.
- e. Provide a descriptive summary of municipal bridge improvements that the applicant has participated in when conducting pipeline projects in the last ten years. For each project, indicate the number of bridges improved for each project as well as the dollar amount contributed by the applicant for each category of improvement (rehabilitation, reconstruction). Describe the range of arrangements that applicant has had with municipalities or counties to address pipeline project impacts to municipal bridges.

5. Context: In the Southwest Region, there are 222 bridges currently owned by NHDOT. Twenty of these bridges are considered red list bridges, which is a state definition that means that at least one of three bridge components (deck, substructure or superstructure) is considered “poor” or worse.

There are 29 E2 bridges owned by NHDOT, some of which are among the red list bridges described above. E2 designated bridges exclude all combination and single unit certified vehicles (heavy loads requiring permits) from crossing a bridge. There are also eight E1 bridges which are bridges that restrict crossing by certified single unit vehicles only. There are five bridges with either a C1 or C2 designation which means that vehicles must cross a bridge one at a time. Furthermore there are two 8 ton weight limit restricted bridges.

Among the state bridges in the Region, there are 13 bridges that have less than ideal height allowances ranging from 9’0” to 14’3”.

Information Request(s):

- a. Provide a table listing of all state owned bridges that are proposed for use, including the municipality in which the bridges are located, the road names, location by milepost, surface type (paved or unpaved), geometrics of the bridge (lane, shoulder, clear zone and right of way), and the type of modification required on existing bridges in order to accommodate pipeline construction and maintenance.
- b. Provide a map and geodata indicating the same information for 5a above.
- c. For each bridge identified in 5a above, indicate the maximum weight, height, width and length of vehicles and their loads which may use any municipal bridge during and after construction activities.
- d. Provide a table showing the estimated daily number of project-related vehicle trips on each bridge identified in 5a above.
- e. Provide a descriptive summary of municipal bridge improvements that the applicant has participated in when conducting pipeline projects in the last ten years. For each project, indicate the number of bridges improved for each project as well as the dollar amount contributed by the applicant for each category of improvement (rehabilitation, reconstruction). Describe the range of arrangements that applicant has had with States to address pipeline project impacts to state bridges.

6. Context: In the Southwest Region, there are an unknown number of culverts currently owned by municipalities. Many of these culverts are in poor condition or are a poor design for accommodating significant additional traffic or heavy loads.

Concern(s): Road and culvert damage and/or failure due to additional traffic pressures associated with the construction and post construction phases of the proposed project.

Information Request(s):

- a. Provide a Statewide Asset Data Exchange System (SADES)-compliant inventory of municipal culverts including photo documentation.
 - b. Provide a map and geodata indicating the same information for 6a above.
 - c. Provide information about the locations of any municipal roads or drainage areas that will require modification to accommodate construction or post-construction activities and whether culvert modifications are also anticipated. Describe any planned culvert modifications.
7. Context: In the Southwest Region, there are an unknown number of culverts currently owned by NHDOT and other state agencies that are in unknown condition.

Concern(s): Road and culvert damage and/or failure due to additional traffic pressures associated with the construction and post construction phases of the proposed project.

Information Request(s):

- a. Provide a Statewide Asset Data Exchange System (SADES)-compliant inventory of state owned and managed culverts including photo documentation.
 - b. Provide a map and geodata indicating the same information for 7a above.
 - c. Provide information about the locations of any state roads or drainage areas that will require modification to accommodate construction or post-construction activities and whether culvert modifications are also anticipated. Describe any planned culvert modifications.
8. Context: The Southwest Region towns of Winchester and Greenville operate municipal water/wastewater systems that will be crossed by or in the vicinity of proposed project construction activities.

Concern(s): The proposed project construction and post-construction activities could potentially damage municipal water/wastewater systems.

Information Request(s):

- a. Provide a map showing water/wastewater system infrastructure on routes identified in 1a and 2a above (municipal and state roads) as well as within a 100 foot buffer area from the proposed NED pipeline.
 - b. Indicate the below ground depth to water and wastewater pipelines identified in the map developed in 8a.
 - c. Provide a description of construction activities such as ground excavation for all relevant water/wastewater areas of the map developed in 8a.
 - d. Provide information about how much water will be used by the proposed NED pipeline project during construction and post construction activities and indicate whether Winchester and/or Greenville's water and/or wastewater systems will be utilized.
 - e. Provide information about how the operation of public water systems could be disturbed or potentially damaged during construction of the proposed NED project.
9. Context: In a recent survey of freight haulers conducted by SWRPC, the agency learned that some utility lines in the Southwest Region are reported by truck owners to be lower than regulated height.

Concern(s): The proposed construction and post-construction activities may encounter potential conflicts with existing utility lines, including construction equipment, trucks, cranes and other equipment.

Information Request(s):

- a. Provide maximum heights of loads associated with NED construction and post construction

activities and the routes that certified oversize (tall) loads will be sent.

- b. Provide the locations of where any cranes or other tall construction equipment will be used and their vicinity to utility poles and lines.
- c. Provide information of the lowest height of all power lines along all proposed NED transportation routes, staging areas and within 100 feet of the proposed pipeline.

10. Context: A major goal of the Southwest Region comes from its newly adopted Broadband Plan which is to “provide and maintain reliable, high capacity broadband infrastructure and technology in all areas of the Region over time” (Goal 2, p. 46). A strategy for achieving this goal is to “promote the inclusion of broadband infrastructure development and maintenance in public works projects” (Strategy 2a.iii, p. 46). The Plan also recommends that broadband development “[r]espect those features that define the Region’s cultural and physical landscape while meeting the broadband infrastructure needs of the future” Goal 4, p. 48). The Plan also looks to promote infrastructure that will aid areas which are either unserved or underserved by broadband service, some of which include areas along the proposed pipeline corridor. The corridor passing through Winchester, Richmond, Fitzwilliam, Troy, Rindge, New Ipswich and Greenville could potentially be used as a corridor for broadband infrastructure.

Concern(s): The proposed pipeline, which will be collocating proximate to a utility line, may prevent the collocation of other public utility needs that Southwest Region communities favor such as broadband infrastructure. The proposed natural gas pipeline may block other activities from happening along the corridor, such as broadband line construction and maintenance, in order to better protect the natural gas pipeline from liability exposure.

Information Request(s):

- a. Provide information about the applicant’s practice of sharing right of way corridors with other uses including broadband infrastructure based on projects owned and operated by the applicant in the U.S.
- b. Provide information about the applicant’s plan for sharing right of way with other infrastructure including broadband infrastructure.

MUNICIPAL AND REGIONAL PLANNING

Introduction

Throughout Southwest NH, towns have developed and pursued methods and procedures for the orderly use of land for the health, safety, and welfare of their community. Within the scope of these parameters visioning sessions have resulted in the development of Master Plans, ordinances, policies, and other planning documents that define desired characteristics, acceptable and appropriate uses of land, and community priorities. The role of these existing documents during the NED application and FERC review processes is not explicit. Following are comments which describe concerns and identify information needs.

Comments

1. Context: Communities in Southwest NH recognize the value of maintaining environmental quality and have a long history of maintaining rural character which serves as a fundamental component of the identity of the Monadnock Region.

Concern(s): NED may interfere with past and ongoing efforts of community leaders to plan for and regulate land development within their jurisdictions and promote specific development and conservation priorities.

Information Request(s): Provide specific information to indicate how the NED proposal can be constructed and maintained while respecting the long term efforts of communities in Southwest NH to provide for orderly development, protecting the environment and maintaining rural character. Indicate specific measures and actions which will be taken to address these concerns.

2. Context: All of the towns within the Southwest Region of New Hampshire have adopted ordinances, master plans, building and health codes, subdivision and site plan review regulations, and other methods to guide development (and preservation) in a manner that is consistent with the desires of the community.

Concern(s): The process for the development and approval of this proposal may not require that local ordinances, land use regulations (and others) are adhered to.

Information Request(s): Studies of ordinances, land use regulations, policies (and others) from each town should be submitted. Information should indicate areas where the proposed project is and is not in compliance with local land use regulations.

3. Context: Zoning ordinances, subdivision and site plan procedures, permit requirements, transportation and road maintenance policies, identification of geological features and constraints, existing and proposed development, public land, open space, agricultural lands, scenic areas, and coordination with regional plans; all reflect the values that are determined to be of major importance to communities within Southwest NH.

Concern(s): The role of local ordinances, procedures, and planning documents has not been specified in the environmental review process to be administered by FERC.

Information Request(s): Review town master plans to identify those areas where the proposed project would potentially be in conflict with established and stated goals and objectives.

4. Context: Each community in NH are encouraged to conduct an inventory of their natural resources in an effort to promote wise land use planning. As such, certain towns within Southwest NH have identified conservation focus areas to help promote informed land use planning.

Concern(s): The proposed project will impact many established local conservation focus and scenic areas.

Information Request(s): Identify conservation priorities, management strategies, and other aspects of local natural resource inventories and how these issues will be resolved in the environmental impact statement and/or FERC review process.

5. Context: *Monadnock Region Future*, the regional plan for Southwest NH speaks to many issues pertinent to the proposed project including the need for reliable and affordable sources of energy. In light of the void of clear information regarding positive impacts associated with the proposed project during the pre-filing phase, we are left with a preponderance of concerns on potential negative impacts of the proposal as expressed in this document. As such, the following excerpts from *Monadnock Region Future* are relevant for consideration:

o “Although we want to support and foster economic development, it should not be at the expense of our greatest assets. Part of our Region’s competitive advantage is its rich scenic, recreational, cultural, and historic resources.”

o “The value of our Region’s natural ecosystems and cultural resources is vast. These features play an important role in sustaining quality of life and well-being, establishing both local and regional identity, and in attracting visitors to our Region.”

o “Given the diversity of interests and values related to the landscape, establishing collective priorities for resource conservation and management is a challenge. Priorities range from maximizing the commodity value of resources to ensuring the availability of clean air and water to preserving scenic views and rural character. Management strategies must balance meeting an array of needs and uses for our resources and natural systems with protecting them from current and future threats (e.g. loss of biodiversity, development pressure, and the impacts of climate change).”

Monadnock Region Future also speaks to the importance of reducing our reliance on fossil fuels and the importance of promoting renewable sources of energy.

Concern(s): That proposed project appears to be at cross-purposes with the above specified overarching themes of Monadnock Region Future, the regional plan for Southwest NH.

Information Request(s): Describe how the proposed NED project can be implemented in such a way as to respect the sentiments and policy directions outlined above as excerpted from Monadnock Region Future, the regional plan for Southwest New Hampshire. In addition, provide clear and convincing information as to positive impacts of the proposed project and how these can be balanced against negative impacts of the proposal to the benefit of Southwest NH.

CONCLUSION

It is clear that there is yet significant additional information and detail required in order to adequately understand and assess impacts associated with the NED proposal on the resources of the SWRPC region and the communities in which we serve. In the initial stages of the pre-filing process, the importance of the proposed project was continually stressed as critical to addressing our future energy needs, reducing our energy costs, and providing a low-cost energy source which would provide us with the means to become more competitive from an economic development standpoint. Yet, ironically, approximately one year later, we are left with little if any clear and quantifiable data which would allow us to assess the positive aspects of the proposal. The information which has been made available suggests a multitude of concerns, many of which have been expressed within the comments contained in this submittal. It is our hope that the comments expressed herein will assist in developing sufficient information and detail to clearly understand and assess the impacts associated with the NED proposal in order for FERC and others to adequately and accurately conduct their work in an equitable and efficient manner.

Finally, we understand that the FERC process is focused on the transport of natural gas and is less concerned with its production and consumption. Monadnock Region Future, the regional plan for Southwest New Hampshire, encourages us to reduce our reliance on fossil fuels and focus more on energy conservation and the use of renewable energy sources. In addition, there are many questions about effects associated with the practice of fracking as used in the Marcellus shale fields where this energy supply is sourced. It's important that we find ways to make these issues relevant in the FERC process during the continued review of this NED proposal

FERC NOI SCOPING SESSIONS - PF14-22

STUDIES AND INFORMATION REQUESTED AS PART OF THE ENVIRONMENTAL IMPACT STATEMENT (EIS)

Kinder Morgan Northeast Energy Direct Project

September 23, 2015

The following Study and Information Requests have been prepared for submission to the Federal Energy Regulatory Commission (FERC) as part of the scoping process for the Northeast Energy Direct (NED) PF14-22 project. The proposed studies and information requests pertain to information that should be included in either the Resource Reports that will accompany Kinder Morgan - Tennessee Gas Pipeline's (KM- TGP) Application for the NED project, or evaluated as part of the environmental review process in connection with preparation of the Draft Environmental Impact Statement (DEIS).

This request for studies and information has been prepared jointly by the:

Berkshire Regional Planning Commission, Berkshire County, MA;

Franklin Regional Council of Governments, Franklin County, MA;

Northern Middlesex Council of Governments, Greater Lowell Region, MA;

Montachusett Regional Planning Commission, Western Worcester County, MA;

Pioneer Valley Planning Commission, Hampshire County, MA;

Southwest Region Planning Commission, Southwest NH; and

Nashua Regional Planning Commission, Southern NH.

These Regional Planning Agencies serve the impacted municipalities along the proposed route of the NED project in Massachusetts and New Hampshire. The Resource Report references are to the July 2015 Resource Reports submitted by Tennessee Gas Pipeline Company (TGP) to FERC.

{ body of reports is omitted here, but is contained in submission 20151007-5074 above}

{ from Franklin Regional Council of Governments }

Ms. Kimberly D. Bose
Federal Energy Regulatory Commission
888 First Street, N.E., Room 1A
Washington DC

Ref.: PF14-22

October 12, 2015

Dear Ms. Bose,

I am writing on behalf of USA Properties, Inc. to express my opposition to the proposed NED gas pipeline that will run through and/or beside our properties on Stowell and Cedar Ridge Roads in New Ipswich, NH and my concerns about the proposed compressor station that would be built on an adjoining parcel.

The area around Stowell and Cedar Ridge Roads, as well as the two large parcels (48 acres and 95 acres) that our company owns and which would directly impacted by the pipeline contain beautiful untouched wetlands areas replete with wildlife of all kinds, from deer and moose to salamanders and birds. The disruption cause by the installation of the pipeline and the construction of the compressor complex would be severe, and the effect of the noise and pollution caused by the compressor station would continue indefinitely.

In addition, a planned subdivision of one of our tracts has a cluster of wells located just a few hundred feet from the planned pipeline route. Any leak or rupture of the thin-walled pipe could have devastating consequences for the water quality on that tract and in the area generally.

There will also be severe financial repercussions. We currently own a number of building lots that will border or be in close proximity to the pipeline. Several, on Cedar Ridge Drive are on a high ridge facing northeast and are currently being marketed as having 'potential views'. The proposed ten acre compressor station is planned to be built directly across from these lots, meaning that the view will be one of a large industrial facility that has the potential to release harmful chemicals into the air at any time. And public concern about the safety of the pipeline and the health risks of chemicals released by the compressor facility means few families will consider purchasing house lots on Cedar Ridge Drive. I will follow this letter with one setting out the economic losses we expect if the pipeline is constructed.

Construction of the pipeline means that the land we own will become next to worthless, as no one will be interested in building their dream house beside the pipeline and within view (and probably hearing) of a compressor station. Likewise, the property values of our neighbors in the area will plummet, causing severe economic hardship for families whose homes are their primary asset. Please see the attached letter for detailed information on the economic losses our company can expect to suffer if the pipeline and compressor station is constructed.

In addition, there is little hard evidence to support the claim that this pipeline will benefit the people of New Hampshire, and good evidence that the gas transported in the pipeline will end up overseas. And although Kinder-Morgan rightfully claims that natural gas is a cleaner fuel than the fuel oil that is widely used here, it doesn't take into account the adverse environmental impacts of fracking to the air, land, and water of the areas where fracking is carried out. When considering the environmental impact of this pipeline, FERC should also take into consideration the off-site environmental impacts of the source of the natural gas that will pass through the pipeline. Fuel oil, which is currently quite cheap, can serve as our bridge fuel as we continue converting to renewable energy sources. This process is already under way in our area, where solar and wind energy systems are being installed in increasing numbers in the past few years.

I join with thousands of my New Hampshire neighbors in asking your Commission to deny this application.

Thank you for your consideration,

Sincerely,

Bruce Simpson, Pres.
USA Properties, Inc.
PO Box 296
Dublin NH 03444
603-563-8471

20151016-5356

Jennie L. Hill, Richmond, NH.

Please note that there are bats living in the vicinity of the proposed pipeline. Several species of bats are protected by State and Federal statutes. The proposed route through this part of Richmond has changed several times in the past 3 months, so it is impossible to say just how many bat habitats will be disrupted by this project. Bats reside in many structures and in the wild in Richmond and in other locales along the proposed route. It is imperative that any environmental assessment take that into account, and that they be afforded the protection granted them by State & Federal regulations.

Tennessee Gas Pipeline Company, L.L.C.

Docket No. PF14-22-000

Comments of FMR LLC

Dear Secretary Bose:

On behalf of FMR LLC, please accept these comments concerning the Northeast Energy Direct Project ("Project"), which is proposed by Tennessee Gas Pipeline Company, L.L.C. ("Tennessee").1

On September 15, 2014, Tennessee requested use of the Commission's pre-filing process for the Project under 18 C.F.R. 157.21. In connection with that process, Tennessee and the Commission engaged in open houses and outreach to various stakeholders. On June 30, 2015, the Commission issued a notice of intent to prepare an Environmental Impact Statement ("EIS") for the Project, opening the scoping period under the National Environmental Policy Act. On September 3, 2015, the Commission extended the scoping com-

ment period on the EIS to October 16, 2015. Tennessee has indicated that it expects to file an application on November 20, 2015 for Commission authorization to construct the Project.

Background

FMR LLC is the parent company for the various financial services and related businesses more commonly known as “Fidelity Investments.” These comments are provided on behalf of FMR LLC and its related affiliates and subsidiaries (collectively, hereinafter “FMR”).

A subsidiary of FMR owns a 554-acre campus in Merrimack, New Hampshire (the “Merrimack Campus”). At the Merrimack Campus, more than 5,400 FMR employees provide asset management and financial services to various institutional and individual clients, including retirement services and investment and customer support, as well as corporate services to FMR’s enterprise.

Comments

On December 8, 2014, Tennessee proposed to adopt an alternative route for the Project (the so-called “Market Path” component) (depicted by the blue line in Figure 1 below) that would be located entirely outside the boundaries of the Merrimack Campus (depicted as the orange shape in Figure 1). Subsequently, in response to comments from the Town of Amherst, New Hampshire (“Amherst”), Tennessee developed an alternative route, “Amherst Option 1” (depicted by the dashed green line in Figure 1), located along Continental Boulevard, which would run alongside and within the western boundary of the Merrimack Campus.

In a September 24, 2015 submittal to the Commission regarding the Project, Amherst indicated that Tennessee intended to change the proposed route for the Project. Specifically, Amherst’s submittal included maps and minutes from a September 16, 2015 meeting between the Amherst Pipeline Taskforce and representatives from Tennessee. Those materials indicated – for the first time – that Tennessee planned to propose to the Commission a preferred route for the Project – as depicted in Figure 2 below – that would run directly through the Merrimack Campus (depicted as the orange shape in Figure 2).

Routing the Project through the Merrimack Campus could result in catastrophic consequences. The Merrimack Campus houses a data center that contains computer servers and other sensitive equipment whose operation may be severely impacted by blasting or other vibration-causing installation activities that are associated with pipeline construction. Disruption of this data center, or any of the other numerous activities associated with FMR’s asset management, customer service, or fund accounting business units at the Merrimack Campus (where FMR’s Fixed Income Division trades daily on an asset base in the hundreds of billions of dollars) could substantially affect national and international financial markets, particularly if the disruption occurs during the daily pricing of FMR’s funds. Because the Merrimack Campus currently handles, on average, 23,000 customer calls to FMR on a daily basis, any disruption to phone lines or servers would result in a substantial and significant impact to FMR’s customers, including market exposure and financial risk. Simply put, routing the pipeline directly through the Merrimack Campus would present an uncontrollable and, therefore, unacceptable risk to FMR’s continuous Disaster Recovery and Business Continuity planning as well as the nation’s financial markets.

As one of New Hampshire’s largest employers, FMR has, for two decades, become an increasingly sustaining element of the state’s economy. As we submit this letter, FMR is considering a multi-year plan to refurbish its 1.2 million-square-foot office space at the Merrimack Campus. The economic impact of this initiative and the significance of FMR’s reinvestment in its presence in New Hampshire would be substantial. The route shown in Figure 2 would directly impact the portion of the Merrimack Campus that is most suitable for development, and would directly affect the ability of FMR to increase its headcount at the Merrimack Campus in the future. Due to the uncertainties raised by the Project, including its potential to significantly impact FMR’s existing operations and future development of the Merrimack Campus, all future projects and development plans are currently on hold pending the outcome of the Project.

In light of the magnitude of these impacts, upon learning of Amherst’s September 24 submittal, FMR promptly contacted Tennessee to discuss the proposed Project route. In meetings with Tennessee on October

7 and 8, FMR explained the aforementioned concerns regarding the substantial impacts that would result from routing the Project directly through the Merrimack Campus. Tennessee acknowledged the legitimacy of those concerns, and on October 8th agreed not to pursue a Project route that ran directly through the Merrimack Campus. Instead, as memorialized in the attached letter (Attachment A), Tennessee has revised the preferred route for the Project so it is now located along the southern and eastern perimeter of the Merrimack Campus, as depicted by the blue line shown in Exhibit A of Attachment A.

While FMR does not endorse or support the Project, FMR nevertheless appreciates Tennessee's willingness to relocate the preferred route of the Project to accommodate FMR's legitimate business concerns. Consistent with these concerns and Tennessee's commitment, FMR is willing to continue to work with Tennessee to further refine the preferred route, if necessary.

FMR appreciates the opportunity to provide comments on the Project. If you have questions or need additional information, please contact me at 617-526-6176 (mark.kalpin@wilmerhale.com) or my colleague David Gold at 617-526-6425 (david.gold@wilmerhale.com).

Respectfully submitted,

Mark C. Kalpin

Federal Energy Regulation Commission

888 First Street, NE

Washington, DC 20426

RE: PF14-22

I live in New Ipswich where the Northeast Energy Direct pipeline and compressor station are proposing to site. I have serious concerns that New Ipswich's natural resources and watershed resources may be impacted by the Northeast Energy Direct pipeline and compressor station. It is difficult to fully determine impacts because Kinder Morgan has announced a proposed route and the final route has not yet been identified. Additionally, there are inaccuracies in the maps and overlays.

Potential impacts include:

Impact on Water Resources

Water is a primary element for all life. People depend on clean water as an essential to health. Water bodies are all interconnected, and the quality of water is directly related to activities on the land. What each property owner does on his or her property affects the water of their neighbor's well, stream water or pond. The demands for clean water continue to increase as New Ipswich becomes more populated.

All citizens of New Ipswich rely on wells for water. There are three stratified drift aquifers that feed many of the wells. The NED pipeline has the potential to impact these aquifers, as well as groundwater and surface water along its route and around the compressor station. Additionally, airborne particles released by the compressor station may also contaminate ground water of properties not directly on the route, but where the prevailing winds and atmospheric conditions may carry them before they come to ground.

More specifically, water resources may be impacted as follows:

- Contamination from nitrites or nitrates introduced during blasting.
- Contamination from previously bound naturally occurring pollutants, such as radon and arsenic that

may be released by blasting.

- Loss of well or reduction of well production through changes in bedrock channels by blasting.
- Contamination through prolonged herbicide use to control vegetation in certain parts of the ROW.
- Contamination from fluids leaked by construction vehicles operating in wetlands or above aquifers, or spilled during fueling or maintenance.
- Disruption of hydrology through soil disturbance, especially in wetlands. Soil layering in wetlands takes centuries to develop and is difficult to recreate once disturbed. Additionally, changes in topography affect runoff patterns and rainwater accumulation needed to recharge aquifers.
- Direct drawdown of aquifers for hydrostatic testing may require more water than the aquifers normally produce.

Impact on Air Quality

Potential adverse effects on air quality come in two forms:

- Direct release of methane into the atmosphere.
- Additional air pollutants released at compressor stations as a side effect of burning hydro fractured gas to provide power, as well as through “blow downs.”

Methane has twenty times the global warming potential of carbon dioxide according to the EPA. Methane loss has been measured in distribution systems, at compressor stations, valve stations, and metering stations along supply lines. The loss of methane from leaks in production, storage, and transmission stations is well documented, and recent studies show that the amount lost to leaks is greater than previously thought.

Air pollutants released along with fugitive methane emissions include nitrogen dioxide and other air toxics, such as benzene, toluene, ethylbenzene, and xylene. Collectively, these and other pollutants contribute directly to adverse health effects such as asthma and other respiratory illnesses, eye, ear and throat irritation, headaches, cognitive complaints and many other maladies documented in recent health studies.

Impact on Wildlife Habitat

Wildlife need water for their survival. Most wildlife species in New Ipswich depend on the habitat of water itself and the surrounding forest and others plants in the wetlands. Bodies of water, because of their function as wildlife habitat and their natural beauty, are important resources for hunting, fishing, nature study, photography, hiking, canoeing, and kayaking. The NED pipeline will destroy forest buffers and vernal pools, and put sediment into streams from long stretches of exposed soil. The wetlands’ ability to function may be diminished by heavy equipment compacting wetland soil. Wetland species will be threatened through the use of herbicides used for ROW maintenance. It is also possible invasive species will be introduced that out-compete native wildlife foods. Wildlife might also be adversely affected by noise, vibration and light as a result of compressor station operation.

Impact on Forests

When property is clear cut, it is left barren of trees or any vegetation, leaving the landscape scarred and prone to erosion. Clear cutting is done because it is thought that trees are obstacles to construction. This lessens the aesthetics of the property and has the potential to lower real estate values. When mature, healthy trees exist on land that is to be developed, it makes good sense, both economically and environmentally, to protect these real estate assets. Keeping mature trees can result in enhanced property value and maintain the traditional wooded aspects of our town.

Mature trees can lower energy costs. In hot weather, the shade provided from the tree can reduce the energy requirements for air conditioning and decrease temperatures both in and outside the house. Trees also act as windbreaks reducing heat loss from a house. Trees help maintain a more constant temperature throughout a building’s interior year-round to provide a more comfortable living environment. This can result in a significant savings to the home owner.

Noise, Vibration and Light Pollution

New Ipswich is a quiet area with no industrial or commercial noise sources, which establishes us as a “Quiet Rural Community.” The existing Background Noise Levels in New Ipswich are less than 30 dBA and 20 dBA at night without natural sounds. The US Environmental Protection Agency and the World Health Organization have published warnings in regard to quiet environments. If the noise levels generated by a commercial or industrial use are not designed to operate quietly, there will be a serious, negative impact on the health and welfare of residents of the community. Industrial and commercial noise level limits for a “Quiet Rural Community” need to be significantly lower than those for an urban setting. Noise standards used by FERC, while appropriate for an urban setting, are not appropriate for a “Quiet Rural Community”. We request that Kinder Morgan be required to meet a noise level standard for the compressor station that is less than 38 dBA leq nighttime at the boundary of residential properties.

Large gas turbine compressors may also create vibrations and infra-sound frequencies below the threshold of hearing. While not considered audible sound, vibration and sound level pressures at low frequency can cause annoyance and sleep interference, potentially resulting in negative health effects. We request that Kinder Morgan conduct analysis of project-induced vibrations and infra-sound generation due to compressor operations, provide turbine manufacturer data, and analysis sufficient to demonstrate that vibrations and low-frequency infra-sound will not affect the surrounding community.

New Ipswich also benefits from a dark night sky because there are very few industrial or commercial sources of light pollution. We request that Kinder Morgan conduct a survey of night-time lighting conditions in the compressor station corridor to determine the nature of night lighting, and to characterize the existing conditions experienced by residents of the community. We also request that Kinder Morgan minimize excess facility lighting and contain any lighting within the immediate property boundaries. For security or other nominal lighting needs, lighting should minimize off-site lighting impacts. Lighting designed to illuminate areas within the station yard should avoid trespass beyond station limits and avoid up-lighting. Lighting should be designed by a lighting engineer and detailed in an illumination plan to specifically avoid off-site lighting impacts by use of full cut-off lighting fixtures (to eliminate off-site light spread and glare), without drop-down optics that can spread light horizontally. Lighting that does not glare or obscure colors should be used to enhance security as needed. Spot lights should be discouraged, and only be used for task lighting as needed to accomplish maintenance.

Impact of Abandonment

It is possible that the pipeline and compressor station may eventually be abandoned in the future. Kinder Morgan does not discuss how it plans to deal with the pipeline or supporting facilities if the line is abandoned. It is not possible to evaluate impacts to the Town’s natural resources if we don’t know what Kinder Morgan plans to do. Similarly, it is not possible to evaluate impacts if the pipeline is repurposed at some point in the future for some other product. In each of these scenarios, it must be incumbent upon Kinder Morgan to pay for all studies that New Ipswich would require to fully understand the impacts of abandonment or change of product being transported. Kinder Morgan must also be fully responsible financially and environmentally, for any subsequent mitigation related to abandonment or change of product being transported.

The protection of our natural resources is a fundamental right. NED pipeline and compressor station construction and associated disruptive activities will pose a threat to private landowners in New Ipswich. I ask that FERC and Kinder Morgan thoroughly attend to the points made and questions raised here as well as those made by the citizens of New Ipswich and our neighboring towns. I further request that ALL citizens impacted by this project be made whole, as impacts extend beyond the artificial incineration zone boundaries and the half-mile distance surrounding the compressor station site.

Sincerely,

Lisa Derby Oden

6 Upper Pratt Pond Road
New Ipswich, NH 03071

20151016-5377

Gian Andrea Morresi, Bridgeport, CT.
Dear FERC,

Drinking water reservoirs need healthy lands around them to filter and protect the water our families use. Clear-cutting and digging a trench 90 feet wide, 5.5 feet deep, and 5.7 miles long through land that protects my drinking water and that of hundreds of thousands of my neighbors is a bad idea! Natural gas pipelines nationwide have suffered alarming failures that pollute water and soil, and put people at risk. Kinder Morgan should find another place for its pipeline—or better yet, invest in renewable energy and stop wasting money on outdated fossil fuel infrastructure.

Thank you for taking my views in consideration.

20151016-5379

Mary Bickerstaffe, Dracut, MA.

I have so many concerns about this pipeline. First off, I know this is different from the pipeline but, in 10 years from when the is in will we turn out like the, Old Pees Air Force Base? They have to live with well contamination from the stuff they sprayed on airplanes to prevent freezing and now they are learning that people are getting sick from this. With this compressor station so close to the properties of so many children, women, and men's families that have come to live in a safe place. In my heart I know this is wrong. Kinder Morgan have pulled the wool over so many people. This is a plan to export we all know this. Why can't you people see this? My home is all I have. More than anything, I love having my family come spend time with me at my home. We have cook outs & we swim in our pool, which by the way is the pool that is right in the way of where you people want to dig up my yard. Are you going to replace my pool that will be ripped down. I love my yard and my family does too! We don't want this. Also, St. Francis Church is where I can go to God's House. Its so beautiful there. The blessed Mother's Garden with my pavers in the ground. What will happen to those and the bridge where we walk in song? We the people of Dracut, MA built that so everyone can feel the joy of the spirit. If more people felt that the world would be a better place. The Devil is involved when there is greed and all you can see is dollar signs. I read this prayer every week and so should you!!

Prayer to the Guardian Angel of the United States

O Glorious Angel of the United States, to whom God has entrusted the care of our beloved country, we honor you and thank you for the care and protection you have given to this great nation from the first moment of its inception.

O Powerful Angel Guardian, whose watchful glance encompasses this vast land from shore to shore, we know that our sins have grieved you and marred the beauty of our heritage. Pray for us.

O Holy Angel, before the throne of God. Obtain for us, from the Queen of Heaven, the graces we need to overcome the forces of evil so rampant in our beloved land.

Help us, our God-given protector and friend, to respond wholeheartedly to the urgent pleas of the Mother of God at Fatima. Assist us to offer the prayer and sacrifice necessary to bring peace and goodness to our nation.

We want to make you known and loved throughout our land, so that with your help we may become once more "a Nation under God"! Amen

20151016-5384

Date: 10/16/15

To: Federal Energy Regulatory Commission (FERC)

From: Gail S. LaGoy
Michael F. LaGoy

Docket: PF14-22

Please find listed below our preliminary comments and concerns regarding the Tennessee Gas Pipeline Northeast Energy Direct pipeline project. Thank you for your time and consideration.

Please Note:

We are significantly impacted landowners in Montague, Massachusetts, and have formally declined permission to survey.

• **Provide corrected maps, and add all additional/available map layers to identify:**

(Note: Our land is not identified correctly)

- o Chapter 61 Forestry land
 - o Agricultural land
 - o Conservation lands of any type
 - o Rare and Endangered Priority and Estimated Habitat
 - o All bodies of water, including but not limited to: seasonal streams, streams, brooks, rivers, ponds, lakes, ocean, other.
 - o Watershed areas for all bodies of water, including: seasonal streams, streams, brooks, rivers, ponds, lakes, ocean, other.
 - o Water supply drinking areas – public and private supplies.
 - o Wells
 - o Springs
 - o Interim wellhead areas – public and private supplies
 - o Flood Zones, including 100 year floodplain areas – public and private
 - o Areas considered to be “bald knobs” with shallow depth soil
 - o Soil types
 - o Other map layers not listed above.
- **Identify all areas with one or more potentials impacts, and assess the environmental, cultural, structural, and financial impacts in the aggregate:**

Including, but not limited to:

- o Forestry and Agricultural
- o Rare and Endangered Priority and Estimated Habitat
- o Vernal pools
- o Water Supply districts
- o Historical and cultural interest
- o Planned Open Space
- o Tourism areas – including scenic vistas and overlooks
- o Conservation land of any type
- o Interim wellheads
- o Flood Zones
- o Watershed
- o Wells
- o Springs
- o Bald knobs with shallow depth soil
- o Driveways and roadways – public and private
- o Other potential impacts not listed above.

• **Assess the financial impacts:**

- o Loss of tax reduction due to loss on conservation classifications
- o Loss of landowner, business, or public entity income (current and future potential, over expected life of owners and heirs) related to:
 - Tourism
 - Real Estate Sales, resales, and rentals
 - Forestry and Wood Products
 - Agricultural
 - Quarry
 - Metals and Minerals
 - Sand and Gravel
 - Soils
 - Water sources
 - Other not listed above
- o Loss of or pollution of soils
- o Additional costs to landowner, business, or public entity due to limitations presented by pipeline and related structures
- o Loss of real and personal property value
- o Loss of tax basis to cities, towns, counties, states, other public entities
- o Loss of clean energy sector jobs
- o Damage to buildings, other structures
- o Damage to forestry and agricultural land
- o Damage to personal property
- o Other financial impacts not listed above.
- o Cumulative financial burden assessments and compensation
- **Impact of groundwater flow alteration to:**
 - o Forestry and Agricultural land
 - o Conservation land of any type
 - o Watershed areas for all bodies of water, including: seasonal streams, streams, brooks, rivers, ponds, lakes, other.
 - o Water supply drinking areas – public and private supplies.
 - o Interim wellhead areas – public and private supplies
 - o Flood Zones, including 100 year floodplain areas.
 - o Wetlands crossings – public and private
 - o Drainage controls – public and private
 - o Retention Ponds – public and private
 - o Reservoirs – public and private
 - o Swales – public and private
 - o Driveways, paths, roadways – public and private
 - o Buildings and other Structures – public and private
 - o Soils
 - o Wells
 - o Springs
- **Impact of air flow and wind pattern alterations to:**
 - o Forestry and Agricultural land
 - o Conservation land of any type
 - o Driveways, paths, roadways – public and private
 - o Buildings and other Structures – public and private
 - o Soils
- **Identification and mapping of all vernal pools in all areas of proposed project:**

- o Impact to vernal pools from proposed project
- o Impact to vernal pool reliant species – animals and plants
- **Identification and mapping of all habitat and range areas, of all species of animal and plants that are:**
 - o Migratory species - all
 - o Federal Endangered, Threatened, or Species of Concern
 - o Massachusetts Endangered, Threatened, or Species of Concern
 - o New Hampshire Threatened, or Species of Concern
 - o New York Endangered, Threatened, or Species of Concern
- **Impact to all habitat and range areas, of all of all species of animal and plants that are:**
 - o Migratory species - all
 - o Federal Endangered, Threatened, or Species of Concern
 - o Massachusetts Endangered, Threatened, or Species of Concern
 - o New Hampshire Threatened, or Species of Concern
 - o New York Endangered, Threatened, or Species of Concern
- **Impact of fragmentation of habitat for:**
 - o Migratory species - all
 - o Federal Endangered, Threatened, or Species of Concern
 - o Massachusetts Endangered, Threatened, or Species of Concern
 - o New Hampshire Threatened, or Species of Concern
 - o New York Endangered, Threatened, or Species of Concern
- **Geological studies should be required to identify potential impacts and alterations to:**
 - o Underground water flows
 - o Aquifers
 - o Fault lines
 - o Radon containing rock
 - o Springs
 - o Wells
- **Geological studies should be required to identify all areas where blasting will be required.**
- **Impact of blasting to:**
 - o Underground water flows
 - o Aquifers
 - o Fault lines
 - o Ground water flow
 - o Radon release into underground water supplies – public and private
 - o Radon release into structures – public and private
 - o Radon release into air
 - o Soil loss
 - o Soil pollution
 - o Springs
 - o Wells
- **Air quality impacts:**
 - o Identification of ALL chemicals in the transported gas itself, along with MSDS and health impact information for each chemical
 - o Identification of ALL chemicals used in the transportation and compression of the gas, along with MSDS and health impact information for each chemical
 - o Identification of ALL chemicals used in the maintenance of the pipeline, compressors, and other

related equipment, along with MSDS and health impact information for each chemical

- **Water quality impacts:**
 - Identification of ALL chemicals in the transported gas itself, along with MSDS information for each chemical
 - Identification of ALL chemicals used in the transportation and compression of the gas, along with MSDS information for each chemical
 - Identification of ALL chemicals used in the maintenance of the pipeline, compressors, and other related equipment, along with MSDS and health impact information for each chemical
- **Fire danger identification, compensation, and remediation:**
 - Identification of all areas that are known high fire danger areas (example = Montague Plains)
 - Identification of all areas that are inaccessible to fire equipment
 - Detailed plans of how fires in high fire danger, inaccessible, and all other areas would be addressed
 - How training and compensation would be provided to first responders and their communities.
 - How compensation would be assessed and provided to landowners, businesses, and public entities in the event of a loss.
- **Evacuation impacts:**
 - Identification and mapping of all possible evacuation areas
 - Evacuation routes for all areas
 - Detailed plans of how evacuations in high fire danger, inaccessible, and all other areas would be addressed and implemented.
 - How training and compensation would be provided to first responders and their communities.
 - How compensation would be assessed and provided to landowners, businesses, and public entities in the event of an evacuation (example = loss of use, loss of rental income, other).
- **Health impacts:**
 - Air pollution from planned and unplanned releases, including impacts to persons with respiratory diseases or conditions
 - Water pollution from planned and unplanned releases
 - Soil pollution from planned and unplanned releases
- **Quality of Life impacts:**
 - Noise pollution impacts
 - Light pollution impacts
 - Smells/Odors
- **Security and Privacy impacts:**
 - How will trespassing onto pipeline areas be stopped?
 - How will trespassing onto property adjacent to the pipeline areas be stopped?
 - How will adjacent property owner privacy be protected from pipeline employees or their contractors, both on foot and aerial?
 - How will the pipeline areas be protected from degradation from motor vehicles, motorcycles, all-terrain vehicles, etc. How will these incursions be stopped?
- **Proximity to other easements:**
 - Require thicker walled pipeline and cathodic protection near power lines.
 - Consider that locating next to existing easement may constitute an overburden of the existing easement.
 - Does locating next to the existing power line easement restrict upgrade or expansion for that existing easement use?
 - Will pipeline be engineered for potential upgrades and expansion of that existing easement use?

- o Require enhanced vibration controls near railroad tracks and roadways.
- **Brownfields and other potentially polluted areas:**
 - o Identify all brownfields and polluted areas in pipeline areas and related structures, and provide a list of all pollutants, with MSDS (Material Safety Data Sheets) and health impact information for each pollutant.
 - o Test for and identify all areas with PCB contamination from adjacent power lines. Note: This is a known issue.
 - o Test for and identify all pollutants present in the waterway beds that will be crossed, and provide a list of all pollutants, with MSDS (Material Safety Data Sheets) and health impact information for each pollutant.
 - o How will these waterway pollutants be captured, contained, disposed of, and downstream impacts avoided?
 - o How will all polluted areas be remediated, contained, disposed of, and the remediation independently be verified?
- **Identification and proper decommissioning of all non-used wells and springs.**
- **Short nose Sturgeon:**
 - o Require pipeline path to be moved well to the south of any known habitat of this federally endangered species.
 - o Require pipeline company to pay for independent monitoring of species impact.

20151016-5386

Date: October 16, 2015

I am writing as a concerned citizen of Windsor, Massachusetts. The proposed Kinder Morgan pipeline presents great risks to the health and safety as well as survival of this community. It will pollute clean air, clean water and our natural environment – what the Berkshires are known for.

The residents of the Town Of Windsor voted and approved a referendum last year stating that we did not want a pipeline through our land – much of which is conserved or protected wetlands. Furthermore, these lands are protected in Massachusetts under Article 97.

The pipeline itself presents major environmental risks. Methane, a greenhouse gas 20 times more potent than carbon dioxide, has been shown to leak as it moves through the pipeline. Methane leakage is a significant contributor to climate change, which threatens our communities, natural resources, and way of life.

Also as a rural community we are dependent on our private wells and the blasting and leakage from such a pipeline could pollute our water supply, essentially resulting in a catastrophe for our communities.

In addition to the pipeline, Windsor is being asked to host a now 41,000 horsepower compressor station as well. The compressor station presents known health risks including methane emissions, as well as emissions of harmful NOx and VOC's which not only affect the climate, but cause local air quality and many health problems, especially for children and pregnant women.

I would like to see both air and water quality tests provided before and after to assure the safety of these resources that we are all dependent on.

On January 14, 2015, President Obama announced a major executive action to reduce the release of methane into the environment by 40% below 2002 levels by 2025. Given that reducing methane pollution is a major goal of the administration, FERC should reject permits for the construction of new infrastructures that are known to leak methane - as well as other toxins – including the Kinder Morgan pipeline and compressor stations.

In Massachusetts our energies should be focused on alternative energy production.

Sincerely,

Cynthia White

Norman Bay, Chairman

Federal Energy Regulatory Commission

via FERC Online filing

Re: Docket No. PF 14-22-000

Tennessee Gas Pipeline Company, L.L.C. (TGP),
Proposed Northeast Energy Direct (NED) Project

October 16, 2015

Dear Norman Bay,

Woolman Hill Retreat Center (Woolman Hill, Inc.) filed initial scoping comments on August 31, 2015 about the proposed Kinder Morgan/Tennessee Gas Northeast Energy Direct project. These are additional comments we ask the Federal Energy Regulatory Commission to review.

Sincerely,

Margaret Cooley

Executive Director, Woolman Hill

(margaret@woolmanhill.org)

COMMENTS for the FEDERAL ENERGY REGULATORY COMMISSION

Re: FERC Docket No. PF 14-22-000

Tennessee Gas Pipeline Company, L.L.C. (TGP),
Proposed Northeast Energy Direct (NED) Project

October 16, 2015

NOTE: Woolman Hill Inc., (Woolman Hill) is submitting these statements in response to the Federal Energy Regulatory Commission's request for comments from the public. Submission of these statements is not a waiver of Woolman Hill's rights as per Civil Action No. 15-cv-30131 (MAP) filed in Federal Court for the Western District of Massachusetts on July 28, 2015.

Woolman Hill Retreat Center (Woolman Hill, Inc.) filed initial scoping comments on August 31, 2015. These are additional comments.

In assessing the impact of the proposed Northeast Energy Direct project, based on detailed examination of map TE-SEG_H011 dated 7/20/2015, we provide these additional comments.

The Woolman Hill northern property line borders the proposed pipeline route between stations 528 and 542. Along this section the pipeline right-of-way centerline would fall just north of the Woolman Hill property line within the right-of-way of an existing overhead power line; the proposed permanent easement would extend onto Woolman Hill property; the proposed temporary workspace would extend an additional 35 feet on Woolman Hill property and additional temporary workspaces would further intrude on our property. If carried out, these intrusions will require removal of a substantial number of trees. Removing these trees will have serious long-term impacts on Woolman Hill operations. The line of trees along Woolman Hill's northern boundary (roughly between stations 528 and 531) is a critical sound buffer to the operation of the quarry and asphalt plant adjacent to it, as well as a visual buffer from the power line. The forest that lies between

stations 521 and 542 was designated by the Woolman Hill Board of Directors over twenty years ago as a portion of our land that should be preserved un-disturbed.

These concerns could be ameliorated by adjustments to the right of way and workspaces. In particular we make these specific observations:

- Constructing the pipeline on the northern margin of the electric utility corridor, rather than the southern margin would resolve the concerns expressed above and would also cluster this new industrial activity with the existing activities to the north (a quarry and asphalt plant).
- If the pipeline remains on the southern margin of the electric utility corridor, these steps should be considered:
 - o moving the pipeline centerline northward approximately 15 feet would eliminate the presence of the permanent easement on Woolman Hill property.
 - o Placing the temporary workspace north of the pipeline centerline (and within the electric utility corridor) would eliminate the need for removal of a 35-foot wide swath of forest.
 - o Additional workspaces on Woolman Hill property can be moved to existing open space within the electric utility corridor. Specifically, eliminating ATWS-H-067 and ATWS-H-068 can be accomplished by expanding ATWS-H-065 and ATWS-H-066.

Two additional issues require comment:

- There is a very popular trail along the ridge at the western edge of Woolman Hill's property. One of the trailheads for that trail lies at the west side of the junction with Keets Road and Woolman Hill's northernmost corner (the northwest corner abutting Keets Road) near station 527.5. The proposed route, and particularly the additional workspaces proposed for that area (ATWS-H-064) would decimate the trailhead and the entry into the forest there, as well as a significant portion of the trail. Expansion of ATWS-H-065 and elimination of ATWS-H-065, which lies within the electric utility corridor, would significantly reduce this impact.
- A well at a residential unit appears to be within 200 feet of the construction zone. Again, the workspace extends to the south of the proposed pipeline easement, bringing the disturbance closer to that well.

In closing, we reiterate Woolman Hill's concerns about temporary and long-term damage to our property, as well as concerns about fossil fuel reliance and climate destruction regionally, nationally and globally.

Thank you for your consideration.

Margaret Cooley, Executive Director Patricia Higgins, Clerk, Board of Directors
Woolman Hill Quaker Retreat Center Woolman Hill Quaker Retreat Center

(Also see comments filed 8/31/15 by Woolman Hill.)

20151016-5392

Christine D'Ippolito, Nassau, NY.

Please do not approve the NED pipeline. The project will have a negative and possibly devastating effect on our environment, families and wildlife. The poisons that will emit from the 90,000 hp compressor station will carry over to our lakes, creeks, groundwater and wells. Please carefully note that most of the people living in Nassau, Averill Park, Stephentown and Schodack, NY receive water from private wells.

The pipeline is certainly not a public convenience for the people of the State of New York and the compressor station will definitely change the character of our beautiful area. Family farms and several local businesses will more than likely not survive the incursion.

What purpose will the pipeline serve the country? Cheaper oil? Short term employment in order to give the false impression of job growth? Am I and my neighbors considered collateral damage for a project that will do more harm than good in the long run for the country as a whole?

Please do not give into to quick fixes and immediate gratification. The pipeline runs contrary to the gov-

ernment's claims that it is seeking solutions to improve the climate and environment by investing in clean energy. Please invest in people and the future and not corporate greed.

20151016-5393

Rosemary Wessel, Cummington, MA.

Kinder Morgan has just announced that it plans to file on November 20. While this delay makes sense given the late and largely incomplete nature of their Resource Reports, it's a full 3 months later than their originally stated filing date of August 2015 that was included in their community presentations throughout 2014 and early 2015; yet their intended finish date for the project has not changed.

Kinder Morgan should specify how they're expecting the 3 months will be made up to make this completion date of November 2018 possible. Do they expect FERC to expedite it's processes to make up for the lost 3 months, or do they intend to rush through the construction process more quickly. Neither option sounds viable for matters of public health and safety.

Please require that they be more specific in revising the rest of their plans accordingly.

TOWN OF NEW IPSWICH

661 Turnpike Rd New Ipswich NH 03071

Board of Selectmen

Kimberly D. Bose, Secretary October 16, 2015
Federal Energy Regulatory Commission 888 First Street, NE
Washington, DC 20426

Re: Scoping Comments

Docket No. PF-14-22, Tennessee Gas Pipeline Co., Northeast Energy Direct Proposal

Dear Ms. Bose:

The Board of Selectmen of the Town of New Ipswich, New Hampshire, respectfully submit the following scoping comments:

As mentioned in previous letters to you and in our discussion with Mr. Eric Tomasi, your Environmental Project Manager for the NED Project, we find the burden of identifying what needs to be "avoided, mitigated, minimized or compensated" that has been placed on the Town of New Ipswich without adequate resources, has been unreasonable.

Further, given the need for NED has yet to be determined by your Commission, this burden only adds insult to injury. Based on the facts that New Ipswich, NH will not benefit in any way from this primarily export pipeline, the limited long-term contracts currently subscribed for the NED pipeline, the existence of more environmentally sound pipeline alternatives to serve New Hampshire's needs, and the existing LNG infrastructure in place to address the region's peak winter heating and electricity demands, we fail to see how the NED project can meet the Commission's criteria for determining whether there is need for NED.

Despite all of the "TBDs" and the severely incomplete sections of Kinder Morgan 24 July 2015 submission of Resource Reports, we have reviewed each of these documents in great detail. In the table below, you will find a reference to the Resource Report, including paragraph and page numbers where applicable, and the Town's associated comment, question and/or request.

In summary, we believe this project will have, not only negative environmental impacts, but also negative socioeconomic impacts, and the Town of New Ipswich will suffer irreparable harm from this project.

Sincerely,

BOARD OF SELECTMEN

George H. Lawrence, Chairman

Rebecca M. Doyle

David S. Lage

 Jeanne Shaheen, U.S. Senator
 Ann McLane Custer, U.S. House of Representatives

Comments to FERC

Resource Report	Paragraph Number	Page Number	Comments
1	1.1.1	1-12	“Additionally, the New York, Massachusetts, and New Hampshire route, which predominantly follows existing utility corridors for its Project, will provide economic service to several geographic areas in northern Massachusetts and southern New Hampshire that are not currently served by an interstate pipeline.” Please explain how Southwest New Hampshire communities, including New Ipswich, will receive economic service.
1	Table 1.1-2	1-28	Width of Existing ROW is identified as TBD; Width of Existing ROW to be Used During Construction is identified as 30-60 ft; Width of Existing ROW to be Used During Operation is identified as 20 ft. Our understanding is no portion of the Existing ROW can be used for operations. Please explain how these widths were calculated.
1	1.1.2.2.1	1-31	The Market Path Mid Station 4, located in New Ipswich, is described to include Titan 130 turbines. Due to emissions, electric turbines should be required.
1	1.1.2.2.1	1-31	The Market Path Mid Station 4, located in New Ipswich, is described to include Titan 130 turbines. Due to emissions, filters for PM2.5 should be used on the turbines.
1	Table 1.2-7	1-74	Based on the Non-Surveyed Areas of the Project, none of New Ipswich, NH has been surveyed.
1	1.3.1.3	1-77	Timber in New Hampshire is a commodity and belongs to the landowner. Unless alternative arrangements have been made with the landowner, proceeds from the sale of timber belong to the landowner. An Intent to Cut permit is required in New Ipswich and all related timber tax must be paid to the Town.
1	1.3.1.4	1-78	Tennessee states “landowner request or permitting requirements may dictate greater depth” than the minimum specifications set forth in Table 1.3-1. Given the frost line in New Ipswich, NH is approximately 48 inches, we request that the depth of cover be no less than 48 inches in all areas.
1	1.3.2.1	1-83	Tennessee states “in areas of rugged topography, ROW restoration will begin within 20 days of final pipeline installation to minimize potential erosion and sedimentation control problems.” It is unclear what is meant by the “20 days.” We request that restoration begin immediately, as weather permits, once backfill has been completed to minimize potential erosion and sedimentation control problems.
1	1.3.2.2	1-84	Due to the sensitive nature of our groundwater in New Ipswich, NH, we request that water wells within 500 feet of the construction workspace along the ROW be tested before and after construction for water quantity and quality.
1	1.3.2.2	1-84	The Town of New Ipswich requests that bonds be in place before any construction work begins within a roadway ROW. All funds should remain in escrow for a period of one year post completion of the project.
1	1.3.2.6	1-89	Due to probability of bedrock aquifer contamination and damage, we request that no blasting be allowed in New Ipswich, NH. New Ipswich has no public water. All homes and businesses rely on private wells which draw their water from both stratified drift aquifers and bedrock aquifers. A hydrogeological study should be performed prior to permitting to identify the bedrock aquifers that will be impacted by the construction of the pipeline. In addition, all wells drawing water from those bedrock aquifers should be identified and tested before and after construction for water quantity and quality.

1	1.3.3.3	1-93	Tennessee states it “will perform air quality impact modeling to support its applications to the ... New Hampshire Department of Environmental Services (“NHDES”) for air permits to construct and operate the proposed turbine-compressors.” We are concerned, based on recent health studies at compressor stations that emissions modeling is proving to be insufficient. What additional efforts are being considered in light of these findings?
1	1.4.2	1-96	Due to the potential for groundwater and surface water contamination, and the resulting contamination of private water wells, the use of herbicides or pesticides should be prohibited on the ROW or at aboveground facilities in New Ipswich, NH.
1	1.4.5	1-120	Tennessee states lithe compressor stations will be remotely linked to Tennessee’s information and data software networks and infrastructure which monitor the pipeline system on a 24-hour per day basis. Tennessee’s Gas Control Center monitors the pipeline system 24 hours a day, 365 days a year from the Gas Control Center using Tennessee’s Supervisory Control and Data Acquisition (“SCADA”) system.” It is unclear how a reliable connection will be established between New Ipswich, NH and Tennessee’s Gas Control Center in Houston, TX. New Ipswich requests 24/7 on-station coverage to ensure rapid communications should an emergency occur.
1	1.5	1-121	Tennessee failed to address abandonment. It is unclear what will happen to the pipeline or the compressor station when no longer in operation.
1	Table 1.6-1	1-127	It is unclear how permit applications can be submitted to NH Department of Environmental Services in December 2015 given 75% of affected landowners have denied access to their property and surveys are likely not to be conducted until after issuance of the certificate of public need and necessity.
2	2.1.1.4.1	2-10	Tennessee failed to identify radon as a water quality concern for bedrock aquifers.
2	2.1.1.4.2	2-11	Tennessee discusses the stratified drift aquifers in Amherst, Hollis, Hudson, etc. which supply municipal public supply wells. However, the three stratified drift aquifers impacted by pipeline construction in New Ipswich are not mentioned. Given all of New Ipswich relies on private water wells for drinking water and many of these wells draw water from stratified drift aquifers, it is necessary to identify both the stratified drift aquifers impacted by pipeline construction and the private wells utilizing those aquifers to ensure proper testing and monitoring is accomplished.
2	2.1.6	2-27 and 2-28	Tennessee states that “owners of wells located within 200 feet of the Project workspace or within 200 feet of blasting activities will be offered pre- and post-construction well testing.” We request that this be extended to SOD feet as suggested by Tennessee in a meeting on 17 September 2015 at the NH Farm Bureau.
2	2.2.5.2	2-43	The proposed site for Market Path Mid Station 4 is a known EPA brown field site. It is unclear why Tennessee has failed to identify it as such. We request that the contamination at the Market Path Mid Station 4 site be mitigated and the lead be removed from the soil prior to construction and prior to any subdivision or sale of land associated with lot.
2	2.2.10.2	2-60	Tennessee failed to identify the surface waters located on the Market Path Mid Station 4 site or the proximity to the Greenville, NH reservoir. We believe these surface waters are “sensitive surface waters” and construction, modification and operation of these facilities will have a negative impact on sensitive surface waters.
2	Table 2.3-8	2-88	The wetland impact summary identified for New Ipswich, NH is inconsistent with the Town’s Natural Resource Inventory. This information should be corrected.
2	Figure 2.1-1a		Bedrock aquifers in New Ipswich, NH have not been identified. Given all of New Ipswich relies on private water wells for drinking water and many of these wells draw water from bedrock aquifers, it is necessary to identify both the bedrock aquifers impacted by pipeline construction and the private wells utilizing those aquifers to ensure proper testing and monitoring is accomplished.
2	Figure 2.1-1b		Stratified drift aquifers in New Ipswich, NH have not been identified. Given all of New Ipswich relies on private water wells for drinking water and many of these wells draw water from stratified drift aquifers, it is necessary to identify both the stratified drift aquifers impacted by pipeline construction and the private wells utilizing those aquifers to ensure proper testing and monitoring is accomplished.

3	Table 3.4-6	3-93	Tennessee failed to identify two plant species in the vicinity of the project in New Ipswich, NH: Lady's-slipper, showy (<i>Cypripedium reginae</i>) and Bearberry.
3	Table 3.4-8	3b-22 and 3b-23	Tennessee failed to identify amphibians for New Hampshire. Three species within the vicinity of the project in New Ipswich, NH are the Marbled Salamander, the Blue Spotted Salamander, and the Northern Leopard Frog.
4	Table 4.4-46	4-63	Tennessee failed to identify the Seventh Day Advent's holy site in New Ipswich, NH.
4	Attachment 4b	4-b3	Tennessee failed to identify or contact the New Ipswich Historical Society.
5	Table 5.9-1	5-24	Given property taxes are collected by towns in New Hampshire, it is unclear why estimated property tax revenues would be identified by county. Estimated property tax revenues should be identified by Town.
5	5.10.2.3	5-31	Tennessee states "during normal operation of the Project, the need for emergency services is not anticipated. In the unlikely event of an incident, local emergency officials will be responsible for managing and protecting people (i.e., traffic control, handle injuries)." New Ipswich, NH relies on an all-volunteer fire department and emergency management department. It is unclear what resources will be required or what responsibilities these departments will assume in the event of an emergency. However, we strongly disagree with Tennessee's statement that "no long-term cumulative impact on infrastructure and public services is anticipated." Any additional resources for emergency services will increase the Town's operating budget thereby increasing property taxes. The short-term and long-term socioeconomic impacts to New Ipswich, NH should be identified and mitigated.
5	5.10.2.3	5-32	Many of the roadways in New Ipswich, NH were not built to handle the weight of the vehicles anticipated during construction. Many town roads are weight-restricted. The use of local roadways during construction will accelerate degradation of roadways and require early replacement of road surfaces, at best. Damage to local roadways is likely so we disagree with Tennessee that "its contribution to this potential cumulative impact will be minimal." The Town of New Ipswich requests that bonds be in place before any construction work begins within a roadway ROW and that all posted weight limits be respected.
5	5.10.2.6	5-34	Tennessee states "it is not anticipated that the Project would adversely impact property values along or outside the proposed pipeline ROW." However, documented studies show this not to be the case, such as the 2014 Fremont Center NY study by a certified real estate appraiser that determined homes close to a compressor station should be reduced by 25% to 50%. The decrease in property values and resulting tax abatements should be addressed along with the short-term and long-term socioeconomic impacts due to an increase in property taxes in New Ipswich, NH.
5			Tennessee failed to address the impact to the Town of New Ipswich, NH for the significant impact to one of the few businesses within the Town (91% residential), Windblown Cross Country Ski Area. In addition to losing a significant portion of the "easy" or beginner trails due to the pipeline ROW, access roads were recently identified which further impact the business. What is the impact on tourism in the area?
5			Tennessee failed to identify the impact to the Wapack Trail.
5			Tennessee failed to identify the impact of deforestation along the pipeline route.
5			Tennessee failed to address the Windblown Cross Country Ski Area in New Ipswich, NH. In fact, Windblown was not mentioned once in the Resource Report. Opened for business in 1972, Windblown attracts tourist from Massachusetts, Rhode Island, Connecticut and Vermont to New Ipswich with approximately 10,000 to 15,000 skier visits per year. The pipeline is proposed to cross seven existing ski trails. The impact to Windblown and, in turn, to New Ipswich should be assessed and identified.

6	6.1.1.6	6-18	Tennessee states “The Project facilities in New Hampshire cross the southern region of the state where the land slopes gently downward toward the ocean from the New England Upland Section to the Seaboard Lowland Physiographic Province. The Seaboard Lowland Section extends 15 to 20 miles into New Hampshire. The Seaboard Lowland Province is characterized by mostly level or gently rolling topography that is underlain by Precambrian igneous rocks (USGS 2014d).” Most of the pipeline and associated facilities are greater than 20 miles from the ocean so it is unclear how this statement applies. In New Ipswich, NH we have significant steep slopes and significant granite at or near the surface. Please clarify the geological conditions and the intent of the statement above.
6	6.1.2.6.1	6-21	Tennessee states “in New Hampshire, one new compressor station is proposed, Market Path Mid Section 4, located in Hillsborough County. The compressor station is situated within areas that consist primarily of glacial till.” First, we believe Tennessee was referring to the Mid Station 4 in New Ipswich, NH. Second, in paragraph 6.1.3.6.1, Tennessee states “New Hampshire has one new compressor station, Market Path Mid Station 4, located in Hillsborough County and is situated within Early Devonian quartz diorite.” Please clarify the apparent contradiction.
6	6.2	6-31	Given the areas of shallow depth to bedrock or outcrops in New Ipswich, NH and due to probability of bedrock aquifer contamination and damage, we request that no blasting be allowed in New Ipswich, NH. New Ipswich has no public water. All homes and businesses rely on private wells which draw their water from both stratified drift aquifers and bedrock aquifers. A hydrogeological study should be performed prior to permitting to identify the bedrock aquifers that will be impacted by the construction of the pipeline. In addition, all wells drawing water from those bedrock aquifers should be identified and tested before and after construction for water quantity and quality. Quality should be tested according to the strategy established by Southwest Pennsylvania Environmental Health Project’s (SWPA-EHP’s) Well Water Contamination: SWPA-EHP Ranking System and Monitoring Strategy, dated 31 May 2012.
6	6.3.4	6-38	What is the impact to taxes collected from sand and gravel removal in New Ipswich?
6	6.4.5.4	6-67	New Ipswich, NH has a steep slopes ordinance which prohibits and construction on slopes greater than 15%. It is unclear why Tennessee only address slopes greater than 30% as steep. Please clarify.
8	Table 8.1-3	8-14	Tennessee states that 20 feet of the width of the existing ROW is to be used during operation. This contradicts what we have learned from Tennessee during Open House events where it has been stated that no overlap of the powerline ROW and the pipeline ROW can occur. Please clarify.
8	Table 8.2-1	8-36	Tennessee has failed to identify the subdivision In New Ipswich, NH currently planned by USA Properties.
8	8.3.1.1.4	8-73	Tennessee has failed to identify contiguous undeveloped land in New Ipswich, NH with deeded conservation easements or conservation restrictions. Many parcels with such restrictions are impacted by the pipeline and should be addressed. These unfragmented lands are of significance for wildlife as well as identifying large areas of open space, minimizing the impacts of development.
8	8.3.3.2.4	8-98	Tennessee has failed to identify contiguous undeveloped land in New Ipswich, NH with deeded conservation easements or conservation restrictions. Many parcels with such restrictions are impacted by the pipeline and should be addressed. These unfragmented lands are of significance for wildlife as well as identifying large areas of open space, minimizing the impacts of development.
8	8.3.4.3	8-104	Tennessee failed to identify specialty crop farms impacted by the pipeline in New Ipswich, NH. Please identify.
8	8.3.6.4	8-108	The proposed site for Market Path Mid Station 4 is a known EPA brown field site. It is unclear why Tennessee has failed to identify it as such. We request that the contamination at the Market Path Mid Station 4 site be mitigated and the lead be removed from the soil prior to construction and prior to any subdivision or sale of land associated with lot.

8	8.4.4	8-116	Outdoor lightening at the Market Path Mid Station 4 should be controlled so that our current conditions of rural sky and truly dark sky are maintained. Please identify the current conditions using the Bortle scale and what measures will be taken to ensure these conditions are maintained.
8			Tennessee failed to address the Windblown Cross Country Ski Area in New Ipswich, NH. In fact, Windblown was not mentioned once in the Resource Report. Opened for business in 1972, Windblown attracts tourist from Massachusetts, Rhode Island, Connecticut and Vermont to New Ipswich with approximately 10,000 to 15,000 skier visits per year. The pipeline is proposed to cross seven existing ski trails. The impact to Windblown and, in turn, to New Ipswich should be assessed and identified.
8	Table 8.3-5	8b-250	Tennessee has failed to identify contiguous undeveloped land in New Ipswich, NH with deeded conservation easements or conservation restrictions. Many parcels with such restrictions are impacted by the pipeline and should be addressed. These unfragmented lands are of significance for wildlife as well as identifying large areas of open space, minimizing the impacts of development. Please identify.
8	Table 8.3-5	8b-250	Tennessee has failed to identify the parcels in Current Use as described in paragraph 8.3.3.2.4 (page 8-99). Please identify all parcels in Current Use.
9	9.1.3.2	9-25	Tennessee states “Detailed air emissions for the compressor stations are not yet available for this draft filing of Resource Report 9 but will be quantified to support the development of the air permit applications and the final Resource Report 9 that will be submitted in the final ER that will be included with the Project’s certificate application.” New Ipswich, NH does not wish to be the next Minisink, NY. Based on the Southwest Pennsylvania Environmental Health Project’s Summary on Compressor Stations and Health Impacts, dated 24 February 2015, we believe there is reason for concern. We request the following be required: build the compressor station to control emissions and prevent air pollution, including the installation of loop lines to capture blowdowns/blowouts; electric turbines rather than gas; 24/7 monitoring of pollution, using the NAAQS standards as a maximum; test all dug wells within a 5-mile radius; and health registry / health monitoring program which should begin at least 2 years in advance of operations at the facility or whatever is deemed by Tennessee to be required in order to establish a health baseline for legal purposes.
9	9.2.1.2.4	9-34	New Ipswich, NH does have a noise ordinance which limits noise between the hours of 10pm and 7am. Given large industry is not allowed per our Zoning Ordinances, a noise ordinance specific to such has not yet been enacted. However, we do have a Large Wind Energy Systems Requirements Ordinance which we would expect Tennessee to use as guide for noise (audible and inaudible, low frequency monitoring) and vibration levels allowed at the Compressor Station (Market Path Station 4) during operations, including blowdowns. We request this be a requirement of the application and any certificate of need that might be issued.
9	9.2.2	9-35	Tennessee appears to be using the existing noise levels at Station 319 as the baseline noise levels for the new compressor stations. However, Station 319 is proposed to be upgraded to a 31,000 HP station but is not that size today as the baseline noise levels were determined. It is unclear how a much smaller station is applicable to the proposed Market Path Mid Station 4. Please clarify.
11	Table 11.2-2	11-4	The pipeline segment in New Ipswich will cross three stratified drift aquifers which are used to supply drinking water to homes and businesses via private drinking wells. We believe this should be considered when determining High Consequence Areas for the Project.
11	11.2.5	11-8	Tennessee states that “Tennessee field personnel are available to respond to emergency events on its pipeline system at any time of day. Typically, the response time is less than one hour, but is dependent on the location of the situation, location of personnel, time of day, weather conditions, and traffic conditions.” Given the remote location of Market Path Mid Station 4, located in New Ipswich, NH, automatic shut-off valves should be required. Otherwise, New Ipswich requests 24/7 on- station coverage to ensure rapid communications should an emergency occur.

11	11.2.5	11-8	Tennessee states that “Tennessee field personnel are available to respond to emergency events on its pipeline system at any time of day. Typically, the response time is less than one hour, but is dependent on the location of the situation, location of personnel, time of day, weather conditions, and traffic conditions.” Given the remote location of Market Path Mid Station 4, where is the closest service field representative located and what is the response time to New Ipswich, NH? Please provide details. New Ipswich requests 24/7 on-station coverage to ensure rapid communications should an emergency occur.
11	11.2.9	11-10	Please provide an impact analysis due to lack of 24-hour police coverage in New Ipswich, NH.
11	11.2.9	11-10	Please provide an impact analysis, including personnel and infrastructure requirements, given the New Ipswich, NH fire department is a call department with minimal manpower during the daytime.
11	11.2.9	11-10	Please identify any involvement required by the FEMA Region 1 in the event of an incident at Market Path Station 4. Does FEMA Region 1 have a plan for response to an incident?
11	11.2.9	11-10	Please identify any involvement required by the State of New Hampshire in the event of an incident at Market Path Station 4.
11	11.2.9	11-10	Please identify the manpower requirements, including those that may be required via Mutual Aid. How does this compare to the current available resources?
11	11.2.9	11-10	Please identify the funding available to the Town of New Ipswich, NH for an emergency response (including alarm activations, incidents), initial and ongoing training for all first responders (police, fire, ambulance, emergency management and highway), and special protective gear needed for first responders.
11	11.2.9	11-10	Please identify the special protective gear or special equipment (e.g., gas meters, ATVs) required for first responders. Please identify how these items will be procured and maintained.
11	11.2.9	11-10	Please identify what messaging system will be used in the event of an incident. How will training on this system be accomplished?
11	11.2.9	11-10	Please identify how a detailed site plan will be provided to local officials. How will this be maintained?
11	11.2.10	11-11	Please provide a copy of the Emergency Response Plan for New Ipswich, NH.
11	11.2.10	11-11	Please identify how scene security will be provided in the event of an incident.
11	11.2.12	11-11	Tennessee failed to identify whether the Market Path Station 4 will have an Active or Passive fire suppression system. Please provide details.
11	11.2.12	11-11	Tennessee failed to identify whether the Market Path Station 4 will have gas leak detectors. Please provide details.
11	11.2.12	11-11	Tennessee failed to identify the water source for dissipation of vapors at the Market Path Station 4. Given New Ipswich, NH has no public water supply, please provide details.
11	11.2.12	11-11	Tennessee failed to identify whether a foam bank for fire suppression will be provided and maintained at the Market Path Station 4. Please provide details.
11	11.2.12	11-11	Tennessee failed to identify how road access would be maintained to the Market Path Station 4. Please provide details, including snow removal and roadway maintenance and upkeep to allow emergency vehicles to respond.
11	11.2.12	11-11	Tennessee failed to identify the security monitoring (e.g., alarms, fences, manpower, cameras, patrols) to be implemented at the Market Path Station 4 or along the pipeline. Please provide details.

Federal Energy Regulatory Commission

800 First Street, NE
Washington, DC 20436

RE: Docket #14-22-000

To the Honorable Committee Members,

SNYFGP would like to express our appreciation for your complete and diligent consideration of the innumerable and extensively detailed scoping comments crossing your desks. We wish to add no undue burden and will do our best to give the bigger picture as we see it, supported by only the most necessary details to render an accurate and coherent account of our perspective.

We understand that the task before you is to assess the consumer need for the proposed NED natural gas pipeline, and to balance this need with consideration of adverse impacts to the environment and residents. Expressed in accordance to legal provisions, on the one hand you are responsible to the Natural Gas Act, section 7, to assess whether “the proposed service, sale, operation, construction, extension, or acquisition, to the extent authorized by the certificate, is or will be required by the present or future public convenience and necessity; otherwise such application shall be denied.” On the other hand, you must be in compliance with NEPA guidelines to evaluate all aspects of environmental impact, which in turn, impacts all living within said environment.

PART 1. Need for NED Pipeline.

Present and Future Domestic Demand for NED Pipeline Natural Gas

We are in a historically dynamic time of change with regards to how we accommodate our energy needs. Electric generating utility companies are presently transitioning from primarily coal-based electricity to primarily natural gas based electricity. If the current trend of increased reliance on natural gas for electricity generation continues, by 2050, fully two-thirds of our electricity nation wide will be fueled by natural gas. Although natural gas emits less carbon than oil or coal when burned, it will fall short by a factor of three in meeting our goal of a 90% decrease in power sector carbon emissions needed to avoid catastrophic consequences of climate change, as recommended by the National Research Council. This shortfall would have considerable impact, as the electric power sector contributes one third of this nation’s carbon emissions, and is the largest source of carbon emissions. In addition, natural gas releases methane, which is a far more potent greenhouse gas than carbon dioxide. Over a 25-year period, methane is 70-86 times more potent than carbon dioxide.

In concluding its review on the risks of the power sector’s over-reliance on natural gas, the Union of Concerned Scientists (UCS) explains, “To meet the NRC’s carbon budget for the power sector, the U.S. needs to invest heavily in energy efficiency and increase renewable energy’s share of the total power supply to 25 percent by 2025 and 80 percent by 2050.” <http://www.ucsusa.org/climate-risks-overreliance-natural-gas-electricity-2013>

Those in positions to look to the future herald the above truth in policies or caveats that move us away from an over-reliance on natural gas.

- Consider that ISO-New England has expressed concern about the over-reliance on natural gas for electricity generation.
- Consider a report by Synapse Energy Economics, Inc, “Avoided Energy Supply costs: 2013 Report”, which fails to substantiate Kinder Morgan’s assertion that New England will need additional natural gas. To the contrary, SEE projects that shortfalls in energy generation for Massachusetts will be isolated to only certain days of the year, and that, at only peak demand. SEE also critiques that KM’s projections do not factor in increases in energy efficiency and an ever-growing reliance on renewable energy sources.
- Consider a new study by Energyzt Advisors LLC. They foresee that the demand for natural gas in the Northeast will decline. They also believe that this region would benefit from diversifying their

sources of energy generation. They contend that, “Even during extreme winter conditions, new pipeline capacity is not required to meet New England natural gas demand needs given existing infrastructure, current market conditions, and policy initiatives.” <http://www.businesswire.com/news/home/20150817006123/en/Report-England-Energy-Winter-Reliability-Solutions-Finds>

- Consider that because we CAN doesn't always mean we SHOULD. For whatever many and obvious reasons, we are basically in another proverbial gold rush. This is our national psyche. We are rich with natural gas and ever improving ways to get at it. We have finally achieved the national energy independence we have longed for. But the most optimistic estimates give us 92 years of this resource wealth. Sounds great, but is it really? The methane that is released in extraction, leaks and blow-downs has devastating greenhouse effects. It is a short lived, but intense climate changer. It is a 100 times more powerful greenhouse gas than carbon dioxide within a 5 year period, and 72 times more within a 20 year period. Contamination of our ground water and water ways are very real possibilities, as well as the exhaustion of water resources in the extraction process in times of real or imminent threat of drought: this is not wealth but a squandering of wealth. The lulling comfort natural gas affords us while we are in a critical time of climate change escalation whose tipping point may already be behind us SHOULD be displaced by a realistic and acute discomfort with our lack-luster response to climate change, so that we as a nation are motivated to aggressively pursue the transition to renewable energy upon which our survival depends.

The broader and unavoidable truth is that even though we are currently experiencing an abundance in extractable natural gas, these fossil fuel deposits are finite in nature, and we know we will have to transition to alternative sources of energy, both for the foreseeable end of fossil fuel availability and for preservation of a livable biosphere. The question becomes, when should we start taking this transition seriously? In between our current reliance on fossil fuels and a hoped for successful transition to a sustainable energy infrastructure lurks a danger that Tom Murphy has coined The Energy Trap. In summary, he writes: “But our reaction to a diminishing flow of fossil fuel energy in the short-term will determine whether we transition to a sustainable but technological existence or allow ourselves to collapse. One stumbling block in particular has me worried. I call it The Energy Trap.

In brief, the idea is that once we enter a decline phase in fossil fuel availability—first in petroleum—our growth-based economic system will struggle to cope with a contraction of its very lifeblood. Fuel prices will skyrocket, some individuals and exporting nations will react by hoarding, and energy scarcity will quickly become the new norm. The invisible hand of the market will slap us silly demanding a new energy infrastructure based on non-fossil solutions. But here's the rub. The construction of that shiny new infrastructure requires not just money, but...energy. And that's the very commodity in short supply. Will we really be willing to sacrifice additional energy in the short term—effectively steepening the decline—for a long-term energy plan? It's a trap!” <http://physics.ucsd.edu/do-the-math/2011/10/the-energy-trap/>

In other words, we need energy, and financial health, to invest in new energy source infrastructure, and if we wait too long, we will fall into the energy trap, and experience widespread collapse of life as we know it. (See also the following link for a more recent and concise explanation of the energy trap.<http://cleantech-nica.com/2014/09/14/energy-trap-world-uae-can-avoid/>)

To conclude this section, multiple sources confer that the distribution area of the NED pipeline will not be providing the demand for the additional gas supply that justifies its construction. Furthermore, this expansion of NG distribution flies in the face of a growing awareness and initiative to veer away from an over-reliance on natural gas while making strides to achieve the NRC's carbon budget to avert climate change disaster.

Foreign Demand for NED Pipeline Natural Gas

Kinder Morgan understands that domestic allocation of NED NG is not adequate to justify the expense and full usage of this pipeline. And, unfortunately, to compound matters, the domestic market is glutted with natural gas, prices have plummeted, and the profit margin is narrowed. It behooves the NG industries to

look for international buyers, where they can exact prices up to four times that of national prices. Nationally, natural gas producers are seeking federal permission from the Department of Energy to ship as much as 50% of their production to foreign markets.

Kinder Morgan is no different in this regard. When Kinder Morgan's President and CEO, Steve Kean, was asked about Northeast supply/demand balance, he replied, "Okay, yeah, so a few things there. I mean one is, again, lower commodity prices do dampen the enthusiasm for making longer term commitments by producers.... quite frankly, we started working on the market side of this. And Ron McClain and his team have been talking to international off-takers who have a different time frame and perspective that they bring to the table." "Kinder Morgan's (KMI) CEO Steve Kean on Q2 2015 Results - Earnings Call Transcript", <http://seekingalpha.com/article/3329175-kinder-morgans-kmi-ceo-steve-kean-on-q2-2015-results-earnings-call-transcript>.

However, there are a few problems with this marketing strategy.

1. According to the Wall Street Journal, in their February 7, 2015 article, Funding Dries up for U.S. Gas Export Terminals, <http://blogs.wsj.com/moneybeat/2015/02/17/funding-dries-up-for-new-u-s-gas-export-terminals/>, "Big international buyers don't feel pressure to sign more long-term contracts. The national utility companies that wanted them have already signed, Mr. Boudrias said. Without more committed buyers, financiers won't step in. They don't want to take the risk that prices can rise enough to support a profitable spot market."

The above is but a reflection of a larger momentum for major investors to divest from the fossil fuel economic sector. Although widespread awareness of environmental urgency fuels this movement, so do pragmatic financial considerations of the risks involved in continued investment in an industry that will be phasing out over the next few decades. As Alan Rusbridger of The Guardian explains, "This is why the divestment movement has changed from being a fringe campaign to something every responsible fund manager can no longer ignore. How could they, when even the governor of the Bank of England, Mark Carney, has warned that the "vast majority of reserves are unburnable" and the bank itself is conducting an inquiry into the risk that inflated fossil fuel assets pose to the stability of the financial system?

When the president of the World Bank, Jim Yong Kim, urges: "Be the first mover. Use smart due diligence. Rethink what fiduciary responsibility means in this changing world. It's simple self-interest. Every company, investor and bank that screens new and existing investments for climate risk is simply being pragmatic." <http://www.theguardian.com/environment/2015/mar/16/argument-divesting-fossil-fuels-overwhelming-climate-change>

2. According to the Natural Gas Act, Section 7a, "public convenience and necessity" is circumscribed to the local domestic market by the following statement:

"... to establish physical connection of its transportation facilities with the facilities of, and sell natural gas to, any person or municipality engaged or legally authorized to engage in the local distribution of natural or artificial gas to the public, and for such purpose to extend its transportation facilities to communities immediately adjacent to such facilities or to territory served by such natural-gas company, ..."

Kinder Morgan's dependence of international off-takers to make the NED pipeline a viable business prospect is at odds with the motives and intents of the Natural Gas Act designed to serve the needs of the domestic public. This should disqualify Kinder Morgan from the Certificate of Public Convenience and Necessity, as well as from the associated empowerment of eminent domain.

To summarize this section, Kinder Morgan's strategy to rely on international off-takers to make this pipeline a viable reality not only risks failure due to the growing disinterest of financiers and foreign markets, but also is in violation of the uses of a Certificate in Public Convenience and Necessity.

Part 2. Environmental and Resident Costs of NED Pipeline.

It is the task of FERC, as we understand it, to balance the need for a pipeline with the environmental and public costs of a pipeline, as the pipeline and associated infrastructure adversely impact environmental and

human health, and has other costs as well. (However, in this balancing act it should be duly noted that Rensselaer County residents have nothing to gain from this pipeline and everything to lose.) This is where the list of concerns gets quite extensive, repetitive across comments, and hence unnecessarily burdensome to the review process. As you have heard all these concerns before, we will keep this listing as abbreviated as possible while once again striving to create the bigger picture to frame the local concerns.

For ease of review, inevitable and unavoidable adverse impacts will be reviewed separately from the risks of accidental adverse events.

1. Pipeline's inevitable and unavoidable adverse impacts.

- **Water:** Rensselaer County is a rural residential region that is heavily dependent upon wells to meet their needs for water.
 - o The very construction of the pipeline, the blasting of bedrock, will disrupt the integrity of our aquifers, establishing extensive contaminant pathways into our ground water. KM expects blasting to result in at minimum temporary disruption to our wells. Blasting, installment of the pipeline, maintenance of the right of way, all involve the use of chemicals detrimental to the quality of our ground water and the health of our residents. Air emissions eventually precipitate to the ground, wetlands, and other bodies of water, and will compromise the health of our waters. Water for pipeline integrity testing will be taken from an EPA Superfund site, The Dewey Loeffel landfill watershed, and spread its contaminants to who knows where, and it will eventually end up in the ground water of our aquifers. The pipeline will pass under the Hudson River, another Superfund site, disturbing sediment and re-releasing contaminants such as PCB's.
- **Land:** The NED pipeline will cut a 100 foot right of way through residential and greenfield ecosystems. It will cut through the Rensselaer Plateau, a treasured forested ecosystem scattered with glacial lakes that residents have gone to extensive measures to conserve. Our treasured scenic environment will be scarred. Wildlife habitat will be irreversibly altered for the life of the pipeline, and perhaps beyond. Construction vehicles will stress our rural infrastructure, roads (many unpaved), culverts, and bridges. The burden of repair will fall upon resident taxpayers.
- **Air:** Mainline valve releases and blowdowns release a soup of chemicals detrimental to health, especially to vulnerable subpopulations, with health challenges such as asthma, COPD, and chemical sensitivities. Dispersal stacks may mitigate local impact, but does not resolve it (as attested by notices to local residents to evacuate or close windows with some blowdowns), and broadcast the impact to further reaches. Nearby agriculture will be affected, and organic farms will likely lose their certification.
- **Light, Noise, and Low Frequency Vibration**, otherwise known as The Hum: The compressor station will be a source of light pollution to the surrounding area. Valve releases and blowdowns are loud and jarring.
 - o The Hum is a low frequency vibration and noise that is emitted by high volume pipelines. A minority of people are sensitive to it, but these people experience serious mental and physical consequences from the hum. The hum is implicated to have affected the mental stability of Adam Lanza in the years and weeks before he murdered his mother and then went on to Sandyhook Elementary School where he fatally shot 20 children. Adam Lanza lived only 1500 feet from a high volume pipeline. For a more thorough understanding of "the pipeline syndrome", read the links below. The hum is becoming a subtle, elusive, but very serious environmental stressor. <http://newtownbee.com/node/183812>, <http://mic.com/articles/91091/a-mysterious-sound-is-driving-people-insane-and-nobody-knows-what-s-causing-it>

2. Risks of accidental impact events.

It is appreciated that the regulatory provisions and pipeline construction companies do everything they can think of to make the pipelines as safe as is possible. Pipeline transport of NG compared to other modes of

transport is relatively safer in that fewer accidents occur, but the accidents that do occur create more widespread and long term damage. And while the probability of an accident involving pipeline infrastructure is low, there are nonetheless hundreds of pipeline spills and ruptures a year over this country's over 2.5 million miles of pipeline. <http://www.propublica.org/article/pipelines-explained-how-safe-are-americas-2.5-million-miles-of-pipelines>

Considering the number of things that can go wrong in the construction and wear of a pipeline, keeping the number of accidents down to a few hundred a year is a remarkable achievement. In other words, accidents WILL happen. This document by the U.S. Department of Transportation Pipeline and Hazardous Materials Safety administration (PHMSA), discusses innumerable factors that can go wrong, from the pipes' creation in steel mills to pipe installment. Construction companies have the responsibility of assuring the qualification of both workers and their inspectors, which is yet another variable in pipeline safety. <https://primis.phmsa.dot.gov/construction/faqs.htm>

Sooner or later, pipelines WILL corrode, no matter the precautions. Once again, the number of variables impacting pipe corrosion are many and intractable. The following two links explain the science of pipeline corrosion.

<http://corrosion-doctors.org/Pipeline/Internal-corrosion.htm>, <https://www.emlab.com/s/sampling/2010-11-Corrosion-Gas-Pipes.html>

That the proposed NED pipeline is designated to share right of way with high voltage electric transmission introduces another source of pipe corrosion from AC discharges.

"Installing pipelines in energy utility corridors containing high voltage AC transmission lines subjects the pipelines to induced AC voltages. This can be caused by an imbalance in the transmission system, and by high voltages near transmission grounding systems resulting from lightning strikes and phase faults." (Transmission line EMF interference with buried pipeline. M.H. Shwedi and U.M. Johar, Electrical Engineering Department at King Fahdu of Petroleum and Minerals, Dhahran, Saudi Arabia.)

