Editor's note:

The comments sent to FERC by citizens, local governments and organizations are meant to provide important information to FERC for use in its review of a proposed project. In this role the information flows essentially in only one direction: to FERC.

A less well known function is to encourage the exchange of information between citizens, groups and local governments. In my view this exchange is as important as informing FERC, perhaps more important.

Unfortunately, while the comments sent to FERC are made part of the public record and are placed on-line, they can be rather hard to access through FERC's somewhat opaque eLibrary interface. In practice they essentially disappear from the public eye.

*As a consequence, much of the value of the comments is lost. While some comments are simple "I'm all for it" or "don't allow it" expressions of opinion, many others contain thoughtful discussions of costs and benefits, suggestions for studies which would be important, considerations of alternative solutions, and other valuable contributions to the public discussion. **It is a terrible waste of human effort and knowledge to allow these comments to disappear from the public discussion.***

The intent of this document was to collect and make easily accessible the comments sent to FERC by citizens, organizations and local governments along with FERC's replies. I wanted to make the comments available as a collection in a small number of PDF files of manageable size - this meant that the comments would have to be in text form rather than as large image scans.

Most of the documents were scanned at FERC and then converted into text via OCR (Optical Character Recognition). While modern OCR can do a decent job, there always will be errors. The errors were compounded by the tendency of some FERC clerks to stamp the documents near to, often on top of, the text - which greatly confused the OCR and made it time-consuming to select and copy the remaining legible parts.

Hand-written documents are not OCR compatible and could not be converted to text. They are listed in sequence below but without text; where possible a note is made as to author and support or opposition.

Maps and similar graphical material are also not included.

Also excluded are the very large document collections provided by Kinder Morgan in their application. Each update of their proposal includes almost 1,000 MB of files containing thousands of pages. These files are listed in sequence below and can be downloaded from FERC's eLibrary if you want them.

Much of the OCR'd text resulted in lines which did not match the page width of this collection; simply copying these short lines this would have at least tripled the length of this already very long document. Instead, after selecting the text I reformatted the paragraphs so that they would fill out the width. I did not attempt to also recreate indentations or tabular formats.

This project has been complicated by several factors:

I found it surprising that many documents which were fully OCR compatible were never converted, including a number which came from governmental bodies, tribes, or influential NGOs. These were either stored as (large) image scans in the PDF files or simply noted as not being convertible with no clue as to content. Some which had "SENT BY EMAIL" in their header, indicating they had been sent to FERC in digital text form were apparently converted into the much less useful scan image format. Processing at FERC seems somewhat inconsistent. Where possible I have applied my own OCR when only scans are provided.

Finally, there is pilot fatigue and error. Long and late hours provided ample occasion for errors and I'm sure I must have made some. I suspect the most likely would be deletions of parts of paragraphs (the Delete key being all too close to other keys I used). Please report any that you discover to Garth@Mason-NH.org and I will repair them.

In short, expect some errors. When in doubt you can consult images of the originals in FERC's eLibrary. The bolded numbers, such as "**20140917-4001(29789308).pdf**", are the FERC document file names in which the first numbers, e.g., **20140917-4001**, are the document's "Accession Number" while the numbers in () are the specific file number (there may be several files, for example a scan Image file and also a PDF version, possibly OCR'd, or not...).

You can search FERC's eLibrary at <http://www.ferc.gov/docs-filing/elibrary.asp> where you can use "advanced search" to find all files under a specific Accession Number.

G.Fletcher.

The files are listed in numerical order - which should correspond to date, beginning with the earliest.

House of Representatives**

September 25, 2015

Norman C. Bay, Chairman
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

Dear Chairman Bay:

I have received correspondence from Supervisor David Fleming, Rensselaer County, New York that was sent to FERC on September 22, 2015. The letter, addressed to FERC Secretary Kimberly Bose, is a resubmission of requests sent to her office on August 12, 2015.

The original letter made three requests, an extension on the FERC comment period for PF14-22, immediate access to Critical Energy Infrastructure Information (CEII) for three chosen town leaders, updates on all Slings made by the applicant to FERC to include complete answers to the enclosures outlined in your letter. We were pleased that FERC has granted an extension on the comment period to October 16, 2015.

I ask that you review the enclosed letters and give them all appropriate considerations. I would like to express my support for these requests. I have long advocated that this process be transparent to my constituents, and this is a reasonable request that would allow my constituents to fully understand the impacts of this project, should it move forward.

Please direct your reply, or any questions, to my Kinderhook District Office at 518-610-8133 or by mail to PO Box 775, Kinderhook, NY 12106.

Sincerely,

Chris Gibson
Member of Congress

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF 14-22-000
Northeast Energy Direct Project

Dear Chairman Bay:

Thank you for meeting with me to discuss the myriad concerns raised by many in the Commonwealth of Massachusetts who are impacted by the proposed Tennessee Gas Pipeline Company/Kinder Morgan Northeast Energy Direct (NED) pipeline project Docket No. PF 14-22-000. Although the NED project is in the pre-filing stage, people throughout the Commonwealth are deeply engaged in the analysis and comment process. And, while I understand that the Federal Energy Regulatory Commission (FERC) evaluates projects such as NED pursuant to its statutory obligation and established regulatory requirements, it is my fervent hope that as part of the evaluation process you will give serious consideration to the concerns and objections raised by those in Massachusetts and other states along the proposed route who will have to live with the effects of this project for many decades if it is approved.

The purpose of my visit is threefold: 1) to present you with a copy of the testimony from the September 10th Greenfield, Massachusetts comment session; 2) to summarize the comments from the perspective of people on the ground; and 3) to gain greater understanding of FERC's decision-making process and to discuss a decision-making framework from the point of view of those constituents and many state legislators.

COMMENT SESSION, SEPTEMBER 10, 2015

On September 10, 2015, over 250 people attended a comment session in Greenfield, Massachusetts that was organized to provide additional information and testimony to FERC regarding the proposed NED project. The format of the comment session was similar to the previous scoping session held by FERC staff in both the format and subject matter. I requested that the comments address the same issues as a FERC environmental impact scoping session. Of those 250 people, 73 people testified orally over a four-hour time period and many submitted written testimony as well. The package presented to you today includes a transcript of both the oral and written testimony at the Greenfield session. Nearly everyone who testified, with very few exceptions, objects to the proposed NED project, arguing that it is not in the public interest and requests that FERC deny issuance of a certificate of public convenience and necessity when officially requested or withhold issuance until such time as Kinder Morgan and the NED project addresses the identified concerns and problems.

In general, the comments address issues regarding the impact on water resources, wetlands, wildlife, air quality, cultural resources, land use, socioeconomics and quality of life, public safety, alternatives to the project and to fossil fuels, and the size and scope of the project relative to the current and projected need for gas in the region. Although the detailed comments on these matters are included in the attached transcript, this letter discusses several key points that were identified by many of the commenters.

COMMENTS AND CONCERNS

ENVIRONMENTAL

Many commenters are concerned about the deleterious and harmful environmental effects of the pipeline and object to the project in its entirety due to the impact of project on the lands and waterways along the selected route. Noting the abundance of groundwater - wells, rivers, fractured bedrock aquifers - some opponents request that FERC require a detailed hydro-geologic survey of the public and private wells along the entire route to adequately evaluate the potential impacts. Many are also concerned about the effect of horizontal drilling as method to install the pipeline during the construction phase. Others expressed concern about the effect of the toxic chemicals that would be emitted by the pipeline components and that would pollute surrounding properties, as well as the harmful health effects of such emissions on people who live near a pipeline. There is also concern that the pipeline would cross some of the most pristine land in western Massachusetts and in addition to the negative environmental impact, would have a harmful economic effect on the surrounding communities by virtue of its existence. And, they are also concerned that the pipeline

would take protected conservation land by private eminent domain.

NEED AND ALTERNATIVES, COST

Many commenters question the need for the pipeline and argue that a pipeline of this size and scope is inconsistent with efforts to reduce our dependence on fossil fuels and increase the amount of clean and renewable energy in the system. And, most people commented that, as proposed, the project will be overbuilt and that the true undisclosed objective of Kinder Morgan is to export the pipeline gas into world markets. They are

also concerned that ratepayers will be required to pay for this pipeline for decades to come, regardless of whether there is any direct local benefit and even if the pipeline becomes uneconomic in the future.

PUBLIC SAFETY

Many municipal officials were troubled by the public safety aspects of the pipeline and by the fact that the size of the project is substantially larger than the identified need for gas in the region. In addition to the pipes, many feel that the compressors and blow off valves present a clear and present danger to people and property proximate to the sites.

DECISIONMAKING PARADIGM

The Commonwealth of Massachusetts is in the process of transitioning from a fossil fuel based energy framework to a new energy paradigm. that reduces our dependence on legacy fuels and incorporates ‘cleaner and renewable sources of energy. Nearly a decade ago, we established aggressive and groundbreaking emission reduction targets pursuant to the state Global Warming Solutions Act and the Green Communities Act, and we are well on our way to meeting those benchmarks. The legislative and regulatory framework we established to guide the transition recognized the need to assist the development of clean and renewable energy technology, energy efficiency and conservation, smart grid and distributed technology and demand reduction by changing the market structure for energy supply and by establishing financial incentives and mechanisms to encourage clean and renewable energy to be competitive with fossil fuels. The Massachusetts Senate, House of Representatives and Governor are in the process of examining that legislative framework, and we anticipate there will be new legislation this session that we hope will speed up development of new green energy market entrants and new technology solutions and expanded energy conservation efforts.

Over the past two winters, Massachusetts experienced both supply shortages and cost increases that had a significant impact on ratepayers throughout the Commonwealth. And, while we will make every effort to address cost issues, we are also concerned about capacity and reliability of in the system both today and into the future. To date, we have seen conflicting studies about the New England gas market and whether the system needs new pipelines or whether the winter needs can be addressed through other means, such as LNG. The Attorney General of the Commonwealth is currently conducting a regional reliability study, which we anticipate will respond to the question of how much supply and infrastructure is needed through 2030.

If approved, the NED project will be a huge intrusion for a long time regardless of whether we ultimately need the pipeline and use the gas, creating the potential for stranded costs in the future that will be borne by ratepayers. And, in addition to the NED project, there are other pipeline, transmission and hydroelectric projects either proposed or under consideration and the proponents of each of these projects assert that they will address the problem of constrained resources in the New England Markets. And, in my district, which is served by The Berkshire Gas Company, even if the NED project is approved, it does not address the current economic distress faced by gas customers due to a moratorium imposed by the Company on adding new customers or expansion for existing customers.

As FERC moves forward in evaluating the NED project, it will be crucial to consider the plan within the overall context of what is happening in the New England region and take into account our substantial efforts to address cost, capacity and reliability while moving aggressively to meet the established and anticipated climate reduction targets. It is important to make a decision that is fair, right and reasonable and in the public interest as we transition to a new energy future. Massachusetts now leads the nation in energy efficiency,

and is among the top five states in overall solar energy production. Furthermore, our green energy industry is one of the fastest growing sectors of our economy. These are just a few examples of the progress we have made, progress that has helped make Massachusetts a nationally-recognized pioneer in addressing climate change.

On behalf of those of us who will be substantially and specifically affected by this project for decades to come, I request that as part of your review, you consider this project within the context of the overall regional needs and alternatives; consider all other peak demand solutions; consider state-level priorities on renewable energy and conservation and their ability to meet both our peak and long term needs in the coming years; consider all proposed pipeline proposals and all proposed energy infrastructure concurrently; consider long term demand in Massachusetts and New England only, not potential exports and that you consider infrastructure improvements and pipeline integrity, including fixing leaks across the distribution system before allowing a project of the size and scope of NED to be built I would also request that the FERC process be extended to accommodate each of these considerations and that you provide time for the public to respond as new information becomes available. Finally, consistent with the FERC pipeline review process, I request that FERC refrain from issuing a certificate for the NED pipeline until such time as the potential adverse consequences have been adequately addressed.

Thank you again for meeting with me on this important matter. I stand ready to provide any additional information and assistance that I can as the process moves forward.

Sincerely,

STAN ROSENBERG

President of the Senate

Hampshire, Franklin and Worcester District

SENATOR ROSENBERG: It is now 6 p.m., so I'm calling this session to order, and I'm asking numbers 1 through 5 to please come to the microphone, and I'm asking number 1 to please take your place at the microphone. And we are ready to begin.

KENNETH BERTHIAUME: Good evening, and welcome. And thank you for this opportunity. Massachusetts currently has under --

SENATOR ROSENBERG: Spell your name, please.

KENNETH BERTHIAUME: Oh, I'm sorry.

SENATOR ROSENBERG: That's okay.

KENNETH BERTHIAUME: It's Kenneth, K-E-N-N-E-T-H, and the last name's Berthiaume, B-E-R-T-H-I-A-U-M-E. Massachusetts currently has underutilized infrastructure, specifically the DistriGas LNG terminal in Everett that, and I quote "on a sustainable basis, has the vaporization capacity of approximately 700 million cubic feet per day," which is 200 million cubic feet per day more than the NED LDC commitments. Massachusetts has unused infrastructure, specifically the Northeast Gateway (the exception being this past winter) and Neptune Deepwater Ports, and previously permitted but unbuilt infrastructure, namely additional tanks at the Berkshire Gas LNG facility in Whately, not to mention Natural Gas infrastructure that continually leaks into our atmosphere at the rate of 15 billion cubic feet per year. For the record, 15 billion cubic feet per year is the approximate re-gasified equivalent cargo of five average-sized LNG tankers, which is approximately the amount of incremental re-gasified LNG injected into New England Natural Gas pipelines this past winter, primarily via the DistriGas (Everett) port and the Canaport (New Brunswick, Canada) terminals. The basic question, "How does FERC consider environmental impacts relative to need as projected into the future" was raised at the August 12th FERC Scoping Session in Lunenburg. The FERC representative, who happens to be the responsible person for generating the NED EIS, responded simply that he could not answer this question as it would involve other sections of FERC beyond his area of expertise. He also indicated that they, FERC, only reviewed past and current energy generation capability needs. The point here is that the energy landscape has changed dramatically over the past five years and shows no signs of slowing for the foreseeable future. How are these rapid changes in renewable technologies, when projected forward, factored into the assessment of need and environmental impact? As previously indicated, Massachusetts already has underutilized and unused infrastructure. We cannot afford additional overbuild at the expense of the environment, homeowners, and ratepayers. ISO-New England has recently stated that the 2014 energy consumption numbers are 2 percent lower than 2013 and the winter peak for those years is also lower, and further indicate that EE and solar are having an impact. And I quote: "When the EE savings are factored into the region's load forecast, energy usage is expected to remain flat, with an average annual growth rate of 0.0 percent rather than the 1 percent projected in the baseline load forecast." Stated another way, the baseline and peak numbers are decreasing, not increasing. In closing, as Massachusetts has led the nation in energy efficiency these past four years, it now needs to increase its use of renewable energy technologies and their associated zero-cost energy sources such as solar and wind, while reducing its dependence on carbon-producing fossil fuels if it is to have any chance of compliance with the Massachusetts Global Warming Solutions Act.