3. Additional concerns that need to be addressed:

- **Comprehensive Health Impact Assessment is needed:** While FERC's natural gas pipeline system infrastructure project review process encompasses environmental impact analysis, it does not encompass a comprehensive health impact assessment. It should. We think this is vital.
- **Cumulative Effects:** We second the comments by New York State Senator Jim Seward on June 30, 2015, in which he urged FERC to reject this project on cumulative impact grounds, noting that the project, coming on the heels of the proposed Constitution Pipeline, would make the region a natural gas pipeline "highway" that is "not in harmony with what residents want or support." "The cumulative effect of multiple pipelines through portions of [New York's] Delaware and Schoharie Counties should be reviewed by FERC. It is not unreasonable to project that multiple pipelines would place arithmetically higher pressure on public infrastructure and public services, land values and the environment. This 'multiplier' effect should be evaluated carefully. ... [L]ong-term environmental and safety costs can also be anticipated. If the Kinder-Morgan project is given federal approval, none of these expenses should be the responsibility of local property taxpayers who are receiving absolutely no benefit and being forced to assume all of the risks associated with the unwanted pipeline."
- **Frost lines:** An additional source of risk to pipelines in the frigid Northeast are frost heaves. These pipelines are not buried sufficiently deep to avoid this risk.

Summary

In summary, Kinder Morgan's proposed NED pipeline does not meet the conditions for a Certificate of Public Convenience and Necessity due to the current lack of need for this gas along the pipeline's domestic distribution network, and because of the anticipated decline in reliance on natural gas due to the on-going shift to alternative energy sources that is necessary to avert climate change disaster. Kinder Morgan's specu-

lative foreign market is not a robust prospect due to investment trends and market unreliability. In addition, international distribution of NED pipeline natural gas violates the Natural Gas Act section 7a stipulation that the gas will be transported for local use and need. Our conclusion is that a strong case cannot be made for the necessity of this pipeline.

As for the costs of the pipeline incurred by the environment and the residents along its path, our conclusion is that there are many significant adverse impacts that are an unavoidable part of pipeline construction and usage. It is also our conclusion that accidents WILL happen, and that its impacts can be catastrophic. Knowing all of this, the most precious thing that residents along its path will lose is peace of mind. And they will not benefit in any manner.

We once again thank you for taking the time to read our scoping comments and look forward to seeing how they will be addressed.

Sincerely,

Stop NY Fracked Gas Pipeline

20151016-5402

TOWN OF LENOX
TOWN MANAGER'S OFFICE
6 Walker Street, Lenox, MA 01240

Christopher J. Ketchen,
Town Manager
cketchen@townoflenox.com
413) 637-5500 (x1201)

Ms. Kimberly Bose, Secretary

Federal Energy Regulatory Commission (FERC) 888 First StreetNE, Room 1A
Washington DC, 20426

October 16, 2015

Dear Secretary Bose,

The Town of Lenox is submitting formal comments in response to the identification of the Proposed Northeast Energy Direct Massachusetts Alternative Route as one that would take the same path and cause the impacts to our resources in Lenox as the original pipeline path which the Town so vehemently opposed in 2014.

The community is gravely concerned about the impacts to our sole public water resource, Upper and Lower Root Reservoir and its feeder stream, Lenox Mountain Brook. It is also concerning that the proposed alternate route would transect lands special to the residents of Lenox and the hundreds of thousands visitors who profit the community annually: Kennedy Park, the Massachusetts Audubon Society Pleasant Valley Sanctuary, October Mountain State Forest, and the George L. Darey Housatonic Valley Wildlife Management Area.

An ongoing challenge Lenox faced by Lenox is the EPA mandated Rest of River cleanup of the Housatonic River. This is a massive project which will last years, excavate and disturb large areas of land along the Housatonic River. This work would directly intersect with the alternate pipeline path. The confluence of both projects would be a confluence of risk and negative impacts to our natural resources in the river corridor as well as the private properties that will be impacted by both projects.

Lenox has taken legal steps to protect its lands and resources from the Northeast Energy Direct, through the placement of a Conservation Restriction on its watershed land, and the formal acceptance of all watershed lands under Article 97. We empathize with the Berkshire and New England communities still facing the pipeline challenge, and will continue to comment on the desultory impacts of development such as the pipeline on our shared Berkshire interests: the landscape, the natural resources, and the cultural and historic institutions which draw visitors from all over the world, making tourism a backbone of our local and regional economy.

Sincerely,

FERC Public Comment Period: October 16, 2015

Introduction

The Town of Lenox is directly impacted by the Northeast Energy Direct Project's Massachusetts Alternative route. The concerns for Lenox extend to other communities and conservation lands on both the alternative and preferred routes. The alternate route proposed would cut through the Lenox watershed land near its Upper and Lower Root Reservoirs and Lenox Mountain Brook, an Outstanding Resource Water which feeds the reservoirs. This brook is a protected waterway under the Massachusetts Surface Water Quality Standards and provides drinking water to thousands of residents in Lenox. The land is also unique for the intact nature of the forest and habitat it provides for species of state-listed concern. The alternate route would also cut directly through an Area of Critical Environmental Concern (ACEC), the Upper Housatonic ACEC, which encompasses land area around the Housatonic River in Lenox's eastern valley. Not only would the alternate route potentially impact the ecological integrity of special natural areas and impact the quality of Lenox's sole public water source, it also has the potential to impact places in Lenox that are important to an integral activity of the local and regional economy: tourism, hospitality and recreation/leisure activity.

While some of the resources and impacts described in this document are specific to Lenox, some are general and will be felt by any community, be it in the Berkshires or in southern New Hampshire, impacted by the Northeast Energy Direct Project's route. The Town of Lenox is empathetic to those towns now in the pipelines path, whose conservation lands, watersheds and aquifers which supply their own water sources are now in peril.

The alternative path identified in the project enters Lenox at approximately 73°19'17.713"W 42°22'57.222"N and exits Lenox at approximately 73°13'22.373"W 42°23'50.231"N. The six (6) mile long segment and its associated 1/4 mile buffer through Lenox would create a swath of 1,760 acres.

This document describes the resources that would be impacted by the proposed alternate route and describes the direct conflict between the proposed alternate route and ongoing planning and management efforts of Lenox.

Inventory of Lenox Resources

Root Reservoirs and Lenox Mountain Brook Watershed Land

Perhaps the most important resource in Lenox to be affected by the alternate pipeline route is the town's sole public drinking water supply, Upper and Lower Root Reservoir. These water supplies are fed by Lenox Mountain Brook, and are protected by approximately 996 acres of land owned by Lenox and governed by a conservation restriction (CR) held jointly by regional land trust Berkshire Natural Resource Council (BNRC) and the Lenox Conservation Commission. The land and water resources are additionally cushioned by conservation land owned and managed by BNRC and the Massachusetts Audubon Society (MAS). The watershed property itself contains over 90% of the topographic watershed of both the Upper and Lower Root Reservoirs. It also includes 200 acres of land not in the reservoir watershed but which is home to historic reservoirs that could one day provide an alternative or new water supply to the Town of Lenox.

The watershed land itself commands a scenic and secluded location on Lenox Mountain. The majority of the property is forested. The area not forested is open water—the two reservoirs – and the cleared areas around the reservoirs includes the water treatment facility. The land is primarily forested with northern hardwoods and oak-hardwoods timber types. There are a few substantial stands of hemlock-hardwoods and small (less than five acres) stands of almost pure evergreens which include Norway spruce, red pine and white pine.

Lenox Mountain Brook and the Root reservoirs have a 400' buffer area within which public access is re-

stricted to protect water quality. Passive recreation is allowed within the watershed boundary but is limited to non-motorized uses. In fact, a person could begin hiking at the southern end of Lenox Mountain and hike Yokun Ridge on Lenox Mountain to Pittsfield, passing through the Lenox watershed land. In this way, the property provides not only clean drinking water to residents, it is also part of a larger land conservation network and recreation system that transcends municipal boundaries and creates a special place beloved by locals and the Berkshire region.

Ninety percent of Lenox residences use town water. The water quality is excellent, with minimal water treatment necessary. The water supply in Lenox is ample, with an average daily demand of 300,000 gallons and peak daily demand of about 700,000 gallons. In the last two years, the Town has taken strong measures to permanently protect the watershed land as both a drinking water supply and as a place of conservation and recreation through the adoption of a Conservation Restriction held both by the Lenox Conservation Commission and BNRC and by ensuring that all watershed land is protected under Article 97.

The size and ecological integrity of the watershed property is evident in data collected by the Massachusetts Geographic Information System (MassGIS), and the Natural Heritage and Endangered Species program of Fish and Wildlife.

- **The watershed property provides habitat for three state listed species and several potential vernal pools¹:**
 - o Eastern Veined White Butterfly *Pieris Olceracea*,
 - o Wood Turtle *Glyptemys insculpta*,
 - o Jefferson Salamander *Amystoma jeffersoniana*
- **The watershed property is classified entirely as BioMap Core Habitat² for**
 - o Twenty two (22) rare plant species,
 - o Two (2) rare invertebrate species,
 - o Eight (8) rare vertebrate species and
 - o Four (4) exemplary natural communities
- **The watershed property includes upland forest identified as Forest Core³ in Bio Map²,**
 - Meaning the area is one of the best examples of large, intact forests least impacted by roads and development providing critical habitat for numerous woodland species”.
- **The area is classified as a Living Waters Critical Supporting Watershed⁴**
- **The area is a central portion of a 4,100 acre block of lands on Lenox Mountain long the object of land protection efforts for over fifty (50) years⁵.**
 - The area is adjacent or in close proximity to 770 acres of protected conservation land owned by BNRC; 1,291 acres owned by the Massachusetts Audubon Society, and another 565 acres known as Kennedy Park owned by the Town of Lenox, creating a large swath of protected conservation land in the heart of the Berkshires;
- **A portion of the premises are located in an area designated as Scenic Landscape in the MassGIS⁶,** meaning that the landscape is of important visual quality in the Commonwealth.

The large-scale deforestation, excavation and likely blasting required for the NED pipeline to traverse this small watershed and its main feeder stream pose serious risks to the Lenox water supply and the natural resources described above. Any contamination by a toxic substance during either construction—from fuel oil or hydraulic fluid, for instance—or due to the pipeline’s leaking or failure, would be catastrophic.

Kennedy Park

Owned by the Town of Lenox, Kennedy Park is the former site of a historic grand hotel. The park connects to the MAS lands as well as the Town’s watershed property and is part of the long swath of protected open space, which includes Lenox Mountain, along the western flank of Lenox. The park hosts a trail network

that encourages walking, hiking, mountain biking, cross country skiing and equestrian use throughout the year. Kennedy Park is also noted by the Natural Heritage and Endangered Species Program of Mass Fish and Wildlife to host habitat for rare animals and rare plants. The Massachusetts Alternative route would use the town park's main access trail, destroying the trail's natural, forested surroundings and canopy, and there, destroying a large part of the park's appeal, which is an attraction to residents and tourists alike.

Massachusetts Audubon Pleasant Valley Sanctuary

Along the slopes of Lenox Mountain, Mass Audubon manages approximately seven (7) miles of varied trails winding through forests, meadows and wetlands. The area is a draw to not only residents who appreciate the ongoing education and gentle hiking opportunities but also to visitors looking to experience a true natural sanctuary. Since 1947, the sanctuary has provided a nature camp which introduces children to the Berkshire landscape and environment, creating lifelong stewards of special places such as Pleasant Valley and Kennedy Park.

Upper Housatonic ACEC

Areas of Critical Environmental Concern (ACEC) are places in Massachusetts with special recognition because of the quality, uniqueness and significance of their natural and cultural resources. ACECs are identified and nominated at the community level, and reviewed and designated by the state's Secretary of the Executive Office of Energy and Environmental Affairs. This designation creates a framework for local and regional stewardship requiring stricter environmental review of specific types of proposed development under state jurisdiction within the boundary of an ACEC.

The Upper Housatonic River ACEC is the only ACEC which spans land in Lenox. The majority of land area within this ACEC is in Lenox. This resource management area encompasses the thirteen (13) mile corridor of the Housatonic River from southern Pittsfield into northern Lee and some area of Washington. This area encompasses a multiplex ecosystem of the river, adjacent wetlands and floodplains, cold water tributary streams, large areas of wildlife and rare species habitat, and the steep, forested, western slopes of October Mountain State Forest, the largest state forest in Massachusetts. According to the Department of Conservation and Recreation, this wildlife habitat offers regionally significant biodiversity, with thirty-two (32) rare species, forty-six (46) certified and potential vernal pools, and 11,405 acres, or 93% of the area, delineated as viable habitat by the Division of Fisheries and Wildlife's Natural Heritage and Endangered Species Program. The corridor has more than 21 river miles of Coldwater Fisheries, providing breeding habitat and populations of native brook trout and other fishery resources totaling roughly thirty (30) fish species. Common wildlife in the area includes bobcat, coyote, deer, bear and moose.

The 2009 ACEC designation identifies the wetland resources within the Upper Housatonic River ACEC as important to the protection of groundwater and public water supply, the prevention of pollution, flood control, the prevention of storm damage, and the protection of fisheries and wildlife habitat. In the process of designation, the state received 136 comments, 114 of which were in support of the designation. Along with the natural biodiversity and ecosystem complex, the area includes historical and archaeological resources, farmland, open space, scenic and recreational areas.

October Mountain State Forest

The largest state forest in Massachusetts at 16,500 acres, October Mountain State Forest provides hiking and camping opportunities. The Appalachian Trail cuts through the park. The state owned property forms the eastern boundary of Lenox. Views from Washington Mountain encompass a great portion of Lenox and the Housatonic River. It is a popular area of recreation for Lenox residents and visitors: trails for all levels of users. Hiking, mountain biking, boating, and skiing are included among the non-motorized activities encouraged at the park.

G. Darey Housatonic Valley Wildlife Management Area

Eight hundred and eighteen acres shared between Lenox, Lee and Pittsfield along the Housatonic River

provides hunting opportunity for sportsmen in Lenox and beyond. The area is stocked with pheasant, waterfowl, aquatic furbearers, woodcock, deer and other nongame, lowland habitat species.

Housatonic River Watershed Priority Conservation Areas (PCAs)

Between 2008 and 2009, NHESP identified Priority Conservation Areas throughout the Housatonic River watershed, several of which are in Lenox and within the buffer area of the original pipeline route. The Housatonic River watershed is considered one of the most biologically diverse areas in Massachusetts, home to plants and animals uncommon and found nowhere else in the Commonwealth.

The survey also identified town conservation priority areas. The PCAs are areas containing especially high concentrations of state-listed species and priority natural communities located in close proximity to relatively intact natural landscapes.

Additional information can be viewed in Appendix B, “The River and Its Valley: Conserving Biodiversity in the Housatonic River Watershed of Western Massachusetts”; “Guiding Land Conservation for Biodiversity in Massachusetts: Lenox”; and “Conserving the Biodiversity of Massachusetts in a Changing World: Lenox”

Tourism in Lenox

Lenox is a destination. Tanglewood, Edith Wharton’s The Mount, Shakespeare and Company, and the Morris Frelinghuysen Home and Studio, along with many other institutions, provide historic and cultural attractions. Inns and hotels provide quality accommodations and hospitality services to guests and employment to residents. The strongest industry in Lenox is Leisure & Hospitality. This sector is also an important economic driver regionally. The Berkshire Visitors Bureau and State office of Travel and Tourism estimates that in 2013, the total direct visitor spending county wide totaled \$403,000,000. They estimate further that Lenox accounts for 40% of this total, or \$161,200,000. This is generated through public transportation, lodging, food service, entertainment/recreation and retail, as well as automobile. Lenox alone provides approximately 24% of accommodations throughout the county. Annual Tanglewood visitation is about 300,000 visitors a year. The scenic landscape and number of recreation amenities in Lenox provide a backdrop to the cultural activities that is unique and makes many visitors return to the area and decide to live here. The alternate pipeline route is not the only threat to the main economic engine of Lenox. In the near future, Lenox will bear the brunt of the EPA mandated Housatonic River restoration. This work, while necessary, will impact municipal services such as our roadway quality and will also impact the use of adjacent recreation and conservation properties, and the value of residential properties along the river restoration work.

Ongoing Planning and Management Efforts

The alternate route through Lenox is not compatible with existing planning or management efforts related to the Lenox watershed land, nor the Upper Housatonic River ACEC. It is in direct conflict with the vision, goals and objectives identified in the Lenox Open Space and Recreation Plan.

The Lenox Comprehensive Master Plan (1999)

The vision crafted for the 1999 Master Plan states that the town, when faced with change, should strive to “Guide the development, enhancement and conservation of the town to create a more diverse yet tightly woven community that pride fully sustains its rich cultural base and excellent amenities as it meets the economic and social needs of present and future residents”. It highlights the distinct aesthetic and natural beauty formed by the town’s extensive forested areas, mountainous topography, pastoral lands and wetlands which are treasured by residents and draw visitors, new residents, institutions and businesses to Lenox.

To achieve its stated vision, it identifies the following goals, all of which are in direct conflict with the proposed alternative route through Lenox:

- The preservation of Lenox’s outstanding historical, cultural and visual resources
- Meeting community needs while promoting cultural tourism as a vital part of the economy
- Preserve communal qualities and enrich opportunities for social diversity and interaction among the

population and with nature

- The provision of varied recreational opportunities to serve all ages, physical conditions and interests of year-round and summer residents
- Maintain the local business and employment base
- Promote and support a strong local and regional base of tourism
- Maintain a viable system for cost effective delivery of high quality drinking water
- All water resources areas related to public health and safety are preserved and protected
- Valuable diversity of plant and wildlife habitat and other ecologically sensitive areas are protected
- Lenox's outstanding historical, cultural and visual resources are preserved
- Kennedy Park is well preserved as a multi-use recreation/conservation area
- When development does occur, strong efforts are made to protect the environment from adverse impacts.

The Lenox Community Dialogues (2006)

In 2006, the Town organized visioning workshops to determine community priorities for growth and change. Participants frequently identified the continued protection of Lenox's semi-rural environment, including ridge lines and vistas. Attention was also paid to how development and growth could impact the quality of the Town's water supply.

The Lenox Open Space and Recreation Plan (2013, Approved 2015)

The most recent planning initiative identifies Root Reservoir as the sole public water supply in Lenox. A primary goal of the OSRP is to:

- Protect water resource areas
- Protect plant and wildlife habitats
- Protect critical visual and historic resources

An objective of the most current OSRP is to eliminate and reduce the threat of invasive plants within Lenox. An ongoing and grave concern to the Town is the presence of Hardy Kiwi in Kennedy Park. This plant dominates areas in which it has colonized, crowding out any native plant. The clearing of a right of way for the pipeline would create an area vulnerable to the spread of Hardy Kiwi as well as listed invasive plants such as Japanese Knotweed, Multiflora Rose, Bittersweet and Barberry, plants which have been identified in lands adjacent to the watershed property.

A second item discussed in the OSRP is the ongoing Rest of River clean up proposed by the US EPA. This immense excavation of miles of the Housatonic River is designated to mitigate the river's PCB contamination caused by General Electric. The operation is multi-year. At its commencement and through its implementation, will unavoidably intersect with the NED pipeline the Town of Lenox. As of October 2015, the Town of Lenox has received no insight or information regarding how this intersection of two large-scale excavation and construction projects, one involving a high-pressure natural gas pipeline would be addressed.

A third item identified in the OSRP is the large, undeveloped block of land in the north-center of Lenox which is currently unprotected. The plan suggests protecting this area with a link from Route 7/20 to the floodplain on East Street, due to this area's tremendous value as a wildlife corridor. It links large, forested area to the west with wetlands along the Housatonic River and October Mountain. This area includes core habitat surrounding two vernal pools.

The Lenox Watershed Forestry Management Plan (2015)

The watershed management plan names a number of goals for its management in response to the unique and special natural resources and public water supply:

- The retention of unique forest areas through sustained forest product yield and management
- The maintenance of the watershed property as a protected area preserving functional watercourses, wetland and wildlife habitat with the retention of riparian ecosystem
- The maintenance of a healthy wildlife habitat to retain or create desirable features including riparian habitat, wildlife cavity trees, mast availability, logs and brush for shelter, vertical and horizontal diversity, vernal pools, coarse woody debris and features species management.
- The ongoing identification and protection of important, functional ecosystems which support rare plant and animals.
- To minimize or eliminate the use of pesticides and fertilizers, and when used, to do so in compliance with state, local and federal laws and regulations.
- The reduction or elimination of non-native plants with invasive tendencies.
- The maintenance of the property's aesthetic quality to maintain or enhance the scenic and/or monetary value of the watershed land.

Norma Traffie, New Ipswich, NH.

I have read many of the comments already posted and don't really feel the need to reiterate what has already been said and proven. I feel that this project does need to be evaluated. I am not in favor of the gas line and think that there are several other options that could be done instead. This is very close to the house I am living in and don't want to be concerned about my well water, the fracking that could/would be taking place and any possible leaks.

Please consider other options for moving our state forward instead of a gas line that could be solved with a myriad of other options.

Re: Docket #PF14-22-000

Dear Members of the FERC Commission:

I am a land owner in southern New Hampshire, and the proposed pipeline will transverse my property.

I do not live in New Hampshire, and if I saw any indication that this pipeline would benefit my New Hampshire neighbors, or other residents of southern New Hampshire in any significant way, I would not comment; but I see no such evidence.

My family purchased this property back in the 1870s, and farmed and raised timber on it for many years. As a teenager in the 1960s, I spent many hours helping my Grand Uncle (then well into his 80's) tend the hundreds of pine trees he had recently set out for the use and enjoyment of future generations. We were taught that this was a legacy we all owed to the future. I am quite certain he did not envision that we were preserving it for a future gas pipeline.

In the years since, my sister and brother and I have purposely left the property vacant in field and woods. We thought this was a good investment in the future of the environment. We do not view this property as an economic investment, but instead view it as an investment in the beauty and resources of the Monadnock Region, and in our family's history. The air is still clear, and you can actually still smell the pines and the other aromas of nature. The water is generally fresh and clean. You can still arise in the morning and have a variety of birds serenade you. As Thornton Wilder said about the Monadnock Region in the iconic play "Our Town": "Things around here don't change very much." With the coming of the pipeline, all things are

likely to change significantly.

From all that I have read, our property, which is mostly ledge rock in the pipelines route, will be blasted to kingdom come. The air will be subject to releases from the nearby compressor station, the water table will be in peril, and significant noise will be generated by the compressor station day and night. The gas pipeline will run adjacent to a power line, which presents its own set of perils.

And for what purpose is all of this environmental sacrifice being made? It appears it is to allow the transport of gas across the region and exported in one fashion or another for the use of others. Only recently has the company proposed some accessibility to a few towns on the eastern side of the New Hampshire portion of the pipeline route, in what appears to be a last minute response to the objection that the pipeline doesn't serve the region. How has a need been established that will justify the use of eminent domain, and the future environmental impact on this region?

This may serve as three lessons to all who own property in rural areas: 1) don't leave it vacant of development, or it will be viewed as an easy and convenient route for any utility; 2) don't donate your land to any environmental preservation organization either, since big corporate interests have no hesitation to seize their properties with impunity; 3) if you want to own rural property, make sure it is in a very wealthy area, where you and your neighbors can afford to fend off large business and government interests. If it is in a less wealthy area, you will be an easy target.

Finally, Kinder Morgan stopped contacting me after its very first contact. I suppose I will be required to contact KM myself.

Please reject the application I Docket #PF 14-22-000.

Sincerely,

Bernard T. Martin, Jr.

20151016-5409

Patricia H. Silvestro, Temple, NH.

Comment on FERC Docket PF14-22-000

Dear Secretary Bose:

Temple is one of many towns in southern New Hampshire that is situated in a heavily forested area of the state. It's a spectacularly beautiful area, especially during autumn's peak foliage season. My home is nestled among white pine, maple, oak, ash, birch, hemlock, and poplar trees that provide shelter to numerous wild-life species.

In the event there is a fire as a result of a pipeline or compressor station accident, our town's volunteer fire department does not have the manpower to conduct an evacuation, never mind deal with a raging forest fire. Loss of life is certain, especially when taking into account the close proximity of the pipeline/compressor station to the Temple Elementary School. Are these young children expected to outrun a fire? What about the loss of homes, property, and businesses, not to mention wildlife and domesticated animals?

We are expected to play Russian roulette with our lives for K/M's benefit. FERC, do the right and moral thing and deny approval for the NED pipeline/compressor station project.

Patricia H. Silvestro

**AMC APPALACHIAN
MOUNTAIN CLUB**

October 16, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission

888 First St NE, Room 1A
Washington, DC 20426

Re: Docket No. PF14-22-000, Tennessee Gas Pipeline Company, L.L.C., Northeast Energy Direct, EIS Scoping Comments

Thank you for the opportunity to provide comments in response to the Notice of Intent to prepare and Environmental Impact Statement for the proposed Northeast Energy Direct (NED) project.

The Appalachian Mountain Club (AMC) is the oldest conservation and recreation organization in the country, with 150,000 members, supporters, and advocates from Maine to Washington, DC. Our mission is to promote the protection, enjoyment, and understanding of the mountains, waters, forests, and trails of the Appalachian region. Because successful conservation depends on active engagement with the outdoors, we encourage people to experience, learn about, and appreciate the natural world.

AMC maintains over 1,800 miles of trail throughout the northeast, including the Massachusetts portions of the Appalachian National Scenic Trail (A.T.) and New England National Scenic Trail (NET) that would be affected by the NED project as it is currently proposed. AMC also collaborates in the maintenance of New Hampshire's Metacomet-Monadnock Trail, which is connected to the NET at the New Hampshire border, and which would also be crossed by the NED project. AMC collaborates in the management of the Bay Circuit Trail in Massachusetts and had a historical role in the establishment and maintenance of New Hampshire's Wapack Trail, both of which would also be crossed by the NED project as it is currently proposed. AMC also has over 30 years of experience researching the effects of air pollution and climate change on the northeast environment and hiker health.

AMC is concerned about the suite of impacts the proposed Northeast Energy Direct project would have on protected lands, nationally and regionally significant recreational resources, air quality, and climate. It is important for the Environmental Impact Statement (EIS) to include a review of the full scope of this multi-state project, including connected actions, cumulative actions, similar actions, as well as direct, indirect, and cumulative impacts as defined by 40 CFR Sec. 1508.25.

The importance of scope under NEPA is especially apparent when considering a project that crosses borders such as this pipeline project. The impact in one individual state may not be large but cumulatively across states the impact on land, water, regional air quality, and/or climate could be substantive. For example, states have mechanisms to address in-state emissions under federal Clean Air Act (CAA) regulations but this capacity is more limited for addressing out of state sources. Therefore NEPA is an important federal program that can and must address the cumulative impacts across the full aerial extent of the project.

AMC's comments on the scope of the EIS below are comprised of two components below and on the following pages: (1) land and direct impacts to recreational resources, and (2) air quality and climate impacts.

1. Project Scope with Regard to Land and Direct Impacts to Recreation Resources

It is the policy of the AMC that public interest lands in our region should be the choice of last resort for energy and energy transmission projects that would create long-term adverse impacts to the ecological, recreational, and scenic values of these lands. Specifically, these values include managing for natural ecosystem and backcountry recreation values, preserving forests for their carbon sequestration abilities, providing 'reserves' that could serve as refugia for ecosystems to adapt to climate change or provide resilience to the impacts of climate change, and protecting recognized outstanding scenic characteristics. When large-scale energy projects occur on these lands, there must be no reasonable alternatives available.

The pipeline route as currently proposed would impact several significant recreational resources managed by AMC, including:

- Would cross the Appalachian Trail in Dalton, MA with disturbance very near, if not impinging upon, the Crystal Mountain Campsite.
- Would cross the New England National Scenic Trail (NET) twice in Northfield, MA and a compressor station and mainline valve/remote blowoff is proposed to be located in Northfield, MA just .75 mile

south of the NET's 4-season Richardson-Zlogar cabin that is heavily used for its unparalleled views of Mt. Ascutney (VT), Mt. Monadnock (NH), and Mt. Wachusett (MA).

- Would cross the NET several times in Bloomfield, Farmington, Simsbury, and West Hartford, Connecticut.
- Would cross the Metacomet-Monadnock Trail in New Hampshire's Rhododendron State Park
- Would cross the Bay Circuit Trail in Andover and Middleton, Massachusetts
- Would impact more than 100 parcels of land in Massachusetts that have been "protected" by public and private entities. At least 85 of these parcels are protected by Article 97 for the Massachusetts Constitution, which states that, "The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose."
- Would impact nearly 50 properties in New Hampshire that have been protected by a combination of private and public entities for public conservation values, including but not limited to forest habitat, water quality, and recreation.

AMC therefore urges FERC to review and evaluate the following impacts as part its EIS:

- Full review of impacts to recreational resources and the user experience, including the impacts to water supplies at overnight sites (on the Appalachian Trail and New England Trail for example) and the impacts of noise, lights, and visual blight associated with the proposed compressor station location in Northfield, which is near a New England Trail overnight sight that was created with federal funding and has become a popular overnight destination.
- Review of cumulative impacts to long-distance trails; the Tennessee Gas Company's Resource Report 8 "Land Use, Recreation, and Aesthetics" section 8.4.1.7 incorrectly states that there is one crossing of the New England Trail. In fact there are two crossings of the NET in Massachusetts, as was confirmed by AMC in a meeting with TGP as recently as 7/23/15. The project would cross the New England Trail a total of five times in Massachusetts and Connecticut. The impacts to the Appalachian Trail would contribute to impacts associated with approximately one dozen proposed and reasonably foreseeable projects on the A.T.
- Review the extent to which expanded corridors will exacerbate problems and associated impacts of uncontrolled access by all-terrain-vehicles associated impacts to trails and conserved habitat areas that are inappropriate for ATV use. For example, illegal ATV use is already problematic in the area of the proposed A.T. crossing and the adjacent Chalet Wildlife Management Area. ATV traffic would likely increase if the existing utility corridor is widened, particularly where it crosses roads to the east and west of the A.T.
- Impacts to the Metacomet-Monadnock Trail in New Hampshire. This section of trail is a critical link between the New England National Scenic Trail and the Monadnock Sunapee Greenway, which then connects with the Sunapee Ragged Kearsage Greenway, together connecting Long Island Sound to popular natural features in New Hampshire. Although a volunteer stewards of the Metacomet-Monadnock Trail met with a TGP representative on April 28, 2015 to convey information about the trail and discuss potential impacts, there is no mention of this trail or the potential impacts in the July 24, 2015 Resource Report 8 "Land Use, Recreation, and Aesthetics."
- Review alternatives based on a premise that permanent protection of land under the terms of Article 97 of the Massachusetts Constitution should be upheld, including conservation land adjacent to existing utility rights-of-way.
- Include alternatives to locate the pipeline within utility rights-of-way rather than adjacent to them, and review the full impacts of installing and operating pipelines in and along these corridors that may be

far greater than the impacts of the existing transmission towers. The Tennessee Gas Pipeline Company proposes to align much of the pipeline's route next to existing corridors in undeveloped areas despite the technical feasibility of constructing the pipeline within the ROW. The expanded impacts to the habitat and recreational resources should be thoroughly evaluated against other alternatives.

- Evaluate the full value of the conservation lands that would be impacted. Significant public and private investment has been applied with deliberate intention to the lands for their ecological, cultural, and recreation values that now appear to be viewed as a “path of least resistance” in direct conflict to the intentions of the investments in protecting these lands. The evaluation should also reflect the value of the ecosystem services that would be impacted as part of the project. For reference, a 2013 report by the Trust for Public Land, “The Return on Investment in Parks and Open Space in Massachusetts,” found that every dollar invested in land conservation returns \$4 in value of the natural goods and services associated with clean air and water, recreation and tourism, and fish and wildlife habitat.¹
- Include proposed mitigation in the Draft Environmental Impact Statement, as opposed to being developed at a later time, so it can be subject to full public review for its nexus and adequacy relative to the proposed project's impacts.

2. Project Scope with Regard to Air and Climate Impacts

AMC believes FERC must consider all of the “connected,” “cumulative,” “similar,” and “reasonably foreseeable future” actions of this project not only to lands, waters, and recreation, but also with regards to air quality and climate impacts because air pollutants are not restricted to the boundaries of the direct project area and air and climate impacts can incur from direct, indirect, and cumulative actions.

The Council on Environmental Quality (CEQ) recently issued a Revised Draft Guidance for Greenhouse Gas Emissions and Climate Change Impacts² that recognizes the challenge of addressing greenhouse gas impacts for projects that fall under NEPA but also provides a useful roadmap for decision-making in regards to a project's potential impact to climate forcing. The AMC commented in support of this guidance and recommended further strengthening of it.

While the EIS should cover all related regulations under which the project is subject to review, they should not dictate or limit the full scope of the EIS, particularly for cumulative hazardous air pollutant and climate impact analysis. For example, the Clean Air Act (CAA) has a definition of “major sources” under the oil and gas National Emissions Standards for Hazardous Air Pollutants (NESHAP) for natural gas transmission and storage. That definition of major source is used to determine if the project falls under CAA regulations but should not be used to limit FERC's consideration of what is included in a hazardous air pollutants impact analysis under NEPA from this project. We believe this distinction in defining scope of a project under NEPA is particularly important for both air pollution and climate impacts. States have mechanisms to address in-state emissions under federal CAA regulations but this capacity is more limited for out-of-state sources. Therefore NEPA is an important federal program that can and must address the cumulative impacts across the full aerial extent of the project.

FERC should consider alternative locations to the current proposed pipeline corridor and specifically consider siting locations that are not upwind of nonattainment or maintenance areas for the 8-hour Ozone, or Fine Particulate Matter, National Ambient Air Quality Standards (NAAQS). Further discussion of downwind impacts to recreational areas is discussed below.

Air and Climate Cumulative Impacts

We urge FERC to require a thorough cumulative impact analysis of the air and climate impacts of this project. The definition of a cumulative impact can be found in 40 CFR §1508.7 and is as follows:

...the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

FERC should not limit the impact analysis to the transmission and storage segment of the proposed project but to all connected actions such as upstream production. This graphic shows the full natural gas system from production to distribution. Beyond direct impacts this project will facilitate more natural gas production and processing as well as increase distribution. The cumulative air quality and climate impacts from these connected segments must be considered.

{illustration omitted}

Air Pollution Impacts

Because hikers, joggers, bikers, paddlers, and other people who spend time exercising in the outdoors risk increased exposure to air pollution such as particulates, ozone, and other hazardous air-borne substances which threaten their cardiovascular and pulmonary health, AMC urges FERC to examine potential air quality degradation from this project in relation to health impacts to these user groups and to the general public, both independently and cumulatively along with other projects with open FERC dockets. Potential air pollution associated with the natural gas pipelines includes methane, ethane, benzene, toluene, xylene, nitrogen oxides, carbon monoxide and secondary ozone and fine particulate formation from the compressor station and pipeline; as well as diesel emissions from construction vehicles. NOx and VOCs contribute to ozone formation downwind of the source emissions. The project's proximity to numerous recreation trails and areas makes these areas vulnerable for increased levels of ozone pollution. This is particularly dangerous for children and young adults who have higher ventilation rates.³ Further, ozone can also be harmful to plants and forests, causing oxidative stress, disrupting carbon sequestration capacity, water resource allocation efficiency, and prematurely browning leaves.

The added ozone precursor emissions from this project may push a number of counties along the pipeline route into non-attainment, even without the additional emissions of VOCs and NOx which would be contributed by this project. EPA recently lowered the current ozone National Ambient Air Quality Standards (NAAQS) from 75 to 70 ppb but impacts, to both human health and plants, are still likely at levels between 60 and 70 ppb. EPA decision should not limit FERC's consideration of the scientific literature and the Clean Air Science Advisory Committee's recommendation to EPA that the standard should be between 60 and 70 ppb and that the lower end of this range is most protective of people and plants at risk from ozone pollution.

We are also concerned about the project's proximity to rural landscapes frequented for outdoor recreation, where air quality may not be currently monitored, but where it could be negatively impacted. The EIS should include requirements for air quality monitoring that ensure these areas are monitored. The nine compressor stations proposed by the applicant, including the one proposed in Northfield, MA approximately .75 miles away from a popular overnight site on the New England National Scenic Trail, are of particular concern as it poses significant air pollution risks to the outdoor recreation community and visitors nearby recreational destinations as well as local residents.

In addition, alternatives should be strongly considered in order to minimize potential air pollution risks to the outdoor recreation community: powering the compressor station turbine with an electric motor instead of natural gas; including zero emission pneumatic control features in plans for the compressor; and supporting other measures that ensure that the pipeline and associated storage tanks and compressor stations can meet and exceed the standards set in EPA's on-the-books and on-the-way regulations controlling all air pollution emissions from the oil and gas industry.

While EPA's 2012 NSPS for VOCs for natural gas and oil new rule did not address compressors and pneumatic controllers in the transmission segment they have been included in the recently proposed Methane Rule. EPA did not include them in 2012 because the agency argued that the downstream sources are processed to remove the impurities like VOC, EPA claimed there just were not enough VOC emissions to justify regulation. However, by regulating methane, EPA now views these sources as having enough emissions now to warrant regulation. FERC should consider this pending regulation that may well be finalized by the start of this project.

Climate Change Impacts

In addition to providing an analysis of local and regional air pollution effects of the proposed pipeline as discussed above, AMC strongly urges FERC to consider the potential for climate change impacts from the NED pipeline. The Council on Environmental Quality (CEQ) recently issued draft guidelines on the process for federal agencies to evaluate greenhouse gas (GHG) emissions when conducting reviews under the National Environmental Policy Act (NEPA). This guidance should supersede the previous 2010 guidance and directs agencies to address the potential climate change impacts of a proposed project as indicated by its GHG emissions. It dictates that the EIS should consider both long and short term effects and benefits based on the duration of the generation of emissions.

These recommendations will likely be formalized during the permitting process for this project. FERC should include climate change as a discussion item in their final record of decision and therefore should demonstrate due diligence by fulfilling these requirements early in the process and including the topic of climate change impacts and opportunities for mitigation within the draft EIS. In this way, FERC can ensure that the public has had a fair opportunity to comment on potential impacts and proposed mitigation measures throughout the lengthy public permitting process.

The CEQ guidance also directs federal agencies to consider the implications of climate change impacts, including potential adverse environmental effects. The potential impacts of a project of this scale are wide-ranging and include contributions to global sea level rise and changes in avian migration patterns, as well as localized impacts that have the potential to hit more close to home, for example, an increased occurrence of intense storm events and extreme flooding along the eastern seaboard. Both local and cumulative climate change and air quality impacts should be thoroughly evaluated, and alternatives to avoid or minimize these impacts should be presented and analyzed. In addition to outlining the potential impacts of carbon dioxide, nitrous oxide, methane and diesel emissions from the project, it is imperative that the EIS also consider the loss of forested lands as an impediment to the landscape's natural ability to sequester carbon.

The analysis should pay special attention to the proposed compressor stations, given that recent studies show compressor stations account for 25% of the methane emissions from the oil and gas industry, much of which is leaked.⁴

These are just some of the many issues to consider in evaluating the need, impacts, and alternatives of this complex project. Thank you for the opportunity to comment.

Sincerely,

Heather Clish

Director of Conservation & Recreation Policy

Gwen Miller, Lenox, MA.

Dear Secretary Bose,

I wish to submit to you comments regarding the Northeast Energy Direct Massachusetts Alternative Route that would cut through Lenox. The community has grave concerns regarding the alternate route's impacts to our drinking water, to our scenic resources, to our ecological resources, and to our economy.

Perhaps the most important resource in Lenox to be affected by the alternate pipeline route is the town's sole public drinking water supply, Upper and Lower Root Reservoir. These water supplies are fed by Lenox Mountain Brook, and are protected by approximately 996 acres of land owned by Lenox and governed by a conservation restriction (CR) held jointly by regional land trust Berkshire Natural Resource Council (BNRC) and the Lenox Conservation Commission. The land and water resources are additionally cushioned by conservation land owned and managed by BNRC and the Massachusetts Audubon Society (MAS). The watershed property itself contains over 90% of the topographic watershed of both the Upper and Lower Root Reservoirs. It also includes 200 acres of land not in the reservoir watershed but which is home to historic reservoirs that could one day provide an alternative or new water supply to the Town of Lenox. The watershed land itself commands a scenic and secluded location on Lenox Mountain. The majority of the property is forested. The area not forested is open water—the two reservoirs – and the cleared areas around the reservoirs includes the water treatment facility. The land is primarily forested with northern hardwoods and oak-hardwoods timber types. There are a few substantial stands of hemlock-hardwoods and small (less than five acres) stands of almost pure evergreens which include Norway spruce, red pine and white pine. Lenox Mountain Brook and the Root reservoirs have a 400' buffer area within which public access is restricted to protect water quality. Passive recreation is allowed within the watershed boundary but is limited to non-motorized uses. In fact, a person could begin hiking at the southern end of Lenox Mountain and hike Yokun Ridge on Lenox Mountain to Pittsfield, passing through the Lenox watershed land. In this way, the property provides not only clean drinking water to residents, it is also part of a larger land conservation network and recreation system that transcends municipal boundaries and creates a special place beloved by locals and the Berkshire region. Ninety percent of Lenox residences use town water. The water quality is excellent, with minimal water treatment necessary. The water supply in Lenox is ample, with an average daily demand of 300,000 gallons and peak daily demand of about 700,000 gallons. In the last two years, the Town has taken strong measures to permanently protect the watershed land as both a drinking water supply and as a place of conservation and recreation through the adoption of a Conservation Restriction held both by the Lenox Conservation Commission and BNRC and by ensuring that all watershed land is protected under Article 97.

The proposed alternate route would directly alter and impact special places in Lenox, attractive to residents and visitors alike:

Kennedy Park

The Massachusetts Audubon Society Pleasant Valley Sanctuary

October Mountain State Forest

The Upper Housatonic Area of Critical Environmental Concern

The George L. Darey Housatonic Valley Wildlife Management Area

Much of the land area is considered unique or important by the Commonwealth of Massachusetts due to its intact habitat for native species. These include estimated and priority habitat area as designated by NHESP, and Priority Conservation Areas of the Housatonic River Valley as designated by NHESP.

The Town of Lenox guides land use through a several documents whose goals are in direct conflict with the development of an alternative pipeline route through Lenox. These include:

Our Open Space and Recreation Plan, approved in 2015:

An objective of the most current OSRP is to eliminate and reduce the threat of invasive plants within Lenox. An ongoing and grave concern to the Town is the presence of Hardy Kiwi in Kennedy Park. This plant dominates areas in which it has colonized, crowding out any native plant. The clearing of a right of way for the pipeline would create an area vulnerable to the spread of Hardy Kiwi as well as listed invasive plants such as Japanese Knotweed, Multiflora Rose, Bittersweet and Barberry, plants which have been identified in lands adjacent to the watershed property.

A second item discussed in the OSRP is the ongoing Rest of River clean up proposed by the US EPA. This

immense excavation of miles of the Housatonic River is designated to mitigate the river's PCB contamination caused by General Electric. The operation is multi-year. At its commencement and through its implementation, will unavoidably intersect with the NED pipeline the Town of Lenox. As of October 2015, the Town of Lenox has received no insight or information regarding how this intersection of two large-scale excavation and construction projects, one involving a high-pressure natural gas pipeline would be addressed.

Our Watershed Forest Management Plan, 2015

Our Comprehensive Master Plan, 1999

And our 2006 Community Dialogue Visioning Document

In addition to threatening the water supply of Lenox, and hurting scenic and natural resources, the alternate route has the potential to hurt our economic jewel, tourism and hospitality. Cultural institutions and the scenery in Lenox draw visitors from all over the world. Tanglewood alone attracts 300,000 visitors a year. While here, the special landscape and places entices them to return in the future and even buy homes or businesses here. Anything that threatens the special qualities which attract people to visit, live and work is a threat to the local and regional economy.

This comment is a truncated version of the document submitted via mail and via the eFiling feature on FERC Online.

20151016-5413

Carol Malz, Oneonta, NY.

While I currently reside in Oneonta, New York, I own land in the Town of Davenport, New York, that is in the path of this pipeline (as it also is for the Constitution Pipeline). That land is 2707 McIwain Road (a/k/a Old 96). The land was transferred to me from Barbara Elmore, whose name is on the Constitution Pipeline filings and who also received mail from Kinder Morgan. Barbara was against both pipelines and so am I. (1) The land is beautiful and should not be disturbed by such development. I have a cabin, mobile home, 2 acre pond, blueberry field, and acres of untouched forest there. A pipeline and the destruction it brings does not belong. It interferes with current and projected uses. (2) Throughout upstate New York, I have seen how invasive species are harming the ecology, and sometimes destroying native species. This pipeline will just bring more. There are no wash stations for the trucks (like the ones they do for boats), and even if there were, invasives can still come through. (3) This country should also be moving in a different direction when it comes to energy. I don't want my land to be sacrificed for an industry that is dying or should be dying due to the pollution and contribution to global warming that it brings. (4) Those of us fighting the pipelines know what we would lose. We don't need it to be gone to know how valuable it was. Trees are more important than gas.

20151016-5415

Kathleen Gauvin, New Ipswich, NH.

Minisink, NY is a rural town much like New Ipswich, NH. It is a story of a population much like the population of New Ipswich, NH. The people in Minisink, NY enjoyed their rural living in a close knit community. Their lives and community were forever ruined once the compressor station was constructed in Minisink.

I recall hearing that Eric Tomasi visited Minisink, NY during a meeting in New Ipswich, NH. We had already been researching the horrors of Minisink when the subject of Minisink was broached by myself in the audience. In retrospect I wonder why Mr. Tomasi made a trip to the town of Minisink? He wasn't the project manager for the Millennium pipeline and compressor station, but he was there. Was he doing some fact finding of his own? It is quite a curious question to consider.

Newspaper articles in the UTNE reader, health studies conducted by numerous experts document the environmental issues that result in health issues:

Harvard study by Epidemiologist, Joel Schwartz and his colleagues

David Brown and colleagues of the Southwest Pennsylvania Environmental Health Project

Harvard epidemiologist, Marc Weisskopf and colleagues' study published in Environmental Health Perspectives in December 2014

American Environmental Scientist, Wilma Subra, President of Subra Company, an environmental consulting firm that helps people facing problems because of environmental health issues

So I ask, "What is FERC going to do differently as far as permitting the NED? What have you learned from the Millenium permit and the disastrous effects in Minisink, New York?"

20151016-5416

Maryann Harper, Rindge, NH.

REQUEST TO DENY N.E.D. Project due to lack of NEED, improper segmentation and excessive burden to stakeholders.

Dear Secretary Bose:

I have written to FERC in regards to PF14-22-000 several times as well as entering comments at the Scoping Sessions held in Nashua, NH and Lunenburg, MA.

In Nashua I addressed the socio-economic impacts of this project, particularly on those whose life investment in their home is now at risk. Those at or nearing retirement age, like myself and my husband, will not live long enough to see the forest grow back between our property and the existing power line easement if the N.E.D. project is constructed. Nor will we live long enough to see our property values recover to pre-N.E.D. days. We will lose much and gain nothing.

In Lunenburg I addressed the issue that the FERC approval process minimizes the concerns of and impacts to landowner's property. I used the Constitution Pipeline approval as an example of how broken this review process is. In addition, I asked that reports from experts with local ties be given the same weight as the reports of experts hired by Kinder Morgan/Tennessee Gas Pipeline Company. I think we should all be able to agree that relying on a study financed by the subject can lead to biased conclusions.

Today, as the formal commenting period for scoping draws to a close, I am asking the FERC Commissioners to shoulder the responsibility inherent in their job with the utmost respect to the citizens of the Northeast that will be harmed should this project be approved. The decision is in your hands and you have received more than ample information to deny this project.

The NEED for this project has been questioned at great length and in great detail. The lack of reviewing the cumulative impacts of all the current pipeline proposals have been questioned by many including the improper segmentation of the Connecticut Expansion.

Simply put, this is not a level playing field and we look to you to do justice in this process. You have heard (through approximately 6,000 comments) that the N.E.D. project does nothing for the Northeast other than to place a burden on those who live here. Many intelligent and researched comments have been placed on the docket documenting this burden whether it is risks to our wells and wetlands or harm to our children and their futures.

A vast amount of information has been filed in opposition to this project that one can see no other resolution than to recognize the N.E.D. project for what it is – a massive overbuilding of infrastructure that will require excessive and abusive use of eminent domain – and this project must be denied.

Respectfully submitted,

Maryann B Harper
Rindge, NH

20151016-5422

Jill L Manfield, Merrimack, NH.

WE know there is NO NEED for Kinder Morgan/TGP's Northeast Energy Direct transmission gas pipeline. No need = No Certificate of Public Convenience and Necessary.

It will ruin our waters, air quality and Merrimack residents will be at risk. We are strongly against it. I will live 50 feet from the proposed pipeline. If you approve, I will not live here nor will my neighbors. They will need to buy us out with a fair market value. Why should you be putting people through this. There is absolutely no need for it and the people in Merrimack are the ones going to be paying the price if this goes through. Please do the right thing and decline it. It is simply not good for Merrimack or NH.

20151016-5425

Kathleen Gauvin, New Ipswich, NH.

MINISINK, NY- A STORY OF FAILURE

Failure of state legislative leaders to act before and after the fact

Failure of the FERC system for pipeline approvals

Failure of the EPA standards being weakened by big companies with big money and influence

Failure of state & federal approval agencies to accept weakened emission models to be accepted as within EPA rules

Failure of inexperienced citizens who didn't have expensive air and water testing done before a toxin emitting CS was built

Failure of ALL the citizenry to be involved

Failure of the news media to fairly and seriously investigate the hazards

Failure of Federal officials who allowed the natural gas industry to circumvent the Clean Air and Clean Water Act due to the Halliburton loophole

WE HAVE LEARNED MUCH FROM THE MINISINK, NEW YORK STORY! WE WILL NOT BE THE NEXT MINISINK!

Should I even wonder why Kinder Morgan didn't bring any experts to answer public health and safety questions that were asked at the New Ipswich Open House?

Washington, DC 20426

Re: Tennessee Gas Pipeline Company, L.L.C. ("TGP")

Docket No. PF14-22-000: Proposed Northeast Energy Direct ("NED")

Sir,

In my opinion there are two significant environmental issues with respect to the NED Pipeline routing through Hudson, NH between milepost 31.5 and 34+ of Segment J, which I do not see being addressed by Tennessee Gas Pipeline (TGP) in their updated publicly available submissions of 24 July 2015.

First, sightings have been made within or in near proximity to the proposed corridor of at least two rare species, Blanding's Turtles and Brook Floaters, identified by the State of New Hampshire Natural Heritage Bureau (see Figure 5 of attached Long Term Variable Milfoil & Fanwort Management Plan: Robinson Pond, Hudson, New Hampshire, prepared by the New Hampshire Department of Environmental Services in March 2013). TGP has only made vague comments on the methods of pipeline construction to be used for lesser stream crossings and in wetland areas, and the procedures they would use to protect these habitats.

Secondly, The Town of Hudson and the State of New Hampshire have expended significant resources to control invasive species in Robinson Pond, the location being seen in Figure 5. The proposed pipeline corridor near Mile Post 32.3 crosses a wetland (NWI-502) which feeds into Robinson Pond. Again, in reading the submission by TGP regarding construction of wetland crossings, I find the discussion of control of invasive species to be vague at best.

To fully evaluate the potential impacts of construction of wetlands on the control of invasive species, The Federal Energy Regulatory Commission must require TPG to provide more definitive discussions of the methods of construction at wetland and lesser stream crossings and sensitive habitat protection and control of invasive species during construction.

Steve Clark, Richmond, NH.

I totally oppose this pipeline coming into the State of NH for many reasons as listed below :

- 1} Puts my family at risk for being what is known as the incineration zone, less than 200' from my home.
- 2} Drilling into the nearby Granite for blasting which will then off gas Radon which is known as a deadly gas.
- 3} Possibility of contamination of my well, which is in the aquifer.
- 4} The Town of Richmond in case of an explosion an large fire have a volunteer fire department, and no way could handle this. Most of the fighter work in during the day and not even in the town during the day.
- 5} The State itself will not gain a thing, this pipeline is nothing but a transit line for profit of Kinder Morgan to line their pockets with money by exporting most of the "Fracked" Natural Gas.
- 6} The Town of Richmond is nothing more than a corridor to get the gas to an export facility, gaining not on drop for heating or generation of electricity.
- 7} The possibility of paying a tariff in my energy bill for something that we don't receive, with the knowledge of a 15 year lifespan of this gas, and a proposed tariff for 20 years.
- 8} Being so close to the ROW in which proposed any blasting would probably crack our house foundations, in which any damage being caused with fall back on the property owners.

I could go on and on but as you can hopefully see this is no good for the New England States, and definitely not Southern or any part of NH.

RE: Tennessee Gas Pipeline Company, LLC-Northeast Energy Direct Project
FERC Docket Number PF 14-22-000

Dear Secretary Bose:

Thank you for the opportunity to provide comments to the Federal Energy Regulatory Commission (“FERC”) on the Northeast Energy Direct Project (“NED”) as proposed by the Tennessee Gas Pipeline, LLC (“Tennessee”). The Connecticut Department of Public Health (“CT DPH”) is concerned with the proposed construction on, and the proposed crossing of the natural gas pipeline through, a public drinking water supply watershed in the Connecticut towns of Bloomfield and West Hartford. Moreover, the CT DPH is concerned with the proposed construction on, and the proposed crossing of 5.7 miles of, Class 1 and 2 water company owned land within these watershed areas as owned and managed by the Metropolitan District Commission (“MDC”) (“water company land”). The MDC public water supply reservoirs provide public drinking water to over 400,000 people in the greater Hartford area with over ten municipalities reliant upon these reservoirs for their daily public drinking water supply; therefore, the protection of water company land is vital to public health.

In Connecticut, public drinking water supply watershed areas have been protected and preserved for public health, water quality and quantity protection. Numerous unique state laws and policies exist that provide Connecticut’s watershed areas with special protections. Each of these laws under the multibarrier approach has preserved Connecticut’s special watershed areas to assure long term public drinking water quality and to protect public health. Use of these watershed lands for commercial purposes is inconsistent with the multi-barrier approach and the intent of the water company land laws. To that end, in a November 2000 formal Connecticut Attorney General opinion, U.S. Senator Richard Blumenthal, at that time Connecticut’s Attorney General, stated:

“Watershed lands are among Connecticut’s most precious natural resources - a legacy for future generations that we have a responsibility to preserve and protect. Besides their vital role in protecting the purity of the state’s water supplies, the natural beauty of these lands, undisturbed and tranquil, provides a refuge and respite from development and commercialism. These pristine lands are irreplaceable; once developed they are forever lost.”

A specific watershed protection Connecticut law as administered by the CT DPH is a requirement for a change of use permit pursuant to section 25-32 of the Connecticut General Statutes (Conn. Gen. Stat.). This law requires a water company who wishes to move forward with any change of use of water company land to apply to the CT DPH for a permit prior to moving forward with construction. The Connecticut water company land statute restricts the type of actions allowed on water company land. Proposals specific to public water supply purposes are generally allowed. Under Conn. Gen. Stat. section 25-32, MDC would be required to apply to the CT DPH for a change of use permit prior to any construction on their water company land.

Given the concerns expressed by the CT DPH for the protection of the public drinking water supply watershed lands, including water company land, and the water supply, the CT DPH respectfully recommends and requests that:

1. All other route alternatives be fully vetted prior to deciding on a final pipeline route. Traversing a public drinking water supply watershed should be seen as a last resort for a pipeline crossing;
2. During the review of alternatives, the vetting process must be fully cognizant and respectful of Connecticut's public health laws that protect the public drinking water supply, including the requirements and restrictions under Conn. Gen. Stat. section 25-32;
3. Permits required pursuant to Conn. Gen. Stat. section 25-32 be added to the list of permits that Tennessee is required to obtain and that CT DPH be added to the list of federal and state agencies in the project area with permitting requirements; and
4. Any order issued by the FERC with respect to the portion of the NED in Connecticut require that Conn. Gen. Stat. section 25-32 be complied with and permits under such section be obtained.

The CT DPH respectfully requests an opportunity to supplement or revise these comments.

It is without question that Connecticut's water company land laws are unique and have afforded the state of Connecticut with the highest level of public drinking water quality in the country. These laws were in place in the 1970s and strengthened in 1980 in order to assure that the over 100,000 acres of water company land are protected and remain in a natural state. Coupled with numerous other source water protection laws, Connecticut has a unique and strong investment in the preservation of its public drinking water supply and the protection of public health. It is with that background that the CT DPH requests that FERC and Kinder Morgan, Tennessee's parent company, strongly consider other routes and alternatives versus the use of public drinking water supply lands in Connecticut.

The CT DPH offers to FERC and Tennessee its technical assistance in the review of alternatives, discussion and application of Connecticut public health law, and the protection of public health and Connecticut's public drinking water supply.

Sincerely

Lori J. Mathieu

20151016-5437

Frank Barrus, New Ipswich, NH.

I am writing concerning the low-frequency vibration impact of the compressor station coming to New Ipswich. How will FERC ensure that the vibrations coming from the compressor station and its turbines does not have a negative impact on health and the quality of life in the surrounding area, or an impact on wildlife? Compressor stations are known for emitting low frequency vibrations that do not show up in the range measured for the 55dB audible sound limit at the fence line. These low frequency vibrations travel through the earth, and can potentially transmit for miles, if they are intense enough and the ground conditions are right. They are known to be disruptive to wildlife and livestock, as well as to cause subtle illnesses, sleep disruptions, disorientation and vertigo, and general feelings of unease with people. They also impact recording devices, such as music studios, and wildlife recordings, imparting an undesirable low frequency to them, as well as higher frequency harmonics if they cause objects to resonate. Since NH is notorious for having extensive amounts of granite bedrock, there is much potential for such low frequency vibrations to be spread for great distances.

How will FERC ensure that the compressor station being built minimizes or eliminates the transmission of low frequency vibrations? This needs to be considered as part of the construction, since it will require some way of absorbing these vibrations before they reach the ground. This isn't as simple as adding an acoustic

foam enclosure around the building, which could work for to reduce audible noise, but not the deep low frequency vibrations that are conducted through the foundation into the earth.

How will FERC ensure that the vibrations are accurately measured, both near the compressor station, and at greater distances? And how will they make sure a limit is set low enough to ensure that there is no harm to people, wildlife, livestock, or pets? Simply following federal regulations is insufficient since there is no regulation in place currently that sets any vibration limits and requires mandatory testing of it.

If the compressor station is built, and issues with low frequency vibrations later arise, how will FERC deal with such issues to ensure that all cases are addressed, and appropriate measurements are taken to ensure that no additional ones occur, or are occurring?

If the public need for the NED Pipeline cannot be proven to outweigh this impact on human and animal health and the quality of life in New Ipswich, Temple, and the surrounding region, it should be denied.

20151016-5441

Deborah Jacobs, Leeds, MA.

I understand that FERC has federal preemption over gas pipeline projects, but as a citizen of Massachusetts I am disturbed and disheartened that you would consider allowing a private company, Tennessee Gas, to cross conservation lands that are protected under the provisions of Article 97 of our state constitution.

The idea that the fracked gas flowing through the pipeline, should it be built, would be cleaner and cheaper does not take into account the degradation of the environment at the production end and the cost of the subsequent clean up which would most likely be passed on to the rate payers. This needs to be considered as it reduces the public benefit.

I would like to thank FERC for agreeing to extend today's deadline for Massachusetts Attorney General Maura Healy commissioned study on the natural gas needs for our region. Like many others at the July 29, 2015 scoping session held in Greenfield, MA I am not convinced the the pipeline as proposed is appropriate for our area. I also wanted to commend you on your no doubt well earned skill in conducting a highly charged hearing.

Re: Northeast Energy Direct Pipeline; Docket PF14-22-000, Scoping Comments

Dear Secretary Bose,

Please accept the following comments from Otsego 2000, Inc. regarding FERC's scope of review for the Northeast Energy Direct (NED) Pipeline (Docket No. PF14-22-000).

Enclosed are our previous scoping comments on the Constitution Pipeline submitted October 9, 2012 (Docket No. PF12-9-000), as well as our comments on the draft EIS submitted to FERC on April 4, 2014 (CP13-499-000 and CP13-502-000). Also attached are our comments on the Constitution Pipeline submitted to the New York State Department of Environmental Conservation on February 27, 2015. At the outset, we must emphasize that we strongly disagree with FERC's decision to support the Constitution Pipeline. The concerns we expressed regarding that project have not been mitigated — indeed, they will be drastically compounded by construction of the proposed NED.

Our prior comments and those of other intervenors and commentators identified numerous severe environmental threats which would be caused by the Constitution Pipeline, including but not limited to: failure to utilize existing transportation or utility corridors to limit ecosystem fragmentation and other impacts, risk of erosion and flooding due to the removal of 700,000 trees in a region that has experienced increased flooding in recent years, impacts to wildlife and habitat loss, harms to plant and wildlife species from pesticide and fire retardants, woefully inadequate wetland and stream crossing measures, and potentially high levels of radon in Marcellus shale gas delivered to consumers in the Northeast. In addition, we discussed at length the direct, indirect, and cumulative impacts associated with fracking and related infrastructure on human health and the environment, including climate change that would be exacerbated by construction of a pipeline which intensifies fossil fuel extraction from Marcellus and Utica shale formations.

The many concerns outlined in each of the enclosed documents are equally applicable to NED, which is proposed to run adjacent to the Constitution Pipeline in the 117 mile “supply path” section of the project from Pennsylvania to Wright, New York. Added to the threats previously identified, are the environmental and public health impacts, which will be induced by the additional 179 mile “market path” section of the NED pipeline proposed from Wright, NY to Dracut, Massachusetts.

Compounding these concerns are nine (9) new compressor stations proposed as part of the NED project in communities along the entire pipeline corridor, which are projected to collectively pump more than a million tons per year of greenhouse gas emissions and pollutants hazardous to human health. Many of these facilities, like the proposed 30,000 horsepower compressor station near Franklin, NY, would introduce industrial pollution into pristine natural areas, permanently diminishing air quality and negatively impacting the character of rural agricultural communities. It is well established that compressor stations are among the most polluting components of the entire natural gas infrastructure chain. Peer reviewed research has documented high levels of formaldehyde and other toxic emissions from compressor stations at levels dangerous for acute and chronic exposures. These are not only the product of combustion, but are also associated with fugitive leakage, blowdowns, and the operation of dehydrators and other equipment. Negative health effects of exposure to these chemicals (and resultant groundlevel ozone) include cardiovascular, respiratory, and neurological damage; birth defects, cancer; leukemia; infertility; burning of lungs, eyes, and throat; muscle pain; mental impairment, headaches, and a host of other acute and chronic illnesses. The research on air pollution from gas infrastructure and health impacts is alarming and growing.¹

The disingenuous justification that has been put forth for both NED and Constitution pipeline projects: namely that their purpose is to serve the public good, i.e. “public convenience and necessity,” is equally disturbing. It is readily apparent that the purpose of both projects is actually to facilitate the export of domestically produced natural gas to foreign markets. This would occur through transmission of gas to the Maritimes and Northeast Pipeline along the eastern seaboard to export facilities in Maine and Canada, as well as transmission of gas to the Iroquois Pipeline, once flow reversal in that pipeline is permitted as part of the announced Iroquois South-to-North (“SoNo”) project. Depleting U.S. gas reserves and selling them to the highest foreign bidder, promoting future escalation of gas prices, ignoring the adverse health and environmental impacts of fossil fuel infrastructure, and dismissing the global ramifications of climate change certainly do not square with “public convenience and necessity”.

Nor can the segmentation of these projects be justified. Within the proposed “supply path” segment alone, construction of the NED pipeline would effectively double the number of stream water and wetland crossings associated with the two projects (from approximately 277 to 544). With respect to FERC’s scope of review, the Constitution, NED, SoNo, and other related pipeline projects now proposed for the Northeast region are intimately connected and their impacts must be considered cumulatively, including impacts upon ecosystems, air and water quality, public health, and climate. We must also emphasize that the Constitution Pipeline has not been built, nor has it received state approvals for construction. As such, the proposed NED corridor is a “greenfield” corridor, and must be treated as such by FERC in its review.

Thank you for your consideration of these comments.

Respectfully submitted,
Nicole A. Dillingham, Esq.

William Dennis Latimer, Pittsfield, MA.

Any analysis of the impact of Kinder-Morgan’s proposed natural gas pipeline across New York, Massachusetts, and New Hampshire should consider the long-term effects of not only the pipeline installation itself, but also the long-term environmental effects of using more fossil fuels as well as the economic impacts of diverting resources away from renewable and sustainable energy sources.

There is no question that our planet is changing drastically, quickly, and inevitably. There can be no question that climate change is caused by human activity since the dawn of the industrial age. Changes are happening, more will take place, and they threaten the very existence of the human species. Even the world’s militaries have recognized fossil-fuel-driven climate change as the number-one threat to the security of their respective nations.

The time has come to include the long view, the big picture, in deliberations over infrastructure for an obsolete, and globally dangerous, energy source.

On an individual basis, my wife and I are doing what we can. We are spending our life savings to fashion a modest home that will use no fossil fuels and will actually produce more energy than it uses. We see some irony that we are doing this in our later years as a gift to future humanity, while a planet-destroying pipeline is being proposed for the very town where we are fighting for our species’ survival.

Yes, we as individuals are taking the long view, digging deep into our pockets, and sacrificing to ensure a future for human beings. We’d like to think that our government agencies too would keep the continued existence of a habitable planet as a primary goal while debating the “need” for more fossil-fuel infrastructure.

Re: FERC Docket # PF14-22

Dear Ms. Bose:

I am a Physician and a member of the Northfield board of health, whose duty is to protect Northfield's environment from damage and pollution, and to protect the health of Northfield residents. I feel compelled to comment on the Northeast Energy Direct (NED) project, in FERC Docket #PFI4-22, regarding the proposed NED pipeline and the NED compressor station proposed to be sited here in Northfield, Massachusetts.

An overarching concern is that information available to date, including the draft Environmental Report, is quite incomplete; consequently, my comments will necessarily also be incomplete until more detailed project information becomes available. Despite this, I have many concerns that are detailed below:

- The most prevalent are medical conditions in individuals living in close proximity to compressor stations and metering stations. Close proximity is defined as "Reported by community members living 50 feet to 2 miles from compressor stations & gas metering stations along gas transmission pipelines" (re: Luzerne County Citizens for Clean air website). The author cites 15 medical conditions associated with individuals living in close proximity. Some of the medical conditions are: respiratory impacts; throat irritation; weakness & fatigue; nasal and eye irritation; joint pain; breathing difficulty; allergies; severe headaches; swollen & painful joints; frequent irritation; . vision impairment; sleep disturbances & sinus problems.
- There are serious long term health concerns regarding contamination from compressor stations & valve stations in Western Massachusetts, Franklin County, Northfield - as cited in a University of Massachusetts Natural Resources Assessment of the Tennessee Gas Pipeline Companies Proposed NED Project's Pipeline Route within Massachusetts, Vol. 1: The Mainline; authors: ... ! Scott Jackson, Bethany Bradley & Thomas Cairns, April 2015
- Two primary crop producing areas are classed as Prime Farmland Soils from NRCS SSURGO.~ Certified Soils and Farmland of Statewide Importance. In both cases the percent of Pipeline route thru Franklin County Prime Farmland Soils is 12%. The percent of pipeline route going thru Farmland of Statewide Importance is 23%. The concern is that protecting these two vital productive land resources is critical to maintaining crop safety for products consumed in these farmland areas;
- The exhaust emissions from the compressor turbine engines produce approximately 2,000 tons of exhaust per day;
- The pipeline will have a regular maintenance program involving "pigging operations" to remove condensate & other contaminants at the Northfield site, and these byproducts may pose a direct threat to local water resources.
- A local hydro geologist disclosed that "the dredging, drilling & blasting of such an extremely large manmade preferential groundwater pathway for containment transport is likely to cause a foreseeable harmful impact to drinking water & human health, and "damage to the environment," as defined by Massachusetts Environment Act (MEPA) regulations (310 CM,R 11 :02): "any destruction or

impairment ... actual or probable, to any of the natural resources of the Commonwealth including, but not limited to water pollution ... reduction of groundwater ‘ levels, impairment of water quality ... (of) rivers, streams, flood plains, lakes, ponds or other surface or subsurface water resources wetlands, natural areas, parks.”

- Radon is shipped thru the pipeline thereby increasing the risk of lung cancer to residents. This risk is present during any Raw Gas releases;
- The noise from a compressor station is 24/7, and 365 days per year except for maintenance or system failures. The Massachusetts Department of Environmental Protection states that: “Noise is a public health concern.”
- The 55 dB noise limit set by FERC, surrounding the proposed compressor station, greatly exceeds the average rural background sound level of 35 dB. However, the average dB sound range from an operating compressor station varies widely from near 55dB to over 90 dB during blow down operations at any time of day with no notice to nearby residents. My concern is these sound levels and variations, together with vibration generated by the compressor station may have a significant negative impact on resident’s mental health, not factoring in the wildlife; <’, disturbances.

In conclusion, I am very concerned about the possible harmful effects of the proposed NED pipeline, and particularly, the proposed NED compressor station. Sincerely,

Flora Sadri, D.O., MPH, FAAFP
Northfield Board of Health, Member

MEMO: FERC comments regarding the proposed NED Pipeline

Dear FERC members:

I am respectfully and formally requesting that FERC investigate the need and safety for the proposed NED pipeline. The following areas of concern are provided below:

NEED Issues

- There are several pipelines already approved or in process of approval for addressing the need for more natural gas. This has to be considered in your evaluation. FERC would be allowing an over-build scenario that adds unneeded risk to the environment, human health and safety issues related to a new pipeline build and negative economic impact for New England residents.
- Justification submitted by Kinder Morgan is questionable since it is based on future demand on optimistic cost assumptions.
- New England rate payers would be penalized by having to ultimately pay tariffs for the building and support of this pipeline, which will be underutilized due to true demand. It would be unconstitutional and unfair for FERC to allow this to happen.

HEALTH and SAFETY Issues

- Explosions occurring at various areas of the pipeline due to ruptures based on difficult environmental conditions. The pipeline is proposed to go over several locations in Western Massachusetts that are susceptible to seismic activity and bitter climate conditions.
- Inability for local fire departments to manage any catastrophe in the event of a rupture or explosion.
- Kinder Morgan should not be allowed to implement a thinner lined pipe in the event of deployment even in rural areas based on the harsh environmental considerations.
- Kinder Morgan has a history of fouling water supplies and has not reasonably addressed how it will assure that this will not happen in New England.

ECONOMIC HARDSHIP Issues

- FERC and the US Federal Government should not allow a corporation the right to implement eminent domain without proving the absolute need and promoting more profitability to a corporation while negatively impacting landowners.
- Kinder Morgan and FERC cannot arbitrarily over turn Article 97 of the Massachusetts constitution; these land holdings were put in place to be preserved.

Please consider all of these items during your review.

Best regards,

Jaime Reloj, Massachusetts Resident

Kinder Morgan / Tennessee Gas Pipeline Co.
Northeast Energy Direct
FERC Docket #PF14-22

REPORTING OF RISKS AND VULNERABILITIES IN REMOTE PIPELINE OPERATION SYSTEMS (SCADA)

Kinder Morgan's website states that they use SCADA (Supervisory Control and Data Acquisition) systems for remote operation of their pipelines¹. While this is a fairly common industry standard, there are substantial concerns in the IT and security communities about internet-based control systems like these being vulnerable to cyber-attack and acts of terrorism². A 2010 case was the Stuxnet worm that threatened the Iranian nuclear power system, setting a precedent that has left the door open for copy-cat attacks³. Since then, multiple cracks into pipeline and electric generation plants have been found AFTER the system was compromised, the number of such attacks doubling in 2014⁴. While the DOT and TSA have authorization to put regulations in place, the resources to implement and enforce them are not available, leaving the public reliant on industry participation⁵.

"While the pipelines sector has many cybersecurity issues in common with other critical infrastructure sectors, it is somewhat distinct in several ways:

- *Pipelines in the United States have been the target of several confirmed terrorist plots and attempted physical attacks since September 11, 2001.*
- *Changes to pipeline computer networks over the past 20 years, more sophisticated hackers, and the emergence of specialized malicious software have made pipeline SCADA operations increasingly vulnerable to cyber attacks.*
- *There recently has been a coordinated series of cyber intrusions specifically targeting U.S. pipeline computer systems.*
- *TSA already has statutory authority to issue cybersecurity regulations for pipelines if the agency chooses to do so, but may not have the resources to develop, implement, and enforce such regulations if they are mandated. TSA maintains that voluntary cybersecurity standards have been effective in protecting U.S. pipelines from cyber attacks. Based on the agency's corporate security reviews, TSA believes cybersecurity among major U.S. pipeline systems is good. However, without formal cybersecurity plans*

and reporting requirements, it is difficult for Congress to know for certain. To a great extent, the public must therefore rely on the pipeline industry's self-interest to protect itself from cyber threats. Whether this self-interest is sufficient to generate the level of cybersecurity appropriate for a critical infrastructure sector, and whether imposing formal regulations would be counterproductive, is open to debate."

~ Pipeline Cybersecurity: Federal Policy 6

With this understanding in place, for the sake of public safety and the ability of federal and state emergency management agencies and local first responders to prepare and carry out their duties, we need to have a thorough understanding of what security protocols are currently in place on the Kinder Morgan / Tennessee Gas pipeline system and how further security measures relating to NED would be structured and implemented and how known vulnerabilities in their standard systems will be addressed.

While attending the Hampshire & Franklin County Municipal Conference in Northampton, MA in May of 2015, I asked Kurt Schwartz, Director, Massachusetts Emergency Management Agency, what plans were in place to deal with the possible 5 new pipeline projects being proposed for Massachusetts between Kinder Morgan and Spectra. When realizing that there was a potential for an additional 4.5 Billion cubic feet a day of gas, much of it at pressures around 1,500 psi, and that they were to be operated on internet based SCADA management systems, he admitted that he had not been given detailed information about any of these pipeline plans, and often doesn't find out about increased risk like these until after something goes wrong.

Filing a detailed plan of operating systems, safety and security protocols and known weaknesses in the system with the DOT, TSA, and federal, state and local emergency management should be required by FERC and PHMSA in their respective duties. Please ask Kinder Morgan to provide this information to such agencies and elected officials, and as much as is possible to the general public as a condition of permitting this project.

20151016-5461

I am a resident of and attorney in West Hartford, Connecticut. I am writing to comment on the proposed pipeline expanding and siting of the Kinder Morgan/Tennessee Gas Pipeline on MDC lands in West Hartford, particularly within the watershed area and Class I and Class II public drinking water supply areas of the Farmington Avenue and Reservoir 6 reservoirs and related infrastructure and water treatment areas. My comments to date are broken down into several categories that I do not believe had been addressed in prior comments that I have read on the FERC docket, although I would reiterate many of the concerns expressed therein and at the October 7th, 2015 public meeting in West Hartford, CT. As such, I have organized my more limited comments as follows:

Public Notices/Public Outreach - Kinder Morgan/Tennessee Gas Pipeline Lack of Transparency and

Intentional Failure to Solicit Public and Local Official Comment Prior to deadline

On October 1st our MDC sent a single email blast to residents who are signed up for its reports. The email attached a notice about a presentation by Kinder Morgan, requested by the MDC, to provide information to the public about the Tennessee Gas Pipeline proposed expansion project through the MDC watershed and reservoir areas serving a group of eight towns and cities, including West Hartford. When I received this email, sent only two weeks prior to the comment period deadline, I undertook a thorough search of media outlets in the Hartford, West Hartford area as well as a two hour search of Kinder Morgan's website, which no notices or effort to undertake public outreach in any sort of timely manner with respect to the project, nor was there any solicitation of town feedback. A poll of our public officials also demonstrated that Kinder Morgan did not undertake to reach out to local public officials regarding the project. A single email blast from the MDC, in format typical of their regular reporting so that it did not stand out, was the only notice provided to the public and to our town council. Given Kinder Morgan's vast resources, including legal resources, media resources and financial resources, its unique ability to reach out to the public and the world when it so chooses, **the lack of public notification was a clear attempt to fly under the radar screen and forward its pipeline projects with little or no meaningful discussion with impacted town.** If and to the extent that a public outreach plan is claimed to have been in place, it either was not implemented or was not implemented in a meaningful way so as to ensure wide dissemination of information or broad public participation.

Kinder Morgan's Attempts at Exploitation of Ordinary Citizens at a Public Meeting

At the informational meeting finally held on October 7th, 2015, Kinder Morgan executives presented its project as a fait accompli and invited individual homeowners to come up to speak with them after the meeting about how they would be compensated - an attempt to begin negotiations without any disclosures of risk and without affording ordinary citizens the opportunity to consult with counsel. Kinder Morgan's approach is clearly calculated to deceive individuals with less knowledge, less information and at a time of great emotion, is certainly not in the "spirit of helping" that their executives declared. The burden of "buyer beware" should never apply to such projects, nor should a federally regulated company be permitted or encouraged by those federal regulators to exploit vulnerable individuals. FERC should not facilitate such actions or any associated exploitation but, rather, should as part of its process, ensure that the public is advised, in a meaningful way, of their legal, physical, environmental and financial risks in dealing with Kinder Morgan and that they can and should be represented by counsel.

Siting Considerations - i.e. the Need for FERC to Recognize a Balance with respect to Public Policy Considerations – The Need for Further Refinement of Natural Gas Policies when Considering Actual Implementation at the Local Level

While I recognize that there is some governmental support of natural gas in Connecticut generally, and specifically for the purpose of reducing winter heating costs, not all public officials or resident agree as to what that implementation might look like "On the Ground." Any approval process for the proposed pipeline expansion project on MDC lands should NOT BE RUSHED until such global policy statements are refined into comprehensive, workable local plans and siting that takes into account potentially conflicting "public necessities." Our state is a bit schizophrenic as to its views and all views should be considered. Additionally, Kinder Morgan should not be in a position to capitalize on the fact that such a comprehensive plan, coordinated with local constituencies, has not been prepared. There is a critical need to evaluate "global policy statement" against its likely impacts at the local level. "Global" position statements should not result in "carte blanche" pipeline approvals for private companies without further policy refinement at the local level to consider specific and local health, safety and environmental impacts. Governors come and go, winters can be more or less cold and costs rise and fall naturally but constituencies and residents remain in place, their homes are immovable, their neighborhoods stationary, and policies protecting their health and safety as well as their environment should form a part of policy and not merely an accessory consideration.

With so many pipelines and expansions thereof affecting such a small state it is imperative that FERC stop,

pause and reflect upon, and recognize that a call for “general” or “global” policy, as requested by the Governor and a Connecticut senator does not and should not be so rapidly implemented and on such a wholesale basis without examination and practical consideration of conditions on the ground. There is NO RUSH. As my son discussed his summer reading for A.P. Biology with me, it became clear that a major concept that came out of his summer reading was that **human actions and policies, implemented in haste, nearly always have PERMANENT effects on local environments.**

The risks to the public, our watershed area, our water supplies and our water infrastructure, as well as our environment, wildlife and recreation areas should NOT be viewed as “**PERMISSIBLE COLLATERAL DAMAGE**” in furtherance of a conceptual policy. Re-routing should be considered each and every time public drinking water supplies could potentially be impacted and particularly in this specific and sensitive area.

Kinder Morgan is stating that constructing high pressure natural gas pipelines through the watershed and supply areas serving the eight towns and cities minimizes impacts due to existing easements in place. That is certainly not true when, under current law, construction of any such pipelines would be prohibited. While we must live with the fact that historical (lower pressure and smaller) pipelines exist to a certain degree in that area, this does not mean that new, expanded and more impactful activities are advisable or safe merely because an easement is in place. While Kinder Morgan states that it “has mitigation policies in place,” “provides necessary training to municipalities on how to deal with explosions, leaks and other emergencies,” and “identifies impact zones,” the terms mitigation, necessary training and impact zone implies known and severe risks. As Kinder Morgan indicated when confronted with its record of safety and maintenance, mitigation measures are not a guaranty and, importantly, that Kinder Morgan is not responsible for third party causes of catastrophe – which includes acts of God. Who then, should suffer the risks and cost of a private party’s risky practices? When it comes to drinking water and watershed areas, there is, in fact, a guaranteed way to minimize impact – through reconsideration of the project entirely in light of the sensitive nature of the proposed location, or consideration of re-location of the proposed project. Minimal impact should not be interpreted merely as minimal impact vis a vis construction timetables, cost and maintenance. Alternatives are certain to be expensive for this private company – but affordable and scaled to the size of the company. The public cannot afford such risks, either on a personal or financial level. Towns and cities cannot afford the risks of permanently damaged water supplies, of public health emergencies, of emergency response or of damage to sensitive environments.

The purported “Public necessity” or “Public convenience” cited for pipeline expansion and construction must not exclude or overshadow the public. It must not override public policies and laws in place – regardless of whether at the municipal, state or federal level – that are designed to serve and protect the necessities of the public – particularly sensitive and critical public drinking water supplies and sensitive environments. Our local and regional watershed and drinking water cannot be replaced. There are no viable alternatives. FERC and Kinder Morgan decision makers should consider the permanent damage to the West Hartford reservoir areas and the towns and cities that they serve that could be caused by the expansion project – as if they too live in the area and as if they too had to decide whether the risks to their own families are “acceptable collateral damage.” We are not “other” and do not wish to be treated as acceptable collateral damage. I would like to note that at the October 7th meeting Kinder Morgan executives were asked if any of them live or would choose to live in the pipeline expansion area. While the room went silent, none of the executives was able to answer that simple yes or no question in the affirmative.

MDC

The MDC is charged by the State with ensuring and protecting our watershed resources and public water supply as well as protecting the environment as stated on their website and in investor relations materials. MDC’s “Town Partners” consist of eight Towns and Cities. As stated on their website “One of the most important measures that can be taken to strengthen source protection efforts is to permanently protect watershed lands.” It is my understanding that The MDC has not been provided with responses to critical questions

so that they can work with their partners in an informed manner to evaluate the pipeline expansion project. FERC should not rush a process wherein it appears that the MDC is being stonewalled.

FERC should formally recognize that Kinder Morgan's lack of transparency and failure to share and produce information, and statements such as those heard from Kinder Morgan at the October 7th meeting stating that "if we can't enter land we can't answer questions" preclude the MDC from doing the job that they are tasked with. An experienced pipeline company such as Kinder Morgan surely has data, planning and other materials, whether from the local area, aerial photography and other aerial technology data, as well as existing pipeline data (as they stated), or similar and relevant data from comparable regions, pipeline systems and the like, that they can provide to the MDC and that the MDC can likewise provide to its Town Partners. The FERC clock should be stopped and the time period for the filing of responses as well as intervening should be tolled to allow for delivery and comprehensive analysis of information by the MDC and its Town Partners and intervenors.

Our Youth

I am not against natural gas. Natural gas is what we have as the alternative to our history and it is a good (albeit not the only) alternative – for now and for the foreseeable future. But it is an alternative that must be monitored, approved and managed by responsible, transparent, wise people who truly respect the public that they claim they are trying to serve and the local environments in which they propose to operate, not just during construction, but for the duration of the use of any pipelines, and not just to satisfy global policy but to consider how that can be implemented responsibly on a local level.

Our "next generation" took the time to study and speak publicly to the proposed pipeline project in the West Hartford reservoir area. The speaker happened to be my 15 year old son, a high school sophomore and A.P. Biology student who may yet become an environmental engineer and work with "you," the reader, some day. I recall that as a 15 year old I never thought about the quality of my drinking water, whether my favorite stomping grounds or my back yard could be permanently contaminated or destroyed. At the time we had coal and oil for fuel – dirty fuels that destroy our environment globally, but that also destroyed our air quality locally, our landscapes, our environments, our mountainsides, our aquifers... That damage can't be undone. We, as a society, didn't take note of that at the time and that is why we are where we are.

Hopefully our kids will come up with better and better fuel alternatives over time. They no longer live in a bubble like we did.

They are watching the decision makers and studying what is being done to protect their safety and local environment (as well as our global environment). My son plans to save the photo I took of Kinder Morgan's executives' faces and body language while my son read, one by one, a list of safety violations, citations, accidents, spills, leaks, human casualties and environmental damage and asked "whether towns should trust Kinder Morgan's "commitment to safety" that they discussed and, if so, why?" He did not receive a response but rather had to stand there and listen to the "collateral damage" discussion and it didn't make him very happy.

Count on a teenager to know when he is being played!

Would you like to see the photo?

20151016-5463

Carol Hammond, Townsend, MA.

This project is WRONG on so many levels. Please do the right thing and do NOT approve this project. This is being shoved down our throats. We'll have to foot the bill so KM can stuff their pockets with \$\$\$.

The price?? Environmental damage that can never be undone. Our precious water supplies contaminated. Our landscapes destroyed. It sounds like a really bad movie but it's real. Unless FERC stops it!!! I want my Granddaughters to grow up with clean air and water.

20151016-5466

Attilio J. Qualtieri, Lynnfield, MA.

The Kinder Morgan/Tennessee Gas pipeline is not needed, and putting it in place will compromise the safety of US citizens. It is also going to negatively impact our environment. There are better alternatives including utilizing pre-existing pipelines and renewable-energy sources. Of particular note, Lynnfield/Peabody lateral is being put in play for one reason: export. That is WRONG, and Kinder Morgan is not being honest with communities.

Yes, the pipeline will go through my property, so I have a vested interest. But when you look at Kinder Morgan's abysmal safety record, how can I not be concerned for myself or my family? Kinder Morgan – run by former Enron executive Richard Kinder – has incurred a host of accidents and safety violations. In August 2003, a Caddo County, Oklahoma Kinder Morgan pipeline failed in a rural arming area and the 26" pipe exploded, throwing a 54-foot long section of pipe 30 feet from the ditch [PHMSA Corrective Action Order, CPF No.4-2003-1008H]. In 2004 a 14" pipeline ruptured in Salano County, California and spilled 120,000 gallons of diesel fuel. In 2005, a 30" Kinder Morgan pipe exploded near Marshall, Texas and sent a giant fireball into the sky, hurling a 160-foot section of pipe onto the grounds of an electric power generating plant. In 2006, a Kinder Morgan Tennessee Gas pipeline exploded near Campbellsville, Kentucky. In 2008, a Kinder Morgan Pipeline exploded and burned for more than 10 hours at Pasadena, Texas. In 2009, a Kinder Morgan Florida Gas Transmission Company 18" pipeline ruptured near Palm City, Florida. In 2014 near East Bernard, Texas, a gas pipeline next to the Kinder Morgan compressor plant blew out and destroyed the road and set a truck on fire.

There are an unbelievable amount of these examples! Just in terms of Kinder Morgan's poor safety record. We cannot have this pipeline. A better plan needs to be thought out and established, and we should seek better alternatives.

Please help the community of Lynnfield, MA. And please help my current (and future) family.

Thank you, AJ Qualtieri

20151016-5467

Mary Candels, Barkhamsted, CT.

To Whom It May Concern:

I am against the proposal by Kinder Morgan/Tennessee Gas Pipeline Company to run their pipeline across Class I and II public drinking watershed lands owned by the Metropolitan District Commission in West Hartford. Using that route undermines Connecticut's protections for its drinking water sources.