SENATOR ROSENBERG: Thank you.

KENNETH BERTHIAUME: Thank you.

SENATOR ROSENBERG: Thank you for your testimony. Number 2? Your name?

BILL KILPATRICK: Bill, B-I-L-L, Kilpatrick, K-I-L-P-A-T-R-I-C-K. Good evening. My wife and I are retired and only have our home and property as our material financial assets. It is located within one mile of the proposed compressor on Gulf Road in Northfield but outside of the half-mile blast zone and apparently no eminent domain coverage. We are unable to move, unable to sell our home, which depends on well water, and is crossed on two sides by Millers Brook, which is a cold water fisheries brook. Our home, along with my neighbors on Gulf Road, Pratt Hollow Road, and Alexander Hill Road are in the middle of the Northfield Water Supply Protection District, the same water protection district that the proposed pipeline and compressor will be located. They will be located at one of the highest points of the water supply protection district, which is uphill from our homes, as well as Main Street, Northfield. Protestors of the pipeline have been called eco-terrorists by Kinder Morgan. It is Kinder Morgan that is the eco-terrorist and worse: A domestic terrorist corporation having government protection. Our property and our lives will be effectively taken for the greater good. The greater good, being Kinder Morgan and its executives as well as Europe. Our property will be effectively taken when our water quantity, that is the flow of the water, and quality are reduced and polluted as well as our air being polluted. Our health and lives will be considered collateral damage from Kinder Morgan's point of view. Kinder Morgan is a corrupt immoral corporation. The only thing that matters to them is money. The residents of Northfield and the other communities affected by this pipeline are just collateral damage to Kinder Morgan. This project is just not only going to destroy the natural beauty of the area, it's going to destroy the community; just collateral damage. When the towns were sacrificed to create the Quabbin Reservoir; it was for the greater good of Americans and wasn't a continual source of pollution, illness, and death to the residents year after year, unlike this pipeline and compressor, which will be forever. Please, tell Washington to stop inking the ink pads to rubber stamp this abomination.

SENATOR ROSENBERG: Thank you.

REBA-JEAN SHAW PICHETTE: My name is Reba-Jean Shaw Pichette. Our home is in West Deerfield at the base of the Hills of Wisdom on the original Boston to Albany Stagecoach and Foundation. We are in Kinder Morgan's incineration zone from two sides. We are where the pipe of the to-be-determined gauge will make a 90-degree turn to descend to the river. Incineration zone is only a few homes, I suppose, but the August explosion in Texas led to the evacuation within a mile radius of the pipeline. "To be determined." That is the operative term. This will determine if citizens still have the right to own their home, to live away from cities, from noise, pollution, and the lights that obliterate the night skies. This will determine whether we are a forward-planning nation economically and environmentally -- smart -- or a corpocracy with little consideration for the future. Fifty-five towns voted against this infrastructure expansion. I am skeptical as to whether corporations are people, or even represent people, but I know the towns are people. Are we still a democracy? Last month I visited Pennsylvania. I saw the swell of anti-PennEast pipeline, also Kinder Morgan, all along the Delaware Canal and through protected parks, and Mennonite, Amish and Quaker farms. The meek are sure getting fracked. No private individual by law would be allowed to do their own assessments of our property impact, yet Kinder Morgan presents coercive letters to owners to sign away the rights to these studies, and they make studies to decide the impact on our wells, our septic, archeology, et cetera. Please ask FERC to consider these reports as null and void on the grounds of conflict of interest. You'll hear a lot about water. New England is an oasis in our country and the world. Nothing that threatens clean water, as fracking does, no perceived fuel need, no corporate bottom line should take precedence over protecting and conserving our water and the aquifers that serve them. And no removal of the miles of hilltop trees that create that water by transpiration should be considered. Water trumps them all, as I've said before. Water is for the future generations and all species on this planet. People are smarter, greener, cleaner, especially here in the tofu belt of our Commonwealth, and more of our homes are PVT solar and zero impact. We have voted our taxes up here to protect and preserve the environment. Please tell FERC that allowing KM

to proceed is taxation without representation. We want energy plans that are forward moving. Investing in this is like basing our economy on whale-oil lamps. The quiz for the past is the present. What did we learn, what decisions will we make that ensure our children's future? Will they have a healthy and a happy world to inherit? To be determined.

JULIE CAVACCO: My name is Julie Cavacco. That's C-A-V-A-C-C-O. I'm a resident of Deerfield. I live two miles south of the proposed pipeline and wetlands, where all the water from the leaking will end up. I'm most concerned about the grade 3 pipeline and the likelihood of leaking and the effect on our water as in the wells, the rivers, for recreation, aquifers, and farmland. We are blessed with sufficient water to provide such a variety for local food. I'd like to see our water not so knowingly be put in jeopardy of being tainted. My second point is that, if the State were to plot out a path for a pipeline that truly was being put in for the greater good of the Commonwealth, I doubt seriously we would impact our day-to-day life with the sound and the noise and construct one much like a Big Dig version that traveled under mountains and rivers through our farmlands and preserved forest and under heavily trafficked roadways. And I live near the train line, so I know the expanded use of the train line. It makes no sense to me that they would go that route. Our ancient footpaths led the way along rivers. We see 5 and 10, the railroad, and 91 follow those paths. The Pike doesn't go over a peak of a mountain, nor does 141 in Easthampton or 116 in Amherst. It goes through passes. Quabbin Reservoir was built in a valley, not on top of a meadowed mountaintop. When looking at it from a practical point where practical monies are involved, we behave practically -- except for maybe the Big Dig. When money is not an object or when it's for profit, then practicality goes out the window. None of Kinder Morgan's plans for this pipeline are practical. I oppose the path of this pipeline and the tainted product that it will be filled with. And I also want to remind all of us that, with the fair, the first week of school, I think all of us represent easily another ten people. Thank you very much, Stan.

SENATOR ROSENBERG: Thank you.

JACK SPANBAUER: My name is Jack Spanbauer, S-P-A-N-B-A-U-E-R, and I am chairman of the Northfield Select Board. I want to thank Senator Rosenberg for this opportunity to speak and for your 15 years of dedicated service to the Town of Northfield. Northfield's adamantly against the pipeline and compressor station, and voted against it by a 6-to-1 margin at our town election and unanimously against it at town meeting. We expect that the pipeline and compressor station will cause many negative environmental impacts. These expected impacts are detailed in the report we prepared and we would like to submit two copies, with the latest addenda, and ask that you bring one of them to Washington. Our report is many pages too long to relate all of it here, but we have expressed concerns relating to all the FERC environmental categories. Most notably are the concerns for impacts on our water resources. One, the pipeline would pass through resource areas for four public water supplies. The watershed for the East Northfield Water Company reservoir, Zone 3 for the Northfield Water District well, and through interim wellhead protection areas for two public water supplies at the Northfield Mountain recreation area. Number 2, it also appears to pass through FEMA designated flood plain areas. Number 3, it closely parallels or crosses three designated cold water fishery streams. Number 4, extensive blasting could affect scores of residences with bedrock wells. Number 5, clear-cutting for rights-of-way and access road will increase stormwater runoff. Number 6, finally, the route will extend over two-and-a-half miles through the Four-Mile Brook watershed. Because of the steep slopes of the watershed, Four-Mile Brook is susceptible to the danger of flash flooding. In 1999, Hurricane Floyd caused a flash flood that washed away hundreds of feet of the roadway, isolating residents for days. Construction clear-cutting and compaction of native soils during construction by heavy equipment is going to greatly increase the danger of this flash flooding. To conclude, Northfield is very frustrated about the lack of transparency and consistency by FERC and Kinder Morgan. For example, the environmental scoping process started before Kinder Morgan had even submitted their report to FERC. FERC held their public hearing only five days after Kinder Morgan's report was made public. FERC held their public hearing at a small, un-air-conditioned venue and scores of concerned citizens had to be turned away. Initially, the deadline for comments was August 31. Uh, no, now it's October 16. The pipeline will be 36 inches. Uh, no, it's going to be 30 inches. The pipeline will just touch the southeast corner of Northfield. Uh, no, it's going to extend

eight-and-a-half miles through Northfield. There will be no compressor station in Northfield. Uh, no, there will be an 80,000 horsepower station. Uh, no, there will be a 41,000 horsepower station. The pipeline plans prepared by Kinder Morgan and presented on the FERC website are unreadable. Northfield has requested full-size hard copies. To date, neither party has responded. Kinder Morgan presented Northfield with a figure of expected real estate taxes that makes it look like Northfield won the lottery. Despite requests for details that resulted in that estimate, Kinder Morgan has not provided them. Our own research into other communities with extensive LNG infrastructure indicates that the Kinder Morgan estimate may be high by an order of magnitude. Finally, Northfield to date has not seen any unbiased objective study about the need for this project. This project will have very significant impacts on Northfield. FERC and Kinder Morgan must be transparent, consistent, and honest going forward. Thank you.

JED PROUJANSKY Number 6, Jed Proujansky, J-E-D, P-R-O-U-J-A-N-S-K-Y, and I'm going to talk about the issue of need. I'm a selectman from Northfield. Let me preface it by saying a man who owns ten cars and signs a contract for an eleventh car has to prove the need for an eleventh car. There needs to be a clear need for FERC to approve the taking of land by eminent domain. The land in question is private land, town land, state land, federally-funded protected land, but I want to address the question. Let me start with the definition of need. Need is something that is required, a necessity, a condition marked by the lack of something requisite. Need is distinguished from desire by the necessity and requirement rather than something someone would like to have. There's no need for more gas. There's no peer-reviewed studies that support the need for gas as proposed by Kinder Morgan. There are many alternative solutions available. Stop the leaks. From BUR radio, and I quote, "According to Senator Markey's 2013 study, the State's gas customers paid between \$640 million and \$1.5 billion for gas that never even reached their homes or business." If this gas were not leaking, then it would help solve any problem that might exist. From the Boston Globe I quote, "Detailed maps of leaks became available this week as a result of a new state law requiring utility companies report the location and age of all their known leaks, which, according to one estimate, has cost ratepayers more than one billion dollars." If the gas companies stop the leaks, we will have more gas and cleaner air and less toxic pollutants. There must be a requirement that gas leaks be fixed before we add more infrastructure. The solution is to clean up our problems before we think about creating new ones. The cheapest way to deal with the issue of perceived shortage is energy conservation. As we did in World War II conserving gasoline, we need to have a war on energy waste. There needs to be a statewide campaign to be cool in the winter, having everyone lower their thermostats to under 70 degrees. Let all politicians and public figures lead this effort and be shown wearing sweaters in public appearances during cold months. They should have an "I save energy" or "Massachusetts is Cool" campaign that commits to reducing household and office temperatures in the winter. Be hot in the summer. All people must be encouraged to raise temperatures in air-conditioned places to a minimum of 72 degrees. Promote the statewide energy audit program. Have grants for low income people and interest free or low interest loans to others for energy saving efforts on homes and offices. Expand that program so that everyone in the State is aware of its uses. Provide loans for solar, wind, and small hydro. FERC needs to demand an explanation from Kinder Morgan on their projected increase of need where federal studies show a decline in the use of gas and the use of energy. Last year the fears of an energy shortage did not materialize. LNG ports were able to help meet this need. 50 percent capacity was used by LNG terminals owned by GDF Suez. There was extra capacity there that was not used. There's no way that more gas need can be proven. As for desire, I think the main desire we're trying to accommodate here is the desire for Kinder Morgan to increase revenue. The choices are there for us to make: Green energy or fossil fuel; a clean environment or gas and oil spills; short-term jobs or long-term growth; a rural landscape or corporate profit. There's no escaping this. The actions, or lack thereof, will determine what happens. Neutral does not exist. Thank you.

MICHELE MARANTZ: Good evening, Mr. President. My name is Michele, one L, M-I-C-H-E-L-E, Marantz, M-A-R-A-N-T-Z, and I'm an officer of the Longmeadow Democratic Town Committee. I'll begin by thanking you for this opportunity to give testimony. I'm here for three reasons: To speak against the proposed Kinder Morgan pipeline, to present you with a DVD of the June 3 Longmeadow climate confer-

ence, and to use the information in that DVD to present an alternative to the pipeline in meeting our state's energy needs. If you're wondering why a Longmeadow resident cares so much about a pipeline here, know that, though my husband and I now live elsewhere, we've lived and worked in Franklin County and the Berkshires for many years. Every summer we join tourists who are drawn to the area for its beauty and cultural institutions. Pipeline construction threatens the tourist economy and the physical integrity of the region while contributing to carbon pollution and global warming. In other words, what happens in Franklin County doesn't stay in Franklin County -- not when it relates to the pipeline's construction and its impact on the environment. Pipeline supporters emphasize job creation as a major benefit, but these jobs are primarily temporary. In contrast, research shows that permanent job creation will result from growth in the state's cleantech industry. Pipeline supporters also cite its necessity in meeting the state's energy requirements. Since a significant portion of this pipeline's gas appears targeted for export, the project hardly seems focused on meeting the needs of Massachusetts residents but rather those of Kinder Morgan shareholders. We can meet our energy needs by turning to currently available liquid natural gas supplies to handle spikes in winter demand. We can also meet these demands by adopting fair carbon legislation. In that regard, our DVD highlights the proven effectiveness of fair carbon pricing in reducing carbon usage while promoting economic growth. Modeled on a law passed seven years ago in British Columbia, the fair carbon bills currently in our Senate provide a win-win for those of us interested in both the economy and the environment. The benefits of British Columbia's fair carbon law are quite clear. Since 2008, British Columbia's fuel consumption has fallen by over 17 percent, and its overall emissions have dropped by 10 percent compared to the rest of Canada. Equally impressive is that GDP growth is higher in British Columbia than in the rest of Canada, corporate income taxes have been cut by 20 percent, and personal income taxes are tied for the lowest in the country. The tools for reducing our dependence on fossil fuels, protecting our citizens' health, and the beauty of our environment and ensuring economic growth for the Commonwealth are contained in current fair carbon legislation. What's urgently needed now is not a new pipeline producing the same set of problems for our state, but for Massachusetts to take the lead, once again, in creating a legislative model that can serve as a blueprint for the rest of the nation.

LEIGH YOUNGBLOOD: My name is Leigh Youngblood, L-E-I-G-H Y-O-U-N-G-B-L-O-O-D. President Rosenberg, thank you for the opportunity to comment on the July 29 filing of the Kinder Morgan Northeast Energy Direct Project. Today is my 51st birthday.

SENATOR ROSENBERG: Happy Birthday.

LEIGH YOUNGBLOOD: There is nothing that I would rather be doing than standing up for public open spaces that are dedicated to the benefit of all Massachusetts citizens. I grew up in the very urban North End of Springfield, first walking to elementary school where our playground was entirely graveled, and later taking the city bus to high school downtown. For the past 21 years I've led Mount Grace Land Conservation Trust, an accredited nonprofit with 1,100 members. Mount Grace primarily serves 23 towns in Franklin and Worcester counties, but also holds a conservation easement in Winchester, New Hampshire and runs a statewide AmeriCorps program called the Massachusetts Land Initiative for Tomorrow. Mount Grace employs 12 people and owns land directly affected by the pipeline. Massachusetts has approximately 150 land trusts. And land trusts are charitable organizations that help landowners protect land, land which must have documentable conservation values. Mount Grace has helped hundreds of landowners permanently protect their land using federal, state, municipal and charitable funds and/or tax incentives. The most serious obligation of a nonprofit is responsible stewardship and management of its assets, whether cash or real, donated or purchased, particularly assets restricted to a specific purpose. Federal and state laws impose specific restrictions on land trusts, towns, and state agencies for the acceptance or the release of restricted assets. I will paraphrase the IRS regulation; the full text is attached to my written testimony. "A qualified conservation" -- this is from the IRS code. "A qualified conservation contribution must be made to a qualified organization exclusively for conservation purposes. To be eligible for a deduction, the conservation purpose must be protected in perpetuity." That's federal. In Massachusetts, when land or cash is donated or dedicated to the purpose of conservation, a public trust is established. And public trusts and charitable trusts impose fiducia-

ry duties on the trustees responsible for the assets in their care. Land trusts, and the conservation agencies of the Commonwealth, and the Massachusetts Attorney General all have a duty to defend the conservation land in their care. For example, Chapter 12 of our General Laws directs the Attorney General to uphold the public interests inherent in nonprofit, municipal, and state conservation land as well as financial gifts made for the purposes of conserving and stewarding the land. More than 110 permanently protected parcels are on the proposed NED pipeline route in Massachusetts. And many protected parcels are not identified in Resource Report 8 at all and, where they are identified, the conservation, social, and economic values of the lands are minimized. Please urge FERC to ensure that the Environmental Impact Statement for the project outline in detail the full cost of impacts to the public interests unique to each and every one of the 110 parcels. Thank you.

DELTA CARNEY: Hello, I'm number 9, Delta Carney. I want to thank Senator Rosenberg for having the moral and ethical courage and the political power to demand that this meeting happen. I applaud you, sir. Tonight we've already heard some facts and figures that are being presented. And Kinder Morgan presents facts and figures. They pay for theirs. We do our own research. I, years ago, borrowed a saying from Judge Judy. "Do not piss on my leg and tell me it's raining." If Kinder Morgan pays for a study, it's going to be biased. You know, it's like, that's all there is to it. Years ago, many of us had the common sense to see a disaster in the making. We protested against nuclear power plants, and we didn't win. And today we have Three Mile Island, we have Chernobyl, we have that horrible disaster of Fukushima. And, unfortunately, we were proven right. Right here in Western Mass. we have Rowe. Spent fuel rods will be there for thousands of years. The Vernon power plant has leaked radiation already into the Connecticut River. In Plymouth, Mass. the Pilgrim power plant is the exact same design and was built by the exact same people who built all of Fukushima. And recent reports have already indicated that they're having some difficulties and problems. Those of us who protested have reports, and so did the other side. But we were all told that the federal government had a solution, and it was called the NRC, the Nuclear Regulatory Commission, and they would protect us and they would make sure that disasters did not happen. We should trust the governmental body, elected officials, and the big business of nuclear power to take good care so that disasters would not happen. Today we have another regulatory body, i.e., FERC, that is only to regulate the oil and gas pipelines. And do the governing bodies really expect us to trust them again? Disasters have already happened. Yes, they have not been big enough for the elected officials, governing bodies to really pay attention or to put a stop to more pipelines. I dread to think about how big a disaster needs to be before people will stop. I ask that anyone and everyone in this room that has the common sense to see a disaster waiting to happen and the moral and ethical courage to do what is needed to stop this to please, right now, in this place, stand up and be counted. Thank you.

SENATOR ROSENBERG: I'll interrupt just briefly to say we have representatives from Senator Elizabeth Warren's office, Everett Handford, and from Representative McGovern's office, Keith Barnicle with us this evening in the audience listening to the testimony as well. Thank you.

REMA LOEB: I'm number 10, Rema Loeb, from Plainfield. First, a the big thank you to Senator Rosenberg for requesting this meeting and delivering these comments. The potential environmental destruction from the Tennessee Gas Pipeline's NED Project is already understood by those who have observed such projects throughout the United States. But supporters of this pipeline speak of the need for more natural gas. If anything, the last year has shown a decrease in demand. In a recent study paid for and conducted by GDF Suez, this energy corporation, "a global collaboration of energy experts" reported that new natural gas pipeline construction is unnecessary. They affirm that there are alternatives and suggest fixing existing pipelines. Their report finds present infrastructure more than adequate. They also note a decrease, and while oil and coal plants are being retired, this would be offset by a high voltage line carrying power from Canada and by renewable energy becoming available. They state, "Even during extreme winter conditions, a new pipeline is not required to meet New England's natural gas needs given current market conditions and public policy initiatives. Contracts, not constructions, are required. New England's energy markets are working." Similarly, Ann Berwick, a former DPU chairperson, has stated in a commentary in the Boston Globe, that Ten-

nessee Gas Pipeline's proposed NED Project is "not needed." She notes that although corporate pressure has defeated an offshore wind project, this is still always a possibility. She notes that Attorney General Maura Healey's study of the need for more natural gas and a new pipeline is highly important, and she points out the rise in energy prices last winter, 2014/15, was caused by an anticipated high natural gas price and shortage that did not materialize. She proposes wind as the State's best solution. Also solar has seen an amazing rise in acceptance, and many of our Western Massachusetts towns are joining community groups to purchase solar panels. In spite of the State administration that supports fracked gas, the solar industry is expanding rapidly. Attorney General Maura Healey's study is expected in October. No decision on your, FERC's, part regarding need should be made until that report is submitted. In the absence of compelling need, there is no public benefit and a great deal of potential harm. FERC, as the regulatory agency, should be legally bound to reject this project.

IRVINE SOBELMAN: Number 11. Good evening. My name is Irvine Sobelman, I-R-V-I-N-E S-O-B-E-L-M-A-N, and I live in Northampton. I'm a member of the steering committee of Climate Action Now, a local all-volunteer, grassroots group in Western Mass., dedicated to education, organizing, and action as part of the global movement for climate justice, working in coalition with others in the Valley, the state, the region and across the country. Our vision is to create a thriving and sustainable world that is free from the detrimental effects of both fossil and nuclear fuels. In comments I've made previously at other hearings about the Northeast Energy Direct Project, I've talked about environmental justice and I've talked about several of the published research studies that outline how Massachusetts, and indeed the country, can transition away from polluting sources of energy toward a renewable energy system. Tonight, I thought that it was time to get back to the absolute basics. To quote President Obama: "Our understanding of climate change advances each day. Human activity is disrupting the climate in many ways faster than we previously thought. The science is stark. It is sharpening. It proves that this once-distant threat is now very much in the present." And then he goes on to warn: "If we stop trying to build a clean-energy economy and reduce carbon pollution, if we do nothing to keep the glaciers from melting faster and oceans from rising faster and forests from burning faster and storms from growing stronger, we will condemn our children to a planet beyond their capacity to repair." Our leading scientists tell us that we must leave 80 percent of currently known reserves of fossil fuels in the ground in order to avoid catastrophic levels of climate disruption. So, what does that mean for us? We need to be aggressively phasing out our dependence on fossil fuels, not building more pipelines that will lock us into years and probably decades of increased greenhouse gas emissions. We are here this evening to offer input to the Federal Energy Regulatory Commission on the Environmental Impact Statement that they are writing in regards to the NED Project. Here, then, is my question for FERC: What greater environmental impact could there possibly be than the disruption of our climate, of the very life support systems of this planet, our home? We are standing at a crossroads. If we intend to walk forward, we cannot be facing backwards. It is time to step out of that crossroads and onto the path to a truly sustainable future and a livable planet. Thank you.

SUZANNE THEBERGE: My name is Suzanne Theberge. Thank you for holding this hearing. I live in Amherst, and I'm honored to follow Irvine Sobelman with her very eloquent remarks. I'm a co-founder and steering committee member also of Climate Action Now, a local, people-powered grassroots organization, and also very involved in the Springfield Climate Justice Coalition. I'm the mother of two adult children and the grandmother of a toddler. There's no greater joy than exploring the wonders of our natural world through the eyes of a toddler. But the more I study the science of climate change, the more I'm haunted by the gut-wrenching knowledge that, if we continue business as usual, my granddaughter's life will be a living hell. So I'm here to speak for my granddaughter and for all the other beings who don't have a voice in decisions that will determine whether or not they will have a livable planet to grow up in. I'm proud of you, Senator Rosenberg, and our other state leaders for passing the Massachusetts Global Warming Solutions Act enacted in 2008, which establishes a comprehensive plan to address the threat of climate change to the Commonwealth. So thank you for that. This law requires greenhouse gas emissions to be reduced between 10 and 25 percent below 1990 levels by 2020 and mandates that greenhouse gas emissions be reduced 80 percent

below 1990 levels by 2050. In order to do this, it requires climate change impacts to be considered in decisions by state agencies, boards, commissions, and authorities, including permitting and licensing decisions. This means that any Environmental Impact Statement must take into account the impact on climate change. Rigorous research has enlightened us as to the significant climate change impacts of methane, or CH₄, gas. Natural gas and petroleum systems are the largest source of methane emissions from industry in the U.S. In fact, methane is the primary component of natural gas and it's emitted to the atmosphere during the production, processing, storage, transmission, and distribution of natural gas. New research is pointing to the underreporting of methane leaks due to faulty measuring tools. Like most of the other people in this room, I'm not an elected official and I have neither wealth nor political influence. But, what I and many others in this room do have is a determination that is deep in our souls and it will fuel us to do what it takes to prevent Kinder Morgan from building a pipeline that will carry methane-leaking fracked gas, a substance that will literally add fuel to the fire of global warming. Senator Rosenberg, we thank you for inviting us here, in our gorgeous corner of the world, as we share with you our deep concerns about the environmental impacts of this pipeline which will not only destroy homes, wells, conservation areas, and threatened habitats. This proposed pipeline is a ticking time bomb. We will stand together to protect our environment, organize tirelessly to stop this pipeline from being built because, to us, it's a life and death issue; it goes to the heart of what we can do to preserve a livable planet for the next generations. Thank you.

JOHN FISHER: Good evening. Again, Senator, thank you for coming here. Thank you for the -- your leadership throughout all of this rather difficult process. I'm going to try and see if I can get finished before the yellow card even comes up, so let's see how well I can do. My name is John Fisher, J-O-H-N F-I-S-H-E-R. My wife, Sebern, S-E-B-E-R-N, Fisher, and I live in Plainfield. We border on the proposed pathway, the proposed pipeline, and directly behind us also bordering it is a number of acres of protected state forest. Obviously, this, you could say, I'm a NIMBY in this, and for that reason I really tried to spend some time trying to think if there was any good reason for this. We've been told that natural gas is the -- is going to be the bridge to the future. The more I looked at it, the more I feared that, instead, what we're really building is a highway to the past here. I have -- we have submitted fairly lengthy testimony already to FERC; we've testified at those hearings. Much of what I say would be really just echoing what some of the other folks are going to be saying here. But I think one thing that really is important is that there is still a mindset of too many people that alternative energy is one of these things that's in the future, that it's a great idea, but it's 50 years away. I had that belief three or four years ago. I'd like to just submit in a somewhat redacted version of my electrical bill from last month. And this is for running two houses, a garage, a plug-in car, and a number of other things. And, again, I realize that some of it I had the ability to be able to have access to put in the solar in ways that some people aren't able to, either because of my own income or because of the fact that we happen to have a nice view of the southern sky. But the point is, something I thought impractical, far in the future three years ago, my bill for August for the two houses was \$5.48 from Eversource. I'd like to add that, and please keep that in mind because, what we're talking about, it's not just impractical, yes, there's a need for alternative energy, yes, there's a need for energy right now, but this is not the answer. And I beat the yellow. Thank you.

SENATOR ROSENBERG: We'd also like to welcome Amad Rivera, who's representing Senator Markey's office has joined us. Thank you for being here.

DAVID ROITMAN: My name is David Roitman, R-O-I-T-M-A-N, from Florence, Massachusetts. The focus of my comments is the question, "Is this pipeline needed?" I bring three perspectives: A citizen of the Commonwealth; I volunteer with Climate Action Now; and I've been a management consultant for 31 years. So, I have a perspective on corporate decision-making from the inside and how that relates to society. On August 31 I received an e-mail containing an 86-page analysis of alternative winter reliability solutions from New England Energy Markets. The main body of my comments summarizes this analysis. First, though, five quick points: * I don't hold GDF stock. I received the e-mail because I participated in some online discussions. * GDF Suez collaborated with Conservation Law Foundation on this study. * GDF Suez is a competitor to Kinder Morgan. * But, at the same time, FERC and the Massachusetts DPU must be aware that Kinder

Morgan is proposing this pipeline because of its financial interest. So, while financial interest may be taken into consideration, analysis bearing on the pipeline should be considered primarily on its merits, not who wrote it. * So that's why, with some dismay, I received a second e-mail sent on September 3 from the DPU hearing officer, that, and I quote, "CLF GDF Suez's late-file comments are untimely and the department will not consider them as part of the proceeding." And that was actually just on the basis of a technicality. Okay. Since I know, Senator Rosenberg, you're very concerned with the question, Is this pipeline needed, I'm going to give you a hard copy of the entire analysis, but here are a few direct quotes: "(1) Existing infrastructure is more than adequate ... In fact, the electricity system has maintained required reserve margins during some of the most extreme conditions over the past three winters. "(2) Winter prices reflected a transient, peaking problem ... high basis differentials for natural gas ... during the past three winters occurred during only a few of the highest peak demand days. "(3) The market is responding with dual-fuel capabilities and LNG contracts. This past winter has demonstrated the powerful ability of competitive markets to respond to price signals. "(4) New pipeline capacity already is being built. This new pipeline capacity needs to be included in any assessment of additional pipelines. "(5) Public policy does not support new pipeline infrastructure. Policies are promoting non-gas-fired generation such as renewables, energy efficiency, and market-based performance incentives already to ensure that generation capacity is available when needed most." So, given these points, still, I quote, "a New pipeline could overserve the New England market resulting in a glut of natural gas that's likely to flow to markets outside of New England." Thank you for hearing my comments and accepting this written analysis plus supporting documentation.