Thank you for your consideration.

Sincerely,

Mary Candels

20151016-5468

Steve Clark, Richmond, NH.

The proposed NED / KM Pipeline will destroy the quality of life we enjoy in the State of NH. The air will be laden with known toxic chemicals, water contaminated by blasting, wells and septic systems destroyed. Our rural town roads cannot handle the amount of heavy construction traffic that would be required. I hunt these ROW where this pipeline is proposed to go, and in the hilly granite ROWs when erosion washes away the ground covering over the pipeline the possibility of a bullet could puncture the line causing life ending cycle for anyone or thing in its path, keep in mind the thinnest steel allowed would be in this area since the population density is so few. My and my neighbors life do matter !!!!

20151016-5469

Alanna Casey, Mason, NH.

I am writing to express my opposition to the NED pipeline proposal. I am a Mason resident, and the collective concerns of the residents in my town have been well voiced.

This proposal has a disproportionately large impact on my town and its residents. We do not have the need for a pipeline or a natural gas supply, nor do the residents seek natural gas as a residential energy source. We take great pride in our conservation lands and wildlife presence, which would be jeopardized by such as effort. We also maintain a small government and municipal footprint, which cannot support the risks that such a project would bring to the area.

I've followed the scoping process with great interest, although I haven't been able to attend the hearings due to family commitments. If you continue to the permitting phase and allow a corporation to run a natural gas pipeline through southern NH, you have done a grave injustice to American taxpayers who live here and who have united in opposition to the project. Please, please listen to the officials who represent us, including Executive Councilor David Wheeler who seeks "no build" as an outcome, as well as our local officials who clearly outlined their concerns and requested a change in plans if the project proceeds, for example, to follow existing rights of way more closely.

I personally live in fairly close proximity to the path of the pipeline, and if the project proceeds, I wouldn't be able to sell at a reasonable price to leave the area. Realtors and sellers alike are expressing that buyers who learn about the potential for a pipeline in Mason abruptly lose interest in the area altogether.

Thanks for your time.

Alanna Casey
Mason, NH

20151016-5470

Lucia Aviles, Temple, NH.

I am a resident of Temple NH and have attended many the FERC hearings. the people and our leaders that live in the region have solidly proven that we will not have any significant benefit to the NED Pipeline, and have alternatives to makeup the 3% we "might need over the next 10-20 years. Massachusetts may need the pipeline so it should be move back to where there is a significant benefit.

Please move the New Ipswich NJ compressor station. It is 1/4 mile for our 1-4 grade school which also serves as our emergency shelter. Please have the decency to not allow the toxins and carcinogens that are released during the pressure relief of the pipeline to affect our childrens health and well-being. Please do not build the compressor station in New Ipswich. Please do your jobs.

20151016-5471

Rosemary L Wessel, Cummington, MA.

I've recently heard that there is consideration of a gas-powered electric generation plant that could be built on the former site of Entergy's VT Yankee Nuclear Power Plant in Vernon, VT. Articles about it have stated that if it goes ahead, it would need to tap into the NED pipeline. If this plan is decided upon during the permit approval period for NED, would lateral pipelines supplying the plant be added into the main project, or would that be a separate permitting process?

If part of the NED project, would the lateral run up from the Deerfield, MA side of the Connecticut River to avoid another river crossing, or would the lateral come from closer-by Northfield MA or Winchester NH, necessitating a SECOND Horizontal Direction Drill under the CT River up in that area?

The relationship of Ozone Depletion and the Greenhouse Effect

Bruce E. Johansen

Chloroflourocarbons (CFCs), initially raised no environmental questions when they were first marketed by Dupont Chemical during the 1930s under the trade name Freon. It was a time when such questions usually were not asked. At about the same time, asbestos was being proposed as a high-fashion material for clothing, and radioactive radium was being built into timepieces so that they would glow in the dark.

By 1976, manufacturers in the United States were producing 750 million pounds of CFCs a year, and finding all sorts of creative uses for them, from propellants in aerosol sprays, to solvents used to clean silicon chips, to automobile air conditioning, and as blowing agents for polystyrene cups, egg cartons, and containers for fast food. "They were amazingly useful," wrote Anita Gordon and David Suzuki. "Cheap to manufacture, non-toxic, non-inflammable, and chemically stable." (Gordon, 24) By the time scientists discovered, during the 1980s, that CFCs were thinning the ozone layer over the Antarctic, they found themselves taking on a \$28-billion-a-year industry.

The ozone shield is important because it protects plant and animal life on land from the sun's ultraviolet rays, which can cause skin cancer, cataracts, and damage to the immune system. Thinning of the ozone layer also may alter the DNA of plants and animals.

By the time they were banned internationally during the 1980s, CFCs had been used in roughly 90 million car and truck air conditioners, 100 million refrigerators, 30 million freezers, and 45 million air conditioners in homes and other buildings. Because CFCs remain in the stratosphere for up to 100 years, they will deplete ozone long after industrial production of the chemicals ceases.

These human-created chemicals do more than destroy stratospheric ozone. They also act as greenhouse gases, with several thousand times the per-molecule greenhouse potential of carbon dioxide. What's more, the warming of the near-surface atmosphere (the lower troposphere) seems to be related to the cooling of the stratosphere, which accelerates depletion of ozone at that level. An increasing level of carbon dioxide near the Earth's surface "acts as a blanket," said NASA research scientist Katja Drdla. "It is trapping the heat. If the heat stays near the surface, it is not getting up to these higher levels." (Borenstein)

During the middle 1990s, scientists were beginning to model a relationship between global warming and ozone depletion. A team led by Drew Shindell at the Goddard Institute for Space Studies created the first atmospheric simulation to include ozone chemistry. The team found that the greenhouse effect was responsible not only for heating the lower atmosphere, but also for cooling the upper atmosphere. The cooling poses problems for ozone molecules, which are most unstable at low temperatures. Based on the team's model, the buildup of greenhouse gases could chill the high atmosphere near the poles by as much as 8 degrees C. to 10 degrees C. The model predicted that maximum ozone loss would occur between the years 2010 and 2019. (Shindell, et. al., 589)

At about the same time, scientists were looking for reasons why the ozone layers over the Arctic and Antarctic were failing to repair themselves as expected following the international ban on production of CFCs. They began to suspect that global warming near the surface might be related to ozone depletion in the stratosphere. In 1998, the Antarctic ozone hole reached a new record size roughly the size of the continental United States. Some researchers came to the conclusion that, as Richard A. Kerr describes in *Science*:

Unprecedented stratospheric cold is driving the extreme ozone destruction.... Some of the high-altitude chill... may be a counterintuitive effect of the accumulating greenhouse gases that seem to be warming the lower atmosphere. The colder the stratosphere, the greater the destruction of ozone by CFCs. (Kerr, 1998, 291)

"The chemical reactions responsible for stratospheric ozone depletion are extremely sensitive to temperature," Shindell, et. al. wrote in *Nature*. "Greenhouse gases warm the Earth's surface but cool the stratosphere radiatively, and therefore affect ozone depletion." (p. 589) By the decade 2010 to 2019, Shindell, et al. expect ozone losses in the Arctic to peak at two-thirds of the "ozone column," or roughly the same ozone loss

observed in Antarctica during the early 1990s. “The severity and duration of the Antarctic ozone hole are also expected to increase because of greenhouse-gas-induced stratospheric cooling over the coming decades,” Shindell, et al. assert. (p. 589)

During the middle 1990s, scientists began to detect ozone depletion in the Arctic after a decade of measuring a growing ozone “hole” over the Antarctic. By the year 2000, the ozone shield over the Arctic had thinned to about half its previous density during March and April. Ozone depletion over the Arctic reaches its height in late winter and early spring, as the Sun rises after the midwinter night. Solar radiation triggers reactions between ozone in the stratosphere and chemicals containing chlorine or bromine. These chemical reactions occur most quickly on the surface of ice particles in clouds, at temperatures less than minus 80 degrees C. (minus 107 degrees F.)

Space-based temperature measurements of the Earth’s lower stratosphere, a layer of the atmosphere from about 17 kilometers to 22 kilometers (roughly 10 to 14 miles) above the surface, indicate record cold at that level as record surface warmth has been reported during the 1990s. Roy Spencer of NASA and John Christy of the University of Alabama at Huntsville and the Global Hydrology and Climate Center, obtained temperature measurements of layers within the entire atmosphere of the Earth from space, using microwave sensors aboard several polar-orbiting weather satellites. They found that, despite significant, short-lived warming following the eruptions of El Chichon in Mexico in 1982 and Mt. Pinatubo in the Philippines in 1991, the stratosphere as a whole has been cooling steadily during the past fifteen years.

Steve Hipskind, atmospheric and chemistry dynamics branch chief at NASA’s Ames Research Center, Moffett Field, California, has been quoted as saying that chlorine atoms use clouds as “a platform” to destroy stratospheric ozone. (Arctic Region, 4) Clouds form more frequently in the stratosphere at lower temperatures. Ice crystals, which form as part of polar stratospheric clouds, assist the chemical process by which ozone is destroyed. CFCs’ appetite for ozone molecules rises notably below minus 80 degrees C. (minus 107 degrees F.), a level that was reached in the Arctic only rarely until the 1990s. During the winter of 1999-2000, temperatures in the stratosphere over the Arctic were recorded at 118 degrees F. or lower (the lowest on record), forming the necessary clouds to allow accelerated ozone depletion.

As Dennis L. Hartmann, et al. explain:

The pattern of climate trends during the past few decades is marked by rapid cooling and ozone depletion in the polar lower stratosphere of both hemispheres, coupled with an increasing strength of the wintertime westerly polar vortex and a poleward shift of the westerly wind belt at the Earth’s surface....[I]nternal dynamical feedbacks within the climate system...can show a large response to rather modest external forcing.... Strong synergistic interactions between stratospheric ozone depletion and greenhouse warming are possible. These interactions may be responsible for the pronounced changes in tropospheric and stratospheric climate observed during the past few decades. If these trends continue, they could have important implications for the climate of the twenty-first century. (Hartmann, et al., 1412)

Ozone depletion has been measured only for a few decades, so these researchers caution that they are not entirely certain that rapid warming at the surface is not caused by natural variations in climate, which is powerfully influenced by the interactions of oceans and atmosphere. “However,” they conclude, “It seems quite likely that they are at least in part human-induced.” (Hartmann, et al., 1416) Hartmann and associates also raise the possibility that the poleward shift in westerly winds may be accelerating melting of the arctic ice cap, part of what they contend may be a “transition of the Arctic Ocean to an icefree state during the twenty-first century.” (Hartmann, et al., 1416). A continued northward shift in these winds also could portend additional warming over the land masses of North America and Eurasia, they write. (Hartmann, et al., 1416)

The connection between global warming, a cooling stratosphere, and depletion of stratospheric ozone was confirmed in April, 2000, with release of a lengthy report by more than 300 NASA researchers as well as several European, Japanese, and Canadian scientists. The report found that while ozone depletion may have stabilized over the Antarctic, ozone levels north of the Arctic circle were still falling, in large part because the stratosphere has cooled as the troposphere has warmed. The ozone level over the some parts of the Arc-

tic was 60 per cent lower during the winter of 2000 than during the winter of 1999, measured year over year. In addition, scientists learned that as winter ends, the ozone-depleted atmosphere tends to migrate southward over heavily populated areas of North America and Eurasia. “The largest ultraviolet increases from all of this are predicted to be in the mid-latitudes of the United States,” said University of Colorado atmospheric scientist Brian Toon. “It affects us much more than the Antarctic [ozone ‘hole’].” (Borenstein)

Ross Salawitch, a research scientist at NASA’s Jet Propulsion Laboratory in Pasadena, Calif. said that if the pattern of extended cold temperatures in the Arctic stratosphere continues, ozone loss over the region could become “pretty disastrous.” (Scientists Report, 3-A) Salawitch said that the new data has “really solidified our view” that the ozone layer is sensitive not only to ozone-destroying chemicals, but also to temperature. (Stevens, A-19) “The temperature of the stratosphere is controlled by the weather that will come up from the lower atmosphere,” said Paul Newman, another scientist who took part in the Arctic ozone project. “If we have a very active stratosphere we tend to have warm years, when stratosphere weather is quiescent we have cold years.” (Connor, 5) New research indicates that global warming will continue to cool the stratosphere, making ozone destruction more prevalent even as the volume of CFCs in the stratosphere is slowly reduced. “One year does not prove a case,” said Paul Newman of NASA’s Goddard Space Flight Center in Greenbelt, Maryland. “But we have seen quite a few years lately in which the stratosphere has been colder than normal.” (Aldhous, 531)

“We do know that if the temperatures in the stratosphere are lower, more clouds will form and persist, and these conditions will lead to more ozone loss,” said Michelle Santee, an atmospheric scientist at NASA’s Jet Propulsion Laboratory in Pasadena and co-author of a study on the subject in the May 26, 2000 issue of Science. (McFarling, A-20) The anticipated increase in cloudiness over the arctic could itself become a factor in ozone depletion. The clouds, formed from condensed nitric acid and water, tend to increase snowfall, which accelerates depletion of stratospheric nitrogen. The nitrogen (which would have acted to stem some of the ozone loss had it remained in the stratosphere), is carried to the surface as snow.

Steve Clark, Richmond, NH.

Strongly oppose having a transit pipeline coming through NH for export. I have no desire to pay a tariff on goods and services that no one can get in the state. They talk of potential lateral lines for home heating from

this 30" 1400PSI line, since most homes heat with oil or electricity in the state who would pay to convert. I sure wouldn't and Kinder Morgan is not going to, or the provider that hasn't committed to any of the gas. I use a renewable wood pellet as many for my source of heat. NO GOOD FOR NH

20151016-5476

Dear FERC, USACE and EPA,

Please do not approve the Northeast Energy Direct Project as the current route is too close to my water supply and runs directly through the water shed of my valley and a head waters system of the Schoharie Creek therefore it violates the Clean Water Act. It also must go through the watershed of the Town of Coleskill Reservoir system in order to reach me. So Please disapprove of this current route.

Sincerely,

Harold Wright

20151016-5477

Andrew King, Bloomfield, CT.

To whom it may concern,

I am writing to voice my strong opposition to the proposed Kinder Morgan pipeline through West Hartford and Bloomfield, CT. Listed below are my reasons:

The proposed pipeline would go through Class I and II lands owned by the Metropolitan District Commission (MDC). This could adversely affect the drinking water of 400,000 residents.

The MDC reservoirs are a valuable recreational resource for the residents of greater Hartford. The construction of the pipeline would disrupt our access to this tranquil and important land, especially since the pipeline would intersect with, at multiple points, the Metacomet Trail. The clear cutting necessary would also irrevocably mar this incredible and precious resource.

The MDC reservoirs also provide habitat for many species of birds, plants, and animals. The blue-winged Warbler, a species of special concern, breeds in the unique habitat of the reservoir. A major population of this bird breeds in this location and destruction of its habitat could result in major decline of the species.

The proposed pipeline would devastate the Wintonbury Land Trust's Speer Preserve. Two community wells are very close to this land and disruption of groundwater through blasting and/or excavating could pollute our wells and render our neighborhood without potable water.

Thank you for the opportunity to comment.

20151016-5480

Frank Barrus, New Ipswich, NH.

I am writing this letter concerning the justification of public "need" for the building of the NED pipeline. If the need cannot be justified, then eminent domain should not be allowable as a means to acquire right of ways in which to build the pipe or place compressor stations. This need currently rests on providing enough gas capacity to NH and New England to justify the need for public good. However, it is my understanding that much of the capacity being listed as required and coming from the new NED pipeline is already being provided by other pipelines. So much of the "need" is coming from transferring service from other existing pipelines over to the new NED pipeline. This is not a true "need" unless there's some reason the other pipelines are being shut down.

How will FERC ensure that the classification of "need" really is fair and in the best interest of the public, before allowing eminent domain to be used to acquire land rights?

Placing this pipeline on private land where it is neither needed nor wanted is not fair or just, and goes against the intent of eminent domain laws if no true greater public need can be shown.

Kinder Morgan / Tennessee Gas Pipeline Co.
Northeast Energy Direct
FERC Docket #PF14-22

Impermissible Segmentation

In the Delaware Riverkeeper Network v. FERC ruling in June 2014, the D.C. Circuit explained that an agency impermissibly segments NEPA review when “it divides connected, cumulative or similar federal actions into separate projects and thereby fails to address the true scope and impact of the activities that should be under consideration.” Delaware Riverkeeper Network v. FERC, 753 F.3d 1304 (D.C. Cir. 2014). Also mentioned by the court were “Connected actions” include actions that are “interdependent parts of a larger action and depend on the larger action for their justification.” Id. § 1508.25(a)(1)(iii), citing physical, functional and temporal connection between the segments.

These two projects, going through permitting nearly simultaneously and having construction schedules just months apart show a temporal connection. Physically and functionally, the ties are even closer, with looping along several points of construction along Northeast Energy Direct’s “Market Path” in eastern upstate New York, Berkshire County, MA and in Connecticut. This clearly shows that these projects are two parts of the same expansion of capacity for Kinder Morgan / Tennessee Gas Pipeline Co.

Please investigate this aspect of both dockets and reject them both as impermissibly segmented. If Kinder Morgan feels it needs a larger project, it should start the process over with both of these projects under one property documented pipeline plan.

Rosemary Wessel
Founder, No Fracked Gas in Mass

20151016-5488

Dear Secretary Bose,

I ask that the FERC consider the following in the scope of the environmental impact statement for Tennessee Gas Pipeline Company's Northeast Energy Direct project (PF14-22):

1. **Air Quality:** Compressor station emissions need to be fully known by the public, and regulated for the health of residents and wildlife. Air currents, including seasonal air inversions, must be understood before compressor stations can be sited. Air quality should also be monitored closely for at least a full year before any construction begins.
2. **Water and Pollution:** There must be an acceptable plan for the removal of liquid condensate produced out of pigging operations. The chemical makeup of this condensate must be fully known by the public. There should be full hydrogeological studies along the pipeline, with adequate detail in areas surrounding value stations, pigging facilities, and compressor stations, so that if liquid condensate were to be leaked or spilled, it would be clear how possible contaminants might move through the watershed. In the event of a spill, the pipeline company must be held liable.
3. **Wetlands and Wildlife:** There must be on-the-ground, springtime surveys of wetland resources, and subsequent protection of them, including buffer zones as established in Massachusetts (which include part of the essential upland habitat for mole salamanders). Many vernal pools, seasonal streams, and small wetlands are still unmapped. These resources are protected from the actions of landowners, and an out-of-state corporation must be held to the same standards.
4. **Land Use and Local Bylaws:** Northfield, MA (my town) is in the midst of revising our bylaws; a bylaw study was started several years ago. Part of this revision includes regulations for industrial sites. Tennessee must follow these bylaws if Northfield voters have passed the bylaws before construction begins.
5. **Alternatives and MA energy policy.** Massachusetts energy policy has encouraged a transition away from fossil fuels in an effort to meet the mandates of our Global Warming Solutions Act, passed in 2008. The idea is that even when slightly more expensive to use renewable energy and demand solutions, it is worth it for the sake of reducing our impact on global warming. Any New England fuel needs should first be met by efficiency measures (including life-style changes, insulation, energy star appliances, a smart grid, etc.), then renewables (solar, wind, responsible hydro, tidal), by fixing leaks in existing pipelines, by utilizing existing resources for peak demand shortages (such as LNG), and by increasing the capacity of gas or electricity storage. If the Attorney General's study reveals that there is an actual need for additional natural gas capacity (not simply a desire on the behalf of companies that would profit from it), then I suggest expanding the capacity of existing pipelines moderately. Building this entirely new, very large transmission pipeline would lock us into its use for many years, rather than encouraging a swift transmission to renewable energy and storage systems.
6. **Socioeconomics:** This pipeline and the associated facilities are sited in rural areas where people have low income. Franklin Co, MA, which would host about 35 miles of pipeline and a compressor station, has an average per capita income of \$29,259, compared with the MA average per capita personal income of \$35,763. People who live here have, in many cases, chosen to live far from the convenience of cities because they love being connected to nature, the small-town, rural feel, and the assurance that the air is clean. To live here, people have sacrificed proximity to employment, economic welfare, and access to other benefits of city life, such as entertainment and shopping, in order to enjoy the rural nature of these towns. Imposing the pipeline and associated facilities on this area, where the residents would bear the

burden of them but not enjoy the benefits, is deeply unjust.

7. Land use and Recreation: In Northfield, MA, the pipeline as proposed would cross the New England National Scenic Trail in two places, quite close to a well-used hiker's cabin, and the compressor station would be situated less than a mile from the hiker's cabin and within 1/3 mile of the trail. Further, the town has developed a hub of hiking trails on the ridge where the proposed compressor station has been sited. This includes multiple loop and long-distance trails in the Northfield Town Forest, Brush Mountain Conservation Area, and Northfield State Forest. The town hopes to capitalize on our excellent scenery and many hiking trails; we have plans to build additional trails in the area, and the close proximity to the compressor station, we fear, would compromise the peaceful and scenic nature of the area.

Thank you for your consideration of these comments. I ask that you consider all applications for the Northeast so that the region is not overbuilt, consider the climate impacts of allowing additional pipelines (i.e. the ability of drillers to export gas leading to additional wells being drilled, resulting in more gas being released into the atmosphere), and ultimately, I ask that you discourage Tennessee Gas from proceeding with this application.

Re: Scoping Comments, Kinder Morgan Northeast Direct Project, Docket No. 14-22-000

As a resident of Massachusetts, I am writing to express my serious concerns with the Northeast Direct project proposed by Kinder Morgan /Tennessee Gas Pipeline. I believe this project will have the most detrimental impact on the environment of Western Massachusetts since the creation of the Quabbin Reservoir in the 1930's. I support the comments of the Environmental Protection Agency, Region 1 filed on October 16, 2015 and further support a no build alternative.

Cumulative Impacts

The cumulative impacts of the project must be fully addressed in the environmental impact statement. Cumulative impacts are: "impact[s] on the environment which result from the incremental impact of the action *when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions.* Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time."¹

FERC, therefore, is required to consider the impacts of the Project in the context of existing and reasonably foreseeable Marcellus Shale development, which includes, but is not limited to, the hundreds of miles of gathering and transportation pipelines that have been and will need to be constructed to move the gas from the thousands of wells that have been and will be drilled to interstate markets.

This expansion project is specifically being proposed to facilitate transportation of Marcellus Shale natural gas and the NEPA document must review the environmental consequences of using hydraulic fracturing techniques in the Marcellus Shale as a cumulative impact of the project. This must include an examination of the impacts to all watersheds in the Marcellus Shale region from withdrawing water for drilling purposes, use, and disposal of water containing fracking compounds back into the ecosystem.

The cumulative impact of the multiple utility and other projects that are being proposed or constructed

across the region on our publically owned lands and critical resources must be examined. These projects do not occur in a vacuum and as each one depletes the natural and scenic resources of the region, their combined impact could be devastating. Within the past five years, FERC has approved numerous pipeline and related infrastructure expansion projects, including twenty-nine in Pennsylvania, eleven in New York, and one each in Connecticut, Rhode Island and Massachusetts. Numerous additional projects have been filed and are in pre-filing status, or have been publicly announced by companies including Spectra Energy, Kinder Morgan and Transco Williams.² If proposals continue to move forward, the impacts would be ruinous and must be addressed in the NEPA document. The cumulative consequences of all these projects, some previously subject to FERC approval, must be assessed in the NEPA document.

The Council on Environmental Quality issued Guidance on how climate change impacts and greenhouse gas (GHG) emissions should be considered in NEPA documents. The revised draft guidance states:

“When assessing direct and indirect climate change effects, agencies should take account of the proposed action – including “connected” actions – subject to reasonable limits based on feasibility and practicality. In addition, emissions from activities that have a reasonably close causal relationship to the Federal action, such as those that may occur as a predicate for the agency action (often referred to as upstream emissions) and as a consequence of the agency action (often referred to as downstream emissions) should be accounted for in the NEPA analysis.”³

Additionally, the Guidance suggests that consistency with goals such as those outlined in Massachusetts’ Global Warming Solutions Act (GWSA) should be included in agencies’ environmental review.

“To provide a frame of reference, agencies can incorporate by reference applicable agency emissions targets such as applicable Federal, state, tribal, or local goals for GHG emission reductions to provide a frame of reference and make it clear whether the emissions being discussed are consistent with such goals.”⁴

With regard to the previously approved Algonquin AIM expansion, the Environmental Protection Agency (EPA) states:

“The EIS should have more fully considered the potential for increased gas production associated with the development of the related pipeline capacity. In addition, we note that the FEIS [Final Environmental Impact Statement] discussion continues to make reference to gas extraction occurring more than 10 miles from the proposed project location as a rationale for limiting the discussion of cumulative impacts. **Geographic proximity is not in and of itself the standard for NEPA’s requirement to consider impacts that have a reasonably close causal relationship to the proposed federal action.**”⁵

In their comments on Spectra’s AIM Final Environmental Impact Statement (FEIS), EPA states:

“EPA notes and agrees with FERC staff acknowledgement that ‘disparate sources of greenhouse gas (GHG) emissions individually contribute to the global climate change issue.’ ... we continue to believe that FERC should avoid the comparison of project related GHG emissions to those associated with an entire regions. The goal of the analysis should not be to make emissions seemingly more or less significant; rather, it should be to disclose the emissions from the project in a manner that allows for an informed discussion of the emissions and measures that can be taken to address them... We also continue to recommend that FERC consider relevant studies regarding methane leaks and emissions.”⁶

Methane and other emissions from the pipeline infrastructure and compressor stations must also be examined. Cumulative impacts of future emissions from the proposed Connecticut Power Ventures (CPV) Towantic Energy Center in Oxford, CT must be considered in the NEPA document. The Connecticut Siting Council granted proposed modifications in May 2015, expanding the size of this facility, which was granted an original certificate in June 1999, pending approval of its Development and Management Plan. ⁷

Export

Pieridae Energy and Bear Head LNG Corporation and Bear Head LNG (USA) LLC (Bear Head) were granted approval by the Department of Energy (“DOE”) to export gas through Spectra Energy’s pipelines

from the United States to the Liquefied Natural Gas (“LNG”) facilities in Canada to Free Trade Agreement countries. There are currently four companies with applications before the Department of Energy to contract with pipeline companies, including Spectra, for gas to export from the US to Canada, and to both FTA and non Free Trade Agreement Countries from existing or planned LNG facilities in Eastern Canada. The other two are Downeast LNG, Inc. (Downeast) and American LNG Marketing, LLC. (American).

In Pieridae and Bear Head’s applications to the DOE, they refer to Kinder Morgan Northeast Direct project, and Bear Head states regarding Spectra’s Maritimes & Northeast pipeline (M&NP):

“M&NP’s current operations involve moving gas from Canada to the United States (i.e., north to south)... An operational reversal of the M&NP would be required in the first instance to enable gas supplies to flow on a firm basis from south to north (i.e., from the Dracut, MA delivery point on the M&NP system to the Project pipeline header).”⁸

The fact that Spectra is proposing to reverse the flow in the M&NP as part of the Atlantic Bridge project shows that their long-term aim is to gain access to export markets and not to serve the public need in the United States. In fact, exporting natural gas is contrary to the public’s interest.

Environmental Impacts Resulting from Fracking

As the project will encourage the expansion of the gas drilling technique of fracking by expanded the infrastructure to export supplies from the region, the consequences of fracking must be examined as a cumulative impact of this project. Between 2 to 9 million gallons of water are mixed with hazardous chemicals and sand and injected into each fracked well. According to a Congressional report, 750 different chemicals are used in fracking in the U.S.⁹ Fracking threatens our water supply with hundreds of toxic chemicals and major water withdrawals. FERC must examine in its review of the proposed pipeline all secondary and cumulative impacts the project will have on encouraging the expansion of fracking in the region.

As noted above, the contribution of fracking to climate change must be studied as a cumulative impact of this pipeline project. Moreover, a cumulative impact analysis requires that these GHG emissions be considered in the context of GHGs emitted from the aggregate of natural gas that have been and will reasonably be extracted from the Marcellus Shale region in the foreseeable future.

Climate Change and Greenhouse Gases

The impacts outlined below that we urge you to examine in the NEPA document are in addition to the concerns with greenhouse gas footprint of shale gas and emission rates of gas fields and pipelines systems expressed earlier.

The construction of the project will require a massive amount of fossil fuel to power construction equipment, which will have a significant impact on climate change. The NEPA document must explore what impact construction vehicle emissions will have on global warming.

FERC should consider the cumulative impacts of the Project’s direct and indirect GHG emissions. Direct emissions may include but are not limited to carbon dioxide (“CO₂”) and nitrous oxide (“N₂O”) emissions from compressor engines, line heaters, and generators; fugitive methane emissions from compressors and pipelines; and black carbon emissions from diesel vehicles and equipment. Notably, N₂O is 280 times more warming than CO₂ over a twenty-year period,¹⁰ while black carbon is estimated to be 2,200 times more warming than CO₂ over the same period.¹¹

Production, processing, transport and use of natural gas accounts for slightly under 30 percent of U.S. climate pollution.¹² Methane is a greenhouse gas over 87 times more effective in trapping heat in the atmosphere than carbon dioxide (CO₂) over a twenty year period.¹³ The contribution of Spectra’s current pipeline system to global climate change through methane emissions and how that would be augmented by expanding that system through the Northeast Direct project must be disclosed by FERC in the NEPA document.

Thank you and I look forward to your full consideration of these comments.

Sincerely,
Karina Wilkinson

20151016-5495

Dear FERC, USACE, EPA and N.Y. DEC,

This project with its current route will bisect the eco system and massive wetlands of this valley. As the current route stands it will inevitably destroy it and the many creatures living here. Please disapprove it and force them to use the I-88 corridor and or the existing rows.

Sincerely,
Harold Wright

NH Geological Survey

The statements describing geologic conditions and hazards are factual and relevant. Flooding and seismicity represent the greatest vulnerabilities as indicated. Paleontological resources are not an issue, although to the best of my knowledge, no “consultation” was ever initiated with the NH State Geologist as stated on page

6-76. The characterization that NH's igneous and metamorphic rocks are of Precambrian age (page 6-75) is inaccurate but the error is of little consequence given the overall context of the Paleontology section.

NH DES questions whether the stated 200-foot blast radius is sufficient to identify wells at risk from impacts of blasting on water quality and quantity. A 1,000-foot buffer may be more reasonable to establish ambient groundwater conditions in wells prior to blasting and safeguard well owners.

2. Water Division

Resource Report 2 – Water Use and Quality:

Reporting must show in all cases that the Least Environmentally Damaging Practicable Alternative (LED-PA) has been evaluated and selected.

In addition, compensatory wetlands mitigation needs to be provided for unavoidable impacts or conversion that is proposed to take place outside of co-location of the pipeline installation in existing utility ROWs.

Wetlands, stream, river and waterbody crossings must be undertaken under low flow conditions – usually from mid-June through September.

Wet open cut waterbody crossings are discouraged. Dry crossing methods or HDD are preferred.

Page 2-58 reports on the Amherst Conservation Commissions' concern for the proposed HDD crossing of the Souhegan River due to the fluvial erosion which occurs there because of the highly erodible soils along the meandering river course. It is recommended, that if at all possible, an alternative route for the pipeline be found to avoid impacts to the Souhegan River, its' associated oxbow ponds and vernal pools.

All wetland impact areas must be field surveyed / ground truthed in addition to being located on aerial photography to determine soils, vegetation & hydrology of the proposed impact areas.

The identification, location, classification and delineation of wetlands using the USACE Wetlands Delineation Manual of 1987 plus the 2012 Northeast Region supplement as well as the USFWS Cowardin et al. 1979 classification system is appropriate. However, section 2.3 Wetlands refers to field surveys conducted in 2014 which covered only a small portion of the areas of wetlands to be impacted. This procedure must be followed for all wetland impact areas whether permanent impact, TWS or ATWS.

The conversion of PFO to PEM wetlands over the pipeline is acceptable. Stream and waterbody crossings must restore the riparian buffer to preexisting conditions.

Section 2.3.1.4 indicates that surveys of permanent and temporary wetlands impact areas have been based on field surveys and publically available data, but are not complete as there are areas where the pipeline is proposed to be installed where access was not available or provided.

Table 2.3-11 shows the total wetland impact in NH to be 73.57 acres.

Resource Report 3 – Fish, Wildlife and Vegetation:

Section 3.4.2.2.4 recognizes the need to coordinate with NHHB and NHFG on NH State-Listed Endangered and Threatened species and habitats to develop survey protocols and appropriate protection measures.

A NH-specific Invasive Species Management Plan needs to be developed and implemented prior to the installation of the pipeline (<http://des.nh.gov/organization/divisions/water/wmb/exoticspecies/index.htm>).

The permittee shall provide the NH DES Wetlands Bureau with a restoration monitoring report for all wetland and waterbody impact areas, including photographs taken from established photo stations, with a special emphasis on the removal of any invasive species that might appear in the impact areas.

Resource Report 4 – Cultural Resources:

The applicant has coordinated with NH DHR and filed a Request for Project Review. A Phase 1A archaeological survey has been undertaken in addition to an above-ground survey has been initiated.

Resource Report 7 – Soils:

See Mapsheet 57 of 99 Figure 7.1-1.

The pipeline segment MP20 to MP21 involving several crossings of the Souhegan River and riparian areas associated with the Souhegan River in Amherst needs to be rerouted to avoid adverse environmental impacts to the River and its environs. This proposed route for the pipeline segment between MP20 and MP21 is certainly not the Least Environmentally Damaging Practicable Alternative.

Resource Report 10 – Alternatives:

See Page 10-75 and Mapsheet 1 of 1 Figure 10.3-15

Town of Amherst, NH Segment J MP20.5 to MP21.5 Reason for Minor Deviation: Deviation to reduce number of crossings of Souhegan River. The Souhegan River will be crossed by HDD to mitigate impacts to the river. Status N/A = Not Adopted = deviation not incorporated.

This issue needs to be resolved and an explanation given as to why the pipeline cannot be rerouted to avoid impacts to the Souhegan River altogether!

The intent of this project was to identify any parcels of land within the proposed right of way for the Kinder Morgan pipeline that were associated with wetland mitigation for a NH DES permit. NH DES reviewed 22 wetland permit files that were identified in the towns the pipeline crosses. These files were identified as permits that provided mitigation in the form of an easement within the Town. The dates of these files ranged from 1998 to 2014. Table 1 (below) summarizes each site and the data reviewed.

Table 1 - Relevant Wetland Mitigation Files

FILE	YEAR	NAME	Address	Town	Database Notes
1998-00447	1998	SALEM CORP PARK ASSOC	Stiles Road	Salem	Mitigate with two easements totaling 5.34 acres (1.13 acres of upland) and dense plantings. Easement appears to be just to the north.
1998-02267	1998	Town of Londonderry	West Road	Londonderry	No information on mitigation.
2000-00321	2000	K.E.M. REALTY	Off Equestrian Road	Salem	Construct 9,000 sq. ft. of wetlands and provide 8.6 acres of Conservation Easement (4 acres of upland and 4.6 acres of wetland).
2000-00787	2000	FRITCH, UDO	32 Northwestern Drive	Salem	Place approximately 60,000 sq. ft. in conservation easement on new lot 10580 shown as 4.17 acres.
2000-02219	2000	WINDHAM, TOWN OF	Griffin Park Range Rd	Windham	Mitigate by providing an 8.15 acre Conservation Easement. Recorded in Rockingham Cty Registry of Deeds on April 16, 2002, at 10:10 a.m., Bk 3755, Pg2626.
2000-02610	2000	CONTINENTAL PAVING	Colby Road	Litchfield	Mitigate by providing an 8.15 acre Conservation Easement. Rec'd recorded Conservation Easement on 10/31/02 from David Sullivan, Town of Windham (Recorded in Rockingham Cty Registry of Deeds on April 16, 2002, at 10:10 a.m., Bk 3755, Pg2626
2001-01318	2001	ASHWOOD CO.		Milford	Easement information not in file. See also 2004-02718. See attached map.
2002-00312	2002	LITTLE MACKENZIE DEV LCC	Route 31 / Route 124	Greenville/New Ipswich	Preserve 13.8 acres of land in a conservation easement, consisting of approximately 4 acres of jurisdictional wetlands and 9.8 acres of contiguous upland buffer.
2002-00327	2002	MERRIMACK SCH. DIST./SAU 26	Baboosic Lake Road	Merrimack	Thirty five acre conservation easement.

2002-01135	2002	CLUFF RD RLTY TR&BRADDOCK, J.	59 Cluff Road	Salem	File box/cabinet not found. A 7.5-acre parcel must be transferred to the Town of Salem; A conservation easement must be recorded on the 100-foot Prime Wetland buffer; PARCEL NOT CONFIRMED, but nothing on the pipeline in the vicinity of the project location.
2002-01717	2002	AGAWAM LTD / M. FREDERICKS III	Independence Drive	London-derry	A 25-acre conservation easement to the Town of Londonderry. RECORDED EASEMENT RCVD 3/9/06.
2002-02297	2002	R&D LONDONDERRY DEV., LLC	Wiley Hill Road	London-derry	Mitigation will be provided as a total of 13.16 acres of land. One parcel is in Londonderry (Lot 5-10-40) and the second in Litchfield (Map 14-48). Identified as Kamko Easement.
2003-01188	2003	H & B HOMES CORP / BENCHMARK E	Rte 28/Rockingham Road	Windham	RECORDED EASEMENT RCVD 10/23/06. Compensatory mitigation for wetlands and surface waters impacts preserve approximately 107.5 acres on-site, including 27.6 acres of wetlands and 79.9 acres of contiguous upland buffer. (Subdivision). Parcel not identified but is well to the northeast of the pipeline. Multiple conservation parcels in the area so need to identify which parcel is for this permit
2003-01296	2003	CHAMBERLAIN, THOMAS & GERTRUDE	Rte 3A	Litchfield	Cabinet is locked. Compensatory mitigation is provided as a 10.2 acre conservation easement deeded to the Town of Litchfield. Parcel identified just to south of project location. Parcel was reported as 10.2 acres, but recorded as 27.8 acres. Note in ConsNH layer identifies it as DES Mitigation parcel.
2003-01878	2003	BACON, HOLLY / BACON, ROBERT	Perry & Old Wilton Rds	Milford	Compensatory Mitigation: A 10 acre conservation easement on the same parcel will be reserved to provide habitat for Bobolinks and other field nesting birds. (Warehouse construction). Parcel not identified and none noted in area but well out of area of pipeline
2004-00670	2004	FRANKLIN PIERCE COLL./KIRSH, B	Mountain Road	Rindge	Preserve 64.2 acres in a conservation easement. RECORDED CE RECVD 8/19/05. Parcel in permit area identified as 49 acres
2005-02083	2005	COMEAU, JOHN & OLIVIA	100 Dutton Rd	Pelham	File not located. See attached Map -Lot 10-10. From Database: Wetland impact mitigation consisting approximately 38 acres of preservation land that includes 15.24 acres of uplands and 22.39 acres of wetlands, vernal pool easements on lots 10-10-11 and 10-10-12, and an amphibian crossing tunnel and an amphibian diversion walls connecting lots 10-10-11 and 10-10-12 to preservation lot 10-10.
2007-00364	2007	H&B HOMES CORP.	Northland Rd Off Rte 28	Windham	Compensatory mitigation consists of a total of 195.08 acres of land that will remain, in perpetuity, in open space through conservation easements, donation of land to the Windham Conservation Commission. (Cluster development). Parcel does not appear on conservation layers, but is well out from the pipeline. Look in file for conservation information.

2007-02278	2007	DODD, FREDERICK J.	357 Robbins Rd	Rindge	Compensatory mitigation for the wetland impacts consists of a conservation easement on a 17 acre parcel created on the project property that will connect to an existing conservation parcel.
2007-02324	2007	CHELSEA PROPERTY GROUP		Merrimack	File not in drawer. Parcel likely not adjacent to impact (Merrimack Outlets). "Grater Road" parcel? However mitigation amount in database indicates 59 acres and these two parcels are only 14.2 acres and are in Amherst. The South Grater Rd. parcel is in Merrimack and is 72 acres but the conservation layer indicates it was added in 1998.
2010-00247	2010	SAU-87/MASCENIC REG. SCHOOL DI	Turnpike Road (NH Rte 124)	New Ipswich .	Mitigation includes preservation of an adjacent ± 45 acre parcel (Greenville Tax Map 2, Lot 8). Need to confirm with tax layer
2013-02888	2013	COLBURN, CAROLE M.	Osgood Rd	Milford	File not available. Recently recorded, not shown on conservation layer. File information indicated 44.146 acres will remain as open space in perpetuity, as part of 96 acres subdivision.

While DES accepts these parcels as mitigation; the parcels are typically turned over to the Town, or a local conservation group. Many of these parcels have been digitized and are identified in a state-wide conservation layer available on New Hampshire's Statewide Geographic Information System (GIS) Clearinghouse, NH GRANIT (<http://www.granit.unh.edu/>); however, given the limited resources of DES, GRANIT and local municipalities, as well as the age of some of these parcels, it is possible some have not been digitized or added to the GRANIT. In addition, since the parcels are not retained by DES, the parcels may not be flagged as mitigation parcels in the GIS layers. To this end, DES has taken the following steps to cross-reference information in DES files and available GIS layers to locate the mitigation parcel associated with each file, and its spatial location in reference to the proposed Kinder-Morgan Pipeline.

1. A list of permits with mitigation required was generated from the Wetland's Foxpro database.
2. Permits in the towns which the proposed pipeline crosses were selected by wetland GIS staff.
3. A GIS Map was created with the following information:
 - a. The location of each of the permitted projects identified in Step 2;
 - b. The location of the pipeline as provided by OEP in March 2015;
 - c. The New Hampshire Conservation lands layer (CONSNH) maintained by NH GRANIT (last updated April 2013);
 - d. The State-wide parcel Mosaic parcel data as available on March 31, 2015.
 - e. A DES layer "deslands" was added; and
- 1.)
4. Information in DES's database was reviewed for each file and relevant information regarding the location of the parcel was noted. In some instances a lot and parcel number were referenced; however other times information only the parcel acreage was noted or a Book and Page number.
- 2.)
5. An attempt was made to locate the paper files for each project in the DES Concord office. The table notes if the file was located. A list of files to be followed up by the Pease office will be forwarded to them.
- 3.)
6. Based on the information in the database and the paper files, the mitigation parcel was identified on the GIS map. In some instances the parcel was adjacent to the mitigation site (i.e. in housing de-

velopments) or a lot number was provided. If only a book and page number for the transaction was noted, the Registry of Deeds was reviewed on line for additional information.

4.)

7. A map for each file number was printed with relevant information and details are noted in the attached table.

5.)

8. Used GIS to select all the parcels that are within 50 feet of the pipeline and the laterals (39 conservation parcels were identified). These selections were reviewed to see if there were any notes within the CONSNH database related to DES Mitigation sites. One site with permit number 1998-02267, associated with a parking area for proposed athletic fields on West Road in Londonderry was identified from this search. Of note, one other parcel noted during this search (SOURCE TAX MAP 15/8-209,210,211), associated with the Pelham Transfer station, indicated it was 70% Prime Wetland.

6.)

Conclusions and Follow-Up

7.) A mitigation parcel associated with Wetlands Permit 2005-02083 is adjacent to the proposed pipeline route from the plan provided by OEP in March, 2015. This parcel is within the current utility corridor based on aerial photographs. The parcel is identified as FID 8170 on the New Hampshire Conservation/Public Lands available from NH GRANIT (<http://www.granit.unh.edu/data/download-freedata/alphabetical/databyalph.html>) and is shown in the attached Figure. While the pipeline as currently shown does not transect this parcel, it is possible access may be necessary on this parcel and is important to note in the event the proposed pipeline route is altered.

8.)

9.) A mitigation parcel associated with Wetlands Permit #1998-02267 is within the proposed pipeline. It is identified in the CONNH Layer as the West Road Fields Easement. TID 197-067-001

Follow-Up/Notes

10.) Litchfield parcel 14-48 from 2002-2297 is not in the Cons NH layer/GRANIT.

NH DES Drinking Water & Groundwater Bureau:

Overall Document Comment – The Kinder-Morgan project documents focusses on the construction of an underground natural gas pipeline. In New Hampshire, some utility easements allow for the conversion of a natural gas pipeline to a liquid oil pipeline. If this the case with the proposed Kinder Morgan natural gas pipeline, all aspects of the Environmental Report should be updated to assess this pipeline use scenario.

Section 2.0 – Overall Comment

This section needs to be update to discuss:

- 1) The location of the pipeline relative to potential groundwater sources of drinking water required to meet future water needs.
- 2) The impact of constructing an extensive pipeline across the state of New Hampshire on water systems that need to install or replace water mains that cross through or are located in closed proximity to the pipeline.
- 3) Methods to manage vegetation once the pipeline is constructed and impacts on groundwater and drinking water quality.

2.1.1.4.1 Aquifers

This section states, “Figures 2.1-1a and 2.1-1b in Attachment 2a to this Resource Report depict the bedrock aquifers and surficial aquifers crossed by the proposed Project in New Hampshire.” This is not correct;

mapsheets 13-15 and 17-18, which depict the New Hampshire portion of the proposed route, do not depict surficial aquifers. DES suggests that the maps also depict wellhead protection areas (WHPAs) on maps included in this report. WHPAs were clearly considered in the preparation of the draft resource report, since they are mentioned, but the term is also inappropriately applied to the watersheds of Canobie Lake and Arlington Mill Pond, both public water supply sources. Also, the discussion in this section focuses on major stratified-drift aquifers and then on WHPAs for the wells in those aquifers, so it is not clear whether the scope of the discussion has been narrowed down based on the location of major aquifers. The discussion should include all WHPAs: groundwater classified GB, GA1, and GAA; and water supply watersheds.

2.1.1.4.3 Groundwater Quality

Correction: the groundwater quality classifications referred to are actually groundwater protection classifications. They refer to different levels of protection. This section discusses groundwater protection under the NH Groundwater Protection Act (RSA 485-C). Equally important is groundwater protection implemented on the local level through land user ordinances, such as aquifer protection ordinances, adopted and implemented by municipalities as authorized by state land use statutes. This section references the groundwater protection BMPs adopted by NHDES under the RSA 485-C; it should be noted that some aspects of the proposed project are subject to those BMPs. The draft RR states, "The Project is not anticipated to have impacts on any aquifers or public and private water supplies." With respect to potential impacts to groundwater quality in general and to water supply sources in particular, the EIS should report on any incidents of groundwater or water supply contaminations associated with Tennessee Gas Pipeline's facilities similar to those associated with the proposed project. The rationale for this request is not that Tennessee's record is at issue, but that it would be informative with respect to potential impacts associated with these types of facilities.

Section 2.1.5 & Table 2.1-2

The document references a using data from NH Granit to identify wells within 200 feet of the proposed pipeline. Wells within 2000 feet not 200 feet need to be identified.

Table 2.1-2 indicates that wells were identified using data from NH Granite and it is unknown if the wells identified or public or private. NHDES has GIS coverages that specifically identifies the location of all sources of water for public water systems. Additionally, NHDES has developed methods to identify if a private well is present on a given lot for all areas of New Hampshire. The most current dataset for identifying the location of sources of water for public water systems needs to be utilized. Additionally, revisions to this document should utilize information from NHDES that identifies lots within 2000 feet of the pipeline with private wells.

2.1.5.1.4 – The document states that it is awaiting a response to an December 2014 request to NHDES regarding the location of public water systems. NHDES has responded to multiple requests for data from consultants working on this project. Additionally, this data can be obtained on the internet from NH DES's OneStop.

2.4.2.3 – Despite the implementation of rock blasting best management practices to avoid the contamination of groundwater, rock blasting has contaminated groundwater sampled from drinking water supply wells up to 2000 feet away in New Hampshire

Section 6.2 – Blasting & Appendix M (Attachment M8 Blasting Management Plan)

The provisions to protect groundwater and public and private water supply wells from becoming contaminated by activities and materials associated with rock blasting are not adequate. In New Hampshire, rock blasting has contaminated groundwater obtained from drinking water wells with nitrate, nitrite and volatile organic compounds. The document needs to be revised to include provisions to:

- 1) Always utilize blasting best management practices to prevent the contamination of groundwater;
- 2) Identify wells within 2000 feet, opposed to 200 feet where blasting will occur. Monitor the water

quality (nitrate, nitrite and volatile organic compounds) in representative wells before , during and after rock blasting;

- 3) Identify methods that will be employed to identify private and public water supply wells
- 4) Identify methods that will be employed to address increased turbidity in wells due to excavating bedrock using mechanical or rock blasting methods.

The provisions proposed in the document do not meet the following standard requirements for NH DES's Alteration of Terrain Applications:

- 1) **[If more than 5000 cubic yards are blasted]** Identify drinking water wells located within 2000 feet of the proposed blasting activities. Develop a groundwater quality sampling program to monitor for nitrate and nitrite either in the drinking water supply wells or in other wells that are representative of the drinking water supply wells in the area. The plan must include pre and post blast water quality monitoring and be approved by NH DES prior to initiating blasting. The groundwater sampling program must be implemented once approved by NH DES.
- 2) **[Applies to all Blasting]** The following Best Management Procedures for blasting shall be complied with:
 - (1) Loading practices. The following blasthole loading practices to minimize environmental effects shall be followed:
 - (a) Drilling logs shall be maintained by the driller and communicated directly to the blaster. The logs shall indicate depths and lengths of voids, cavities, and fault zones or other weak zones encountered as well as groundwater conditions.
 - (b) Explosive products shall be managed on-site so that they are either used in the borehole, returned to the delivery vehicle, or placed in secure containers for off-site disposal.
 - (c) Spillage around the borehole shall either be placed in the borehole or cleaned up and returned to an appropriate vehicle for handling or placement in secured containers for off-site disposal.

Lastly, the document should include provisions to address the potential for rock blasting resulting in the indoor air of nearby structures being contaminated with carbon monoxide.

NH Geological Survey has commented With reference to <http://elibrary.ferc.gov/idmws/common/OpenNat.asp?fileID=13939516>:

NH DES questions whether the stated 200 foot blast radius is sufficient to identify wells at risk from impacts of blasting on water quality and quantity. A 1,000 foot buffer may be more reasonable to establish ambient groundwater conditions in wells prior to blasting and safeguard well owners.

Waste Division has commented:

1. Resource Report 2, 2.2.5 Contaminated Sediments, page 2-41. The report mentions that Figure 2.1-3 (sheets 14-18 of 28) depicts the location of known state and federal hazardous waste sites. It appears that it also includes other contaminated sites such as landfills, leaking underground storage tanks and sites listed as "remediation sites" on DES' One Stop web page. The report does not evaluate in detail whether the anticipated construction may encounter contamination (soil, groundwater or wastes) associated with the sites. In some instances where the planned construction is near known contamination sites, pre-construction sampling and assessment may be prudent to determine if contaminated materials will be encountered and to develop to specific plans to manage the contaminated materials. There are numerous asbestos disposal sites in the Nashua-Hudson area that historically received wastes from the former Johns-Manville when it operated. DES suggests you add asbestos sites to Figure 2.1-3 to anticipate where asbestos may be encountered and require management during construction.
2. Resource Report 2, 2.1.1.4.3 Groundwater Quality, page 2-11. In the discussion of the Groundwater Protection Act RSA 485-C the reference to the Department of Safety "NHDOS" is not correct and should be

deleted.

3. Resource Report 2, 2.1.1.4 Groundwater Hazards, page 2-12. DES recommends that Figure 2.1-3 and Table M7-A-1 include the location of known asbestos sites that may be near the proposed project. There are a number of asbestos disposal sites in the Nashua and Hudson area that received asbestos waste from the former Johns-Manville manufacturing plant.

1. Appendix M, Environmental Construction Plan for New Hampshire

a. Page M-27, Section 4.3 Spill Prevention and Response Plan and Attachment M3 Spill Prevention And Response Plan

- i. DES has a fact sheet on notification for spills and the discovery of contamination <http://des.nh.gov/organization/commissioner/pip/factsheets/rem/documents/rem-13.pdf>. The report should be updated to include the information in the fact sheet relative to reporting spills.
- ii. Please provide a list of materials and quantities expected to be used during the construction of the pipeline such as fuels used for construction vehicles, hazardous wastes, hazardous substances and other chemicals.
- iii. In the event of the spill/discharge of oil and/or hazardous wastes or substances the investigation and remediation must be conducted in compliance with Env-Or 600 Contaminated Site Management Rules. These rules contain soil and groundwater clean-up standards and the procedures to be followed to investigate and remediate contamination resulting from a spill or discharge of oil, hazardous waste/substances or other regulated release of contamination.
- iv. Section 3.0 of Attachment 3. If any of the locations are a federal small quantity generator or large quantity generator of hazardous waste, New Hampshire law requires compliance with 40 CFR 265.50, Contingency Planning.

b. Page M-28, Section 4.4 Waste Management Plan and Attachment M4

- i. Please clarify whether this plan is intended to address wastes produced from the actual activities associated with construction of the pipeline and appurtenances. Attachment M7 addresses unanticipated discovery of contamination from buried wastes, contaminated soil and contaminated groundwater and DES provided additional comments to that section.
- ii. DES requests a more detailed description of the wastes that are anticipated to be generated based on construction of other pipeline projects. For example what types and quantities of hazardous wastes (pipeline sludge, spent pig wastes, sandblast abrasives, paint thinner and solvents), asbestos, PCB wastes and non-hazardous wastes (oily rock/soil, oily rags, sandblast abrasive and general trash/garbage) are generated during construction? The information would be helpful to DES in order to better understand the scope of wastes to be generated during the pipeline construction in New Hampshire. With that additional information DES may be able to provide more specific guidance.
- iii. PCBs wastes are subject to the federal Toxic Substances Control Act (TSCA) program administered by the U.S. Environmental Protection Agency. Please describe how PCBs wastes are generated during pipeline construction and the expected quantities to be generated during construction in New Hampshire.
- iv. Page M4-2 Section 3.1 HAZARDOUS WASTE.
 1. A variety of waste streams would be generated during construction and operation of the pipeline, and under the New Hampshire Hazardous Waste Rules, generators of waste are required to determine if that waste is a hazardous waste (see Env-Hw 502.01). The waste management plan (WMP) does a decent job of describing how that will be done in section 2.2. These determinations are the responsibility of the generator.
 2. If and when it is determined, that hazardous waste will be generated, please notify DES to obtain an EPA ID number by calling the Reporting and Information Management Section (Maria

Michel) at 603-271-2921.

3. The WMP uses the term “Large Quantity Generator” where in New Hampshire a generator is either a Full Quantity Generator (basically generates greater than 100 kilograms in any single month), or a Small Quantity Generator (basically generates less than 100 kilograms in each and every month). New Hampshire has certification programs for each of these classifications of generators which will need to be complied with.
 4. New Hampshire also regulates Used Oil as a state hazardous waste, although when it is a “used oil for recycle” it is subject to less stringent standards than a hazardous waste.
 5. New Hampshire has specific requirements for the outside storage of hazardous waste which can be found in Env-Hw 507.01(e) which includes set-back requirements, and Env-Hw 509.02(c) which includes a fence, means to control access, and a sign.
 6. During construction and operation of the pipeline, any wastes that is generated needs to be managed properly (i.e., not dumped along the pipeline), and if the waste is hazardous waste, the waste needs to be delivered to a facility authorized to accept the waste. Depending on the circumstances, it may be possible to self-transport the hazardous waste but DES recommends it be discussed further either by contacting the Hazardous Waste Compliance Section or at a future meeting.
 7. The following is the link to the DES Hazardous Waste Compliance Section webpage which has information on the Hazardous Waste Rules, including Fact Sheets., <http://des.nh.gov/organization/divisions/waste/hwcb/hwcs/index.htm> .
 8. There are different provisions for storing hazardous waste at the site of generation (on-site) and off-site (must be delivered to a permitted TSD facility). Please clarify to what constitutes “on-site” and what constitutes “off-site”. Additionally, specify who is the generator (Morgan Kinder? Contractor? Property Owner?) and the generator’s responsibilities to under New Hampshire Hazardous Waste Rules, including those aspects of the rules that are more stringent than federal requirements, including small quantity generator requirements, and hazardous waste coordinator requirements.
- v. Page M4-3 SECTION 3.2, NON-HAZARDOUS WASTE: Last bullet should read “Non-hazardous waste can only be transported to and disposed of at approved facilities”, i.e. it can’t be hauled to any place that is not properly permitted to receive it. Once it leaves the site of generation, in NH, and with few exceptions, it must go to a permitted transfer station, processing/treatment, or final disposal facility.
- vi. Page M4-4 Section 3.3.1, Asbestos/ACM:
1. It is not clear how the asbestos waste might likely be generated, it is difficult to assess the adequacy of the plan. If the asbestos waste is the result of abatement (i.e., the removal of asbestos from structures and roads) the work must be done by a New Hampshire licensed asbestos abatement contractor, in accordance with RSA 141-E and Env-A 1800.
 2. First tier Bullet #2:
 - Subbullet #2—revise to read: “Gloves and other non-hazardous solid can be added before sealing.”
 - Subbullet #4 regarding storage of containers should be moved to be first tier bullet #4, for logic purposes;
 - Subbullet #5—for better grammar and clarity, DES suggests revising to read: “For accumulation containers, each item placed therein must be individually wrapped and placed in the drum.
 3. First tier bullet #3—revise to read: “Mark of label the outer most container with the following

information:”

4. First tier bullet #4---the “company-approved disposal facility” must be properly permitted to receive the asbestos. Additionally, in NH, prior to shipping asbestos waste to a landfill, the landfill must be notified of the pending delivery.
 5. First tier bullet #5, allowing asbestos pipe to be sold or transported to scrap dealers or individual buyers---this is not allowed in New Hampshire. Env-Sw 901.05 prohibits reuse of asbestos waste.
 6. First tier bullet #6, subbullet #4, referencing use of a “manifest”---a manifest is not required. The correct term is “asbestos shipping papers”.
 7. Transportation vehicles must be placarded.
- vii. Page M- 28 Section 4.7 Unanticipated Discovery of Contamination Plan and Attachment M7.
1. The plan deals with management of contamination that is discovered during excavation activities for the pipeline and not contaminated wastes/materials generated by the actual construction of the pipelines and appurtenances.
 2. The report states that known hazardous waste sites within 0.25 miles of the project were identified (Table M7-A-1 and Figure 2.1-3, sheet 14 of 28 thru sheet 18-28). The sites identified are from NH DES Site Remediation and Groundwater Hazardous Inventory and include a wide range of sites that are known to currently have contamination or had contamination in the past. NH DES recommends that table and figure also include known asbestos disposal sites, particularly prevalent in the Nashua and Hudson area where there are numerous waste asbestos disposal sites associated with the former Johns Manville manufacturing plant.
 3. Several sites were identified relatively close to the pipeline. NH DES recommends a more detailed analysis of the proposed construction (e.g., depth of construction, need to dewater) near those sites and consideration be given to performing some pre-construction environmental assessment to better analyze whether any contaminated materials (wastes, soil or groundwater) would likely be encountered during the construction activities. And this would apply to the Nashua and Hudson area, where there are numerous asbestos disposal sites and it is common to encounter asbestos wastes during construction
 4. As mentioned in a comment above NH DES included link to a fact sheet outlining the requirements for reporting contamination (oil and hazardous waste).
 5. DES request more detailed information on the field screening procedures that will be used. Soil and groundwater with odors or discoloration should be sampled. Liquids other than water should be sampled. The field screening methods (such as photoionization detector (PID)) should be specified. DES also requests a list/table of analytes (e.g. VOC, SVOCs, RCRA metals, TPH, PCBs, pesticides etc.), with their respective analytical methods, that will be sampled should unanticipated/unknown contamination be discovered. DES recommends that the qualified professional doing the assessment and sampling of materials suspected of being contaminated be a professional engineer or professional geologist licensed in New Hampshire.
 6. If soil or groundwater contamination is detected above the standards contained in Env-Or 600 Contaminated Site Management Rules, the requirements of those rules shall apply to the investigation and remediation of the contamination.
 7. DES recommends the preparation of a materials management plan to deal with different categories of contaminated materials:
 - Materials that must be managed as a hazardous waste.
 - Contaminated groundwater (exceeds Ambient Groundwater Quality Standards (AGQS) encountered during pipeline construction. The options are off-site disposal at an approved

facility, temporary groundwater discharge permit, USEPA remediation general permit, treatment under an approved remedial action plan, and discharge to a wastewater treatment plant if allowed.

- Non-hazardous contaminated soil.
- Miscellaneous solid waste such as trash, mattresses, demolition debris.
- Mildly contaminated soil/urban fill such as soil that typically contains low concentrations of contaminants (e.g., metals and polyaromatic hydrocarbons) and meets the definition of “background” per Env-Or 602.03.
- TSCA regulated materials (PCBs).

3. Waste Management Division

1. Resource Report 2, 2.2.5 Contaminated Sediments, page 2-41. The report mentions that Figure 2.1-3 (sheets 14-18 of 28) depicts the location of known state and federal hazardous waste sites. It appears that it also includes other contaminated sites such as landfills, leaking underground storage tanks and sites listed as “remediation sites” on DES’ One Stop web page. The report does not evaluate in detail whether the anticipated construction may encounter contamination (soil, groundwater or wastes) associated with the sites. In some instances where the planned construction is near known contamination sites, pre-construction sampling and assessment may be prudent to determine if contaminated materials will be encountered and to develop to specific plans to manage the contaminated materials. There are numerous asbestos disposal sites in the Nashua-Hudson area that historically received wastes from the former Johns-Manville when it operated. DES suggests you add asbestos sites to Figure 2.1-3 to anticipate where asbestos may be encountered and require management during construction.

2. Resource Report 2, 2.1.1.4.3 Groundwater Quality, page 2-11. In the discussion of the Groundwater Protection Act RSA 485-C the reference to the Department of Safety “NHDOS” is not correct and should be deleted.

3. Resource Report 2, 2.1.1.4 Groundwater Hazards, page 2-12. DES recommends that Figure 2.1-3 and Table M7-A-1 include the location of known asbestos sites that may be near the proposed project. There are a number of asbestos disposal sites in the Nashua and Hudson area that received asbestos waste from the former Johns-Manville manufacturing plant.

1. Appendix M, Environmental Construction Plan for New Hampshire

2.

a. Page M-27, Section 4.3 Spill Prevention and Response Plan and Attachment M3 Spill Prevention And Response Plan

i. DES has a fact sheet on notification for spills and the discovery of contamination <http://des.nh.gov/organization/commissioner/pip/factsheets/rem/documents/rem-13.pdf> . The report should be updated to include the information in the fact sheet relative to reporting spills.

ii. Please provide a list of materials and quantities expected to be used during the construction of the pipeline such as fuels used for construction vehicles, hazardous wastes, hazardous substances and other chemicals.

iii. In the event of the spill/discharge of oil and/or hazardous wastes or substances the investigation and remediation must be conducted in compliance with Env-Or 600 Contaminated Site Management Rules. These rules contain soil and groundwater clean-up standards and the procedures to be followed to investigate and remediate contamination resulting from a spill or discharge of oil, hazardous waste/substances or other regulated release of contamination.

iv. Section 3.0 of Attachment 3. If any of the locations are a federal small quantity generator or large quantity generator of hazardous waste, New Hampshire law requires compliance with 40 CFR 265.50, Contingency Planning.

b. Page M-28, Section 4.4 Waste Management Plan and Attachment M4

i. Please clarify whether this plan is intended to address wastes produced from the actual activities associated with construction of the pipeline and appurtenances. Attachment M7 addresses unanticipated discovery of contamination from buried wastes, contaminated soil and contaminated groundwater and DES provided additional comments to that section.

ii. DES requests a more detailed description of the wastes that are anticipated to be generated based on construction of other pipeline projects. For example what types and quantities of hazardous wastes (pipeline sludge, spent pig wastes, sandblast abrasives, paint thinner and solvents), asbestos, PCB wastes and non-hazardous wastes (oily rock/soil, oily rags, sandblast abrasive and general trash/garbage) are generated during construction? The information would be helpful to DES in order to better understand the scope of wastes to be generated during the pipeline construction in New Hampshire. With that additional information DES may be able to provide more specific guidance.

iii. PCBs wastes are subject to the federal Toxic Substances Control Act (TSCA) program administered by the U.S. Environmental Protection Agency. Please describe how PCBs wastes are generated during pipeline construction and the expected quantities to be generated during construction in New Hampshire.

iv. Page M4-2 Section 3.1 HAZARDOUS WASTE.

1. A variety of waste streams would be generated during construction and operation of the pipeline, and under the New Hampshire Hazardous Waste Rules, generators of waste are required to determine if that waste is a hazardous waste (see Env-Hw 502.01). The waste management plan (WMP) does a decent job of describing how that will be done in section 2.2. These determinations are the responsibility of the generator.
2. If and when it is determined, that hazardous waste will be generated, please notify DES to obtain an EPA ID number by calling the Reporting and Information Management Section (Maria Michel) at 603-271-2921.
3. The WMP uses the term “Large Quantity Generator” where in New Hampshire a generator is either a Full Quantity Generator (basically generates greater than 100 kilograms in any single month), or a Small Quantity Generator (basically generates less than 100 kilograms in each and every month). New Hampshire has certification programs for each of these classifications of generators which will need to be complied with.
4. New Hampshire also regulates Used Oil as a state hazardous waste, although when it is a “used oil for recycle” it is subject to less stringent standards than a hazardous waste.
5. New Hampshire has specific requirements for the outside storage of hazardous waste which can be found in Env-Hw 507.01(e) which includes set-back requirements, and Env-Hw 509.02(c) which includes a fence, means to control access, and a sign.
6. During construction and operation of the pipeline, any wastes that is generated needs to be managed properly (i.e., not dumped along the pipeline), and if the waste is hazardous waste, the waste needs to be delivered to a facility authorized to accept the waste. Depending on the circumstances, it may be possible to self-transport the hazardous waste but DES recommends it be discussed further either by contacting the Hazardous Waste Compliance Section or at a future meeting.
7. The following is the link to the DES Hazardous Waste Compliance Section webpage which has information on the Hazardous Waste Rules, including Fact Sheets., <http://des.nh.gov/organization/divisions/waste/hwcb/hwcs/index.htm> .
8. There are different provisions for storing hazardous waste at the site of generation (on-site) and off-site (must be delivered to a permitted TSD facility). Please clarify to what constitutes “on-site” and what constitutes “off-site”. Additionally, specify who is the generator (Morgan

Kinder? Contractor? Property Owner?) and the generator's responsibilities to under New Hampshire Hazardous Waste Rules, including those aspects of the rules that are more stringent than federal requirements, including small quantity generator requirements, and hazardous waste coordinator requirements.

- v. Page M4-3 SECTION 3.2, NON-HAZARDOUS WASTE: Last bullet should read "Non-hazardous waste can only be transported to and disposed of at approved facilities", i.e. it can't be hauled to any place that is not properly permitted to receive it. Once it leaves the site of generation, in NH, and with few exceptions, it must go to a permitted transfer station, processing/treatment, or final disposal facility.
- vi. Page M4-4 Section 3.3.1, Asbestos/ACM:
1. It is not clear how the asbestos waste might likely be generated, it is difficult to assess the adequacy of the plan. If the asbestos waste is the result of abatement (i.e., the removal of asbestos from structures and roads) the work must be done by a New Hampshire licensed asbestos abatement contractor, in accordance with RSA 141-E and Env-A 1800.
 2. First tier Bullet #2:
 - Subbullet #2—revise to read: "Gloves and other non-hazardous solid can be added before sealing."
 - Subbullet #4 regarding storage of containers should be moved to be first tier bullet #4, for logic purposes;
 - Subbullet #5—for better grammar and clarity, DES suggests revising to read: "For accumulation containers, each item placed therein must be individually wrapped and placed in the drum."
 3. First tier bullet #3—revise to read: "Mark of label the outer most container with the following information:"
 4. First tier bullet #4---the "company-approved disposal facility" must be properly permitted to receive the asbestos. Additionally, in NH, prior to shipping asbestos waste to a landfill, the landfill must be notified of the pending delivery.
 5. First tier bullet #5, allowing asbestos pipe to be sold or transported to scrap dealers or individual buyers---this is not allowed in New Hampshire. Env-Sw 901.05 prohibits reuse of asbestos waste.
 6. First tier bullet #6, subbullet #4, referencing use of a "manifest"---a manifest is not required. The correct term is "asbestos shipping papers".
 7. Transportation vehicles must be placarded.
- vii. Page M- 28 Section 4.7 Unanticipated Discovery of Contamination Plan and Attachment M7.
1. The plan deals with management of contamination that is discovered during excavation activities for the pipeline and not contaminated wastes/materials generated by the actual construction of the pipelines and appurtenances.
 2. The report states that known hazardous waste sites within 0.25 miles of the project were identified (Table M7-A-1 and Figure 2.1-3, sheet 14 of 28 thru sheet 18-28). The sites identified are from DES Site Remediation and Groundwater Hazardous Inventory and include a wide range of sites that are known to currently have contamination or had contamination in the past. DES recommends that table and figure also include known asbestos disposal sites, particularly prevalent in the Nashua and Hudson area where there are numerous waste asbestos disposal sites associated with the former Johns Manville manufacturing plant.
 3. Several sites were identified relatively close to the pipeline. DES recommends a more detailed analysis of the proposed construction (e.g., depth of construction, need to dewater) near those

sites and consideration be given to performing some pre-construction environmental assessment to better analyze whether any contaminated materials (wastes, soil or groundwater) would likely be encountered during the construction activities. And this would apply to the Nashua and Hudson area, where there are numerous asbestos disposal sites and it is common to encounter asbestos wastes during construction

4. As mentioned in a comment above DES included link to a fact sheet outlining the requirements for reporting contamination (oil and hazardous waste).
5. DES request more detailed information on the field screening procedures that will be used. Soil and groundwater with odors or discoloration should be sampled. Liquids other than water should be sampled. The field screening methods (such as photoionization detector (PID)) should be specified. DES also requests a list/table of analytes (e.g. VOC, SVOCs, RCRA metals, TPH, PCBs, pesticides etc.), with their respective analytical methods, that will be sampled should unanticipated/unknown contamination be discovered. DES recommends that the qualified professional doing the assessment and sampling of materials suspected of being contaminated be a professional engineer or professional geologist licensed in New Hampshire.
6. If soil or groundwater contamination is detected above the standards contained in Env-Or 600 Contaminated Site Management Rules, the requirements of those rules shall apply to the investigation and remediation of the contamination.
7. DES recommends the preparation of a materials management plan to deal with different categories of contaminated materials:
 - Materials that must be managed as a hazardous waste.
 - Contaminated groundwater (exceeds Ambient Groundwater Quality Standards (AGQS) encountered during pipeline construction. The options are off-site disposal at an approved facility, temporary groundwater discharge permit, USEPA remediation general permit, treatment under an approved remedial action plan, and discharge to a wastewater treatment plant if allowed.
 - Non-hazardous contaminated soil.
 - Miscellaneous solid waste such as trash, mattresses, demolition debris.
 - Mildly contaminated soil/urban fill such as soil that typically contains low concentrations of contaminants (e.g., metals and polyaromatic hydrocarbons) and meets the definition of “background” per Env-Or 602.03.
 - TSCA regulated materials (PCBs).

4. Air Resources Division

Resource Report 9, Section 9.1.1.2, Table 9.1.7, p.9-7 shows air quality monitoring data, but does not specify the monitoring period from which these data were taken. The report should indicate the monitoring period for the data.

Resource Report 9, Attachment 9b -Emissions Calculations, Footnote 15, repeated on multiple pages throughout. Footnote 15 cites the 2007 IPCC report values for GHG emissions as Table 2.14 of Climate Change 2007: The Physical Science Basis. Contribution of Working Group I to the Fourth Assessment Report of the IPCC - CO₂ = 1, CH₄ = 25, N₂O = 298

This report was updated in 2013 and the value for CH₄ was increased to 34. This assessment uses 2013 report values in other places (e.g. Note 8 throughout uses NO₂ factors from a 2013 TCR protocol). The calculations should be updated to use 2013 IPCC values.

Resource Report 9, Section 9.1, p. 9-1: The report notes that detailed compressor station emissions are not yet available. NHDES may have additional comments once detailed compressor station emissions are available.

Resource Report 9, Section 9.1, p. 9-2: A new ozone NAAQS of 140 ug/m³ announced on 10/1/2015. This new NAAQS should be included in Table 9.1-1.

Resource Report 9, Section 9.1, p. 9-3: The report includes a presumptive conclusion that visibility will not be affected at Class I areas due to distance. Emissions of NO_x are cumulative in ammonium nitrate formation. This conclusion should be revisited with final emissions, considering all new NO_x sources.

Resource Report 9, Section 9.1.1.2, p. 9-7: Representative monitoring data for NH should use Londonderry data for CO, O₃, and SO₂. For PM_{2.5}, use Keene for Cheshire County and Londonderry for remaining portions of affected project area.

Resource Report 9, Section 9.1.1.2, p. 9-8: Currently, the only pollutant in nonattainment in NH is SO₂ (outside project areas as noted). Ozone is currently in attainment state-wide and in maintenance. This is expected to continue to be the case with the new ozone NAAQS. Table on Page 9-13 is correct.

Resource Report 9, Section 9.1.1.2, p. 9-8 & Section 9.1.2.5, p. 9-18: NH recently updated its nonattainment NSR program. The nonattainment NSR major source threshold for NO_x is now 100 tpy statewide. While NH is currently classified as attainment for ozone, it is part of the Northeast Ozone Transport Region (OTR). NH's presence in the OTR requires implementation of nonattainment NSR based on moderate ozone nonattainment thresholds. This is the source of the 100 tpy NO_x nonattainment threshold in NH. USEPA approved NH's updated program in September 2015 (see FR Vol 80 P 57722) <http://www.gpo.gov/fdsys/pkg/FR-2015-09-25/pdf/2015-23176.pdf>.

Resource Report 9, General comment: Cumulative in-state and upwind emissions of NO_x and PM_{2.5} are of air pollution transport concern for ozone and regional haze in the Northeast, especially during the summer ozone season.

Resource Report 9, Attachment 9b -Emissions Calculations, p. 71-93. NOTE 4 references use of The Climate Registry General Reporting Protocol as the source for the HAP emissions factors, but does not say which version of the protocol these factors are from. The most recent version of the protocol should be used and cited.

{map omitted}

20151016-5498

New Hampshire Natural Heritage Bureau
DRED - Division of Forests & Lands
172 Pembroke Road, Concord, NH 03301
(603) 271-2214

October 16, 2015

To: Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

From: Amy Lamb, Ecological Information Specialist, NH Natural Heritage Bureau

**Subject: NH Natural Heritage Bureau comments regarding the second Draft
Environmental Report (dated July 24, 2015) for the Northeast Energy Direct
Project, FERC Docket No. PF14-22-000, Tennessee Gas Pipeline Company, L.L.C.**

The NH Natural Heritage Bureau (Division of Forests and Lands, Department of Resources and Economic Development) is the State entity which is responsible for enacting RSA 217-A, the New Hampshire Native Plant Protection Act of 1987. This Act gives the NH Natural Heritage Bureau (NHB) the ability to investigate and research the native plants and natural communities of New Hampshire, to propose legislation regarding the listing of plants as Endangered or Threatened, and to conserve and protect these resources through management and project environmental review.

NHB has reviewed the proposed Northeast Energy Direct natural gas pipeline project (FERC DOCKET NO. PF14-22-000), as filed in July, 2015, for impacts to rare plants and exemplary natural communities. Below, please find NHB's comments regarding this filing. Please note that all comments listed herein reflect only upon the content of the report itself, as well as our concerns regarding New Hampshire's natural resources, including but not limited to: threatened and endangered plants, exemplary natural communities and systems, and Stateowned lands. The numbers and headings listed below reference section headings as written in Resource Report 3, Appendix H, and Appendix M.

3.2 WILDLIFE RESOURCES

3.2.2 Significant or Sensitive Wildlife Species and Habitats

3.2.2.4 New Hampshire

- The Ponemah Bog Wildlife Sanctuary is the property that houses one of the exemplary Kettle Hole Bogs that is intersected by the Project corridor. This association is not noted in this section of the report text. Kettle hole bogs have a State rarity ranking of S2; ranks are on a scale of 1 to 5, with a 1 indicating critical imperilment, a 3 indicating that the species or natural community is uncommon, and a 5 indicating that the species or natural community is common and demonstrably secure. Kettle hole bogs are thus fairly rare, and the project should seek to avoid impacting these resources altogether. - As specified in a letter dated August 31, 2015, from William Carpenter, Administrator of the Lands Management Bureau of the Division of Forests and Lands, to Robert Varney of Normandeau Associates, Inc., permission has been granted for Normandeau to complete pedestrian surveys of natural and historical resources on DRED-managed State lands that are intersected by this project. No vehicle access is permitted on these lands.

3.3 VEGETATION

3.3.1 Existing Resources

3.3.1.4: New Hampshire

- Plant names are referenced inconsistently throughout the filing, beginning in this section. In some instances, Latin names of plants are used, while in other sections, only common names are referenced. Using both Latin and common names when first mentioning a plant would prevent confusion and provide consistency in nomenclature.

3.3.2 Vegetation Communities of Special Concern

3.3.2.4 New Hampshire

3.3.2.4.1: Natural Community Systems

- Drainage marsh-shrub swamp system erroneously named 'emergent marsh-shrub swamp system'. This system is located south of an existing ROW; impacts associated with ROW expansion should be located and/or shifted to the north to avoid impacting this resource.
- Moderate gradient Sandy-Cobbly Riverbank System: more information is needed about directional drilling to determine whether or not impacts are to be expected.
- Mapped portion of swamp white oak floodplain forest is outside of impact area; however, surveying is recommended where pipeline crosses associated wetlands
- Will the existing right-of-way be expanded where it crosses the exemplary red maple - sensitive fern swamp?

3.3.4 Measures to Avoid, Minimize, and Mitigate Impacts

3.3.4.1: Clearing

- As cited in the text regarding wetland boundaries, any exemplary natural community boundaries and rare plant population boundaries should be clearly marked prior to clearing so that Project personnel and inspectors will know where these sensitive environmental resources are located

and where specialized mitigation measures and techniques must be implemented.

- Timber mats should not be used on rare plants wherever possible. Timber mats should only be used on rare plant populations in certain circumstances, such as after seed-set and only on annuals or perennials with vigorous root systems. Consultation with NHB is needed to determine where timber mat usage is appropriate, and what alternatives are available.
- Data that is being supplied by NHB should be utilized for continued planning, design, and modification of the pipeline alignment.
- After rare plant and exemplary natural community surveys have been completed, a discussion between Kinder-Morgan, its consultants, and NHB is needed to review the locations of these resources and anticipated impacts, and to determine measures to avoid, minimize, and mitigate impacts. This discussion should include measures such as clearing by hand with chain saws in the vicinity of rare plants.

3.3.4.3: Cleanup/Restoration

- The text states that, “Once backfilling is complete, Tennessee will restore the original contours and drainage characteristics of the ROW to the extent practicable, with the exceptions of unnatural features and unstable grades.” In areas where wetlands are impacted, particularly exemplary natural communities and systems, more information is needed regarding how contours and drainage characteristics will be restored.
- Any seed mixes used to restore vegetation on disturbed areas within the NH portion of the corridor must have prior approval from NHB. Seed mixes should contain nonaggressive, native vegetation so that disturbed areas may be restored as close to their natural state as possible.
- Whenever possible, disturbed areas should be allowed to revegetate naturally, especially in the vicinity of rare plants.
- Any mulch used should be free of weed seeds. Mulch should not be used in the vicinity of rare plants unless the area is prone to erosion and weather conditions necessitate its use.

3.4 ENDANGERED AND THREATENED SPECIES

3.4.1 Existing Resources

3.4.1.1 Federal-Protected Species

- A recently discovered (October 2014) population of a federally-listed threatened plant species, *Isotria medeoloides* (small whorled pogonia), occurs within 1 mile of the project centerline. The plant is located in the vicinity of the proposed lateral that extends from Mason, NH into Massachusetts. Rare plant surveys should include this plant, and consultation with the US Fish & Wildlife Service is required. Refer to the U.S. Fish & Wildlife Service’s IPaC website for habitat information, and contact Maria Tur of the New England Field Office at 603-223-2541, extension 12.

3.4.1.5 New Hampshire State-Listed Species

Table 3.4-6: State-Listed Species Potentially Occurring in the Vicinity of the Project in New Hampshire

- The State rarity status of waxy-leaved meadow-rue (*Thalictrum revolutum*) was previously listed as “indeterminate”. However, the species is now tracked in NH as state endangered.
- Please note the following suggested edits to the preferred habitats of the following species:
 - o Meadow garlic (*Allium canadense*) - various floodplain forests, riverside outcrops, enriched terraces
 - o Round-leaved trailing tick-trefoil (*Desmodium rotundifolium*) – Dry to dry-mesic forests and woodlands, commonly associated with rocky slopes

- o Northern blazing Star (*Liatris novae-angliae*) - fire-influenced landscapes (grasslands, heathlands, barrens, sandplains), as well as dry, open managed areas, dry river bluffs, gravelly slopes, and railroad beds associated with these areas
 - o Early crowfoot (*Ranunculus fascicularis*) – Rocky forests and woodlands, especially in oak forests, thin tills, often associated with circumneutral to highpH bedrock
 - o Licorice goldenrod (*Solidago odora*) – Dry, open woods, especially oak, oak-pine, and oak-hickory communities on till soils; can also be found in open right of way areas
 - o Late purple American-aster (*Symphotrichum patens*) – dry open woods, dry meadows or fields
 - o Waxy-leaved meadow-rue (*Thalictrum revolutum*) – dry forests, ridges, talus slopes, and ledges, and open or disturbed areas including meadows, fields, and rights-of-way
 - o Bashful clubsedge (*Trichophorum planifolium*) – Dry-mesic to mesic forests and woodlands (often rocky), usually with oak
 - o Perfoliate bellwort (*Uvularia perfoliata*) – Dry-mesic to mesic deciduous forests, moist rocky woodlands, and open woods and clearings
 - o Palmate violet (*Viola palmata*) – open woods, meadows, fields, and talus or rocky slopes, disturbed areas
 - o Bird-foot violet (*Viola pedata*) – similar habitat to palmate violet (*Viola palmata*): open woods, meadows, fields, and talus or rocky slopes, disturbed areas
- Survey areas for rare plants and exemplary natural communities and systems should include all potential areas of impact, including but not limited to: the proposed pipeline footprint and associated excavation areas, existing and proposed rights-of-way (ie., tree clearing areas), access roads, compressor stations and other facilities, and all associated staging areas.

3.4.2: Construction and Operation Impacts and Measures to Avoid, Minimize, and Mitigate Impacts

- As noted above, any seed mixes used for Erosion Control Practices should be approved by NHB prior to construction, and should consist of native, non-aggressive species. Any sensitive areas (rare plants and natural communities) that are impacted should be allowed to revegetate naturally, whenever possible.

3.4.2.2 State-Listed Species

3.4.2.2.4 New Hampshire State-Listed Species

- Under NH law, NHB develops and implements measures for the protection, conservation, enhancement and management of native New Hampshire plants (RSA 217-A:3XII). The NH Fish and Game Department assists in the protection of species of wildlife which are determined to be threatened or endangered (RSA 212-A). Please contact the Nongame and Endangered Wildlife program in NHFG regarding state listed wildlife species.

Table 3.4-8: Locations and Timing of Pending Species Specific Biological Surveys Associated With the Project

- In New Hampshire, Ecological Systems and Natural Communities are ranked according to rarity within the state and globally. Ranks are on a scale of 1 to 5, with a 1 indicating critical imperilment, a 3 indicating that the species or natural community is uncommon, and a 5 indicating that the species or natural community is common and demonstrably secure. For the purposes of the FERC Environmental Report, only the state rankings are applicable. The state rankings for the three exemplary ecological systems and four exemplary natural communities should be listed as follows under the “Status” column of Table 3.4-8:

- o drainage marsh - shrub swamp system S5

- o kettle hole bog system S2
- o moderate-gradient sandy-cobbly riverbank system S3
- o mixed pine - red oak woodland S1/S2
- o red maple - sensitive fern swamp S3/S4
- o silver maple - false nettle - sensitive fern floodplain forest S2
- o swamp white oak floodplain forest S1
- NHB suggests the following edits to the proposed survey times for state listed rare plant species present within the project area:
 - o *Allium canadense*: Late May to mid-July would be a more appropriate search time frame. If survey is done too early in May, the plant might not have emerged.
 - o *Solidago odora* – August-September or even July would capture this plant in flower, but October might be too late as the plant would be senescing.
 - o *Thalictrum revolutum* – Surveys are requested as this is now a state endangered plant. The proposed June – July timing is appropriate.

3.5 CUMULATIVE IMPACTS TO FISH, WILDLIFE, AND VEGETATION

3.5.2 Cumulative Impacts Evaluation

- Exemplary natural communities, by their nature, are either a rare type of community, or are high-quality examples of a common community type. Thus, any impacts to these communities (direct or indirect), including but not limited to buffer disturbance, community conversion or partial loss, increased human presence, and increased access could be considered major, permanent impacts (as opposed to the minor cumulative effects listed in this section.) Similarly, any permanent conversion of previously conserved land undermines the integrity and the protection afforded these parcels, and could make inroads for further conversion and development.
- A complete inventory of the existing right-of-way areas and the forested areas that will be converted to right-of-way has never been conducted. Unless thorough surveys for rare plants are completed throughout the entire corridor, accurate pre-existing conditions are not known and it cannot be assumed that impacts resulting from this and other projects will be inconsequential.
- Many rare plants occur within utility rights-of-way because this maintained early successional habitat type is not common in New Hampshire. Any direct impacts to known rare plant populations existing within the corridor should not be considered minor due to “abundance of comparable habitat in the area,” as rare plants often need specialized conditions and lack of competing overstory species to establish. These conditions are not frequently found in New Hampshire, which is why these plants continue to be rare.
- All efforts should be made to ensure that rare plants and natural communities within the project area are identified and avoided to the extent possible. Tennessee Gas Pipeline, LLC should seek to find alternative routes that have as few rare species and exemplary natural communities as possible. Any species that are identified should be protected; relocating species or spreading seed have a high rate of failure, and avoiding impacts to rare plants is always preferable to attempting to restore disturbed populations.
- Any and all erosion control and revegetation practices that will be employed in NH should be reviewed with NHB. Disturbed areas should be allowed to revegetate naturally whenever possible to prevent introduction of non-native, exotic, aggressive, and/or invasive species. In rare plant areas, allowing natural revegetation is particularly important, as fast-growing species used for stabilization can often out-compete rare plants. If a seed mix must be used, it should be comprised of native seed, used only where appropriate, and should be approved by NHB prior to its use. Areas that are allowed to revegetate naturally should be monitored and any invasive vegetation should be controlled, in a man-

ner approved by NHB, as vegetation is re-established.