KATHRYN EISEMAN: I'm Kathryn Eiseman, K-A-T-H-R-Y-N, E-I-S-E-M-A-N, president of the Pipeline Awareness Network for the Northeast. Thank you for holding this hearing. I'd first like to mention the parcels that TGP wants to occupy for contractor yards, where they'd pile their construction materials and stash their equipment. In Massachusetts alone, they total nearly a thousand acres, including over 60 in Whately, as well as land in Greenfield, Bernardston, Ashfield, Deerfield, and Erving, just to list the Franklin County towns. Much of this acreage is agricultural and wetlands, an TGP's proposed misuse of this land should be avoided. At a minimum, TGP must be required to prevent any permanent damage to these lands and to comply with the Massachusetts Wetlands Protection Act. Tonight, though, I primarily want to address NED's risks to drinking water supplies. We request of FERC a detailed hydrogeological study so that impacts on aquifers and public and private wells along the entire proposed route can be adequately evaluated. Most potable groundwater surface aquifers in this region are town-scale or smaller, generally keeping localized any industrial contamination of drinking water. The other major source of potable groundwater in this part of New England is fractured bedrock aquifers. A new pipeline corridor can act as a conduit for groundwater contamination between aquifers, river basins, and other water sources that would normally be isolated from one another. This is of particular concern where a pipeline is horizontally drilled through bedrock, and applies to potential contamination sources as well as pre-existing sources not related to the pipeline. FERC should address the likely impacts of the pipeline corridor as conduit for existing sources of contamination, as well as the impacts of any coatings, solvents VOCs and other potential contaminants introduced to the soil through pipeline construction and operation. This review should also include the impacts that blasting for pipeline construction is likely to have on wells along the entire route, in terms of altering the fractured bedrock network and also the risk of contamination from the explosives used in blasting. Perchlorate from blasting could travel through bedrock fractures to contaminate drinking water supplies. All of these risks to groundwater and drinking water should be evaluated, minimized, and monitored, with a plan in place to compensate adequately any landowners, municipalities, or water supply districts in the event of contamination. To date, TGP has stated that they would offer bottled water. This is not adequate and is insulting to communities with some of the best water supplies in the country. Thank you.

ROSEMARY WESSEL: My name is Rosemary Wessel, R-O-S-E-M-A-R-Y W-E-S-S-E-L, and I'm founder of the citizens grassroots organization No Fracked Gas in Mass. Senator Rosenberg, thank you so much for holding this hearing, and thank you for recognizing that FERC has failed to allow appropriate and timely venues for review of this project. I have with me the text of a petition that has been in circulation since we

first became aware of the pipeline projects being proposed for Massachusetts. Similar language has been adopted by most of the 74 municipalities across Massachusetts, New York, and New Hampshire that have so far filed resolutions opposing new natural gas transmission line projects. I'll be filing a full version of this petition and all the signatures as well as as many of the resolutions as I can gather with FERC before the October 16 deadline. Nearly 15,000 people have signed this petition so far, and it states opposition to new natural gas pipelines and stands in favor of expanded energy efficiency and clean energy solutions. This is the will of the people. Massive expansion of gas infrastructure is not what people of the impacted region want for their energy needs and energy policy. Some pundits have quipped, "You don't want pipelines? Then don't buy the gas." The bitter irony of it is, the vast majority of people impacted by this pipeline are already not buying the gas and won't ever have gas available to buy even after it's built. Many thousands of people who have signed this petition want more energy solutions like the kind we've been seeing popping up all around us: Top-notch energy efficiency programs, solar and wind (particularly when sited on rooftops and existing brownfields), and even refitting existing dams to maximize hydroelectricity without flooding new habitat. We are not captains of industry who can file and build a counterproposal. We are teachers, nurses, EMTs, designers, salespeople, doctors, craftspeople, artists, lawyers, firewood cutters, and deli workers. We are the people who clean your house, make your sandwiches, teach your children, help you buy and sell a home, fix your roads and make sure you're healthy and safe. What we ask for in return is that we can trust you, not only our elected officials, but our policymakers and especially our regulatory agencies like FERC to make the right decisions, to listen to the will of the people, and to implement policies that affect us, to make sure that it's nothing disruptive, harmful, or unduly costly without our consent. This pipeline proposal is disruptive, harmful, and unnecessarily large and costly, but most of all, it is unnecessary. Along with this statement, I'm filing several recent reports analyzing energy needs now and in the future that show that the so-called energy crisis is greatly exaggerated and that new gas infrastructure is the most costly, most permanently disruptive and most harmful way to answer any need for additional energy that may arise in the future. Thank you very much.

JIM MOORE: Thank you, Senator Rosenberg, for being here with us.

SENATOR ROSENBERG: Thank you. What number are you?

JIM MOORE: Seventeen.

SENATOR ROSENBERG: Seventeen? Okay. We have lots of folks lined up. So, proceed.

JIM MOORE: My name is Jim Moore. I'm a member of the ad hoc task force -- pipeline task force committee and a selectman for the Town of Conway. And these are two of my task force associates, Meg Burch, who's the chair, and Marcel Morgan, who's also a member. And we have looked at some of Kinder Morgan's reports, and it's voluminous and complicated and such. We've been very fortunate to have some folks with technical expertise who have been able to explain some of that to us, and we have comments and a report here. We won't take all your time, but we would like to say thank you very, very much. And I would like to say that maybe someone could suggest to Congress that they dissolve FERC as it now exists.

SENATOR ROSENBERG: How do you really feel about that?

JIM MOORE: And really reconstitute it with people who are not bootlickers of the energy industry. Thank you very much.

SENATOR ROSENBERG: Thank you.

POLLY RYAN: Hi. My name is Polly Ryan, P-O-L-L-Y R-Y-A-N. I'm an impacted landowner from Plainfield. Senator Rosenberg, first and foremost, I want to thank you for representing us at FERC and hearing our comments tonight. I have already submitted written comments to FERC and gave oral presentations at two other FERC scoping sessions. I also submitted oral and written comments to the Energy Facilities Siting Board. In essence, they all had the same theme which can be summarized as follows: Studies have clearly identified carbon neutral and other renewable or alternative energy solutions that can meet our energy needs

instead of the natural gas pipeline. Should a natural gas pipeline be deemed necessary, it can be done -- I mean, should a natural gas solution be deemed necessary, it should be done with improvements to existing infrastructure or LNG storage. Either of these alternatives are clearly less impactful on our environment and serve us better in terms of meeting the goals of our Global Warming Solution Act. Please consider a "No Action" alternative. Natural gas is not a bridged fuel to renewables. Once we commit to this infrastructure, we're stuck with it while the gas industry rides out their boom-and-bust export business. We should be keeping the gas here for our future generations. I've also commented to FERC on the negative impacts this pipeline will have on landowners. In essence, they can be summarized as follows: * Increased risk to health and safety * Depreciated property values * Decreased property resale options * Increased property liability * Continued tax liability for land that can't be built on * Increased energy costs once the gas hits Europe * The imposed cost of a tariff on our energy bill for building the pipeline * Loss of future home business income These items can all be clearly defined in terms of their qualitative and quantitative negative impacts. So I ask that this environmental impact study demonstrate how these negative impacts relate to benefit by conducting a comparative study. In fact, please define benefit. I have not heard any benefit mentioned other than "we need the gas" and "it provides jobs." Also consider, please, that these impacts mentioned are just the tip of the iceberg. If such a comparative study is done, it would have to be cumulative and include all the different kinds of impacted landowners like conservation land trusts, conserved Article 97 land, and state forests, to name a few. Also, I'd like to mention how I have been personally impacted so far. I have had to put major life decisions on hold because I don't know anymore the future outcome or potential of my one and only asset, my home, and possibly my future business. I feel like I've lost a year-and-a-half of my life while having to learn about this pipeline and stand against it. This time has been sacrificed for things I'd prefer doing like gardening, reading to my grandchildren, or focusing on professional development, to name a few. It has been extremely stressful, and has truly impacted the quality of my life as well as my health. Tell me, Senator Rosenberg, how do you think FERC should quantify that in this study? Through August, since the beginning of the pipeline, there have been 5,411 comments made to FERC on this NED Project. Only 426 of those have been in support of this pipeline. So, please consider, Senator Rosenberg, let FERC know that our country is supposed to be governed by the people and for the people, not by corporate lobbyists, and that we, the people, have spoken. Thank you.

VINCE PREMUS: Good evening, Senator Rosenberg. My name is Vince Premus, P-R-E-M-U-S, from Pepperell, Mass. and a member of Stop NED. It's a group of Massachusetts and New Hampshire residents that are dedicated to stopping the Northeast Energy Direct Project. Before I begin, I have to say amen to everything that Polly Ryan just articulated. It's an amazing story and a very eloquent statement. Every statement here tonight has been thoroughly researched and heartfelt, and it's been amazing to be here. I'm here to talk to you about the issue of need, like many others. In my view, the issue of need is of paramount importance in the matter of this proposal. Yet, need plays no part in Eric Tomasi's charter to develop an Environmental Impact Statement. Need falls under the purview of "credentialed" industry stakeholders. The public is dismissed as unqualified to contribute, as we can be "fickle and recalcitrant," if you recall Ben D'Antonio saying last year, who's an attorney for the New England States Committee on Electricity. Well, I beg to differ. I think we can do our homework. The case for need is generally predicated on the winter peaking problem. Winter is a time when the weather can be dangerous and people are vulnerable. It's a scenario screaming for exploitation by an opportunistic businessman looking to export natural gas to global markets. The thing is, New England's winter peaking problem is a one-percent problem. If you were to add up all of the peak-shaving episodes, those times when gas-fueled generators that do not commit to firm supply choose to sit idle because gas on the spot market is too expensive to make generation profitable, the gas you would need equates to about one percent of the region's annual demand of 889 billion cubic feet. That's just 10 billion cubic feet. Well, according to the EIA, the average natural gas price reached a high of more than \$20 per million BTU in January last year. The average LNG tanker holds about 3 billion cubic feet of natural gas. This translates to an estimated cargo value of about \$60 million at this unit price. Under the Winter Reliability Program, ISO New England could subsidize three tankers worth of LNG each winter for the next

30 years before we exceeded the price of a \$5.5 billion pipeline, and that's not including the price of the gas in the pipe. Not a long-term solution I'm proposing here, but a viable bridge to the time when renewable, distributed generation and battery storage have matured enough to serve our grid-scale power needs. A recent study by the Home Energy Efficiency Team called attention to the widespread leaks throughout the Commonwealth, and many have mentioned them here tonight; 20,000 by their count, many decades old. An Eversource spokesman responded by saying, "utilities have allowed those leaks to seep indefinitely because they didn't see them as an imminent threat." Well, staring down the barrel of an eminent domain land-taking to build this export pipeline, we see every one of these leaks as an imminent threat. A 2013 study by the Conservation Law Foundation estimated that 8 to 12 billion cubic feet of gas was lost to leaks in Massachusetts alone in 2010. Ironically, this is also about the one percent of New England's annual demand and enough gas to cover the winter peaking problem. We have Marcy Reed, president of National Grid, who has the audacity to assert the "inconvenient truth" that we need not one, but two new pipelines to meet our growing electricity demand. This is a demand that, by ISO's own predictions, has flattened due to the success of energy efficiency and demand response programs. So I'll close with this: We cannot trust these credentialed stakeholders, like ISO and National Grid, to advance a strategic energy policy that balances demand against the impact to our homes, health, and the environment. The subject of need deserves to be deliberated in a transparent and quantitative manner, with the direct participation of informed ratepayers who understand the personal cost of this project. Please urge FERC to convene a formal public hearing specifically dedicated to an assessment of need, and one in which the "No Build" option is also on the table. Thank you.

DAVID GILBERT KEITH: Hello. My name is David Gilbert Keith. G-I-L-B-E-R-T, K-E-I-T-H. I am an independent researcher specializing in energy, and I have been asked to speak here tonight. I want to start by thanking you, Senator Rosenberg, for holding the hearing, and I reiterate the person before me, Mr. Premus, is right that everybody has been incredibly eloquent. I have three key points to convey: (1) Less is better. (2) New England cannot use it. (3) NED is an export project. Why is less better? New England might benefit from ability to receive gas more quickly for a matter of hours of the year. But if we built more pipeline capacity than we can use, gas producers will want to get the bulk of the gas to export markets. Regulators acknowledge that natural gas exports will raise its domestic cost, which also raises cost of electricity and the products manufactured with either gas or electricity inputs. The Industrial Energy Consumers of America has testified about the competitive advantage of cheaper domestic fuel rates: "Using natural gas in manufacturing can create eight times as many jobs as exporting it, twice the value added and eight times as many construction jobs." (2) New England cannot use it. By the time NED can begin, it will not be needed. Spectra Energy's Algonquin Incremental Market pipeline expansion is already under construction and will provide plenty of extra gas to avoid price spikes. Spectra is also proceeding with its larger Access Northeast Project and has partnered with energy companies that control 70 percent of New England's existing gas-fueled electric plants as well as the largest power plants that might still be converted to natural gas. Remaining power plants may or may not buy gas from NED, so it is not even assured of sales to the independent power plants. And, in New England, the electric companies have chosen to pay cheaper interruptible rates for gas rather than reserving it. This means they buy what local distribution companies are releasing from the volumes they have reserved. NED has precedent agreements reserving only 40 percent of its capacity. Sales to its only other potential customer, electricity generators, will come almost entirely out of that 40 percent, not in addition to it. The remaining 60 percent of NED's capacity has no market in New England. Despite assertions by promoters, the Energy Information Agency and others are projecting that gas use in New England will be declining at least through 2028. So where will the unclaimed 60 percent of NED's capacity go? NED's plans include a 30-inch lateral to the Maritimes & Northeast pipeline. Kinder Morgan now says it will use a 30-inch pipe on its scaled-back NED, which means the entire capacity of NED could be shunted north to Canada once the Maritimes pipeline is reversed as planned. (3) It's an export project. Finally, here is why I conclude NED is primarily an export project. Only three years ago a Tennessee Gas Pipeline executive compared two alternative pipeline proposals. One was essentially NED, a green-field project that had the primary advantage of expandability. But the alternative was to loop, build parallel pipe, to the existing

Line 200, meaning lay pipe parallel to it, and carry up to an additional 1 billion cubic feet per day to Boston. Looping Line 200 has been projected to cost somewhere between one-third and one-sixth as much as NED. Looping Line 200 would meet up to twice what NED has been able to demonstrate as New England's demand, despite a prolonged open season. Clearly the only reason to proceed with the far more expensive proposal is that it is more expansive. It can push more gas through and past New England. As Canada's Globe & Mail reported in August: "Two proposed liquified natural gas projects have received approval from the National Energy Board to export LNG, but they are counting on the United States to build pipeline capacity into New England in order for them to obtain the supply needed to underpin their ambitious plans." NED is an export project. New England does not need it and should not be made to pay for it.

SENATOR ROSENBERG: Do we have a copy of that, sir? Do you have an extra copy of that?

DAVID GILBERT KEITH: You have the extended version.

SENATOR ROSENBERG: We have it, okay.

LOREN KRAMER: We're here together. And we each have a number. We'd like to --

SENATOR ROSENBERG: So that means you have four-and-a-half minutes, right?

LOREN KRAMER: I'm Loren Kramer, L-O-R-E-N, K-R-A-M-E-R, and I would like to start with our personal experience here. In Greenfield, we have many commercial and residential buildings that are net zero fossil fuel or nearly net zero rehabs. No new inventions need to come along to get us to net zero fossil fuel, nor does one have to build a new solar building. Our family's little cape built in 1951 is now nearly net zero, and we're a family trying to live on social security, struggling against rapidly rising and erratic fossil fuel and electric pipe fluctuations. However, it happens that, by saving annually over a lifetime, we have capital saved in an IRA retirement account. So we invested a traditional IRA in what I consider to be a better retirement plan than Wall Street: Excellent energy efficiency, and better than what MassSave recommends even, which immediately cut our fossil fuel we used to use, and the heating bill, in half, then invested in very efficient electric appliances, such as heat pump hot water heater, and, most important, a 6.5 kilowatt solar electric power generation system, accompanied by a cold climate mini-split heat pump, eliminating the electric and heating bills. Number 3: We are now paying Eversource monthly for electric distribution fees only, but we will purchase about \$150 of fuel oil a year, at the moment, for the minus 10-degree extreme cold days. Even that can be replaced with bio-diesel, to be manufactured in Greenfield by Co-Op Power from used cooking oil, as we get it rolling. Number 4: The same formula (excellent energy efficiency, solar electric generation, and heat pumps) have been used by many others. For example, our own local landlords, Barbara and Mark Zaccheo, in their near zero fossil fuel energy-saving large apartment building on Allen Street in Greenfield, across the intersection from Foster's Grocery, used the same formula I use: Solar/heat pumps and excellent insulation, delighting their renters who pay little or no heating electric bills. The Southern Amherst Congregational Church is at near zero fossil fuel, saving over \$15,000 a year on heat and cooling costs using that same formula. Others are now catching on because it's less expensive to generate your own electricity if, and only if, you can find the capital to invest in these efficient fossil fuel-freeing technologies.

PAM KELLY: So my name is Pam Kelly, I'm following on with Loren. And, once again, we're from Greenfield. And the question is, How do you get the capital to invest in these efficient fossil fuel-freeing technologies? And we had a handy-dandy IRA, but not everybody does. And we need massive amounts of capital, we need lots of capital to get this rolling. So, in order to raise the capital, our own state rep, Paul Mark, introduced House Bill 3532 in the Massachusetts legislature to create a Green Development Bank. The legislation will pass, with the help of Senator Rosenberg and friends, and is designed to use a modest investment of public funds to attract five to ten times as much private investment for a massive statewide program in commercial energy rehabs, getting our for-profit businesses and our not-for-profit commercial buildings, like schools and churches, rehabbed with extensive renewable energy programs at a reasonable 20-year-long interest rate. Repaying the loans is much cheaper than burning the fossil fuel, especially the gas, so owners of buildings come out way ahead. Plus, it would continue our excellent Massachusetts labor history, the

largest job creator in the state, has been and would continue to be, the Green sector. In this plan, we would be following the lead of at least seven states that have now created Green banks or Infrastructure banks, starting with Connecticut four years ago. According to the CEO of the nonprofit Coalition for Green Capital, Jeffrey Schub, Green banks are attracting \$10 of private investment for every \$1 of public investment. In a recent briefing held July 22 in the Massachusetts legislature, one of the presenters, Ben Healey, Assistant Director of the Connecticut Green Bank, reported that within four years from the standing start, Connecticut had done \$400 million worth of commercial green updates and smart grid development. In November of this past year, 2014, New York State capitalized their new Green Bank with a \$1 billion worth of capitalization. Now, just imagine the effects if we capitalized a Massachusetts Green Bank with a 5-plus billion dollar cost of a Kinder Morgan pipeline. The bank would create essentially a revolving loan fund. Multiply a 5 to 7 billion dollar investment by 10, you get a 50 to 70 billion dollar revolving loan fund designed to “alleviate the need for electric generation using natural gas” by streamlining the transition to commercial energy efficiency, insulation, weatherization, installation of off-shore wind, solar collectors directly generating electricity, the encouragement of the use of efficient cold climate heat pumps, energy storage, and grid -- smart grid establishment and resilience. And we could make the long-term plan to deal with climate issues that are likely to put 25 percent of our coastline, according to a study by the Senate, under water from rising tides. But the State’s put a cap on solar. I’ve been attending the Massachusetts Energy Committee Hearings at the Statehouse in Boston since April 14. There is a current cap on the total kilowatts of solar power hookup to the electric grid. It’s called the “net metering cap.” Businesses that already build systems that are over 28 kilowatts have hit the cap. They’re stalled. They can’t tie onto the grid. They’ve built the solar systems, but they can’t tie up to the grid. And way back in June I was shocked by the testimony that I heard from the representative of National Grid in an answer to a question posed by the chair of the committee, Benjamin Downing: “Okay, so how many applications for solar hookups have come in since March 20, when you hit the net metering cap?” And the representative of National Grid replied, “5,600 applications.” March 20 to a June hearing, mid June. “So how many kilowatts does that represent,” said Benjamin Downing. “225 kilowatts, or one percent of total capacity in a month.” So why are we considering natural gas infrastructure at all when we could make a rapid transition to a fossil fuel-free future with no pipeline, using solar and the three to four gigawatts of potential wind energy that those giving testimony said was available off the coast of Massachusetts and Rhode Island, if we lift the net metering cap, foster community-based solar, and build windmills. Thank you.

MOLLY CHAMBERS: Good evening. Thank you, Senator Rosenberg, for taking the time to make this hearing possible. We really appreciate your concern in this area. My name is Molly Chambers, C-H-A-M-B-E-R-S. Speaking personally as a resident of Greenfield since 1973, I have cherished living in a place where our forests, lakes, rivers, farms, and Native American historic sites have been protected until now from damages such as this pipeline would create. This protection must continue. The Nolumbeka Project is investigating the danger the pipeline presents to these Native American sites. I’m somewhat concerned that no one else has spoken to this concern yet this evening in this group. I’m also authorized to speak for Judy Phillips of Northfield, whose home is on Orange Road, about one mile from the site of the proposed compressor station. She states that she and her neighbors worry about the blasting and digging of the pipeline, drinking their water system and supply. I know she cherishes the wonderful well water which she receives in her home and really feels that this is endangered by this compressor station. She also fears that if the compressor station exploded that they would be in grave danger or worse. For these and many reasons, Judy and I strongly oppose the construction of this unneeded pipeline in Franklin County. Instead, we seek the development of more renewable energy sources and energy conservation efforts. Thank you for your consideration of these comments.

SENATOR ROSENBERG: While you’re coming to the microphone, let me point out that Paul Brennan, Assistant Attorney General, Special Counsel for Energy Policy, has joined us from Maura Healey’s office.

DAVID FISHER: Lacking a number 24, I’m number 25, David Fisher, D-A-V-I-D, F-I-S-H-E-R, from Natural Roots Farm in Conway. I’m also a member of the Conway Agricultural Commission. And, Sena-

tor Rosenberg, I just want to thank you so much for taking the time to come here and listen earnestly to our concerns over the proposed NED pipeline. After 18 years of incredibly hard work, my wife and I have built a successful organic farm, Natural Roots, here in Conway. It's a beautiful and healthy environment in which to raise our two children. They thrive here and tell us on a regular basis how much they love our farm and never want to leave. But it is not just a nourishing home for our family; our farm is visited by hundreds of customers every week who come for their produce, meat, and eggs and simply to enjoy the beauty of the place. Children swim in the South River and they pick berries by the fistful. Just out of curiosity, maybe with a show of hands, how many folks in the room have lived, worked, or eaten food from Natural Roots Farm? That's a good representation here. I also, in addition to my own comments to you, I'm going to hand you my written testimony to FERC, but I also have here a compilation of many letters, really great testimony, including some great drawings and all sorts of testimony to pass on to FERC, if you would. You can enjoy looking at the pictures and reading the commentary on your train ride down to DC. Our community is deeply invested in our farm and has supported us through several floods and natural disasters over the years, including Hurricane Irene, when a lot of our produce was washed away out of our fields, and some of our fields were permanently altered. But from where we stand, right now the proposed NED pipeline poses the greatest threat that our farm has ever faced. I'm deeply concerned about all of the issues that are being discussed tonight, ranging from habitat destruction to the contamination of drinking water to the real risk of explosions, especially in our area where the lowest grade of pipe would be used. One issue that is particularly disturbing to me, however, involves the remote blow-off valve located on the TGP NED route map, about 600 feet east of Shelburne Falls Road, just about a mile above our farm. These valves are designed to periodically vent gas in the pipe to regulate pressure. And, along with the discharged gas, are residual amounts of over 60 hydrofracking chemicals, including many proven carcinogens, neurotoxins, and endocrine disruptors linked to cancer, infertility, and impaired neural and immune function. When released, the gas and chemicals would travel with the prevailing wind, which would bring this mixture directing over our farm. These chemicals are heavy and readily settle out, which would mean that my wife and I, our two young children, all of the crops and animals on our farm, our employees, and all of the families who eat our produce would very likely be exposed to these carcinogenic chemicals. Countless independent researchers, many of whom have spoken this evening, industry studies such as the GDF Suez, and even the Massachusetts DPU's former head, Ann Berwick, have clearly established that there's no need for increased natural gas supply in Massachusetts that cannot be addressed by proper maintenance and management of existing natural gas infrastructure, improved energy efficiency, and conservation measures alone or in combination with investment in renewables, all of which are already essential in this time of global warming. Furthermore, the projections for the gas yield of the Marcellus Shale are continually shrinking, making the investment and the risk in infrastructure of this scale absolutely absurd. As we weigh the information before us, we realize that the question we are dealing with here is not actually whether or not NED is justified, as that question has been clearly and decisively answered. The question we are dealing with is whether FERC will proceed in accordance with its mission and the due process of law, or whether they will exhibit corruption at the highest level of government. Thousands of people are watching them very closely. Senator Rosenberg, I urge you to remind FERC that they have an obligation to protect and serve the well-being and safety of the American citizens. If they pander to the interests of corporate giants such as Kinder Morgan, they will not only compromise ecological and human health and safety, but they will undermine the fundamental institution of democratic government. Thank you sincerely for your efforts towards a safe and healthy future for our children's children.

SENATOR ROSENBERG: So as the next speaker approaches the microphone, let's do a quick progress check. We have 65 people who are signed up. We've heard from 25 so far. What I'm going to suggest is that somewhere in the next 30 minutes or so that we have to do one of two things, because we have to give the stenographer a bit of a break. We either need to have several people in a row who are going to read their testimony and we will hold it aside and make sure that you have them, and we will then proceed, once she returns, in the fashion we've been going so far, or we literally take a ten-minute break and reconvene, and, if

we do that, then we will reconvene exactly ten minutes after we start the break. And, so, I'm thinking about both of those options, and we'll figure that out in the next few minutes. So, please proceed.

BARRY PFANNEBECKER: Number 26, Barry Pfannebecker, B-A-R-R-Y P-F-A-N-N-E-B-E-C-K-E-R. I'm from South Deerfield and these are comments on the Draft Environmental Report, FERC Docket No. PF14-22-000. This report lacks design details for construction and environmental regions or acknowledgment of environmental design constraints anywhere along its path. For example: (1) The only objective is in the Environmental Construction Plan for Massachusetts, paragraph 1.1, and states, "general Best Management Practices before, during, and after construction to minimize erosion." This neglects any of the obvious environments and those that have been provided to FERC by other parties. (2) The report states that for the majority of waterbodies (they mean rivers) the pipe will be buried a minimum of five feet. This is unsubstantiated by acceptable geological and environmental information. (3) TGP states that sensitive waterbody information is defined in the Data Response Matrix, Comment ID 17, page 9. However, Appendix H and Appendix L, as referenced, do not do so. This neglects the requirement and is non-responsive. (4) It is known that both temperature and pressure vary along gas pipelines. TGP has not defined the temperature profile in the pipeline and the long-term impact on the associated environments. This is unacceptable. (5) The Wetland and Waterbody Crossing Construction and Mitigation Procedures states the Director of the Office of Energy Projects will consider a variance if "a portion of this Plan is infeasible or unworkable based on project-specific conditions." This almost assures that an issue can be overridden by a government agency that does not understand environmental impacts to Massachusetts and is unacceptable. (6) The Upland Erosion Control, Revegetation, and Maintenance Plan, paragraph 1A, allows project sponsors to specify measures they consider unnecessary, technically infeasible, or unsuitable due to local conditions. Again, this almost assures the granting of a variance without understanding its impact and is unacceptable. To summarize, this report neglects design details by the use of empty industrial terms such as general best management practices, TBD, minimize, and "to the extent practicable," and indicates a lack of knowledge or interest regarding the local environments, particularly since TGP can apply for a variance whenever they say a solution is "unnecessary, technically infeasible, or unsuitable." This suggests a negligent approach to construction and the project should not be allowed to proceed. There are more requirements that pertain to the construction of a house than pertain to the construction of this pipeline.

BILL COPELAND: Thank you, Senator Rosenberg. This was a great idea. Tell FERC, very creative, very necessary. I hope there are representatives from Kinder Morgan here because you need to hear this: Our region leads the way nationally in the effort to decrease fossil fuel use and to create a sustainable energy future. We also lead the nation in reforesting our public and private lands. The NED Pipeline Project is a huge commitment to proceed in exactly the wrong direction. Of the many harms that this project would cause, none is greater than the damage to climate. Over a 20-year horizon, methane has nearly 90 times the heat trapping impact of carbon dioxide. Kinder Morgan states that it will, as part of normal operations, release this gas under pressure periodically. It will lose even more by leakage, ensuring that the climate impact of this fuel is more than tripled. The National Academy of Sciences has recently estimated leaked volumes of 3 percent from pipelines in the Boston area. This amount of leakage is unintentional, may be unavoidable and does not even account for the leaking at fracking sites, wellheads, or in homes. To say that natural gas is a clean fuel ignores the fact that its primary constituent is a planet-killing greenhouse gas that cannot be fully contained. For more information on the role of methane and earth's climate history, you may search "Permian Extinction, scholarly articles." The iconic forests and farmlands of Western Massachusetts are a model of community-based conservation for the entire country. Having recovered beautifully from near-total land clearing, our forests now capture and sequester three to four tons of carbon per acre per year and will continue to do so for a hundred years. Small farms and woodlots invigorate and stabilize our local economies and create the scenic backdrop for our vital tourism industry. The forest canopy, the little layer and the soil beneath all act as filters for water and air. The mosaic of undeveloped lands here provide sanctuary for diverse native and migratory species. Even if they are careful, the NED Pipeline Project will permanently deforest over two square miles of this well-stewarded land. It will damage wetlands and aquifers, introduce

and spread invasive species, create barriers to animal movements, decrease primary production and wildlife habitat and degrade the appearance of the landscape. If they are not careful (and what is to motivate them once they have the green light), it could easily create a huge mess, undoing years of work by local conservation groups. The proposal is therefore especially galling because it is grossly insensitive to our history and values. One has to assume that those who support this project are themselves inured to these values or blinded by distance and greed. Efforts to secure sustainable energy supplies for our future are well under way in our state and should be ramped up, something our governor supports. Repairing leaks can increase supply; improved heating efficiency and insulation can reduce demand; alternative energy sources further increase supply; improved appliance and vehicle efficiency further reduce demand. Infrastructure investments at this time must be focused on grid stabilizing energy storage, efficiency, and carbon neutral sources, not new pipelines. We are at an historic time of transition and nothing else makes sense. Those in a position to influence the fate of this project should be mindful of the commitment to sustainability that our region has embraced and take notice of our fierce resistance to ethical compromise. The permanent legacy of water, land, and climate degradation that would be inflicted by the project despite the reasoned opposition is intolerable. Our opposition to the energy pipeline project will not end until the project is stopped.