- In rare plant areas, special care should be taken to not spread invasive plant species.

Appendix H

Part 1

II. SUPERVISION AND INSPECTION

B. RESPONSIBILITIES OF ENVIRONMENTAL INSPECTORS

- It is not listed explicitly, but it should be known that Environmental Inspectors are responsible for ensuring the protection of rare plants and exemplary natural communities. All of these areas should be properly demarcated, and Best Management Practices relating to rare plants and exemplary natural communities and systems should be implemented, as agreed upon through consultation with the NHB, prior to, during, and after construction.

III. PRECONSTRUCTION PLANNING

A. CONSTRUCTION WORK AREAS

- Item number 2 states that “Project sponsors are encouraged to consider expanding any required cultural resources and endangered species surveys in anticipation of the need for activities outside of authorized work areas.” Threatened and endangered plant and exemplary natural community survey areas should be determined in conjunction with NHB. Areas to be surveyed should include all potential rare plant habitats and potential exemplary natural communities and systems, proposed access roads, and all areas where compressor stations and other structures will be constructed.

F. AGENCY COORDINATION

- Item number 1 states that the project sponsor must “Obtain written recommendations from the local soil conservation authorities or land management agencies regarding permanent erosion control and revegetation specifications.” NHB should be included among the ‘land management agencies’ and should provide input regarding revegetation practices as they relate to rare species and exemplary natural communities and systems.

IV. INSTALLATION

A. APPROVED AREAS OF DISTURBANCE

- NHB should be notified when any work areas will be expanded beyond previously determined rights-of-way, so that we may evaluate potential impacts to rare species and exemplary natural communities and systems.

B. TOPSOIL SEGREGATION

- In areas where rare plants occur, topsoil should not be stripped. Instead, Tennessee Gas Pipeline Company, LLC should coordinate with NHB to determine the appropriate measures for handling soils and vegetation in locations where rare plants could be impacted.

F. TEMPORARY EROSION CONTROL

- Temporary erosion control measures and structures should not be installed in areas where rare plants occur such that the plants would be negatively impacted.
- Use of mulch in rare plant areas and in the vicinity of exemplary natural communities and systems should be reviewed by NHB. Mulch should be free of seeds and weeds to prevent adverse impacts to vegetation.

V. RESTORATION

- Sensitive vegetation areas should not be plowed.
- Rare plant and exemplary natural community areas should be allowed to revegetate naturally. Fertilizers and pH balancers should not be used in rare plant/exemplary natural community areas because

they often have unique soil requirements.

- Restoration practices in rare plant/exemplary natural community areas should be discussed with NHB prior to construction.

VII. POST-CONSTRUCTION ACTIVITIES AND REPORTING

A. MONITORING AND MAINTENANCE

- Any rare plant mitigation areas should be monitored for a minimum of 3 years, and monitoring specifications should be developed in consultation with NHB.
- Routine maintenance activities should be reviewed by NHB to prevent further impacts to sensitive vegetation areas.

Part 2

V. WATERBODY CROSSINGS

- Any water body crossings that occur through exemplary natural communities or systems should be reviewed by NHB prior to construction.
- Directional drilling beneath exemplary natural communities or systems (and other sensitive areas) is the preferred crossing method.
- Any restoration in exemplary natural communities or systems should be reviewed by NHB prior to construction.

VI. WETLAND CROSSINGS

- Extra work areas and access roads should be located 100' from exemplary natural communities or systems wherever possible.
- The text states, "The project sponsor can burn woody debris in wetlands, if approved by the COE and in accordance with state and local regulations, ensuring that all remaining woody debris is removed for disposal." Please clarify what is meant by this statement.

Appendix M

ATTACHMENT M9-B

INVASIVE SPECIES FACT SHEETS – NEW HAMPSHIRE

(To be submitted in the final ER)

- A plan detailing procedures related to invasive species management should be developed and submitted to NHB for review prior to construction.

In summary, the New Hampshire Natural Heritage Bureau requests ongoing involvement with this project, as any changes in the project footprint occur and if the project progresses through permitting. It is NHB's mission to conserve, protect, and study the rare plants and exemplary natural systems and communities of New Hampshire. Through our continued involvement in this process, we will ensure that impacts to these resources will be avoided, minimized, and mitigated to the fullest extent possible. We appreciate the opportunity to comment.

20151016-5499

Ernest Andre Kirslis

The Calhoun Pasture, 220 Goddard Road, Rindge, New Hampshire
(Mailing address: P.O. Box 6, Central Village, Connecticut 06332)

October 15, 2015

Kimberly D. Bose, Secretary
Federal Regulatory Energy Commission

Dear Secretary Bose:

On April 10, 2015 I wrote to you and the Commission regarding the NED Project and some of the concerns I have as a landowner with property I own in Rindge, New Hampshire. This separate letter is now, in addition, being sent to you to make certain requests and express additional comments and concerns during the scoping process for your consideration in preparation of the EIS.

1) SECTION 106 REVIEW

I understand the FERC is responsible for initiating Section 106 review regarding TGP's NED Project. This process includes gathering information on properties that may be affected by the project "that are listed, or are eligible for listing in the National Register of Historic Places." As you may be aware I also sent a copy of the above mentioned April 10 letter to Elizabeth Muzzey, Director of the New Hampshire Division of Historical Resources "NHDHR", and State Historical Preservation Officer "SHPO". In that letter, among other things, I drew attention to a number of adverse effects of the NED Project pipeline's current design path crossing the historically significant land parcel I own, the Calhoun Pasture, in Rindge, NH. I also proposed an alternative path that reduced or eliminated those effects should the pipeline project be ultimately approved. In addition, I provided specific documentation to Director Muzzey's office in hopes of their advocacy on my behalf for consideration during Section 106 review of the National Historic Preservation Act.

Normally, the NHDHR, as a state agency, through the SHPO consults with the FERC and other agencies during Section 106 review. After further discussion with Director Muzzey's office however, specifically with Ms. Edna Feighner the Review and Compliance Coordinator and Historical Archaeologist, I was advised by her to request consulting party status for myself directly to you under Section 106 of the National Historic Preservation Act. In addition it was suggested I also provide additional information already sent to Director Muzzey's office, due to the complexity of information related to my property, with Section 106 review, directly to FERC and Kinder Morgan's cultural resource consultants. To that end please note that I am hereby requesting consulting party status under Section 106 of the National Historic Preservation Act as an affected landowner regarding the NED Project and my Rindge, NH property. Despite myself having legal and economic interests in the project as an affected land owner, there is obviously no guarantee whether I would normally be granted consulting party status by the FERC. Furthermore if I was denied such status by you, I would then have to ask the Advisory Council on Historic Preservation to review the denial, and make recommendations to the FERC regarding my participation. Kindly note that my request to you is also at the recommendation of the NHDHR.

In consideration for consulting party status please note the rarity and historic significance of the Calhoun Pasture, its characteristics and features, as truly representative of working farm properties typical of America's colonial and agricultural past. It is on an unpaved road and in a visually pristine setting unto itself. In particular the importance of its "setting" or its physical environment, character if you will, as well as a 'feeling' or the expression of its aesthetic or historic sense of the past is unique and worthy of preservation. Visually, removal of its northern stands of pines in the targeted path of the pipeline through it would destroy this completely. It would also effect the property's capacity to operate as a farm properly in the same way without this physical windbreak. In addition, how its features and their relationships should be examined however not only within the exact boundaries of the property, but also between the property and its surroundings is important. This is particularly important for properties in agriculturally zoned districts, and involves not just where, but how, a property is situated and its relationship to it surrounding features and open space.

For over two centuries the Calhoun Pasture has been kept an un-subdivided parcel of land that is specifically and completely stone wall enclosed and preserved as such. My family has maintained this preservation in our ownership for more than the last fifty years. In addition to it possessing the aforementioned stone walls, even noted "as the walls now stand" in its deed description currently, it is also important to note two of the property's boundary walls are in fact 'lot' and 'range' walls from the time when it was even more notably a

parcel in a corner of “lot 10 in the 4th range”. Its namesake owner, the Rev. Andrew Calhoun purchased it from the Platts family (John Varnum Platts a descendant of Able Platts) whose ownership of it traces directly back to the very ‘father of the Town’ of Rindge, Captain Abel Platts (b. 1704 – d. 1777), credited as being the town’s first settler. (See Enclosure F). In addition, one of the families that owned and worked the property from an era of agricultural splendor, and lived during the time of our colonial historic past was Rindge’s noted Hubbard family. Specifically, Hezekiah Hubbard (b. 1757-d. 1822), a highly respected citizen and Revolutionary War soldier who is noted by name in Ezra S. Stearns’, History of the Town of Rindge, New Hampshire (Boston: Press of George H. Ellie, 1875; 136-139) (See Enclosure A – it is an astounding account of the times and the lives of the men of Rindge and specifically the experiences of one of the Calhoun Pasture’s past owners, Hezekiah Hubbard during the late 1700’s) and later Deacon of the Congregational Church, as well as his eldest son, Otis Hubbard. Each of these gentlemen were among Rindge’s most highly respected citizens in each era with Otis Hubbard the individual who bequeathed the money, in trust to the town, for a clock in the late 1800’s (See Enclosure E, Page 1 of 2, Seventh provision). To this day that clock, with a dial on each side of the town’s Second Meeting House’s spire graces it. The town’s meeting house, coincidentally also one of the largest meeting houses in New England, is on the National Register of Historic Places. This is but one example of the relationship the Calhoun Pasture has as a part of the town’s history. If historic connections and relationships aren’t preserved, they are in time forgotten and lost forever. The wealth of the Hubbard family allowed them to continue to actively work and use the Calhoun Pasture, further building its stone walls to such a degree that boulders exceeding five feet in length pulled by oxen have been built into it in places and routinely, sections of its walls measure over four feet in width and two feet or more above grade. (See Enclosure G) The Hubbard family also had the Calhoun Pasture name added into the property deed description even long after, decades after, Hezekiah purchased it from its namesake owner during the Hubbard family’s ownership of it from 1821 to 1895. Typically, land parcels are simply renamed by subsequent families, for a variety of reasons including the relationship between Rev. Calhoun and Deacon Hezekiah Hubbard, this was deliberately not the case. In part it was due to a sense of respect for the history of the land and commitment made to preservation of the cultural and agricultural lifestyle from the era. Kindly note the following:

- 1) I am the owner of Rindge’s historic “Calhoun Pasture” so named in its deed to this day.
- 2) For a site to receive historic preservation consideration under Section 106 review it needs to meet the standards of eligibility for listing in the National Register of Historic Places which it does due to many factors including its unique historic significance.
- 3) The site and land parcel is associated with the lives of specific persons from the colonial era through the late 19th century in Rindge’s, even the state and our country’s history, and events that have made a significant contribution to patterns of history. The Rev. Andrew Calhoun, Revolutionary War private and Deacon Hezekiah Hubbard, his son were all owners of it with Otis and other Hubbard family members actively working the property throughout the 1800’s.
- 4) The parcel embodies distinctive characteristics unique to American agricultural and cultural history. It is even specifically referenced and named in town records and annual reports related to its agricultural function throughout the 1800’s.

Agriculture has long been an integral and vital part of the social, economic, and cultural fabric of New Hampshire. Farmers have been producing crops from New Hampshire soil for more than 375 years. As important as agriculture is, it faces significant challenges from the increasing pressure of growth and development. Its site possesses value worthy of protection because it is representative of the colonial and post-colonial agrarian lifestyle of New England. It has maintained the integrity of location and site, and its setting and feeling physically as well as visually with the exception of the scar across the rural landscape of the area from the electric utility corridor and transmission power lines, which it should not be further exposed to.

The NED Project and pipeline if approved and constructed on or near my property will adversely affect and

negatively alter characteristics that qualify my property, Rindge's historic Calhoun Pasture, for inclusion in the National Register in a manner that would diminish the integrity of the property. Specifically its integrity as a historically intact agricultural property and its ability to convey its significance based on its location, setting, feeling, and association would be permanently destroyed. The property's ongoing careful development committed to its continued preservation as an agricultural property and consistent zoning use as a working farm would be undermined and utterly ruined. The NED Project will:

- 1) In its present path permanently bisect the Calhoun Pasture itself.
- 2) Permanently eliminate agriculturally zoned land from the future use consistent with its USDA identified soil type for uses as described in my previous April 10, 2015 letter on file with the FERC and also sent to Tennessee Gas Pipeline, LLC.
- 3) Needlessly further and permanently expose the property visually and physically to the adjacent eyesore and scar across the landscape of the 345kV power transmission lines destroying its location, setting, feeling, and association within the rural landscape

The Calhoun Pasture, represents a direct nexus to very specific and significant facets of the Town of Rindge's, the State of New Hampshire's, and our country's colonial and post-colonial agricultural culture and history. To receive historic preservation consideration under Section 106 review it needs to meet the standards of eligibility for listing in the National Register of Historic Places which it does due to many factors including its unique historic significance.

The National Historic Preservation Act of 1966 was enacted by Congress to preserve the historical and cultural foundations of the nation as a living part of community life. I ask you kindly consider your ability to recognize that in this case preservation of this property involves little more than requiring TGP to respect this living part of the town's heritage being developed as an organic farm. I ask you mandate, should the NED Project be approved, the pipeline be instead constructed on the adjacent four acre land tract which possesses none of the attributes of the Calhoun Pasture and as already land owner by another energy infrastructure entity and is a far more appropriate location for it.

Lastly, kindly note although none of the enclosures are copies of certified copies of deeds as recorded in the Registry in Keene, NH, or documents held at the State's archives in Concord, NH, the information contained herein is easily subject to verification and if necessary during Section 106 review I am able to provide such if requested for further consideration.

2) PRESERVATION OF HISTORIC STONE WALLS

The Calhoun Pasture's walls are an important part of its history. The TGP pipeline through it and disruption of its stone walls would permanently destroy its stone walls and their appearance over a length under their current permanent and proposed easements of over 480 feet in length; 372 feet on its northern boundary, and 110 feet in length on its eastern boundary. The rebuilding of an historic wall changes when it must be entirely removed and reconstructed alters the appearance of it and its stones. The majority of the walls possess bases four feet in width and wider. Boulders that are landmarks, pulled into them by oxen from yesteryear are at times over four feet in length. Moving such stones by modern mechanical methods will deface and scar them destroying their appearance. They have aged with lichen, moss, and weathering that are a part of their character that once disturbed takes decades if not centuries to return to the same state. The colonial stone walls in New England are some of the most important and beautiful walls ever built. It is absolutely impossible to demolish the walls on the Calhoun Pasture and rebuild them without destroying the character of the property. For examples, please refer to enclosed imagery. (See enclosure G)

3) RIPARIAN BUFFER ZONE

The Calhoun Pasture possesses two significant wetlands. More importantly, they, and a much larger adjacent wetland south on another land parcel are fed by a riparian buffer zone that is vital for seasonal streams and vernal pools. This riparian zone extends through the targeted NED Project path of the Calhoun Pasture and

starts on the four acre land parcel north of the Calhoun Pasture. TGP has failed to indicate this area on their existing maps. Kindly refer to the attached images regarding an area that if disturbed will severely impact the health of the aquatic ecosystem of these wetlands. In particular, the topography of the spur at an elevation of approximately 1200 feet on my property declines toward the property's saddleback wetland. Polluted runoff will head through that buffer zone damaging it and the wetlands if the pipeline is constructed in its current part. An enormous amount of water seasonally runs across this area and disturbing the soil structure will affect that runoff drastically. I must request formally here during the scoping period that a study be conducted to identify the size of this area, and determine the environmental impact. Merely even moving the pipeline construction path off the Calhoun Pasture may not be adequate to eliminate the adverse impact. Kindly consider a comprehensive study of this area.

4) DRIVEWAY IMPACT.

Kindly consider TGP has proposed the pipeline route and adjacent temporary easement area which would adversely impact the property as completely obliterating the driveway access to Goddard for the property. Kindly consider require this area not being affected and the pipeline not allowed to destroy it. (See Enclosure I).

Thank You,

Ernest A. Kirslis

20151016-5510

To FERC committee,

This is in reference to the natural gas pipeline which has been proposed to be dug in southern New Hampshire starting in January 2017.

I have two requests of the committee. First, I would like to see a study conducted which would estimate the effect on the value of properties close to the pipeline but which will not be purchased by the government and/or the private company constructing the pipeline. If it is found that the property values will be significantly impacted in a negative way, I would like to know if FERC intends to have the owners of the properties compensated by the government and/or the private company constructing the pipeline for the loss in value.

Second, I would like to see a study conducted which would investigate the impact of a natural gas compressor station on the health of children attending a school that is located less than a mile from the station. My understanding is that the current proposal would build a compressor station less than one mile from the elementary school in my town, Temple, NH. If the study finds that it would be unhealthy or unsafe for the

children to have the compressor station built at this distance, would the government and/or the private company building the compressor station be responsible for compensating the school district for relocating the children and for having one of its buildings rendered unuseable?

Thank you.

Sincerely,

Bruce Stockwell

Hand written letter, 3 page, Catherine W, PO Box 447, New Ipswich, NH 03071: opposing

20151019-0007

CHRIS GIBSON
19th District, New York

**Congress of the United States
House of Representatives**

October 15, 2015

Norman C. Bay, Chairman
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Dear Chairman Bay:

Before the formal comment period closes for Docket No. PF14-22-000, the Northeast Energy Direct pipeline proposed by the company Kinder Morgan, I want to reiterate my position on this project.

I support expanding access to a broad range of energy resources, including the modernization and improvement of infrastructure to move these resources. Expanded access will lower energy costs for my constituents, create jobs, and improve our energy security. However, I have significant concerns with this proposed project for a variety of reasons and, therefore, I do not support the proposal in its current form.

Based on my many conversations with concerned residents across the 19th District, my reservations focus on public safety and potential environmental and economic impacts. It's vital that we make improvements to our infrastructure with tremendous care and maximum input from local residents. Unfortunately, Kinder Morgan has not provided adequate information about its plans, as outlined in an October 8, 2015 news article in *The Recorder*). Neighbors of this pipeline have many questions, and those questions should be answered by the applicant in a public forum.

It is important that the process by which this proposal moves forward is transparent and proves the safety of the project. In addition, there should be substantial risk mitigation planning and the process should engage and be responsive to local concerns. The project should also provide significant local benefit, especially given potential financial burdens from decreased property value. Our community should not bear the burden of the project, take on all the risk, and not benefit from the construction and placement of the pipeline. Furthermore, with several other projects recently approved or close to approval, it is important that we not over-develop, which could increase risk and significantly decrease any offsetting economic benefits to local communities.

I concur with the concerns of many of my constituents and also believe that the industrial compressor station, if the proposal is approved, should not be located in a residential area. Just because an area is rural, the lives of its residents do not matter any less than those in a more densely populated area.

I believe it is important that, as an elected representative, I listen to all of my constituencies and advocate for what is best for our communities. The current proposal will not provide a long term benefit to these communities and I will continue my advocacy [0 ensure our communities and constituents have a seat at the table.

If you have any questions, please do not hesitate to contact me or my staff at my Kinderhook District Office at 518-MO-8133 or by mail to »0 Box 775, Kinderhook, NY 12106.

Sincerely,

Chris Gibson
Member of Congress

Storrs Friends Meeting
57 Hunting Lodge Ter
Storrs, CT 06268

October 1, 2015

Norman C. Bay, Chairman
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Dear Norman Bay,

At our September 27 Meeting for Worship with Attention to Business, Storrs Friends Meeting unified in approval of a minute to support Woolman Hill, the Quaker Retreat Center in Deerfield, MA, in its opposition to the Tennessee Gas Pipeline proposed to run through retreat center property. As members of the Religious Society of Friends (Quakers) in Storrs, CT, we are part of the wider community of Quakers who contribute to Woolman Hill, and cherish the tranquil setting it provides for Friends to gather in worship, for workshops, for youth programs, and other Quaker events. We also contribute to the center to support its continued availability as a uniquely valuable site for local community gatherings, including retreats, conferences, and weddings.

We urge you to read the public statement written by the Board of Directors of Woolman Hill (attached) and to join us in opposing the proposed gas pipeline.

Thank you for your consideration.

Anna Andrews,
Clerk, Storrs Friends Meeting

Cc: Margaret Cooley, Woolman Hill Executive Director
Patricia Wallace, Clerk, Connecticut Valley Quarterly Meeting

PUBLIC STATEMENT REGARDING THE PROPOSED TENNESSEE GAS PIPELINE

Woolman Hill Quaker Retreat Center joins with other communities, organizations and individuals in opposing the proposed Tennessee Gas Pipeline through Massachusetts and New Hampshire, and in calling for sustainable solutions to energy needs.

In addition to significant concerns about the danger, environmental destruction and economic disturbance posed to Woolman Hill by the pipeline's proposed route across our land, we carry equal concern for the broader implications of the pipeline's regional and global impact. We have found no convincing demonstration that New England needs more natural gas pipelines for its residences, businesses, or power plants. Tennessee Gas has not denied that a large portion of the gas to be transported through the pipeline is for export

to foreign countries. Exporting fossil fuels depletes a finite resource, increases dependent on non-renewable energy elsewhere in the world, and contributes to greenhouse gas emission levels that further damage the earth's ability to support humans and other animal and plant species.

Situated on the beautiful Pocumtuck ridge in Deerfield, our retreat center emphasizes the importance of reflection, spiritual engagement, and connection with nature. We provide simple, comfortable facilities for individual retreats, group gatherings and programs that nurture spiritual growth and foster peacemaking, simplicity, integrity, social responsibility, and stewardship of the earth.

Beginning with Antoinette Spruyt's original intent to "further the causes of peace and brotherhood in the world" when she donated the land to Quakers in the 1950s, Woolman Hill has a long history of advocacy and witness in western Massachusetts and beyond. It has served as the locus of peace conferences, international youth work camps, an alternative school, the birthplace of Traprock Peace Center, the home of war tax resisters Juanita and Wally Nelson, and innumerable spiritual and social justice events.

Consistent with Woolman Hill's purpose and its Quaker values, we encourage lifestyles that reduce dependence on non-renewable energy and minimize negative impact on the earth. We acknowledge that fossil fuel and climate change issues are very complex, and that at this point in time we ourselves are often complicit with unsustainable environmental, economic, political and social systems. We grieve the destruction of the natural environment and of vulnerable communities due to human disregard for finite resources and for the sanctity of all life. We support the development of renewable and responsible energy systems which will allow us all to live sustainably on the earth.

We call on our local, state, and federal officials to promote sustainable energy use, to protect public conservation land and private landowners' rights, and to make decisions that prioritize the well-being of our natural environment and of future generations. We call on them to prevent the construction of the Tennessee Gas pipeline. May we all work towards furthering the causes of peace and kinship in the world.

Woolman Hill Board of Directors:

May 2015

20151019-0009

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, DC 20420

October 15, 2015

OFFICE OF THE CHAIRMAN

The Honorable Seth Moulton

U.S. House of Representatives

Washington, DC 20515

Dear Congressman Moulton:

Thank you for your September 10, 2015, letter regarding Tennessee Gas Pipeline Company's proposed Northeast Energy Direct Project (No. PF 14-22-000).

On June 30, 2015, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings, which initiated the formal public scoping period and indicated the locations, dates, and times for the public scoping meetings. Pursuant to the Notice, Commission staff has conducted 14 public scoping meetings for the Northeast Energy Direct Project. The meeting locations were selected to be convenient for the greatest number of people who might be interested in the project. One of these locations was in Dracut, Massachusetts, at the start of the Lynnfield Lateral which runs about 16 miles through Middlesex and Essex Counties and terminates in Lynnfield, Massachusetts.

While scoping meetings are a valuable tool for us to receive comments from the public, they are only one of several ways for interested parties to bring their concerns to the Commission's attention. Stakeholders may also file written comments with the Commission. Those comments will receive the same attention and scrutiny as comments received at public meetings. In addition, we accept and will address comments made after the end of the extended scoping comment period on October 16, 2015. I encourage you and your constituents to continue to participate in the review of the project, and to file any comments that you believe will help the Commission consider this planned project.

As in any Commission matter, please be assured that we strive to make our review of energy proposals both accessible and transparent to the public. If I can be of further assistance in this or any other Commission matter, I hope you will not hesitate to let me know.

Sincerely,

Norman C. Bay
Chairman

Washington, DC 20426

Re: Project Docket Number PF14-22000

Dear Chairman Bay:

We are writing to you regarding the Northeast Energy Direct (NED) pipeline being proposed by Kinder Morgan/Tennessee Gas Pipeline.

We are extremely concerned that FERC approval process is rigged in favor of the oil and gas companies that fund the commission. FERC has apparently only denied one pipeline project, ever. Citizens in New Hampshire alone have put in thousands of hours over the past months educating themselves and writing and speaking to FERC about the negative health, financial, and environmental problems this project would create. But, with a track record of approving almost all past pipeline projects, history demonstrates that FERC doesn't in all honesty weigh both sides equally. We fear that FERC will not give any real credence to these public comments during its hearings. KM/TGP have submitted incomplete plans filled with "To Be

Determined” information, yet the public comment period will close before we learn what those new TBD points will be. How is this process fair and impartial?

New Hampshire citizens are extremely frustrated with the ongoing dishonesty of Kinder Morgan/TGP officials who continue to smile and tell us that we have nothing to be concerned about, hoping we will eventually believe them if they repeat it enough. We are concerned that almost all the fracked gas this pipeline would carry would never be used in New Hampshire, but would instead be exported to Canada where it would be converted into Liquid Natural Gas and exported to European and Asian buyers at higher prices.

Yet, company officials claim there is a shortage of supply here and that our electric bills will be lower. It makes no economic sense to us that if there is a smaller supply of fracked gas remaining after having exported most of it, that the companies will sell it to us at a lower price, or that our electric rates will be lower once we start paying an additional new tariff to cover KM/TGP’s costs for building this pipeline. Why aren’t they paying for their project? New Hampshire is already a net exporter of electricity to the rest of New England and our state currently has several environmentally sound energy proposals on the table for hydro, wind, and solar with virtually none of the frightening long term health and environmental issues the KM/TPG fracked gas pipeline would bring.

We are extremely concerned about the noise and health hazards that the proposed 40,000 to 80,000 horsepower compressor station would bring to our particular area. This compressor station would regularly blow off poisonous gas and toxic carcinogens into the air, as within shouting distance to our elementary school, hazardous emissions that never have to be disclosed to the public by the company. The company officials just tell us they are highly regulated and that even though they have never built a compressor station this large, they know the compressors really won’t produce that much noise and that the emissions during daily operations and blow-offs are really nothing for us to worry about. We wonder why the company will have no personnel working on-site if it’s so safe. If a major explosion or disaster occurs, how long will it take for the company to first realize it and then to send response crews from Texas’

It’s incredulous that in America five FERC commissioners have the power to allow a for-profit company to take over hundreds of both longtime family owned and publicly conserved properties using the eminent domain process that was once strictly reserved for truly public sector projects such as interstate highways. After our state and communities have worked for decades to protect environmentally fragile lands for perpetuity, how can just five people have the power to approve a project that will forever negatively impact our lives, property, and environment all for the purpose of steering billions of dollars of profit to corporations whose leaders have repeatedly shown us they have no intentions of doing “what’s right”?

We respectfully ask that you, Chairman Bay, and each commissioner of FERC conduct this project review with the utmost integrity, honesty, understanding, and empathy for those of us who do not have deep corporate pockets, but who have instead, put our hearts and souls into doing “what’s right” raising our families and bettering our communities in this beautiful unspoiled part of America. We are the people who will be forever negatively affected by this project.

Respectfully,

Steven and Niki McGettigan

20151019-0020

Typed FERC Comment form: Nancy Brandt, 16 Pikes Pond Rd, Averill Park, NY 12018

Respectfully submitted by: Nancy Brandt, 16 Pikes Pond Rd., Averill Park, (Town of Nassau) NY 12018, July 15, 2015 to Federal Energy Regulatory Commission's Scoping Hearing RE: Docket No. PF14-22-000

I am a resident of Town of Nassau and am in opposition to routing a fracked gas pipeline and compressor station in Rensselaer County.

I am requesting that FERC use new and independent data specific to Rensselaer County as requested by residents, local, county, state and federal officials; and to use this new data as the basis for review and in making an informed and uncompromised decision regarding how the health, safety and welfare of the residents, including our air quality, drinking water quality, soil quality, current rural residential noise levels, property values, and forests, lakes, streams and wetlands, plant and animal life and historic and cultural land marks of our peaceful rural communities will be preserved; and moreover that this new data become the basis for standard measures in developing an environmental impact statement for a large scale and industrial gas pipeline and compressor station infrastructure in the rural Rensselaer County.

Statement Regarding the Proposed Tennessee Gas/Kinder Morgan Pipeline and Compressor Station (Northeast Energy Direct) to be routed through southern Rensselaer County, including the entire width of the northern portion of the town of Nassau. The proposed project would utilize a 30-36 inch in diameter pipeline and a 41,000-90,000 horse power compressor station operating 24 hours a day, 7 days per week, 52 weeks year.

The Town of Nassau's Natural Resources Committee analyses by experts in ecosystems and the town's natural resources, made it clear that the proposed project would impact Nassau's groundwater, sensitive habitat and economic development. In addition, the proposed project would negatively impact the sensitive and economically important Rensselaer Plateau and oppose county-wide economic development efforts. As a result of these findings, the Nassau Town Board issued a strong resolution in opposition to the Proposed Northeast Energy Direct pipeline project and compressor station proposed by Kinder Morgan and its subsidiary Tennessee Gas Pipeline, LLC.

In addition, the proposed Tennessee Gas/Kinder Morgan pipeline and compressor station (Northeast Energy Direct) operation in the Town of Nassau, Rensselaer County would violate numerous provisions of the 1986 Town of Nassau's Land Use and Development Regulations. The law's Enacting Clause and Purposes (Article I C.) state that this law was enacted:

- ~ "To permit growth and development, while protecting the rural, scenic, historic, aesthetic, economic, recreational and environmental qualities of the Town."
- ~ "To preserve and protect the physical characteristics- of soils, topography, vegetation and water sources which sustain low density rural housing dependent upon septic systems and wells."
- ~ "To protect public health, safety and welfare"
- ~ "To encourage the management of natural resources, including the land, plant life, minerals, surface waters, ground waters, soils, wildlife and aquatic life throughout the town, to ensure that their economic, recreational, social, health and aesthetic benefits will remain."

The proposed Northeast Energy Direct pipeline/compressor station project is not only in opposition to the purpose of the 1986 law it is antagonistic to its intent to preserve and protect a healthy and safe environment for all of the residents.

Like the other residents, I chose to live in the Town of Nassau for its beautiful and tranquil environment

with clean water and clean air and the peace and quiet of the natural sights, sounds and fragrances of an attractive natura I rura I residentia I community.

The Tennessee Gas/Kinder Morgan pipeline and compressor station (Northeast Energy Directj proposed for the Town of Nassau would threaten this safe and clean environment. It would be replaced by the disturbing, violent sounds and smells and discolored and highly toxic exhaust from blasting and compressor station blow offs and pipelines; and the constant threat of leaking pipelines and explosion 24 hours a day—seven days a week--52 weeks a year in our rural residential community.

The proposed industrial gas pipeline and compressor station would threaten the health and lives of residents and potentially destroy the Town of Nassau's:

- ~ Natural resources, including water quality and quantity, air quality, and wildlife and plant habitats;
- ~ The public health, safety, and welfare of the residents living in areas near the proposed pipeline and compressor station sites;
- ~ The rural character of the Towns and its "orderly development"
- ~ Economically sound and safe rural community

I recognize from other communities', adverse experiences with gas pipelines and compressor stations, without having't'o directly experience these effects would have on the quality and safety not only on my life but of my neighbors. My neighbors are all the residents of the Towns of Nassau, Schodack and Stephentown.

Thank you

20151019-0021

Docket 14-22

Dear Ms. Bose:

We are the Board of Selectmen, the governing body for the Town of Temple, New Hampshire. We have a responsibility to look out for the health and security of our residents and are extremely concerned about the KNOWN HEALTH EFFECTS of the compressor station planned for New Ipswich which would be approximately one-quarter mile &om our town.'s Elementary School and in close proximity to many of our residents.

While that compressor station is now officially planned to be 41,000 HP; Kinder Morgan has, repeatedly said in recent weeks that they are considering increasing its size to the original 80,000 HP.

In 2012 FERC was asked to consider a 12,260,HP compressor:station in the town of Minisink NY which is

very. similar in population and geography as the Temple/New Ipswich..area. There were warnings then that, if built, there would be severe human health consequences. The FERC Commissioners were split in their decision but, in the end, it was approved, built and put into operation. Today ninety percent of residents are experiencing health problems associated with the emissions &om this facility.

Frankly, we hope that FERC has learned an important lesson from Minisink. The compressor station in New Ipswich would be thirteen times the size of the one in Minisink, emitting 400,000 tons of toxins, VOC's, and greenhouse gases a year thus causing a tremendous degradation of human health over a much wider area.

Kinder Morgan is obviously expert in convincing elected and appointed officials as well as the. genend public that this pipeline is needed domestically and-that it will lower domestic energy. costs; The.local distribution, companies attempting to show need have a financial interest in this pipeline and thus a conflict. Similarly, studies by the Department of Energy have consistently shown that this export project will drive up the price of energy domestically.

This project is bad for New Hampshire and the United States. We urge you to deny this application.

Sincerely,

Gail Cromwell, Chairman, Board of Selectmen

George Willard, Selectman

Re: Docket No. PF14-22-000

Dear Commission Members,

Thank you for giving me the opportunity to have Mr. John Keiley read my letter for the record, as I am out of state and unable to be present for this meeting. I also appreciate the many meetings with representatives from afi entitles involved in this proposed pipeline, and I look forward to a continuing open dialog where we can discuss the concerns residents have and the solutions to ensure we protect this great state and the people in it.

Nevertheless, I do want to comment on this matter before FERC tonight due to the significant potential impact on the residents in the district and to afi those who enjoy the natural beauty of New Hampshire. This project is projected to cross miles of the most conserved, pristine, traditional land in this wonderful state, and the prospect of disturbing this habitat is alarming and appears unnecessary. The thought that, to accomplish this task, people will be vacated from their family home against their will only adds insult to afi those who treasure traditional NH values.

Acknowledging you will hear much tonight concerning many existing issues and challenges which need to be addressed prior to a meaningful consideration of a project like this, due to my 3-minute limit, I wish to focus my comments on the fundamental need to protect people from eminent domain “takings” as authorized by your agency.

Frankly, there is no issue more precious than the right of people to safely own and manage their land, free of the fear that their government will come take it away. The concept of a Government empowered to take, by legislative proxy, their home defies the most basic sanctity of “rights” of people in America. To protect individual and property rights, New Hampshire has worked hard to create a fair, level process where projects like this can and should be given robust consideration through existing legislative intent and the recently enacted Site Evaluation Committee (SEC).

There continues to be confusion as to what role, if any, the NH SEC plays in this project, and I do believe FERC needs to clearly confirm if it intends to fully and faithfully comply with the SEC process, findings and recommendations. I am formally requesting that FERC publically state to what extent it will support and follow recommendations put forth through the SEC and under what conditions, if any, it may choose to preempt local statutes.

Clarification of FERC’s position on this issue will help NH residents better understand to what extent the federal government and its regulating agencies will respect NH laws. I believe that it is incumbent upon FERC to clearly express its position on this critical issue. Thank you for your time.

Best to you all,

Andy Sanborn

RE: Tennessee Gas Pipeline-Northeast Direct Project

Docket 1PF14-22-000 Public Scoping Comments.

Response to Environmental Impact Statement

The Montague Energy Committee (MEC) was established in 2008. Our mission is to reduce energy use in Montague by the municipality, residents and businesses. We oppose the Northeast Direct Pipeline project proposed to run through our town as inconsistent with our mission for the following reasons.

First, it would result in the diversion of our limited town funds away from spending on infrastructure im-

provements, particularly those promoting energy efficiency, in order to address pipeline-caused needs such as special training and outfitting of first responders.

Secondly, it would make our work implementing energy-saving upgrades more difficult, by encouraging even greater dependence on natural gas.

Third, the MEC is not convinced the Northeast Direct (NED) project is necessary to satisfy regional energy needs in the long term. We share the concern with many stakeholders that increased dependence on natural gas will undermine conservation and the transition to renewables.

We also believe that the FERC criteria for determining “public necessity,” developed before both the recent natural gas boom and the concurrent expansion of renewables, is outdated. ‘The criteria take a very narrow, short-term view of “need” and do not sufficiently take into account the cumulative impact of the NED pipeline, together with other recent proposals for new pipeline infrastructure.

Thank you for the opportunity for local input.

Sincerely,

Chris Mason, Chair Montague Energy Committee

David M. Hunt, Ph.D.
Rensselaer County Biodiversity Greenprint Project
October 8, 2015

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

RE: Additional Comments for Proposed Kinder-Morgan Pipeline,
Rensselaer County, New York.
Docket # PF-14-22-000

Important Biodiversity Features, Presence & Mitigation.

Dear Ms. Bose and Federal Energy Regulatory Commission Staff,

Attached, please find an 8-page document summarizing the findings of field surveys for important biodiversity features in the Towns of Stephentown and Schodack, New York along the existing National Grid powerline proposed for use for the Kinder-Morgan Pipeline throughout Rensselaer County, New York. These comments serve as a supplement to my July 12, 2015 scoping hearing comments which were based on three previous documents referenced in those comments suggested for FERC review and presented in person to FERC staff at the July 16, 2015 meeting in Schodack, New York.

Again, I suggest that the presence, importance, and mitigation of impacts to all the regionally-important biodiversity features in the attached document be addressed in the EIS. As someone who has studied and helped identify important biodiversity sites throughout the NE U.S. and New York for The Nature Conservancy and New York Natural Heritage Program and most intensively during the past 25 years throughout Rensselaer County, New York in a project entitled the "Rensselaer County Biodiversity Greenprint Project II", I hope that the numerous regionally-important biodiversity features of various scales that are known along the proposed pipeline are addressed in the EIS. The supplemental features of importance addressed in the attached document focus on rare plant species populations and significant natural communities encountered on various field surveys during 2015.

Sincerely in Conservation,

David M. Hunt, Ph.D.,
Conservation Ecologist Rensselaer County Biodiversity Greenprint Project.
348 Jay Hakes Road; Cropseyville, NY 12052 (518) 279-4124

Proposed Kinder-Morgan Pipeline, Rensselaer County Segments.
Prioritized 2015 Field Surveys of Important Biodiversity Sites
Towns of Stephentown and Schodack, New York

David Hunt, Ecological Intuition & Medicine

October 8, 2015

OVERVIEW.

Field visits to five sites within the Towns of Stephentown and Schodack representing those among the most regionally important for native biodiversity throughout the proposed Rensselaer County route for the Kinder-Morgan pipeline were conducted between May and October 2015 to gather more information on these sites, especially to expand known information on their importance or to confirm suspected importance based on underlying physical features known from remote means. From west to east, these sites are: East Schodack Powerlines (Town of Schodack), Stump Pond Outlet Wetlands (Town of Stephentown), Crumb Pond Bog (Town of Stephentown), Cemetery Hill (Town of Stephentown), and Rounds Mountain South (Town

of Stephentown). Several other sites in the Town of Nassau were also visited in 2015, including some with similar regional importance, and were summarized in a separate, more detailed report for and funded by the Town of Nassau (Hunt 2015c). A sixth site, Calvin Cole Road Powerline, part of the broader Stephentown Powerline site with sandplain vegetation, was casually encountered during the 2015 field season. The 6 sites addressed here were mapped and summarized prior to field surveys in a brief report focusing on the most important biodiversity sites along the entire portion of the proposed pipeline route following the National Grid powerline across the county (Hunt 2015b). That report served as a supplement to a similar prior one for the Rensselaer Plateau portion of the proposed pipeline route (Hunt 2015a) that provided more detailed site information. The current summary provides updated information on the six selected sites. Focus was placed especially on finding rare plant and animal species, although confirmation or refinement of information for important examples of natural communities was also conducted. Essentially all remaining sites of “suspected” regional biodiversity importance along the National Grid portion of the proposed pipeline in the county from the prior report (Hunt 2015b) have now been field checked. Important biodiversity features from other areas along the proposed pipeline in the western half of the Town of Schodack outside of the existing National Grid powerline, including the Hudson River and its associated tidal wetlands, have not yet been summarized by me in a compilation report.

--Site Categorization.

Surveyed sites were displayed via maps in a prior report (Hunt 2015b) from three perspectives to assist with efforts to conserve them and/or protect them against potential impacts from any pipeline construction/malfunction: regional importance (Map 2), site type (Map 3), and importance certainty (Map 4). A comparison of prior and revised designations is shown in the table below. Designated regional importance levels are: very high, high, moderately high, moderate, and uncertain. Recent field surveys documented in this report suggest that the Stump Pond Outlet Wetlands is of high, not moderately high, regional biodiversity importance based on county-rare plant findings. Three other sites of prior uncertain importance, Cemetery Hill, Rounds Mountain South, and Calvin Cole Road Powerline, are now designated as sites of moderate importance. Designated site types are: aquatic networks, ecosystems, and isolated natural communities. No changes to these designations resulted from field surveys. Lastly, designated importance certainty categories are: certain, probable, and suspected. All sites are now of certain importance based, especially for sites formerly of only suspected importance, on the 2015 field surveys, some only to parts of much larger sites under and immediately adjacent to the powerline.

{table omitted}

--Rare Species.

New information in this report focuses on species rarity, which relies on field surveys and cannot be determined accurately by remote means. All rare species observed in 2015 are plants, mostly vascular plants but also some mosses. While some globally-rare and state-rare species were previously known from these sites and relocated in 2015, newly discovered populations of rare species were all for county-rare species. Global and state rarity ranks and categories are those designated by the New York Natural Heritage Program. County-rare species are categorized as either “county-active list species”, those most rare in the county and warranting active tracking with recommended conservation for all sites, or “county-watch list species”, those slightly less rare in the county and warranting periodic monitoring of their status and trends in abundance throughout the county. County rarity ranks for plant species referenced below are based on very specific numbers of sites and individuals in the county, as follows:

Dounty Rarity Ranks.

C1: extremely rare in region, with 1 to 5 known/suspected sites or 1 to 1000 known/suspected individuals.

C2: rare in region, with 5 to 20 knowr./suspected sites or ICCO to 10,000 known/suspected i~dividuals.

C3: uncommon in region.

Plants with rarity ranks of C1 to C1C2 are generally included on the county active list; those with rarity ranks of C2 to C2C3 are generally included on the county watch list.

SITE DESCRIPTIONS.

The six important surveyed sites are documented below on separate pages. For each site, information is summarized on the reason for the 2015 survey, rare species previously known and encountered in 2015, new or revised data on important natural communities, and any special concerns about potential pipeline impacts (construction and/or malfunction). Site biodiversity information was derived through rapid field surveys of up to about 2 hours per site. Surveys were conducted by a combination of the Capital District Friday Field Group and personal trips of David and Terrason Hunt. Site boundaries are shown on three maps (Maps 1 to 3), superimposed over copies of 1:24,000 USGS quadrangles. Precise maps for some of these important sites, as derived from GIS boundaries, were shown in previous pipeline reports (Hunt 2015a, 2015b), although at a very broad scale. Fine-scale maps for most of these important sites are available on the Rensselaer Plateau Alliance computer including sites on the Rensselaer Plateau that are inferable from available online datasets (Databasins).

Site #1. East Schodack Powerlines (Town of Schodack)

The importance of this site in the context of Rensselaer County was previously detailed in a report summarizing known and suspected important biodiversity features potentially impacted by the portion of the proposed Kinder-Morgan pipeline along the National Grid powerline route throughout Rensselaer County (Hunt 2015b). The site was identified as part of the East Central Schodack Region (Map 8 in that report). Site boundaries are shown on Map 1 (Site 1A) on the Nassau and East Greenbush USGS topographic quadrangle maps, representing the most precise mapping of this site to date. Surveys in previous years in the vicinity of this site focused on the abandoned trolley line, now part of a proposed rail-to-trail system. A 2015 revisit to the site was planned to better delimit the extent of the known rare biodiversity features, especially along the National Grid powerline. The 2015 survey on August 21 focused on the powerline, especially the 0.2-mile stretch north of the abandoned trolley line. This survey revealed that a 0.1-mile stretch of the powerline north of the abandoned trolley line contains part of the populations of some (3), but not all, of the regionally-rare plants that were previously known from the abandoned trolley line. All 3 rare plants occur in a dry open grassland/shrubland with shallow to exposed shale substrate. The rarest plant is Bicknell's Sedge (*Carex bicknellii*), a plant that is both state-rare (S3 ranked and on the state watch list) and county rare (C1 ranked and on the county active list), with 10 observed individuals on a shale outcrop along the powerline. It is known from only two sites in the county and concentrated in the Hudson Highlands region within New York state. Two county-watch list plants: scrub oak (*Quercus ilicifolia*), ranked C2 with about 5 individuals, and field milkwort (*Polygonum sanguinea*), ranked C2C3 with about 100 individuals, were observed in similar habitats. One other county-uncommon plant, ebony spleenwort (*Asplenium platyneuron*), ranked C3, was observed here along the powerline. Nearby rare species characteristic of dry open habitats with shale or sand substrate known from the abandoned trolley line, not yet found along the powerline here, but potentially present on the powerline farther away from the trolley line include the county-rare plants big bluestem (*Andropogon gerardii*), slender flatsedge (*Cyperus filiculmis*), grass-leaf rush (*Juncus marginatus*), and round-headed bushclover (*Lespedeza capitata*).

Site #2. Stump Pond Outlet Wetlands (Town of Stephentown)

The importance of this site in the context of the Rensselaer Plateau was previously detailed in a report

summarizing known important biodiversity features potentially impacted by the proposed Kinder-Morgan pipeline throughout the Rensselaer Plateau (Hunt 2015a). Several remotely-mapped natural community types were noted as being vulnerable to pipeline impacts in that report. Site boundaries are shown on Map 2 (Site 2A) on the Stephentown Center USGS topographic quadrangle map, however the most precise mapping of this site is represented by a composite of natural community types in one of the ecological datalayers of the Rensselaer Plateau Alliance (Databasins: Rensselaer Plateau, ecological community polygons). The 2015 field visit to this site was planned to conduct an initial evaluation of the presence of regionally-important community types and any regionally-rare plants. This ~80-acre wetland complex appears to be the largest crossed by the proposed Kinder-Morgan pipeline in Rensselaer County and is suspected to be among the largest ones along the entire proposed natural gas route between Pennsylvania and New Hampshire. The 2015 survey on June 26 (5:45pm-7:45pm) focused on the portion of the National Grid powerline that bisects former Cowee Timber Company lands, especially in the western half of the wetland. This survey confirmed the presence of regionally-important examples of sedge meadow, shrub swamp, and dwarf shrub bog, with small embedded patches resembling inland poor fen. Plants characteristic of acidic open peatlands (lfbog plants”) were suspected at this site and several were found. The rarest plant found is alpine cottongrass (*Trichophorum alpinum*, synonymous with *Eriophorum alpinum* and *Scirpus hudsonianus*). This county-active list plant, ranked C1, is known from only about 2 other sites in the county, both large peatlands, and about 300 individuals were observed in a small inland poor fen patch at this site. One county-watch list plant, bog laurel (*Kalmia polifolia*), ranked C2C3 with about 100 individuals, was observed in a similar microhabitat. A moss likely to be classified as county rare, woolly haircap moss, *Polytrichum strictum*, was also observed in the same spot. Several other county-uncommon plants were observed in the inland poor fen and dwarf shrub bog patches under the powerline: pitcher plant (*Sarracenia purpurea*), round-leaf sundew (*Drosera rotundifolia*), tamarack (*Larix laricina*), bristle-stalked sedge (*Carex leptalea*), all ranked C3, and dwarf St. Johnswort (*Hypericum mutilum*), ranked C2C4. The 2015 survey was limited in time and area. Several other rare plants are suspected from this large wetland complex, especially in large patches of dwarf shrub bog mapped in the online Rensselaer plateau Alliance ecological datalayers to the south and including areas further east along the powerline.

Site #3. Crumb Pond Bog (Town of Stephentown)

The importance of this site in the context of the Rensselaer Plateau was previously detailed in a report summarizing known important biodiversity features potentially impacted by the proposed Kinder-Morgan pipeline throughout the Rensselaer Plateau (Hunt 2015a). Three previously known regionally-important natural community types at this site were noted as being vulnerable to pipeline impacts. Site boundaries are shown on Map 2 (Site 2B) on the Stephentown Center USGS topographic quadrangle map, however the most precise mapping of this site is represented by a composite of natural community types in one of the ecological datalayers of the Rensselaer Plateau Alliance (Databasins: Rensselaer Plateau, ecological community polygons). The 2015 field visit to this site was planned to better delimit the extent of known rare plants. This ~15-acre wetland complex has the rarest known plant potentially impacted by the proposed Kinder-Morgan pipeline in Rensselaer County, Angerman’s Peat Moss, a globally-rare species. While not directly under the powerline, the wetland complex is directly downslope of the proposed pipeline route and in close enough proximity to it to be vulnerable as a kettlehole wetland to pollution from any leaks. The 2015 survey on July 31 (5:45pm-7:30pm) focused on the southern and western halves of the wetland complex. This survey confirmed the continued presence of regionally-important examples of dwarf shrub bog, bog lake, and inland poor fen, as well as possibly highbush blueberry bog thicket. The rarest plant at the site is Angerman’s Peat Moss (*Sphagnum angermanicum*), one that is globally rare (ranked G3G4), state rare (ranked SI and on the state-rare moss list), and county rare (ranked C1 and on the county-active list). In Rensselaer County, it is known from only this site, and at a regional perspective this “inland” population is widely disjunct from the Coastal Plain of New York and New Jersey. Thousands of individuals of this moss were observed in various peatland communities at the site, representing about 7% overall cover in the dwarf shrub bog and inland poor fen communities. The importance of this disjunct population was previously documented in the pub-

lished bryological literature. Another county-active list plant, hatpins (*Sriocaulon aquaticum*), ranked C1 and previously documented from the bog lake (Crumb Pond) in the 1980s (Hunt 2015a), was not found during 2015 surveys. It may still be at this site, as the 2015 survey was focused more on the peatland than the lake. One county-watch list plant, water sedge (*Carex aquatilis*), ranked C2C3, was observed in the fen patches. Several other county-uncommon plants known as characteristic bog plants were observed in the inland poor fen and dwarf shrub bog patches at this site: pitcher plant (*Sarracenia purpurea*), round-leaf sundew (*Drosera rotundifolia*), small-leaved cranberry (*Vaccinium oxycoccus*), all ranked C3, plus tawny cottongrass (*Eriophorum virginicum*) and white beakrush (*Rhynchospora alba*), both ranked C3C4. Additional county-rare plants are suspected from this site, especially bog laurel (*Kalmia polifolia*), ranked C2C3, and woolly haircap moss (*Polytrichum strictum*).

Site #4. Cemetery Hill (Town of Stephentown)

The importance of this site in the context of Rensselaer County was previously detailed in a report summarizing known and suspected important biodiversity features potentially impacted by the portion of the proposed Kinder-Morgan pipeline along the National Grid powerline route throughout Rensselaer County (Hunt 2015b). While no field information was previously available from this site, it was thought to have good potential to contain some county- to state-rare calciphilic plants (Hunt 2015b) that could be vulnerable to pipeline impacts based on its physiographic setting. Site boundaries are shown on Map 3 (Site 3A) on the Hancock, Massachusetts USGS topographic quadrangle map, representing the most precise mapping of this site to date. The site represents an isolated hill in the Taconic Valley region near the lowest slopes of Taconic Mountains, which are known to contain rich soils and support many circumneutral to calciphilic plants. The 2015 field visit to this site was planned to gather initial information on the presence of any regionally-important natural communities and/or regionally-rare plants. The 2015 survey on May 21 (1:30pm-2:30pm) focused on the western half of the portion of the hill under the National Grid powerline, which crosses the steep southern slopes of the hill. This survey confirmed the suspected presence of multiple regionally-important biodiversity features including an apparently large, and probably regionally-important example of Maple-Basswood Rich Mesic Forest surrounding the powerline, especially towards the summit of the hill north of the powerline, as well as two county-rare circumneutral plants. The rarest plants encountered at the site during the brief survey are roundleaf ragwort (*Senecio obovatus*) and wild leek (*Allium tricoccum*), both countywatch list plants ranked C2C3 and both estimated at about 700 individuals within this site. Both species were found in dry gravelly open habitat with shallow to exposed shale substrate on the upper crest of the hill. Several other county-uncommon plants known as characteristic circumneutral upland plants were observed at this site: bitternut hickory (*Carya cordiformis*), smooth rock-cress (*Arabis laevigata*), both ranked C3, fragile fern (*Cyrtopteris fragilis*), ranked C2C4, and bloodroot (*Sanguinea canadensis*), ranked C3C4. More common characteristic circumneutral upland plants known from this site include Virginia waterleaf (*Bydrophyllum virginicum*), columbine (*Aquilegia canadensis*), and herb-robert (*Geranium robertianum*). The Maple-Basswood Rich Mesic Forest north of the powerline, situated on private land, was observed only from its edge and is suspected to contain several county-rare plants. The rare plants under and adjacent to the powerline are susceptible to pipeline construction impacts, especially if the very steep slopes of this hill are to be drastically altered to meet any construction grade requirements (e.g., blasted to decrease the slope to less than 25 degrees).

Site #5. Rounds Mountain South. (Town of Stephentown)

The importance of this site in the context of Rensselaer County was previously detailed in a report summarizing known and suspected important biodiversity features potentially impacted by the portion of the proposed Kinder-Morgan pipeline along the National Grid powerline route throughout Rensselaer County (Hunt 2015b). While no field information was previously available from this site, it was thought to have good potential to contain some county- to state-rare calciphilic plants (Hunt 2015b) that could be vulnerable to pipeline impacts based on its physiographic setting. Site boundaries are shown on Map 3 (Site 3B) on the Hancock, Massachusetts USGS topographic quadrangle map, representing the most precise mapping of this

site to date. The site is situated near the lowest slopes of Taconic Mountains, which are known to contain rich soils and support many circumneutral to calciphilic plants. A 2015 field visit to this site was planned to gather initial information on the presence of any regionally important natural communities and/or regionally-rare plants. Two separate field surveys were conducted at this site in 2015, one near East Road and one near Rounds Mountain Road.

The first of two 2015 surveys focused on the westernmost slopes of Rounds Mountain under the National Grid powerline east of East Road on June 19 (1:30pm-2:30pm). This survey confirmed the suspected presence of multiple important biodiversity features including a large, probably regionally important example of Maple-Basswood Rich Mesic Forest surrounding the powerline, especially along the midslopes of the hill north of the powerline, as well as four county-rare circumneutral plants. The rarest plants encountered at the site during the brief survey are roundleaf ragwort (*Senecio obovatus*), wild leek (*Allium tricoccum*), bottlebrush grass (*Elymus hystrix*), and false melic (*Schizachne purpurascens*), all county-watch list plants ranked C2C3 and all estimated at hundreds of individuals within this site. They were found near the ecotone of the dry gravelly open powerline habitat with shallow to exposed shale substrate and the rich forest north of the powerline on the midslopes of the hill. Other county-uncommon plants known as characteristic circumneutral upland plants were observed at this site including bitternut hickory (*Carya cordifolia*), ranked C3. More common characteristic circumneutral upland plants known from this site include Virginia waterleaf (*Bydrophyllum virginicum*) and columbine (*Aquilegia canadensis*), and herb-robert (*Geranium robertianum*). The Maple-Basswood Rich Mesic Forest north of the powerline, situated on private land, was observed only from its edge and is suspected to contain several county-rare plants. The rare plants under and adjacent to the powerline are susceptible to pipeline construction impacts, especially if the very steep slopes of this hill are to be drastically altered to meet any construction grade requirements (e.g., blasted to decrease the slope to less than 25 degrees).

The second 2015 survey focused on the part of Rounds Mountain under the National Grid powerline both west and especially east of Rounds Mountain Road on October 4 (2:45pm-3:45pm). This survey confirmed the suspected presence of one regionally-important biodiversity feature, county-uncommon nodding ladies tresses (*Spiranthes cernua*), ranked C3C4, with six individuals growing on a dry gravelly open slope directly under the powerline east of Rounds Mountain Road.

Site #6. Calvin Cole Road Powerline. (Town of Stephentown)

The importance of this site in the context of the Rensselaer Plateau was previously detailed in a report summarizing known important biodiversity features potentially impacted by the portion of the proposed Kinder-Morgan pipeline throughout the Rensselaer Plateau (Hunt 2015a) under the broader site "Stephentown Powerline". Site boundaries are shown on Map 2 (Site 2C) on the Stephentown Center USGS topographic quadrangle map, representing a casual but most precise mapping of this local survey area. The Stephentown Powerline site was most precisely mapped in the Rensselaer Plateau pipeline document (Hunt 2015a). Two previously known county-rare to uncommon plants at this site were noted as being vulnerable to pipeline impacts. The brief 2015 field visit to this site was spontaneously conducted to check on the status of the known rare plants and search for additional rare species. The 2015 survey on July 31 (5:10pm-5:20pm) confirmed the continued presence of county-watch list plant field milkwort (*Polygonum sanguinea*), ranked C2C3, and county-uncommon plants round-leaf sundew (*Drosera rotundifolia*), ranked C3, and nodding ladies tresses (*Spiranthes cernua*), ranked C3C4, all growing in a dry gravelly. open habitat under the powerline with localized peaty seeps. An additional county-watch list plant, pineweed (*Hypericum gentianoides*), ranked C1C3, was discovered in 2015 at this site.

7 Patrice Lane
Lynnfield, MA 01840

Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street North East
Room 1A
Washington, DC. 20428

Dear Secretary Bose,

I am writing out of concern regarding Docket number PF14-22 called the Lynnfield Lateral a proposal by Kinder Morgan/Tennessee Gas to lay additional gas pipeline not just in my town but also in neighboring towns throughout Massachusetts.

As you know, the Lynnfield Selectmen have taken a position against the proposal as have many community members who have been attempting to educate themselves. To date, Kinder Morgan hasn't seen fit to have an open meeting with the citizens of Lynnfield.

My objections to the pipeline concern existing leaks, the impact on the environment, neighborhoods and wetlands. I am also concerned about the contention that additional gas service is needed by consumers.

The Boston Globe on August 21", 2015 published a front page article entitled, "Leaks widespread in state's gas lines . Lynnfield is one of the communities with the most leaks which have cost rate payers more than one billion dollars. How much damage is this doing to human health and the ozone layer and our environment in general? It is important to repair the leaks before it is said that more gas is needed. Massachusetts has goals for increasing renewable energy. The growth of solar and wind power are in evidence everywhere.

In Lynnfield we have a high water table and many wetlands. We also have Reedy Meadow, one of the largest reedy meadows in the country according to the Ipswich Watershed Association. The wetlands include, "interior forest species'. Our drinking water comes from shallow wells and drilled wells. I am concerned about the impact of a pipeline on wetlands and trees.

Lynnfield has many beautiful neighborhoods which I visited recently to view the areas most impacted by the pipeline. Properties will be impacted and some subjected to the noise of the meter station and blowouts.

I question the need for this further endangerment to human and animal health, neighborhoods, and the environment.

I request that you study:

- √ The leaks we already have, the cost to the consumers, and the contention we need more and larger pipelines
- √ Environmental Impacts including on wetlands, animal and plant species, and drinking water
- √ The impact on residential homes

Additionally, I ask you to consider what I have recently heard that the intent is to import gas to Europe and that residents would not benefit from the pipeline which would negatively impact Lynnfield forever.

Thank you for your consideration.

Sincerely,

Patricia Campbell

Kimberly Bose:

The birdfoot violet is slated as being imperiled and threatened by the slate's aiteria. It has only 9 sfies and it can be located on lot 7-11 of Pelham's map. There are three distinct areas the plants are located on this krt which is just south of the electric tower 214-114. Each area as 20 to 30 pktnts. There are a few plants heated just South of tower 214-117near the edge of Brierwood Road (formerly called Old Lawrence Road). Tower 2114-116has a couple of plants near the side of the same road. Note that Brierwood Road is a Cktss six road. See the New Hampshire Natural Heritage for exact locations. Pktnts were verified by John Viera senior project manager and senior ecologist -Company Vanasse Hangen Brustlin, Inc.

My concern is for the watershed in the Rindge, NH area. Most of the area surrounding the proposed construction sites are dotted with large bodies of water, vernal pools and wetlands containing endangered specks of frogs and salamanders. Most concerning are three large bodies of water including Hubbard Pond, Emerson Pond and Converse Meadow Pond. Pollution of any of these aquifers would pose a major environmental disaster. There are many more ponds and pools in the area of construction the above are located close to our immediate area. I strongly encourage your review of this potential devastation.

Re: Project Docket Number PF14-22-000

Dear Commissioner Honorable:

We are writing to you regarding the Northeast Energy Direct (NED) pipeline being proposed by Kinder Morgan/Tennessee Gas Pipeline.

We are extremely concerned that FERC approval process is rigged in favor of the oil and gas companies that fund the commission. FERC has apparently only denied one pipeline project, ever. Citizens in New Hampshire alone have put in thousands of hours over the past months educating themselves and writing and

speaking to FERC about the negative health, financial, and environmental problems this project would create. But, with a track record of approving almost all past pipeline projects, history demonstrates that FERC doesn't in all honesty weigh both sides equally. We fear that FERC will not give any real credence to all these public comments during its hearings. KM/TGP have submitted incomplete plans filled with "To Be Determined" information, yet the public comment period will close before we learn what those new TBD points will be. How is this process fair and impartial?

New Hampshire citizens are extremely frustrated with the ongoing dishonesty of Kinder Morgan/TGP officials who continue to smile and tell us that we have nothing to be concerned about, hoping we will eventually believe them if they repeat it enough. We are concerned that almost all the fracked gas this pipeline would carry would never be used in New Hampshire, but would instead be exported to Canada where it would be converted into Liquid Natural Gas and exported to European and Asian buyers at higher prices.

Yet, company officials claim there is a shortage of supply here and that our electric bills will be lower. It makes no economic sense to us that if there is a smaller supply of fracked gas remaining after having exported most of it, that the companies will sell it to us at a lower price, or that our electric rates will be lower once we start paying an additional new tariff to cover KM/TGP's costs for building this pipeline. Why aren't they paying for their project? New Hampshire is already a net exporter of electricity to the rest of New England and our state currently has several environmentally sound energy proposals on the table for hydro, wind, and solar with virtually none of the frightening long term health and environmental issues the KM/TPG fracked gas pipeline would bring.

We are extremely concerned about the noise and health hazards that the proposed 40,000 to 80,000 horsepower compressor station would bring to our particular area. This compressor station would regularly blow off poisonous gas and toxic carcinogens into the air, all within shouting distance to our elementary school, hazardous emissions that never have to be disclosed to the public by the company. The company officials just tell us they are highly regulated and that even though they have never built a compressor station this large, they know the compressors really won't produce that much noise and that the emissions during daily operations and blow-offs are really nothing for us to worry about. We wonder why the company will have no personnel working on-site if it's so safe. If a major explosion or disaster occurs, how long will it take for the company to first realize it and then to send response crews from Texas?

It's incredulous that in America five FERC commissioners have the power to allow a for-profit company to take over hundreds of both longtime family owned and publicly conserved properties using the eminent domain process that was once strictly reserved for truly public sector projects such as interstate highways. After our state and communities have worked for decades to protect environmentally fragile lands for perpetuity, how can just five people have the power to approve a project that will forever negatively impact our lives, property, and environment all for the purpose of steering billions of dollars of profit to corporations whose leaders have repeatedly shown us they have no intentions of doing "what's right"?

We respectfully ask that you, Commissioner Honorable, and each commissioner of FERC conduct this project review with the utmost integrity, honesty, understanding, and empathy for those of us who do not have deep corporate pockets, but who have instead, put our hearts and souls into doing "what's right" raising our families and bettering our communities in this beautiful unspoiled part of America. We are the people who will be forever negatively affected by this project.

Respectfully,

Steven and Niki McGettigan

20151019-5001

Marilyn Learner, Hollis, NH.

I would think that preserving the integrity of our living environment, which includes ensuring the continuation of life-sustaining clean drinkable water, clean breathable air, and a healthy self-sustaining ecosystem for future generations would be the first and primary concern for a federal energy regulatory agency.

FERC has been given authority to approve highly invasive and permanently planet-altering energy infrastructure. That authority, given by the people, and subject to review and revocation by the people, should be used very sparingly and judiciously, and only when other, better options for essential energy services is not possible. Kinder Morgan is hard put to justify building NED, as “need” is obviously contrived and invented. Additionally, KM’s cavalier attitude toward scoping comment concerns reveals their overall attitude, “yeah yeah, we complied, check off the boxes; let’s get on with it.” According to their Resource Report KM intends to utilize the minimum standards required in construction materials, practices and maintenance if ever allowed to build NED.

This is not “just” a pipeline. NED highly impacts the environmental future and energy future of PA, NY, MA, NH, NE, the USA and Earth. It is time for FERC to throw off the “regulatory capture” that guides its decision making processes and start REGULATING corporate oil and gas’ deceit and greed.

20151019-5002

Kathleen Ziobrowski, Averill Park, NY.

I am in opposition to PF14-22 creating the pipeline and natural gas compressor station proposed for Nassau. It will devalue my home, cause my family and I potential serious health issues, and hurt the wildlife in my area. Please don’t let this project move forward. It will also potentially hurt the well water we drink. This compressor station is too close to residential and recreational areas. Please don’t do this, or move it out of our area to more rural area. This is not the correct place for this pipeline and compressor station.

20151019-5003

Holly B Koski, Rindge, NH.

This is my last comment (of this period)... My only request is to Please -Do what you were hired to do - do your jobs. The Northeast Energy Direct Project is not - I repeat- NOT needed. This project is of no direct benefit to Southern New Hampshire or to New England. NED will benefit Kinder Morgan / Tennessee Gas and its subsidiaries- it will not benefit the residents of New Hampshire... How can FERC approve a project that will benefit a private companies pockets... Look at all of the other small countries in this world that are succeeding with Solar Energy and with Wind Turbines. I do not want to live in an “Incineration Zone- or an Impact Blast Radius”. We do not have the resources to deal with faulty natural gas pipes and the destruction of our wells- our water- our means of life....

I hope that the last FERC Scoping meeting held at Franklin Pierce University was listened to by your commission. I do wonder how FERC was able to come up with all of those questions to the EIS report - (dated BEFORE- the FERC scoping meeting)

Don’t we matter? Don’t the Kids of the Pipeline Matter? Don’t Rural Lives Matter?

I think all that matters is \$\$\$\$\$ - I am personally holding you accountable for all of the future accidents(that occur from Natural Gas) in New England- and they will happen if you approve this NED “disaster”

Sincerely

Holly Koski

If NED is put in I expect Kinder Morgan to improve the Road that I live on and I expect them to pay for an Emergency Egress....

20151019-5006

Mary Rickel Pelletier, Hartford, CT.

15 October 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street, NE, Room IA

Washington, DC 20426

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/
Kinder Morgan (FERC Docket No. PF14-22-000)

Dear Secretary,

Park Watershed is a 501c3 urban-suburban watershed stewardship organization for Park River regional watershed, which stretches east of the Metacomet Ridge through MDC reservoir properties to the Connecticut River. West Hartford, Hartford and Bloomfield as well as parts of Newington, New Britain, Farmington and Wethersfield are within the Park River watershed. Our organizational goal is to improve the water quality and ecosystem health of water courses and water bodies that enhance neighborhood character even within high-density urban development. Park Watershed is currently focused on green infrastructure for stormwater management, as we work on implementation of the North Branch Park River Watershed Management Plan, which was approved in 2010 by US Environmental Protection Agency.

The Northeast Energy Direct (NED) project (FERC Docket No. PF14-22-000) proposed by Kinder Morgan would cross through headwaters of the Park River regional watershed. Park Watershed is opposed to new pipeline construction through Class I and Class II land that protects our exceptionally pure drinking water. With a population that exceeds two hundred and fifty thousand, the seventy-eight square mile Park River regional watershed is one of the most densely developed metropolitan areas in the state of Connecticut. Well-managed landscapes of the MDC reservoir system have considerable cultural and recreational value, because most other areas of the Park River watershed have been extensively developed. The landscapes along the Metacomet Ridge also host habitat for wildlife and migratory birds, and significant cultural heritage features, such as the New England National Scenic Trail.

In addition, Park Watershed seriously questions the ethics of a pipeline for gas extracted with problematic “fracking” methods that negatively impact human, environmental and community health. In the future, clean water will surely increase in value. The NED project threatens to undermine the integrity of the historic MDC reservoir system and the clean water that it provides to Connecticut residents. As a federal agency, we recommend the Federal Energy Regulatory Commission prioritize preservation of local cultural assets, especially our drinking water reservoirs.

Sincerely,

Mary Rickel Pelletier
Founding Director
Park Watershed
www.ParkWatershed.org

20151019-5007

Cory Kern, Bloomfield, CT.

I strongly oppose the proposal by Tennessee Gas/Kinder Morgan to install a natural gas pipeline through the Class I and Class II watershed land owned by the Metropolitan District Commission (MDC). A gas pipeline installation on this land has potential to impact a high quality drinking water source. Also, granting permission for a new pipeline through this land undermines Connecticut’s current protections for drinking water.

CT General Statute 25-32 requires a change of use permit from the CT Department of Public Health for projects like this one. Furthermore, it restricts the use changes that are allowable. The existing gas pipeline and easement on the MDC property pre-date the statute. A proposal now, to install new pipeline and enlarge the permanent right-of-way, is inconsistent with the letter and intent of CGS 25-32.

Regardless of the degree of threat posed by this particular pipeline, allowing an exception to the statute sets a dangerous precedent, paving the way for other encroachments on water supply land. Connecticut’s standards for drinking water quality are second to none in the country. They are important in maintaining public health and quality of life in our state. While other regions face increasing threats from contaminants in their

drinking water sources, Connecticut's protective legislation stands out as a model and should not be compromised.

The first drafts of the NED Environmental Reports submitted to FERC contained an erroneous statement that the proposed pipeline route is not located within any public drinking water or aquifer protection areas. In the recent public forum held by Kinder Morgan in West Hartford on October 7 (held after an emphatic request by the MDC) it was clear that Tennessee Gas/Kinder Morgan has every intention of putting more pipeline through the MDC's drinking water supply area. During the question and answer session, alternate routes were dismissed as impracticable.

20151019-5008

RE: Kinder Morgan/Tennessee Gas Pipeline Company, LLC (KM/TGP)
Docket No. PF14-22-000
Northeast Energy Direct (NED) Pipeline Project

Dear Secretary Bose:

I oppose the above referenced project. This is Part 1 of a 2 part letter, as I had insufficient space to e-comment the entire letter.

On 10/8/15, at a special town meeting, KM/TGP reps surprised the Merrimack (MMK) Town Council/residents with yet another revised map, showing a legend with six different routes through parts of south MMK.

These routes have 2 things in common:

1. They all end on the Anheuser Busch property, located on the DW Highway, MMK, in the area where KM/TGP has stated they must deliver the pipeline for Liberty Utilities to build a metering station, and
2. They all negatively impact MMK.

I ask that FERC does not issue KM/TGP a Certificate of Public Convenience and Necessity, because there is a documented lack of necessity.

- KM/TGP bought a full page ad in the 9/18/15 MMK Journal sub-headed "NH's ENERGY CRISIS". FERC knows there is no energy crisis in NH. There is a winter reliability issue that has been handled, and energy prices are dropping. (1) (2) (3) (4)

KM/TGP will try to prove "need" in NH with their one NH anchor shipper, Liberty Utilities (LU), who is owned by Algonquin Power & Utilities Corp, who has partnered with KM/TGP (5)

KM/TGP's press release of 9/29 claims commitments for 627,000 Dth/d, between their market and supply paths, including a group of "producers, local distribution companies and a NY end-use market participant" who "did not wish to be named". (6)

LU now gets gas from KM/TGP through the Concord Lateral. The 115,000 dekatherms/day requested from NED would fuel their hopes of expansion to other parts of NH. "Melissa Whitten, a utility consultant hired by the PUC staff, testified in May that the pipeline deal would leave Liberty with "substantial excess capacity that it would not completely absorb or grow into over the life of the contract." (Union Leader 10/5/15)

Sharon Chamberlin, NH's Consumer Advocate, advised the NH PUC not to allow Liberty to buy gas from NED, because "if Liberty buys a huge share in a brand-new pipeline, and then fails to grow its business, its customers will be stuck paying for a big empty pipe."

She says the company hasn't done enough analysis to compare the cost of signing on to the NED pipeline to

other proposals that are floating around.

“There are many different pipeline proposals out there right now, and it’s a moving target,” she says, “We know we’re in a period of transition right now, so we don’t know that it is the least cost means of supplying the customers.” (7)

The NH PUC Consumer Advocate Residential Ratepayers Advisory Board Roster should comprise of nine (9) members. At the time of LU approval on 10/2/15, 6 out of 9 commissioners on the NH PUC Consumer Advocate Residential Ratepayers Advisory Board Roster had expired terms. Sharon Chamberlin, who advised against approving LU, was not reappointed to her position by the three who approved LU. (8)

Other energy projects on the table for New England include 2 other pipelines (Access Northeast and AIM), that total 1.5B cubic feet of natural gas/day, at a total cost of \$4.5B, and both use existing pipeline corridors. In addition, there are 4 wire projects, with the potential of up to 5,000 megawatts of power, costing about \$8.5B.

NED has customers signed for 627,000 Dth/d, but says it could bring up to 1.3B cubic feet/day of gas. “Co-location” must sit outside the power line corridors because of EM interference, requiring a clear cut corridor of over 100 feet beside the power lines. NED is estimated to cost \$5B, which is more than Access and AIM combined. (9)

New England’s actual energy needs vary daily. Yesterday, we peaked at 15,168MW, out of an available total of 18,577MW. The all time winter peak was 22,818MW on January 15, 2004. (10)

According to the ISO-NE website (11) our energy is a mix of:

- 67% Natural gas
- 16% Nuclear
- 11% Renewable
- 5% Hydro
- 1% Oil and coal

Combined gas from Access Northeast, AIM and NED totals up to 2.8B cubic feet of gas/day = 845,600MW, according to this converter (12). That leaves us with quite an excess, and that doesn’t take into account the 6 wire projects, which adds between 5,500 to 6,900 MW? AIM and Access Northeast would provide plenty of gas for all of New England, with lots to spare.

I respectfully ask the FERC Commissioners to please say no to Kinder Morgan/TGP’s NED.

Thank you,

Gina Rosati

RE: Kinder Morgan/Tennessee Gas Pipeline Company, LLC (KM/TGP)
Docket No. PF14-22-000
Northeast Energy Direct (NED) Pipeline Project

Dear Secretary Bose:

I oppose the above referenced project. This is part 2 of a 2 part letter.

If the reasons I outlined in Part 1 of this letter are not enough to convince the FERC that NED is not needed, please consider the following impact on the town of Merrimack.

- Water – there are several aquifers that provide over 50% of Merrimack’s drinking water located along the proposed routes. If KM/TGP goes near Greens Pond, they will affect one. If they go Route 101A/Continental Boulevard by Home Depot, they will affect another. South of Continental Boulevard, much of that land is Pennichuck wetlands. I’ve seen the maps where KM/TGP brings their pipeline right up to the edge of the green wetland legend, as if the thin line between green legend and the white is a magical barrier that will keep contaminants from the installation of their pipe and any potential gas leaks from contaminating Nashua’s drinking water.
- Thorntons Ferry Elementary School (TFS), a public elementary school attended by about 500 students, including several special needs children, is along the route, as well as a private school and at least one pre-school. KM/TGP is under the impression that their latest route has taken the pipeline further from TFS, but this route is not only closer, it zigs and zags 15 times within about one mile, and it’s now on the same side of Continental Boulevard as TFS, separated only by a grove of pine trees/ thick layer of ground brush.
- Barry Duff, Kinder Morgan Project Manager, told me the Merrimack Community Hospice House (MCHH) is 400 feet from the pipeline. According to the legend on Google Maps, the MCHH is less than 200 feet from the pipeline.
- The pipeline will come close to several historic buildings in Merrimack, notably the Merrimack Historic Society (Boston Post Road) and 16 Tinker Road, which is registered with the National Register of Historic Places, as well as the barn at 15 Tinker Road, which is considered older than 16 Tinker. Records show the land on which 16 Tinker Road sits was sold from Joshua Converse to William McClure back in 1741. Until 2015, only two families have lived in the house at 16 Tinker – generations of the McClure family, and the Hilton family. It recently sold to a young family with small children, and one of the proposed routes is less than 300’ from their front door. Tinker Road is an old road connecting two bodies of water - Bowers Pond (providing much of Nashua’s public water supply) and Naticook Pond. Along Tinker Road, you’ll find some of the Pennichuck wetlands which feed into Nashua’s public water supply. Because Tinker Road is so old, there are several homes from the early 1700’s that will be very near this pipeline. Their foundations are not built to handle the blasting that will be necessary to trench this pipe.
- Wildlife – Merrimack is home to moose, bear, deer, bobcat, fox, coyote, beaver, porcupine, heron, wild turkey, many songbirds, including bluebirds, and numerous smaller animals. They’ve already lost habitat to the Merrimack Premium Outlets. Clearing the acreage needed for this pipeline would further decimate the animals’ habitat. Two proposed pipeline routes are through popular hunting spots, as well.

- The New Ipswich compressor station isn't near Merrimack, but it's proposed to be within 1/2 mile of an elementary school, nursing home, and closer to numerous homes. More doctors are coming out saying compressor stations emit toxins that are harmful to humans, animals and the environment (1). I would hope FERC will agree that more research needs to be done on the long-term health effects of those living near compressor stations before approving any more.

Commissioners Norman Bay, Tony Clark, Colette Honorable, Cheryl LaFleur, and Philip Moeller hold our climate, our water, our air, our land, our health, our safety, the value of our homes, and our peace of mind in their hands. I respectfully ask them to please say no to NED.

Thank you,

Gina Rosati

Merrimack, NH

20151019-5010

sarah h reloj, Deerfield, MA.

1. I ask FERC for Ask for a No Action Alternative on PF14-22-000, with a complete Restart to the Scoping Meetings to allow time to review and share materials with valid energy demand data provided by Mass. AG Maura Healey to be disseminated by 10-31-15.

TGP/Kinder Morgan left out so much in their reports that I cannot even believe your branch accepted them at FERC. It is shameful. They used maps that are 30 to 35 years old for sections of the Franklin County towns in Massachusetts to underplay to FERC the amount of buildings and number of people living on certain streets and in certain areas in their "Incineration Zones", I have counted buildings and compared the maps they used to submit to FERC with actual streets by driving around and counting. Their submitted maps from July 2015 do not show many, many known structures built around 1980 onward. TGP KINDER MORGAN IS DOWNPLAYING THEIR IMPACTED LAND OWNERS. THEY ARE NOT TELLING YOU ALL THE TRUTH ABOUT IMPACTS BY DELIBERATE USE OF OLD MAPS.

I have many Questions:

2. How would they plan to work around Protected Lands and Protected species in NHESP and other gov. agencies, that are there for our and their protection, by law? HOW?

3. How would they place pipes/ Drill, Dynamite, Frack and Monitor in areas of known seismic activity, on or near fault lines? How to monitor granted access roads for continued, year over year, enforce on violations and quantify/track erosions of soil?

4. I'd like to bring up: the total lack of emergency response capabilities across the entire line in these rural towns. No equipment, NOT ENOUGH Responders, NO Burn Units nearby for fighting pipeline disasters.

5. How will they ensure the multiple areas of Native American artifacts and known burial grounds will remain, in situ, and also protected from access roads, equipment, and the pipeline itself? Ditto: for Colonial Heritage artifacts, including the Revolutionary War sites and sites from the French and Indian War. As well as documented finds of Dinosaur and fossils from the Jurassic and Triassic periods that dot our lands across the entire valley.

6. And, how is the horizontal bore done? How deep, exactly where and how wide? They skipped all that in their reports in Dec. '14 and July '15 filings with FERC so we cannot even know their proposed ideas about our land and waters here in western Mass.

7. How do they test for radon being forced into homes from dynamiting the land and fracking the land or rivers to get the line through?

8. FERC: Do they have a schedule forever for that testing on our homes? Or a proximity?

9. Deerfield: How do the homeowners get home when they blow through there to lay a pipe? Ask the Same for emergency vehicles? How do we get across 91 N or S? What time do they bore or blast through all our roads and streams and fields? Their reports are incomplete, inaccurate and ill-conceived based on our many cultural assets and varied soils.
10. How do they actually do that drilling or blasting on fault lines?
11. How can Pipe then be laid in known fault zones and flood zones and in our cases in Deerfield, both issues at the same time?
12. How would the hills be cleared of trees in such a way as we do not have landslides when the snow melts or when we get a Cat. 3, 4, 5 Hurricane Irene's Sister or Another Sandy coming by?
13. How do they monitor and maintain the welds under rivers during plate shifts, epic floods? It is a seismic area all over here, and is predicted to have more seismic events. On faults and near faults, edge to edge from French King Bridge on down. How FERC? HOW?
14. How do they fix the pipe if it breaks under a river in an icejam, with heavily frozen ground or epic, extended ice storms? We have those.

FERC: All the gorgeous towns in MA + NH, CT, NY, & PA cannot bear the disaster this could bring. Enough is enough.

FERC to re-look at NED's lack of foresight & detail on the actual HOW this thing can get built. It is 3X to 4 X capacity needed -ever- and WE KNOW THAT GAS IS NOT FOR US TO USE HERE. IT CANNOT EVEN BE USED IN SO MANY TOWNS IT CROSSES.

FERC: Kinder MORGAN bribes, toxifies and pays off landowners to take their beloved land in such a way as they cannot actually use it for farming as we know it.

DID FERC EVER farm around herbicides, clear cuts 100 feet wide that pollute crops and animals and the watershed here including the Deerfield and CT that we cherish like our own babies?

SAY NO KINDER MORGAN! SAY NO TO NED.

IT IS NOT APPROPRIATE AND WE WILL NOT ACCEPT THIS POWER PLAY TO GET GAS OUT TO EXPORT AT TOO LARGE A COST TO OUR REGION FOR NO LONG TERM OR SAFE, COST-EFFECTIVE BENEFIT. THE RISKS OUTWEIGH THE REWARDS.

WE CAN FIX LEAKS AND USE BETTER METHODS TO CONSERVE.

NED IS OVERBUILT FOR PROFIT THAT VIOLATES ARTICLE 97 of our Mass. Constitution.

FERC NEEDS TO STOP PERMITTING PROJECTS THAT DESTROY OUR LOCAL COMMUNITIES, LAND, WATER AND PEOPLE'S LIVES FOR CORPORATE GREED. NED IS NOT INFRASTRUCTURE.

20151019-5011

Tammy Fareed, Hollis, NH.

I've read thousands of eComments and eFilings on this site this past year pertaining to the Kinder Morgan/Tennessee Gas Pipeline NED project. Aside from a few NY job seekers (who probably would not be able to compete successfully for good pipeline jobs against the guys who'll be trucked in from TX and OK), the overwhelming evidence from most commenters has indicted this project and its creators for the profiteering grab it is.

The overwhelming evidence also indicts FERC itself. Many commenters have called FERC a rubber-stamp agency in regulatory capture. Several have challenged FERC to do its job and Regulate the very industries that pay its way.

As I've contemplated all this - if FERC isn't doing its job, legally, how is it still in business? - I've come to realize that FERC has molded its job into doing just that: helping ensure that all applicants make their projects REGULAR. In other words, to become FERC-certified, all a project has to do is to become a REGU-

LAR FERC PROJECT. FERC isn't a rubber-stamp agency, it's a cookie cutter agency.

No matter how egregiously against all sense and law a project may be, if it can conform to FERC's measuring formats, it will become REGULAR and FERC can (and will) approve it. Regardless of the intent behind FERC founding. Regardless of a project's excesses, redundancies, superfluosities, mendacities, and the severe harm it will cause to thousands, if an application meets FERC's checklist, it is deemed REGULAR and thus it is REGULATED and certified.

And for this REGULATION, FERC is paid by those whom it has made REGULAR. This reminds me of the image of a snake swallowing itself, which suggests that in the near future FERC will disappear.

Until then, thousands upon thousands of American citizens will suffer the kinds of losses and harms associated with the unfortunates who live in lawless countries subject to despotism and oppression. Never mind Ukraine, North Korea, Syria. Pity the folks who are subject to FERC's REGULATION process, invisible victims of a sycophantic agency aiding and abetting the pillaging of lives by its corporate masters.

No doubt FERC has seen many, many projects it didn't like. But it never bites the hand that feeds it. That would be irregular.

20151019-5012

Susan, Nassau, NY.

I am very concerned about many issues concerning the proposed compressor station site on Clarks Chapel Road. This site is directly across the street from my daughters organic farm. The blow downs will cause chaos with her beef cattle and also cause pollution both noise and air. There are at least 50 children within 1/2 mile of the site. We already deal with issues from the Dewy Loffel GE polluted site approximately 3/4 mile away. I personally have invested in 200 acres within 1/2 mile of the proposed site. I was a realtor and know that this compressor station will bring a financial hardship to my husband and myself if it goes in. All of my children and many of my relatives have built within 1 1/2 mile of this site. I grew up on a farm next to the 200 acres and many family members have all built homes on these two farm sites. There are 35 of us all within 1 1/2 mile of the site and most in the incineration zone of the pipeline. This is a lot to ask of one family to bear. It is a very unusual circumstance and I am asking ferc to consider the human aspect of this as well as the environmental. This site is surrounded by many homes with young children, Burden Lake which is in the direct path of the prevailing wind and a highly populated area.

There are Eagles on the proposed site, bee farming at three of the sites in the 1/2 mile zone and farms that surround it.

Thank you for considering my request.

Susan Phelps

20151019-5013

Hugh Rogers, Washington Depot, CT.