SARAH PIRTLE: Number 29. My name is Reverend Sarah Pirtle, S-A-R-A-H P-I-R-T-L-E. I'm speaking tonight as an educator, as a parent, and also as a chaplain. I want to thank Senator Rosenberg for this hearing. And, in the very beginning, you were saying we're looking tonight for an outcome with a framework of what could constitute a fair and reasonable decision from FERC. With all of the powerful testimony tonight, it seems that the framework that's emerging is that it's not needed, that it's an export project, that it's dangerous, and that instead we need an alternative to this pipeline. My theme tonight, I want to represent and speak for the young people. So I'd like us to imagine the tens of thousands of young people not only in the county, but we've been talking tonight about the wide influence, that people are watching us. Do we stand up? So here are four things that would happen for them: So, generations have secured protected state forest. Generations have made possible the 150 land trusts that we heard about tonight. And that wetlands would be used for storage of building materials. You know, right there, that just -- it's sort of -- it's emblematic, just totally disregarding the essential need of water. Groundwater contamination and protecting Native American historical sites that have just come to light. So, the Pocumtuc people who've lived here, the values that they have, can you imagine, would it be true that right at Woolman Hill, where the last Pocumtuc village is that there would be the pipeline, or where Juanita Nelson's house sits just a few yards away. It's unthinkable and we can't let it happen. I've been a homeowner in Shelburne Falls for 22 years. In Shelburne Falls, we're one of 55 towns, we not only come out in opposition to the pipeline for Shelburne, but for anywhere. And so, for young people to have to watch that these careful legislative bodies have said no, and yet somebody would override it is -- it's unthinkable that they would have to live with a ticking time bomb with a sense of words like incineration zone. How would that affect the stability of our social fabric? Mental health? Would there be increased teen suicide? These are questions we have to be asking ourselves. How would we explain to a young person that beloved places like Natural Roots Farm have been threatened when these are rare jewels. So, in closing, I urge FERC to include in the framework the responsibility to young people and future generations. May young people watch our perseverance. May they watch our moral courage. This is our homeland. The essence of democracy and sovereignty is at stake and we are taking together a moral stand.

ANN GIBSON: I'm number 30. My name is Ann Gibson, A-N-N G-I-B-S-O-N, and I speak for the Town of Conway Board of Health, of which I'm a member. Thank you, Senator Rosenberg, for holding this public hearing and for delivering our comments to FERC. The proposed Tennessee Gas Pipeline Project, which crossed the Town of Conway over nearly three-and-a-half miles will specifically and significantly impact the Town in multiple ways. In addition to the Town's concerns about the impact on environmentally sensitive areas, the Board of Health has particular concerns about a number of things: One, the impact on the quality and flow of water in wells, streams, and groundwater aquifers. Two, noise during construction and operation, particularly in light of the location of a mainline valve in the town. Three, the impact of planned and unplanned gas releases on air quality. Four, the impact to roads, bridges, and related infrastructure, particu-

larly during construction. Five, proximity of the pipeline to high-tension lines. And, six, emergency access. I'd like to make two points: First is about public health. It is the mandate of the Board of Health to be vigilant about the health and safety of our community. And the health of our community is directly related to the health of the environment. If the quality of our air, our drinking water, or our farmland were compromised in any way, our collective health would be compromised. The body of literature on the health risks associated with the transporting of gas by pipelines is not yet well-developed. But the lack of evidence that something is harmful is not proof that it is safe. The Conway Board of Health is not willing to risk the public health of our citizens. The second point is about need. There is mounting and persuasive evidence that there is no need for this project. Alternatives must be explored, such as repairing leaking pipes, implementing efficiency, conservation, and improved storage measures, and developing clean energy. Kinder Morgan has yet to make a convincing case for the need, yet the risks to our community are great. We, the Board of Health of Conway, therefore join with others in asking FERC to provide a full assessment of the need for this project. We ask that this assessment include a comprehensive analysis of alternative solutions, and consider the cumulative environmental impacts of the NED Project in conjunction with all other projects aimed at meeting the energy needs of the Commonwealth. There are alternatives to this risk-filled project. Together we can create them. Thank you.

GARRETT CONNELLY: Garrett Connelly, C-O-N-N-E-L-L-Y, Number 31. The Bacharach sampler is something I'd like to bring up, especially for all the government politicians and everybody. The Bacharach sampler is a tool used to sample methane, and that sampler is what's used on all the pipelines, all the tanks, all the wells, all the seals that go around all the wells, and it's been used to project that natural gas is a bridged fuel. The thing is is that I don't read newspapers much anymore, because they're all so full of it, so I mostly read science magazines nowadays, and the Bacharach sampler has been used incorrectly to determine that gas is a bridged fuel. If you use -- according to the science magazines -- nature, science, all the different periodicals, this sampler has been used incorrectly, and the decision that natural gas is a bridged fuel, based on using this sampler, is completely false. It may very well be that natural gas is worse than coal. So, here we are, discussing some hair-brained scheme, a corporate scheme -- something like a communist scheme, to get the people to pay the money for a crooked corporation that only exists because it skipped out on the pension funds of the people who worked for the gas manipulating company; they took the assets and ran. And the people that had pensions lost their pensions. That's what Kinder Morgan is. So let's step back a second and look at the world we're in. There's another pipeline going for export in British Columbia. Kinder Morgan. It's going right into the harbor where the killer whales live. Homeland for killer whales, home water for killer whales; the very center of the killer whale culture is where Kinder Morgan is taking the pipe for export or out through the Pacific. There's a huge pipeline going across Texas down into Mexico. There's another one coming through here to go over into Europe after they overthrew Ukraine. They want to frack Ukraine, too. The thing is, these corporations are reducing us to an extraction economy. And look what happened in Guatemala, okay. The president is in jail. The vice president is in jail. They're in jail because they work for these kinds of companies. So we're talking here a democracy, an undermining democracy. That's what their extraction industry does. The first thing it does is -- does that mean I'm done, when you put up the red? Ladies and gentlemen, America is on the line here.

VINCENT DEVITO: Good evening. I thank you for tonight. Vincent Devito on behalf of Northeast Energy Solutions. Northeast Energy Solutions has, through its members, represents about 180,000 citizens who own, collectively, about 50,000 acres of conservation restricted land. With regards to Kinder Morgan, I happen to agree that they -- we should not expect them to be a good corporate citizen in the Commonwealth. But, more to point, I think I'm going to mention a few things with -- in regulators' jurisdictions that haven't been mentioned yet. And I'll run through, most importantly, with regards to the scoping proceedings of which are continuing tonight: That on Friday, August 28 of this year, the United States began enforcing a new rule called the Waters of the United States Rule. That particular rule expands federal jurisdiction over small waterways, like streams and wetlands. Unfortunately, the impact of this new rule was never disclosed or discussed by Tennessee Gas Pipeline; not before tonight or any other scoping hearings or documents they

have filed with FERC. This particular rule opens a whole new line of questioning as to federal jurisdiction and landowner responsibilities. In fact, as a result of that rule, a landowner in your Senate district or elsewhere in the Commonwealth could potentially be liable for nearly \$40,000 per incident per day in the form of a fine by the EPA for a pipeline breach attributable to the TGP, not yet discussed. As such, this scoping process, as it has been run so far, is defective and it must be continued until this new rule is discussed and the potential impact of that rule is addressed. Moreover, the failure of Tennessee Gas Pipeline to disclose that rule's potential impact during the public process further discredits Tennessee Gas Pipeline and their self-purported transparency and assertions of governmental and public cooperation. This is a pattern of TGP. TGP and Berkshire Gas have continually misrepresented data to elected officials and regulators, all of which is proveable. Most recent was the lack of disclosure to the Department of Public Utilities by Berkshire Gas. Through an entire evidentiary proceeding, they claimed that their moratorium on new customers could only see its demise if Northeast Energy Direct is built. Berkshire Gas summarily dismissed all alternatives and assured accuracy of their testimony to state regulators. Not until that evidentiary proceeding at that meeting was closed did Berkshire Gas reveal their investment interest to the pipeline. At a minimum, this is a breach of the company's fiduciary responsibility on a regulated utility. In fact, NEES charged in a letter to the attorney general this month, who has been responsive, that the investment in a proposed Tennessee Gas Pipeline Project without disclosing it publicly until mentioned by NEES needs to be closely examined. Further, it is certainly time that Berkshire Gas explain to the public the impact of the moratorium on present and potential future demand of natural gas in Hampshire and Franklin counties. I'm going to skip through a lot, I'll be submitting something that will cover this, because my time is up. Ultimately, despite what Tennessee Gas Pipeline and Berkshire Gas have been trying to sell to this region, the issue is not one of supply, it's one of capacity. Tennessee Gas Pipeline is not the only way to bring natural gas supplies to Berkshire. An August 24 -- this is important -- an August 24, 2011 order by FERC, an Order Issuing Certificate for the Northampton Expansion Project, which I found through research, expressly intended to serve Berkshire Gas, thereby avoiding a moratorium. That's the Northampton letter. It exists. And its intended purpose is stated in a FERC order that came out in 2011. Tennessee Gas Pipeline and Berkshire Gas want to build a bazooka and all we need is a peashooter. Thank you for your patience.

SENATOR ROSENBERG: So, we are going to hear from Carolyn, who's number 35, and then we're going to take a ten-minute break. And again, when Carolyn finishes, I'm going to look at the clock, and that's when the ten minutes begin, and number 36 please be at the microphone exactly ten minutes later.

CAROLYN NESS: Thank you, Stan, for holding this hearing. My name is Carolyn Ness, N-E-S-S. I'm a member of the Deerfield Select Board and the Board of Health. The Town of Deerfield has submitted to your staff our comments to FERC that we sent in at the end of August. The Town of Deerfield remains especially concerned about the lack of horizontal drilling information that will occur under the railroad, under Interstate 91, under the Deerfield River, the contaminated rail yard, aquifer, and the Connecticut River. There's destruction to our archeological sites and loss and damage to our agricultural lands and town. These are our major concerns; we have many pages that we submitted. I have worked with you, Stan, for really decades as a public official, and the Town of Deerfield now asks you to use your position, your expertise, and your interest in long-term policy, which you have always presented to us, to stop this pipeline. The Town formally requests a suspension of the FERC process and a no-action alternative analysis be done, as well as a full evaluation of the attorney general's report when it comes out in October. We formally request that of you. Over the past year-and-a-half, the Town of Deerfield was appalled to learn that, to save money, about 30 to 40 percent on the construction costs, a thinner pipe and lesser grade wells was being proposed for the pipe to go through the Town of Deerfield and through all the other towns because we are rural. Over the next several months, we did lots of research. As Polly Ryan had articulated, there are certainly other things we would love to do. But after doing so much research, it led to the Board of Selectmen having voted against a resolution against the pipeline on August 20, 2014. On October 22, 2014, after an exhaustive public hearing process and much research by the Town of Deerfield's Board of Health, which we are a select board, we issued a cease and desist order for all Kinder Morgan activities in the town based on their safety record. It was

absolutely appalling. The Town has continued to be engaged in this process, where we had nearly a hundred people attending our August 12 meeting to prepare comments to submit to FERC. What has emerged over the year and a half is that seven pipelines proposed for New England is clearly not for domestic use and not for use here in Massachusetts. The glut of fracked gas now is on the domestic market and they are having a time getting it to market. But once the LNG tankers start across the Atlantic to Europe, this domestic market becomes an international market. We reserve space on the pipeline but we pay the going rate, the international rate. Our utilities are switching to fracked gas generation, our rates will go up when the international pricing kicks in. The Marcellas fields are estimated to produce for the next 10 or 15 years at the current rate. If we ship out all this gas, all seven pipelines shipping and sending out the LNG tankers, we could have as low as five years. What the bottom line here is, there is no domestic pricing protection and there is no domestic supply protection. This is really critical. By continuing to rely on fossil fuels, we are not meeting our state's agreed goals. We are having hundred-year storms almost every other year. We are dealing with regular destruction and states of emergency on a regular basis. Most of us are on very familiar terms with the FEMA teams. My four kids played in the yard of our home, they rolled around in the lawn. My grandkids can't even cross the same lawn without getting ticks and having to do tick checks. The bugs, mosquitoes. They have to have bug spray to keep the mosquitoes away. They have West Nile virus and Triple E. As chair of the Board of Health for well over a decade, it's incredibly frustrating to say to people, "Check for ticks daily, patrol your yards for standing water." This is so awful. We have climate change now. We have to do something now. Please help us. Thank you.

SENATOR ROSENBERG: We'll reconvene at 8:11. And we mistakenly skipped over number 24, so if you will be at the microphone at 8:12, we'll begin with your testimony. (Brief recess)

SENATOR ROSENBERG: We're now at number 34. We'll go to 27 and then we're going to 36.