October 16, 2015

To the Federal Energy Regulatory Commission,

As a resident of Connecticut, I am deeply concerned about the proposed gas line through Metropolitan District Commission land and strongly urge you to disapprove the project. This land is classified as Class I and Class II, and disturbing it, for anything other than its maintenance as natural and open land, is prohibited by state law. To allow this pipeline would undermine the legal protections of Connecticut's drinking water and set a precedent that would threaten the future of clean drinking water.

I urge FERC to consider whether the entire project is necessary, the legality and safety of a route through Class I and II land, and alternate routes and their impacts.

Sincerely,

Hugh Rogers
21 Moody Bridge Rd. W.
Washington Depot, CT 06794

20151019-5014

Michelle Krichbaum, New Ipswich, NH.

Please do NOT approve the pipeline or compressor station, we the people do NOT want this. This pipeline and/or compressor station will destroy what makes us want to live here, peace and quite, nature's splendor, fresh air, fresh water and so on. There is no need for a pipeline to destroy all this beauty when it appears to be going in solely to line Kinder Morgan's pockets as they EXPORT the gas. We implore you to deny their application.

20151019-5015

Susan Landon, Tewksbury, MA.

My husband and I sent a letter, certified mail receipt, to Tennessee Gas Pipeline LLC on October 3 informing them and their representatives, contractors and other associates that we deny permission to enter our property. We are strongly against this project not only because of the significant impacts to our property but the significant environmental and public impacts across the Commonwealth of Massachusetts. A 24-inch 1400 psi pipeline does not belong in residential areas, much less the larger transmission pipes and enormous compressor stations. An additional significant concern is that this project is ultimately intended to deliver natural gas for overseas export and corporate profit at the expense of Commonwealth residents quality of life.

Sincerely, Jeff and Susan Landon

20151019-5016

Chip Caton, Bloomfield, CT.

First, although I followed your recommended procedure and created a Word File this section is not taking it. In any case, I am a resident of Bloomfield, CT and am opposed to this project for many reasons. The primary one involves the safety of the MDC's watershed. At the least you should extend the time for public comment. And, if it must go through, the route and the land-taking - ninety feet is ridiculous - should be modified.

Respectfully,

Chip Caton
59 Duncaster Rd.
Bloomfield, CT 06002

20151019-5017

Jean Nigro, Temple, NH.

Dear FERC Commissioners,

You must consider the cumulative effect of the multiple natural gas initiatives that are proposed for the New Hampshire and New England region.

What NED/Kinder Morgan proposes is overkill of the highest order. This, as only one project of many is just the company's strategy for getting in on the glut of gas that is coming out of the Marcellus Shale. There is no way all this gas can be consumed locally. They are in the business of export and they cannot do it at the expense of the health, welfare, and livelihood of New Hampshire residents.

DENY KINDER MORGAN'S APPLICATION!!

20151019-5018

Scott Campbell, New Ipswich, NH.

-Dear FERC

Kinder Morgan says there will only be five permanent jobs that come to New Hampshire. This is nowhere near enough permanent jobs that could make any type of impact. Only providing five jobs is a joke compared to the amount of land that will be taken, amount of money lost to current homeowners due to losses in property values, and future health issues related to the pipeline.

20151019-5019

Scott Campbell, New Ipswich, NH.

-Dear FERC

Kinder Morgan should be required to fix all current leaks at any location before it gets any opportunity to build a new pipeline. Why should Kinder Morgan be able to keep taking on infrastructure when they cannot maintain what they currently have. They need to take proper care of what they currently have before I would even consider letting them create more of a headache. So NO from me.

20151019-5020

Hughes Pack, Northfield, MA.

Thank you for this opportunity.

The "NEED" for the Northeast Energy Direct Project has NOT been established. Either, we in the northeast need it or we do not. It is not rocket science to figure this out. Without comprehensive studies providing incontrovertible evidence of its need, you cannot approve this project. That would be so very wrong.

The damage that will be done to the areas through which this pipeline passes simply during the construction phase must be far outweighed by the short term AND long term benefits to the area before approval can be granted. These benefits have not been shown to exist.

So far, you do not have the evidence to approve this project unless it is a secret.

Please do not approve this project.

Thank you.

Hughes Pack

20151019-5021

Elizabeth Spencer, Averill Park, NY.

Re: Scoping Notice; Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000 Northeast Energy Direct Project

I am a resident in the Town of Nassau less than a quarter mile from the proposed pipeline corridor south of Pikes Pond in Averill Park NY.

The loss of environmental quality, economic opportunity and property values along the entire pipeline route and in the communities in the compressor station impact zones and in the natural gas production fields should be the FERC's primary concern and any project approved should maintain or protect the public health of the communities of the production, transport and distribution infrastructure.

The preparation of detailed emergency response plans addressing dedicated financial, equipment resources and staffing for the entire northeast direct pipeline and all of its component segments and proposed compressor stations is needed to ensure that public health and safety are protected in the event of accidents including pipeline and compressor stations leaks or explosions,

This pipeline follows the route of a high power electric right-of-way, making the use of electric compressor station motors feasible. These release far fewer VOCs into the air and run more quietly. This alternative

must be fully explored. Cost burden for providing a substantially less polluting emissions as a means of powering a station should fall on the applicant and not the public communities where compressor stations are proposed to be located.

The estimated emissions from construction may exceed the tons-per-year threshold for major sources for multiple of the pollutants emitted, including NO_x, VOCs, CO, and PM. If it is determined during analysis that the project exceeds the limits for attainment status for VOCs and NO_x's, additional air pollution measures must be taken to meet or exceed the general conformity requirements. Moreover, the Draft EIS must include the potential health effects to workers and members of the community who live nearby and who may be at risk of exposure to harmful air pollutants.

Of concern for all proposed compressor station locations along the NED route and the Nassau NY location in particular. The construction and operation of the proposed projects will result in significant emissions of various air pollutants, including NO_x, VOCs, carbon monoxide, particulate matter, sulfur dioxide, and GHGs, particularly methane. These pollutants affect air quality—and therefore human health—in a variety of ways. NO_x is a precursor of both ozone and fine particulate matter (“PM_{2.5}”). VOCs are also an ozone precursor. Fine particulate matter is linked to increased heart attacks, aggravated asthma and decreased lung function, and for people with heart or lung diseases, premature death. Ozone exposure can lead to coughing, chest pain, and throat irritation. It also worsens bronchitis, emphysema, and asthma, and can reduce lung function. The EPA has listed Rensselaer County NY as a nonattainment area for ozone pollution. http://www.epa.gov/oaqps001/greenbk/anayo_ny.html

I formally request that FERC supplement its review of compressor station impacts by seeking the assistance of the U.S. Dept. of Health and Human Services.

Additional Mitigation. FERC should consider the following matters and related mitigation measures:

- The No Action Alternative. The natural gas transported by the NED would add to total carbon emissions loads in direct contravention of the EPA's Energy Plan. It is unnecessary to relieve constraints on electric capacity since existing shortfalls are easily met with LNG purchases. These shortfalls could be eliminated entirely by repairing leaks in the current system, adding renewable sources of energy such as wind, water and solar and increasing energy efficiencies in general. Electric use has been flat since 2008 and the world is adding more capacity for renewables each year than coal, natural gas and oil combined. The NED and other northeast pipelines are likely to be obsolete and unused before they reach the end of their useful lives, leaving ratepayers to pick up the bill and leaving a trail of environmental destruction.

Thank you for the opportunity to comment and for your diligence in protecting the health of the communities proposed to be impacted by this infrastructure development by Kinder Morgan and Tennessee Gas Pipeline.

20151019-5022

Scott Campbell, New Ipswich, NH.

-Dear FERC

I would require by law and constant enormous fines that if the pipeline running across New Hampshire goes into construction, no flow will go through the pipeline at any point if there is a leak. We the people who live here mean something. So NO from me.

20151019-5023

Robert, Dianna, Jayme & Alexander Laroche

958 Starch Mill Road

Mason, N.H. 03048

October 15, 2015

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

RE: FERC docket PF14-22-000

Dear Ms. Bose:

The purpose of this letter is to express our grave concerns about the proposed Northeast Energy Direct natural gas pipeline project, which, if approved will pass through our land (Mason NH Tax Map parcel B-19-2). In this part of Mason granite quarries surround us. Large amounts of blasting through granite will pose a great risk to our well from shifting bedrock and contamination from the chemical byproducts of explosive materials. Our well is the only clean water supply we have. There is no replacement. Please do not risk it on a pipeline we will not benefit from.

The pipeline will be crossing several wetlands in this vicinity. THESE WETLANDS ARE HOME TO A PAIR OF VERY RARE AND ENDANGERED SPOTTED TURTLES. The wetlands also feed the largest stratified drift aquifer in Mason. This is essentially our public water supply! Contamination of this aquifer will affect hundreds of wells. This resource is too precious to risk. Mitigating the damage after the fact is not an option!

Kinder Morgan claims that a 30" high-pressure gas pipeline in our back yard will not devalue our home. We beg to differ. Any family looking to buy our house or any other in this area would need to give very serious consideration to the fact that an otherwise attractive property is in an INCINERATION ZONE! It is illogical to believe the pipeline will not be used as a negotiation ploy to reduce the price significantly, or compelling reason to SEEK SAFER ALTERNATIVES. Our house insurance rates will certainly rise while our ability to secure equity capital will be reduced.

Adding insult to injury ratepayers will be charged a tariff to pay for the NED pipeline construction. We would much prefer to invest our money to build a system of solar panels on roofs of existing and new dwellings, which could provide an abundance of truly clean, renewable energy to the grid without any risk to our lives and environment.

Please DO NOT ALLOW Kinder Morgan to violate nearby Conservation Lands such as the Fifield Tree Farm. It was Mr. Fifield's' dying wish that his land be forever protected from just such a desecration. NED would invalidate agreements which took years of effort by the State & municipality working together with land owners.

One of the main reasons we moved to Mason was for the quiet solitude we enjoy here in our log cabin haven. If approved the pipeline project will literally be a CATAclysmic Event, creating an unprecedented impact on this region for years to come. One we may never recover from.

Our final question is: do you represent "government of the people, by the people, for the people", or do you represent government of the corporations, by the corporations, for the corporations? We implore you consider what is best for the people in the affected towns of Southern New Hampshire, all of whom unanimously object to Kinder Morgan's' invasion of our land for PRIVATE BENEFIT, NOT PUBLIC NEED.

Respectfully,

Robert, Dianna, Jayme & Alexander Larochelle

20151019-5024

Scott Campbell, New Ipswich, NH.

-Dear FERC

We hear that we have been chosen to host the pipeline across our backyard because if something happens the life lost is low. We the People mean something and the last I checked we are all equal. We are the same here as the people that are in Memphis, Tennessee. We here are the same as the people in Corvallis, Oregon.

We are the same here as the people in Valdosta, Georgia. Do not ever rate us a lower class than how Kinder Morgan has made us feel as “Our Lives Matter.” So NO from me.

20151019-5025

Scott Campbell, New Ipswich, NH.
-Dear FERC

Kinder Morgan says they can do things such as “trout in the classroom” or donate trees for arbor day. I am deeply troubled by this train of thought. I have seen more wildlife in my backyard then I have seen in my life. I have seen different salamanders, frogs, birds, and owls. I do not want to see these in the classroom. Seeing these animal in their natural habitat has been quite peaceful to me in knowing that there is a whole ecosystem right outside my door. I never saw any of what I currently see in a classroom. In a classroom I saw pictures. When you see pictures of wildlife, they are usually extinct or on their way. I went to the University of Massachusetts in Amherst and have a degree in Environmental Science. I was taught that if there are amphibians in the area then the ecosystem is good and there are plenty of amphibians around. Do not let this pipeline change this ecosystem by giving Kinder Morgan a permit. So NO from me.

20151019-5026

Scott Campbell, New Ipswich, NH.
-Dear FERC

Kinder Morgan says they are going to be working with Unitil so that Unitil can meet their needs. In late 2008 Unitil was heavily criticized for their response to power issues and an ice storm. According to the Sentinel & Enterprise, “State Rep. Stephen DiNatale, D-Fitchburg, quite rightly lashed out at power company Unitil on Saturday about their lack of communication with city officials at the outset of the major ice storm on Thursday night that left thousands of people in North Central Massachusetts without power.

“I don’t believe Unitil has responded the way they should have,” DiNatale said. “The response, up until today, has been lackluster to say the least.”

Fitchburg Ward 4 City Councilor Kevin Starr said Unitil did not send enough work crews to the city when the storm hit, delaying the needed repair work to restore power.

“They have set the progress back hours and hours and hours,” Starr said Saturday.

Read more: http://www.sentinelandenterprise.com/editorial/ci_11243903”. That is not good company for Kinder Morgan to be with as I was definitely a witness to Unitil’s lackluster performance. Is this what we can expect from Kinder Morgan too? So NO from me.

20151019-5028

Robert T. Duby, Sunderland, MA.

The proposed pipeline will cross approximately 2500’ of my land in Northfield, MA. The filing by Kinder Morgan for the NED project suggests that at the end of the pipeline’s useful life it will be “abandoned in place” suggesting that landowners will be responsible for the deteriorating pipeline. This seems unreasonable. The pipe line will eventually rust through and leave craters on the surface as well as fill with water that will dissolve whatever is contained in the residues within. This will result in a 400 mile disaster as the materials will leach into and onto private property. It is easy to visualize a situation where the pipe rusts through and a high elevation and then sends the contaminated water to lower elevations where it would flood those properties. The landowner will then be responsible for the cleanup. If the pipeline is built, a condition should be that Kinder Morgan be required to remove the pipe from all property it crosses. Funding should be guaranteed through the establishment of a trust fund that will be funded by a “use tax” based on the estimated total gas to be transmitted through the pipe during its lifespan.

KM has indicated that the pathway would parallel existing utility ROW. Over much of the proposed path-

way this will expand the ROW by up to 100 feet creating a scar across the primarily wooded wooded areas. Again, this is unacceptable as it will severely impact the rural character of the area.

Based on several studies, it is not clear that the gas the pipeline will deliver is not essential to Massachusetts' requirement for heating or electrical generation. Since the vast majority of the gas is for export, the project does not meet the requirements of demonstrated need required for the granting of a permit. Hopefully the permit will be denied to prevent an environmental disaster. Thank you.

20151019-5029

October 16, 2015

Ms. Kimberly D. Bose
Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

RE: Docket Number PF14-22-000

Dear Ms. Bose,

We are directly affected landowners in the proposed route of the Northeast Energy Direct (NED) Project. The proposed route takes the pipeline approximately 150 feet upslope from our home and cuts a swath through 52 acres of our tree farm. We are opposed to the construction of the pipeline. Building this in the proposed route will cause irreparable damage to our trees, wildlife habitats, and the aesthetics of our property. We are also deeply concerned about the safety of the pipeline. The right of way for the Constitution Pipeline which was taken by eminent domain parallels the NED route 500 feet further to the north. Why should we be subjected to two pipelines crossing our property? What more can we expect?

In 2006 we commissioned a Landowner Forest Stewardship Plan from the New York State Department of Environmental Conservation, (DEC). Their survey included characterization of the soils and topography of the property. The entire proposed pipeline route crosses an area composed of Lackawanna/Bath soils. To quote the report: "The steep slopes, (15-35%), and excessive surface stones limit the use of these soils to woodland and pasture. A severe erosion hazard exists whenever this soil is disturbed". In addition, the plan states that "this is the most valuable stand from a timber perspective on this property". The eventual goal with this stand is to increase the sugar maple component. What will become of this area if the pipeline is constructed? Obviously, this is no place to run a pipeline.

In addition, the placement of the pipeline will cause irreparable damage to our wells and the numerous springs found on our property. Many of these springs feed wetlands adjacent to our 10 acre pond. Erosion and runoff from pipeline construction will cause sedimentation to occur in these sensitive areas. The stewardship plan emphasized the need to protect these natural features.

We do not believe that gas pipelines are safe. There have been two pipeline explosions in our area since 1990. The North Blenheim explosion in 1990 took two lives and destroyed eight homes. The second explosion was in 2004 involving a 6" Texas Eastern pipeline which burned for three days, and was less than a mile from our home. Flames were 200' high and we could see them from our house. What would be the consequences of a leak in a 30" pipeline next to our house?

Construction of this pipeline will forever disfigure the landscape and degrade the quality of our water and wildlife habitats. It will destroy our potential income from timber and maple sugar production. It will harm our water. It will create an unacceptable safety hazard. The FERC must not allow this dangerous and unnecessary project to proceed for the sole benefit of Kinder Morgan's profit.

Thank you for your consideration.

20151019-5030

Nancy Bowden, Bloomfield, CT.

I oppose the expansion of existing gas pipelines in CT, and in particular ANY pipeline that is running through protected watershed or other preserved spaces. Sooner or later (likely sooner) this pipeline will be carrying fracked gas - I believe that is what is spurring the expansions across the region, NOT supposed increased consumer demand.

The risks of fracked gas - the damage from the process itself as well as the harm that comes from pipeline mishaps - is well understood by the public, even if industry officials go to great lengths to bury or deny them. This is all heading in the WRONG direction as we approach the diminishing stores of fossil and non-renewable fuels. We need to put human energy to work on alternatives (including changes in lifestyles) that will the health and well-being of all of us.

Please deny the request from Tennessee Gas / Kinder Morgan to run a pipeline though MDC land.

20151019-5031

Susan Dunham, Worthington, MA.

Dear FERC:

I am writing to briefly express a few of my concerns regarding the proposed NED pipeline project.

- There is no clear evidence that this pipeline is actually necessary. Conservation and more efficient systems, plus more sustainable energy sources, should take care of the tiny winter shortfall. Furthermore, according to studies by the Home Energy Efficiency Team and the Conservation Law Foundation, there are approximately 20,000 gas leaks in Massachusetts alone, which lost an estimated 8-12 billion cubic feet of natural gas in Massachusetts alone in 2010. Repairing the leaks alone might cover the shortfall.
- There is grave concern over the possibility of major contamination of drinking water. The drilling, blasting and dredging that will be required in order to build and bury the pipeline will alter the geologic formations and alter the current paths that connect the underground aquifers. A variety of hazardous chemicals are used in some of the drilling processes, and the drilling is also likely to transport high concentrations of underground radium and arsenic (shown in US Geologic Survey maps) to underground aquifers which currently have no contact with these chemicals. Furthermore, the hydrofracked shale gas which will be transported through the pipeline, if it is built, also contains numerous known toxins and carcinogens. Many Massachusetts and New Hampshire residents have private wells for their drinking water – and these wells will be at great risk.
- The massive compression stations proposed for this project will be sources of massive noise and light pollution in essentially rural areas, as well as sources of numerous air-borne toxins.
- The proposed pipeline route will pass through numerous public conservation lands, which have been protected. It is unconscionable that these protected public lands should be violated for private profit.
- Virtually every town which would be affected by the proposed pipeline has voted overwhelmingly to reject and/or fight this pipeline. Private companies should not have the right to overrule the rights and wishes of the majority of the people.
- Inasmuch as so many people whose land would be affected by the proposed pipeline are fighting against it, their land would have to be taken by the rights of eminent domain – which should not be applicable and/or utilized for the private profit of corporations.
- The amount of gas proposed to pass through this massive pipeline is far more than could even remotely be considered as necessary for the northeast. It is clearly intended primarily for export.
- Hydrofracking is a filthy, dangerous, and environmentally unsound and unsustainable source of energy. At a time when it has become obvious to almost everyone that we need to back away from fossil fuels and

that we need to leave deposits of oil and gas in the ground if we are to have any hope of slowing or reversing the effects of global warming, we should not be supporting fracking or destroying more land and polluting the environment even more in order to transport fracked gas.

Thank you.

20151019-5032

Debra Huffman, Merrimack, NH.

October 16, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

RE: Docket PF14-22-000

Dear Secretary Bose,

As you evaluate the Northeast Energy Direct (NED) project, I request that particular consideration be paid to the following issues:

ASSESSMENT OF ALTERNATIVES

- Resource Report 10 does not adequately assess alternatives to NED. Advantages of alternatives are ignored; disadvantages of NED are understated. The public deserves nothing less than an independent, complete and accurate assessment of all alternatives, including the ‘no build’ option, and a comprehensive cost/benefit comparison of alternatives.
- Analysis of alternative solutions must not be segmented. We are told time and again that New Hampshire must not look at our state’s needs in isolation (the fact that we produce 40% more electricity than we use; the fact that only 19% of our energy is produced by natural gas, and so on), we must always consider our state as part of the New England region. If that’s true, then surely when we assess solutions we must look at all potential solutions being proposed in our entire region and consider their effects as a whole.
- It must be proven that NED supports the goals set forth in the New Hampshire 10-Year State Energy Strategy, prepared by the New Hampshire Office of Energy and Planning, published in September 2014 and endorsed by Governor Hassan. That well-researched policy focuses on grid modernization and other forward-thinking strategies. Strapping New England to 20th century technologies will hamper our growth in the 21st century.

ENVIRONMENTAL IMPACTS

The Town of Merrimack is at a disadvantage when requesting that specific issues be addressed in the Environmental Impact Statement (EIS), because the applicant has proposed several routes through our town and we have no idea which route will be ultimately selected. I respectfully request, therefore, that the following issues be thoroughly addressed in the Environmental Impact Statement (EIS) for all properties along the various proposed pipeline routes:

- Impacts to wildlife during the construction, operation, and maintenance of the pipeline, including specific reference to all lifecycle stages, such as mating and gestation areas and migration requirements. All terrestrial and aquatic plant and animal life must be identified and included in the studies.
- Impacts to wetlands during the construction, operation, and maintenance of the pipeline. All wetlands, including vernal pools, ponds, streams, uplands surrounding wetlands, and so on, must be identified and included in the studies.
- Specific information on the use of non-mechanical means of vegetation control (e.g., chemical defoliants and herbicides), including responsibility for monitoring for chemical use and corrective action that will be taken if agreements with property owners are not adhered to.

- Specific information on air and water quality, based on studies before, during, and after construction, within a one-mile radius of the meter station being proposed for Merrimack. Studies must include all components that may be released, including VOCs, radon, particulate matter, and so on. The results of pre-construction tests, and a specific plan for ongoing monitoring and notification, must be included in the EIS.

SAFETY

Industry wisdom seems to be that natural gas transmission pipelines are extremely safe, but recent PHMSA data calls that wisdom into question. Please address the following:

- Data suggests that natural gas transmission lines built within in the last 10 years have a worse failure rate than pipes built at any other time in the last 50 years. Please describe this data at length, and detail how NED will avoid all pitfalls that have caused pipeline safety to be compromised.
- Extreme temperatures have an effect on pipelines. Please ensure that the EIS includes detailed information specific to New Hampshire, such as extremes of temperature, expected maximum depth of frost, impact of frost heaves on the pipeline, case studies of pipelines in a similar topography and climate, and so on.

Thank you for your careful attention to these requirements.

Sincerely,

Debra Huffman Merrimack, NH

20151019-5033

Diane K Varney-Parker, Mason, NH.

I am seeking clarification on a comment made by Eric Tomasi at the Scoping Meeting in Lunenburg, MA on Aug. 2, 2015. As residents from the MA route in Townsend, etc. spoke at the hearing explaining why the pipeline should NOT go through properties originally proposed, Eric stated that "If a new route (or old) is decided on this whole process will have to Start Over". My question is - Where is the the deliniation of a "New Route"? Both before and since that hearing there have been MANY route changes, most recently the change of route from areas in Amherst and Merrimack NH. Yet even though these changes were made after the scoping hearings and so close to the deadline for comments there has been NO Extension and certainly no "Starting Over" in the process. The rule Eric suggested sounded "fair" - yet Once Again the people are let down by FERC's system. Kinder Morgan again gets all the benefit of changing their mind with no consequence while the people try to do research and protect themselves following a blind plan and a highly ambiguous set of rules. Please clarify what the rule is and how FERC believes this process is fair to the stakeholders of NED (besides Kinder Morgan). Thank you!

20151019-5034

Catharine Grady-Benson, Farmington, CT.

I strongly oppose the proposal by Tennessee Gas/Kinder Morgan to install a natural gas pipeline through the Class I and Class II watershed land owned by the Metropolitan District Commission (MDC). A gas pipeline installation on this land has potential to impact a high quality drinking water source. Also, granting permission for a new pipeline through this land undermines Connecticut's current protections for drinking water.

CT General Statute 25-32 requires a change of use permit from the CT Department of Public Health for projects like this one. Furthermore, it restricts the use changes that are allowable. The existing gas pipeline and easement on the MDC property pre-date the statute. A proposal now, to install new pipeline and enlarge the permanent right-of-way, is inconsistent with the letter and intent of CGS 25-32.

Regardless of the degree of threat posed by this particular pipeline, allowing an exception to the statute sets a dangerous precedent, paving the way for other encroachments on water supply land. Connecticut's standards for drinking water quality are second to none in the country. They are important in maintaining public health and quality of life in our state. While other regions face increasing threats from contaminants in their drinking water sources, Connecticut's protective legislation stands out as a model and should not be com-

promised.

The first drafts of the NED Environmental Reports submitted to FERC contained an erroneous statement that the proposed pipeline route is not located within any public drinking water or aquifer protection areas. In the recent public forum held by Kinder Morgan in West Hartford on October 7 (held after an emphatic request by the MDC) it was clear that Tennessee Gas/Kinder Morgan has every intention of putting more pipeline through the MDC's drinking water supply area. During the question and answer session, alternate routes were dismissed as impracticable.

I do not feel any natural gas pipeline is necessary. The exploration and implementation of solar and wind need to be considered first before something this invasive is considered. It is my opinion that this is just a conduit for moving the gas to the Long Island Sound for export. That is the last thing we need as a state and as a country.

I hike on the land they wish to exploit and ultimately destroy. Where would we be without the ability to see nature in its unadulterated form? To take land that is home to native species of both animal and plant life in order to fill the pockets of a few is unconscionable.

Thank you for this opportunity to comment.

20151019-5035

Conrad Liebenow, Cumington, MA.

This comment poses a safety related question:

Please explain the AC Mitigation implementation that will be utilized for the extensive distances where the pipeline runs parallel with, and in close proximity to high voltage transmission lines. Will TGP be able to guarantee that even under transient conditions, such as faulted transmission circuit, or lightning strikes, that damage to the pipeline will not occur? Potential damage includes creating a pipe coating holiday, structural loss of pipe steel through arcing, and destruction of installed active DC Cathodic protection systems. While the conductive and inductive interference due to normal electric transmission line operation, and even a faulted condition, may be modeled with reasonable confidence, it may be impossible to characterize the worst case lightning scenario. The collocation of this gas pipeline with electric transmission lines appears to pose an unnecessary risk to the host communities.

20151019-5036

Cynthia M Boundy, West Townsend, MA.

We are abutters to the lateral line running of the main pipeline of the Northeast Energy Direct Project.

There is no need for this pipeline. There is no need to destroy historic properties, pristine farmlands, woodlands, wetlands, rivers, aquifers, conservation lands, and neighborhoods. This project will not benefit anyone in my community. We are Unitil customers and we already pay some of the highest electric and gas bills in the country. Unitil has not placed an order for gas from this pipeline.

We were given a lot of conflicting information from TGP and Kinder Morgan. The last letter we received from them dated October 6, 2014, indicated that our property was no longer affected by the project. When the maps came out this past summer, the "construction zone" is in my yard. The tree line that separates two historic homes will be gone, our family's pet cemetery will be destroyed, and we will have no privacy. Our septic and leach field are placed in the vicinity of the "construction zone". Our neighborhood will be devalued. The quality of our community will be diminished. And to what end, this destruction, so Kinder Morgan and TCP can reap profits on a misguided energy plan based on a manufactured energy crisis.

We ask you, FERC, to dismiss this project as there is no need for this pipeline. This project will not provide value or benefit to any of the people whose lands and homes you will take by eminent domain. Instead, our communities will be scarred and degraded while a huge energy companies line their pockets with profits.

Sincerely,

Cynthia M Boundy
Paul F Boundy

20151019-5037

Alison Jaskiewicz, Mason, NH.

NO need

NO build

NO environmental impact (beyond the extreme stress imposed on impacted citizens over the past year+ and the hours not devoted to their families and communities in order to oppose the pipeline)

20151019-5038

Cathy Bertinuson, South Deerfield, MA.

PLEASE CONSIDER BEFORE RUSHING TO APPROVE THIS PROJECT:

1. Need has not been demonstrated: what are results of attorney general's study? What about already available options, like conservation, fixing leaks, using LNG? What about capacity in Whately and other storage facilities?
2. What would be the impact on vernal pools? Waterways that are used for recreation? Farmland? Aquifers? Conservation land? Scenic byways? Hiking trails?
3. What is the impact on property values? Ability to obtain insurance? Tourism industry? Quality of life?
4. How can this project be justified within the parameters of the Global Warming Solutions Act and the Green Energy Act? What effect will this have on global climate change?
5. How well have you considered the other energy solutions which are growing, , including wind and solar?
6. Please detail all research on health and safety costs presented by the pipeline, including chemicals in the gas, emissions from pipelines, effects on drinking water and air, and risks of explosions. Detail how communities would deal with a leak/explosion/accident.
7. Please address the proximity of proposed pipeline to railroad tracks, high tension wires, toxic wast site in East Deerfield.
8. Just how financially stable is Kinder Morgan anyway? And how long is the Pennsylvania going to be producing this fracked gas.
9. Since so many landowners have denied access to Kinder Morgan, and people here don't want this pipeline, what "public good" do you claim to justify the taking of private and public property for the financial gain of Kinder Morgan?

Thank you

20151019-5039

Washington, DC 20426

RE: Proposed Northeast Energy Direct (NED) Pipeline Project, Tennessee Gas Pipeline
LLC/Kinder Morgan (FERC Docket No. PF14-22-000)

Dear Secretary Bose,

I am writing over a matter of great concern to our community and to my family: the Kinder Morgan/Tennessee Gas Pipeline. The proposed route of the pipeline would take it across land owned by the Metropolitan Water District (MDC) on land designated by the State of Connecticut as Class I and Class II land. Kinder Morgan's poor safety record with regard to pipeline maintenance and the large number of accidents involving Kinder Morgan pipelines poses a risk to major drinking water sources in this area of Connecticut.

In addition, the pipeline is projected to run through the Wintonbury Land Trust, a large area of protected land that they intend to clear cut with a 90 foot path. I am also greatly concerned about the prospect of this new pipeline running through our one-acre lot. While Kinder Morgan contacted me on several occasions to indicate that they needed to make measurements on my property on an existing line, they never indicated that this new project would definitely be moving forward. There have been no efforts on the part of the company to inform me of any property restoration subsequent to the installation of the proposed pipeline, nor have they provided any details about the amount of damage this project will do to our property. As you can imagine, I am worried about the safety for my family and the potential devaluation of my property as a result of the installation.

The meeting held to give West Hartford residents the opportunity to express their concerns about potential contamination of drinking water sources was very poorly publicized and many questions were left unanswered by Kinder Morgan representatives. I can only conclude that the company has no intention of answering the community's concerns. The town of Bloomfield has not been offered any meeting to address the community's questions, so I am requesting that the deadline for comments be extended and that Kinder Morgan provide other venues for residents to have questions answered.

Thank you for your consideration of this request.

Sincerely,

Jane Livziey

20151019-5040

Danika Padilla, Great Barrington, MA.

I could send in a long, detailed, well-documented outline of all that is wrong with the proposed natural gas pipeline, but I trust the organizations such as MassPLAN and No Fracked Gas In Mass to do this more ably than I ever could.

Berkshire Environmental Action Team in particular is a great organization and I urge you to listen to them.

The EIS is supposed to take into account the concerns of the public. This is my primary concern: runaway human exploitation of the earth we live on, exemplified by climate change as a result of greenhouse gas emissions, is killing species and people and making life more difficult on this planet. This isn't only about Massachusetts, or the ponds and fields and forests this pipeline would destroy, or the waters and air it would pollute. This is about the communities in the Marcellus shale whose groundwater is being destroyed by fracking. Most importantly it is about frontline communities worldwide who are feeling the effects of climate change, not in the future, but now - from islands rapidly disappearing to once-fertile farmland being covered by desert. Natural Gas isn't providing a "bridge"; it is distracting from resources and effort which should be spent developing more renewable energy resources.

The environmental laws that serve as the basis for the process of assessing this pipeline aren't built to deal with the global nature of these concerns.

That doesn't mean they shouldn't. Any assessment of the impact of the proposed pipeline is incomplete and inadequate without acknowledging its impacts on the global climate and continuing environmental degradation whose impacts are most acutely felt far from the hills and wetlands of my home Western Massachusetts.

20151019-5041

Elizabeth Reilly, Nassau, NY.

The proposal of this pipeline/compressor station to be located on Clarks Chapel Road has already greatly disrupted the lives of my family and neighbors. We have experienced great anxiety, loss of sleep and valuable family life. Having a panic attack disorder I fear if the compressor station is to go in across the street from me on Clarks Chapel Road, my condition will worsen leaving me in constant fear. I also fear for the health of my children and the other 50 that border the compressor station location. My son's and I have a condition that prevents us from detoxing like the average person, we have structured our lives around clean eating and living.

We have taken on a business adventure with a plan to continue expanding on our beef cattle, pigs, meat chicken, honey bees and maple syrup production for sale to local markets. Our cliental purchases our products because we are organic. If a toxic compressor station is built next to my cow pasture, I will experience a major economic loss. We will not be able to continue our farm and fulfill our business plan. The installation of an industrial complex across the street from our home, which is located in a residential neighborhood is outrageous. We should not be being subject to this type of infrastructure. Our town has set zoning laws for a reason, to protect the citizens of their town, to protect their health and economic investment. Kinder Morgan has caused great anxiety amongst the population and should be shut down from moving forward with this unnecessary project. In the event the compressor station is approved for this outrageous location I and the 11 other households of Family members that live on this section of the pipeline will file a lawsuit.

20151019-5042

Kristen Brassard, Temple, NH.

I am deeply concerned about the possibility of a pipeline going through our nearby community in New Ipswich, NH. I live in Temple the next town over and I feel it is in my best interest, as well as many others to fight against this pipeline. It serves no greater good for the NH residents. Also, it is dangerous and harmful. The compressor site is located near my 5 year old son's school, Temple Elementary School. This is ridiculous and angering! How is this ok?! Our livelihoods are at stake. If this happens, my family and I are going to have to sell our home, which will be worth a lot less then what we bought it for and find a new place to live. This just doesn't seem right. I would not want to keep my son in a school right near a compressor site! We moved here knowing this is a peaceful and happy community and we want it to remain that way! I want to continue to live in a healthy and peaceful place and to do that, the pipeline should not be here.

Sincerely,

Kristen Brassard
Temple, NH

20151019-5043

Jay Koutavas, Windham, NH.

As a home owner who's property will literally have this proposed pipeline running through it, I've become quite concerned over the value and purpose of the pipeline.

My assessment of the this proposed pipeline route through 71 miles of the southern NH region, namely, the Pelham, Windham, and Merrimack area, indicates the environmental and community impact being far worse than any tangible gains for having such a pipeline. The pipeline does little to improve the energy needs for the region. Material provided by Kinder Morgan indicate that NH has "energy needs" and yet NH is actually an exporter of energy. From my understanding, the majority of what will be pumped is an export, one that NH doesn't benefit from.

For these reasons, I oppose the routing of the pipeline through southern NH. Please do not allow our beautiful rural country side be torn-up by this unnecessary pipeline. Thank you.

Signed,

Jay Kouatavas

20151019-5048

Wayne R Stinson, Summit, NY.

To: Federal Energy Regulatory Commission

RE: PF14-22, Northeast Energy Direct pipeline

I am one of the many citizens resisting the Constitution Pipeline and have previously submitted comments concerning that project, all of which apply to this ill-conceived project as well. I submit this additional comment in the interest of my children and grandchildren who will have to live with the world we leave them.

This is absolute insanity! Over the past few years we have learned much more about climate disruption caused by global warming and yet we are presented with another fossil fuel infrastructure project. We have learned that we are fast approaching a tipping point, a point of no return for avoiding a sixth great extinction. Can we respect the science? Can we behave intelligently? Can FERC do the right thing?

I appeal to you, do the right thing, the smart thing, do not allow the NED project to go forward.

Wayne R. Stinson
108 Southmeadow Dr
Summit, NY

20151019-5049

Royal S Graves, IV, Wethersfield, CT.

The proposed clear-cut trench 90 feet wide, 5.5 feet deep, and 5.7 miles long through land that protects my drinking water and that of hundreds of thousands of my neighbors is a bad idea!

Drinking water reservoirs need healthy lands around them to filter and protect the water our families use. Natural gas pipelines nationwide have suffered alarming failures that pollute water and soil, and put people at risk. Kinder Morgan should find another place for its pipeline—or better yet, invest in renewables and stop wasting money on outdated, polluting, and dangerous fossil fuel infrastructure.

Thank you for considering my thoughts.

BY ELECTRONIC FILING

Ms. Kimberly Bose, Secretary
Federal Regulatory Energy Commission
888 First Street, NE
Washington, DC 20426

Re: Tennessee Gas Pipeline Company, LLC, PFI4-22-000

Dear Ms. Bose:

The Massachusetts Energy Facilities Siting Board (“Siting Board” or “EFSB”) appreciates the opportunity to comment on filings related to the Tennessee Gas Pipeline Company, LLC (“Tennessee,” “TGP,” or “Com-

pany”) Northeast Energy Direct Project (“NED” or “Project”) in the Federal Energy Regulatory Commission (“FERC” or “Commission”) proceeding PFI4-22-000. These comments are intended to provide additional information to both FERC and Tennessee relative to the portion of the NED project that the Company is proposing to construct in Massachusetts. For each topic presented, the comments provide: (1) an introductory context; (2) a summary of the comments received by the Siting Board; and (3) recommendations of the Siting Board staff.

The Siting Board is an independent board of the Commonwealth of Massachusetts with a statutory mission to ensure a “reliable energy supply for the Commonwealth with a minimum impact on the environment at the lowest possible cost.” G.L. c. 164, § 69H. The Siting Board is required by regulation at 980 C.M.R. § 7.07(9)(a) to conduct public information hearings and intervene at PERC when an interstate natural gas pipeline company applies to PERC to construct or modify pipeline facilities within Massachusetts. In addition, the Siting Board participates in the pre-filing phase of FERC proceedings in order to preserve the rights of interested residents of the Commonwealth, consistent with the Siting Board’s statutory and regulatory mandate.

Siting Board staff attended four public scoping meetings held by the Commission, in Pittsfield (July 28), Greenfield (July 29), Dracut (August 11), and Lunenburg (August 12). The Siting Board separately held public comment hearings in the same four communities during the week of August 3, 2015. Siting Board staff also invited and received written comment from the public. Siting Board staff has monitored postings on the FERC website for NED and has participated in bi-weekly interagency telephone calls coordinated by PERC.

These comments reflect the Siting Board staff’s understanding of the Project as it has developed during the Pre-Filing process, which commenced on September 15, 2014 and is now nearing its completion. The next step of the FERC review process would be the submission by Tennessee of a formal application to FERC for a Certificate of Public Convenience and Necessity. At the conclusion of the application review process, FERC will make its decision whether or not to approve the Project.

As referenced in Section I below, a recent Order issued by the Massachusetts Department of Public Utilities (“Department” or “DPU”) has concluded that, in general, there is a need in Massachusetts for additional natural gas pipeline capacity to serve both gas and electric customers. 1 However, the Department also noted that all possible options should be considered in developing a solution to the natural gas capacity constraint issues facing Massachusetts. Recognizing that there are many issues and concerns about the Project yet to be addressed and resolved, such as its design, environmental impacts, choice of proposed route, and currently unsubscribed capacity, the Siting Board will remain actively engaged in this process to help ensure that these and other key issues are fully addressed. Accordingly, this letter neither endorses the Project, as currently proposed, nor rejects the possibility that it can ultimately be appropriately routed, designed, built, and operated in a manner that would warrant PERC approval- provided that all necessary environmental, economic, safety, and other regulatory requirements are satisfied.

Attached to these comments (in Appendix B) are additional comments of the Siting Board’s sister agencies: The Massachusetts Department of Environmental Protection; the Massachusetts Department of Fish and Game; the Massachusetts Department of Agricultural Resources; and the Massachusetts Department of Conservation and Recreation. The staff of the Siting Board urges PERC and the Company to fully address these agencies’ recommendations as well as those articulated in this letter.

I. INTRODUCTION

Tennessee proposes construction of the Project to expand its natural gas transmission pipeline network and facilities in Pennsylvania, New York, Connecticut, Massachusetts, and New Hampshire. PERC is reviewing the Project under its regulations in compliance with the Natural Gas Act (“NGA”) and the National Environmental Policy Act (“NEPA”).

The Commission issued a “Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public

Scoping Meetings” (“Notice”) on June 30, 2015, in keeping with procedure at this stage of FERC project review. The Company, in accordance with PERC requirements, provided the Commission with a second draft of its Environmental Report (Resource Reports 1 through 13), on July 24, 2015? Comments herein reflect the July 24, 2015 draft of the Company’s Environmental Report.

Tennessee has stated that it plans to submit an Environmental Notification Form (“ENF”) to the Massachusetts Environmental Policy Act Office (“MEPA”) regarding NED later this fall. MEPA staff will conduct scoping sessions after the ENF is filed to take comments on the ENF. MEPA expects that the Project will also require a mandatory Environmental Impact Report because of the size and scope of NED. As a result, MEPA expects that Tennessee will file both a Draft Environmental Impact Report and a Final Environmental Impact Report. The Draft and Final Environmental Impact Reports will be subject to a minimum 30-day comment period. The Secretary of the Massachusetts Executive Office of Energy and Environmental Affairs will issue Certificates following each submittal indicating whether the Draft and Final Environmental Impact Report adequately address MEPA requirements. The Certificates may also identify issues requiring further analysis. State agencies cannot issue any permits or licenses, and cannot grant any easements, until the MEPA process has been concluded.

Tennessee has also represented that it will seek permits from the MassDEP relating to water quality and air quality requirements. Other state agencies whose permits and approvals will be sought by Tennessee include: the Massachusetts Division of Fisheries and Wildlife, the Massachusetts Historical Commission, the Massachusetts Department of Transportation, and the state legislature for Article 97 land disposition, if an easement on state lands is sought (as proposed by Tennessee). In addition, Tennessee has committed to seek local approvals under the Massachusetts Wetlands Protection Act. This list is not exhaustive, and other permits, approvals, and authorizations from federal, state, and local authorities may also be necessary for construction and operation of NED.

A. Proposed Massachusetts Facilities

As of the Company’s July 24, 2015 filing, Tennessee proposes construction and operation of approximately 418 miles of natural gas transmission pipeline and associated facilities in Massachusetts, Pennsylvania, New York, New Hampshire, and Connecticut. The Company’s Project, as now proposed, would provide 1.3 billion cubic feet per day (“bcf/d”) of natural gas” transmission capacity east of Wright, New York (the so-called “Market Path” portion of NED) to local distribution companies (“LDCs”), and potentially to gas-fired generators, electric distribution companies, industrial plants, natural gas producers, and other customers in New England.” Tennessee has executed precedent agreements for long-term firm transportation capacity for a total of approximately 500,000 dekatherms per day (“Dth/d”) with Market Path shippers.

In Massachusetts, Tennessee would construct approximately 64 miles of mainline pipeline and 38 miles of lateral pipeline. The tables below provide a summary of pipeline and other NED facilities proposed for Massachusetts. As of August 31, 2015, Tennessee has performed biological surveys on 36 percent of the NED Project Market Path route, and performed cultural resource surveys on approximately 20 percent of the NED Market Path route (Tennessee Monthly Status Report, September 23, 2015). The Siting Board notes that Tennessee has not sought land survey permission from the Massachusetts Department of Public Utilities, which has the authority under G.L. c. 164, §§ 72A, 75D to grant or deny survey petition requests by natural gas pipeline companies.

Table 1: Proposed New Pipeline Facilities in Massachusetts

Facility Name	Diameter (inches)	Location	Length (miles)	Maximum Allowable Operating Pressure (pounds per square inch)	Maximum Operating Pressure (pounds per square inch)

				square inch)	
Wright to Dracut Pipeline Segment	30	Hancock, Lanesborough, Cheshire, Dalton, Hinsdale, Peru, Windsor, Plainfield, Ashfield, Conway, Shelburne, Deerfield, Montague, Erving, Northfield, Warwick, & Dracut	63.75	1,460	1,460
Fitchburg Lateral	12	Townsend & Lunenburg	9.00	1,460	1,460
Lynnfield Lateral	24	Dracut, Andover, Tewksbury, Wilmington, North Reading, Reading, & Lynnfield	15.86	1,460	1,460
Haverhill Lateral	20	Dracut & Methuen	5.67	1,460	750
Concord Delivery Line	24	Dracut	0.51	1,460	750
Maritimes Delivery Line	30	Dracut	1.20	1,460	1,460
Peabody Lateral	24	Lynnfield, Middleton, Peabody, & Danvers	5.33	1,460	730

Compressor Stations

The Company proposes to construct three new compressor stations in Massachusetts, in Windsor, Northfield, and Dracut. The proposed compressor stations and sites are summarized below.

Table 2: Proposed New Compressor Station Facilities in Massachusetts

Town	Total Horsepower	Number of Compressor Units	Estimated Acreage of Compressor Station Site (acres)	Estimated Acreage of Property (acres)	Residents Within Half Mile of Property
Windsor	41,000	Two	10	89	6
Northfield	41,000	Two	10	242	10
Dracut	23,000	One	10	29	260

Meter Stations

The Company would construct nine new meter stations and modify eleven meter stations in Massachusetts, listed by town in Table 3 below.

Table 3: Additional Metering Facilities in Massachusetts

Facility Type	Location
New meter stations (nine in total)	Dracut (3), Lanesborough, Deerfield, Lynnfield, Lunenburg, Longmeadow, Everett
Modifications to existing meter stations	North Adams, Methuen, Southbridge, Spencer, Leominster,

B. Public Comments

At the four Siting Board public hearings held during the week of August 3, 2015, members of the public had an opportunity to comment on the Project. At these hearings, a total of approximately 550 people attended, with 129 individuals providing oral comments, including those of 51 elected and other public officials. The transcripts from these hearings are attached as Appendix A.

In addition, the Siting Board staff invited members of the public to submit written comments by August 13, 2015. The Siting Board received almost 250 written comments, which are attached as Appendix B.

The comments covered a wide range of issues involving environmental, safety, and socio-economic impacts of the Project, which the following sections of this letter summarize in detail. The vast majority of oral and written comments received by the Siting Board expressed concerns and/or opposition to the Project.' Some commenters reported difficult encounters and communications with Company officials, representatives, and contractors, particularly with regard to survey requests on landowner property. Some municipal officials expressed frustration that Company officials apparently contacted landowners before town officials were notified, and thus, they were unable to respond knowledgeably to constituent inquiries (Carolyn Smart Comments, 8/6/2015).

A significant number of commenters questioned the need for NED. Many commenters maintained that the energy needs of the Commonwealth and the New England region could be met with non-fossil fuel energy resources, such as wind, solar, and energy efficiency, or by repairing existing gas pipeline systems - particularly at the distribution level- where a number of leaks have been identified and are in need of repair.? A number of commenters cited the importance of reducing greenhouse gas emissions and meeting the requirements of the Massachusetts Global Warming Solutions Act. The Project's reliance on gas supplied from the Marcellus Shale formation, where hydraulic fracturing (or "fracking") is increasingly used to produce natural gas, elicited concerns about the environmental impacts of such gas production. In addition, some commenters voiced concerns about the constituents in the "fracked" gas that could be released into the environment in Massachusetts given potential pipeline leaks, compressor station venting, or other potential releases. Others questioned the need for ratepayer financial support for NED (estimated by Tennessee to cost \$3.3 billion for the Wright, New York to Dracut, Massachusetts "Market Path" segment). They maintained that existing LNG import terminals off the Massachusetts coast are underutilized and might be a more cost-effective solution for meeting peak winter gas needs when interstate gas pipelines lack sufficient capacity to heat homes and businesses and supply fuel to electric generators. Several commenters asserted that FERC is either required by NEPA or should otherwise conduct a comprehensive regional analysis of the various pending pipeline proposals to determine which of them (if any) are necessary and best suited to meet any identified regional need, at the lowest cost both to consumers and the environment.

Another concern expressed during hearings and in written comments relates to the markets NED would supply, and that a substantial amount of the intended pipeline capacity remains unsubscribed. Some commenters expressed concerns that the capacity might ultimately be used for export to Atlantic Canada, or for liquefaction and transshipment to global LNG markets, where prices may be at a premium. Some expressed a view that supplying gas for export is the fundamental objective of Tennessee, and that by serving such markets gas prices in New England could rise. A number of commenters took exception to the Company seeking eminent domain for siting NED facilities when a significant portion of the Project's capacity could potentially be destined for use beyond New England. Some expressed their belief that NED is not needed in New England, but rather, reflects Tennessee's pursuit of export-related markets.

While Project supporters were few in number at the Siting Board hearings and in written comments submitted, these individuals contended that NED would help residents and businesses by providing affordably priced energy (especially in relation to the price of heating oil); helping reduce the region's high electric power prices; and also creating a number of skilled trade jobs during pipeline construction. Some also

referred to the existing moratoria on new gas customer hookups in certain areas of the Berkshire Gas Company and the Columbia Gas Company service territories as an economic impediment that they maintained could only be alleviated by NED.

A number of studies conducted or sponsored by government agencies, non-governmental organizations, industry groups, and others were cited by the Company and commenters in asserting either support for need, or lack thereof, associated with the Project. Referenced studies finding need for NED (or some form of additional pipeline capacity in New England) include the following (starting with the most recent):

- Report on Investigation into Potential Approaches to Mitigate Wholesale Electricity Prices, September 15, 2015, prepared by Staff of the New Hampshire Public Utilities Commission for the New Hampshire Public Utilities Commission.
 - New England Energy Market Outlook, Demand for Natural Gas Capacity and Impact of the Northeast Energy Direct Project, 2015, prepared by ICF International for Kinder Morgan, Inc.
 - Massachusetts Low Gas Demand Analysis: Final Report, January 7, 2015, prepared by Synapse Energy Economics, Inc, for the Massachusetts Department of Energy Resources.
 - Natural Gas Infrastructure and Electric Generation: A Review of Issues Facing New England, December 14, 2012, prepared by Black & Veatch, for The New England States Committee on Electricity,”
- Studies cited questioning the need for NED include the following:
- Analysis of Alternative Winter Reliability Solutions for New England Energy Markets, August 2015, prepared by Energyzt for GDF SUEZ Energy North America.
 - Examiners’ Report, Staff Recommendation in Docket No. 2014-00071, October 1, 2014, prepared by Commission Staff for the Maine Public Utilities Commission.
 - Solving New England’s Gas Deliverability Problem Using LNG Storage and Market Incentives, 2015, prepared by SkippingStone, LLC for Conservation Law Foundation.

C. Recent Orders Issued by the Massachusetts Department of Public Utilities

1. Precedent Agreements

There have been Orders issued recently by the Massachusetts Department of Public Utilities (“Department”) that are relevant to the issue of gas capacity in Massachusetts and the region. Three relate directly to precedent agreements between LDC’s over whom the Department has jurisdiction and Tennessee. Another was an order relating to the need for gas capacity to address pipeline constraints that are affecting gas availability to electric generators in during the winter. Each is described briefly below:

The development of new interstate gas pipeline capacity to serve the firm gas supply requirements of Massachusetts customers typically occurs through the execution of gas transportation Precedent Agreements between local distribution companies (“LDCs”) and interstate pipeline companies, such as Tennessee. Pursuant to G.L. c. 164, § 94A, gas or electric distribution companies seeking to enter into a contract for the purchase of gas or electricity covering a period in excess of one year must obtain the approval of the Department for such contracts. The Department has reviewed and approved several such Precedent Agreements recently in connection with the Algonquin Incremental Market Project, and is currently reviewing a Precedent Agreement associated with the Algonquin Atlantic Bridge Project.

The Department reviewed and recently issued orders approving three precedent agreements for NED capacity with Bay State Gas Company (114,300 Dth/day), Berkshire Gas Company (36,000 Dth/day), and Boston Gas Company (151,962 Dth/day). Bay State Gas Company, D.P.U. 15-39 (August 31, 2015); Berkshire Gas Company, D.P.U. 15-48 (August 31, 2015); Boston Gas Company, D.P.U. 15-34 (August 31, 2015). In Massachusetts, no LDC may enter into a gas capacity contract unless it receives approval by the Department. (G.L. c. 164, § 94A) The Department reviewed these agreements applying precedent and applicable standards. It is important to note that Department consideration of the filed agreements did not, as a matter of law, address the pipeline route, any environmental issues, or other impacts on property that might be caused

by the proposed Project.

In each case, the Department found the acquisition of NED capacity to be consistent with the standards for approval. Specifically, each agreement was consistent with the LDC's portfolio objectives and the Massachusetts Global Warming Solutions Act, and that the NED capacity would be needed to meet growing customer demands given growing gas conversions from fuel oil- even with significant energy efficiency programs currently in place, or as enhanced. The Department found that the NED Project will enable The Berkshire Gas Company to end its moratorium on new customers in both its Eastern and Western Divisions. D.P.U. 15-48, at 50. Similarly, the Department found that Bay State Gas Company's precedent agreement is necessary for the Company to continue to serve existing customer load reliably and at least cost, and to serve future customer growth. D.P.U. 15-39, at 40.

The Department further found that the precedent agreements for NED "compare[s] favorably to the range of alternative options" such as LNG, and that demand response programs for natural gas do not currently exist in the Massachusetts market. The Department also found that the subject LDCs established a need for incremental pipeline capacity to ensure reliability and deliverability of natural gas to meet their existing and future customer requirements.

2. Investigation Regarding Gas Capacity for the Electric Sector

In D.P.U. 15-37 (October 2, 2015), the Department recently concluded an investigation on its own motion to examine how new natural gas delivery capacity may be added to the New England market, including possible capacity purchases by the electric distribution companies ("EDCs"). It is important to note that the investigation did not review any specific pipeline projects. Rather, the investigation addressed gas capacity needs for the electric generation sector generally, including the legal authority of EDC's to contract for gas capacity. The Department concluded that sufficient information had been provided in the docket to arrive at a conclusion that increasing regional gas capacity will lead to lower wholesale gas and electricity prices. The Department did not make a finding that voiced a preference for any particular gas pipeline project over any other potential capacity constraint solution. However, the Department found that innovative solutions and a menu of options are required to alleviate capacity constraints and the associated downstream market price impacts experienced by Massachusetts ratepayers. The Department further concluded that, pursuant to G.L. c. 164, § 94A, it has the requisite authority to approve EDC contracts for the acquisition of new natural gas capacity and to allow recovery of such costs through electric distribution rates.

II. ARTICLE 97 PROTECTION

A. Introduction

Potential consequences of the Project include impacts to "Article 97 lands" as defined in Article 97 of the Articles of Amendment to the Constitution of the Commonwealth of Massachusetts," Massachusetts assigns the Article 97 designation to lands protected for their significant value for conservation purposes. As currently proposed, of the more than 110 public and private conservation and recreation parcels impacted by the proposed NED route, approximately 85 would be afforded Article 97 protection.¹ In addition, many farms in Massachusetts are preserved through the Massachusetts Department of Agricultural Resources Agricultural Preservation Restrictions ("APRs"). APR land has a permanent deed restriction, which precludes any use of the property that will have a negative impact on its agricultural viability. Article 97 lands, APRs, and other such conservation-restricted properties are protected in perpetuity, for the benefit of the Commonwealth, its residents, and its ecosystem.

NED facilities that pass through Article 97 lands would trigger a process that requires that both houses of the Massachusetts Legislature approve by a two-thirds vote any change in use or disposition of lands held under the provision's constitutional strictures. State practice requires that an equal amount of protected conservation land must be secured to offset any land removed from Article 97 protection.

B. Public Comment

Speakers at EFSB and FERC scoping hearings raised a number of concerns around Article 97 lands. These comments focused on the disposition of Article 97 lands for private commercial uses (such as that proposed by Tennessee) given the outlay of public funds originally made for their purchase; the potential loss of conservation values associated with the disposition of Article 97 lands; and impacts on Massachusetts farming in general, and specific farm properties should NED cross Article 97 -designated lands.

Commenters asserted that natural gas pipelines and their ancillary facilities impact all of the values articulated in Article 97 such as air and water quality, and natural, scenic, historic, and aesthetic qualities. Specifically, the commenters maintained that a pipeline built across public protected lands reduces public use and enjoyment of the agricultural, mineral, forest, water, air and other resources that are declared a public purpose consistent with the intent and values for which a parcel was protected. Land preservation organizations and conservation agencies also stated their belief that donor and public trust is the cornerstone of existing land protection efforts, and the foundation of every land conservation project. They asserted that disposition of such lands for construction of a gas pipeline would harm such donations and bequests in the future.

C. EFSB Recommendations

As some commenters noted, the proposed Project may contradict the terms of the conservation trust documents or other conservation requirements underlying affected Article 97 properties and this could diminish the public's confidence that such programs offer permanent, protection for conservation land. The disposition of Article 97 lands for pipeline easements, or other commercial or industrial uses, could certainly send a detrimental message to donors and benefactors of future conservation lands.

FERC should direct Tennessee to avoid Massachusetts Article 97 lands, to the extent possible. Where avoidance is not possible, Tennessee must adhere to Massachusetts law and seek legislation for the disposition of Article 97 lands through the Massachusetts Legislature, including the Commonwealth's no net loss policy. Such "converted land" must be replaced with land of equal monetary value and recreational or conservation utility. This will ensure that Massachusetts experiences no net loss of Article 97 lands today, and that future conservation efforts are not jeopardized. I I

III. PROPERTY VALUES

A. Introduction

The Project, as proposed, would require easements on public and private properties in Massachusetts involving some 659 acres, and approximately 101 linear miles. To the best of our knowledge, compensation for easements sought by the Company has yet to be negotiated with landowners or determined through eminent domain legal proceedings (if and when a certificate is issued by PERC). A basic principle underlying acquisition of easements, whether through voluntary negotiation or by eminent domain, is just compensation. Project proponents and affected landowners can sometimes be quite far apart in their relative assessments of the proper compensation for project easements. While Tennessee's stated goal is to arrive at mutually beneficial terms and conditions in obtaining easements with landowners, this is not always the outcome achieved. In cases where eminent domain is used, the law requires that the landowner be fully compensated for the rights obtained under the easement.

B. Public Comment

Commenters described a number of reasons for anticipating impaired value of their properties stemming from a potential pipeline: preclusion of intended development use of the property; loss of value in the eyes of future buyers due to aesthetics, undesirable land use characteristics, and safety-related issues; or other factors. Some commenters noted that homes often represent the largest single asset in the asset portfolio of the property owner. A number of property owners voiced concern that whether negotiating voluntary easements with Tennessee or having their property condemned through eminent domain proceedings following FERC certificate approval, they stand to receive inadequate levels of compensation for their property, and that the impairment of property value may not be fully recognized by the Company.

Some commenters noted that property values would be adversely affected by both pipelines and compressor stations. For example, Paul and Patricia Zapert, property owners in Dracut, MA, submitted comments to the Siting Board concerning the “co-location” of the proposed pipeline with existing electric transmission utilities (Zapert Comment, 8/12/2015). Tennessee proposes a 50-foot easement “alongside” the existing electric utility easement behind homes on Heather Road in Dracut. However, the existing band of trees that provides a natural barrier to the easement would be entirely removed for the new pipeline easement. As a result, direct abutters and neighbors will no longer have this natural tree screening the transmission line. As the Zaperts state in their comments, “[t]he landscape of the Heather Road properties will be permanently altered and this, along with the end result of living across the street from a massive gas pipeline, will negatively affect the property values of every home on the street.”

The Northern Middlesex Council of Governments (“Council”) also submitted comments to the Siting Board concerning property values (Council Comments, undated). According to the Council, numerous paired-sale studies have shown that there may be long-term loss of property value caused by the presence of natural gas pipelines (Council Comments at 3-4).

Inconvenience, restrictions on use, unsightly paths cut through wooded areas, and potential stigma are all likely to have a negative impact on property values, particularly in communities such as Dracut, where nine miles of new pipeline, three metering stations and a compressor station are proposed by Kinder Morgan. Hard data should be provided outlining the impacts that other projects of this magnitude have had on property values and marketability.

Edward C. Dow, of West Townsend, MA, raised the concern that he may experience a “loss of income from our hay crop for an unknown number of years.” (Edward C. Dow Comment, 8/7/15). Similarly, the Town of Dalton asked how the Project would affect people’s timber rights (i.e., the timber income they would have derived but for the perpetual clearing required by the Project) (Town of Dalton Comment, 8/4/2015).

C. EFSB Recommendations

In the past, FERC has acknowledged the possibility that pipeline facilities could, in fact, adversely affect the property values of nearby residents, but it has not been able to quantify with any degree of certainty the impact on or decrease in property values that may be experienced. Millennium Pipeline Company L.L.C., 145 PERC 61,007, at’ 96 (2013). In other cases, FERC has found only that “a significant loss of property value due to construction of a pipeline is not supported by the literature.” Constitution Pipeline Company, LLC, 149 FERC, 61,199 at’ 95 (emphasis added).

Many of the available studies on property value impacts of gas pipelines were funded directly by the pipeline industry. For example, the Interstate Natural Gas Association of America (“INGAA”) produced a study in 2001, titled “Natural Gas Pipeline Impact Study,” concluded that there is no significant impact on the sales price of properties located along natural gas pipelines” in the areas studied. Some experts have suggested that additional research is necessary to achieve any conclusions about the effects compared to earlier study results. See Diskin, B., Friedman, J., Peppas, S., January/February 2011, The Effect on Natural Gas Pipelines on Residential Value, Right of Way at 24-28.

By analogy to property value losses, in at least one FERC pipeline case, a pipeline company itself proposed to compensate landowners for reduced crop yields due to construction of the Rockies Express East pipeline facilities and use of the easement. Rockies Express Pipeline LLC, CP07-208-000, Final EIS at ES-5 (April 11, 2008). According to the PEIS, “[c]onstruction of the pipeline may affect the fertility of the agricultural fields for several years.” Id. Of course, reduced crop yields arising from pipeline construction are not limited to the Rockies Express case. And reductions to crop yields and timber growth, which have tangible financial consequences, are not dissimilar to the loss of homeowner property values.

Given the concerns related to general use, visual impacts, agricultural productivity and marketability, the Siting Board concurs that the time is ripe to conduct additional research into the relationship between property values and interstate pipeline facilities, including compressor stations. The Siting Board requests that PERC fund and conduct third-party studies so that homeowners may be compensated, as appropriate, for

any demonstrated loss of value associated with the proposed NED Project.¹²

IV. FARMLAND

A. Introduction

The proposed NED route would run through significant farming regions of the Commonwealth. Various impacts to farms along and in the vicinity of NED facilities may result from construction of the Project. Relative to other regions of the country, farmland in Massachusetts is at a premium, farms tend to be smaller, and production costs higher. To promote viability in a challenging business climate, Massachusetts farmers therefore tend to specialize in high-value production and property uses (~. bed and breakfast tourism, “pic-your-own,” farmstand marketing, cultivation of organic or specialty produce, etc.) to achieve and maintain profitability. In fact, many farms along the NED route are considered in practice, and in some cases, certified as “organic.” Some commenters were wary that the construction and operation of NED could threaten their farms due to pollution of land, air and water, degradation of prime agricultural soils, or through disruptive effects on livestock, drainage, wetland and delicate farmland eco-systems.

B. Public Comment

Some who provided comments at the scoping hearing detailed anticipated changes to particular farms. On one farm that Tennessee has designated for a 12-inch lateral, the Company also anticipates use of a field for equipment storage (Edward C. Dow Comment, 8/7/15). In addition to any impacts of the lateral, the owner of the farm expressed concern about potential damage to his septic leach field, loss of his hay crop for an undetermined number of years, and reduction of tree cover, with localized erosion resulting. Among concerns expressed by certain organic farmers (David Fisher and Anna Maclay Comments, 8/13/15) along the NED route was that the agricultural operation they run (Natural Roots Farm, Conway, Massachusetts), located in a valley, would be subject to emissions from a nearby blowoff valve. In the commenters’ view, exposure to blowoff valve emissions might jeopardize their ability to certify, advertise, or otherwise promote their farm as organic.

C. EFSB Recommendations

The Siting Board notes that many of the farms along the NED route may be protected Article 97 lands where every effort should be made to avoid siting the Project. As noted by commenters, potential impacts to farms concern both the quality of resources required for their operation and their aesthetic and perceived market appeal. Their success depends on the ability of farm owners to establish their reputation and a loyal clientele. These are both hard-earned assets that could be threatened by pipeline development. The Siting Board asks that PERC direct Tennessee to submit a list of farms along the route of its proposed pipeline and facilities and the construction and operational impacts of the Project on such properties. The Siting Board suggests that PERC require that Tennessee honor any protections now associated with individual farms under Article 97 and other Massachusetts state protection provisions. The Siting Board further suggests that FERC encourage Tennessee to locate its pipeline and facilities to avoid working farms to the extent possible. Where complete avoidance of working farms is not possible, Tennessee should accommodate requests for route alterations by farmland owners that would minimize the impacts to the ongoing viability of Massachusetts’s scenic and highly valued - but fragile - farms.

v. WETLANDS

A. Introduction

Wetlands protection practices in Massachusetts under the Massachusetts Water Protection Act (“WPA”) are, as a rule, more stringent than protections at the federal level under the Clean Water Act (“CWA”). Furthermore, municipalities and townships may adopt local protections that are above and beyond those required under the WPA. While Tennessee acknowledges such provisions, neither the Company nor FERC has yet guaranteed the protection of Massachusetts wetlands at the level of protection required under state and local regulations. Meeting these regulations would require the Company to operate within the bylaws and ordi-

nances of Massachusetts communities, wherever appropriate, to file Notices of Intent with local conservation commissions and to implement any resulting conditions contained in an Order of Conditions.

B. Public Comment

Commenters at EFSB and PERC scoping hearings expressed particular concern regarding alteration of wetlands for NED construction in Massachusetts and the potential of these changes to have irreversible impacts. Many of these comments suggested taking strong measures necessary to safeguard long-term wetland ecosystem health. The described measures included establishing a pre-construction baseline for wetlands and planning for their post construction restoration. Commenters also called upon FERC to require, and Tennessee to effect, a five-year program of wetlands management after NED construction to ensure that full wetland resource restoration occurs.

C. EFSB Recommendations

The Siting Board asks that FERC act in accord with the high value that Massachusetts places on wetland resources. The Siting Board suggests that FERC might do this, first and foremost, by directing Tennessee to avoid disturbance to wetlands for NED construction or operation to the extent possible. Tennessee should mitigate unavoidable wetland impacts by restoring wetlands to their original condition. The Siting Board agrees with commenters who suggest that pre-construction study of wetlands along the NED route is advisable as an aid to wetland restoration. The Siting Board recommends that Tennessee underwrite research by a third-party consultant both for initial wetland studies and for continued study of affected wetlands for several years after NED completion to check for the success of resource restoration efforts. The Siting Board observes that on-going changes to the NED proposal present a challenge to participants in the PERC pre-filing process attempting to evaluate wetland impacts of the Project.

VI. WATER QUALITY, WATER SUPPLY, AND WELL WATER

A. Introduction

On the proposed route, the Project would cross 139 waterbodies in addition to groundwater protection zones and other water resources. The impacts of the Project on surface water quality, well water quality, and other water resources are issues of concern. Additional water quality issues relate to construction methods for the Project and the potential for disturbance of river sediments; river-bank work associated with horizontal directional drilling; removal of protective vegetation from river edges and habitat degradation for wild trout and other fisheries

B. Public Comment

General concerns around community water supplies and NED stem from the potential of a pipeline leak or break to contaminate aquifers and wells; the potential of a horizontal drilling borehole to trigger groundwater migration; and the potential of air pollutants released with venting at meter and compressor stations to contaminate surface waters. The possible infiltration of water resources and wells by NED-related contaminants is a particular issue in western Massachusetts where reliance on private wells and natural springs is common, increasing the number of points where drinking water contamination may occur.

Scoping hearing remarks addressed possible NED impacts to the sources or delivery system of public water supplies, particularly in Berkshire County. Flows within watershed networks exacerbated concerns around the persistence and physical extent of NED pipeline installation impacts on local water resources. Commenters provided specific information regarding watersheds, wells, and other water supply sources that serve close to half the Berkshire County area and the location of these resources vis-a-vis proposed NED facilities. In at least one case (Town of Dalton), the community provided a route alternative that would, among other advantages, avoid watersheds associated with local drinking water supplies. Stakeholder remarks also addressed the reduction or elimination of impacts to water resources and water quality potentially gained by installing TGP's pipeline in roadways rather than across resource areas and residential properties. Additional commenters (~, Town of Montague) urged PERC to mandate the Company's adherence to relevant state

regulation, especially MA Drinking Water Regulations, 310 CMR 22.00.

Other commenters expressed concern about the lack of baseline water resource information currently available. The Conservation Commission of the Town of Warwick, for example, explained that the town's hydrology is largely unknown. Because its residents rely entirely on private wells and natural springs for their water supply, Warwick requested thirdparty testing of all private wells and public drinking water supplies within five miles of the proposed pipeline corridor to establish a baseline for water quality prior to natural gas pipeline construction.

Illustrative of landowner concerns, H. John and Sebern Fisher, of Plainfield Massachusetts, suggested pre- and post-Project testing of well water; in addition, they questioned whether the Company can guarantee remediation of well water in the event that testing reveals construction-related contamination. The Fishers not only sought assurance of water resource protection in the near-term, but also wondered about water resource protections over the life of the NED Project. The Fishers also expressed concern about hydrostatic testing of the pipeline and the chemical composition and disposal of any additives that might be used in the hydrostatic testing process.

C. EFSB Recommendations

The Siting Board requests that FERC review, or require Tennessee to review, the modification to the NED pipeline route submitted by the Town of Dalton (Town of Dalton Comments, 8/7/15, at 4) and those modifications submitted by other commenters. FERC should also direct Tennessee to test and monitor public and private water supply wells potentially impacted by NED before and after pipeline construction sufficiently to assure pre-construction water quantity and quality is not adversely affected. The Siting Board further suggests that PERC direct Tennessee to submit measures the Company will take to prevent, reduce, and mitigate any impacts to public water supplies associated with Project construction. As part of such mitigation, Tennessee must communicate and coordinate with the public water supplier regarding protection of the public water supplier's infrastructure and all its resources. The public water supplier conducts required water quality testing and has emergency plans that could be modified, with assistance of the Company, to include contingencies related to the Project.

VII. COMPRESSOR STATIONS AND ABOVEGROUND FACILITIES

There would be three new compressor stations, nine new meter stations, eleven modified meter stations, and additional aboveground appurtenant facilities (~, mainline valves) constructed for the Project. The impacts of aboveground facilities are related to air quality, noise, and site selection. Many commenters addressed concerns and provided recommendations related to those permanent impacts.

A. Air Impacts

1. Introduction

The analyses provided in Resource Report 9 do not contain information about the existing or operational climatological conditions and air emissions for the compressor station locations (Resource Report 9, at 9-1 and 9-25). The Siting Board will provide comments on the complete data analyses when available. Below, the Siting Board has identified specific recommendations related to the air analyses.

2. Public Comment

There were many comments regarding the impacts on ambient air quality, agriculture, and recreational land uses due to air emissions of normal operations, blowdowns, emergency shutdowns, and fugitive emissions. Many local residents expressed concerns about the lack of information about the scale, frequency, and duration of blowdowns. While most of the comments received were related to compressor stations, concerns with blowdowns and fugitive emissions were also identified for meter stations and mainline valve locations.

3. EFSB Recommendations

The Siting Board requests that the Company provide ambient air quality data from air monitoring stations

closer to and more representative of each individual compressor station compared to the locations identified in Table 9.1.6. The towns of Windsor and Northfield are rural communities, and could be misrepresented by the suburban air monitoring station in Loudonville, NY. Similarly, Dracut is a suburban community, and could be misrepresented by the rural nature and geographic locations of air monitoring stations in Greenfield or at the Quabbin Reservoir. For example, the MassDEP monitoring station in Chelmsford, MA (ID 25- 017-0009), appears to be closer to, and more representative of Dracut. The Siting Board requests that the Company consult with MassDEP to identify the most representative monitoring stations for each pollutant for all aboveground facility locations.

The Siting Board requests that the Company provide information related to the frequency and duration of blowdowns for compressor stations in its portfolio, specifically for both (1) gasfired compressor stations around 40,000 hp; and (2) electric-powered compressor stations around 20,000 hp. For each of these examples, the Company should provide the number of unit and station blowdowns on a monthly and annual basis over a ten-year period, the duration of each blowdown, the quantity of natural gas released, and the quantity of criteria pollutants released (See Resource Report 9, at 9-2). For each facility used as an example, the Company should provide information about the location; the numbers of residents, businesses, and industrial facilities within a half-mile radius of each facility; the total horsepower; the total property acreage; the acreage of the compressor station facilities; and an air quality analysis completed pre- and post-construction.

The Siting Board requests that the Company provide information about blowdowns at meter stations and mainline valves, including the typical number and duration of blowdowns, the quantity of natural gas released, and the quantity of criteria pollutants released for existing facilities in the Company's portfolio. The Siting Board also requests a full discussion on how post-construction air quality monitoring will be conducted for all aboveground facilities.

B. Noise Impacts

1. Introduction

Resource Report 9, at 9-33 states that the Commonwealth of Massachusetts noise regulations "may be more stringent than the PERC criterion." MassDEP standards vary from PERC criteria in several ways in that a new noise source: (a) must not increase ambient noise levels by 10 dBA at the facility property line; (b) must not create a "pure tone,"¹³ and (c) are evaluated on a background A-weighted L90 scale.

2. Public Comment

Concerns about the noise impacts from normal compressor station operations were expressed by many commenters. Additionally, many residents stated concerns about the noise from blowdowns and emergency shutdowns. Similar to the concerns about information available for air emissions, many commenters said that there was little information about the frequency, duration, and sound levels of any compressor station activity. Many commenters worried that noise impacts of the compressor stations would disrupt the quality of life in comparison to their existing quiet surroundings.

3. EFSB Recommendations

The Siting Board requests that the Company provide a detailed noise analysis for compressor stations and meter stations based on both MassDEP and FERC standards. Each analysis should incorporate the following factors:

- The noise analysis should include a table that consists of at least the following columns: receptor, measured ambient sound level, modeled facility-only noise level, combined ambient and facility noise level, and increase above ambient.
- Nighttime measurements should be taken between midnight and 4:00 a.m., which is likely to be the time period with the quietest ambient sound levels in the Project area.
- Background noise measurements were taken in late May and early June 2015 when leaf cover from wooded tree buffer would mitigate noise impacts and not account for noises that are buffered by tree

cover in summer and fall months (Resource Report 9, at 9-45, 46 and 48). The noise analysis should therefore be adjusted for the mitigation of tree buffer or completed after November, to more accurately represent the maximum sound levels.

- The noise analysis should also discuss options for noise mitigation during normal operations and blowdowns. The noise analysis should include a description of mitigation practices at other similar facilities and the effectiveness of such practices.
- Attachment 9a identifies the distance and direction of “Noise Sensitive Areas” (“NSAs”) from compressor station locations, and states that the Company will provide NSAs for meter stations in the Company’s certificate application. The Siting Board asks that the maps show the location of noise-producing equipment, station property boundaries, and all residential properties within a half-mile radius.
- Additionally, the Company should provide a description of the anticipated frequency of blowdowns for the three compressor stations, including a description of Company, federal, and industry requirements or recommendations for the frequency of blowdowns, as well as ambient noise measurements, both pre- and post-construction.

C. Site Selection

1. Introduction

The three compressor stations proposed in Massachusetts would provide a total of 105,000 hp of compression. These facilities are being proposed in both suburban and rural areas, with multiple impacts, as outlined below. Many commenters have raised questions regarding the need for the compressor stations in each specific location, especially with respect to existing land use.

2. Public Comment

Many commenters, including Tim Crane and Douglas McNally of the Windsor Selectboard, voiced opposition to the siting of an industrial facility in the rural community of Windsor (Tim Crane Comments, 8/4/2015; Douglas McNally Comments, 8/4/2015). Commenters stated that the entire town of Windsor is zoned for residential and agricultural use, and the development of a heavy industrial facility would disrupt the bucolic and rural nature of Windsor. Commenters also cited the proximity of the compressor station to conservation and recreation land, such as the Tamarack Hollow Nature and Cultural Center and Notchview Reservation.

The Siting Board received many comments related to the proximity of the Northfield compressor station to the town center and watershed (Andrew Vernon, President of the Greater Northfield Watershed Association Comments, 8/3/2015). Commenters also stated that the compressor station will be located in close proximity to conservation and open space areas, such as the Northfield State Forest and New England National Scenic Trail.

Many commenters expressed concerns with the land use characteristics and residential density surrounding the Dracut compressor station location. Several individuals filed very detailed and specific comments with PERC outlining alternatives to the proposed location (~, Dana Atwood Comments to PERC, 8/26/2015). Resource Report 8, at 8-115 states that there are 260 landowners within a half-mile radius of the Dracut location. John Yurka of Dracut estimated that there are approximately 200 to 500 homes in the “blast zone”, likely totaling over 1,000 people (John Yukra Comments to PERC, 8/11/2015). Many commenters from Dracut noted that one fire station is located within this half-mile radius and the single Dracut Police Station is located very close to the edge of this radius.

3. EFSB Recommendations

The compressor station alternatives presented by Tennessee are limited to the specific municipalities included in the proposed design, and do not consider potential alternative locations in other towns. The Siting Board requests that the Company expand Resource Report 9 to include alternatives for each compressor

station outside of Windsor, Northfield, and Dracut. Additionally, the alternatives analysis should include a description of how each town was selected over other towns as well as over other parcels within the preferred town, and the pipeline engineering specifications which make each location ideal.

The Siting Board requests that the Company provide a detailed analysis, based on engineering and safety requirements, to support the geographic site selection of the proposed compressor stations. Specifically, the analysis should include the following;

- Describe in general how the Company identifies the location of a compressor station. Include all factors such as pipeline diameter, maximum operating pressure, maximum allowable operating pressure, pipeline capacity, and pipeline length. Given this information, explain the basis for the specific geographic locations selected for the Project's compressor stations.
- With regard to any pipeline diameter or capacity (bcf) changes in general, describe whether the number of compressor stations, amount of compression at each, and total Project compression changes given the change in pipeline size and/or capacity.
- Specifically describe if the reduction in proposed pipeline capacity from 2.2 bcf to 1.3 bcf, announced shortly before the July 24 issuance of the resource reports, changes the need for any of the compressor stations, the distance between compressor stations, and the total compression (208,600 hp) needed for the Project. If there is no change in the compressor station status since July 24, please explain why given the change in pipeline capacity.
- Describe the land use requirements for the compressor stations, specifically the amount of land purchased versus the land use required for the physical compressor station structures.

The Siting Board requests that the Company identify compressor stations within their portfolio which are located on similar parcel characteristics as the proposed Dracut compressor station, including either (or both): (a) greater than 100 residences or businesses within a half-mile radius; and (b) total parcel size less than 30 acres. For each comparable compressor station, provide the total number of residences and businesses within a half-mile radius, property size, compressor station size, total horsepower, number of compressor units, type of unit (gas or electric turbine), average monthly and annual number of partial and full system blowdowns, and site safety standards developed for the specific location.

Resource Report 10, Table 10.5-7 contains a description of two alternatives to the Dracut compressor station, but without geographic information about the identified alternate locations. The Siting Board requests that the locations of the alternative sites be provided, specifically a map showing the location of the preferred and two alternative sites, and the Project pipeline facilities (mainline and laterals). The maps should identify locations of wetlands and wetland buffer zones, locations of transmission line within the ROW as well as ROW boundaries, and the location and number of residences within a half-mile radius.

With respect to Alternative 1 described in Table 10.5-7, the Siting Board requests that the Company expand further on the "Reason for Dismissal," specifically in comparison to the property characteristics of the preferred property location.

- The Company states that Alternative 1 was not selected because "close proximity to existing residences and subdivisions ... over 30 homes are located less than 0.5 mile away" (Resource Report 10, at 10-82). In Resource Report 8, at 8-115, the number of homes within a half-mile radius of the proposed compressor station property is listed as 260. The Siting Board requests that the Company expand on this reason, specifically outlining the weight of this characteristic versus the other identified concerns (i.e., parcel size, restrictions from the electric transmission company).
- The Company states that Alternative 1 was not selected because "the area north of the power ROW is too small to use." Does this statement refer to the parcel size - 45 acres for Alternative 1 and 29 acres for the preferred site? The Siting Board requests that the Company expand on this reason, and provide a map of this location which clearly shows the distance from the ROW, land to be acquired within the ROW, and where the compressor station equipment could be placed within the parcel.

- The Company states that Alternative 1 was not selected because “the power line company will not allow any permanent, aboveground structures within their ROW.” Please explain why the structures could not be located outside of the ROW.
- The Company states that Alternative 1 was not selected because “there is an existing home/business within the property that would require purchase and removal.” The Siting Board requests that the Company specify if the structure is a home or a business. In considering this alternative, was the Company in contact with the owner to discuss property acquisition?

With respect with Alternative 2 described in Table 10.5-7, the Siting Board requests that the Company expand further on the “Reason for Dismissal” provided. The Company stated that Alternative 2 was not selected due to the identification of numerous wetlands. The Siting Board requests that the Company provide the number of residences within a half mile of this location. In addition, please discuss if the Company has considered an option of wetland replication if permanent impacts to wetlands would be unavoidable at this alternative location.

Additionally, the Siting Board requests that the Company update the following maps and aerial images related to compressor station locations in the Company’s certificate application and PERC’s draft EIS:

- The Siting Board requests that the Company provide a public version of the Preliminary Draft Compressor Station Drawings. These documents, contained in Volume IV of the Appendices filed on July 24, have been classified as Critical Energy Infrastructure Information (“CEII”), and are not available for public review. These drawings contain valuable information, such as the location of specific noise producing equipment and the layout of the compressor station on the total property to be acquired.
- The Siting Board requests that the aerial mapping included in the June 1 and June 5 supplemental filings to the docket be updated and included in the Company’s Application and FERC’s draft EIS. The aerial mapping contained compressor station locations, property acquisition status, and sensitive receptors within a half-mile radius. These images were not included in the July 24 resource reports.
- The Siting Board requests that Appendix E and F be updated to show, at a minimum, the entire proposed compressor station property boundary. Appendix E and F only contain a milepost marker to indicate the location of compressor stations, not the entire footprint of the property. If the scale of the appendix permits, the layout of equipment should also be included.

VIII. SAFETY

A. Introduction

Safety concerns stem from the proximity of the pipeline and compressor stations to homes, farms, businesses, government facilities, and other properties coupled with the potential for pipeline incidents involving a gas release, fire, explosion, or other safety emergencies. According to Tennessee, NED will be designed, installed, operated, and maintained in accordance with best industry practices and federal safety and operational regulations for interstate natural gas pipelines. The Company indicated that NED safety practices would be similar to those used on Tennessee’s existing pipeline system.

B. Public Comment

A number of commenters voiced concern that the proposed pipeline will traverse many small communities that do not currently have the necessary equipment or training to address a significant emergency associated with either pipelines or compressor stations. Other commenters expressed concerns about the proximity of high-pressure natural gas pipelines to high-voltage electric transmission lines (“co-location”), as proposed by the Company for most of the Massachusetts pipeline route. These commenters noted that pipeline corrosion is accelerated by chemical reactions between the pipe and the surrounding soil, and also from externally generated electric current passing between soil and pipeline.

The Town of Conway, Massachusetts submitted comments to the Siting Board stating:

It is expected that the applicant, [Tennessee], would be responsible for all costs associated with training

of emergency management personnel, purchase, storage, and maintenance of all necessary equipment and retain liability for any significant incident related to the proposed NED pipeline.

A full and detailed independent risk analysis for the placement of the proposed NED pipeline in or adjacent to an existing right-of-way for high [voltage] lines should be provided. Such risk analysis should include, but not be limited to, analysis of risk of equipment failure, longevity of sacrificial cathodes in cathode beds, and evidence based maintenance plans. (Town of Conway Comment at 7-8, 8/12/2015)

As shown in Table 4, below, some examples of similar requests were made by other Massachusetts cities and towns in their comments to the Siting Board.

Table 4: Comments on Fire Equipment

Commenter	Comment on Fire Equipment
Berkshire Regional Planning Commission (“BRPC”), August 13, 2015, at 2-3	“Require TGP to provide training to local volunteer fire departments for responses to fires created by construction activities. Assess materials and equipment available for their response to such incidents. Provide at no cost all necessary response training, materials, and equipment.”
Town of Dalton, MA, August 4, 2015, at 8.	“The cost of any emergency response related to the construction, maintenance, or failure of the pipeline cannot be borne by the Town.”
Dalton Fire District, August 11, 2015, at 2.	“The cost of any emergency response related to the construction, maintenance, or failure of the pipeline cannot be borne by the Dalton Fire District. How will TGP ensure that these costs are paid for?”
Town of Deerfield, Report to FERC, August 2015, at 1.	“However, extensive training, planning and other resources would be required in order to adequately plan for and protect against the extraordinary threat of a major incident related to the pipeline. These measures would result in costs of both time and money - and still may not adequately prepare for a possible incident”

C. EFSB Recommendations

The certificate application and the draft EIS should include a detailed description of all the federal, state, and local safety regulations and inspections that pertain to the Project, as well as any additional Company safety protocols. The Siting Board further requests that the Company provide a detailed history of its safety record, which would include failures, incidents, and accidents with respect to pipelines and compressor stations within the Company’s portfolio. The information should include the cause of the incident; the quantity of leaked gas and pollutants, and other environmental impacts; and any related injuries or fatalities. Additionally, the Siting Board requests that the Company provide information on incidents and accidents at any compressor station across the United States in the past ten years.

Historically, PERC has found that the U.S. Department of Transportation (“DOT”) is solely responsible for establishing criteria and requirements for the safety of natural gas pipeline facilities. Questar Pipeline Company, 95 FERC, 61,404, at’ 6 (2001). FERC has also held in Section 7(c) proceedings, “once a pipeline certifies that it will comply with its [Natural Gas Pipeline Safety Act of 1968] obligations, [PERC] “is generally precluded from further consideration of pipeline safety issues.” Independence Pipeline Company, 91 FERC, 61,102, at ,40 (2000).

Existing DOT pipeline safety standards require different pipeline specifications be used based on population density in the vicinity of the pipeline, “and specifies more rigorous safety requirements for populated areas.”

Independence Pipeline Company, 89 FERC, 61,283 at' 62 (1999).