BARBARA LEMOINE: I'm Barbara Lemoine and I live in Northfield. The proposed Kinder Morgan pipeline story needs to be rewritten. Like all stories, there should be a beginning, a middle and an end; a logical sequence that makes sense. First, the beginning: Before even a route is suggested and eminent domain mentioned, the question of whether the Northeast requires this project is basic. It is apparent that the amount of natural gas that would be transported far exceeds the need. FERC's concern must start with the need of citizens. Allowing private lands and public lands to be surveyed, taken by eminent domain, and then irrevocably altered must only be done after clear need is established. This has not been done. The lives of residents, towns, and the environment should not and must not be jeopardized so that a corporation can export natural gas overseas. The middle part of the story must be the foundation of planning. Thorough and complete plans for the towns, Massachusetts officials, and citizens must be available. "To Be Determined" is not sufficient. Is there a route with lesser consequences? Again, if there are adverse consequences, how can eminent domain and trespassing on private land and restricted and conserved land be possible if there is no public benefit? Third, how will the pipeline be placed and maintained under the Deerfield River and the Connecticut River? How will leaks be detected under these and other smaller waterways? Kinder Morgan has not been open and transparent in their dealings with citizens and government officials. Can we make the leap of faith to guess that any leak or problem would be immediately rectified, or would it go ignored? In the vicinity of the proposed route are sites of historical importance, including early homesteads and sites both identified and not identified as significant to aboriginal peoples. How will Kinder Morgan ensure that sites are not disturbed, including artifacts and human remains. Third party archeologists, naturalists, and geologists must be on site in conjunction with Kinder Morgan agents. I circle back to need. Senator Rosenberg, thank you for holding this meeting and listening to your constituents. Thank you.

ROWAN MCKEON: My name is Rowan McKeon, R-O-W-A-N M-C-K-E-O-N. Good evening and thank you for giving me the opportunity to present my thoughts on the Kinder Morgan NED pipeline. My name is Rowan McKeon and I've just begun the 7th grade this week. I think my perspective on this discussion is an important contribution. While you have the responsibility to vote and make the decisions about whether or not to construct this pipeline, I'm part of the generation that will have the responsibility of dealing with

the effects of your actions. I'm concerned that I'll be cleaning up after the mess that you have made, and my mom tells me it's not right to make a mess and expect others to clean up after you. The fact is, I have a few serious questions for you this evening. Can you assure me that this is the best choice for our energy needs given the long-term effects of land contamination that you will leave behind? I am concerned about the harmful chemicals that will seep into the ground in the area of the pipeline, leaving the land and waterways useless and valueless. Can you promise me that you are making this decision with full awareness of how wasteful fracking is in terms of water usage? As far as I can see, my generation will be focused on finding solutions to providing clean water as your generation has been focused on solving energy questions. Can you imagine that the world you would create by building this pipeline is a world you would want to live in in 15 to 30 years from now? Pipeline explosions, poor air quality, and destruction of natural environment seem like risky irreversible downsides to this short-lived energy "solution." Can you promise me that you've considered all the options available for meeting our energy needs for the present and future? Is this really the best you can come up with? I ask you smart people in the room charged with making the best decision here to do just that. You have an opportunity to do the right thing, set a new standard of excellence, and launch forward thinking. Don't let me down by leaving me with bigger problems to solve. Believe me, there's plenty of other important work to be done in my lifetime besides cleaning up after your mess. Thank you for your thoughtful consideration of me and my generation.

NINA KELLER: Hi. Good evening, Stan, and everyone. I'm Nina Keller. I'm the chair of the Board of Health in Wendell, and I have spoken at all the other opportunities to be heard by the feds and the state, and it's great that you're here. We've waited, we trusted in your recognition of what this part of the state needs and has been asking for. If Kinder Morgan had come into our community, not as offspring of Enron, even if they had, some people do evolve, but if they had come here and said, "We are going to finance solar panels on every house in this area, we are going to train all of the GCC and anybody who wants a job," there would have been a very different reception for Kinder Morgan. These are not good neighbors. And what we need to hear from you is an affirmative "Stop wasting our time, Kinder Morgan. It will never happen here. This is a fiercely savvy community who understands environmental progress and it will never happen here." So please help us stop wasting our time on this fruitless, polluting, horrible concept. And thank you and we look forward to hearing from you saying, "No, absolutely not, Kinder Morgan. You're in the wrong world."

DOUG WHITE: Hi. My name is Doug White. I'm from Greenfield. I'm an international environmental activist and independent journalist, and I'm also the founder and president of a local not-for-profit called the National Alliance of Concerned Americans for the Well-Being of All People and Earth, Inc. The title of this piece, this short piece, is Why We, the People, Must Defeat This Unnecessary and Unhealthy Natural Gas Pipeline. First off, LNG gas is clearly underutilized and can fully meet the needs of Western Mass., so this pipeline is truly not needed. Tennessee Gas Pipeline, a division of Kinder Morgan, has never clearly shown via any hard science that this natural gas pipeline is needed. Clearly, if you combine LNG and factor in other things like energy efficiency and renewable energy development, Western Mass. will have all the energy we need for heating, cooling, and electricity for a very long time to come. Number 3: At least 70 percent of Tennessee's natural gas will be sold to Canada and Europe. So, clearly, they're in it for the money, not really to supply gas that we don't need. Their argument that we desperately need their natural gas is totally false. Number 4: In the last 20 years, Western Mass. has made incredibly great strides in its development of wind and solar, and we ought to be given credit for that. And it's very important, both for our own economic self-sufficiency as well as our healthy sustainability, to continue the development of wind and solar. Stay on that course because it's the only course that's going to make it possible for the United States and the world to be healthy and sustainable and to survive. It's the only course. Number 5: Today the whole world is severely impacted by a colossal global warming burning climate change crisis. We are in crisis. We've been in crisis. We are continuing in crisis. We are now nearly at 400 parts per million of harmful greenhouse gases which we actually hit two years ago. And when I interviewed him in front of the White House in Washington, D.C., esteemed climate scientist, former head of the NASA climate change program, Dr. Jim Hansen, told me, when I interviewed him, that "we must get below 350 parts per million in order to be sustainable but

also in order to survive.” And I don’t see how this project helps us do that, quite frankly. Obviously, one of the major solutions to our global warming burning climate change crisis is a hundred percent renewable energy revolution, and since our log-jammed moribund Congress continues to fail the American people and the world by not slowing and stopping our poisonous fossil fuel emissions, it’s up to we, the people, to do it. Locally, statewide, bio-regionally, whatever it takes, it’s up to we, the people. We’re the ones that have to take the stand and make it happen. In conclusion and in truth, Kinder Morgan’s natural gas pipeline is not needed and it’s not wanted. Thank you very much.

TOM MINER: Good evening, Senator. My name is Tom Miner, number 37. T-O-M, M-I-N-E-R. I’m representing the Shelburne Select Board, which is meeting tonight so that their members are not able to be here to deliver any comments to you. I’ve been a member of the advisory committee that was set up by the Select Board to look at the pipeline issue and has helped develop comments that the Town will be submitting. Speaking for the Select Board, I first of all want to thank you, as others have, for giving this opportunity for local voices to be heard on this issue, which affects all our lives, for a goal of the corporate sponsor is to use our pathways to get gas to another part of the Commonwealth and beyond. A month ago the Select Board, in response to voices from the community and recommendations of the advisory committee, unanimously passed a resolution of opposition by the Town of Shelburne to the pipeline, and we will be conveying that together with scoping comments to you to deliver that packet that goes to Washington. Again, thank you.

SENATOR ROSENBERG: Thank you.

WHIT SANFORD: Good evening, Senator Rosenberg. My name is Whit Sanford. I’m number 38. My nickname is spelled W-H-I-T. My last name is S-A-N-F-O-R-D. I submitted, I don’t know, 12 pages of comments to FERC already and have sent you the copy of those. And much of my comments tonight do not repeat what has already been said because I want to focus on two issues that I think are relevant to our rural economy and to also something that I call rural equity. The NED pipeline will have a huge impact on rural areas like the Berkshires, where tourism, farming, forestry, and outdoor recreation are a significant and growing part of our economy. These businesses and industries are based in and dependent upon the quality of our lands and waters, the scenic beauty of our mountain landscapes, the rural character, culture, and heritage of our communities and the well-being of our natural and historic resources. In essence, the quality of our rural and natural and cultural resources are inseparable from our efforts to grow the economy of the Berkshires and Franklin County. If the pipeline goes through, it will compromise the region’s prosperity and sustainability and the ongoing public and private efforts in Massachusetts to address climate change and transition to renewable energy sources. In fact, the pipeline will contribute little to our prosperity. Few, if any, full-time year-round jobs will be created in our area even as the pipeline crosses and scars our rural landscape. Only a very small percentage of the Marcellus Shale gas transported by the pipeline will be used in the Berkshires. Instead, the pipeline will change our communities and weaken our economy because it is an industrial use that heretofore has not existed in northwest Massachusetts. And it runs counter to our growth. It will impair the operation of our farms and the management of our forests, the protection and restoration of our waters and wildlife habitat and the preservation of our scenic beauty. This creates an inequity. Rural areas are forced to bear the financial and economic burden of the pipeline while the people and businesses elsewhere reap the benefits of the low electric rates and Kinder Morgan and TGP profit from the pipeline year after year. I’m way past my time, so I just would like to say, Senator, to please have FERC really study not only the environmental implications of the pipeline but the economic implications, and also begin to think about the environmental services that rural regions provide not only to our regions but to the Commonwealth and to New England as a whole. We have gotten basically short shrift with respect to that, and I think it’s time that the Commonwealth begin to recognize the value of our rural landscapes and natural resources as it pertains to climate change. And then also to ensure that Kinder Morgan and Tennessee Gas begin to reimburse those landowners for the value not only of the use of their land but for the crops and other uses that the landowners will no longer be able to use or have because the land is owned by somebody else and taken by somebody else. Thank you.

JERRY WAGENER: Number 39. Thank you, Senator Rosenberg, for this session. I'm Jerry Wagener, W-A-G-E-N-E-R, with the Northfield Open Space Committee. This proposal is a bad deal for the nation, the State of Massachusetts, and my local community. It's a bad deal for the nation because it would significantly increase the greenhouse gas-producing infrastructure with its associated foot-dragging on dealing with the climate change problem. The U.S. should be playing a leadership role in addressing this problem. If we, as the strongest, most influential nation in the world, do not provide such leadership, future generations will suffer unduly and history will not be kind to the U.S. It is a bad deal for the state because it would set back decades of investment, financially and in terms of human commitment, in safeguarding the environment. Massachusetts has aggressively promoted both permanent protection of open space and adoption of renewable energy infrastructure. These laudable goals have become part of the state's identity, with widespread support and involvement of residents, to say nothing of financial support by the state and individuals. This proposal flies in the face of this spirit of conservation, will adversely impact many of the associated achievements, and discourage further forward-looking commitment. It is a bad deal for the community because it would be a permanent major setback to the tranquil magic of life in a pastoral rural environment. The distinctive characteristics of this environment are open space (farms and forests), walking/skiing trails, quiet surroundings, good air, and good water. All of these characteristics would be degraded by this proposal; the community would thus be transformed adversely. For example, the pipeline and its compressor station would be located on or adjacent to a much permanently-protected land in the town. The compressor station would be within sight and earshot of the "nerve center" of the community's trail system, including along a long stretch of the New England National Scenic Trail. The pipeline and compressor station would be at the top of three watersheds that supply much of the town's drinking water and, thus, over time, adversely affect the town's water quality. Likewise, with occasional venting of the pipeline, not to mention possible breaks and compressor pollution, air quality could be degraded. The compressor station, with its massive industrial footprint and presence, would certainly be a white elephant in this peaceful rural community. This proposal is a bad deal for the nation, the state, and the community. Thank you.

JUDY WOLTER: Number 40, Judy Wolter, J-U-D-Y W-O-L-T-E-R, of the infamous Gulf Road. "Natural" gas ingredients, besides methane: Hexane, octane, butane, methylpentane, propane, benzene, naphthalene, toluene, styrene, methanol, formaldehyde, ozone, lead, hydrofluoric acid, sulfur dioxide and various sulfides, various nitrogen oxides, many of which I can't pronounce, carbon monoxide, silica, and various other particulates, as well as over 700 fracking chemicals (undisclosed, thanks to Halliburton, et al), and don't forget radon (as in radioactive, as in the number one cause of lung cancer in nonsmokers). You call that natural? What are these ingredients? Poisons. Meaning irritants and allergens, endocrine disruptors, neurotoxins, mutagens, carcinogens feticides. What do they do to you? They make you sick, they kill you, and they deform and kill your offspring before they are born or in future generations. No wonder the majority of doctors and biologists polled are against fracking. Studies show that living within two miles of a compressor station may be more dangerous to your health than living around the fracking wells themselves. People in these areas experience symptoms like nausea, sinus problems, tiredness dizziness, throat and eye irritations, frequent headaches, muscle aches, joint pains, allergies, sores and ulcers, ringing in the ears, urinary tract infections. Well, not too bad. Endurable and mostly treatable. Let's go on. Difficulty in concentration, forgetfulness, amnesia, depression, severe anxiety, personality changes, staggering, decreased motor skills, abnormal EEGs, other nervous system disorders. It's getting worse. Irregular and rapid heartbeat, severe nosebleeds and bruising, strokes. Breast lumps, spleen, and thyroid problems, cancerous lesions, liver and kidney problems, reduce reproduction, aplastic anemia, cancers, miscarriages, birth defects. Enough. Plus loss of hearing from the noise. Create jobs? You bet. For health care workers and undertakers. Leaks? There sure are. You can identify them because the stuff is so toxic it kills the grass and trees around them. Toxic gas leaks from valves, connectors, flanges, threaded unions, ties, plugs, caps, hatches, valves and instruments, gauges, vents, all kinds of places, not to mention the blown-up pipes. And, with time, corrosion increases. Leaks increase. Plus, there are massive leaks in scheduled and accidental blow-downs with plumes of this stuff rising 200 feet in the air, lasting 30 minutes to three hours multiple times a year. Beginning to

feel not so safe? Even the Wall Street Journal criticized Kinder Morgan's horrible safety record and its tactic of minimizing maintenance to maximum profit. The PHMSA, which is the Pipeline and Hazardous Materials Safety Administration, has identified a long list of failures to update the maps, test safety devices, maintain firefighting equipment, monitor corrosion, et cetera. From 2003 to 2014, Kinder Morgan had 180 spills, evacuations, explosions, fires, and fatalities, not just leaks. At least seven human beings have been killed, including by instant incineration. Who can trust natural gas?

SENATOR ROSENBERG: I'm sorry, we're going to have to ask you to wrap up. Thank you.

RON COLER: Number 41, Ron Coler, R-O-N, C-O-L-E-R. Senate President Stan Rosenberg; that's got a real nice ring to it. Thank you so much for doing what you've done here and providing us the opportunity to come before you and to actually listen to our comments. I'd also like to thank everybody that's here who are either speaking or just coming in solidarity to this common cause. I live in Ashfield, and I, with my family, have lived in that town for 20 years off the grid. We -- if there's anyone who questions the ability to do so or the concept of conservation, you are invited to welcome them to my house and I will show them that it is possible in the Northeast. But I am less here for personal reasons than I am for governmental reasons. I am a select board member in the Town of Ashfield. And the Ashfield, my Ashfield constituency, which I take very seriously, has voiced their opposition to this project in the development of this pipeline. I have before me a resolution, which I've left in the box in the back there, which was developed at our special town meeting on June 23, 2015. And it is a citizen petition resolution to oppose Tennessee Gas Pipeline through the Town of Ashfield. And there are very many "whereases" here, and they deal with issues such as social justice, environmental degradation, irresponsible use of fossil extraction, and so on and so forth, and I will not go, in the interest of time, through every single one of those "whereases," But I will say that I will read the resolve: "Therefore, it is resolved that the citizens of Ashfield, Massachusetts oppose the proposed TGP pipeline through Ashfield and neighboring communities. "2: Hereby call on our Select Board and all relevant town permitting authorities to contest the proposed TGP pipeline. "3: Hereby instruct our state and federal legislators and executive branch officials to enact legislation and take such actions as are necessary to prohibit this pipeline and the hazardous condition it engenders from within the boundaries of Ashfield." I take this charge very, very seriously and will do all that I can do to oppose this pipeline. Thank you.