Class locations representing more populated areas require higher safety factors in pipeline design, testing, and operation Class locations also specify the maximum distance to a sectionalizing block valve (~, 10.0 miles in Class 1, 7.5 miles in Class 2, 4.0 miles in Class 3, and 2.5 miles in Class 4). Pipe wall thickness and pipeline design pressures, hydrostatic test pressures, maximum allowable operating pressure, inspection and testing of welds, and frequency of pipeline patrols and leak surveys must also conform to higher standards in more populated areas.

Id. at' 62 (emphasis added).

However, there have been a number of pipeline applications submitted to PERC, which PERC has approved pursuant to Section 7(c), where the applicant has included additional safety measures that exceed DOT's minimum standards. Constitution Pipeline Company, 149 FERC '61,199, at' 97 (2014) (Constitution will put in place several measures that exceed DOT's requirements, including installation of Class 2 design pipe in all Class 1 locations, installation of the pipeline deeper than required for Class 1 locations with a minimum depth of 36 inches in normal soils, inspection of 100 percent of mainline pipeline welds, hydrostatic testing of the entire pipeline at a higher level suitable for Class 3 locations, and spacing of mainline valves at closer intervals to meet Class 2 requirements in all areas); Rockies Express Pipeline LLC, 123 PERC, 61,234, at' 182 (2008) (following construction, Rockies Express will initiate a pipeline integrity management plan to ensure public safety during operation); Questar Pipeline Company, 95 PERC, 61,40, at' (2001) (Company proposed higher pipe-yield strength from X-65 to X-70 in anticipation of future community development in the area); Independence Pipeline Company, 89 PERC, 61,283, at' 66 (1999) (FERC orders Transco to implement additional measures it discussed in Company responses to FERC Staff information requests).

Recognizing that pipeline companies may voluntarily propose to construct pipeline that exceed DOT standards, the Commission has stated that "[w]e would not necessarily preclude the installation of facilities consistent with a higher DOT class standard that does not now apply." Transwestern Pipeline Company LLC, 122 FERC, 61,165, at ftnt. 90 (2008).

The Siting Board is troubled by any design and construction methods that fail to ensure that only the best and most protective safety standards are used throughout Massachusetts, regardless of whether construction occurs in a rural, suburban, or urban location. No community, no matter its size, should be required to host an interstate pipeline with safety standards that are less than best practices or that fail to provide the greatest assurance of safety.

Although safety is regulated by the DOT, Tennessee should adopt the highest levels of safety standards for the entire Massachusetts portion of the proposed pipeline. Accordingly, the Siting Board requests that Tennessee study those additional safety measures put forth by its sister pipeline companies in the above-referenced cases and voluntarily propose, as appropriate, to incorporate safety standards for NED that would exceed the "minimum" DOT standards required by 49 C.F.R. Part 192.

Historically, PERC has required developers of approved LNG terminals to file an Emergency Response Plan ("ERP") that includes a "Cost-Sharing Plan" identifying the mechanisms for funding all project-specific security/emergency management costs that would be imposed on state and local agencies. See Dominion Cove Point LNG, LP, 148 FERC, 61,244, at Appendix B, Environmental Condition No. 32 (2014). This FERC condition also states that "[i]n addition to the funding of direct transit-related security/emergency management costs, this comprehensive plan shall include funding mechanisms for the capital costs associated with any necessary security/emergency management equipment and personnel base." Id.

The proposed pipeline route goes through numerous small towns in Massachusetts that often lack the equipment and personnel to respond to large-scale potential emergencies. These communities may lack the financial resources to upgrade their existing police and firefighting equipment to accommodate the pipeline. Such towns should not be required to fund the cost of emergency management equipment, training and programs associated with an interstate natural gas pipeline. The Siting Board suggests that FERC require that Tennes-

see file an ERP that includes a “Cost-Sharing Plan” identifying the mechanisms for funding Project-specific security and emergency management costs that would otherwise be borne by state and local agencies.

IX. ALTERNATIVE ROUTES

A. Background

In its Draft Resource Reports 1 and 10, filed with FERC July 24, 2015, Tennessee provided an overview of major and minor route alternatives to the Massachusetts portions of its proposed Wright to Dracut mainline pipeline and its Lynnfield, Haverhill, and Fitchburg Laterals. Tennessee indicated that the factors it considered in its selection of the proposed route for the Project, rather than alternative routes and deviations, include: landowner concerns; minimization of the number of affected landowners; minimization of adverse environmental impacts; constructability; safety; and minimizing disruption during construction. Tennessee acknowledged that, due to the lack of available survey data, desktop data were used for the alternative route analyses, although some field reconnaissance data were also evaluated. As data sources for its alternative route analysis, the Company cited its use of aerial photography; topographic maps by the U.S. Geological Survey; and National Wetland Inventory maps.

The Company evaluated a number of major alternatives to the Proposed Project mainline route in Massachusetts (previously called the New Hampshire Powerline Alternative): the original proposed route (also known as the Massachusetts Alternative); the Massachusetts Powerline Alternative; the Mass Turnpike Alternative; the Massachusetts Route 2 Alternative; the Article 97 A avoidance Route; and the Existing 200 Line Alternative. Based on its quantitative and qualitative analysis of the mainline options, Tennessee chose the Proposed Project as the preferred route for the Project, accepting some minor route deviations proposed by landowners and agencies.

Similarly, Tennessee evaluated a number of major and minor routing alternatives to the Project’s lateral pipelines for the Lynnfield, Haverhill, and Fitchburg Laterals, as well as landowner- or agency-requested minor deviations of the Peabody Lateral and the Maritimes Delivery Line. Again, Tennessee chose the Proposed Route as it preferred option, making a small number of minor route deviations requested by landowners and agencies.

B. Public Comment

Attendees at EFSB and FERC scoping hearings asserted that there were information gaps hindering a comprehensive evaluation of the impacts of proposed Massachusetts NED pipeline, lateral facilities, compressor station locations and their alternatives. Commenters maintained that Tennessee inappropriately used a “bean counting” methodology to compare alternatives. These speakers also maintained that totaling the number, type, and linear distance or acreage of natural resource disturbances is not the same as a real analysis of the relative ecological values and impacts of Project alternatives. Stakeholders noted, in particular, their concerns stemming from continued uncertainties with respect to the physical location of the mainline pipeline and lateral alternatives.

In its comments, Massachusetts Audubon and The Trustees noted the availability of useful tools to guide an analysis of protected open space and to avoid, minimize, and better mitigate impacts. They cited BioMap2, produced by the Division of Fisheries & Wildlife Natural Heritage & Endangered Species Program, as a tool that “guides strategic biodiversity conservation in Massachusetts over the next decade by focusing land protection and stewardship on the areas that are most critical for ensuring the long-term persistence of rare and other native species and their habitats, exemplary natural communities, and a diversity of ecosystems.” In addition, they cited the University of Massachusetts study of the Project and its potential impacts to habitat values using the Conservation Assessment and Prioritization System (“CAPS”) analysis technique that assesses the ecological integrity of lands and waters and subsequently identifies and prioritizes land for habitat and biodiversity conservation. Massachusetts Audubon and The Trustees maintain that CAPS can be used to further assess the Project, impacts to natural resources, and any future route changes.

The Town of Deerfield attested to a long list of concerns with the Project, including the lack of information

about horizontal drilling under railroads, Interstate 91, the Deerfield River, a contaminated aquifer in the East Deerfield rail yard, and the Connecticut River. According to Deerfield officials (EFSB Tr. C, pages 21-22), the information they received was both incomplete and perpetually changing. Residents and officials of Deerfield also faulted Tennessee for a lack of information provided with respect to historic and archaeological resources impacted by the Project.

The comments of Carolyn Smart, a member of the Townsend Board of Selectmen, typified community concerns specific to lateral alternatives and information shortfalls. Selectwoman Smart reported that Townsend views the proposed Fitchburg lateral and its uncertain route as a potentially significant disturbance to local ecological, historical, and water resource areas, including a brook (Willard Brook), state park (Pearl Hill Brook State Park), and area of critical concern (Squannacook ACEC). Carol Regan, a Methuen resident, voiced concerns about environmental impacts and the lack of complete siting information with respect to the Haverhill lateral and the potential impacts to densely populated neighborhoods, wetlands, conservation land, and groundwater resources.

Many comments regarding the proposed Lynnfield and Haverhill Laterals noted that they would operate in areas already criss-crossed by existing pipelines. Some residents in these affected communities contended that the proposed NED laterals would contribute to an already unacceptable burden in the area, and would provide no additional benefit to local residents.

C. EFSB Recommendations

The Siting Board observes that, in Resource Report 10, the Company analyzed the Massachusetts pipeline and lateral route alternatives for NED by tabulating the number, type, and linear distance and area of natural resource disturbances for each considered alternative. No specific data were provided on the number of affected residents, noted as a “TBD” in the comparisons. The Company’s methodology appears to omit any explicit consideration of cultural resources such historical or archeological sites impacted.

As noted by Massachusetts Audubon and The Trustees, the comparative approach used by the Company fails to capture qualitative differences between resources disturbed and lacks any objective or defined method of weighing the inevitable tradeoffs between the quantity and quality of resources impacted, and other siting considerations considered by the Company. The Siting Board urges PERC to direct that the Company incorporate a complete set and well-defined set of qualitative as well as quantitative factors in its ongoing analysis and comparisons of Project alternatives.

X. CLOSING COMMENTS

In summary, the Massachusetts Siting Board staff appreciates the opportunity to file comments on the scope of the Draft EIS and available resource reports, as well as filings relating to the Northeast Energy Direct Project, FERC proceeding number PFI4-22-000.

Sincerely yours,

Stephen August Presiding Officer
Andrew Greene Director

Enclosures:

Appendix A - Transcripts of EFSB Public Comment Hearings *{see 20151019-5094 below}*

Appendix B - Written Comments Submitted to EFSB *{see 20151019-5097 below}*

Footnotes:

- 1 See Order Determining Department Authority Under G.L. c. 164, § 94A, D.P.U. 15-37 (October 2, 2015).
- 2 Prior to submitting the second draft of its Environmental Report, the Company provided FERC with drafts of Resource Reports 1 and 10 for the Project on November 5, 2014, and a revised draft of Resource Report 1 on December 8, 2014. Tennessee filed the first draft of its Environmental Report (Resource Reports 1 through 13) with FERC on March 13, 2015.
- 3 On July 16, 2015, Tennessee scaled back the Project to a 30-inch diameter pipeline of 1.3 bcf/d from its original

36-inch diameter with a maximum capacity of up to 2.2 bcf/d. The Company's press release noted, however, that "while TGP is now moving forward with a 30-inch pipeline design, circumstances could arise in the very near term as more capacity commitments are made that would necessitate a design modification to a 36-inch pipeline design, and that would require us to file an amended application with the FERC" (Kinder Morgan Press Release, July 16,2015). Kinder Morgan, Inc. is the parent company of Tennessee Gas Pipeline Company.

- 4 In its September 15,2014 Pre-Filing Request to FERC, Tennessee noted that NED may also access potential customers in Atlantic Canada through interconnections with the Maritimes & Northeast Pipeline and the Portland Natural Gas Transmission System at Dracut, Massachusetts. The filing noted that such customers might include LDCs, power generators, industrial customers, and liquefied natural gas ("LNG") export projects.
- 5 As of August 5, 2015, approximately 55 Massachusetts municipalities voted on some form of resolution in opposition to the Project. Transcript of Siting Board Comment Hearing, at 102, Greenfield (August 5, 2015).
- 6 See, for example, the DPU's recent Gas System Enhancement Plan Orders, D.P.U. 14-130 through D.P.U. 14-135.
- 7 This is not a comprehensive list of studies that have been conducted on the subject. There are others not listed here.
- 8 It is our understanding that, pursuant to PERC's policy on determination of need, approved precedent agreements carry significant weight at FERC in establishing the need for pipeline capacity. [See Certification of New Interstate Natural Gas Pipeline Facilities, 88 PERC, 61,227, at' 19, (1999), clarified, 90 PERC, 61,128, further clarified, 92 FERC, 61,094 (2000)].
- 9 Article 97 states that: "The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose."
- 10 See Mount Grace Land Conservation Trust Comment, 8/5/2015.
- 11 In this letter, the Siting Board staff is not addressing the scope of federal preemption authority to authorize the taking of land designated as Article 97 property should the Legislature not grant its approval.
- 12 To the extent that Tennessee is able to reroute the pipeline under roads and streets rather than through other public or private lands, it is possible that property value reductions could be avoided or minimized.
- 13 MassDEP defines a pure tone condition where anyone octave band sound pressure level exceeds the two adjacent frequency bands by three dBA or more. *{end of 20151019-5092}*

The Calhoun Pasture, 220 Goddard Road, Rindge, New Hampshire
(Mailing address: P.O. Box 6, Central Village, Connecticut 06332)

October 15, 2015

Kimberly D. Bose, Secretary
Federal Regulatory Energy Commission
88 First Street, ND, Room 1A
Washington, DC 20426

Docket: PFI4-22-000

Dear Secretary Bose:

On April 10, 2015 I wrote to you and the Commission regarding the NED Project and some of the concerns I have as a landowner with property I own in Rindge, New Hampshire. This separate letter is now, in addition, being sent to you to make certain requests and express additional comments and concerns during the scoping process for your consideration in preparation of the EIS.

1) SECTION 106 REVIEW

I understand the FERC is responsible for initiating Section 106 review regarding TGP's NED Project. This process includes gathering information on properties that may be affected by the project "that are listed, or are eligible for listing in the National Register of Historic Places." As you may be aware I also sent a copy of the above mentioned April 10 letter to Elizabeth Muzzey, Director of the New Hampshire Division of Historical Resources "NHDHR", and State Historical Preservation Officer "SHPO". In that letter, among other things, I drew attention to a number of adverse effects of the NED Project pipeline's current design path crossing the historically significant land parcel I own, the Calhoun Pasture, in Rindge, NH. I also proposed an alternative path that reduced or eliminated those effects should the pipeline project be ultimately approved. In addition, I provided specific documentation to Director Muzzey's office in hopes of their advocacy on my behalf for consideration during Section 106 review of the National Historic Preservation Act.

Normally, the NHDHR, as a state agency, through the SHPO consults with the FERC and other agencies during Section 106 review. After further discussion with Director Muzzey's office however, specifically with Ms. Edna Feighner the Review and Compliance Coordinator and Historical Archaeologist, I was advised by her to request consulting party status for myself directly to you under Section 106 of the National Historic Preservation Act. In addition it was suggested I also provide additional information already sent to Director Muzzey's office, due to the complexity of information related to my property, with Section 106 review, directly to FERC and Kinder Morgan's cultural resource consultants. To that end please note that I am hereby requesting consulting party status under Section 106 of the National Historic Preservation Act as an affected landowner regarding the NED Project and my Rindge, NH property. Despite myself having legal and economic interests in the project as an affected land owner, there is obviously no guarantee whether I would normally be granted consulting party status by the FERC. Furthermore in was denied such status by you, I would then have to ask the Advisory Council on Historic Preservation to review the denial, and make recommendations to the FERC regarding my participation. Kindly note that my request to you is also at the recommendation of the NHDHR.

In consideration for consulting party status please note the rarity and historic significance of the Calhoun Pasture, its characteristics and features, as truly representative of working farm properties typical of America's colonial and agricultural past. It is on an unpaved road and in a visually pristine setting unto itself. In particular the importance of its "setting" or its physical environment, character if you will, as well as a 'feeling' or the expression of its aesthetic or historic sense of the past is unique and worthy of preservation. Visually, removal of its northern stands of pines in the targeted path of the pipeline through it would destroy this completely. It would also effect the property's capacity to operate as a farm properly in the same way with-

out this physical windbreak. In addition, how its features and their relationships should be examined however not only within the exact boundaries of the property, but also between the property and its surroundings is important. This is particularly important for properties in agriculturally zoned districts, and involves not just where, but how, a property is situated and its relationship to its surrounding features and open space.

For over two centuries the Calhoun Pasture has been kept an un-subdivided parcel of land that is specifically and completely stone wall enclosed and preserved as such. My family has maintained this preservation in our ownership for more than the last fifty years. In addition to its possessing the aforementioned stone walls, even noted “as the walls now stand” in its deed description currently, it is also important to note two of the property’s boundary walls are in fact ‘lot’ and ‘range’ walls from the time when it was even more notably a parcel in a corner of “lot 10 in the 4th range”. Its namesake owner, the Rev. Andrew Calhoun purchased it from the Platts family (John Varnum Platts a descendant of Able Platts) whose ownership of it traces directly back to the very ‘father of the Town’ of Rindge, Captain Abel Platts (b. 1704 - d. 1777), credited as being the town’s first settler. (See Enclosure F). In addition, one of the families that owned and worked the property from an era of agricultural splendor, and lived during the time of our colonial historic past was Rindge’s noted Hubbard family. Specifically, Hezekiah Hubbard (b. 1757-d. 1822), a highly respected citizen and Revolutionary War soldier who is noted by name in Ezra S. Stearns’, History of the Town of Rindge, New Hampshire (Boston: Press of George H. Ellie, 1875, 136-139) (See Enclosure A - it is an astounding account of the times and the lives of the men of Rindge and specifically the experiences of one of the Calhoun Pasture’s past owners, Hezekiah Hubbard during the late 1700’s) and later Deacon of the Congregational Church, as well as his eldest son, Otis Hubbard. Each of these gentlemen were among Rindge’s most highly respected citizens in each era with Otis Hubbard the individual who bequeathed the money, in trust to the town, for a clock in the late 1800’s (See Enclosure E, Page 1 of 2, Seventh provision). To this day that clock, with a dial on each side of the town’s Second Meeting House’s spire graces it. The town’s meeting house, coincidentally also one of the largest meeting houses in New England, is on the National Register of Historic Places. This is but one example of the relationship the Calhoun Pasture has as a part of the town’s history. If historic connections and relationships aren’t preserved, they are in time forgotten and lost forever. The wealth of the Hubbard family allowed them to continue to actively work and use the Calhoun Pasture, further building its stone walls to such a degree that boulders exceeding five feet in length pulled by oxen have been built into it in places and routinely, sections of its walls measure over four feet in width and two feet or more above grade. (See Enclosure G) The Hubbard family also had the Calhoun Pasture name added into the property deed description even long after, decades after, Hezekiah purchased it from its namesake owner during the Hubbard family’s ownership of it from 1821 to 1895. Typically, land parcels are simply renamed by subsequent families, for a variety of reasons including the relationship between Rev. Calhoun and Deacon Hezekiah Hubbard, this was deliberately not the case. In part it was due to a sense of respect for the history of the land and commitment made to preservation of the cultural and agricultural lifestyle from the era. Kindly note the following:

- 1) I am the owner of Rindge’s historic “Calhoun Pasture” so named in its deed to this day.
- 2) For a site to receive historic preservation consideration under Section 106 review it needs to meet the standards of eligibility for listing in the National Register of Historic Places which it does due to many factors including its unique historic significance.
- 3) The site and land parcel is associated with the lives of specific persons from the colonial era through the late 19th century in Rindge’s, even the state and our country’s history, and events that have made a significant contribution to patterns of history. The Rev. Andrew Calhoun, Revolutionary War private and Deacon Hezekiah Hubbard, his son were all owners of it with Otis and other Hubbard family members actively working the property throughout the 1800’s.
- 4) The parcel embodies distinctive characteristics unique to American agricultural and cultural history. It is even specifically referenced and named in town records and annual reports related to its agricultural function throughout the 1800’s.

Agriculture has long been an integral and vital part of the social, economic, and cultural fabric of New Hampshire. Farmers have been producing crops from New Hampshire soil for more than 375 years. As important as agriculture is, it faces significant challenges from the increasing pressure of growth and development. Its site possesses value worthy of protection because it is representative of the colonial and post-colonial agrarian lifestyle of New England. It has maintained the integrity of location and site, and its setting and feeling physically as well as visually with the exception of the scar across the rural landscape of the area from the electric utility corridor and transmission power lines, which it should not be further exposed to.

The NED Project and pipeline if approved and constructed on or near my property will adversely affect and negatively alter characteristics that qualify my property, Rindge's historic Calhoun Pasture, for inclusion in the National Register in a manner that would diminish the integrity of the property. Specifically its integrity as a historically intact agricultural property and its ability to convey its significance based on its location, setting, feeling, and association would be permanently destroyed. The property's ongoing careful development committed to its continued preservation as an agricultural property and consistent zoning use as a working farm would be undermined and utterly ruined. The NED Project will:

- 1) In its present path permanently bisect the Calhoun Pasture itself.
- 2) Permanently eliminate agriculturally zoned land from the future use consistent with its USDA identified soil type for uses as described in my previous April 10, 2015 letter on file with the FERC and also sent to Tennessee Gas Pipeline, LLC.
- 3) Needlessly further and permanently expose the property visually and physically to the adjacent eyesore and scar across the landscape of the 345kV power transmission lines destroying its location, setting, feeling, and association within the rural landscape

The Calhoun Pasture, represents a direct nexus to very specific and significant facets of the Town of Rindge's, the State of New Hampshire's, and our country's colonial and post-colonial agricultural culture and history. To receive historic preservation consideration under Section 106 review it needs to meet the standards of eligibility for listing in the National Register of Historic Places which it does due to many factors including its unique historic significance.

The National Historic Preservation Act of 1966 was enacted by Congress to preserve the historical and cultural foundations of the nation as a living part of community life. I ask you kindly consider your ability to recognize that in this case preservation of this property involves little more than requiring TGP to respect this living part of the town's heritage being developed as an organic farm. I ask you mandate, should the NED Project be approved, the pipeline be instead constructed on the adjacent four acre land tract which possesses none of the attributes of the Calhoun Pasture and as already land owner by another energy infrastructure entity and is a far more appropriate location for it.

Lastly, kindly note although none of the enclosures are copies of certified copies of deeds as recorded in the Registry in Keene, NH, or documents held at the State's archives in Concord, NH, the information contained herein is easily subject to verification and if necessary during Section 106 review I am able to provide such if requested for further consideration.

2) PRESERVATION OF HISTORIC STONE WALLS

The Calhoun Pasture's walls are an important part of its history. The TGP pipeline through it and disruption of its stone walls would permanently destroy its stone walls and their appearance over a length under their current permanent and proposed easements of over 480 feet in length; 372 feet on its northern boundary, and 110 feet in length on its eastern boundary. The rebuilding of an historic wall changes when it must be entirely removed and reconstructed alters the appearance of it and its stones. The majority of the walls possess bases four feet in width and wider. Boulders that are landmarks, pulled into them by oxen from yesteryear are at times over four feet in length. Moving such stones by modern mechanical methods will deface and scar them destroying their appearance. They have aged with lichen, moss, and weathering that are a part of their character that once disturbed takes decades if not centuries to return to the same state. The colonial

stone walls in New England are some of the most important and beautiful walls ever built. It is absolutely impossible to demolish the walls on the Calhoun Pasture and rebuild them without destroying the character of the property. For examples, please refer to enclosed imagery. (See enclosure G)

3) RIPARIAN BUFFER ZONE

The Calhoun Pasture possesses two significant wetlands. More importantly, they, and a much larger adjacent wetland south on another land parcel are fed by a riparian buffer zone that is vital for seasonal streams and vernal pools. This riparian zone extends through the targeted NED Project path of the Calhoun Pasture and starts on the four acre land parcel north of the Calhoun Pasture. TGP has failed to indicate this area on their existing maps. Kindly refer to the attached images regarding an area that if disturbed will severely impact the health of the aquatic ecosystem of these wetlands. In particular, the topography of the spur at an elevation of approximately 1200 feet on my property declines toward the property's saddleback wetland. Polluted runoff will head through that buffer zone damaging it and the wetlands if the pipeline is constructed in its current part. An enormous amount of water seasonally runs across this area and disturbing the soil structure will affect that runoff drastically. I must request formally here during the scoping period that a study be conducted to identify the size of this area, and determine the environmental impact. Merely even moving the pipeline construction path off the Calhoun Pasture may not be adequate to eliminate the adverse impact. Kindly consider a comprehensive study of this area.

4) DRIVEWAY IMPACT.

Kindly consider TGP has proposed the pipeline route and adjacent temporary easement area which would adversely impact the property as completely obliterating the driveway access to Goddard for the property. Kindly consider require this area not being affected and the pipeline not allowed to destroy it. (See Enclosure I).

Thank You,

Ernest A. Kirslis

2. LT. ABEL PLATTS. Born in England and the son of Samuel and Sarah. Lt. Abel was the first of the Platts to settle in Rowley. He was a rebel and in considerable trouble with the town fathers. He was a soldier and a colorful character (see Platts family story). He was an ensign in the Rowley Company of the Canadian Expedition. At the time of his appointment as ensign, objection was made by the two ministers of Rowley for reasons set forth in their letter to the General Court accusing him of not taking communion or showing proper respect for religion. He was Rowley's first shipbuilder. Abel appears to have been a rebel who chafed under the strict Puritan church. He was excommunicated from the church. He went off to fight the French at Quebec in 1690 and died of exposure and starvation at Cape Breton. His heirs appealed for redress and were granted land in New Hampshire to which his grandson, Captain Abel moved and settled, calling this town 'Rowley, Canada'. The name was later changed to Rindge. He commenced clearing land as early as 1742 and started a permanent residence in the 1750's upon the shores of Pool Pond. His lots were 16 and 17 in the 8th range. B. England Md. Lydia Bailey (see Bailey Addenda) May 8, 1672, b. September 1644 Moses 2-4-1672 Abel 6-13-1675 Hannah 2-5-1678 Samuel 2-5-1681 D. Died in Battle at Cape Breton in 1690.

3. MOSES. Son of Abel and Lydia. He is recorded as serving as selectman in 1717. In 1734 he was employed by the town in settling the boundaries of Plum Island, Mass. He charged the town "for three days at Plum Island and one quart of 'Rume 0-14- 0'". About 1750 he appears to have owned a store in Rowley. B. February 4, 1673 Md. Hannah Platts (see Platts II addenda) on November 22, 1693 b. April 16, 1676, d. March 31, 1755 Children of that marriage were: Abel 8-26-1694 Lidia 3-20-1695 Elizabeth 2-8-1698 an infant 7-15-1701 Hannah 11-8-1702 Abell 2-6-1703 Moses 4-9- 1707 Hannah 3-27-1710 Mehitable 11-11-1712 Nathan 7-23-1715 Jonathan 11-10-1719 D. Re: Docket No. PF14-22

Revised and corrected from that previously submitted October 15, 2015

Dear Secretary Bose,

Greenville NH, while geographically one of the smallest towns in the State, has a relatively large population (over 2100) relative to its land area. It developed as an industrial village centered around the textile mills that proliferated throughout the northeast in the 1800's. As such, the housing is tightly clustered within the village district with a large majority of the population living within this area. The densely settled village district begins at the northwestern corner of the town slightly over one half mile downwind in a southeasterly direction from the proposed Kinder Morgan Market Path Mid-Station 4 compressor station off of Route 45. The heart of the village district lies approximately one mile from the proposed compressor station; in this area lies a mix of closely spaced residences, businesses, churches, town offices, police, fire, and school district department buildings, as well as the large Greenville Falls housing complex for the elderly and disabled which serves the needs of not just Greenville, but the entire region as well.

The dense housing and business in Greenville precludes the possibility of private wells and septic systems, and these necessities are provided by the Town with a local sewage treatment plant, and a reservoir situated in the Town of Temple. Greenville is unique in this regard in relation to the neighboring towns of Temple, New Ipswich and Mason which are not so densely settled and can rely on both private wells and septic systems.

The above mentioned reservoir is located approximately one half mile downwind in a northeasterly direction from the proposed compressor station. Moreover, the compressor station sits on land elevated above this reservoir, and which drains in several directions into streams which feed into the water supply. As mentioned previously, this reservoir supplies the only source of water for most of the Greenville residents and businesses, as well as the Temple Elementary School.

The densely populated areas of Greenville, as well as the municipal water supply, both located in close proximity to, and downwind from (westerly winds prevail regionally) the compressor station, place Greenville at greater risk than surrounding communities from the toxic emissions. The less densely populated village districts of Temple and New Ipswich would be similarly affected when the winds shift to the south [for Temple] and the northeast [for New Ipswich], a far less common occurrence when averaged over the year.

In Summary,

The FERC should deny the approval for placement of the Market Path Mid-Station 4 compressor station as sited by Kinder Morgan for the following reasons:

- 1) The compressor station location poses the greatest health risk to the most densely populated (and one of the lowest income) community along the pipeline route in this region. The thickly settled sections of Greenville are located approximately one half mile at the nearest point, to approximately one mile at the very center of the village to the proposed compressor station. This district contains a tight mix of residences, businesses, churches, municipal offices (town hall, police, fire, district school dept. buildings), as well as the large Greenville Falls Elderly Housing facility which serves the needs of the elderly and disabled throughout the region. The location of this district downwind from (westerly winds prevail regionally) the compressor station places Greenville in a very vulnerable situation from the toxic emissions of this auxiliary pipeline infrastructure.

- 2) The location of the Greenville municipal water reservoir, a mere one half mile downwind from the compressor station, places what is the only source of water for the majority of both residences and businesses in Greenville (as well as the Temple Elementary School) at high risk from both air and surface contamination (the Temple Elementary School is also at great risk here from air contamination). Moreover, the placement of the compressor station on land elevated above the reservoir, and which drains into streams feeding the reservoir, greatly enhances the danger of contamination of this water supply. It is inconceivable that any other industrial infrastructure - even one having a far lesser environmental impact - would be permitted by any state or local agency in this watershed in such close proximity to a municipal water supply.

The Kinder Morgan Market Path Mid-Station 4 compressor station poses an unreasonable risk to the community of Greenville - a community with one of the lowest median income rates in the region - and a com-

munity which can ill afford to sustain the environmental degradation and health risks that would ensue with Kinder Morgan's plans. In light of this and the above mentioned conditions, it would be irresponsible for the FERC to approve this compressor's siting, and expose the residents of Greenville to its inherent and well-documented harmful effects.

Sincerely,
Henri Vaillancourt
Greenville NH

**Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF 14-22-000
Northeast Energy Direct Project;
Scoping Comments of Massachusetts Attorney General Maura Healey**

Dear Secretary Bose:

The Office of Massachusetts Attorney General Maura Healey (AGO) is pleased to submit the following scoping comments pursuant to the National Environmental Policy Act, as part of the pre-filing process for the Northeast Energy Direct interstate gas pipeline project ("NED Project"). These scoping comments are submitted in response to the Federal Energy Regulatory Commission's (FERC) June 15, 2015 Notice of Intent to Prepare an Environmental Impact Statement in connection with the Project's application for a certificate of public convenience and necessity.

The AGO's attached comments call on FERC to undertake a full assessment of the need for the NED pipeline in conjunction with other natural gas pipeline proposals for the region. The AGO's comments also urge FERC to undertake a rigorous and comprehensive review of the proposed NED pipeline. Specifically, the AGO's scoping comments:

- Insist that FERC undertake a full evaluation of the nature and extent of the regional need for new gas capacity. The AGO urges FERC to consider the results of the AGO's Regional Electric Reliability Options Study, prepared by the Analysis Group, to evaluate options to address regional electricity reliability in New England, including natural gas capacity needs, through 2030.
- Propose that FERC combine its NEPA reviews of several pending New England pipeline projects into a single process (a combined Environmental Impact Statement) to avoid piecemeal review, to utilize a common analysis of regional gas demand, and to compare each projects' impacts and benefits.
- Focus on the need for FERC to scrutinize and condition any approval on adherence to two important

Massachusetts policies - the protection of conservation lands under Article 97 of the Massachusetts Constitution, and the Massachusetts Global Warming Solutions Act greenhouse gas emissions reduction targets.

- Insist on a thorough review of the many environmental and socioeconomic implications of the project (including its impacts on important ecological resources, public safety, and local communities), and all reasonable alternatives to the current proposal.

AG Healey would like to thank the Commission for this opportunity to provide detailed scoping comments on the NED Project.

Respectfully submitted,
Melissa A. Hoffer,
Chief, Energy and Environment Bureau,
Christophe Courchesne,
Chief, Environmental Protection Division,
Matthew Ireland,
Assistant Attorney General, Environmental Protection Division

**Scoping Comments of Massachusetts Attorney General Maura Healey to
Kimberly D. Bose, Secretary, Federal Energy Regulatory Commission
for the Tennessee Gas Pipeline Company, L.L.c., Northeast Energy Direct Project,
Docket No. PF 14-22-000**

INTRODUCTION AND SUMMARY OF COMMENTS

The Office of Massachusetts Attorney General Maura Healey is pleased to submit the following scoping comments pursuant to the National Environmental Policy Act, as part of the pre-filing process for the Northeast Energy Direct interstate gas pipeline project (the “NED Project” or “the Project”). These scoping comments are submitted in response to the Federal Energy Regulatory Commission’s (“FERC” or the “Commission”) June 15, 2015 Notice of Intent to Prepare an Environmental Impact Statement in connection with the Project’s application for a certificate of public convenience and necessity (“CPCN”).

The NED Project proposed by the Tennessee Gas Pipeline Company, L.L.C. (“Tennessee Gas”) is among the most significant energy infrastructure proposals in recent Massachusetts history. As proposed, the NED Project calls for construction of a 188-mile, 30-inch pipeline designed to deliver up to 1.3 billion cubic feet per day (“Bcfjday”) of natural gas from Wright, New York, to Dracut, Massachusetts, at a total cost of at least \$3 billion. As currently designed, 64 miles of pipeline would be located in Massachusetts.[1] The NED Project also would construct nine new compressor stations and thirteen new meter stations, and modify an existing compressor station and twelve existing meter stations to service the new pipeline.[2]

If constructed, the NED Project would have major and lasting consequences for Massachusetts communities, the Commonwealth’s natural resources, and the economy and energy systems throughout the Northeastern United States. The NED Project would double the capacity of Tennessee Gas’s pipeline system in New England and increase New England’s total interstate natural gas pipeline capacity of 3.951 Bcfj day by nearly one-third in a single project.[3]

In New England and in Massachusetts in particular, there is intense debate regarding the nature and extent of the need for additional natural gas pipeline capacity-both for the projected future growth in demand for customers of local natural gas distribution companies (“LDCs”) and for natural gas-fired power plants on which the region is increasingly dependent for electric power generation. Gas and electric utilities, gas pipeline developers, and the Independent System Operator (“ISO-NE”) claim that there are capacity constraints in New England’s existing pipeline infrastructure during periods of peak winter demand-constraints that can lead to natural gas pricing volatility and corresponding spikes in wholesale electric prices-and have argued

that significant new pipeline development is needed to alleviate these constraints, preserve electric system reliability, and lower market prices.[4] Other stakeholders, including over fifty Massachusetts municipalities, regional planning organizations, clean energy advocates, property owners, environmentalists, community groups, power generators, and liquefied natural gas (“LNG”) interests, have vigorously opposed new pipeline development, and the NED Project in particular, arguing that such development requires significant environmental and other impacts that are unacceptable to local residents and communities; new fossil fuel pipelines are antithetical to the region’s goals to reduce energy sector greenhouse gas emissions; and pipeline system constraints and incremental gas capacity needs, if any, are short in duration and can be addressed through better use of the existing natural gas system and alternative energy solutions like energy efficiency and renewables.[5] The Attorney General’s Office (“AGO”) will soon release a study it commissioned, discussed in more detail below, that examines the extent of New England’s need for additional energy supplies to ensure electric system reliability through the year 2030, and analyzes alternative solutions to meeting any such need, including the costs to ratepayers and effects on greenhouse gas emissions.

Against the backdrop of this debate, pipeline developers have proposed multiple natural gas pipeline projects affecting New England, including the largest single project the NED Project. FERC has recently approved two projects, Spectra Energy’s Algonquin Incremental Markets (itAIM”) project and Tennessee Gas’s Connecticut Expansion project (“CT Expansion”), which are now under construction and together will add more than 0.4 Bcf/ day of additional capacity to New England. A series of additional projects are at various stages of securing customers and applying for FERC CPCNs, including the NED Project, Portland Natural Gas Transmission System’s (ItpNGTS”) Continent to Coast (ItC2C”) project (currently 0.168 Bcf/day), Spectra Energy’s Atlantic Bridge project (currently 0.13 Bcf/ day, in FERC pre-filing) and Access Northeast project (proposed jointly with Spectra Energy, National Grid and Eversource Energy, up to 1 Bet/day) projects.[6] Together with the AIM Project and the CT Expansion project, these projects total nearly 3.0 Bcf/day of additional capacity.

With these projects on the table, New England is at crossroads in the development of new energy infrastructure. While many decisions about New England’s energy future will arise in other venues, FERC’s overriding siting authority for natural gas infrastructure encompasses the obligation to provide a comprehensive and rigorous review of all proposed interstate natural gas pipeline projects pending before it, including the NED Project.

Under both the Natural Gas Act and the National Environmental Policy Act (“NEPA”), FERC’s review must address a series of issues that are fundamental to New England’s and Massachusetts’s energy future: the nature and extent of the regional need for gas capacity; the reasonable alternatives to meeting that need, if any; and the environmental and socioeconomic impacts of those reasonable alternatives. Federal law also requires that FERC’s review address the full range of impacts from new gas pipelines (including the direct and indirect air and greenhouse gas emissions caused by the projects), the impacts to public and conserved lands, the economic burdens for residents and communities, and the many other impacts to natural resources as well as public health and safety. As evidenced by the thousands of scoping comments filed thus far expressing concerns about the NED Project, these issues are of significant concern to stakeholders throughout Massachusetts and New England.

For the reasons set forth in these comments, the AGO believes that FERC should undertake an integrated, inclusive review of all pending pipeline projects affecting New England in one combined Environmental Impact Statement (“EIS”) in order for FERC to meet its obligations under NEPA and the Natural Gas Act consistent with U.S. Supreme Court and other federal court authority. A combined EIS would reasonably consider the issues discussed above and the various projects as alternatives to each other in delivering additional energy to New England, along with the other reasonable alternatives consisting of alternative pipeline routes and alternative energy sources like energy efficiency, renewables, and LNG. The combined EIS should place the projects in the context of the region’s overall need for gas pipeline capacity, which FERC should independently study. FERC’s standard practice of reviewing individual projects piecemeal is simply not adequate to address the overriding and common issues affecting all pending proposals and could result

in the approval of much more pipeline capacity than is consistent with the public interest.

Regardless of whether FERC prepares a combined EIS, the AGO also requests in these comments that FERC scrutinize the specific need for, and the full range of impacts from, the NED Project as proposed, including several concerns of special importance to the AGO and the Commonwealth. Foremost among these concerns is the availability of reasonable alternatives to the Project. Under NEPA, FERC must undertake a meaningful review of available pipeline and no-build alternatives that would allow the region to meet any identified need without the NED Project. Similarly, FERC must analyze all reasonable routing alternatives to the NED Project as proposed, including the use of Tennessee Gas's existing pipeline right-of-way and collocation with state and federal highways such as the Massachusetts Turnpike. With regard to the Project's impacts, FERC should place special emphasis on its evaluation of the Project's impacts on land protected under Article 97 of the Massachusetts Constitution, on the significant ecological resources along the proposed route, and on the Commonwealth's greenhouse gas emission reduction goals under the state's Global Warming Solutions Act ("GWSA").⁸ Finally, FERC must review the public health impacts of the proposed Project, particularly compressor station emissions.

ABOUT THE ATTORNEY GENERAL'S OFFICE AND THE ENERGY AND ENVIRONMENT BUREAU

Attorney General Maura Healey is the chief law enforcement officer for the Commonwealth of Massachusetts. The AGO, through its Energy and Environment Bureau, works to protect utility ratepayers and our environment, and to reduce the threat of climate change for the people and families of the Commonwealth. As the state's Ratepayer Advocate, the Bureau's Energy and Telecommunications Division represents consumers in matters involving the price and delivery of natural gas, electricity, water, and telecommunication services before state and federal regulators. The Bureau's Environmental Protection Division and Environmental Crimes Strike Force enforce the laws that protect our air and water, preserve our lands and open space, require the cleanup of contaminated sites, and govern the use of pesticides and the handling and disposal of hazardous waste. The Bureau's integration of energy and environmental advocacy ensures that our office speaks with one voice in addressing the intertwined ratepayer and environmental protection matters that impact the Commonwealth and our residents.

The AGO is committed to a clean energy future in Massachusetts built around cleaner, renewable energy sources that allow Massachusetts to achieve regional and federal climate goals, as well as to meet the mandates of the GWSA.⁸ Attorney General Healey also is seeking to protect ratepayers by ensuring that when the Commonwealth makes long-term decisions about additional gas capacity investments, it is done on the basis of facts that quantify future natural gas demand, and take into account all cost-effective sources that can be deployed to meet that demand, including energy efficiency, renewables, large scale hydropower, LNG, and natural gas.

DETAILED COMMENTS

I. FERC Should Undertake a Robust Assessment of the Need for Additional Natural Gas Capacity as the Starting Point for the EIS.

FERC's NEPA review of the NED Project must begin with a complete and inclusive statement of the project's "purpose and need." 40 C.F.R. § 1502.13. An appropriate purpose and need statement is critical because "the range of alternatives that is deemed reasonable depends upon the underlying purpose and need to which the agency is responding." *NRDC v. Evans*, 232 F. Supp. 2d 1003, 1038 (N.D. Cal. 2002). In other pipeline EISs, FERC has defined purpose and need with reference to applicant objectives, including its proposed pipeline receipt and delivery points and the volume of gas proposed to be delivered by the projects.⁹ Although FERC has committed to considering the need for the gas capacity and the related AGO study of the New England region's as part of its review of Tennessee Gas's application for a certificate of public convenience and necessity.¹⁰ FERC has indicated that this inquiry will not be part of the EIS.

That approach is insufficient here, and inconsistent with the Council on Environmental Quality's ("CEQ")

NEPA guidance and federal court authority. [11] For these reasons, the AGO urges FERC to evaluate New England's gas capacity needs in the EIS. In a purpose and need statement, "an agency cannot define its objectives in unreasonably narrow terms." *Nat'l Parks & Conservation Ass'n v. Bureau of Land Mgt.*, 606 F.3d 1058, 1070 (9th Cir. 2010). Because the purpose and need statement drives the selection of alternatives for study in the EIS, agencies "cannot define a project's purpose and need so narrowly that it contravenes NEPA's mandate to evaluate [all] reasonable alternatives." *Coalition for the Advancement of Required Transp. v. FHA*, 576 Fed.Appx. 477, 487 (6th Cir. 2014), citing *Citizens Against Burlington, Inc. v. Busey*, 938 F.2d 190, 196 (D.C. Cir.1991).

Here, the NED Project proposes to increase gas pipeline capacity to New England to address a supposed need for fuel to serve electric generators and LDC load. The NED Project justifies its proposal with an unprecedented expectation that electric utilities may contract for more than a majority of the Project's capacity. However, the applicant's views of the project purpose and need are not controlling, and the EIS should be guided by FERC's independent judgment. See, e.g., *Nat'l Parks & Conservation Ass'n*, 606 F.3d at 1072 (agency erred by "adopting private interests to draft a narrow purpose and need statement that excludes alternatives that fail to meet specific private objectives"). Thus, as part of the EIS for the NED Project, it is FERC's obligation under NEPA to evaluate and define the nature and extent of New England's gas capacity needs. This task requires searching scrutiny of the supposed need for the NED Project to serve New England's electric system and LDC load.

A. Electric System Needs

First and foremost, FERC must take into account and evaluate the need for Tennessee Gas's unprecedented plan to support the balance of the NED Project's capacity through contracts with electric utilities. Under this plan, electric utilities will purchase firm natural gas capacity and resell that capacity in the market to increase gas availability for electric generation, primarily during winter peak demand, which occurs only a few dozen days per year. Tennessee Gas recently announced an open season for the entire uncommitted portion of the NED Project's capacity to achieve this objective.[12] In the announcement, Tennessee Gas specifically referenced regulatory proceedings in four of the six New England states, including Massachusetts, which could advance approvals of such contracts.[13]

The Massachusetts Department of Energy Resources petitioned the Massachusetts Department of Public Utilities ("DPU") to open an investigation into how new natural gas delivery capacity may be added to the New England market, including through a proposed mechanism that would allow Massachusetts electric distribution companies ("EDCs") to purchase pipeline capacity and recover costs from customers.[14] The AGO was an active participant in the proceeding, filing detailed comments that urged the DPU to focus on finding the most beneficial and cost effective way to address spikes in winter electricity prices due to gas capacity constraints, and to undertake a rigorous regional economic study of new gas capacity and alternatives before considering any proposal to authorize EDCs to purchase gas capacity with ratepayer backing.[15] The AGO also urged the DPU to consider the interrelationship of gas and electric markets in Massachusetts and to conduct a factual analysis of future demand and cost-effective energy efficiency resources before making any decisions regarding additional gas capacity investments.[16] The AGO warned that the proposed mechanism for the EDCs to procure gas capacity appeared contrary to state law.

A wide range of other stakeholders-including environmental groups, power generators, and clean energy advocates and businesses-also expressed strong objections to such a mechanism. Of the fifty-two sets of comments received in the DPU's investigation, only eight commenters supported EDCs entering into long-term pipeline capacity contracts; of those eight commenters: five are EDCs or pipelines companies (National Grid, Eversource Energy, Tennessee Gas Pipeline, PNGTS, and Algonquin Gas Transmission / Spectra Energy) that stand to profit from the proposal; one commenter is an industry group that promotes natural gas; and one commenter, Coalition to Lower Energy Costs, is an end user group funded in part by, and represented by the same counsel as, Tennessee Gas [17] On October 2, 2015, the DPU nonetheless issued an order urging EDCs to file proposals to purchase natural gas pipeline capacity for resale to electric generators, finding

no legal or other impediment to such proposals.[18] Any such EDC proposals are likely to be vigorously opposed by numerous stakeholders, including the AGO, and any DPU approval of said proposals would likely be subject to legal challenge.

The AGO's Electric Reliability Options Study for the New England Region

In light of the AGO's call for a detailed factual analysis of gas capacity constraints and electric system options to address those constraints, if any, the AGO received a private grant to commission an independent and comprehensive study by The Analysis Group to evaluate all options to address any electricity reliability needs in New England through the year 2030.[19] The study will provide an assessment of costs and benefits, including price impacts, of each option, consistent with the region's energy and climate goals. The study will address both winter and summer reliability needs, and include an analysis of all potentially available resource options, in specific quantities, to meet those needs, including natural gas (both natural gas pipelines and LNG), oil, hydropower imports, energy efficiency, demand response, and renewables. The study has benefited from significant input from a stakeholder advisory group, which provided feedback on modeling assumptions and inputs and included representatives from major utilities, electric generators, the natural gas industry, the business community, and clean energy advocates. The study will be completed soon, and the AGO will immediately submit the study to FERC for its consideration in this docket. At a minimum, the AGO urges FERC to consider and discuss all relevant findings of the study in defining the purpose and need for the project in the EIS, as well as in the EIS's alternatives analysis.

B. LDC Needs

Second, FERC should consider whether the gas capacity amounts under Tennessee Gas's precedent agreements with New England LDCs-the only transportation service commitments currently supporting the NED Project's development-are justified not only by the LDC's need but also an absence of reasonable alternatives. On August 31, 2015, DPU approved 20-year firm transportation service agreements between three LDCs and Tennessee Gas to purchase natural gas capacity on the NED Project. Pursuant to the precedent agreements between the LDCs and Tennessee Gas, Tennessee Gas will deliver a total of 151,962 dekatherms per day (Tith/day"), 114,300 Dth/day, and 36,000 Dth/day of interstate pipeline capacity to the distribution systems of Boston Gas Company d/b/a National Grid, Bay State Gas Company d/b/a Columbia Gas of Massachusetts, and the Berkshire Gas Company, respectively.[20] Separately, on October 2, 2015, the New Hampshire Public Utilities Commission approved a similar precedent agreement between Liberty Utilities, a New Hampshire LDC and Tennessee Gas for the delivery of 115,000 Dth/day of capacity on the NED Project.[21] Tennessee Gas has also announced several other smaller LDC agreements.[22]

However, three of the NED Project commitments are in legal limbo because the DPU approvals by the Department of Public Utilities are now on appeal to the Massachusetts Supreme Judicial Court [23] and there are numerous alternatives that allow these LDCs to meet their projected future gas demand without the NED Project but that the DPU failed to consider. In this latter regard, we direct FERC's attention to the record before the DPU, where the AGO and other stakeholders opposed approval of the precedent agreements.[24] Under these circumstances, FERC should consider the nature and extent of the LDC need for gas in the context of both pipeline and non-pipeline alternatives, in order to evaluate and define the overall purpose and need for the NED Project in the EIS.

II. FERC Should Undertake a Combined EIS Encompassing All Pending Gas Pipeline Proposals Affecting New England

As discussed in the introduction to these comments, FERC's review of the NED Project coincides with pending and upcoming FERC reviews of several other gas pipeline proposals affecting New England. Together with the two approved incremental pipeline projects, these proposals would add up to 3 Bcf/day of additional natural gas capacity to the region. The following table lists these projects and their current status.[25]

Table: Present and Proposed New England Natural Gas Pipeline Capacity

Existing New England interstate natural gas pipeline capacity: 3.95 Bcf/day

Incremental approved projects		
Spectra AIM	0.342 Bcf/day	<i>under construction</i>
Tennessee Gas CT Expansion	0.072 Bcf/day	<i>under construction</i>
	0.414 Bcf/day	
Announced projects		
NED Project	1.3 Bcf/day	<i>FERC pre-filing</i>
Spectra Access Northeast	≤1.0 Bcf/day	<i>open season ended</i>
Spectra Atlantic Bridge	0.13 Bcf/day	<i>FERC pre-filing</i>
PNGTS C2C	≤0.13 Bcf/day	<i>open season ended</i>
Total	Up to 2.974 Bcf'/day, approximately 75% of existing	

These projects would collectively increase New England’s existing interstate natural gas pipeline capacity by approximately 75% within a relatively short period of time. With so many active natural gas pipeline projects, there is a real risk that, if FERC considers each new project in isolation, it will fail to capture the common, synergistic, and cumulative impacts presented by these similar projects during its NEPA reviews. Consequently, this method could threaten the legal integrity of the NEPA process and impair FERC’s ability to reach a well-informed decision on the respective applications for CPCNs under the Natural Gas Act. As the Supreme Court has noted, “when several proposals for [] actions that will have cumulative or synergistic environmental impact upon a region are pending concurrently before an agency, their environmental consequences must be considered together.” *Kleppe v. Sierra Club*, 427 U.S. 390, 410 (1976). See 40 C.F.R. § 1508.25(a) (EIS must include other “connected,” “cumulative,” and “similar” actions). The First Circuit has likewise urged comprehensive review of multiple projects in a single EIS:

[O]ne initial comprehensive study, which could be referred to and supplemented by less comprehensive individual studies ... would appear to reflect a better use of scarce resources. In such a case it would not seem sensible to adopt the piecemeal approach which [the agency] seeks to adopt, whereby it will prepare a modified impact statement separately for each proposed [project], an approach akin to equating an appraisal of each tree to one of the forest [I]t seems a perversion of NEPA for [the agency] to approach each parcel, wholly depending in its timing of environmental review on the filing of applications ... and considering anew the scene as it is changed by each subsequent approval. Not only would this be wasteful of bureaucratic resources, but the plurality of possible appeals would suggest a wasteful prolongation of time spent in litigation.

Jones v. Lynn, 477 F.2d 885, 890 -91 (1st Cir. 1973).

A well-established tool for addressing similar projects within a geographic area is a programmatic EIS. The NEPA implementing regulations urge agencies to consider conducting a programmatic EIS in several circumstances, including when an agency is considering approvals for multiple projects in one geographic region, or for multiple projects that are similar in other ways. See 40 C.F.R. § 1502.4(c)(1)-(2) (EISs on broad issues appropriate when federal actions share “relevant similarities, such as common timing, impacts, alternatives, [and] methods of implementation”). In addition, 40 C.F.R. § 1508.25(a)(3) requires agencies to consider preparing a singular, programmatic EIS for “similar actions, which when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating their environmental consequences together, such as common timing or geography.”

A recent CEQ memorandum emphasizes that agencies should prepare a regional or programmatic EIS when “approving multiple actions” that are “temporally or spatially connected and will have a series of associated

concurrent or subsequent decisions.[26] This may include similar projects in a region, or a “suite of ongoing, proposed or reasonably foreseeable actions that share a common geography or timing, such as multiple activities within a defined boundary n [d. See also *Churchill Cnty. v. Norton*, 276 F.3d 1060, 1077 (9th Cir. 2001) (“At least when the projects in a particular geographical region are foreseeable and similar, NEPA calls for an examination of their impact in a single EIS”) (internal quotations and citations omitted); *Nat’l Wildlife Fed’n v. Appalachian Reg’i Comm’n*, 677 F.2d 883, 888 (D.C. Cir. 1981) (“the environmental consequences of proposed actions must all be considered together in a single, programmatic EIS when their impacts will have a compounded effect on a region”).

While a full programmatic EIS with full tiered supplemental EISs for each project may not be necessary, a combined EIS covering all pending projects would be efficient and avoid delay. See CEQ NEPA Guidance at 15 (encouraging combined programmatic and sitespecific environmental analysis in single EIS when appropriate).

A combined EIS would achieve the same goal of addressing the projects in a comprehensive, integrated manner that ensures a single assessment of regional need, a common base of environmental information, methodological consistency, and a robust NEPA-compliant alternatives analysis.

A combined EIS would also most effectively and efficiently identify and evaluate system and route alternatives that avoid or minimize environmental impacts for the entire region, and provide a more comprehensive and informed cumulative impacts analysis than provided by separate, isolated NEPA reviews for each pending pipeline project. In a combined alternatives analysis, FERC would be able to compare the environmental impacts of all pending projects and determine the optimal combination and alignment of pipelines to deliver any needed gas to the New England market.[27] At the end of the process, FERC can utilize the information in a combined EIS to reject proposals with capacity that exceeds the identified regional need or with inferior environmental impact profiles.

Given the current status of FERC review for all pending pipeline projects, combining them all into a single EIS would not cause delay, and would result in a more efficient and robust EIS which fulfills FERC’s mandate under NEPA.[28]

Even if FERC declines to perform a combined EIS for all pending projects, in order to meet its NEPA mandate, FERC should, at the very least, conduct a comprehensive alternatives analysis that includes a detailed study of the wide range of pipeline and energy alternatives to the NED Project, as discussed in Section III below. Thereafter in Section IV, the AGO provides detailed comments concerning the environmental impacts that FERC must address in its NEPA review of the NED Project, regardless of whether that NEPA review is pursued jointly with other projects.

III. FERC Should Include Detailed Study of the Wide Range of Pipeline and Energy Alternatives to the NED Project, including the No-Action Alternative, in the EIS.

FERC’s analysis of alternatives to the proposal is “the heart of the environmental impact statement,” and “should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision maker and the public.” 40 C.F.R. § 1502.14 (emphasis added). CEQ regulations make clear that FERC must “rigorously explore and objectively evaluate all reasonable alternatives ... devot[ing] substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.” 40 C.F.R. §§ 1502.14(a)-(b). FERC must consider the “no action” alternative and all reasonable alternatives, including those that are not within the applicant’s direct capabilities. See 40 C.F.R. § 1502.14(c)-(d).[29] FERC also must (i) justify-as supported by independent, expert analysis-the exclusion of any of these alternatives from detailed analysis in the EIS, and (ii) provide a detailed and holistic comparison of the impacts and benefits of the analyzed alternatives, which must guide FERC’s ultimate determinations on the application. See 40 C.F.R. §§ 1502.14(a)-(b).

A NEPA-compliant alternatives analysis depends on an appropriately framed purpose and need statement because the selected alternatives must meet the purpose and need for the project. As discussed above, the

NED Project EIS's purpose and need statement (or the statement in any combined EIS covering multiple projects) should build on FERC's analysis of New England's need for natural gas capacity or equivalent energy resources. That analysis will guide FERC in identifying the reasonable alternatives to the NED Project in the EIS.

FERC's alternatives analysis should address, at a minimum, the following alternatives:

Alternative Pipeline Routes, including Existing Pipeline Rights-of Way. Tennessee Gas has already proposed shifts to the route to its original NED Project proposal, including the relocation of the original proposed right-of-way to the north through southern New Hampshire. FERC should assess all reasonable alternative routes for the NED Project, especially routes that either make use of existing pipeline infrastructure like Tennessee Gas's existing interstate pipeline, or follow disturbed rights-of-way like the Massachusetts Turnpike or railroad rights-of-way. In addition, FERC should analyze, on a mile-by-mile basis, those potential alternative routes that avoid or minimize impacts to conserved land and other community resources identified by commenters, and also environmental impacts like the disruption of wetland resources and priority habitat for species of special concern.

Alternative Pipeline Sizes and Configurations Given Current Contractual Commitments. FERC should analyze potential options for alternative pipeline sizes and configurations that would cost-effectively provide the pipeline capacity for which Tennessee Gas has currently entered into precedent agreements with New England LDCs, in lieu of the 1.3 Bcf/day identified in Tennessee Gas's filings in this docket to date. In particular, FERC should study in depth those alternative configurations that would permit use of Tennessee Gas's or another pipeline company's existing pipeline infrastructure in New England.

Non-Pipeline Energy Alternatives. As discussed above, the purpose and need for the NED Project should be defined with reference to a comprehensive and independent assessment of regional gas capacity needs. To the extent that gas capacity needs are identified, FERC should analyze non-pipeline gas system alternatives, including LNG imports and LDC storage. Moreover, gas is only one of many energy resources that are capable of supplying electric and thermal energy to consumers. As numerous commenters have argued in submissions to this docket, these other resources-like gas and electric energy efficiency, renewable thermal energy, renewable electric generation, and electric system demand response-are readily available and viable means of meeting customer electric and thermal loads. As such, incremental additions of these resources are reasonable alternatives to the NED Project that should be studied in depth in the EIS. The AGO understands that FERC typically views such alternatives as beyond the scope of its required NEPA alternatives analysis for pipeline projects.[30] However, in light of the evident public interest in non-pipeline alternatives and the clear command of NEPA that all reasonable project alternatives be included in an EIS, FERC should evaluate energy resources available to New England that would substitute for natural gas and provide equivalent amounts of electric and/ or thermal energy to consumers.

The No-Action Alternative. NEPA itself requires FERC to perform a robust and impartial assessment of the environmental, cultural, and socioeconomic implications of simply denying the project. 40 C.F.R. § 1502.14[d]. See, e.g., *Pit River Tribe v. U.S. Forest Serv.*, 469 F. 3d 768, 786 (9th Cir. 2006) (EIS inadequate for failure to consider noaction alternative). In the context of the ongoing debate about the nature and extent of the need for new gas capacity in New England and FERC's potential findings in assessing the purpose and need for the project, FERC should be open to deciding in the EIS that the impacts of the proposed project and other reasonable "action alternatives" are unacceptably significant and that the "noaction" alternative is the preferred alternative.

IV. FERC Should Conduct a Comprehensive and Robust Evaluation of All Environmental Impacts of the NED Project Proposal and Alternatives

Introduction

As a part of its NEPA mandated analysis, FERC must evaluate the proposed NED Project's effects on natural resources and affected ecosystems, along with the direct, indirect, and cumulative impacts of the

project's aesthetic, historic, cultural, economic, social, and health effects. See 40 C.F.R. § 1508.8. In addition, FERC must evaluate strategies to mitigate any identified harmful effects to the environment that would result from the proposed NED Project.

At the outset, FERC's preparation of a thorough and accurate EIS depends on full and complete information from Tennessee Gas about its NED Project proposal and its impacts. Despite the flexibility of the pre-filing process, Tennessee Gas's filings and submissions to date have failed to provide FERC and the public with sufficiently detailed information about the NED Project, its route, its impacts, and the alternatives considered by Tennessee Gas. The AGO is concerned that Tennessee Gas's Draft Resource Reports filed to date do not adequately address, among many other data gaps, NED Project impacts on conservation land protected by both Massachusetts constitutional and statutory provisions, or adequately evaluate the Project's greenhouse gas emissions and effect on Massachusetts' ability to meet GWSA greenhouse gas reduction targets.

Therefore, FERC should require Tennessee Gas to complete all surveys, studies, data compilations, and evaluations undertaken during pre-filing preparation of Draft Resource Reports and to provide FERC with all information and documents necessary to clarify deficiencies and to supply missing information, as requested in FERC's October 8, 2015 comments on Tennessee Gas's July 24, 2015 Draft Resource Reports. This thirtythree [33] page information request includes one hundred and sixtysix (166) paragraphs identifying missing or incomplete data—often simply identified by Tennessee Gas as “TBD” (to be determined)—on nearly every environmental or natural resource impacted by the NED Project proposal, as well as missing or deficient information concerning pipeline route and compressor station location alternatives.³¹ The AGO's comments below highlight some specific deficiencies that Tennessee Gas must address.

In addition, the Commission should require that Tennessee Gas address all comments timely filed by all stakeholders before the close of the public scoping comment period. Despite the massive volume of comments filed to date, FERC should insist that Tennessee Gas specifically respond to all individually filed comments and to all specific issues, concerns and questions raised by individuals, governmental entities, elected officials, or nongovernmental groups and organizations.

The AGO strongly urges that FERC not initiate formal NEPA review, including any substantive preparation of a draft EIS, until Tennessee Gas has responded to all timely received stakeholder comments [filed during the scoping period ending October 16, 2015]. Further, FERC should not commence NEPA review until Tennessee Gas has fully addressed FERC's October 8, 2015 request for information—or until Tennessee Gas has otherwise remedied all deficient or incomplete data and documentation that is required to be provided to FERC, such that FERC has a complete and sufficiently detailed record to enable formal NEPA review.

FERC and its consultant should complete all of its own pending evaluations, surveys, and studies in advance of formal NEPA review. The AGO also urges FERC to identify, develop, perform, or contract for performance of all additional research, surveys and studies necessary for FERC to develop a robust and comprehensive EIS that enables FERC to meet its mandate under NEPA.

The scoping comments that follow address many, but not all, of the resource areas identified in the Commission's June 15, 2015 Notice of Intent to prepare an EIS. However, rather than providing comprehensive scoping comments on all resource areas impacted or potentially impacted by the NED project preferred route and alternatives, the following comments focus on a few areas of particular interest and concern to the AGO.³² First, the AGO discusses conservation land protected by both Massachusetts constitutional and statutory provisions, and urges FERC to condition any CPCN on Tennessee Gas's compliance with all substantive and procedural legal protections afforded such conservation land under state law. Second, FERC must examine Tennessee Gas's plans and proposals to reduce greenhouse gas emissions, and fully assess the effect of NED Project related emissions on Massachusetts's ability to meet its GWSA reduction targets. Third, the AGO urges FERC to scrutinize Tennessee Gas's plans and proposals to address and reduce methane emissions, including opportunities to implement new and state-of-the-art methane emission reduction technologies during pipeline construction, as well as during pipeline and compressor station operation and maintenance. Finally, and in general, FERC should assess the NED project's net effect on greenhouse gas

emissions in accordance with the recent draft CEQ guidance on addressing climate impacts in NEPA analysis.

A. The Commonwealth’s Substantial Investment in Constitutionally-Protected Conservation Land Should Not Be Subject To Eminent Domain by the NED Project When Less Disruptive Alternatives Can Meet the Same Gas Needs

Natural resource conservation and protection is an important part of the Commonwealth’s identity and heritage. Beyond traditional state and local regulatory controls or land recording mechanisms such as conservation easements, “conservation and environmental protection are express obligations of the [state] government,” enshrined in Article 97 of the Massachusetts Constitution.³³ As Massachusetts’s highest court recently noted, the environmental benefits provided by protected conservation land “extend beyond the parcel of land itself,” and include sustaining wildlife and species habitat, purifying the air by filtering harmful particulates, maintaining clean drinking water sources by filtering contaminants from groundwater, controlling the damaging effects of storm water runoff, and promoting “ecosystem resilience” in the face of climate change.³⁴

Approved and ratified in 1972, Article 97 of the Amendments to the Massachusetts Constitution superseded Article 49 of the Amendments (“Article 97”) and provides, in pertinent part:

The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air, and other natural resources is hereby declared to be a public purpose.

...

In the furtherance of the foregoing powers, the general court shall have the power to provide for the taking, upon payment of just compensation therefor, or for the acquisition by purchase or otherwise, of lands and easements or such other interests therein as may be deemed necessary to accomplish these purposes.

Lands or easements taken or acquired for Article 97 conservation purposes shall not be subject to any change in use or other disposition except by law enacted by a two-thirds vote of each branch of the legislature, taken on a roll call vote. See Article 97.

Many conservation parcels subject to Article 97 are also subject to specific controls and prohibitions imposed by deed through various forms of conservation-based restrictions established by Massachusetts statutory provisions, including conservation, preservation, watershed and agricultural restrictions. See M.G.L. c. 184, § 31.³⁵ Conservation restrictions may be held by a state or local government entity or by a charitable corporation or trust dedicated to land and natural resource conservation. M.G.L. c. 184, § 32, 2.³⁶ Approvals and releases of said restrictions must be certified and recorded by the Secretary of Energy and Environmental Affairs [“EOEEA”], the Massachusetts Historical Commission secretary, the commissioner of food and agriculture, the town selectmen, or the Mayor or city council, as applicable. See M.G.L. c. 184, § 32, Tf 1, 4.³⁷

Conservation Land Impacted by the NED Project

Although incomplete, Tennessee Gas has identified fifty-six [56] parcels subject to protection under Article 97, including those protected by M.G.L. c. 184, § 31 conservation-based restrictions, which would be directly impacted by Tennessee Gas’s preferred NED route.³⁸ The Commission should insist that Tennessee Gas completely identify and evaluate all such conservation parcels directly and indirectly impacted by the NED Project, not only by the company’s preferred pipeline route and compressor station locations, but also by all alternative routes, laterals, and compressor station locations.

FERC and its consultants should conduct their own accounting, assessment, and evaluation of all conservation land—including all land subject to M.G.L. c. 184, § 31 restrictions and Article 97—impacted by the

NED Project preferred route, laterals, and compressor stations, and by all alternative routes and compressor station locations during preparation of the draft EIS and final EIS.

EOEEA's No Net Loss Policy

Tennessee Gas has committed to “working to avoid” impacts to conservation land subject to protection by recorded conservation-based restrictions and Article 97 “to the extent feasible.”³⁹ Tennessee Gas has also acknowledged EOEEA’s longstanding policy to assure “no net loss” of Article 97 lands under the control or ownership of the Commonwealth or its political subdivisions.⁴⁰ This policy requires that disposition of Article 97 land should only be pursued in cases of “exceptional circumstances,” when all other options to avoid Article 97 disposition have been explored and no feasible and substantially equivalent alternatives exist.⁴¹ In addition, any proposed disposition or change in use must not destroy or threaten a unique or significant resource, including habitat for statelisted and protected rare species,⁴² unique or unusual terrain, or areas of significant public recreation.⁴³ Tennessee Gas expects that, “to the maximum extent practicable,” any disposition of Article 97 lands sought or required by the NED Project “will be evaluated and determined to meet the policy conditions identified above” [the conditions noted in this paragraph].⁴⁴

However, EOEEA’s “no net loss policy” requires more; the loss of any disposed Article 97 land must be mitigated, including by protecting replacement real estate “of equal or greater fair market value or value in use of proposed use, whichever is greater, and significantly greater resource value.”⁴⁵

The Commonwealth’s Investment in Conservation Land Should Not Be Subject to Eminent Domain Taking Without Adequate Demonstration of Need and Public Benefit

The Commonwealth invested over \$360 million in land protection between 2007 and 2014, acquiring significant state-owned conservation land including wildlife management areas, protected core habitat areas, and priority habitat lands for statelisted species,⁴⁶ which does not include the significant expenditures on conservation land made separately made by charitable trusts and nonprofits.

As identified by the Massachusetts Division of Fisheries and Wildlife [“DFW”], the NED Project preferred pipeline path and laterals alone impact large areas of conservation and wildlife management land owned, managed, and controlled by DFW, or land subject to conservation restrictions held by DFW. These areas include the Chalet Wildlife Management Area, the Montague Plains Wildlife Management Area,⁴⁷ the Peru Wildlife Management Area, the Upper Westfield River Management Area, and the Windsor Brook Wildlife conservation restriction.⁴⁸

The Massachusetts Fisheries & Wildlife Board has raised concerns about the “the longterm effects” of governmental and private entities’ ability to acquire and hold land in trust for conservation purposes in the event of any change in use or dissolution of Article 97 land to accommodate the NED Project, especially by an eminent domain taking.⁴⁹ “The reputational cost to those entities charged with protecting public lands is significant and needs to be understood and evaluated.”⁵⁰

FERC should require that the NED Project fully comply with all substantive and procedural protections afforded Article 97 conservation land by the Massachusetts Constitution, including an express requirement that Tennessee Gas seek legislative approval by a two-thirds, roll call vote of a bill allowing a change in use or disposition of Article 97 land. To the extent that Tennessee Gas is able to secure legislative approval for the disposition of Article 97 land—whether owned or controlled by the Commonwealth, a municipality, or a private individual, land trust or other nongovernmental organization— to accommodate NED pipeline impacts, FERC should condition any CPCN on Tennessee Gas’s strict compliance with EOEEA’s No Net Loss Policy, including that policy’s mitigation and replacement land goals and requirements. Further, FERC should expressly require that Tennessee Gas prepare a detailed plan for each Article 97 parcel detailing all proposed mitigation and land replacement plans for review and approval by the Commonwealth prior to any disposition.

Given the longstanding, strong, and unique constitutional protection afforded conservation land in the Commonwealth, any CPCN for the NED Project should strongly encourage Tennessee Gas to avoid preemption

at all costs by securing legislative approval for any Article 97 dispositions or land use alterations and fully complying with EOEEA's No Net Loss Policy. To the extent that Tennessee Gas seeks eminent domain land takings or easements through conservation land protected by Article 97 or conservationbased restrictions, the Commission must not only weigh the impacts to constitutionally and statutorily protected resources reflected in the NEPA assessment, it must also determine that the Project's public benefit is sufficient to justify the extent of eminent domain takings required by the Project when making its ultimate CPCN determination.⁵¹

As discussed above, FERC's NEPA review should independently analyze the need for the NED Project by collectively evaluating all currently pending pipeline proposals together, as well as alternatives potentially capable of meeting any regional need for additional capacity.⁵² FERC's ultimate determination on a Tennessee Gas application for a CPCN should weigh any need by the NED Project to exercise eminent domain takings against less environmentally disruptive alternatives.

B. FERC Should Scrutinize the NED Project's Greenhouse Gas Emissions, Including Assessment of Compliance with GWSA Reduction Targets

Massachusetts has led the nation in combatting climate change, including by playing a leading role in the fight to regulate greenhouse gases under the federal Clean Air Act. The Commonwealth led a coalition of states, in coordination with numerous environmental groups, in the landmark case of *Massachusetts v. EPA*.⁵³ Massachusetts has also been a national leader in promoting a clean energy economy. The Commonwealth has taken costeffective measures to reduce carbon emissions from the power sector, including establishing renewable portfolio standards to encourage greater reliance on clean energy, implementing energy efficiency programs, and participating in marketbased programs, such as the Regional Greenhouse Gas Initiative ("RGGI").⁵⁴ For the past four years, Massachusetts has topped the American Council for an EnergyEfficient Economy's State Energy Efficiency Scorecard, leading the nation on energy efficiency efforts.⁵⁵ FERC should scrutinize Tennessee Gas's plans and proposals to reduce greenhouse gas emissions, including by evaluating opportunities for the NED Project to implement new and stateoftheart methane emission reduction technologies during pipeline construction, as well as during pipeline and compressor station operation and maintenance. The AGO urges FERC to assess the NED Project's net effect on all greenhouse gas emissions in accordance with the recent draft CEQ guidance on addressing climate impacts in NEPA analysis, and to fully evaluate the Project's effect on Massachusetts's ability to meet GWSA greenhouse gas reduction targets.

In recent revised draft guidance, CEQ requires that federal agencies assess climate impacts during NEPA review ["2014 CEQ Climate Impact Guidance"].⁵⁶ This draft guidance specifically addresses how agencies should analyze greenhouse gas emissions during EIS preparation.⁵⁷ The 2014 CEQ Climate Impact Guidance directs agencies to perform and publish an estimate of a project's net effect, both direct and indirect, on greenhouse gas emissions if they are likely to be above 25,000 metric tons of CCh_e (Carbon dioxideequivalent).⁵⁸ Agencies are further instructed to assess not only a proposed project's greenhouse gas emissions and other potential impacts to climate change, but also to evaluate how climate change may potentially impact the project in ways requiring climate change adaptation planning and measures, including from sealevel rise, more frequent and intense storms, and increased occurrences of wildfires and drought conditions.⁵⁹

The Massachusetts GWSA

In 2008, the Massachusetts legislature set ambitious goals for ensuring greenhouse gas emissions reductions over time by enacting the GWSA.⁶⁰ The GWSA sets a 25 percent [25%] greenhouse gas emissionreduction target [from 1990 levels] for 2020, and an 80 percent [80%] reduction target for 2050.⁶¹ With these important state targets in place, the EIS should analyze the net effect of the NED Project on energyrelated greenhouse gas emissions against the GWSA targets. In addition, the GWSA includes mandatory emissions reporting from facilities that emit more than 5,000 tons of greenhouse gas per year. As part of any CPCN for the NED Project, FERC should mandate full compliance with all GWSA reporting requirements.

More broadly, as part of its analysis of cumulative impacts in the EIS, FERC must scrutinize all NED Project-related cumulative impacts of greenhouse gas emissions and the effect of such cumulative impacts on Massachusetts' ability to meet GWSA targets. This NEPA-required cumulative impact analysis should evaluate the potential combined greenhouse gas emissions from the NED Project together with emissions from the recently approved AIM and Tennessee Gas CT Expansion projects, from all NED Project systems alternatives, from all other pipeline project proposals currently pending in the New England region. See discussion in Section III, above. FERC should evaluate the extent to which these cumulative impacts impair Massachusetts' achievement of its GWSA targets.

C. Methane Emission Reduction Technology and Efforts

FERC should scrutinize Tennessee Gas's plans and proposals to address and reduce methane emissions, including opportunities to implement new and state-of-the-art methane emission reduction technologies during pipeline and new compressor station construction, as well as during pipeline and compressor station operation and maintenance.

Natural gas is primarily composed of methane, a potent greenhouse gas that is over thirty [30] times more powerful than carbon dioxide in its ability to trap heat in the atmosphere over a 100-year time frame, and is eighty-six (86) times more potent over a twenty-year timeframe.⁶² According to the EPA, methane emissions from the oil and gas sector are the largest industrial source of methane emissions in the United States, accounting for about 30 percent of total U.S. methane emissions.⁶³

The climate impacts of natural gas must be analyzed in terms of lifecycle greenhouse gas emissions (i.e. from "wellhead to burner tip"). When methane leaks throughout the entire natural gas production and delivery system are taken into account, the climate benefits of natural gas is significantly diminished in the short term (over a few decades). Recent studies have demonstrated that if total fugitive emissions (gas leaks) from the production, transmission, and distribution systems are greater than about two and a half to three percent (2.5%–3%), the benefits from natural gas as a substitute for coal disappear.⁶⁴

The EPA recently proposed new rules for methane emissions reduction from the oil and gas sector, and also to further limit emissions levels of volatile organic compounds ("VOCs"), such as benzene and formaldehyde, from the oil and gas sector. FERC should require that the NED Project address EPA's new rules and the CPCN should require compliance with all prospective regulatory changes.

Pipeline Infrastructure Leaks and Slowdowns

FERC should evaluate Tennessee Gas's current and proposed methods and schedules for identifying and repairing leaks from its existing pipeline infrastructure and from the new pipeline and laterals proposed for the NED Project.⁶⁵ Any CPCN for the NED Project should require that Tennessee Gas's pipeline leak monitoring schedules and methodology utilize state-of-the-art leak detection and repair technology, including infrared camera technology to the greatest extent possible.

The AGO also urges FERC to evaluate Tennessee Gas's current practice and proposed plans for managing pipeline blowdown frequency, including ongoing efforts to reduce blowdown frequency without sacrificing public safety.⁶⁶

Compressor Station Emissions

FERC should scrutinize the NED Project's new compressor station construction proposals and plans and require that Tennessee Gas demonstrate that its plans appropriately evaluate and incorporate compressors and pneumatics that decrease methane emissions to the greatest extent possible using available, state-of-the-art technology. In addition to evaluating the necessary horsepower, FERC should analyze Tennessee Gas's turbine proposals, and evaluate the extent to which the NED Project has employed waste heat electric (cogeneration) or other turbine technology.⁶⁷

The AGO also urges FERC to evaluate Tennessee Gas's proposed plan for directed inspection and maintenance of compressor stations to prevent and repair methane emissions from gas leaks. In its NEPA review

for the NED Project, FERC should carefully analyze Tennessee Gas's plans for regular monitoring of compressor stations, with a special focus on Tennessee Gas's use of state-of-the-art leak detection technology and methodology, including, without limitation, infrared cameras, acoustic leak detection technology, and electronic screening.

FERC should also require that Tennessee Gas record and report emission reductions from all leak detection monitoring and repair, and other procedures to minimize fugitive emissions during blowdowns.⁶⁸

D. Additional Environmental Impacts of Concern, including Those Which Tennessee Gas Has Failed to Address Adequately to Date

Many stakeholders across Massachusetts have raised a multitude of concerns about impacts to specific environmental resources from the NED Project's preferred pipeline and lateral routes, and from the construction and operation of new compressor stations.⁶⁹ In addition, many of these stakeholders have carefully analyzed the Tennessee Gas Draft Resource Reports filed to date, noting missing information and deficient data, including some of the incomplete information noted in FERC's October 8, 2015 request for information to Tennessee Gas. While not intended to be comprehensive, the AGO raises the following concerns we share with other stakeholders about the NED Project's impacts and the scope of NEPA review. In addition, the AGO is particularly concerned about the following issues regarding the scope of NEPA review for the NED Project:

- **Wildlife and Massachusetts Listed and Protected Endangered Species**

The Commonwealth is home to a rich diversity of plant and animal species, including many which are listed and protected under the Massachusetts Endangered Species Act ["MESA"], and for which DFW's Natural Heritage and Endangered Species Program ("NHESP") has delineated protected upland and wetland habitat. Habitat destruction is also widely recognized to be a significant threat to species. Thus, maintaining large, continuous tracts of various ecosystems is important for protecting and maintaining biodiversity.⁷⁰ In any draft and final EIS, FERC should thoroughly evaluate NED Project's compliance with all applicable MESA required project review procedures, including requirements that Tennessee Gas perform all necessary wildlife or vegetation studies for MESA listed and protected species (in addition to the surveys for federally listed and protected species which Tennessee Gas has already begun).⁷¹ Any CPCN for the NED Project should include conditions expressly requiring that the NED Project fully comply with all substantive MESA statutory and regulatory requirements, including MESA's "take" prohibition, either by avoiding a prohibited take, by altering the NED Project with conditions allowing a take, or by full MESA conservation and management review and permitting.⁷²

- **Public Safety**

Many residents, public safety officials, and elected town officials have raised several concerns and questions about public safety and emergency preparedness.⁷³ In some cases, the proposed pipeline route passes not only within residential areas, but within 50 feet of homes.⁷⁴ Several communities have expressed concern about local emergency response capacity to take on the additional burden of responding to pipeline-based emergencies. Many commenters have raised concerns about the need for first responder trainings in and around affected areas. Public safety is of paramount importance, thus the AGO urges FERC to include a rigorous analysis of these issues in the draft EIS and final EIS.

- **Public Health and Air Emissions**

Many residents, especially those living near proposed new compressor stations, have expressed concern over air emissions from the NED Project, including from pipeline blowdowns and compressor station blowdowns.⁷⁵ In its July 24, 2015 Resource Report, Tennessee Gas stated that "[d]etailed air emissions for the [newly proposed] compressor stations are not yet available."⁷⁶ FERC should condition any CPCN on Tennessee Gas making publically available all chemical constituents of transported gas. Tennessee Gas must ensure that those living within a mile of a compressor stations will

suffer no increased adverse health risk from blowdown or other emissions of criteria pollutant levels, including carbon monoxide, lead, nitrogen dioxide, ozone, particle pollution (both small particle, PM2.5, and large, PM10], and sulfur dioxide, as well as VOC emissions.⁷⁷

• **Property Values and Homeowners Insurance**

Property owners living near the preferred pipeline route, near proposed laterals, and near newly proposed compressor station locations are very concerned about the NED Project's effect on the value of their homes and property, which is often the single largest lifetime investment made by an individual or family.⁷⁸ These concerns include fears about home resale value and the cost or availability of adequate homeowners, property, or business insurance.⁷⁹ The AGO urges FERC to review and seriously consider all resident and business owner concerns about the NED Project's effect on property values, as well as the many concerns raised about the need for eminent domain takings for a pipeline proposal that may ultimately export a large amount of its transported gas capacity. The AGO encourages FERC to follow through on the commitment it made publically to contract for new research study analyzing natural gas pipeline effects on property values.⁸⁰ As FERC has acknowledged, existing studies cited by Tennessee Gas in its Resource Reports are old and outdated, and/or were commissioned by pipeline interests or by representatives of the natural gas industry.

• **Noise**

Many stakeholders have expressed serious concern about noise impacts on their homes and business from pipeline construction, operation and maintenance, including blowdown and other noise impacts from compressor stations.⁸¹ Increase in ambient noise levels resulting from the proposed project is an important consideration which FERC must fully address in any draft EIS and final EIS. MassDEP has established a Noise Level Policy for implementing Massachusetts law, 310 C.M.R. 7.10, regarding noise pollution. Namely, the ambient sound level, measured at the property line of the facility or at the nearest inhabited buildings, may not be increased by more than 10 decibels due to the sound from the facility during operating hours.⁸² Additional ambient noise has implications both for public health and for local wildlife. The current NED Resource Report on Air Quality and Noise is incomplete and missing data about decibel increases in ambient noise from proposed NED Project facilities.⁸³ These must be addressed in the draft and final EIS.

• **Environmental Justice communities**

Many stakeholders have raised concerns about the NED project's impacts on environmental justice communities, including lowincome rural communities in portions of Western Massachusetts.⁸⁴ The AGO urges FERC to review and seriously consider all stakeholder concerns about the NED Project's impact or disparate impact on environmental justice communities.

The AGO would like to thank FERC for the opportunity to submit these scoping comments for the NED Project.

Respectfully submitted,
Melissa A. Hoffer,
Chief, Energy and Environment Bureau,
Christophe Courchesne,
Chief, Environmental Protection Division,
Matthew Ireland,
Assistant Attorney General, Environmental Protection Division

 - 26 See Council on Environmental Quality, Final Guidance for Effective Use of Programmatic NEPA Reviews (“CEQ NEPA Guidance”), Federal Register, Vol. 79, No. 246, Dec. 23, 2014, at 14, <http://www.gpo.gov/fdsys/pkg/FR-2014-12-23/pdf/2014-30034.pdf>, attached as “Exhibit 8.”
 - 27 The administrative guidance for how the Commission evaluates natural gas pipeline proposalsits Certificate Policy Statement-does not speak to the potential use of a combined EIS. See Certification of New Interstate Natural Gas Pipeline Facilities, 88 FERC ,-r 61,227 (1999), clarified, 90 FERC ,-r 61,128 (2000), further clarified, 92 FERC ,-r 61,094 (2000) (UFERC Certificate Policy Statement”). The AGO urges FERC to utilize its considerable flexibility and discretion under the FERC Certificate Policy Statement to undertake a combined EIS in these specific circumstances.
 - 28 As discussed further in Section IV, *infra*, Tennessee Gas has not yet filed an application for the NED Project, and must first reply to all scoping comments and answer FERC’s October 8, 2015, request for information and comments on Tennessee Gas’s July 24, 2015 Draft Resource Reports. Likewise, applications have not been filed for Spectra’s Atlantic Bridge project, which is currently in pre-filing; Spectra’s Access Northeast project, which Spectra has announced will enter pre-filing this year; or PN GTS’s Continent-to-Coast project, which may enter pre-filing soon. The Atlantic Bridge, Access Northeast, and Continent-to-Coast projects are proposed along existing pipelines and therefore are unlikely to require the level of environmental analysis that the NED Project will require.
 - 29 See also CEQ Executive Office of the President, Memorandum to Agencies, Forty Most Asked Questions Concerning CEQ’s National Environmental Policy Act, 2a. A, at <http://energy.gov/sites/prod/files/GCEQ-40Questions.pdf> (“In determining the scope of alternatives to be considered, the emphasis is on what is ‘reasonable’ rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant”) (emphasis added).
 - 30 See, e.g. AIM Final EIS, Volume I, Docket No. CP14-96-000, “Alternatives Considered,” p. ES-9-10.
 - 31 In its October 8, 2015 request for information, FERC noted that much of the stillmissing data had been previously requested in FERC’s May 15, 2015 request for information.

- 32 Stakeholders across Massachusetts and New England have filed thousands of comments with FERC that carefully analyze the NED Project's impacts on specific resource areas, raising multiple questions and concerns regarding the Project's preferred pipeline route and laterals, compressor station locations, and other Project components and alternatives. FERC should carefully and thoroughly consider all of these comments as part of its NEPA review.

- 34 *Id.* at 150151.
- 35 See also *Breary v. Fagan*, 447 Mass. 68, 74 [2006] [the restrictions established by M.G.L. c. 184 § 31 were "explicitly designed to supplant... commonlaw rules with clearer, more definitive, and more efficient methods of resolving the enforceability of land restrictions"].
- 36 See also M.G.L. c. 44B, § 12 [a], which authorizes municipalities to appropriate funds for purchase of open space "community preservation" lands so long as the parcels are encumbered by conservation restrictions held by another government entity or nonprofit organization.
- 37 A two-thirds vote of the legislature allowing for dissolution of Article 97 protections may be required for geotechnical surveys that require soil boring or excavation work, or for any other land surveys or evaluations that require vegetation disturbance, destruction or removal. Such invasive surveys may also violate specific provisions of conservation restrictions and may also require compliance with Article 97 procedural and substantive requirements.
- 38 See RR 8, 895 897 [noting information about impacted conservation land from state and local government, private land trusts, other conservation organizations and private property owners, and further noting that Tennessee Gas "is still in the process of determining title and compiling a complete list of all Article 97 lands"]. Other stakeholders have noted that there are more than one hundred [100] protected conservation parcels impacted by the NED Project, more than eighty [80] of which are subject to Article 97 protection. See e.g. *Town of Ashby*, Massachusetts Conservation Commission Comments filed August 24, 2015, p. 2; *MassAudubon* comments filed with FERC on July 22, 2015.
- 39 See RR 8, 895.
- 40 See Article 97 Land Disposition Policy, EOEEA, February 19,1998, Section II, <http://www.mass.gov/eea/docs/eea/dcs/dcsarticle97.pdf>, attached as "Exhibit 9."
- 41 *Id.*
- 42 The Massachusetts Endangered Species Act ["MESA"] is administered and enforced by the Massachusetts Division of Fisheries and Wildlife's ["DEW"] Natural Heritage and Endangered Species Program ["NHESP"]. The NHESP maps Priority Habitat to screen proposed projects for the potential to cause a rare species "take" prohibited by MESA. See M.G.L. c. 131A, §§ 24, and 321 C.M.R. 10.11 10.25. See also RR 8, 89596. As discussed in Section IV D, *infra*, FERC should require that the NED Project fully comply with all substantive MESA statutory and regulatory requirements, including MESA's "take" prohibition, either by avoiding a prohibited take, by altering the NED Project with conditions allowing a take, or by full MESA conservation and management review and permitting.

- 64 See Ramon A. Alvarez, et al., Greater focus needed on methane leakage from natural gas infrastructure, *Proc. Nat'l Acad. Sci., U.S.A.*, vol. 109[1] (Apr. 24, 2012) at 6437, available at <http://www.pnas.org/content/109/17/6435> [last visited Oct. 15, 2015] ["new natural gas power plants produce net climate benefits relative to efficient, new coal plants using lowgassy coal on all time frames as long as leakage in the natural gas system is less than 3.2% from well through delivery at a power plant given limited current evidence, it is likely that leakage at individual natural gas well sites is high enough, when combined with leakage from downstream operations, to make the total leakage exceed the 3.2% threshold beyond which gas becomes worse for the climate than coal for at least some period of time,"]. See also Bob Howarth, *A bridge to nowhere: methane emissions and the greenhouse gas footprint of natural gas*. *Energy Sciences & Engineering*, Vol. 2, Issue 2 (May 2014), available at <http://onlinelibrary.wiley.com/doi/10.1002/ese3.35/full> [noting that "breakeven point" is 2.8%, not 3.2% using updated estimates for the radiative forcing of methane from the 2013 IPCC assessment, and further noting that if the uncertainty in the radiative forcing of methane of 30% or more is taken into account, this "breakeven" value becomes a range of 2.4—3.2%."] [citations omitted]. See also Stefan Schwietz et al., *Global Bottom-up Fossil Fuel Fugitive Methane and Ethane Emissions Inventory for Atmospheric Modeling*, *ACS Sustainable Chemistry & Engineering*, Vol. 2 Issue 8 [June 2014], available at <http://pubs.acs.org/doi/pdf/10.1021/sc500163h>.
- 65 Recent studies have scrutinized fugitive methane emissions from various sources of natural gas infrastructure, raising new concerns about greenhouse gas emissions. For instance, a recent study found that fugitive methane emissions from natural gas gathering facilities are approximately eight times higher than EPA estimates. See *Environ. Sci. Technol.*, 2015, 49 [17], pp 1071810727 <http://pubs.acs.org/doi/abs/10.1021/acs.est.5b02275>. Natural gas leaks from aging urban infrastructure are also a major problem. A recent study from the Proceedings of the National Academy of Science [PNAS] found that fugitive natural gas emissions in Boston are two to three times larger than predicted by existing inventory methodologies and industry reports, suggesting that natural gas consuming regions may be larger sources of climate impacting methane emissions than is currently estimated. See PNAS, *Methane Emissions from Natural Gas Infrastructure in the Urban Region of Boston, MA*, December 12, 2014, <http://www.pnas.org/content/112/7/1941.full>, last visited Oct. 10, 2015].

NH AUDUBON

Protecting our environment since 1914

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Room 1A
Washington, D.C. 20426

Dear Secretary Bose

I write on behalf of the Audubon Society of New Hampshire in regard to the Notice of Intent to Prepare an Environmental Impact Statement (EIS) for Docket No. PF14-22-000, the Northeast Energy Direct Project. We are a statewide, nongovernmental organization dedicated to protecting New Hampshire’s environment for wildlife and for people. My staff has reviewed the information provided in the July 15 Draft Environmental Report, and I am pleased to provide the following scoping comments.

Our comments focus on the following topics:

- Impacts to wildlife and habitats
- Impacts to wetlands and water bodies
- Impacts to protected conservation lands
- Project need in light of regional context

Impacts to wildlife and habitats

- Resource Report 3 (footnote p. 3-2) indicates that proposed impacts on fish, wildlife, and other sensitive resources are based on assumed overlaps of construction workspace and permanent easements with existing power-line rights-of-way (ROWs). However, to our knowledge these overlaps have not yet been negotiated with the affected utility companies. Such overlaps would substantially lessen the need for clearing new ROW and construction workspace, and thereby lessen impacts on wildlife habitat. In your analysis of impacts to wildlife and wildlife habitats associated with the “preferred” alternative, we request that you provide both a best case estimate of potential impacts on wildlife and

wildlife habitat, assuming that all proposed ROW overlaps are implemented, and a worst case estimate assuming that no ROW overlap agreements are approved.

- Table 3.2-1 is entitled “Common Wildlife Species Occurring in Major Habitat Types Crossed by the Project.” This list is inconsistent with Table 3.4-8 and incomplete. Many common species are absent from this list, while a number of uncommon species are included, as are several introduced species. Some species (e.g. Bay-breasted Warbler, Great Cormorant) are included whose presence within the project area is highly unlikely, while others (e.g., American Black Duck, Black-throated Blue Warbler) which are quite likely to occur within the project area are excluded from the list. In addition, no information is provided for mammals, reptiles, amphibians, or invertebrates of conservation concern, despite their inclusion in Table 3.4-8, “Locations and Timing of Pending Species-Specific Biological Surveys Associated with the Project.” We request that FERC prepare a comprehensive list of native fish and wildlife species occurring in major habitat types crossed by any considered alternative, with an additional column indicating whether or not each species is considered a species of conservation concern in an affected state (and thus included on a separate list of pertinent species. Introduced species (e.g. house mouse, rock dove) need not be included. Providing lists in alphabetical order by common name, rather than alphabetical order by scientific name, would greatly enhance the ability of wildlife professionals and the public to review this information efficiently.
- The proposed ROW of the Haverhill Lateral crosses wetlands associated with World’s End Pond in Salem, New Hampshire. This wetland complex is extremely important to migrating waterfowl and shorebirds, and supports an unusual diversity of bird species. To date, observers have documented 170 avian species at this location, including 17 species of waterfowl and eight species of shorebirds. World’s End Pond is also the only known breeding location in New Hampshire for Least Bittern, a Species of Special Concern in the state. Construction activities within these wetlands are likely to negatively impact breeding and migration use of this area, and to result in long-term impacts on hydrology and water quality. We strongly recommend that the DE IS include an alternative that completely avoids impacts to the wetlands associated with World’s End Pond.
- Resource Report 3 (p. 3-14) indicates that the proposed project includes 36 pipeline and 8 access road crossings of streams that support cold water fisheries (CWF). We request that the following information be provided for such streams for all alternatives considered in the DEIS:
 - o Thorough analysis of route alternatives to avoid each pipeline crossing
 - o Number of access road crossings on existing roads and class of said roads
 - o Number of access road crossings requiring new construction
 - o Status of CW populations in affected streams
 - o Habitat conditions extending a minimum of two stream widths above and below center line of crossing (bottom substrate, longitudinal profile, channel pattern)
 - o Minimum and maximum flows for affected stream reach
- Resource Report 2 discusses impacts to floodplains in the context of impacts to flood storage area. Floodplains provide unique and important habitat for wildlife, including some sensitive species. We request that the DEIS address the extent of clearing in floodplain forest associated with each considered alternative.

Impacts to wetlands and water bodies

- While power lines can span the majority of wetlands and water bodies with little or no impacts to aquatic or riparian ecosystems, pipeline burial requires modification of every wetland, water body, and riparian area crossed. Table 2.3-8 indicates nearly 55 acres of wetland impact within New Hampshire, including approximately 13 acres of emergent, 16 acres of forested, and 13 acres of scrub-shrub wetlands as

classified by the National Wetlands Inventory. Trenching across wetlands results in long-term impacts to wetland vegetation and hydrology, both of which have important implications for wildlife habitat. Pipeline sections in ephemeral wetlands and at wetland edges subject to repeated wet/dry cycles are particularly vulnerable to corrosion, and may require more frequent maintenance than sections in drier locations. For these reasons, we urge that the DEIS include alternatives that substantially reduce wetland crossings. We further urge that the DEIS address long-term impacts of wetland crossings on wildlife and wildlife habitat.

- Table 2.2-2 indicate that the proposed route across New Hampshire includes 55 perennial and 27 intermittent stream crossings, affecting 5,118 ft of stream. No details are available as yet regarding crossing methods at specific locations. Open-cut crossings requiring hard nonnative erosion control structures will result in long-term changes to riparian and in-stream habitat conditions. We urge that the DEIS include alternatives that minimize perennial stream crossings, and provide information on current stream-bank conditions (e.g. slope, height, vegetation of bank) at proposed crossings for each alternative considered. We request that the following information be provided for perennial streams for all alternatives considered in the DEIS:
 - o Thorough analysis of route alternatives to avoid each pipeline crossing
 - o Status of fisheries in affected streams
 - o Known or potential occurrence of fish, reptile, and amphibian species of conservation concern in affected streams
 - o Habitat conditions extending a minimum of two stream widths above and below center line of crossing (bottom substrate, longitudinal profile, channel pattern)
 - o Minimum and maximum flows for affected stream reach
- National Wetlands Inventory Data for southern New Hampshire was last revised in 2001, and many changes are likely to have occurred since that time. We strongly recommend that more recent hydrologic data be used in analysis of stream and wetland impacts.

Impacts to Protected Conservation lands

- The proposed project route crosses 37 tracts of protected conservation land, including state, municipal, and non-governmental organization ownerships. Crossing distances range from less than 100 feet (six cases) to more than 1000 feet (11 cases). These lands were originally acquired to protect important natural resource and recreational values for future generations. In many cases, easements or deed restrictions preclude the development or industrial use represented by a pipeline. We request that the DEIS include alternatives that avoid impacts to protected conservation lands.
- The proposed project route crosses New Hampshire Audubon's 75-acre Ponemah Bog Wildlife Sanctuary in Amherst, New Hampshire. We understand that the applicant and local residents have proposed alternative routes through the Town, and that the Board of Selectmen has submitted comments supporting an alternative that incorporates Option 1 proposed by Kinder Morgan and Alternative 2 proposed by Alice and Kenneth J. Bury. We request that this proposal be considered in the DEIS.

Project need in light of regional context

We are aware that energy demand, supply, and delivery in the Northeast are rather dynamic at the present time, with several major infrastructure projects in various stages of proposal and review. We strongly support regional transition to a more efficient and lower-carbon energy market that is both environmentally responsible and affordable for consumers. We urge FERC to consider the environmental costs and public benefits of the Northeast Energy Direct project in the context of all available supply and demand projections and proposals and make all possible effort to ensure that approved infrastructure projects are adequate, but not excessive for meeting regional needs.

We appreciate your attention to our concerns regarding this project.

Sincerely,
Carol R. Foss
Senior Advisor for Science and Policy

20151019-5134

Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Northeast Energy Direct Project, Docket Number: PF14-22

I am protesting against the construction of the NED Pipeline through New Hampshire and specifically through the town of Milford for the following reasons:

FERC has failed to provide conclusive proof that a public benefit can even be achieved. The public benefits are not guaranteed for NH residents. Prices for electricity may even increase.

The project is that of a private company, Kinder Morgan, which intends to sell fracked gas to countries abroad. There is nothing wrong with this idea if the company would pay for transportation of the gas to the next harbor. But why pay for transportation, if there is a way to make the general public pay for it?

The US government has implemented a mechanism that a company can take advantage of to make such big pipeline projects happen. How does it work? The company has to prove that there is a public interest for the pipeline running through the backyards of thousands of Americans across land that the company does not own. If the company is successful it can acquire the land from stubborn homeowners by eminent domain. The cost models FERC uses to determine if there is a public interest have not been disclosed and therefore whatever is said about public benefits is most likely a lie, based on fabricated, incomplete, incorrect, inappropriate or negligent assumptions that favor the construction of the pipeline. We do not know if the input data used to model the economic impact of the project were relevant in the first place. We do not know if alternatives have been studied with the same effort as the pipeline project. FERC has failed to publish a conclusive model that can be challenged by a third party. Therefore there is no pipeline project to begin with.

Conclusion: (i) FERC has failed to prove that there is a public benefit and consequently has to stop the pipeline project until such data are provided and have been reviewed. (ii) FERC has to reveal the criteria defining public interest. (iii) Since NH residents would pay for the pipeline, FERC has to prove specifically that there is a benefit for NH residents. (iv) The studies that must have been carried out about alternative strategies to secure the energy supply of the NE states have to be published.

It is intentionally misleading that in glossy brochures about the NED pipeline the gas running through it is touted natural gas. That is not true as it is fracked natural gas laden with undisclosed chemicals in undisclosed concentrations. Since it is unregulated, nobody knows what impact those chemicals will have on the environment and health of exposed residents.

At this point I would like the commissioners to picture their own homes for a moment, and the beautiful and safe neighborhood in which it is located. Now picture the construction crew that comes and puts a nice pipeline right through your property. You are smart enough to know that it will explode. You do not know, however, where and when. It could happen right at your house. It could happen when your grandkids play in the backyard while you are at work. That's why you want to move to another place far away from any pipeline. What about the value of your house? Who do you think will be the buyer? A person equally smart and educated about the risks as you are, who could afford to pay the asking price? Not likely. So you have to drop the price. By how much, nobody knows. For homeowners in New Hampshire this is reality. There will be a price to pay for living close to the pipeline. Unfortunately, the homeowners will not be compensated appropriately for the financial loss. On top of that they will have to pay the same fee as everybody else for the construction of the pipeline and its maintenance. That is not American. I am sure that many lawsuits will be filed based on this injustice.

Dear commissioners, it will be on your conscience if an unneeded pipeline leads to disaster with casualties, financial hardships, loss of homes, and the destruction of the environment. Let us pray that this will never happen. But if it does, I cannot imagine the pain that will overwhelm you knowing that you could have prevented it had you only done the right thing. For your own piece of mind I encourage you to pray every day that there actually is a public benefit from the pipeline. You may also want to remind yourself every day that fracked gas is an inappropriate fuel as it is dirty and carries the risk of making people sick from the toxins it carries. Within ten years nobody will even talk about dirty fuel any more. The pipeline, if ever built, will become obsolete sooner than expected and with it the public benefits that yet have to be proven to exist. We will remember who was responsible for the approval: Tony Clark, Cheryl A. LaFleur, Norman C. Bay, Philip

D. Moeller, Colette D. Honorable.

Like most Granite Staters, I have a private well. A massive project to bury a pipeline of this size may have a catastrophic impact on the productivity of the well and the quality of the water. In order to keep my permit of occupancy, I have to have a functioning well. Should my well dry out during the construction of the pipeline, a new well has to be drilled. I will not pay for it.

Conclusion: FERC must ensure that all wells along the pipeline that could be affected are protected. The protected area is defined by the geology of the aquifers that feed the wells. A geological study has to be carried out by at least two independent companies. After completion of the pipeline the water quality has to be tested every 6 months in perpetuity or as long as the pipeline exists by a randomly selected test company at the expense of the pipeline owner

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

RE: Docket PF14-22-000

Dear Secretary Bose,

As you evaluate the Northeast Energy Direct (NED) project, I request that particular consideration be paid to the following issues:

ASSESSMENT OF ALTERNATIVES

- Resource Report 10 does not adequately assess alternatives to NED. Advantages of alternatives are ignored; disadvantages of NED are understated. The public deserves nothing less than an independent, complete and accurate assessment of all alternatives, including the 'no build' option, and a comprehensive cost/benefit comparison of alternatives.
- Analysis of alternative solutions must not be segmented. We are told time and again that New Hampshire must not look at our state's needs in isolation (the fact that we produce 40% more electricity than we use; the fact that only 19% of our energy is produced by natural gas, and so on), we must always consider our state as part of the New England region. If that's true, then surely when we assess solutions we must look at all potential solutions being proposed in our entire region and consider their effects as a whole.
- It must be proven that NED supports the goals set forth in the New Hampshire 10-Year State Energy Strategy, prepared by the New Hampshire Office of Energy and Planning, published in September 2014 and endorsed by Governor Hassan. That well-researched policy focuses on grid modernization and other forward-thinking strategies. Strapping New England to 20th century technologies will hamper our growth in the 21st century.

ENVIRONMENTAL IMPACTS

The Town of Merrimack is at a disadvantage when requesting that specific issues be addressed in the Environmental Impact Statement (EIS), because the applicant has proposed several routes through our town and we have no idea which route will be ultimately selected. I respectfully request, therefore, that the following issues be thoroughly addressed in the Environmental Impact Statement (EIS) for all properties along the various proposed pipeline routes:

- Impacts to wildlife during the construction, operation, and maintenance of the pipeline, including specific reference to all lifecycle stages, such as mating and gestation areas and migration requirements. All terrestrial and aquatic plant and animal life must be identified and included in the studies.

- Impacts to wetlands during the construction, operation, and maintenance of the pipeline. All wetlands, including vernal pools, ponds, streams, uplands surrounding wetlands, and so on, must be identified and included in the studies.
- Specific information on the use of non-mechanical means of vegetation control (e.g., chemical defoliants and herbicides), including responsibility for monitoring for chemical use and corrective action that will be taken if agreements with property owners are not adhered to.
- Specific information on air and water quality, based on studies before, during, and after construction, within a one-mile radius of the meter station being proposed for Merrimack. Studies must include all components that may be released, including VOCs, radon, particulate matter, and so on. The results of pre-construction tests, and a specific plan for ongoing monitoring and notification, must be included in the EIS.

SAFETY

Industry wisdom seems to be that natural gas transmission pipelines are extremely safe, but recent PHMSA data calls that wisdom into question. Please address the following:

- Data suggests that natural gas transmission lines built within in the last 10 years have a worse failure rate than pipes built at any other time in the last 50 years. Please describe this data at length, and detail how NED will avoid all pitfalls that have caused pipeline safety to be compromised.
- Extreme temperatures have an effect on pipelines. Please ensure that the EIS includes detailed information specific to New Hampshire, such as extremes of temperature, expected maximum depth of frost, impact of frost heaves on the pipeline, case studies of pipelines in a similar topography and climate, and so on.

Thank you for your careful attention to these requirements.

Sincerely,

Debra Huffman
Merrimack, NH

RE: Northeast Energy Direct Project, Docket, N. PF-14-22-000

Dear Ms Bose and To Whom It May Concern,

I write today as a concerned citizen to comment on the proposed Northeast Energy Direct Project (NED) and to ask the committee to weigh the many negative effects of this plan to take people's homes, land and livelihood to serve a poorly justified and possibly nonexistent public need. The considerations I see are the following:

The large capacity pipeline is not needed. There is no substantial shortage of gas in New England at present and in the next decade or more. Such small shortage as exists can be met with smaller projects already in development and/or can be alleviated by the robust conservation efforts and alternative sources increasingly being developed in the New England. Only the developers would benefit. Moreover, the people of

New Hampshire whose land would be taken would potentially pay higher fees to their electricity provider if markets for the pipeline gas are not found.

The proposed pipeline would cause damage to the environment and significant health hazards during the construction process and forever after. Health hazards would be extreme for people living or attending school near power stations. There is no commitment to remove the pipeline and restore the land when its relatively short useable life ends, and thus the benefits of the land would be lost for future generations.

As was obvious at public hearings, entire communities across New Hampshire are united in opposing the proposed plan. At the hearing I attended (Rindge NH), a more dramatic display of involved concerned articulate citizens opposing the plan would be hard to image. How can the proposal possibly be considered a public necessity?

Although I wrote that this message comes from “a concerned citizen”, it is also that of a confirmed and long-time admirer of New England, of its land, its history and its people. Although not originally from the region, I have regularly visited southern New Hampshire for several decades. It is a wonderful part of our nation, rich in history with a varied landscape that has been a welcoming host to city visitors since the early 1800’s. Foreign guests (from England, Germany, Russia, China) who sometimes join me on these visits are amazed that we have access to such beautiful land within easy reach of a coastal city. For my part, I rejoiced when those proposing the Pipeline dropped their threatened route through Massachusetts, but the circuitous route through New Hampshire that was quickly substituted is potentially far more damaging.

Sincerely,

Eileen Remold

20151019-5214

Reginold Brown, Belkshire Rd, NY.

It is a good job for our members in our local and we really need the jobs badly. Please help us to retain this work so we can pa our bills. Thank you.

20151019-5216

Rodney Padden, Andover, NY.

Instead of running good job opportunities out of this state. How about we start creating good paying jobs local to this area and once great state like the NED project. Please help.

20151019-5223

Robin Slaby, Little Sioux, NY.

This job would be very good for our communities and the Unions will be able to man it with good skilled trained guys from our areas Locals. Thank you very much.

20151019-5224

Robin Slaby, Little Sioux, IN.

We really need this project so we can pay our bills and not move out of state. Thanks

20151019-5225

Kevin Moore, Lindley, NY.

I have been a pipeliner for many years. I have witnessed first hand the benefits of the building pipelines in our areas. Things that come along with pipelines are good paying jobs, full motels and campgrounds, business for local stores, restaraunts. No matter how you look at it there are more pros than cons for having a pipeline in your area. please we need these jobs badly. Thank you.

20151019-5226

Micheal B Riley, Scipio Center Ed, NY.

Come on! Good, Clean Cheap energy for the northeast? Its a no brainer, good labor good pay that goes back into the communities. I fully support the Northeast Energy Project for the near future until such time where alternative energy becomes as cheap and efficient as natural gas, coal, and oil and I don't see that coming anytime soon. Thank you.

20151019-5227

David Marsh, Alpine, NY.

As a life long resident of the southern Tier of NY. I am concerned about the loss of jobs and lack of private investment in the area. The Northeast Energy Project Direct will create good job demand and will create a source of long term tax revenue for the southern Tier. I urge the ferc commission to approve this project.

20151019-5231

{ duplicate copy of 20151019-5094 above }

20151019-5286

Donna Dailey, Merrimack, NH.

I am writing to express my strong opposition & concern regarding the proposed pipeline in my neighborhood of Merrimack, NH. I am against having the pipeline installed in NH, especially the proposed route which is near my house & my daughter's school. I believe the risks greatly outweigh any perceived benefits.

The project ends in MA & should not be routed through NH.

Thank you for your consideration,

Tom & Donna Dailey

Chairman Norman Bay

Federal Energy Regulatory Commission

888 First Street, NE

Washington, DC 20426

Re: The Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000 Northeast Energy
Direct Project

Dear Chairman Bay,

I write today regarding the Northeast Energy Direct Project, a natural gas pipeline proposed by the Tennessee Gas Pipeline Company, L.L.C. As you know, 15 miles of the project are proposed to be constructed in Connecticut and through a path predominately in the First Congressional District.

We can all agree on the need to bring affordable energy to the residents and businesses of Connecticut. At the same time, in doing so it is of the utmost importance to protect our land, natural environment, drinking water, recreational areas, and public health. I strongly urge the Commission to ensure this project is fully vetted, the costs and benefits are weighed, all alternatives are considered, and the concerns of the public are addressed. Particularly, a number of my constituents have expressed concerns that a portion of the pipeline route is proposed to go through Metropolitan District Commission (MDC) property which is the source of much of our region's drinking water. When considering whether to grant a certificate of public convenience and necessity for this project, I ask the Commission to take a particularly close look at any possible effects on public water supplies.

I will continue to monitor this project and I urge FERC to ensure that there are continued opportunities for robust public input going forward.

Sincerely

John B. Larson

MEMBER OF CONGRESS

20151020-0014

Congress of the United States

House of Representatives

Washington, DC 20515

Congresswoman Tsongas —FERC Scoping Meeting Statement

August 12, 2015-Lunenburg, MA

First, I would like to thank you for hosting this scoping meeting in my district today and I hope it is the first of several opportunities for the constituents I represent to provide their input.

I recognize FERC's challenging responsibility to ensure that our energy system is reliable and to minimize natural resource degradation in the face of a quickly changing energy market. Constituents and businesses across Massachusetts have had trouble absorbing the increasing cost of energy. And, there is agreement that the best solution to New England's energy issues will be through careful, long-term planning with significant public input. Meetings like this begin to provide the public with that opportunity.

I also appreciate the opportunity to continue my office's dialogue with FERC and to share directly with you some of the foremost concerns brought to me by my constituents, hundreds of whom have contacted me about this proposal, concerns that I share and believe must be taken seriously by the regulators reviewing this proposal.

As I am sure you will hear tonight, there are many concerns with the impact this proposed pipeline will have on the environment and the surrounding ecology. My constituents and I have worked hard to preserve our diverse and historic Massachusetts landscape and I value the long determined and valued by so many of the communities I represent, so that future generations can enjoy our cherished landscape well into the future. We must protect our historic farmland as it is rooted in New England's character, heritage, and economy; being both an important source of income for local families and integral to the historic New England landscape. Environmental protections should be held to the strictest of standards for this proposed project. We know how precious and vital our wetlands, state and local conservation land, threatened and vulnerable species, and watersheds are to our own quality of life and the ecology surrounding us. A lesson hard learned from New England's industrial past. We have made significant progress cleaning up our rivers and restoring habitats. To see this work progress would be devastating. Questions such as, Does drilling a pipeline cross-

ing rivers such as the Nashua River, currently being studied for Wild gt Scenic status by the Depsrtnel of interior, agitate Eeiiled pollutants'? How will construction and alterations to the hydrology ofthe headwaters of the Squannacook River impact our water resources? How will farmers bc compensated for loss of future crop production? And, how temponuy is "minimal impacP? IINse questions should be thoroughly exploml.

Homeowners are understandably concerned with how the pipeline might affect individual property values. A house is an investment for one's family and for a futme generation. As pipelines are sited near reidence, how will homeowners be compensated for potential loss in property value even iftheir property is not directly impacted? I have heard the very reasonable concern that pmperty owners both directly and indirectly impacted by the construction and mute ofthe pipehne may see the value of their property decrease, only to see the gas ultimately movhqt thughb the pipeline exported overseas, with no benefit to the community serving as its host. How is a community compensated for loss in property value, especially when they are not serviced by natural gas but ere simply hosting a portion ofthe mainline? How will FERC know the company has made every effort to avoid utiiliing eminent domain'2 How will public need be determined ifthere is the slightest potential to export natural gas'2

Residents are also concerned with the public safety risks Som potential accidents, a reality we must confiuat with honesty and transparency. While remote technology has impmved dramatically in the last few decades, can residents living near a remotely manned compressor station feel at ease? What measures will be taken to ensure that disruption ofthe gmund while drilling, blasting, and laying pipe will not negatively affect the wells that so many ofmy constituents depend on for drinking water? WIII there be constant monitoring ofthe gmundwater in residential areas that depend on wells?

I have also head concerns regarding the process with which this project has proceeded. Contact with local town offtciah best able to identify local concerns has not gone as smoothly as desired. For example, local officials were not the first parties contacted, but instead discovered an energy company was proposing to build a massive irdrastructure project from their own constituents. Them have also been many concerns with the speed with which public meetings have been scheduled without providing complete Resource Reports in advance. For example, in the most recent release, tlousands of"To Be Determineds" were noted thugh-out the report. As is the case with very large infmstruciure projects there will be constantly changing information and this process is in the early sieges, however, I fail to sce how my constituents can comment as informed citizens with so many unknowns.

Additionally, I would like io ask thai FERC consider viewing the numerous natumi gas pipeline projects pending or appmved in the New England region in a holistic manner to ensure thai we are not overbuilding our pipeline infnstructure for domestic need. As a country, we have made a commitment io building a renewable future and not reducing the competitiveness of solar, wind, hydropower, and other alternative sources in fitvor ofadditional pipeline infmstrucurL Accordingly, would FDRC consider a "no4uiki" option, instead considering the option to repair our existing pipeline infrastructure io answer our region's energy needs?

Also, knowing that the Massachusetts Attorney Genmul's office is conducting a study to determine regional pipeline infrastructure need, to be released in October 2015, I ask in advance that this study be given consid-eration in FERC's decision.

I respectfully request consideration ofthese questions raised by my constituents closely and carefully befrom deciding. And, I would like to request additional FERC scoping meetings to be held in the early months of fidi in locations that have not yet hosted scoping meetings to give my constituents further opportunities to review and provide input on this project. Thank you again, FERC, for hosting these scoping sessions and pmviding me with this opportunity to present the concerns my constituents have brought to me.

I look forward to yow responses and to continuing this dialogue on behalf ofthe Third Congressional Dis-trict.

Sincerely,

Niki Tsongas

Member of Congress

20151020-0021

Ms. Kimberly D. Bose
Secretary, Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

Dear Ms. Bose,

We are writing you to voice our concerns regarding the “Lynnfield Lateral” pipeline proposed by Kinder Morgan/Tennessee Gas. We lived in Lynnfield on Timberhill Lane for a period of fourteen years when our children were growing up. During that time there was a huge gas explosion that ran through Timberhill Lane. Friends of ours, the Kelley’s on Edgemere Road, were in the path and their house was very badly damaged. It was a miracle that no one got hurt. This was during the night and the whole South Lynnfield neighborhood had to be evacuated. Since then, there have been many leaks in various underground pipelines in town.

My daughter, husband and three boys purchased a home on North Hill Drive in Lynnfield just a year ago. Theirs is one of the homes in Lynnfield most affected by the pipeline since it goes right through their property. They do have an easement there, however, it is solely electrical for above ground equipment. Nothing about underground gas lines. How are we and our children ever going to skrep weI if that pipeline goes in, not to mention that the boys will lose their play area, all the trees on the side of their property and the possible danger from the chemicals that will be put down to stunt grass growth above the pipeline.

One of the most frustrating aspects of this situation is that is doesn’t benefit any of the communities begin affected. The main benefIciary is Kinder Morgan/Tennessee Gas. Please consider carefully the families everywhere that will be affected when you make this critical decision.

Thank you,

Douglas and Myra Vernon

**NRPC
NASHUA REGIONAL PLANNING COMMISSION**

October 15, 2015

Kimberly D. Bose,
Secretary Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

Comments of the Nashua Regional Planning Commission, Merrimack NH

Re: Tennessee Gas Pipeline Company, LL.C. (“TGP”)

Dear Ms. Bose:

The Nashua Regional Planning Commission (NRPC) serves 13 municipalities in southern New Hampshire, including Nashua, Hudson, Amherst, Brookline, Hollis, Litchfield, Lyndeborough, Mason, Merrimack, Milford, Mont Vernon, Pelham, and Wilton. The Commission focuses on developing and implementing innovative planning strategies that preserve and improve the quality of life of the residents and is dedicated to promoting the orderly development of the region.

Nine of the 13 NRPC member communities are directly impacted by the Proposed Northeast Energy Direct (MNEDM) pipeline. Many of these communities have taken a position or made a public statement to oppose the proposed pipeline. NRPC needs to obtain more information to help our communities to evaluate risks and potential benefits of the NED proposal and impacts to the orderly development of the region. Attached please find a copy of the NRPC “Status Report and Summary of Findings as of September 16, 2015 Relative to The Proposed Northeast Energy Direct Pipeline” which sets forth some of the issues that we believe must be addressed by Kinder Morgan and considered by FERC going forward. In addition, we respectfully request the project applicant address and FERC consider the following questions and concerns.

1. The proposed co-location of the pipeline in Pelham and Hudson, New Hampshire is in direct conflict with an approved expansion of Eversource electric transmission lines known as the Merrimack Valley Reliability project. please have Kinder Morgan provide alignment sheets or other design drawing that describe exactly how the pipeline will be “co-located along the permanent electric utility right-of-way as it will be laid out to accommodate the Merrimack Valley Reliability Project.
2. Please have Kinder Morgan quantify the reduction in electric rates that residential, commercial and industrial consumers will realize should the proposed project go online. In addition, please have Kinder Morgan evaluate implications of the reduced electric rates in attracting economic development. Particular attention should be paid as to how well New Hampshire will compete with other areas of the country, in terms of lower energy costs, due to the presence of additional natural gas supplies in the region.
3. Please have Kinder Morgan justify the need for a lateral through the town of Mason, New Hampshire. The proposed lateral is intended to provide gas to the Fitchburg Massachusetts area, however it is our understanding that no end-customer has committed to purchasing the gas at this time. NRPC strongly urges FERC to require that Kinder Morgan justify in detail this lateral or see that gas needs in the Fitchburg area are met through other projects in Massachusetts. NR pC further requests that Kinder Morgan justify the need to locate this lateral through undisturbed land as opposed to existing right of ways through the area.
4. Require Kinder Morgan to provide a detailed assessment of the ability of localemergency services to respond to incidents involving gas pipeline facilities, and to outline resources needed to keep their training, supplies and equipment up to an adequate standard to respond to those incidents.
5. Kinder Morgan should quantify and FERC should consider the direct economic benefits to the communities in New Hampshire along the proposed pipeline route. For instance, in Hillsborough County, NH the proposed pipeline is anticipated to provide little benefit to the communities directly impacted since the region is largely unserved by natural gas supplies for home heating or businesses. To our knowledge, Liberty Utilities is the only LDC in NH that has contracted for capacity on the NED project. It has committed to purchase 115dekatherms per day from Kinder Morgan which represents only approximately 8.8%of the 1.3 Bcf/day of pipeline capacity.
6. Kinder Morgan should provide and FERC should consider a detailed analysis of the tax revenue impacts as a result of the construction of the pipeline. The methodology utilized for developing the revenue figures should be clearly explained.
7. The proposed pipeline would cross a variety of types of roadways, including unmaintained “Class

VI” roads. While “Class VI” roads in New Hampshire are not maintained, it is critical that they not be viewed as “not used”. Any roadways in NH, including those classified as “Class VI” can be - and in some cases are regularly - used by fully-loaded logging trucks which are of substantial weight. The NRPC concurs with the 15 towns of the NH Municipal Pipeline Coalition and request’s FERC require that Kinder Morgan:

- Use construction techniques across all roadways in New Hampshire, including all unmaintained “Class VI” roads that will account for the heavy loads presented by logging trucks or emergency vehicles.
- We ask that, at a minimum, this includes using pipe under all roadways consistent with that required of a state road.

8. Finally, the NRPC requests Kinder Morgan provide and FERC consider a thorough explanation of the need for the project and the justification for the project to be located in New Hampshire.

Given the unprecedented scale of the project and magnitude of potential impacts to the region the NRPC respectfully requests a response to the questions and comments outlined in this letter.

Sincerely,

NASHUA REGIONAL PLANNING COMMISSION

Re: Tennessee Gas Pipeline Company

Air and Groundwater Emissions

Northeast Energy Direct (“NED”) Project

Market Path Mid Station 4 Compressor Station

Dear Ms. Miller:

It was a pleasure meeting you at the Tennessee Gas Pipeline Company, L.L.C.’s (Tennessee) open house meeting on September 9, 2015 in New Ipswich, New Hampshire. At the open house meeting, you expressed concern over the potential air and groundwater impacts of the above referenced proposed compressor station. In addition to the discussion of your concerns at the open house meeting, Tennessee wanted to follow-up in writing to provide you with more detailed information, and to provide references that are available to assist you in researching answers to your concerns.

Air Emissions

As part of Tennessee's pre-filing proceeding for the NED Project, a second draft of the Environmental Report ("Draft ER") was prepared and filed with the Federal Energy Regulatory Commission ("FERC") on July 24, 2015. Air emissions related to construction and operation of the NED Project, including new compressor stations, are addressed in Resource Report 9 of the draft ER ("Resource Report 9"), which can be downloaded from the FERC website (www.ferc.gov), eLibrary, under Docket No. PF14-22-000.

In summary, Resource Report 9 notes that the U.S. Environmental Protection Agency ("USEPA") has promulgated National Ambient Air Quality Standards ("NAAQS") to protect human health and welfare. The NAAQS include primary standards which are designed to protect human health, including the health of sensitive subpopulations such as children, the elderly and those with chronic respiratory problems. The NAAQS also include secondary standards designed to protect public welfare, including economic interests, visibility, vegetation, animal species, and other concerns not related to human health.

The NAAQS currently apply to the following criteria pollutants:

- Sulfur dioxide
- Particulate matter with a nominal aerodynamic diameter of 10 microns or less
- Particulate matter with a nominal aerodynamic diameter of 2.5 microns or less
- Nitrogen dioxide
- Carbon monoxide
- Ozone
- Lead

Resource Report 9 outlines the NAAQS standards for each of these criteria pollutants. Equipment installed as part of the above-referenced proposed compressor station will be subject to the New Source Review ("NSR") permitting process. This NSR permitting process ensures that current NAAQS standards are not exceeded for the criteria pollutants listed above after installation of the proposed compressor station. Federal air quality requirements are contained in 40 CFR Parts 50 through 99. Standards of performance for stationary combustion turbines installed after February 18, 2005 are provided in 40 CFR Part 60 Subpart KKKK. Equipment installed by Tennessee as part of the NED Project will meet these performance standards.

While state and municipalities may adopt standards more stringent than NAAQS, the New Hampshire Department of Environmental Services has decided to adopt the NAAQS as promulgated by USEPA. In addition to the above requirements, stationary emissions sources such as industrial turbines would be subject to New Hampshire's air quality requirements contained in Env-A Chapters 100-4800 for facilities in New Hampshire.

The New Hampshire Department of Environmental Services ("NHDES") Air Quality Division ensures that all new projects located in the state will not cause an adverse impact to human health or the environment prior to issuing construction or operational permits.

It is also important to note that the natural gas that Tennessee transports in its existing pipeline system, and that it will transport through the NED Project facilities, is referred to as "pipeline quality" natural gas. Pipeline quality natural gas is the same natural gas that ultimately is consumed by the public, in homes, businesses, hospitals, schools, and other public institutions. This natural gas has already been treated and processed prior to its entry into the interstate pipeline network so the impurities have been removed. Benzenes and other hazardous air pollutants, that may be present as a result of production of the natural gas, have been removed prior to custody transfer into Tennessee's pipeline system.

Groundwater Impacts

Groundwater Impacts are addressed in Resource Report 2 of the Draft ER ("Resource Report 2"), which can be downloaded from the FERC website (www.ferc.gov), eLibrary, under Docket No. PF14-22-000.

As discussed in detail in Resource Report 2, NED Project construction and operation is not anticipated to have any major impacts on groundwater quality or supply (i.e., quantity). During construction, Tennessee will implement Best Management Practices ("BMPs") designed to avoid, reduce, and/or eliminate potential

impacts on groundwater, as detailed within the project Specific Environmental Construction Plans for the State of New Hampshire and Tennessee's Project-specific Plan and Procedures (which Plan and Procedures incorporate the FERC's Plan and Procedures (Draft ER, Volume II, Appendices J through N and Volume II, Appendix H, respectively). Other issues, including but not limited to, equipment refueling and lubrication, well and spring sampling, and potential blasting impacts on groundwater quality and/or quantity are address in Resource Report 2.

In terms of potential impact to groundwater quality that may result from operation of the proposed compressor station, there is also very little chance of groundwater impact. The only potential source of groundwater contamination would be the result of spills of liquids stored on the compressor site. However, only small quantities of liquids would be stored on site. The only source of liquids stored on site would be liquids produced from filtering or separators that result from pipe inspection and cleaning ("pigging") operations. Tennessee expects very small quantities of these liquids because the source natural gas is very dry, and as stated above, the natural gas being transported has already been treated and processed prior to its entry into the interstate pipeline network so the impurities have been removed. Benzenes and other pollutants that may be present as a result of production of the natural gas have been removed prior to custody transfer into Tennessee's pipeline system.

Tennessee hopes the above information is helpful and we want to thank you for taking the time to stop by our open house meeting in New Ipswich and sharing your concerns. If you have any questions or require additional information, please contact me at (860) 763-6033 or Jim.Hartman@kindetmoruan.com

Very truly yours,

James D. Hartman

Please do not approve this pipeline as it is NOT NEEDED in our area%. We have never had a gas shortage and Kinder Morgan wants to use this pipeline to go to Beverly, MA where it will be exported to Europe. Why do electric and gas rate payers have to pay for this profit making pipeline for Kinder Morgan. Existing pipelines have more than enough capacity for our area.

RE: Tennessee Gas Pipeline, LLC
Northeast Direct Project (NED)
Docket No. PF14-22

Dear Secretary Bose,

We are the School Board of the Mascenic District that serves New Ipswich and Greenville, New Hampshire. The Boynton Middle School that is located in New Ipswich is attended by children from both Greenville and New Ipswich. Our Middle School is located just about 1 1/2 miles from the 40,000 horse power compressor station that is proposed by the NED project. Our Boynton Middle School students use the outdoor sports facilities that are located just outside the 1 mile radius from the compressor station. Kinder Morgan/Tennessee Gas have left their options open regarding the size of this compressor station stating that it may increase to an 80,000 compressor station if necessary. We request that the Tennessee Gas Pipeline's FERC application be denied for the following reasons:

The emissions including numerous toxins from the compressor station are known to produce serious health effects. We know from the research that the emissions from a 40,000 horse power compressor station will easily pollute the air at the Boynton Middle School. We also are well aware that as the size of the compressor station increases so does the tonnage of emissions per year and the distance those emissions travel. As our staff and children spend countless hours during the school year at this close proximity, the air that they will be breathing will expose them to this polluted air that will be drawn into the

HV AC system. Any outside activities conducted at the school complex during the school year and summer breaks will further expose our children and staff. To reiterate, this contamination will expose our students and staff to a long list of chronic health issues. More and more research is appearing constantly regarding this exposure and its effects on health.

Throughout the school year, our Boynton Middle School sports teams use the sports facilities that are located just outside the 1 mile radius from the compressor station. Here again, the children and coaching staff will be exposed to the toxin air when participating in what should be "healthy" activities.

If FERC is considering approving the (NED) application, we request that FERC require the following:

Kinder Morgan/Tennessee Gas will pay for a pre-construction baseline health survey of the students and staff at the Boynton Middle School, conducted by professional public health practitioners. The commitment of the study will continue for a 10 year period, during which time health practitioners will professionally monitor health profiles on an annual basis.

An air quality monitoring facility located at the Boynton Middle School with round the clock reporting to a qualified independent agency charged with timely evaluation of the results.

Due to the fact that the New Ipswich and Greenville fire departments are volunteer units, Kinder Morgan/Tennessee Gas must pay for the development of a safety plan. Training must take place in order to keep our Boynton Middle School students and staff as safe as possible in the event that a pipeline or compressor station emergency situation arises.

We request that you pay attention to our concerns and take action to eliminate the health and safety risks that this project would bring to our students and staff.

Thank you for your consideration,
The Mascenic School Board
Earl Somero, Chairman

20151020-5003

Caroline Zuk, Dracut, MA.
Dear Commissioners,

As a lifelong resident of Dracut, MA, I am concerned about the long term environmental effects of the proposed Kinder Morgan Pipeline Project (Docket # PF-14-22-000) will have on our community after the supply of natural gas has stopped and the pipelines are no longer needed.

My concerns further involve environmental protection guidelines for compressor stations in general. If emissions cannot be further defined, if safety concerns for residents cannot be guaranteed, if noise levels are unpredictable, if protection against terrorism remains a potential threat, if remote controlled (programmable logic devices) cannot be secured from cyber attacks, if design specifications are not subject to independent review, then this project presents a recipe for disaster.

Please do not issue a certificate to proceed. The number of complaints coming from residents who have experienced encounters with Kinder Morgan/Tennessee gas is appalling.

Kinder Morgan's newsletters promising support of residents' concerns without a qualified detached third party to monitor delivery of such solutions on the part of Kinder Morgan is nothing short of irresponsible.

Please make every effort to assure every environmental concern pertaining to potential pollution to our environment and public safety is taken into full consideration.

Please consider alternative energy solutions. As little as twenty five years from now, the Kinder Morgan project positions itself to be not needed and we will all be left to deal with nothing more than industrial junk, underground to degrade the natural water sources we need to protect and sustain the food chain and generations to follow.

Thank you for taking the time to review this project in its entirety as I feel this project is too haphazard to be granted any type of certification to proceed.

Best regards,
Caroline Zuk

20151020-5004

Lisa Harris, Dracut, MA.

I have concerns regarding this pipeline project, particularly with the proposed compressor station in Dracut, MA, which would cause a major safety risk to the community. I do not feel comfortable with my family and neighbors passing through an "incineration zone" on their way to and from school and work every day. I understand that a major disaster at the compressor station would cause loss of property and life for those in the "incineration zone." I have been to many meetings and heard testimony from several people living near a compressor station, regarding the change in air quality. They are unable to open their windows due to the smell. They also described the noise pollution they must endure day and night. Dracut residents in the area of the proposed compressor station have private wells for their drinking water. Any discharge of chemicals from this compressor station could impact the ground water feeding these wells and ultimately the health

of Dracut citizens. Many Dracut residents are turning to solar generated power as a green alternative and encouraging their neighbors to do the same. It hardly seems fair to put more gas pipes and a compressor station in our community when we can't and won't use it for our own power needs. I respectfully ask that you please consider the impact this pipeline project would have on Dracut and listen to our collective concerns. Thank you, Lisa Harris

Energy Facilities Siting Board 8/3/15 / FERC Statement 8/11/15

Re: Tennessee gas Pipeline/Northeast Direct FERC Docket# PF 14-22-000

As a resident and **Selectman in Dracut**, a majority of opinions that have been expressed to me have been against the pipeline project or an overwhelming feeling of frustration that the project is coming and there is nothing we can do to stop it. I want to thank you for coming and hearing our concerns. Most clear are my residents' concerns regarding a decrease in their property values, safety issues and residual effects to the agricultural activity of our rural farming community.

As Chairman of the Board of Selectmen, I brought the need for a resolution to oppose the NED pipeline to my colleagues, and voted to uphold such a resolution.

As Selectman, I have been attending meetings of the Northeast Municipal Gas Pipeline Coalition for over a year on behalf of my residents. The information that I have gleaned has helped me formulate the following opinion..

Given the other pipeline projects that are in process at this time which are less intrusive and have much less in new greenfield construction...

Given the varying estimates of the life expectancy of the Marcellus shale field..

Given the significant investments in conservation land throughout the state which this proposal will decimate..

and given the green energy initiatives that the state of Mass. has embraced..

it would therefore be my opinion that NED is not needed in Dracut or anywhere. I demand that FERC look at all of the above factors, not only whether or not NED has secured enough customers, in their opinion, to justify the NED project.

Additionally, an extension of timelines by FERC is absolutely warranted. For instance, in KM's new filings on 7/24, 10 new towns were listed as affected by NED however they were not notified of the EFSB hearings.

Light pollution from the proposed compressor station is concerning, especially given the close proximity of the proposed site to the Dunlap Sanctuary, East Richardson Preserve, Dennis McNamara Way, New Entry Sustainable Farming sites and extensive agricultural lands in our town. These fragile ecosystems house owls, coyote, fox, raccoons and many other nocturnal creatures. FracDallas.org quotes "Cycles of light and darkness are necessary to the production of plants, including food...Bright lights at night can adversely affect ..livestock breeding, foraging and sleep cycles as well as general health... In agriculture, animals such as dairy cows and chickens, this can lead to decreased production and weight loss that reduces agriculture revenues."

In environment about.com " (Over-lighting's) cost to us in terms of energy consumption is staggering. In the US alone, excessive use of light at night wastes over 2 million barrels of oil a day... In the USA, over 5 million birds a year that migrate at night die after becoming disoriented by lights and colliding with all towers. The breeding habits of turtles, toads, frogs and salamanders have all been reported as being damaged by excessive light. Many species of bats are threatened by suburban light; it creates no – go areas for them to search for food or meals. Certain moths..only mate on dark, moonless nights..It's the same for fireflies and glowworms..There is also concern at the sheer number of insects that are killed by flying into the lights at night..This has a great impact on ecosystems as so many animals and birds are dependent on them for

food.”

In physics.fau.edu we read that “bats seem to concentrate around..lights, looking for easy meals from insects captured around the lights. Such concentration could lead to faster disease transmission among predator species not to mention faster depletion of their food source. Studies demonstrate that 10-15 minutes exposure to moderately bright light ,equivalent to twilight levels ,can shift the circadian clock by 1-2 hours for nocturnal animals...Those animals that do not hibernate properly...need more time to find food for their survival. Lights at night therefore reduce the number of hours that they have to find food, leading to hungrier animals.” Where are they to go? Let’s extrapolate this to a station that is lit around the clock.

Although the above cites examples of the disastrous effects of over lighting on animals, there are several studies that cite the negative effects on people as well i.e insomnia, headaches and stress related symptoms.

Finally, Dracut is being burdened with a very large compressor station, 3 metering stations , a major line and 3 lateral extensions. Dracut will be affected in significant ways and it is unclear at best as to how residents will benefit, but it very clear to my residents as to how KM will benefit. This is unacceptable.

In closing, is it acceptable to expect rate payers to share the burden of the expense of a pipeline that only benefits a multibillion dollar for profit company, using eminent domain, and a tariff that is still under legal scrutiny? I think not. Thank you.

Cathy Richardson, Board of Selectmen, 316 Richardson Rd., Dracut, Ma. 01826

BOARD OF SELECTMEN

Resolution Opposing the Expansion of the Tennessee Gas Pipeline in Lynnfield, Massachusetts

WHEREAS, a proposed High-Pressure Pipeline carrying natural gas may come through parts of Lynnfield and our neighboring communities; and

WHEREAS, a high-pressure gas pipeline, by its nature, carries the potential for leak, rupture, or devastating explosion causing untold damage to property and lives; and

WHEREAS, said pipeline may potentially destroy forests, wetlands, conservation land and farmland, and require maintenance in perpetuity of an expanded utility right-of-way through the possible use of herbicides; and

WHEREAS, said pipeline's proposed route could adversely impact the wells that the Town of Lynnfield relies on for drinking water; and

WHEREAS, said pipeline may adversely impact property values, adversely impact residents' safety, livelihood and otherwise may negatively impact the town's rural character; and

WHEREAS, the cost of said pipeline may require Massachusetts citizens to pay a utility bill tariff, as well as environmental costs not required by law for Tennessee Gas Pipeline Company, L.L.C. ("TPG", a subsidiary of Kinder Morgan Energy Partners, L.P.), potentially making ratepayers bear financial risk for the endeavors of a private corporation; and

WHEREAS, federal eminent domain powers will be used to forcibly take pipeline easements from unwilling landowners;

NOW THEREFORE BE IT RESOLVED THAT the Selectmen of Lynnfield, Massachusetts:

1. Stand in opposition to Tennessee Gas Pipeline Company, L.L.C.'s Northeast Expansion pipeline and not allow it within town borders;
2. Oppose any pipeline that potentially threatens the safety of any Lynnfield residents, visitors, or property; and
3. Hereby request that our state and federal legislators and executive branch officials enact legislation and take any such actions as are necessary to disallow such projects that go against our commitments to life, the environment, our economic wellbeing and our bodily safety, and, instead to legislate more stringent energy efficiency and further exploration of and subsidies for renewable energy sources.

{typed but poor scan quality}

October 15, 2015

Dear Ms. Bose,

I am writing to you about my concerns of the Tennessee Gas Pipeline Company, L.L.C. Docket No. PF14-22-000, who is planning to run a pipeline, through my property. I live in Richmond NH on RTE 32, I am against this project for many reasons. First of all there's a small pond under the power lines that is fed by springs from my land and across the road. The well near the house is the one I use to drink from. It is a free flowing well extra water runs through a pipe all the time into the pond. Who pays for another well if it gets polluted by leachate? I have two more wells that are in a ravine on my land. One is encased with concrete casing which in the 1980's seeped into the house.

The other well was built with field stone. although not usable there may be some historic value. It would be a shame to have them DESTROYED because they are in the way of a new line. My trees which I only have a few of them would be cut down gone. my land would be graded flat and changed for ever. What do I expect out of this??.?

My home. the main part of the foundation was built with field stone. I fear that if any blast of rock nearby could cause damage to the foundation and my house would fall down. Who would pay for the damage if that happens??.??

I live on a high concentration of spring water. in the early Spring months I've seen water bubble right out of the ground. My homestead sits on the aquifer. part of the Rice Brook valley although I live up on the hill the water is plentiful and clean. Why do I want a pipeline 'To Go I'house My Land?????

Sincerely:

Mark J. Baurceard

Arsenic in our state

I would like to talk about As, the 20th most abundant element, naturally occurring in the earth's crust.

It is No. 1 on the EPA's list of hazardous substances

Arsenic in nature Is usually found in sedimentary or igneous rock joined or mixed to other elements. Because it is an element it does not break down, but underground water flowing over arsenic rich rock may be contaminated with high concentrations of a toxic form of arsenic.

40% of New Hampshire residents use private wells - Most residents of most towns, and all residents of some towns along the route of NED (like NI) use private wells.

1/5 of wells sampled in southern NH contain arsenic levels greater than 10 parts per billion- the EPA standard

NH = granite bedrock = arsenic

This is a huge concern as NED blasts through granite and through many aquifers, (3 in New Ipswich alone) on its route through southern NH

A study by Professor Tullis Onstott from Princeton U. shows his concern about Similarly high concentrations of arsenic in Hunterdon County NJ, and the affects of its release during the building of the PENN EAST pipeline there.

The study's results emphatically illustrate our concern about the same thing occurring during construction of NED in Southern NH.

Professor Onstott gives an example in layman's terms. If you took a 1 kg. rock containing 100 ppmillion of arsenic (a fist size rock) and broke it up and leached out all the arsenic and put it in a 1 liter bottle of say Fugi water, the concentration would be 250 parts per billion.

To reach a minimum contamination level you would need to add an additional 50,000 litres of or 12 % thousands gallons of pure well water.

But how much of this arsenic containing rock could be blasted, excavated, broken up, exposed to air, and reburied in a 100ft. trench within the ROW during construction?

He estimates about 75,000 KG in a 100 ft. long trench. Not a lot of rock, but if it contained 100 ppm of arsenic, he estimates 75,000,000,000 litres of water would be needed to dilute it to reach acceptable EPA levels.

If anything like this were to happen -IT MAY NOT BE ABLE TO BE FIXED.

Considering the fact that KM/TGP at this point has contracts for only 38% or .5 bet of the 1.2 bet that will flow through this pipeline, none of which will be available to my town, and only 22% if they pipeline is again made 36", as stated is possible in the fine print -I say considering the severe threat to southern NH's drinking water-

The only conclusion the FERC and this EIS should come to is NO BUILD!

Sincerely,

Maria Schmauz

Mobilization of iron and arsenic from soil by construction and demolition debris landfill leachate.

Wang Y1, Sikora S, Kim H, Dubey B, Townsend T.

Abstract

Column experiments were performed to examine (a) the potential for leachate from construction and demolition (C&D) debris landfills to mobilize naturally-occurring iron and arsenic from soils underlying such facilities and (b) the ability of crushed limestone to remove these aqueous phase pollutants. In duplicate columns, water was added to a 30-cm layer of synthetic C&D debris, with the resulting leachate serially passed through a 30-cm soil layer containing iron and arsenic and a 30-cm crushed limestone layer. This experiment was conducted for two different soil types (one high in iron (10,400mg/kg) and the second high in iron (5400mg/kg) and arsenic (70mg/kg)); also monitored were control columns for both soil types with water infiltration alone. Despite low iron concentrations in the simulated C&D debris leachate, elevated iron concentrations were observed when leachate passed through the soils; reductive dissolution was concluded to be the cause of iron mobilization. In the soil containing elevated arsenic, increased iron mobilization from the soil was accompanied by a similar but delayed arsenic mobilization. Since arsenic sorbs to oxidized iron soil minerals, reductive dissolution of these minerals results in arsenic mobilization. Crushed limestone significantly reduced iron (to values below the detection limit of 0.01mg/L in most cases); however, arsenic was not removed to any significant extent.

Ultramafic-derived arsenic in a fractured bedrock aquifer

Applied Geochemistry

By: P.C. Ryan, J. Kim, A.J. Wall, J.C. Moen, L.G. Coenthals, D.R. Chow, C.M. Sullivan, and K.S. Bright

DOI: 10.1016/j.apgeochem.2011.01.004

Abstract

In the fractured bedrock aquifer of northern Vermont, USA, As concentrations in groundwater range from <1 to 327??g/L (<13-4360nm/L) and these elevated occurrences have a general spatial association with ultramafic rock bodies. The ultramafic rocks in this region are comprised mainly of serpentinites and talc-magnesite rocks with average As concentration of 93ppm and a range from 1 to 1105ppm. By comparison, the other main lithologies in the study area are depleted in As relative to the ultramafics: the average As concentration in metabasaltic rocks is 4.1ppm with a range of <1-69ppm, and mean As concentration in meta-sedimentary phyllites and schists is 22ppm with a range of <1-190ppm. In the ultramafic rocks, As is correlated with Sb and light rare earth elements, indicating that As was introduced to the ultramafic rocks during metasomatism by fluids derived from the subducting slab. Evidence from sequential chemical extraction, X-ray diffraction (XRD) and stoichiometric analysis indicates that the majority of the As is located in antigorite and magnesite (MgCO₃) with lesser amounts in magnetite (Fe₃O₄). Hydrochemistry of monitoring wells drilled into fractured ultramafic rock in a groundwater recharge area with no anthropogenic As source reveals above background As (2-9??g/L) and an Mg-HCO₃ hydrochemical signature that reflects dissolution of antigorite and magnesite, confirming that As in groundwater can be derived from ultramafic rock dissolution. Arsenic mobility in groundwater affected by ultramafic rock dissolution may be enhanced by alkaline pH values and relatively high HCO₃⁻ concentrations. ?? 2011 Elsevier Ltd.

In cooperation with the

U.S. ENVIRONMENTAL PROTECTION AGENCY (EPA NEW ENGLAND), NEW HAMPSHIRE DE-

**ARSENIC CONCENTRATIONS IN PRIVATE BEDROCK WELLS IN SOUTHEASTERN NEW
HAMPSHIRE**

U.S. Geological Survey Fact Sheet 051-03

2003

This fact sheet is available in pdf format.(1.1MB)

Major Findings:

- Nearly one-fifth (19 percent) of randomly selected private bedrock wells tested in southeastern New Hampshire contain concentrations of arsenic that exceed 0.010 milligrams per liter, the U.S. Environmental Protection Agency's maximum contamination level for public water supplies.
- An estimated 41,000 people in Hillsborough, Rockingham, and Strafford Counties may have private bedrock wells with concentrations of arsenic that exceed 0.010 milligrams per liter.
- Arsenic concentrations are similar in all three counties; however, the spatial distribution of arsenic concentrations that exceed 0.010 milligrams per liter is variable and relates to geology.
- Although most of the well owners (90 percent) reported that they use the water from their bedrock well for drinking, less than 14 percent had tested for arsenic prior to this study.

New Hampshire Department of Environmental Services

Environmental Fact Sheet

WD-DWGB-3-2 2012

Arsenic in New Hampshire Well Water

Wells drilled into New Hampshire's bedrock fractures have about a 1 in 5 probability of containing naturally occurring arsenic above 10 parts per billion. In addition, wells within short distances (~50 feet) can present very different water quality because of our highly fractured bedrock. Arsenic in water has no color or odor, even when present at elevated levels. Therefore, the only way to determine the arsenic level in your well water is by testing.

STOP THE NED PIPELINE!!

Protect NH land from Eminent Domain!

I oppose. the Kinder Morgan Northeast Energy Direct (NED) EXPORT pipeline. The pipelines, and compressor station will scar the NH landscape and put our water, wildlife, forests, agricultural lands and rural character at risk. These include health and safety risks from emissions, industrialization, pollution and the devastating effects of fire and explosions. Greed, not need is fueling this project. Say NO to this private company that will TAKE OUR LANDS with NO BENEFIT TO US.

RE: Kinder Morgan/Tennessee Gas Pipeline Company, LLC (KM/TGP)
Docket No. PF14-22-000
Northeast Energy Direct (NED) Pipeline Project

Dear Secretary Bose:

Kinder Morgan's surveyors, Hatch Mott MacDonald were spotted in several locations along the original route near the high school in Amherst, NH and near the power lines in Merrimack, NH trying to enter Horse Hill Nature Preserve from two different entrances.

Kinder Morgan/TGP wonders why so many people in New Hampshire don't trust them, and here's one example. They were told to keep their surveyors off Merrimack land unless there was a Merrimack town official with them. Now they are sneaking around trying to survey without permission and without a Merrimack town official with them. The police were called and they were told to leave.

If Kinder Morgan/TGP cannot respect a simple request from the town, how can we expect them to build a safe and reliable gas pipeline?

Sincerely,

Gina Rosati
Merrimack, NH

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22
Northeast Energy Direct Project

Dear Secretary Bose:

It is time to acknowledge the truth.

We are told to ‘trust the process’. How many examples of FERC’s disregard for private property and the public will it take before everyone will acknowledge the truth? FERC does not and will not protect our property, health or safety. Those of us living in the forprofit sacrifice zones (referred to by corporate/governmental agencies as “host communities”) are overwhelmingly opposed to having our towns, property, water, health and future destroyed for corporate profit.

I oppose the Northeast Energy Direct and all other fossil fuel infrastructure projects being proposed by industries whose profits are derived from destroying our atmosphere and planet. Fossil fuel-driven industrial globalization is not only unsustainable, it is a death sentence for humanity.

I understand perfectly well that nothing I say will sway FERC’s decision because you are not bound to honor any ruling from the Court of Public Opinion. You believe you are the designated commission for permitting the Northeast Energy Direct pipeline, but I am writing to tell you that in fact you are not. We the People are. And the Constitution of the State of Massachusetts has got our back:

“All men are born free and equal, and have certain natural, essential, and unalienable rights; among which may be reckoned the right of enjoying and defending their lives and liberties; that of acquiring, possessing, and protecting property; in fine, that of seeking and obtaining their safety and happiness.”

Those of us living in the profit sacrifice zones are very aware of all the invasive, cruel, destructive greed-driven projects FERC rubber-stamps. Many of us are living with the devastation already and many more are living with the threat of having our world destroyed.

Recently FERC became the target of citizens who were protesting to keep their communities from becoming extraction colonies for the Corporate Elite. When former FERC Chairman Cheryl LaFleur acknowledged the protestors by saying the Federal Energy Regulatory Commission has a “situation here” she sure was right. The situation FERC is experiencing is The People exercising their rights as laid out in the Declaration of Independence:

“Governments are instituted among Men, deriving their just powers from the consent of the governed,
-That whenever any Form of Government becomes destructive of these ends. it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness.

Let democracy ring,

Anna Fessenden

STOP THE NED PIPELINE!!

Protect NH land from Eminent Domain!

I oppose. the Kinder Morgan Northeast Energy Direct (NED) EXPORT pipeline. The pipelines, and compressor station will scar the NH landscape and put our water, wildlife, forests, agricultural lands and rural character at risk. These include health and safety risks from emissions, industrialization, pollution and the devastating effects of fire and explosions. Greed, not need is fueling this project. Say NO to this private company that will TAKE OUR LANDS with NO BENEFIT TO US.

Norman Bay, Chaitman
Federal Energy Regulatoqr Commission
888 Fixst Stmet, NE
Washington, DC 20426

Dear Chairman Bay:

I write to the Federal Eneqgr Regulatoqr Commission (FERC) regsxding Kindet Morgan's proposed North-east Energy Ditect (NED) Project, Docket N. PF14-22-000. Many of my constituents have fotwanhd me copies of the comments they have submitted to the Docket for this project. I am enclosing those comments with this letter for yout review.

As you will see, my constituents have raised a number of concetns that warrant consideration by FERC. While reviewing information relative to the proposed NED Project, I trust that you, yom feJIow Commis-sioners and your staffs will carefully consider the comments of all stakeholders of the impacted communi-

ties. Pursuant to the National Environmental Policy Act (NEPA), I also expect that the Commission will conduct a thorough analysis of all potential impacts of the proposed NED route in New Hampshire, as well as all possible alternative routes and configurations that lessen potential impacts to the region.

It is imperative that New Hampshire residents are provided ample opportunity to participate in the FERC permitting process in a meaningful way. The pre-filing comment period is a critical piece in that process and I trust that the comments my office has received, along with all New Hampshire comments submitted to Docket No. PF14-22-000, will play a key role in your continued analysis of the NED project.

Thank you in advance for your careful consideration.

Sincerely

Jeanne Shaheen
United States Senator

RE: Docket No. PF14-22-000

Dear Chairman Bay:

On behalf of the Pelham/Windburn Pipeline Awareness Outreach Subcommittee, we respectfully request that the Federal Energy Regulatory Commission reconsider "NO BUILIX" or the Tennessee Gas Pipeline (TGP) Company's proposed Kinder Morgan Northeast Energy Direct (NED) Project. While we have many concerns, we have grave concerns regarding the issues of compressor stations, particularly since the issues surrounding the Dracut MA compressor station crosses state lines.

The compressor station in Dracut MA is located less than a mile from our Pelham NH borders. It causes us great concern not only for us, but for our neighbors across the state line in Dracut, MA. We have never received clear information concerning the amounts, types and frequency of emissions that would be released from this compressor station. Nor have we received clear indication of the effects of these emissions concerning short term and long term health effects on both people and the wildlife (including the threatened loon populations of Little Island Pond and other water bodies in southern NH), water and farms in the path of these emissions. We have similar concerns regarding the larger compressor station in New Ipswich NH. The Dracut compressor station and the Pelham length of the pipeline is located too close to Little Island Pond and its watershed. The pipeline and compressor station are also located too close to a neighborhood in Dracut MA and the surrounding neighborhoods in Pelham, NH. This high-pressure, high-capacity station located in Dracut, MA will bring significant human safety risks to our families and the businesses nearby. In Pelham alone the pipeline affects over 500 families. (18 shutters and 380 in blast zone.)

We therefore request that significant research be done regarding the weather and wind patterns in this region to determine what effects the low altitude air flow and the higher altitude "atmospheric sewer" will have on our town and those in the region. Research concerning the effects of fracked gas compounds and chemicals negatively impact the skin, eyes, sensory organs, the respiratory system, the gastrointestinal system, the liver, the nervous system; and are candidate endocrine disrupting chemicals needs to be done. Endocrine disrupting chemicals (EDCs) present unique hazards, particularly during fetal and early childhood growth and development and that needs to be clearly documented that that will not be an issue here in NH or with our neighbors in Dracut. We do not want to be exposed to any of these toxic substances. In addition to the compressor station, leakage from existing pipes in the region is well documented and substantial and need to be repaired before any new pipelines are considered.

Based on these issues we again ask that you recommend, "NO BUILD".

Respectfully submitted,

Pelham/Windham Pipeline Awareness Outreach Subcommittee

**FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, DC 20426**

OFFICE OF THE CHAIRMAN

The Honorable Chris Gibson
U.S. House of Representatives
Washington, DC 20515

October 20, 2015

Dear Congressman Gibson:

Thank you for your September 25, 2015, letter regarding the Northeast Energy Direct (NED) Project, proposed by Tennessee Gas Pipeline Company in (Docket No. PF14-22-000).

There were three main issues raised by Supervisor Fleming: extension of time to comment on the project; access to Critical Energy Infrastructure Information (CEII); and answers and outstanding information that Tennessee Gas has not provided to date. The NED Project is currently within our pre-filing environmental review process. That process allows Commission staff to actively participate with stakeholders, including local governments and elected officials, in order to identify environmental issues of concern, and discuss potential solutions before a formal application is filed. On September 3, 2015, we issued a Notice of Public Scoping Meeting for the Northeast Energy Direct Project and Extension of Scoping Comment Period, that extended the public scoping comment period to October 16, 2015. As always, the Commission will accept and consider written comments from any interested stakeholder at any time during the pre-filing and application review process.

It has been the practice of the Commission not to release materials filed as CEII. However, our pre-filing procedures do require the applicant to file responses to public comments. Therefore, we expect Tennessee Gas to address Supervisor Fleming's questions in its formal application, or in a separate filing. If there are data gaps in the application, Commission staff will send out a data request to address those issues. Lastly, Commission staff will address all the environmental issues raised by Mr. Fleming, including the impacts associated with the planned compressor station in the Town of Nassau, in a forthcoming draft environmental impact statement (EIS). The draft EIS will be published and distributed for a 45-day public review and comment period.

The Commission strives to make its review of energy proposals both accessible and transparent to the public. I hope this information has been helpful. If I can be of any further assistance in this or any other Commission matter, please let me know.

Sincerely,

Norman C. Bay
Chairman

20151022-5061

Lawrence Panfil, Dracut, MA.

I am a concerned resident of 17 Cart Path Rd. We have a neighborhood of about 60 homes with families, a lot of small children. As Kinder Morgan/Tennessee Gas has proposed to add even more gas pipe lines to an area with one already going through the middle of our community, I strongly urge you to decline their

proposal. I already have a gas line running directly behind my backyard.

I don't think that a new high pressure line coexisting with high tension electrical lines, also within a 1/2 mile from an active blasting quarry is very safe. Brox's blasting shakes our houses almost weekly, and I can't imagine that it would be a good idea for those to all be close to each other. Explosions involving pipelines of this size and pressure occur often - and are catastrophic, with the fire being fed by many miles of fuel between shut-off stations, leading to prolonged, extremely high-temperature burn.

These woods that we're talking about are often trafficked by 4 wheelers, snowmobiles and motorbikes. They are also used for hunting. Not that I hunt, but I can't imagine a bullet is a good idea for a pipeline either.

As someone who also has very sensitive hearing, I am also deeply concerned about a nearby compressor station (especially of this size) to be running 24/7. One of the reasons that we all moved out here, away from Boston and the city was to be away from such noises and pollutants.

Last but not least, the area behind Cart Path Rd was set aside as land all shared by our neighborhood for conservation purposes, that is supposed to be kept away from the exact thing that they are proposing. Construction would leave permanent degradation of the landscape, private properties, wildlife, forests, agricultural land, and residential wells. Not good for farm area, where we also get our food.

Please help ensure that this does not come to our neighborhood, and vote against this pipeline.

20151022-5076

Robert Ritter, Dracut, MA.

We do not want this project in our neighborhood. A high pressure line coexisting with high tension electrical lines within A 1/2 mile from an active blasting quarry is not a good idea in my opinion. A loud compressor station in our neighborhood would also disrupt a peaceful and enjoyable place to live.

20151022-5119

Tom Jackson, Dracut, MA.

Dear FERC,

My name is Thomas Jackson and I live at 46 Cart Path Rd in Dracut, MA 01826. I am writing to you to protest the project, docket #PF14-20-000, as a concerned abutter. I am concerned for the safety of my neighborhood, specifically a high pressure gas line that would coexist with high tension wires. This is also less than .5 mile from a quarry they do frequent blasting. Also the noise from a nearby compressor will have a negative environmental impact on our area. This is my written statement, as an affected property abutter to this project, that I protest this project going forward. Docket # PF14-20-000

Thomas Jackson
46 Cart Path Rd
Dracut MA

20151023-0014

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, DC 20426

October 22, 2015

OFFICE OF THE CHAIRMAN

The Honorable Kimberly Driscoll
North Shore Coalition
Mayor of Salem, Massachusetts
93 Washington Street
Salem, MA 01970

October 22, 2015

Dear Mayor Driscoll:

Thank you for your September 10, 2015, letter regarding the Northeast Energy Direct (NED) project, proposed by Tennessee Gas pipeline Company in Docket No. PF14-22-000.

On June 30, 2015, we issued a Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings (NOI), which initiated the scoping period and indicated the locations, dates, and times for public meetings. The meeting locations and dates were selected to be convenient for the greatest number of people who might be interested in the project. Commission staff held four meetings in Massachusetts. In addition, on September 3, 2015, the Commission issued a supplemental notice that extended the scoping period to October 16, 2015.

While scoping meetings are a valuable tool for the Commission to receive comments from the public, they are only one of several ways for interested parties to bring their concerns to the Commission's attention. Stakeholders may also file written comments with the Commission. Those comments will receive the same attention and scrutiny as comments received at public meetings. I encourage you and the residents of cities and towns on the North Shore to continue to participate in the review of the project and to file any comments that you believe will help the Commission's consideration of this matter.

As in any Commission matter, please be assured that we strive to make our reviews of proposals both accessible and transparent to the public. If I can be of any further assistance in this or any other Commission matter, please let me know.

Sincerely,

Norman C. Bay
Chairman

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION
INTERAGENCY PRE-FILING CONFERENCE CALL

Tennessee Gas Pipeline Company, LLC

Docket No: PF14-22-000

NORTHEAST ENERGY DIRECT PROJECT

September 17, 2015

Agencies in Attendance (list of attendees is attached):

- Federal Energy Regulatory Commission (FERC)
 - Cardno (FERC 3rd Party Contractor)
- U.S. Army Corps of Engineers (USACE)
- U.S. Environmental Protection Agency (USEPA)
- U.S. Fish and Wildlife Service (USFWS)
- PA Department of Conservation and Natural Resources (PA DCNR)
- NY State Department of Environmental Conservation (NYSDEC)
- NY State Parks and Recreation
- NY State Department of Public Health
- NY Department of Transportation
- MA Attorney General's Office
- MA Department of Conservation and Recreation (MA DCR)
- MA Department of Environmental Protection (MA DEP)
- MA Department of Public Utilities Siting Board (MA DPU)

- NH Department of Environmental Services (NH DES)
- NH Public Utilities Commission (NH PUC)
- NH Division of Historical Resources (NH SHPO)
- NH Department of Transportation (NH DOT)
- Berkshire Regional Planning Commission
- Southwest Regional Planning Commission
- Franklin Regional Council of Governments
- Nashua Regional Planning Commission
- Northern Middlesex Council of Governments
- Tennessee Gas Pipeline (Tennessee Gas)
 - o Hatch Mott (Contractor for Tennessee Gas)
 - o AECOM (Contractor for Tennessee Gas)

Meeting Summary

The conference call was conducted to review the general status of the Northeast Energy Direct (NED) Project, including the Project's schedule, field surveys, landowner coordination, and the National Environmental Policy Act (NEPA) process. Topics discussed included:

- Status
 - o Final scoping meeting scheduled in Rindge, NH at Franklin Pierce University Field House for September 29, 2015
 - o FERC will be conducting site visits and setting up meetings with regional planning commissions to coincide with the scoping meeting next week.
 - o Formal Comment Period has been extended to October 16, 2015
 - o FERC is in the process of finalizing data request to send to Tennessee Gas on the July Resource Reports.
 - o Tennessee Gas planning to submit Application to FERC on October 23, 2015.
 - o FERC will be meeting with the Northeast Tribes on October 9, 2015 in CT.
- Tennessee Gas status update:
 - o Surveys
 - Continuing to survey accessible lands in all states crossed by the project.
 - Completed surveys on 10 miles of recently accessible land in NH
 - Threatened and Endangered (T & E) species
 - ≠ Surveying mussels this week in CT.
 - ≠ Ongoing plant surveys in PA
 - ≠ Completed acoustical surveys for bats. Bat hibernaculum mist netting surveys ongoing in NY through October
 - ≠ Working on internal plans for turtle surveys in MA
 - Cultural resource surveys ongoing where they have access
 - Survey accessibility is approximately the same as reported on the last agency call.
 - o Meetings
 - Continuing to meet with all state agencies
 - Working on Site Evaluation Committee (SEC) application in NH. Tennessee Gas plans to file the NH SEC application soon after the FERC application is filed.
 - Tennessee Gas will be attending FERC Tribal Meeting October 9, 2015.
 - Finishing up the last of the five Open Houses this week in NH. Number of attendees ranged

from approximately 40 to 100 people for each meeting.

- Miscellaneous:
 - o Contact FERC regarding Section 106 Consultation
 - o FERC Commissioner may be giving an interview to Boston Globe next week and could speak about the NED project.
 - o Agencies that wish to become a cooperating agency need to send request in writing or email to Eric Tomasi at FERC ASAP.
 - As a cooperating agency, you will be able to help write and comment on the Environmental Impact Statement (EIS) documents prior to their release to the public.
 - Agencies cannot be an Intervenor if they are a cooperating agency.

Next Call

- Agency call will be held every 2 weeks.
- Call for October 1, 2015 cancelled.
- Next call scheduled for October 15, 2015.

List of Attendees

Mr. Norman C. Bay, Chairman
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

RE: eFiling Docket PF14-22

Dear Chairman Bay:

The **Worcester Regional Chamber of Commerce** is the largest Chamber of Commerce in New England, representing approximately 2,300 from 35 cities and towns in central mass and beyond. The Chamber advocates for its members on a broad range of issues that have both positive and negative impacts on their ability to operate a successful business. In recent years the topics of regulatory compliance, healthcare coverage and energy costs have dominated the issues and discussion brought forth by our members.

The ever increasing costs of energy in New England have created an environment where some businesses are no longer discussing expansion, but instead are looking at contraction or relocation. (See: New England has the highest energy costs in the U.S. – EIA, Table 5.6.A. Average Price of Electricity to Ultimate Customers by End-Use Sector, Table 5.6.A. Average Price of Electricity to Ultimate Customers by End-Use Sector, http://www.eia.gov/electricity/monthly/epm_table_grapher.cfm?t=epmt_5_6_a) Like all businesses their motivation is survival and the Chamber continues to be an advocate for their success and long-term viability in Central Massachusetts.

Saint-Gobain Abrasives, a manufacturing institution in our area, has seen a thirty seven percent (37%) increase in their overall electricity costs between 2013 and 2015. Further, their natural gas expenditures went from \$5.1 million in 2013 to \$6.1 million in 2014. Adding this together, their Worcester, Massachusetts operations have the highest natural gas and electricity costs in comparison to all of their North American operations. These continually increasing costs certainly factor into the decision making process as the company analyzes their business models and operations moving forward.

Additionally, it is estimated that 5 million homes in the Northeast heat with oil averaging 850 to 1,200 gallons in the winter months alone. (See: EIA, Heating Oil Explained, Factor Affecting Heating Oil Prices – Basics, available at: http://www.eia.gov/energyexplained/print.cfm?page=heating_oil_factors_affecting_prices - “A homeowner in the Northeast might use 850 gallons to 1,200 gallons of heating oil during a typical winter, while consuming very little during the rest of the year.”) This accounts for 87 percent of U.S. residential heating oil sales. (See: Ibid)

Furthermore, as we look to transition from relying on oil energy production to renewable energy production there must be a bridge fuel. We recognize natural gas as being the safer and environmentally sound alternative as we seek that renewable energy future. Natural gas, with sufficient infrastructure in place, is a more reliable alternative to meeting emergency power needs. Natural gas plants can go “online” in a relatively short period of time, whereas oil or coal plants need time to “ramp-up” their production. (See: MIT Energy Initiative, “Managing Large-Scale Penetration of Intermittent Renewables” (4.20.11) - “Natural gas-fired power plants provide the greatest generation flexibility to mitigate large-scale penetration of intermittent

renewables with ramp rates of 8% per minute. New natural gas combined-cycle (NGCC) plants continue to improve their capabilities for responding to the intermittency of renewable generation.”) Delays are critical in the event of a major event or shortfall of energy production and could lead to public safety matters.

We want to grow business here in Massachusetts and to aid our region in growing jobs and investment. The Chamber aims to provide our members with an environment where they can compete and be part of a more emission friendly initiative potentially leading to a more renewable future.

On behalf of the Worcester Regional Chamber of Commerce and our 2,300 members I respectfully request that the Commission support the proposed pipeline projects. Increasing the natural gas supply to our region will lower energy costs and improve emissions.

Thank you for your consideration and please do not hesitate to contact me with any questions.

Respectfully Submitted,

Timothy P. Murray

IN REPLY REFER TO:

A.1.2.(NER-RSS)

October 22,2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

Subject: FERC Docket PFI4-22-000 - Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project (Tennessee Gas Pipeline Company, L.L.C.); in Pennsylvania, New York, Massachusetts, New Hampshire and Connecticut; NPS (ER 15/0370)

Dear Secretary Bose:

The National Park Service (NPS) is pleased to provide additional comments on the Notice of Intent (NO I) to prepare an Environmental Impact Statement (EIS) for the Northeast Energy Direct Project (NED). NED would involve the construction and operation of natural gas facilities by Tennessee Gas Pipeline Company, L.L.C. (TGP), in Pennsylvania, New York, Massachusetts, New Hampshire and Connecticut. The NED Project would consist of the construction and operation of approximately 412 miles of new natural gas transmission pipeline and associated facilities, including modifications at existing compressor and meter stations, and construction of nine new compressor stations, fourteen new meter stations, and various appurtenant facilities. These facilities would be capable of providing 2.2 billion cubic feet per day of capacity to transport natural gas to markets in the northeastern United States and Canada. The pipeline includes supply path and market path components. NED also includes construction of nine pipeline laterals, loops or delivery lines in Massachusetts, Connecticut and New Hampshire to provide natural gas to local markets. This second set of

comments submitted by NPS address potential impacts of the proposed project on the New England National Scenic Trail.

I. The New England National Scenic Trail

The New England National Scenic Trail (NET) is a 215-mile hiking trail route that has been in existence for over half a century. The NET travels through 40 communities in Connecticut and Massachusetts, and is comprised primarily of the historic Mattabesett, Metacomet, and Monadnock (M-M-M) Trail systems.

The National Park Service manages the New England National Scenic Trail in accordance with the Trail Management Blueprint described in the 'Metacomet Monadnock Mattabesett Trail System National Scenic Trail Feasibility Study and Environmental Assessment', (Spring 2006) and referenced in the Omnibus Public Land Management Act of 2009 (Public Law 111-11 Subtitle C Section 5210-02). Consistent with the Trail Management Blueprint, NPS administers the New England National Scenic Trail's planning, acquisition, protection, operation, development, and maintenance through a partnership-based management framework with the two primary trail partners, the Appalachian Mountain Club and Connecticut Forest and Park Association.

Since the federal designation in 2009, there have been some noteworthy changes to the historic route, including a 15-mile extension to Long Island Sound in Connecticut and a 22 mile eastward deviation from the historic Metacomet-Monadnock Trail in Massachusetts.

The NET experience celebrates classic New England landscape features: long-distance vistas with rural towns as a backdrop, agrarian lands, large unfragmented forests, and scenic river valleys. The trail also connects with colonial historical landmarks and highlights a range of diverse ecosystems and natural resources: mountain ridges and summits, forested glades, wetlands and vernal pools, lakes, streams and waterfalls.

Of note to the proposed NED project is the NET's Richardson-Zlogar Cabin in the project area, near the proposed Market Path Mid Station 3 compressor station. See Figure 1. Located on NET Section 17 in Northfield Massachusetts, the Richardson-Zlogar Cabin offers unparalleled views of Mt. Ascutney, Mt. Monadnock and Mt. Wachusett. Designed for year-round use, the Cabin provides space for up to sixteen and is supplemented by two tent platforms. In 2011, NET landowners and trail maintainers Sam and Barbara Richardson donated a Conservation Restriction to the Town of Northfield on a 38-acre lot on Stratton Mountain. The cabin components were purchased by the National Park Service and built by Appalachian Mountain Club-Berkshire Chapter volunteers in the Fall of 2011 and the Spring of 2012, whose combined efforts contributed over 1,000 hours of work.

{photo omitted}

Figure 1: Richardson-Zlogar Cabin on the New England National Scenic Trail in the vicinity of the Proposed NED Market Path Mid Station 3 compressor station.

II. Potential Impacts

NPS has concerns regarding potential impacts to the NET, and the thousands of trail users, from the proposed NED pipeline and associated infrastructure. The NED pipeline proposes to cross the NET seven times over the course of the pipeline route by NPS estimations from the NED project maps available. See Figure 2, Massachusetts; Figure 3, Northern Connecticut; and Figure 4, Southern Connecticut below. These crossings would be disruptive to trail users in the short and long term as detailed below. Of particular concern are the impacts to trail users from the Market Path Mid Station 3 compressor station, located approximately 1/2 mile from the Richardson-Zlogar Cabin.

Trail Crossings and the User Experience

As noted, NPS estimates there would be seven crossings of the NET over the course of the proposed pipeline route in MA and CT. This is a large number of crossings over a relatively short distance and would likely result in adverse impacts to Trail users during both the construction and operations phases. In the short term, pipeline construction would present safety hazards to trail users, could require reroutes adding

considerable distance to their hikes, and would disrupt the sights and sounds they expect to enjoy while hiking. In the longer term the hiking experience would be altered: the visual landscape trail users enjoy could be degraded by the open corridors created by the maintained rights-of-way (ROW), and could encourage illegal use by motorized vehicles utilizing the pipeline corridor to gain access to the NET, thereby increasing health and safety issues for hikers. Operations phase impacts to trail users could include decreased air quality, increased noise, and negative night sky impacts from nearby pipeline infrastructure. NPS recommends all of these impacts to NET trail users be analyzed and disclosed in the environmental impact statement (EIS) prepared for the proposed NED pipeline.

{3 maps omitted}

Figure 2: The proposed NED pipeline crossings of the New England National Scenic Trail in Massachusetts.

Figure 3: The proposed NED pipeline crossings of the New England National Scenic Trail in northern Connecticut.

Figure 4: The proposed NED pipeline crossings of the New England National Scenic Trail in southern Connecticut.

Pipeline Infrastructure Impacts on the Trail User

The Market Path Mid Station 3 compressor station has the potential to adversely impact NET trail users. The location of additional proposed infrastructure (valve control units, pig launchers and receivers, etc.) should be disclosed so the effects of these units on the NET trail user can be understood. Specific resource concerns include air quality, noise, night sky, and health and safety impacts to the trail user.

Air

The air quality trail users enjoy could be negatively impacted by the construction and operation of the Market Path Mid Station 3 compressor station. In its Resource Report 9 on air and noise, Tap identified federal and state air quality permitting requirements for the nine new and one modified compressor stations proposed for the Northeast Energy Direct Project. There is no emission data for the compressor station at this time; the DEIS should include these emission levels. Report 9 includes air quality analysis of proposed or modified compressor and metering stations, and a variety of modeling analyzes to be completed. These modeling analyses will be required by state air quality requirements; NPS is not requesting any additional modeling work to be conducted. The DEIS analysis should specifically address air quality impacts to Trail users, including those staying at the Richardson-Zlogar Cabin. NPS will review the modeling results as they are completed and released, in addition to proposed mitigation measures.