SENATOR ROSENBERG: Thank you. While the next participant is coming to the microphone, I've just been informed that another ten people have signed up while we were on break. So we now have 32 people who wish to speak from this point forward, which means it's not possible for each person to do three minutes and have each speak. So I'm going to ask each of you now, from this point forward, to please hold your comments to two minutes, and I will have to say something audibly if you go beyond the two minutes so that we can really keep it going. Otherwise, some people will not have their chance.

ALICE SWIFT: I'm Alice Swift. I live in Amherst. I would like to speak about Woolman Hill in Deerfield. Woolman Hill has traditionally been a place of peace and quiet. Woolman Hill Conference Center is a Quaker center where people come for retreats and conferences. During the installation of the pipeline across Woolman Hill, there would certainly be excessive noise and disruption of that peace. It's difficult to imagine quiet contemplation and silent worship while noisy machines blast into the rocky hillside. Trucks coming up that treacherous road to the site during construction and later for monitoring the the pipeline would cause all kinds of problems. The road would certainly need to be widened and improved. Later there would be the possibility of leakage and even explosions. Both would have catastrophic effects on the soil, water, and air quality. The wide swath cut during construction would alter the landscape and mean destruction of many trees. Woolman Hill is not a place that should be permanently scarred by a pipeline that is not needed. We should not be allowing the construction of a pipeline that will be there forever at a time when we recognize the need to leave the gas and oil in the ground. Once that infrastructure is there, it will be extremely difficult, if not impossible, to stop the flow of gas through it. It would be much better to plan for phasing out the use of gas, a fossil fuel that is contributing to climate change.

SENATOR ROSENBERG: Thank you.

PIXIE HOLBROOK: My name is Pixie Holbrook, P-I-X-I-E, H-O-L-B-R-O-O-K. I'm from Conway. It's been a long day, Stan; I'm really impressed with your stamina. I want to thank you. We so appreciate this hearing and to have our voices make it down to D.C. An issue that I'd like to have them investigate further is in regards to the plan to co-locate with the high-tension wires. Our local Council of Governors, the FR-COG right here in this building, had held a public information meeting in May that included a gas industry engineer, whose specialty was pipeline installation. When asked how far away a pipeline should be from the high-tension wires, he quickly responded with, "400, 500 feet." Then, with a lower voice, he said, "a thousand feet." And he went on to explain the dangers of them being closer, and it was very disturbing to all of us that were in attendance. So we're asking, how can Kinder Morgan justify the placement of this pipeline that, in places, runs only 50 to 100 feet away from the high-tension wires? Based on what this engineer said, this is clearly putting our residents at risk. So, next to that, we need to also ask for a detailed plan on how would that be monitored and who would be monitoring the integrity of the juxtaposition; who would that objective part be? It's very disturbing, and I'm sure you would agree with that. In general, we think you should be questioning the ethics of this company. They lie about hiring thousands of people to install the pipeline while, in fact, we know historically they bring in their own crews. They lie about building a pipeline to benefit New England, had open houses with photographs of quaint little buildings but, in fact, the compressor station proposed is one of the largest in the country. We're concerned about the manipulation of their schedules to profit them. And let's not forget the most recent, this ICF international needs study that they just released and they paid for. So I will skip the part about the remote blow-down valve, which is a big concern to Conway but, as so many have said, it's not wanted and it's not needed. Thank you.

SENATOR ROSENBERG: Thank you.

PAT LARSON: 44, my name is Pat Larson, Orange, Mass., and it's L-A-R-S-O-N. I'll try to keep it to two minutes. In my longer comments to FERC, I focused on alternatives and conservation, which you have. Tonight my comments focus on three spots along the proposed pipeline route, which many of you know. These are places that I know from living, working, and raising a family in Franklin County for almost 40 years. I have not only driven past these spots but have also hiked and biked in this area for years. Here I raise environmental concerns about land. First, the Montague Plains Wildlife Management Area is protected. Its purpose is to preserve a unique Massachusetts pine barren. Now each year for the past 15 years, small prescribed burns are conducted to help preserve this sensitive eco-system. What happens with these prescribed burns if a gas pipeline is built across the land? Second, the proposed route crosses the Millers, a tributary of the Connecticut. The proposed route travels down a rocky steep embankment, crosses the Millers and then travels up another very steep embankment to go under Route 2 into Erving. Following heavy industrial pollution of the river, citizens worked to clean up the Millers River for years. It is now a clean, living river. How do we guarantee that water contamination will not happen along the river if there is horizontal drilling under the Millers? The third site I was going to mention is the old M&M Trail which is now part of the New England National Scenic Trail that was set up in 2009. And federal funds have been used to help support parts of this trail. Now the NED pipeline could cross the trail. It's a trail used by thousands each year where, standing on a high lookout, one can see for miles and wonder how this spot has survived unblemished. I ask that FERC investigate and report on how there will be no impact from possible blasting on steep terrain, how a sensitive eco-system will not be impacted, and how water from rivers will not be contaminated. Thank you.

SENATOR ROSENBERG: Thank you. Number 45.

NANCY HAZARD: Nancy Hazard. N-A-N-C-Y, H-A-Z-A-R-D. So, thank you, Senator, for being here tonight and listening to us. I have been very concerned about energy policy for over 40 years and I've been advocating for a sane energy policy for that time, and I'd have to say that the progress has been poor, to say the least. And so this is another opportunity for us to make a decision and to make the right decision now. When I worked at the Northeast Sustainable Energy Association and ran the Tour de Sol event, I learned a lot about looking at, when assessing fuels, looking at full fuel cycle, so looking at all of the emissions in-

volved, from extraction to distribution to use. And it's been brought to my attention that the EPA accurately accounts for the carbon dioxide emitted from natural gas when it's burned, but they do not accurately account for all the methane that is emitted. So we've been making decisions to focus on natural gas under false pretenses, and that really needs to be changed. In terms of how much energy we use and how to decrease the energy we use on a per capita basis, Europeans use half of what we use. So, how do we get there? One of the things that we've discovered in Greenfield is that, when we had a marketing campaign, we increased the request for utility energy audits five-fold just by having a better marketing campaign. And if we had a Green Bank, we'd have a lot more money so we could do better there also. In terms of moving to greener fuels, we need to raise the net metering cap, as you know, so the community-shared solar projects can move forward today. We also -- a little known fact is that I've been following, for the last five years, the whole issue of a sequestering carbon in the soil. Just cutting the emissions is not adequate. We also need to take carbon dioxide out of the atmosphere and put it in the soil where it belongs and where the soil can then become more fertile and we will have more food for everyone. Thank you so much.

SENATOR ROSENBERG: 46. 46? 47? 48? Can I get 48?

BUD DRIVER: 47, Bud Driver. This is an archeological impact statement for the Town of Deerfield along with our personal accountability policy that makes any archeological entity that comes with a state permit to have to come before our historical commission -- excuse me?

ATTENDEE: You have to go to the mic.

BUD DRIVER: So, anyways, other towns north of Deerfield, they're all adopting an accountability policy also, which is really good because it monitors your cultural assets within your town, and that's the Historical Commission's responsibility is to know where they are, so that when somebody like the archeological entity that got the bid for the pipeline can work with historical commissions to understand where our cultural assets are, and that's the low impact aspect of it. But what's important, I don't really want to talk about this stuff. What I want to talk about is the general laws of Massachusetts governing archeological laws, and this is very important for everybody in this room to understand. The private landowner owns what's in the earth and on top of the earth; it's called freehold rights. So when you buy your land, you expect to have freehold rights where nobody can come and tell you, Hey, because I have a permit from Brona Simon's office at Massachusetts Historical Commission, now the artifacts found on privately owned land, because of a state permit issued, belongs to the Commonwealth, that she's overreaching her powers. And I need everybody in this room to write Brona Simon a letter, she's at Morrissey Avenue in Boston, to let her know that we want clarification on how she's able to do that; how is she able to write a permit to allow the archeological laws that are only for public and federal lands to be applied to the private landowner. And this goes because -- this is really important -- when the archeologists for the pipeline got their permit, Brona Simon had to sign it for them. So, when I checked on FERC and the federal government, such as Natural Parks Service, they're stating that because they have a permit, that the artifacts belong to them, or to the Commonwealth of Massachusetts who issued the permit. That's the flaw, you guys; that's the problem. The general laws of Massachusetts do not apply archeological to privately-owned land, and so we need clarification on how, firstly, the permit was issued to FERC, or to the Natural Parks Service, where they're allowed to take personal property. Something's not right here and we need clarification; that's what's important, Stan.

SENATOR ROSENBERG: Is that in the material you gave us?

BUD DRIVER: Some of it is, but I didn't want to bore you with all that. It's bad behavior from the Commonwealth of Massachusetts, because I used Representative Kulig to ask -- from Brona Simons' office, how she's doing that. And she's an appointed official. She will not answer the elected official. So that's why I'm asking you, Stan.

SENATOR ROSENBERG: So this does have an impact on the pipeline, is that what you're saying?

BUD DRIVER: Absolutely --

SENATOR ROSENBERG: I'll talk with Steve and then we'll close the loop with you. Thanks.

BUD DRIVER: Thanks a lot, you guys.

JANICE KURKOSKI: My name is Janice Kurkoski, J-A-N-I-C-E K-U-R-K-O-S-K-I. Thank you, Senator Rosenberg for tonight and all the people who are still here and awake and the people who went before me. I chair the Warwick Buildings and Energy Committee for the last eight years. My comments tonight are aimed at the perceived need of the pipeline and also I'm going to try to answer the question, the very important question, If not this, then what? In the TGP Resource Report, RR-10, Section 10.1.1, TGP says, "implementation of sufficient energy conservation measures to eliminate the need for the proposed project is not feasible in the short term." Our committee's experience in Warwick is contrary to this. We now know that conservation is the most practical, effective, and least costly method to insure against rising energy costs, premature building failure, resource depletion, and climate change. By using low-cost weatherization methods, voted almost unanimously every time at town meeting for things that were not sexy like insulation, air sealing, storm windows, we've been able to lower our energy use in every building and in two of the five buildings by more than 50 percent. Conservation is cumulative in its energy savings. Each year conservation activities add to the conservation done in prior years, so there is a cumulative savings, sort of a compound interest. At the end of 20 years, the conservation done in the first year is still contributing to savings. The situation with a gas pipeline is quite different. The gas gets burned, for some it leaks along the way, and except for the pollution it's caused, it is gone. Think about it. There is no carryover benefit for one year to the next. At the end of 20 years or 40 years, or whatever the useful life of a pipeline is, we are left with a depleted gas resource and an old leaky dangerous pipeline which is more of a hazard than an asset. The projected \$5 billion would go a very long way if it were redirected to accomplish the goals of a safer, healthier, more secure energy future for all of us if it were put towards conservation, efficiency, and renewables. This is not only feasible in the short-term, it is terribly urgent. Thank you very much.

SARAH HEATHER RELOJ: Hi, there. Sorry I'm loud. Heather Relej. Sarah Heather Relej. Deerfield, Massachusetts. This is my son, John. He's happy to be watching democracy in action. Thank you. Thank you, my neighbors and friends. Thank you, officials who have joined us. I'm actually sending this letter via Stan to FERC but I'm asking if FERC could also send it to all associated persons within FERC or other government officials tasked with assessment, permitting, or the actual legality TGP/Kinder Morgan's proposed NED. Specifically my questions relate to pipeline facilities. I can't answer a lot of my son's questions about our personal safety. We're 500 feet into a map zone that's purported to be a thousand feet where we would be rendered to carbon, so I'm quite concerned, Stan. They say their initial pipeline route planning was selected through desktop analysis of environmental resources and the potential impacts to the resources crossed by the project. They didn't look at the impact to me or my beautiful son. They really didn't. I would like to say also that I purport they lack correct conduct through analysis of these sites via desktop and aerial recon. If the maps they then used to actually show us towns, maps that correspond to land parcels and sections that we can look at, lack dates and lack many existing physical structures and characteristics which must be considered by FERC at the outset, not as an afterthought. They failed to include labels for places where schoolkids play in fall, winter, spring, summer, in the mapped incineration zones, on maps I have seen, and also buildings that house people on multiple dates of every month of every hour of every year. I have to say that this is a major flaw in the methodology for producing quality and true data, since it is grossly inaccurate for anybody making an interstate transmission line to utilize old maps. I am not allowed to use my old driver's license from 30 years ago because it would get me in a heap of trouble to use my old data if I got pulled over by higher bodies tasked with keeping others safe. I'm going to close here really fast by saying my point is, look at NED now, before it's too late. By failing to look at the larger damages wrought by pipelines, by FERC's continued allowance of segmentations of projects, via loops, laterals, and state lines, FERC and TGP are continuing, hand-in-hand, to fail at the cost of waters, lands, and communities. If TGP/Kinder Morgan really wants to increase our access to energy, they would invest in ways not to pump it out of the ground instead of exploiting earth-dwelling resources with a finite lifespan, ourselves included.

SENATOR ROSENBERG: Thank you.

MEG WORCESTER: My name is Meg Worcester, W-O-R-C-E-S-T-E-R, and I live and operate a bed and breakfast on Keets Road in Deerfield near the Woolman Hill Quaker Conference and Retreat Center. Senator Rosenberg, thank you very much for hearing us, as we share our angst. I was once told that if you speak from the heart, those with hearts will hear. I have every confidence that you will hear us, as we speak from our hearts. I'll come right to the point: We're scared. I thought the government was supposed to help us in times of despair and to help keep us safe. The longer this proposed Kinder Morgan pipeline situation goes on, the more frustrated we're getting. We don't feel that anyone is hearing us no matter how many hearings are held, no matter how many people are voicing their concerns or in how many different ways or for how many different reasons. We don't want the pipeline in Massachusetts, a pipeline that plans to ship most of its gas overseas. Why should we allow our countryside, at our expense, to be spewed upon with toxins, ruining our landscape, our water, our orchards, our farms, putting our health and safety in peril; risking our very lives if we, as I do, happen to live within the incineration zone of such an operation so that a corporation out of