Noise

Compressor stations, and assorted pipeline infrastructure such as valve control units, pig launchers and receivers, etc. all add noise to the surrounding environment. Trail users use the NET for the nature-based visual and auditory environment it provides. Pipeline infrastructure has the potential to significantly degrade that environment. NPS manages sounds and noise to restore and maintain natural conditions wherever possible. The DEIS should analyze the impacts pipeline infrastructure may have on the noise the NET trail user experiences. NPS is particularly concerned with the noise impacts to trail users staying at the Richardson-Zlogar Cabin, due to its proximity to the proposed Market Path Mid Station 3 compressor station. The Cabin and the compressor station would be located 3/4 mile apart.

Assessing Impacts to the Acoustic Environment

Resource Report 9 on noise focuses the analysis on regulatory thresholds designed to protect humans in residential areas from negative effects of noise. Full environmental analysis of noise would examine a suite of metrics which are appropriate for the array for resources impacted. Other considerations could examine whether existing sound levels exceed certain decibel (dBA) values that relate to human health and speech. At 35 dBA, human and wildlife sleep can be interrupted [4], [2]. The World Health Organization recom-

mends that noise levels inside bedrooms remain below 45 dBA [3]. At 52 dBA, a listener wouldn't clearly hear another person speaking in a raised voice at 10 meters. [1] All of these resources may help to more fully analyze the impacts of pipeline infrastructure on trail users and overnight guests at the Cabin.

The NPS recommends that the DEIS include an acoustic analysis that:

- Includes the NET environment as areas that can potentially be affected by noise
- Uses appropriate metrics to assess potential environmental impacts
- Determines the natural ambient acoustic condition that exists at the Trail and Cabin
- Assesses the effects from the cumulative noise output of all of the equipment on site (compressor, fans, lube oil coolers, utilities, etc.) under full operating conditions
- Determines the distance at which noise from construction, operation, and maintenance of the compressor will attenuate to natural ambient levels
- Calculates noise levels in the area of the Trail in which the noise associated with the compressor station would be above natural ambient levels.
- Assesses the effects that these noise levels would have on trail users, particularly overnight visitors.

NPS can provide technical assistance and guidance on conducting this type of analysis.

Noise Mitigation

NPS recommends measures are taken to mitigate noise impacts. These can include:

- an acoustically designed compressor building;
- high performance turbine exhaust and air inlet systems;
- low noise turbine lube oil coolers;
- unit blowdown silencers.

Night Skies

Trail users, particularly those who stay overnight on the trail, value the dark night skies the NET provides. NPS works to protect natural lightscapes and prevent the loss of dark conditions and of natural night skies. Pipeline infrastructure could degrade that experience for the trail user. The DEIS should analyze the impact of these potential effects. The analysis should include a lighting plan and specific measures that would be taken to mitigate impacts to the naturally dark conditions near the Trail and Cabin.

The NPS recommends the EIS analyze and consider incorporation of the following general lighting principles.

- Light only where needed
- Light only when needed
- Shield lights and direct them downward
- Select lamps with warmer colors (avoid blue-white)
- Use the minimum amount of light necessary
- Select the most efficient lamp and fixture

Health and Safety

The areas around compressor stations sometimes have to be evacuated for safety reasons. Explicit safety planning to make sure visitors staying at the Richardson-Zlogar Cabin are contacted and transported from the area in such an event must be included in an overall safety plan. At this stage of the project, the DEIS should analyze the impacts of ensuring contact and providing transportation out of the area to trail users who will by their nature be on foot.

III. Conclusion

NPS would be interested in meeting with FERC and the project proponent to discuss the overall project, the NET crossings, pipeline infrastructure and ways to reduce or eliminate impacts.

The NPS, New England National Scenic Trail representative and lead contact is Charles Tracy, Superintendent, at charles.tracy@nps.gov or (617) 223-S210.

We appreciate efforts to consider and address NPS concerns regarding the proposed pipeline. While this, and our previously submitted comment letter, together address a large number of NPS units and program lands, it is important to note that this list might not be complete, and it is the applicant's responsibility to verify the information and ensure that all resources are taken into account. Thank you for the opportunity to provide comments. If you have any questions or need additional information, please contact Mary Krueger, Energy Specialist for the Northeast Region at Mary.C.Krueger@nps.gov or 617-223-S066.

Sincerely

Frank R. Hays, Associate Regional Director
Resource Stewardship and Science, Northeast Region

888 First St.NE Rm 1A Washington, DC 20426
From: Pelham Pipeline Awareness group
RE: Docket PF 14-22 Kinder Morgan Pipeline
Date: Sept 15,2015**

The Marcellus Shale fields are pumping out frecked product and so the push is on to build pipelines to EXPORT natural gas with all the risk, but no benefit to the communities that they cross. In NY, MA and NH we are facing the Kinder Morgan Northeast Energy Direct (NED) Project

In NH and Dracut Ma, this involves over 75 miles of pipe, two 22,000 - 44,000 hp compressor stations and valves every 10 - 20 miles. In NH they plan to drill under the Merrimack River twice and the Souhegan River 6 times, potentially unleashing the heavy metals in the sediments - consequences from the industrial activities of the mills a hundred years ago - and potentially contaminating the drinking water of towns downstream. Over 5,000 landowners are abutters and 5 times that are in "incineration zones" should an accident occur.

We cherish our rural character and culture and we are deeply concerned that our lands will be taken by

Eminent Domain - all for the profit of one of the largest pipeline transport companies in the US, - Kinder Morgan, started by former executives of ENRON.

We are worried about pollution from emissions, loss of habitat, contamination of our water supplies, and destruction of local food systems as well as the unintended consequences of industrialization including noise, light and air pollution. We cannot get clear answers about what is emitted during blowdowns and leaks, and there is little research about the health effects to people, wildlife or livestock. Kinder Morgan indicates that their pipelines are safe, yet accidents have increased and their track record nation wide is extremely poor. Kinder Morgan states that this is needed, yet there are over 17 other energy projects under consideration in NE alone and energy usage is going down in NE thanks to conservation measures. Further research shows that the number of pipes that are leaking methane is enormous — large enough to keep pipe-fitters working for ten years. Greed not need is fueling this project.

The Kinder Morgan project is a bad one for NH, for the nation and for world environmental health. We firmly oppose this pipeline project and ask that you recommend, “NO Build”.

Thank you for your attention.

Dracut, MA 01826

Ref. Dracut, MA compression station & high pressure gas line
Tennessee Gas Pipeline Company, L.L.C. / Kinder Morgan

Good Morning

A few questions for FERC. Who do we contact to get some answers on this compression plant/pipeline? I think its very important to get a government investigating this compression plant answers to these questions. It is going to effect our health, lives and property values of approximate 500 homes and 1000 people in the blast zone.

1. At our Dracut, MA town meeting, FERC told us that Kinder Morgan told them there will be no change in our homeowners insurance. Yet when I called my insurance company, they said I would not be covered for any issues caused by the gas line or compression station. I would have to bring Kinder Morgan to court. I ask you; what chance does a home owner have against a 100+ Billion dollar company? I think its safe to say NONE! How can the government allow no coverage for pipeline/compressions station damage or our health for the homeowners in the blast zone?
2. At the Dracut town meeting FERC said they had lots of information for us but do not have time at the meeting. When will Dracut get this information? Hopefully not after the reviews & approvals have past.
3. When is FERC going to address to Dracut the great many safety/violations issues we see on the web for Tennessee Gas Pipeline Company, L.L.C./ Kinder Morgan? We also see articles on Kinder Morgan reducing standard maintenance. After reading the web info, why does Kinder Morgan have a license to build anything any where? I see on the web many articles on violations, safety issues, explosions both large and small, deaths, polluted water/land, lawsuits, etc where they have built. Why are they allowed to continue to build when there are so many issues where they have been based on the web? Shouldn't they have to solve the is-

sues where they have been before building new issues?

4. In 2009 Kinder Morgan was cited by PHMSA for building the pipeline in a high consequence area. What is different from that citation and Dracut? Within the blast zone of the compression station are hundreds of homes and approx. a 1000 or more people living. The Geography Division U.S. Census Bureau says Dracut is a high consequence area. Please explain to Dracut what is the difference is?

5. There are also many web articles on how Kinder Morgan is currently reducing the maintenance on the gas lines. In 2011 Kinder Morgan was cited by the PHMSA for safety issues for what looks to be standard maintenance issues. Wall Street wrote about how horrible their safety record is. Another article found that their own safety records show they have the worst safety record in their own industry. Another article wrote Kinder Morgan has been cited by the U.S. government in 24 incidents which led to five federal enforcement actions from 2006 to 2014. How safe is Dracut's people from the compression station when we consider all the violations, reduced maintenance, safety issues and a automated compression plant? Please answer.

6. Several years ago Dracut had a gas line from Canada to Dracut. We were told that gas line was to solve the northeast energy issues for the future. Why do we need another gas line from PA & Ohio that is many times larger 30/36 inch diameter at a great higher pressure of 1400psi? Was Dracut lied to when the last gas line was presented to us or are we being lied to now for the new gas line or is there another answer? Please explain.

7. We hear the northeast needs the gas. From the web and town meeting my understanding a 30/36 inch diameter high pressure gas line is to transport gas over long distances. The web and at the town meetings we were told that Kinder Morgan has applied for gas export licenses in three place including Maine and also told part of the gas is going to Canada and over seas. Something seams wrong if these things are correct. Canada is sending gas through Dracut and now Kinder Morgan want to send gas back to Canada. Why? Is Canada going to resell the gas back to us on the other gas line?

8. Why do property owners along this pipeline have to sacrifice our property values hundreds of millions so Kinder Morgan can sell their gas over seas for their profit of hundreds of millions? We have worked for 47 years and to loose our home value so a 100 billion dollar company can make more money at our cost is wrong. Please explain.

9. FERC has worked with Kinder Morgan for many years in many towns. Why doesn't FERC tell us how much we can expect our property values will decrease before the compression plant is approved? You must have this data.

10. Gas lines and compression plants are not new. What are the actual chemicals being vented from the compression plants - what health effects are there short & long term from the gases - how many waterways have been polluted from building and operation - what are long term economic & health issues - how much noise pollution is there 1/4, 1/2 & 1 mile from the plant - does Kinder Morgan need to take a bond to protect Dracut - what happens if a major explosion happens - how close is Kinder Morgans response team (assuming there is a team) if a problem occurs - etc. This info I would think should be available from years of operation in other towns. Why hasn' Dracut received this info?

11. Is the government mandating this pipeline to be created or is it Kinder Morgan? If government - who/ what department/agency and what was their reason?

12. Is Kinder Morgan going to take a bond out to cover any damage during and after the construction? If not, why not? Or does Kinder Morgan just have to go bankrupt to get out of any major problems and the people loose everything?

13. Is this project already approved and we just don't know it yet?

I truly do not want to get involved with the Dracut compression plant or pipeline. I also did not believe my neighbors about all the negative things about this compression plant at first. As a father of a family that lives in the blast zone, I felt I should at least look into it a little. Having the chance of my family/home being blown up at any moment from a automated high pressure compression plant by a company that the web says

has the worst safety record in its industry or the web saying the air pollution life issues is not comforting living day to day.

I found that FERC had very little facts to tell us in the town meeting. Which left me looking on the web. What I found on the web about Kinder Morgan & Tennessee Gas scared me! I asked myself, is this info on the web good info - If not good, then why hasn't FERC or Kinder Morgan get the bad info removed from the web'?

As a father I think it's horrible of FERC and other government agencies not to give the people of Dracut facts before we had the town meeting. FERC and other agencies have worked with Kinder Morgan on hundreds if not thousands of towns before Dracut over the years. These other towns I am sure asked the same questions Dracut is now asking. FERC should already know most of the answers to the questions Dracut asked. Yet FERC, to my knowledge, has not given Dracut this info. What Dracut got is incomplete, inaccurate Kinder Morgan information. To have so many Dracut lives and hundreds of millions in property values at stake with little government information I find even more scary. And what are we not being told???????

How do we get answers to these questions?

Sincerely

John Yurka

October 12, 2015

Dear Governor Hassan,

We are writing to oppose the pipeline proposed by Kinder Morgan. The Northeast Energy Direct (NED) pipeline will bring no benefit to New Hampshire.

It feels like the negative effects of this pipeline do not matter to elected officials. Well it matters to all of us who are being asked to live near a compressor station's hub of noise, light pollution, toxic chemicals and frequent "blow downs."

Not only are homes affected, but the compressor station is proposed to go near Temple School where children are. We can prevent the compressor station going in New Ipswich if we find endangered species of animals living there — well isn't this endangering our children of New Hampshire who will be exposed to the harmful effects of this compression station! What if it blows up? I ask you, are children no longer valuable in the eyes of the American government?

If you want this to go through we highly recommend that in your agreement with Kinder Morgan they must offer to buy out the Temple School and the homes in the "burn zone" for fair market value if the owner wishes to sell! If you don't do this all homes will become worthless, it won't sell for fair market value and many people will eventually have to walk away with nothing — because home owners in the burn zone will not be able to live in the type of safe, clean environment that everyone in New Hampshire is entitled to!

After doing the research I am convinced the pipeline construction process will pollute our air, contaminate our aquifers, wells and other water resources. Over 800 NH families will lose their homes and it will destroy conservation lands. It will harm the tourist industry and rural character of New Hampshire. Stand up and stop the greed of Kinder Morgan from ruining our way of life!

Thank you for your consideration.

Most Sincerely
Roger & Joan Crooker

Re: Docket 1PF14-22-000

Dear Members of the FERC Commission:

I am a land owner in southern New Hampshire, and the proposed pipeline will transverse my property.

I do not live in New Hampshire, and if I saw any indication that this pipeline would benefit my New Hampshire neighbors, or other residents of southern New Hampshire in any significant way, I would not comment; but I see no such evidence.

My family purchased this property back in the 1870s, and farmed and raised timber on it for many years. As a teenager in the 1960s, I spent many hours helping my Grand Uncle (then well into his 80's) tend the hundreds of pine trees he had recently set out for the use and enjoyment of future generations. We were taught that this was a legacy we all owed to the future. I am quite certain he did not envision that we were preserving it for a future gas pipeline.

In the years since, my sister and brother and I have purposely left the property vacant in field and woods. We thought this was a good investment in the future of the environment. We do not view this property as an economic investment, but instead view it as an investment in the beauty and resources of the Monadnock Region, and in our family's history. The air is still clear, and you can actually still smell the pines and the other aromas of nature. The water is generally fresh and clean. You can still arise in the morning and have a variety of birds serenade you. As Thornton Wilder said about the Monadnock Region in the iconic play "Our Town": "Things amund here don't change very much." With the coming of the pipeline, all things are likely to change significantly.

From all that I have read, our property, whic is mostly ledge rock in the pipelines route, will be blasted to kingdom come. The air will be subject to releases form the nearby compressor station, the water table will be in peril, and significant noise will be generated by the compressor station day and night. The gas pipeline

will run adjacent to a power line, which presents its own set of perils.

And for what purpose is all of this environmental sacrifice being made? It appears it is to allow the transport of gas across the region and exported in one fashion or another for the use of others. Only recently has the company proposed some accessibility to a few towns on the eastern side of the New Hampshire portion of the pipeline route, in what appears to be a last minute response to the objection that the pipeline doesn't serve the region. How has a need been established that will justify the use of eminent domain, and the future environmental impact on this regions

This may serve as three lessons to all who own property in rural areas: 1) don't leave it vacant of development, or it will be viewed as an easy and convenient route for any utility; 2) don't donate your land to any environmental preservation organization either, since big corporate interests have no hesitation to seize their properties with impunity; 3) if you want to own rural property, make sure it is in a very wealthy area, where you and your neighbors can afford to fend off large business and government interests. If it is in a less wealthy area, you will be an easy target.

Finally, Kinder Morgan stopped contacting me after its very first contact. I suppose I will be required to contact KM myself.

Please reject the application in Docket 1PF14-22-000.

Sincerely,

Bernard T. Martin, Jr.

STOP THE NED PIPELINE!!

Protect NH land from Eminent Domain!

I oppose. the Kinder Morgan Northeast Energy Direct (NED) EXPORT pipeline. The pipelines, and compressor station will scar the NH landscape and put our water, wildlife, forests, agricultural lands and rural character at risk. These include health and safety risks from emissions, industrialization, pollution and the devastating effects of fire and explosions. Greed, not need is fueling this project. Say NO to this private company that will TAKE OUR LANDS with NO BENEFIT TO US.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION
INTERAGENCY PRE-FILING CONFERENCE CALL

Tennessee Gas Pipeline Company, LLC

Docket No: PF14-22-000

NORTHEAST ENERGY DIRECT PROJECT

October 15, 2015

Agencies in Attendance (list of attendees is attached):

- Federal Energy Regulatory Commission (FERC)
 - Cardno (FERC 3rd Party Contractor)
- U.S. Army Corps of Engineers (USACE)
- U.S. Environmental Protection Agency (USEPA)
- U.S. Fish and Wildlife Service (USFWS)
- NY State Department of Environmental Conservation (NYSDEC)
- NY Department of Transportation (NYDOT)
- MA Attorney General's Office
- MA Office of Energy and Environmental Affairs (EEA) – MA Environmental Policy Act (MEPA) Office
- MA Department of Conservation and Recreation (MA DCR)
- MA Department of Environmental Protection (MA DEP)
- MA Department of Fish and Game (MA DFG)
- MA Department of Public Utilities Siting Board (MA DPU)
- NH Department of Environmental Services (NH DES)
- NH Department of Fish and Game (NH DFG)
- Berkshire Regional Planning Commission
- Southwest Region Planning Commission
- Franklin Regional Council of Governments
- Nashua Regional Planning Commission
- Northern Middlesex Council of Governments
- Tennessee Gas Pipeline (Tennessee Gas)
 - Hatch Mott (Contractor for Tennessee Gas)
 - AECOM (Contractor for Tennessee Gas)

Meeting Summary

The conference call was conducted to review the general status of the Northeast Energy Direct (NED) Proj-

ect, including the Project's schedule, field surveys, landowner coordination, and the National Environmental Policy Act (NEPA) process. Topics discussed included:

- Status

- o Final FERC scoping meeting held in Rindge, NH at Franklin Pierce University Field House on September 29, 2015

FERC also attended meetings with NYDOT, the town of New Ipswich, NH, the Southwest Region Planning Commission, and the Berkshire Regional Planning Commission.

FERC attended a meeting with the Tribes and Tennessee Gas on October 9, 2015 to discuss cultural resources surveys and additional tribal monitors.

- o FERC conducted site visits to several locations along the proposed route, compressor station sites, and alternative routes the week of September 28, 2015.
- o Data request sent to Tennessee Gas on October 8, 2015.
- o Formal scoping comment period closes October 16, 2015. Tennessee Gas must respond to all comments received during the comment period by this date. Any comments received afterwards from agencies will be addressed by FERC, or directed to Tennessee Gas for a response.
- o FERC is in the process of analyzing data filed by Tennessee, specifically related to the alternatives. Additional site visits may be scheduled before winter this year.
- o Tennessee Gas planning to submit the application to FERC on November 20, 2015. They are looking at additional information related to route changes suggested by towns and information regarding additional pipeline in PA.
- o Comments from the public and agencies will be addressed in the draft Environmental Impact Statement (EIS). There will be another comment period after the draft EIS, which would last 45 days or longer. Comments received during this comment period would be addressed independently in the Appendix of the next version of the EIS. FERC may address agency comments specifically in the draft EIS.

- Tennessee Gas status update:

- o Surveys

- Recently received permission from Eversource to survey. Surveys may be conducted on fee-owned land and any land in which Tennessee Gas has permission from the private landowner.
- Continuing environmental and cultural surveys on accessible lands in all states crossed by the project. Tennessee Gas is aiming to complete these surveys by December 1, 2015.
- Threatened and Endangered (T & E) species surveys will continue next year as applicable when the snow melts.

- o Meetings

- Three Open House meetings are scheduled in MA from 6:00 – 8:00 pm at the following locations:
 - ≠ Oct. 27 – Windsor, MA – Windsor Fire Department
 - ≠ Oct. 28 – Northfield, MA – Northfield Elementary School
 - ≠ Oct. 29 – Lynnfield, MA – Spinelli's Function Facility
- Continuing to meet with all state agencies to determine permit information.
- Tennessee Gas will be holding a meeting in Franklin, NY. Date of the meeting is still to be determined.
- Meeting was held with FERC and Tennessee Gas to discuss the project schedule and concerns related to survey permission, the EIS, and the projected start date for construction. If there

are any major changes to the routes, FERC will have to open up another scoping period, depending on the route changes and how many landowners need to be notified.

• Miscellaneous:

- USACE application and federal authorizations will be filed simultaneously with the FERC Application on November 20, 2015.
- Tennessee Gas is evaluating the MEPA document submission date. This document will likely be submitted in December 2015 or early 2016.
- Tennessee Gas anticipates submitting the NH Site Evaluation Committee (SEC) application in January 2016.
- Tennessee Gas is completing an in-depth analysis of the I-88 alternative in NY.
- Representatives from the State of MA met with staff at FERC to discuss federal preemption on Article 97 lands

Next Call

- Agency call will be held every 2 weeks.
- Next call scheduled for October 29, 2015.

20151028-0009

STOP THE NED PIPELINE!!

Protect NH land from Eminent Domain!

I oppose. the Kinder Morgan Northeast Energy Direct (NED) EXPORT pipeline. The pipelines, and compressor station will scar the NH landscape and put our water, wildlife, forests, agricultural lands and rural character at risk. These include health and safety risks from emissions, industrialization, pollution and the devastating effects of fire and explosions. Greed, not need is fueling this project. Say NO to this private company that will TAKE OUR LANDS with NO BENEFIT TO US.

VIA FEDERAL EXPRESS OVERNIGHT DELIVERY

October 27, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E., Room IA
Washington, D.C. 20426

RE: Carolyn and Eric Ness, Mega Worcester, Michael and Kelly Paulsen, Holly and Gordon Lovelace, and Woolman Hill Inc., Comments in response to FERC Notice of Intent for the Northeast Energy Direct Project, Docket No. PF14-22-000.

Dear Ms. Bose:

The aforementioned individuals and corporation are directly impacted by the Northeast Energy Direct Project (NED) proposed by Tennessee Gas in Pennsylvania, New York, Connecticut, New Hampshire, and Massachusetts.

Your office issued on June 30, 2015 a request for comments from all parties regarding NED asserting that the EIS will discuss impacts that could occur as a result of the construction and operation of the planned Project under these general headings:

- geology and soils;
- water resources and wetlands;
- vegetation and wildlife;
- cultural resources;
- land use, recreation, and visual resources;
- socioeconomics;

- air quality and noise;
- cumulative impacts; and
- public safety.

You did not invite comments regarding the jurisdiction of FERC to entertain the proposed NED project on the grounds that most of the natural gas to be transported by NED is for export to foreign countries. In fact in all you documents FERC is derelict in not even requiring the NED proponents to specify what they plan to do with the gas since the amount of gas proposed to be transported is far in excess of the amounts that can be used in New England.

The aforementioned Plaintiffs do not believe that the Natural Gas Act grants PERC jurisdiction over the project on the ground that exportation of gas to foreign countries is not “public use” and therefore FERC’s assumed jurisdiction over NED is unconstitutional. Given their belief the aforementioned Plaintiffs filed a Complaint in Federal Court in Springfield on July 28, 2015 followed by an Amended Complaint filed on August 20, 2015. The filing of this case was extensively covered by the local press thus there is no reason for anyone to believe that you were not aware of these filings.

The United States notified Plaintiffs today that it plans to file a Motion to Dismiss the Complaint on the grounds that Plaintiffs proper place to raise these arguments is with FERC. The US does not explain how an agency that is operating on the assumption that it has jurisdiction to operate, can entertain, or has jurisdiction to entertain, a constitutional challenge of the statute on which PERC bases its jurisdiction.

Plaintiffs believe that the argument by the United States that FERC’s jurisdiction to entertain a challenge to the constitutionality of a statute, on which it bases its on jurisdiction, is wrong and will so argue in Springfield Federal Court on November 17, 2015.

Plaintiffs here nevertheless are filing their Amended Complaint and Exhibits as Comments with FERC given the view taken by the United States today in this matter.

Sincerely,

Cristobal Bonifaz, Esq.

Cc: All Plaintiffs

Enclosures: First Amended Complaint with Exhibits 1-21

Case 3:15-cv-30131-MAP Document 5 Filed 08/20/15 Page 1 of 31

**IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF MASSACHUSETTS
WESTERN DIVISION**

HOLLY AND GORDON LOVELACE,	
CAROLYN AND ERIC NESS,	
KELLY AND MICHAEL PAULSEN,	
WOOLMAN HILL INC.,	
MEG WORCESTER AKA	
MARGARET W. FRIEDRICH, AND	
THE MARGARET W. FRIEDRICH TRUST,	
Plaintiffs,	
v.	
THE UNITED STATES OF AMERICA	

C.A. NUMBER:
3:15-cv-30131 (MAP)

FIRST AMENDED COMPLAINT

I. SUMMARY OF THE CLAIM

1. The Fifth Amendment of the United States Constitution grants the United States the power to take private property for “public use,” by paying adequate compensation to property owners, as well as the right to grant such power to private entities. The sole issue in this litigation is the constitutionality of Section 15 U.S.C. § 717(a) of the Natural Gas Act 42 U.S.C. § 7111 et seq., which grants the United States power to allow private entities to take Plaintiffs’ real property by eminent domain, with adequate compensation, for the construction of pipelines to carry natural gas, **not for “public use” but for exportation to foreign countries.**

II. JURISDICTION

2. This action arises under the Constitution of the United States and the laws of the United States, including 15 U.S.C. § 717(a) and 42 U.S.C. § 7111 et seq. This Court has subject matter jurisdiction over this action pursuant to 28 U.S.C. § 1331 as this is a civil action arising under the United States Constitution and pursuant to 28 U.S.C. § 1346(a)(2) as this is a civil action against the United States not exceeding \$10,000.00, said action being founded upon the Constitution and an Act of Congress.

III. VENUE

3. Venue is proper under 28 U.S.C. § 1391(e) (1) (B) because the defendant is the United States; under 28 U.S.C. § 1391(e) (1) because the properties subject matter of this action are located in this district; and 28 U.S.C. § 1402(a) (1) (2) because all Plaintiffs reside in this district.

IV. PARTIES

A. Holly and Gordon Lovelace

4. Holly and Gordon Lovelace have lived in their idyllic 22-acre homestead in Northfield, Massachusetts since February 2007. It is an absolutely amazing property, including a barn, pond, stream, mixed woodlands, blueberries, blackberries, peach and pear trees and an extensive woodlot as well.
5. The home itself is 200 years old, having survived the Civil War, hurricanes, historic blizzards and at least one fire. It has three original fireplaces, a beehive oven and a floor plan nearly identical to one of the reproduction homes in Sturbridge Village. It is truly an historic home.
6. This historic home needed a lot of love -- and work. When the Lovelaces arrived, its basement was just a dirt floor and fieldstone walls.
7. Holly and Gordon installed a pea-stone base and lots of insulation. They refinished and made extensive repairs to the original 12-inch-wide floorboards throughout the main floor. They replaced a wall, three exterior doors, and almost every window. They replaced the ceiling in the dining room, renovated the main bathroom, installed crown molding and repainted nearly every room.
8. Outside, they replaced the front porch completely. They added two levels to the backyard deck, so now there is a view of the stream and wetlands surrounding their home. Several ill trees were professionally removed, as well as an ancient dump area, where they found many bottles and relics from the 1800s. They hired a bulldozer crew to level a massive area of the property.
9. All the work done on the property was worth every penny. Their renovated, historic home is now insulated, warm and comfortable. Sitting on the deck with binoculars and birdwatching books Holly and Gordon have identified more than 50 bird species, and sighted two more as yet unidentified.

Their game camera catches photos of foxes, deer, coyotes and they see black bears round and about at least once a year. The Lovelaces collect garnets, tourmaline and other mineral-rich stones from up their hill and place them in their gardens.

10. This is not just their home. They have three businesses there: Homestead Computing Solutions; Mom's House Estate Finds online collectibles store; and, in addition, they carry out sustainable logging on their land.
11. On June 4, 2015 Holly and Gordon Lovelace received communication from a Kinder Morgan Corporation's subsidiary, Tennessee Pipeline Company, ("Tennessee") stating that a major compression station will be built adjacent to their property. (Ex-1)
12. The proposed compressor station would be one the largest, if not the largest, compression station in the entire United States. (Ex.-2).
13. Building of the compression station adjacent to the Lovelaces' land amounts to a de facto taking of their property since it will make it impossible for Holly and Gordon to continue residing on their property.
14. No one would buy a property so close to what Safety Insurance Company describes as a bio-hazard area. Among the myriad threats are carcinogenic, toxic chemicals -including benzene -- released by the station into the air, probable groundwater contamination due to blasting to build the station, and toxic waste from the periodic cleaning of the massive pipeline. Running 24/7, the massive station would always be brightly lit, ruining the rural night sky. Sporadic blasts of noise at levels in excess of 100 decibels will average, over 24 hour periods, to be significantly in excess of acceptable noise levels for residential use.
15. The construction of such compression station adjacent to their land will destroy the value of their land.
16. The knowledge that the United States, through the Federal Energy Regulatory Commission, would allow the taking of their home and despite the fact that the gas to be pumped by the compression station is primarily for exportation to foreign countries has caused and continues to cause Holly and Gordon Lovelace emotional distress and anguish.

B. Carolyn and Eric Ness

17. Eric and Carolyn were married on 1 May 1977 in Seattle, Washington and moved to 10 Old Albany, Deerfield in August 1980 when they bought their home. Deerfield, being close to Carolyn's family, was chosen as the place to raise their four children, William, Andrew, Samuel and Victoria, and has continually been their home except for Eric's two family-accompanied military assignments outside the continental United States. Despite Eric's current work location in Bloomsburg, Pennsylvania, Deerfield remains the family home, with Eric home regularly on weekends. The Deerfield home is the site for annual hosting of major family events like Thanksgiving and Christmas.
18. While living at their home in Deerfield through the years the Nesses have made significant improvements to their property, including a new septic system, new heating system, potable water, well deepening/improvement, renovations to two bathrooms and five bedrooms, rebuilt kitchen chimney, replaced slate roof flashing, new 200-amp below-grade electrical service, plumbing improvements, kitchen ceramic floor installation, electrical and data line distribution expansion, new workshop outbuilding, land clearing, landscaping, and pasture fencing, to name the most obvious.
19. The Nesses expected to eventually sell their home and use the funds so gained to finance a smaller retirement property.
20. Eric and Carolyn's commitment to this long-term plan for raising their family and financial strategy included retaining the house during overseas military assignments to London and Alaska and has meant Eric has worked away from his family, as a geographical bachelor, for 28 of the past 35 years.

21. Eric and Carolyn received two letters from Kinder Morgan's subsidiary, Tennessee Pipeline Company, dated January 26, 2015 and March 6, 2015 in which Kinder Morgan requested access to their property located at 10 Old Albany Road in Deerfield for the purposes of conducting civil, geotechnical, archaeological, wetlands and water body delineation and an endangered species survey. This request to survey the property is tied to the fact that the proposed pipeline would pass through their property. (Ex-3).
22. This letter has impacted Carolyn and Eric in more ways than one: a) The projected intrusion of the pipeline onto their property has caused a significant decrease in the value of their property if not destroying it completely; b) The proposed taking has caused and continues to cause emotional distress to Carolyn and Eric, as it undermines the purpose of all their sacrifices, time apart over the years, and their dreams and hopes for the future.

C. Kelly and Michael Paulsen

23. Kelly and Michael Paulsen bought their house on 10 Windsor Avenue in Plainfield almost 17 years ago. They didn't have much money but wanted a place with enough land for gardening and horses. When they purchased the house, it had old rattling windows that barely slowed down the wind. It had plywood floors and a hatch with a ladder that led to the basement.
24. Kelly was pregnant with their first daughter at the time. They decided to fix up the house and build equity. Instead of investing in a 401k or like product they poured their savings into the house. They put in hardwood floors, new cabinets, tile, windows, siding, electrical service, spiral staircase, new roof, solar hot water panels, and an addition for a mudroom/laundry room. They put up new window and door trim and baseboard throughout. Outside, they added a stone patio with a concrete soaking tub and a native locust wood pergola. They constructed a full-size riding ring for the horses and installed new fencing.
25. Kelly and Michael knew that all their work would eventually allow them to sell the house and move to a new house, closer to their girls' schools, and still have enough to help out with college tuition. Once their younger daughter became old enough to need her own bedroom, they planned on building an addition that would give Kelly and Michael their own bedroom and bathroom. They planned on adding solar electric panels to save on electric costs, over time, and to do their part to lower their carbon footprint.
26. In the fall of 2014, a man came to their door asking them to sign a piece of paper that would grant him permission to survey their land. The man told them that a gas pipeline was being planned to be built through their property. When they inquired as to the kind of pipeline, they were told it was to transport fracked gas out of Pennsylvania. Kelly and Michael denied him permission. He came back two more times and both times he was denied the requested permission.
27. Kelly and Michael began to inquire as to the nature of the proposed gas pipeline and finally established that the pipeline was going to be built by Kinder Morgan, a Texas corporation. The plan was to put the pipeline through their property, cutting a giant one-hundred-foot wide path to bury and hide a 36-inch pipeline planned to transport billions of cubic feet of natural gas per day from Pennsylvania to Dracut, Massachusetts, a natural gas hub from which natural gas could be transported for liquefaction to natural gas plants and then for exportation to foreign countries.
28. The value of the Paulsens' house was destroyed by this news, as no one wants to buy a house with a massive amount of explosive gas passing through the property.
29. Kelly and Michael quickly established that natural gas pipelines could leak and break and explode, destroying their house and ending their lives and the lives of their children. They can no longer sell their house and their equity has disappeared. They cannot move and have nothing to leave their daughters. They can no longer fulfill their plans to build an additional bedroom and bath or to add the planned solar panels.

30. They have been paralyzed by the pipeline proposal. Their emotional distress has damaged their marriage and it has made it impossible for their teenaged daughters to do the things that their friends do.

D. Woolman Hill Inc.

31. Situated on the beautiful Pocumtuck Ridge in Deerfield, Woolman Hill Retreat Center is a non-profit organization dedicated to the importance of reflection, spiritual engagement, and connection with nature. It provides simple, comfortable facilities for individual retreats, group gatherings, and programs that nurture spiritual growth. In its operations and its programming, Woolman Hill seeks to foster the values of peacemaking, simplicity, integrity, social responsibility, and stewardship of the earth.
32. Beginning with Antoinette Spruyt's original intent to "further the causes of peace and brotherhood in the world" when she donated the land to Quakers in the 1950s, Woolman Hill has a long history of advocacy and witness in western Massachusetts and beyond. Woolman Hill has served as the locus of peace conferences, international youth work camps, alternative school, the birthplace of Traprock Peace Center, the home of war tax resisters Juanita and Wally Nelson, and innumerable spiritual and social justice events.
33. The Nelson homestead was intentionally built with no reliance on fossil fuels or electric power. A demonstration fruit tree and nut project, begun several decades ago, continues to this day. Over the years, significant financial and human resources have been invested in the upkeep, improvement and renovation of Woolman Hill's buildings and land.
34. Consistent with its purpose and its Quaker values, Woolman Hill encourages lifestyles that reduce dependence on non-renewable energy and minimize negative impact on the earth. It places a high value on environmental stewardship in its operations --for example, using wood as the primary heating source, benefiting from solar panels for two of its buildings, and recently installing on-demand hot water heaters in its main building.
35. On February 5, 2014, Kinder Morgan's subsidiary Tennessee Gas Pipeline Company (jointly "Tennessee") sent a letter to Woolman Hill requesting permission to survey Woolman Hill's property because Tennessee was planning to expand its natural gas transmission system in the area. (Ex. -4).
36. On March 11, 2014, Tim Corcoran, an agent of Tennessee, met with two Woolman Hill staff members (Margaret Cooley and Will Stark) and indicated that the projected pipeline would require Tennessee to acquire an easement over Woolman Hill's property.
37. Tennessee has indicated in public meetings and informational pronouncements that the gas projected to be transported through the pipeline originates in the Marcellus Shell located in Pennsylvania and other states, will cross Massachusetts and other New England states, terminating at a natural gas hub located in Dracut, Massachusetts.
38. Tennessee and KM have also indicated at public meetings that the size of the projected pipeline would be 36" to 42" and that the pipeline will transport 2.2 billion cubic feet per day of fracked natural gas per day.
39. The energy that can be generated from two and two tenths billion cubic feet of fracked natural gas per day is the equivalent of one half the equivalent energy expected to be generated by tar sands oil scheduled to be transported by the heavily litigated Keystone pipeline, or the energy than can be generated by eleven nuclear power plants each of the size of the Vermont Yankee nuclear power plant.
40. Tennessee and KM have never denied that the great portion of the fracked natural gas to be transported through the pipeline is for exportation to foreign countries after the gas is liquefied at facilities expected to be approved by the Department of Energy of the United States ("DOE").
41. Woolman Hill relies on income from services that depend on a peaceful, quiet, naturally beautiful setting. Woolman Hill's setting, and its financial wellbeing, would be severely impacted by the con-

struction and installation of the pipeline. Keets Road is also the only egress from the retreat center, and the pipeline would cross that road in three places. Woolman Hill hosts large groups of people, and emergency response or evacuation would be seriously hampered in the event of any pipeline malfunction.

42. In addition to significant concerns about the danger, environmental destruction and economic disturbance posed to Woolman Hill by the pipeline's route across its land, the Woolman Hill community carries equal concern for the broader implications of the pipeline's regional and global impact. All that Woolman Hill stands for would be challenged by the taking of its property for the purpose of fossil fuel export.
43. Installation of the proposed pipeline through Woolman Hill will destroy the moral, spiritual and physical value of Woolman Hill, reducing significantly its future value as a Quaker retreat center and/or the value of the property which could be derived from other possible uses.

E. Meg Worcester aka Margaret W. Friedrich and the Margaret W. Friedrich Trust.

44. Meg Worcester married Edmund E. Friedrich, "Eddie," on December 28, 1989 and moved into the home where she has resided ever since. Eddie died on May 30, 2011.
45. During her lifetime Meg has lived in many homes around the country, but the home where she now lives, in Deerfield, Massachusetts, holds a great deal of significance for her. It is the modern version of her family's 150-year-old home in the White Mountains of New Hampshire. The setting is similar, has a view of the mountains, and it is where she has lived now for 25 years, a longer period in one home than anywhere else in her lifetime.
46. This home is Meg's ideal home, and finding it was the culmination of a life-long spiritual journey. It was designed by her beloved late husband 25 years ago, and where she lived with him there for 21 and half years, before his passing four years ago. She expected to live in this home with memories of him for the rest of her life, hosting guests at her bed and breakfast, all of whom are enchanted not only with the beauty of the accommodations (newly renovated last year) but with the view and quietness of the rural setting as well.
47. On December 12, 2014, Kinder Morgan, on Tennessee Gas Pipeline stationery, sent a three-page letter to Margret (sic) W. Friedrich Trust, owner of the property where Meg Worcester resides, stating that her home and property would be affected by a proposed natural gas pipeline expected to be built through her property. (Ex.-5).
48. The aforementioned letter was clear indication to Meg that Kinder Morgan or Tennessee Pipeline intended to take an easement by legal action on the property where she has resided for 25 years.
49. Meg was devastated when she learned that Kinder Morgan wanted to install a 36inch- wide natural gas pipeline across her property. She is still in a state of shock, suffering from nightmares about it. She is concerned about not only the construction noise that will completely destroy the sense of peace on her hill, but also the awful realization that her well water (within 30 feet of Kinder Morgan's proposed route) could be ruined by either contamination or mechanical malfunction of the pipeline. There is no other place on the property to build a new well.
50. Uppermost in her mind is the potential for an explosion, the fear of which would loom over her constantly.
51. Consequences of the construction of a pipeline across her property would be, for her, devastating. At her age (a healthy, active septuagenarian who is just trying to remain independent and productive) she is distraught, to say the least, and suffering from enormous emotional distress. She feels she belongs on this land and home, and she is not at an age when she can embark on a "fresh start" away from familiar, safe, and nostalgic surroundings. The pipeline would rip all of that away and destroy who she is.
52. The property is in her Trust, with the understanding that it will be given to Eddie's son, Kris, (if still

alive) or to her daughter (if Kris is deceased). However, the value of the property has been destroyed by the announcement of the proposed pipeline.

F. Defendant The United States

53. Defendant the United States of America is the proper defendant in an action arising under 28 U.S.C. § 1331, a civil action arising under the Constitution, and under 28 U.S.C. § 1346(a)(2), a civil action against the United States not exceeding \$10,000.00 and founded upon the Constitution and an Act of Congress.

V. THE NATURAL GAS ACT AND THE FEDERAL ENERGY

REGULATORY COMMISSION

54. The Natural Gas Act was enacted by Congress in 1938 and was subsequently amended in 1954 and 1992. June 21, 1938, ch 556, § 1, 52 Stat. 821; March 27, 1954, ch 115, 68 Stat. 36; Oct. 24, 1992, P.L. 102-486, Title IV, § 404(a) (1), 106 Stat. 2879.

55. In 1977 Congress created the Federal Energy Regulatory Commission (“FERC”) and granted the newly-created agency responsibility for formulation and implementation of a national energy program, whereas previously that responsibility had been fragmented among various departments and agencies of the Federal Government. 42 U.S.C. § 7111 et seq.

56. The newly-created federal agency assumed, as of that date, full responsibility for creation of regulations and for implementation of the Natural Gas Act, previously assigned to the Federal Power Commission and terminated as of the date of enactment of 42 U.S.C. § 7111 et seq., 15 U.S.C. § 717. Transfer of Functions.

57. From the date of its inception in 1977 through 2005 the Federal Energy Regulatory Commission lacked the power to regulate natural gas for import and export and Courts clearly recognized this lack of power:

An exporter of natural gas that, like Entex, is not otherwise engaged in interstate gas transactions is not a “natural-gas company” within the meaning of the Act, because the Act defines a “natural-gas company” as a “person engaged in the transportation of natural gas in interstate commerce, or the sale in interstate commerce of such gas for resale,” Natural Gas Act § 2(6), 15 U.S.C. § 717a(6) (1976), and defines “interstate commerce” as “commerce between any point in a State and any point outside thereof, or between points within the same State but through any place outside thereof, but only insofar as such commerce takes place within the United States,” Id. § 2(7), 15 U.S.C. § 717a(7) (emphasis added). See *Border Pipe Line Co. v. Federal Power Commission*, 84 U.S.App.D.C. 142, 171 F.2d 149 (1948); *Compañía de Gas de Nuevo Laredo v. Energy Regulatory Commission* 606 F. 2d 1029 (1979) (emphasis here only).

58. In 2005, with the advent of fracking in the United States, Congress amended the Natural Gas Act and extended jurisdiction of the Federal Energy Regulatory Commission (“FERC”) to the exportation of natural gas with the following language:

Necessity of regulation in public interest. As disclosed in reports of the Federal Trade Commission made pursuant to S. Res. 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress, it is hereby declared that the business of transporting and selling natural gas for ultimate distribution to the public is affected with a public interest, and that Federal regulation in matters relating to the transportation of natural gas and the sale thereof in interstate and foreign commerce is necessary in the public interest. 15 U.S.C. § 717(a). (Emphasis here only).

59. Congress erred in justifying the inclusion of jurisdiction of gas for export based on public interest by referring to “...S. Res. 83 (Seventieth Congress, first session) and other reports made pursuant to the authority of Congress.” Id., since S. Res 83 of the Seventieth Congress (1928) was based on

Federal Trade Commission reports which dealt solely with 1928 interstate commerce. (Ex.-6, Hearings before the Committee on Intrastate Commerce Seventieth Congress Record of S. Res. 83 of the 1928, applicable discussions at pgs. 10, 16, 79, 94, 97, 98 and 221).

60. The Natural Gas Act was enacted in 1938, and the awarding of gas for export jurisdiction to FERC took place in 2005. Congress' assertion of public interest in its amendment to the Natural Gas Act of 2005 was not only baseless but highly premature, as evident from the two attached letters to the Department of Energy of the United States ("DOE") by two different groups of senators, one group arguing that gas exportation is in the public interest, the other asserting that it is not in the public interest. (See attached letters to DOE by senators, dated July 13, 2013 and February 11, 2015). (Exs.-7 and 8).
61. Important public policy issues related to exportation of gas have not yet been dealt with by either group of senators.
62. Exportation of United States gas to foreign countries depletes a national resource for the use of future generations without bringing any benefit whatsoever to the public interest.
63. Exportation of United States gas to be burned into carbon dioxide and water in foreign countries adds significantly to climate change, an issue of great concern to the people of the United States and their government.
64. It is a self-evident fact that exporting natural gas depletes a national resource from usage by future generations.
65. The issue of climate change, the result of such export, touches on an issue which has generated a great deal of concern to the government of the United States and other governments across the world. The purpose of reducing carbon dioxide emissions is vacated when at the same time a country exports fossil fuels. If and when the United States becomes an exporter of energy reaped by fracking, any agreement between the United States and countries such as China for emission reduction within the United States is rendered meaningless since those exported fossil fuels will be converted to carbon dioxide in other countries. Carbon dioxide emitted by exported fossil fuels is not taken into account in the United States-China agreement to reduce carbon dioxide emissions within each country.
66. Public interest is not, however, the deciding factor as to why FERC cannot regulate transportation of natural gas across the United States for export, and as to why DOE cannot approve export of natural gas transported across the United States in gas export pipelines regulated by FERC.
67. **The critical issue is that the 2005 Amendment to the Natural Gas Act permitting jurisdiction by FERC, to regulate transport of gas for export, is unconstitutional because the Natural Gas Act provides for eminent domain taking of property to satisfy goals set by FERC.**

h) Right of eminent domain for construction of pipelines, etc.

When any holder of a certificate of public convenience and necessity cannot acquire by contract, or is unable to agree with the owner of property to the compensation to be paid for, the necessary right-of-way to construct, operate, and maintain a pipe line or pipe lines for the transportation of natural gas, and the necessary land or other property, in addition to right-of-way, for the location of compressor stations, pressure apparatus, or other stations or equipment necessary to the proper operation of such pipe line or pipe lines, it may acquire the same by the exercise of the right of eminent domain in the district court of the United States for the district in which such property may be located, or in the State courts. The practice and procedure in any action or proceeding for that purpose in the district court of the United States shall conform as nearly as may be with the practice and procedure in similar action or proceeding in the courts of the State where the property is situated: Provided, That the United States district courts shall only have jurisdiction of cases when the amount claimed by the owner of the property to be condemned

exceeds \$3,000. 15 U.S.C. § 717f. (Emphasis here only).

68. To the extent that FERC includes exportation of gas in its regulatory domain, it is violating the Fifth Amendment of the United States Constitution which clearly states that:

“[N]or shall private property be taken for public use, without just compensation.” U.S. Const., Amdt. 5. That Clause is made applicable to the States by the Fourteenth Amendment. See *Chicago, B. & Q. R. Co. v. Chicago*, 166 U.S. 226, 41 L. Ed. 979, 17 S. Ct. 581 (1897). (Emphasis here only).

69. FERC’s consideration for approval of pipelines carrying gas for export is in conflict with Fifth Amendment law as interpreted by the Supreme Court of the United States.

On the one hand, it has long been accepted that the sovereign may not take the property of A for the sole purpose of transferring it to another private party B, even though A is paid just compensation. On the other hand, it is equally clear that a State may transfer property from one private party to another if future “use by the public” is the purpose of the taking; the condemnation of land for a railroad with common-carrier duties is a familiar example. *Susette Kelo et al., v. City of New London* Supreme Court of the United States 545 U.S. 469, 477; 125 S. Ct. 2655, 2661; 162 L. Ed. 2d 439, 444 (2005.) (Emphasis here only).

70. In *Kelo Id.*, in an opinion by Justice Stevens, J., joined by Justices Kennedy, Souter, Ginsburg, and Breyer, JJ., it was held that the city’s proposed disposition of property under the development plan qualified as a “public use” under the Fifth Amendment, so that the city properly could use the power of eminent domain to acquire the unwilling sellers’ property.

We emphasize that nothing in our opinion precludes any State from placing further restrictions on its exercise of the takings power. Indeed, many States already impose “public use” requirements that are stricter than the federal baseline. Some of these requirements have been established as a matter of state constitutional law, while others are expressed in state eminent domain statutes that carefully limit the grounds upon which takings may be exercised. As the submissions of the parties and their amici make clear, the necessity and wisdom of using eminent domain to promote economic development are certainly matters of legitimate public debate. This Court’s authority, however, extends only to determining whether the City’s proposed condemnations are for a “public use” within the meaning of the Fifth Amendment to the Federal Constitution. *Kelo Id.* 545 U.S.469 at 489; 125 S. Ct. 2655 at 2668; 162 L. Ed. 2d 439 at 457-458 (2005.) (Emphasis here only).

71. Were the Supreme Court to eventually rule that a foreign trade benefit justifies Fifth Amendment takings, the prophetic words of Judge O’Connor in her dissent, joined by the Chief Justice and Justices Scalia and Thomas, in *Kelo Id.*, would come to pass:

...nearly any lawful use of real private property can be said to generate some incidental benefit to the public. Thus, if predicted (or even guaranteed) positive side effects are enough to render transfer from one private party to another constitutional, then the words “for public use” do not realistically exclude any takings, and thus do not exert any constraint on the eminent domain power. *Kelo Id.* 545 U.S.469 at 501; 125 S. Ct. 2655 at 2675; 162 L. Ed. 2d 439 465 (2005.) (Emphasis here only).

72. Once trade benefit is accepted as “public use” Congress could allow the taking of virtually any private property that could more profitably be marketed abroad, which taking might improve the economy of the United States. Congress could, for example, permit one of its agencies to confiscate all automobiles in the United States older than three years. This congressional agency could then confer this power on a corporation, which would pay wholesale value for the automobiles (just compensation) and sell them at a profit in foreign markets. This too-easily imagined nation would no longer be the United States of America.

73. Kelo Id. is not the case here. The strip mall to be built on Mrs. Kelo's property was to be used by the public, and that is exactly what the majority of the justices concluded. Furthermore, contrary to Congress's vague referral to an obscure 1928 interstate trade report, the City of New London clearly put forward the argument that the taking of Mrs. Kelo's property was for public use. (See Ex.-21, City of New London's Response Brief in Kelo Id.)
74. FERC is about to approve the installation of a gas pipeline, subject matter of this action, destroying the value of Plaintiffs' properties, while this pipeline cannot be considered, under any definition of the term, to be for "public use" since it is only going to transport less than thirty percent of the gas for use within the United States, with the balance going for export to foreign countries for the sole purpose of enrichment of the corporations planning the gas transportation.
75. Defendant may argue that because thirty percent of the natural gas to be transported by the pipeline is for "public use" (as it will be used in New England) the entire pipeline transporting the balance of the gas for export qualifies as "public use" within the meaning of the Fifth Amendment.
76. Such an interpretation of the Fifth Amendment "public use" clause will create a slippery slope, destroying the meaning of the "public use" term. How far would the defendant go if it uses this argument? Is it thirty percent? Is it twenty percent? Is it one percent? Is it one thousandth of one percent?
77. The United States Department of Energy is considering granting permits for construction of Liquefied Natural Gas Plants ("LNGP") for export of natural gas approved for transportation, for eventual export, by pipelines approved by FERC.
78. The exportation of natural gas is a very profitable venture for private parties and, per Kelo Id., such enrichment of a private party is not justification for Fifth Amendment takings.
79. In the last analysis, what FERC and DOE are overlooking is that "public interest" is not equivalent to "public use" within the meaning of the Fifth Amendment.
80. The framers of the United States Constitution did not say that governments had the right to take private property if such takings are in the public interest. What they said was that government had the right to take private property for "public use." (See also Exhibit-19 Professor Bruce L. Benson Article Published in the Independent Review Volume XII Winter 2008 pgs. 423-432, filed here with permission from Professor Benson).
81. Taking of private property because it is in the public interest is a fallacious excuse for eminent domain takings since in a democratic society anything a government does is by definition in the "public interest."
82. Adoption of the "public interest" term as a justification for eminent domain takings will simply turn the Fifth Amendment provision permitting eminent domain takings into useless paper.
83. Congress, the Executive branch, and the Courts can approve gas or oil transportation pipelines for exportation of oil and/or gas or the building of LNG facilities using transported gas or oil for export only when the proposed oil and gas pipelines carrying gas or oil for exportation do not take private land by eminent domain or threaten to take private land by eminent domain. This is the restriction imposed by the Fifth Amendment whether the proposed pipeline is the Kinder Morgan ("KM") pipeline, pipelines scheduled to transport tar sands' oil for export, or any other similar pipelines.

VI. KINDER MORGAN AND THE FRACKING GAS INDUSTRY

84. Kinder Morgan's subsidiary, the Tennessee Gas Pipeline Company, L.L.C. ("Tennessee"), filed on September 15, 2014 a request with the Federal Energy Regulatory Commission seeking eventual approval to build a pipeline to carry 2.2 billion cubic feet of natural gas per day from the Marcellus Shale through New England.
85. Prior to September 15, 2014 and starting sometime in 2014, Kinder Morgan conducted a series of

public meetings in Franklin County, Massachusetts, describing the nature and extent of the project, including the projected pipeline capacity and the volume of gas expected to be transported through the pipeline.

86. At no time has FERC conveyed to Kinder Morgan, or any of its subsidiaries or affiliated companies, that, since a portion of the gas expected to be transported through the pipeline is for export to foreign countries rather than for usage within the United States, FERC has been and will continue to be in violation of the United States Constitution if it continues to take any action regarding the project.
87. On or about July 6, 2015, FERC mailed Plaintiffs' counsel a Notice of Intent to Prepare an Environmental Impact Statement ("EIS") for the Planned Request for the "Northeast Energy Direct Project...involving construction and operation of facilities by Tennessee Gas Pipeline Company, L.L.C. ('Tennessee')" (Ex-9).
88. FERC states in its July 6, 2015 communication, referred to in ¶ 87, that "The Commission will use this EIS in its decision-making process to determine whether the Project is in the public interest and necessity." Id. at pg.-1.
89. FERC continues on in its July 6, 2015 communication:

If you are a land owner receiving this notice a Tennessee Gas Representative may contact you about the acquisition of an easement to construct, operate, and maintain the planned facilities. The company would seek to negotiate a mutually acceptable agreement. However, if the Commission approves the Project, the approval conveys with it the right of eminent domain. Therefore if easement negotiations fail to produce an agreement, the pipeline company could initiate condemnation proceedings where compensation would be determined in accord with state law. Id., at pg.-2
90. The majority of gas to be transported by the proposed Tennessee pipeline is for export to foreign countries. (Ex.-12, Expert Report of David Keith.)
91. Neither Kinder Morgan nor Tennessee nor FERC have ever denied in any forum that the great portion of the natural fracked gas to be transported in the Tennessee pipeline is, in fact, for export.
92. FERC is aware that a great portion of the natural gas to be transported by the proposed Tennessee pipeline is for export to foreign countries.
93. FERC is aware Tennessee has not been able to contract more than thirty percent of the gas projected to be transported by the proposed pipeline for sale within the United States.
94. On December 30, 2014, counsel for the Plaintiffs raised the issue of exportation of gas through the Tennessee pipeline with Tennessee and Kinder Morgan's counsel. (Ex.-10).
95. Neither Kinder Morgan nor Tennessee ever responded to counsel's letter dated December 30, 2014, referred to in ¶ 94, thus admitting by their silence that FERC has no jurisdiction over the proposed pipeline given the fact that most of the gas to be transported is for export to foreign countries.
96. The Department of Energy of the United States ("DOE") claims jurisdiction over the exportation of natural gas.
97. At no time has DOE taken into account, in its permitting processes for exportation of natural gas, that gas for foreign export, including KM's gas, is transported through pipelines approved by FERC under authority allegedly granted them by the 2005 Amendments to the Natural Gas Act ("NGA") and that approval by FERC of such transportation of natural gas for exportation is in violation of the Constitution of the United States.
98. The United States Department of Energy is aware that a great portion of the natural gas to be transported by the proposed Tennessee pipeline is for export to foreign countries.
99. The United States Department of Energy is aware that Tennessee has only been able to contract for sale within the United States less than thirty percent of the gas projected to be transported through

the proposed pipeline.

100. The lack of communication to anyone by DOE of these facts, while at the same time continuing to grant permits to transport natural gas for foreign export through FERC- approved export gas pipelines, represents a continuing violation of Fifth Amendment rights of individuals such as Plaintiffs who stand to have their land taken for transportation of natural gas intended for exportation to foreign countries, solely for the enrichment of Kinder Morgan and Tennessee.
101. On July 20, 2015, Plaintiffs Eric and Carolyn Ness received a letter from KM addressed through Plaintiffs' counsel. (Ex.-11).
102. KM's submission through the July 20, 2015 letter is a Notice for Public Comment Hearings by the Massachusetts Energy Facilities Siting Board regarding the gas pipeline and associated facilities in Berkshire, Essex, Franklin, Hampden, Hampshire, Middlesex, and Worcester Counties proposed by the Tennessee Gas Pipeline Company. Id.
103. Tennessee admits in its application to the Energy Facilities Siting Board that the diameter of the Main Line Pipeline is 30 or 36 inches. Id.
104. Tennessee also admits that the diameter of the Maritime Delivery Line is 30 inches. Id.
105. The admissions made by Tennessee as per paragraphs 103 and 104 are, in fact, admissions that a minimum amount of gas scheduled for export through the Maritimes Delivery Line is, in fact, a minimum of seventy per cent of the gas to be transported by the Main Pipeline entering Massachusetts.
106. The admission comes about from the fact that the volumes to be transported through the Main Delivery Line and the Maritimes Lines are proportional to the square of the diameters of the pipelines.
107. Berkshire Gas ("Berkshire") is a supplier of natural gas to some Western Massachusetts towns. Berkshire is owned by UIL Holding Company ("UIL").
108. In May or June of 2015, a major European Conglomerate, Iberdola, won federal approval for the purchase of UIL, which also owns Connecticut Natural Gas and Southern Connecticut Gas.
109. Iberdola is a Spanish corporate giant who already owns Rochester Gas and Electric Company, New York State Electric and Gas, and Central Maine Power.
110. The amount of natural gas Berkshire Gas projects to purchase from Tennessee is less than 1.6 per cent of the total gas expected to be transported by Tennessee's pipeline. (Ex-12, Expert Report by David Keith.)
111. Berkshire, given the profit it is going to derive from the sale of UIL to Iberdola, has a keen interest in the construction of the Tennessee pipeline.
112. Iberdola's interest in small gas suppliers in the United States, such as Berkshire Gas, is directly related to the importation of natural gas by Iberdola into Europe.
113. Berkshire appears to have overstepped its bounds in its sale to Iberdola when its principal spokesperson, Mr. Christopher Farrell, accused those opposed to the Tennessee pipeline, including Plaintiffs in this litigation, of eco-terrorism for their efforts to protect their lives and property. (Ex.-13).
114. The matter of the Tennessee pipeline came before the Deerfield Massachusetts, Board of Health ("BOH") at the request of citizens of Deerfield, who asked the BOH to hold adjudicatory hearings to determine whether the fracked gas pipeline KM and Tennessee propose to build through Deerfield's boundaries presents unreasonable risk to the health and lives of the citizens of Deerfield. (Ex.-14, Transcript of the Hearings by a Certified Court Reporter).
115. Between September 9, 2014 and October 23, 2014, the BOH held the requested adjudicatory hearings to establish facts and to evaluate the dangers to the health and well-being of the residents of Deerfield. Id.
116. KM and Tennessee were invited to participate and introduce evidence at the adjudicatory hearings

in person and in writing. Id.

117. KM and Tennessee refused to participate in any way at the adjudicatory hearings, thereby showing nothing but contempt for the BOH and the law in Massachusetts which grants boards of health in Massachusetts the right to ban from their respective towns activities that may endanger the health and well-being of the residents of the town. M.G.L. Ch. 111 §§s. 31 and 143. Id.
118. The Massachusetts Supreme Court has ruled that federal preemption does not apply to such rulings or regulations issued by Boards of Health or Town Commissioners of Health. *Arthur D. Little v. Commissioner of Health of Cambridge* 395 Mass. 535; 481 N.E.2d 441; 1985 Mass. LEXIS 1720 (1985).
119. After extensive adjudicatory hearings before the BOH of Deerfield between September 9, 2014 and October 23, 2014, the BOH banned the building and operation of the projected Deerfield pipeline within the boundaries of Deerfield. (Ex.-15).
120. The Deerfield BOH established a series of facts, not contested or objected to by KM or Tennessee, at the adjudicatory hearing. Id.
121. The uncontested facts, upon which the BOH based its decision to ban the pipeline, follow.
122. A Kinder Morgan subsidiary was convicted in California of six felony counts regarding the deaths of Javier Ramos, Israel Hernandez, Tae Chin, Victor Rodriguez and Miguel Reyes. Id.
123. The Supreme Court of the United States has rejected the argument that political speech of corporations or other associations should be treated differently under the First Amendment simply because such associations are not “natural persons.” *Citizens United v. Federal Election Commission* Supreme Court of the United States 558 U.S. 310 at 343; 130 S. Ct. 876 at 900; 175 L. Ed. 2d 753 at 784 (2010)(citations omitted).
124. The order of the Supreme Court, establishing that corporations cannot be treated differently from “natural persons,” albeit in the context of the First Amendment, gives clear indication to the BOH that a corporation cannot be treated differently from “natural persons” in the context of felonies committed.
125. Felons have limited rights in Massachusetts, i.e., cannot participate in elections (as they cannot vote while incarcerated), cannot be members of the Gaming Commission, etc.
126. The Deerfield BOH found that a corporation convicted of felonies resulting in the tragic deaths of five people presents an unreasonable risk to the health and lives of residents of Deerfield if such felon were to be allowed to build a massive, high- pressure fracked-gas pipeline through Deerfield. (Ex.-15).
127. The Deerfield BOH found that Kinder Morgan was cited by the Hazardous Materials Safety Administration for violating its regulations five times in 2011. Id.
128. The Deerfield BOH found that, in Texas alone, from 2003 to 2014 Kinder Morgan experienced 36 “significant incidents” resulting in fatalities or hospitalization, fires, explosions or spills. Id.
129. The Deerfield BOH found that allowing Kinder Morgan--a corporation known to have acted with willful disregard for regulations enacted to prevent injury to, or death of, residents and citizens--the right to build and operate a massive, high-pressure fracked gas transportation pipeline through the town would present unreasonable risk to the health and lives of residents of Deerfield. Id.
130. The Deerfield BOH found that Kinder Morgan has a record of bribery, pollution, fraud, scams, thefts, deaths, felonies, environmental disasters, labor violations, unsafe working conditions, and influence-buying. Id.
131. The Deerfield BOH found that Kinder Morgan’s operations in Portland, Oregon, have been host to pollution, law-breaking, and even bribery. Id.
132. The Deerfield BOH found that the Federal Bureau of Investigation determined that between 1997

and 2001 “Kinder Morgan systematically scammed some of its customers, including the Tennessee Valley Authority (“TVA”), a publicly owned provider of electricity in the mid-South.” Id.

133. The Deerfield BOH found that the same federal investigation found that, at its Grand River Terminal in Kentucky, Kinder Morgan officials took coal from a customer’s stockpiles and resold nearly 259,000 tons. Id.
134. The Deerfield BOH found that, in another case, the US Environmental Protection Agency (“EPA”) fined Kinder Morgan \$613,000 for violations of the Clean Air Act after “regulators discovered that the company had been illegally mixing an industrial solvent described as a ‘cyclohexane mixture’ into unleaded gasoline and diesel.” Id.
135. The Deerfield BOH found that in 2010 the federal government fined Kinder Morgan \$1 million for repeatedly violating the Clean Air Act. The US Department of Justice found that “among other crimes” Kinder Morgan managers lied on permit applications, stating that the company would control its pollution, when all the while they knew the control equipment was not being operated or even maintained properly. Id.
136. The Deerfield BOH found that currently Kinder Morgan is under investigation by the EPA for violating the federal Renewable Fuels Standard. Officials believe that Kinder Morgan purchased conventional fossil fuels while filing falsified documents certifying that the fuels came from renewable sources. Id.
137. The Deerfield BOH found that allowing Kinder Morgan--a corporation with a record of having acted with such willful disregard for regulations, enacted to prevent injury to, or death of, residents and citizens--to operate within the bounds of the town of Deerfield would present unreasonable risk to the health and lives of residents of Deerfield. Id.
138. The Deerfield BOH found that Kinder Morgan’s pipelines have endangered lives in many communities across the United States and Canada, as enumerated below. Id.
139. The Deerfield BOH found that in 2007 a Kinder Morgan pipeline ruptured in Burnaby, British Columbia, forcing 50 families to evacuate their homes as oil rained down on a residential neighborhood. Id.
140. The Deerfield BOH found that in January of 2012 a Kinder Morgan storage facility in British Columbia spilled roughly 29,000 gallons of crude oil into the community of Abbotsford. Id.
141. The Deerfield BOH found that in April of 2004 a long stretch of a Kinder Morgan corroded pipeline ruptured, spilling 123,000 gallons of diesel fuel into a sensitive saltwater wetland on San Francisco Bay. Kinder Morgan pled guilty on four counts relating to that spill, as well as an unrelated spill in Los Angeles Harbor. Id.
142. The Deerfield BOH found that in November of 2004 an oil pipeline of a Kinder Morgan subsidiary burst in the Mojave Desert, sending a jet of fuel 80 feet into the air. The break closed the nearby interstate highway and contaminated more than 10,000 tons of soil in the habitat of the federally-endangered California Desert Tortoise. Id.
143. The Deerfield BOH found that in 2005 Kinder Morgan had spilled 70,000 gallons of fuel into Oakland’s inner harbor and then 300 gallons into the Donner Lake watershed in Sierra Nevada. And in 2007 the City of San Diego sued Kinder Morgan for falsifying records of the clean-up of a fuel leak that contaminated the aquifer. Id.
144. The Deerfield BOH found that in May of 2011 the US Pipeline and Hazardous Materials Safety Administration announced a proposed \$425,000 fine against Kinder Morgan for safety violations following a federal investigation into Kinder Morgan’s having spilled 8,600 gallons of hazardous liquids in New Jersey. Id.
145. The Deerfield BOH found that in December of 2011 a two-year-old Kinder Morgan natural gas pipeline leaked in Ohio, spewing 127,000 cubic feet of natural gas and forcing residents to evacuate

- their homes. Id.
146. The Deerfield BOH found that allowing Kinder Morgan, a corporation with a known record of endangering lives of residents across North America, to build and operate a massive fracked gas transportation pipeline through the town would present unreasonable risk to the health and lives of residents of Deerfield. Id.
147. The Deerfield BOH found that pipeline transportation of fuels is a dangerous operation in the United States and worldwide, as instances enumerated below illustrate. Id.
148. The Deerfield BOH found that from 2000 to 2009 there were 460 accidents on record related to pipeline discharges of fuels, whether gas or liquids, in the United States. Id.
149. The Deerfield BOH found that pipeline-related incidents have brought pipeline safety to national —and presidential —attention. Id.
150. The Deerfield BOH found that from 1994 through 2013 the United States had 745 serious incidents with gas distribution, causing 728 fatalities, 1059 injuries, and \$110 million in property damage. Id.
151. The Deerfield BOH found that National Public Radio reported in January of 2014 that more than 6,000 leaks of gas had occurred in the District of Columbia alone. Id.
152. The Deerfield BOH found that in Massachusetts in the last ten years it has cost consumers more than \$1.5 billion for fuel leaked from pipelines. Id.
153. The Deerfield BOH found that there is a danger to the health and lives of residents of Deerfield if the BOH were to permit construction and operation of a natural gas pipeline within the town of Deerfield, particularly when the company constructing and operating the pipeline is Kinder Morgan. Id.
154. The Deerfield BOH found that Kinder Morgan’s Official, Mark Hamrich, reported at a public meeting held at Greenfield Community College on July 14, 2014 that Kinder Morgan does not know the composition of the fracked gas planned to be transported through the proposed pipeline. Id.
155. The Deerfield BOH found that fracking is a process designed to extract gas from shale buried in the soil. Fracking fluid is a toxic brew consisting of multiple chemicals, which may include materials such as petroleum distillates, ethylene glycol, methanol, polyacrylamide and many others. Id.
156. The Deerfield BOH found that Kinder Morgan has not denied that some of these fracking chemicals might be present in the fracked gas to be transported through the pipeline.
157. The Deerfield BOH found that the statement of Mark Hamrich of Kinder Morgan at an open meeting disingenuous as the actual composition of the gas in the pipeline can be established at any time by simple gas and/or liquid chromatography analysis. Id.
158. The Deerfield BOH found that the unknown composition of the gas in the pipeline will indeed present a danger to the health and lives of residents of Deerfield if the BOH were to permit construction and operation of a natural gas pipeline within the town of Deerfield, particularly when the company constructing and operating the pipeline, Kinder Morgan, does not know the composition of the gas to be transported through the pipeline. Id.
159. The Deerfield BOH issued an Order, dated October 23, 2014, banning construction and operation of the proposed pipeline through Deerfield based on the factual, uncontroverted evidence presented at the public adjudicatory hearings held between September 9, 2014 and October 23, 2014. Id.
160. Kinder Morgan’s and Tennessee’s response to the Deerfield BOH Order, based on the board’s findings through its extensive adjudicatory hearings (where neither Kinder Morgan nor Tennessee were willing to participate, nor did they object to the facts introduced), was a letter sent on November 17, 2014 by Kinder Morgan and Tennessee’s counsel, stating that “...the Order is a nullity.” (Ex.-16).
161. The aforementioned letter also states that “Tennessee expressly reserves all legal rights and remedies, including, without limitation, the right to dispute the factual allegations and legal claims in

the Order.” Id.

162. Neither KM nor Tennessee seems to be aware that by not participating, as repeatedly requested to do so, at the BOH hearings held between September 9, 2014 and October 23, 2014, they waived their right to object to the factual findings of the BOH.
163. Kinder Morgan stated at a public relations meeting held at Greenfield Community College on July 14, 2014 that the thickness of the walls of the proposed 36-inch to 42-inch pipeline will be only 60% of the thickness of other pipelines that pass through more populated areas.
164. Wall thickness of gas pipes is one of the major costs of pipelines for manufacture, installation, and operation. The thinner projected pipeline represents savings in the hundreds of millions of dollars in the projected five-billion-dollar project.
165. KM/Tennessee rationalizes implementation of the thinner-walled pipelines by using a cost-benefit analysis which values total expected lives lost in an explosion in rural areas much lower than total expected lives in a more populated area because of projected lower number of deaths.
166. Plaintiffs’ lives and other lives possibly lost by an explosion are thus merely a cost of doing business for KM/Tennessee.

**VII. THE ALLEGATION BY FERC THAT THE PIPELINE
PROJECT IS IN THE “PUBLIC CONVENIENCE AND
NECESSITY” IS IRRELEVANT
TO THE FIFTH AMENDMENT CLAIM
SUBJECT MATTER OF THIS COMPLAINT
AND IT IS ALSO NOT TRUE**

167. FERC justifies, in its July 6, 2015 communication referred to in ¶ 87, that the pipeline project subject matter of this action is “in the public convenience and necessity.” (Ex.-9).
168. FERC is now arbitrarily modifying the language of 15 U.S.C. § 717 (a) from public interest justified by a 1928 interstate trade report to “public convenience and necessity,” thus in its mind trying to simulate desperately, the Fifth Amendment language of “public use.”
169. What the Fifth Amendment states is that:

“[N]or shall private property be taken for public use, without just compensation.” U.S. Const., Amdt. 5. That Clause is made applicable to the States by the Fourteenth Amendment. See Chicago, B. & Q. R. Co. v. Chicago, 166 U.S. 226, 41 L. Ed. 979, 17 S. Ct. 581 (1897). (Emphasis here only).
170. The 2005 amendment to the Natural Gas Act, subject matter of this action, allegedly grants FERC jurisdiction over exported gas when such exportation is in the public interest, justified by a 1928 interstate trade report, which is not “public use.” The effort of FERC to redefine its jurisdiction based on public interest, justified by a 1928 interstate trade report, into “public convenience and necessity,” is a futile effort to place a square peg into a round hole.
171. Defendant cannot re-write the statute. This attempted re-writing of 15 U.S.C. § 717(a) as justifying takings of land based on “public convenience and necessity” deserves an E grade for effort on the part of the agency, and nothing more, since the statute reads public interest justified by a 1928 interstate trade report and the Fifth Amendment reads “public use.”
172. Defendant’s attempt to re-write the statute suffers from an identical flaw as does the term public interest justified by a 1928 interstate trade report language of 15 U.S.C. § 717(a) since neither “public interest justified by a 1928 interstate trade report” nor “public convenience and necessity” can be equated with “public use.”
173. Defendant admitted in 2014 in a report prepared by one of its agencies, the General Accounting

Office (“GAO”), that “In passing the NGA, Congress did not define public interest.” (Ex.-17 at pg. 11).

174. This Court is faced with three separate and distinct explanations as to why Defendant claims justification for KM/Tennessee to take Plaintiffs’ property by eminent domain:
- A. Congress, in enacting 15 U.S.C. § 717(a), justified the taking of private property by eminent domain on the basis of an obscure 1928 interstate trade report. (Ex. - 6).
 - B. FERC justifies the taking of private property by eminent domain based on a rabbit pulled out of a hat which it calls “public convenience and necessity.” (Ex.-9)
 - C. The General Accounting Office (“GAO”) comes clean and admits that Congress failed to define the public interest, for taking private property, for a multibilliondollar- company to enrich itself by exportation of gas to foreign countries. (Ex.-17 at pg. 11).
175. The fact that GAO in 2014 finds that the Natural Gas Act has not defined public interest should give this court pause as to how far Defendant is willing to go to redefine the statute as if it said “public convenience and necessity,” which it does not say, which furthermore is, in fact, not “public use” satisfying the requirements of the Fifth Amendment.
176. Moreover, the projected pipeline is not even in the “public convenience and necessity” since it is going to result in a sharp increase of natural gas costs and it is not needed to supply natural gas to New England. (Exs.-12, 18, 20).
177. Plaintiffs’ expert David Keith has testified that the natural gas expected to be transported through the pipeline is not needed in New England. (Ex.-12).
178. Industrial expert Paul Cicio, CEO of Industrial Energy Consumers of America, has opined that consumer prices of natural gas will most likely increase if natural gas is exported to foreign countries. (Ex.-18).
179. Defendant’s own agency, the United States Energy Information Administration, has concluded unequivocally that “Increased LNG exports lead to increased natural gas prices.” (Ex.-20 at pg. 12).

VIII. RESERVATION OF RIGHTS

180. This case is filed under 28 U.S.C. § 1331 and 28 U.S.C. § 1346(a) (2) since this is a civil action against the United States arising under the Constitution and does not claim damages in excess of \$10,000.00, as per 28 U.S.C. § 1346(a) (2), and it is based on the Constitution and an Act of Congress, in this case 15 U.S.C. § 717(a).
181. Plaintiffs, through this filing, are not waiving any damages to which they might be entitled under Massachusetts tort laws and the Federal Torts Claim Act.

IX. CAUSE OF ACTION

182. Plaintiffs re-allege and incorporate by reference each and every allegation contained in the preceding paragraphs as if set forth fully herein.
183. This is an action to halt the approval under consideration by federal agencies of the Kinder Morgan/Tennessee pipeline, as described in this Complaint. The purported basis for considering construction and operation of the pipeline is Section 15 U.S.C. § 717(a) of the Natural Gas Act 42 U.S.C. § 7111 et seq., which grants the United States the power to allow private entities to take real property by eminent domain, with adequate compensation. In a case such as this, however, where the pipeline is expected to carry a minimum of seventy per cent of the gas for foreign export, approval by these federal agencies amounts to an unconstitutional exercise of their powers.
184. This Court has subject matter jurisdiction over this action pursuant to 28 U.S.C. § 1331 because this is a civil action arising under the Constitution and pursuant to 28 U.S.C. § 1346(a)(2) and because this is a civil action against the United States not exceeding \$10,000.00, and founded upon the

Constitution and an Act of Congress.

185. The defendant is the United States of America.

186. As a direct result of 15 U.S.C. § 717(a) of the Natural Gas Act 42 U.S.C. § 7111 et seq., the federal government is considering permitting KM/Tennessee to take Plaintiffs' properties or an easement over Plaintiffs' properties.

187. These actions of the United States are unconstitutional and have caused damages to Plaintiffs, granting them Article III standing to bring this action to have 15 U.S.C. § 717(a) of the Natural Gas Act 42 U.S.C. § 7111 et seq., declared unconstitutional, in that it permits the United States to allow KM/Tennessee to take Plaintiffs' properties by eminent domain or to place an easement over Plaintiffs' properties by eminent domain in violation of the Fifth Amendment of the United States Constitution since the takings are not for "public use."

X. PRAYERS FOR RELIEF

WHEREFORE, Plaintiffs pray this court:

1. Declare 15 U.S.C. § 717(a) of the Natural Gas Act 42 U.S.C. § 7111 et seq., unconstitutional as applied to Plaintiffs in this litigation.
2. Issue a Temporary Restraining Order halting all further actions of Defendant's agencies in the matter of the KM/Tennessee pipeline until the issues raised in this Complaint are fully adjudicated.
3. Enjoin Defendant's agencies from considering approval of the KM/Tennessee pipeline, subject matter of this action, since a great portion of the gas to be transported by the proposed pipeline is for export to foreign countries.
4. Award Plaintiffs judgment as allowed by law, and such other relief as the Court may deem just, including an award of reasonable litigation costs incurred in this proceeding pursuant to 28 U.S.C. § 2412(a)(1) and an award of attorney's fees pursuant to 28 U.S.C. § 2412 (b).
5. Grant such other and further relief as the Court may deem equitable and proper.

Massachusetts State House
Boston, MA 02133

Kimberly D. Bose, Secretary
Nathaniel J. Davis, Sr. Deputy Secretary
Federal Energy Regulatory Commission
888 First St, N.E.
Washington, DC 20426

Ms. Bose and Mr. Davis,

I wish to officially declare my intent to intervene in relation to Tennessee Gas Pipeline's Northeast Energy Direct proposal, FERC docket number PF14-22-000. The pipeline threatens to not only endanger land in the towns of Wilmington and Tewksbury, but also violate Article 97 of the Massachusetts Constitution and serve as a burden to residents across the state. I ask that you add my name to the list of interveners so that I may remain well-informed on the status of the project and submit comments when I believe it to be necessary. Thank you.

Sincerely,

Representative James R. Miceli
19th Middlesex District

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

Dear Ms. Bose:

According to the article linked below from the Roanoke Times, even in 2012, FERC commissioners knew there were health risks associated with compressor stations. Why do you continue to approve more infrastructure? Before you approve another thing, I suggest you fix what's broken. Find a way to make compressor stations safe, and PROVE THEIR SAFETY before you build any more, especially a 41HP compressor station that would be built 1/2 mile from an elementary school, as Kinder Morgan/TGP proposes to do in New Ipswich/Temple, NH. And make it mandatory that leaking pipes are fixed before more pipelines are approved. Boston/Massachusetts is losing lots of gas because of leaks, yet there are three transmission pipelines on the table to come into Dracut, MA. Fix things before you build new things! It might not make dollars, but it makes sense.

http://www.roanoke.com/business/news/ferc-split-over-n-y-compressor-station-shows-differing-opinions/article_83badb2e-f02b-584e-8b41-2a471850e6d4.html

Sincerely,

Gina Rosati

Washington, DC 20426

STOP THE NED PIPELINE!!

Protect NH land from Eminent Domain!

I oppose. the Kinder Morgan Northeast Energy Direct (NED) EXPORT pipeline. The pipelines, and compressor station will scar the NH landscape and put our water, wildlife, forests, agricultural lands and rural character at risk. These include health and safety risks from emissions, industrialization, pollution and the devastating effects of fire and explosions. Greed, not need is fueling this project. Say NO to this private company that will TAKE OUR LANDS with NO BENEFIT TO US.

Statement of opposition to the proposed North East Energy Direct project:

Background: Natural features and lay of our land on our property relative to the power corridor and proposed project

I bought our property in Plainfield in 2004 and created the homestead by building our home with my own hands and creating 2 miles of woodland trails throughout our 20 acres of rugged contoured land with plenty of exposed ledge and a pristine small river known as Mill Brook.

The river begins 3 miles upstream and flows across the Eversource corridor from north to south (1/2 of the width we own with an easement for the original WMECO power company) before traveling 1500' throughout our woodland property and exiting at our southern boundary before entering the Westfield River watershed.

We have several smaller spring fed streams which originate on our land and flow into Mill Brook. A major natural feature on our land is Bassett Brook which has a head water at a spring fed pond one mile west of our property boundary. This Bassett Brook cascades 1400' through a series of rock chasms and bold outcroppings of ledge and glacial erratic boulder fields before flowing into our main water course - Mill Brook.

A view of a short section of cascade along the 1100' run of Bassett Brook on its way to Mill Brook.:

(This water course runs 1100' through our property paralleling our easement along the power corridor about 50' to 80' in to the woodland beyond the southern edge of the wood line which bounds the exposed footprint of the power corridor. Bassett Brook is a cascading series of waterfalls dropping some 250 feet in elevation on the way to it flows into Mill Brook.)

{photo omitted}

A view of crystal clear Mill Brook as it runs 1500' through our woodland:

{photo omitted}

Mill Brook, three miles downstream from its headwaters, crosses the power corridor through a piece of flatland/wetland which is laced with a dozen beaver dams creating numerous ponds under the cables and steel structures. All of this lies at the very bottom of a vast open power corridor about 300' wide which runs downhill on an estimated 30 degree slope running a distance of approximately 1000' from a high ridge until it reaches the wetland and Mill Brook crossing at the bottom of the falling landscape.

The potential here for erosion if excavation begins for the proposed pipeline would be great. Mill Brook leaves the corridor and flows 1500' throughout our homestead before going downstream to the Westfield River watershed.

Despite the KM stated plans for erosion control the internet has numerous documents that cite erosion violations from earlier Kinder Morgan projects that are explained as " third party" incidents. KM distances itself from any responsibility for damages in such cases even though they hire the subcontractors.

Erosion from construction in this unique landscape setting could easily result in transforming a clear free running natural stoney bottom brook- Mill Brook - into a slow moving shallow waterway chocked with silt

and covering fish and vegetation along the way.

Quality of Life:

We're here for a reason

We bought this land on purpose for the quite, fresh air, crystal clear rushing waters, wildlife that we share this natural wonder world with. If an industrial infrastructure penetrates this pastoral setting it will be a violation of the balance of nature we have invested in and cultivated here in this space we call home.

I built this place when I turned 60 years old in preparation for future retirement. Now, what has been a place for reflection, contemplation and cohabitation with nature has, for the past 15 months, been threatened by a proposed industrial project.. This is not an industrial region, in fact, it is defined by and visited because it is a rural setting with all of the typical qualities one seeks as a retreat. Beyond our individual homesteads we know the surrounding natural settings attract 1000's of travelers and tourists - a main part of the economy of western Massachusetts.

I am one of many citizens who feel we are at war with a project driven mostly by corporate profit objectives as we try to preserve our quality of life. I didn't envision going into my 70's wasting my life fighting a corporation and defending the natural environment and a vision I have worked for all of my life.

The current proposed route for NED runs along the northern boundary of the power corridor on the opposite side of the corridor from our property. The land there along the current proposed route is open and rolling landscape and easily excavated. If that route is changed to the south side of the corridor and into our woodland it would require destroying the Bassett Brook waterway and cascading rock-scape (seen in the first included photograph).

This is unacceptable to me and my family. If this change is ever considered it will be a game changer for us and our involvement will need to be scaled up to respond to that threat of destruction and violation to our way of life.

Opposition to the North East Energy Direct pipeline project proposed by Kinder Morgan/ Tennessee Gas Pipeline:

I will list our key concerns beyond those stated above in a topical outline form to save time. These are my issues that I want FERC to fully understand and consider:

Homestead

Health and Safety risks from pipeline infrastructure. Local organizations and authorities are not prepared to respond to events that threaten communities.

Loss of homeowners insurance and/or increased costs for insurance if coverage remains available.

Inability to refinance my home due to the proximity of the pipeline. A real loss since I am retired and may need to tap this resource in the years ahead.

Loss of our quality of life due to air quality, sound pollution, night light pollution and industrial footprint in an otherwise rural and natural setting.

Loss of market value for the future sale of our home due to the industrial presence in the surrounding area.

Environment

The damage to greenfield landscapes and waterways will obviously be significant for this new pipeline infrastructure. Beyond this local physical and quality of life impact there is the larger issue of Global Warming and the damage done by continued use of fossil fuels as a main solution to our future energy needs if billions of dollars is invested in pipe in the ground the fossil fuel future. It is clear Natural gas will be a "bridge fuel" for the near term as battery storage technology extends the ever-expanding potential for Solar and wind generation. Hydro power from the north is on the horizon. These "free files" - wind, water and solar are kinder to the earth.

Economy

Since the capacity of the NED pipeline at 1.3 Bcfd is substantially greater than the customer base identified by KM 600 Mcfd (some not even on the market path in New England) it seems absolutely clear that a large portion of this capacity will be earmarked for export. Prices in Asia and Europe are significantly higher and will make the price of domestic gas more expensive.

Even by KM's own admission, NED, like all pipeline projects, are for profit. Why would they sell their product for less at home when they could double/triple their profit abroad? This concern is only underscored by the prospect of all 5 pipeline projects currently in various stages of development all being approved leading to an overbuild of infrastructure resulting in 8 to 10 times the amount of gas anyone states the New England region needs.

Energy Future: conclusion

Please do not overbuild the fossil fuel infrastructure when the bridge we need for a fossil fuel to meet the brief "peak period needs" for additional natural gas only needs to be a short bridge for the short term. Increased LNG storage, conservation and investing in and expanding the build out of renewable energy infrastructure to support the use of "free fuel" is the best way to insure a safe, reliable, renewable and responsible energy future for New England, America and the Earth.

Thank you, Stephen Wicks. 50 west Hill Road, Plainfield, Massachusetts. 413 634 8023

20151030-5162

katharine gregg, mason, NH.

We are approaching the date Kinder Morgan will file with FERC. I realize NH needs more and cheaper electricity, but please push for alternative ways of generating it. Natural gas is not as clean as it is made out to be. Nor is the amount of gas proposed to be piped through the state necessary for New Hampshire's electricity needs. Our communities are being used to transport gas for export and for Kinder Morgan's profits. Please be clear about this and do not approve this pipeline project

Sincerely,

Katharine Gregg
243 Valley Road
Mason, NH 03048
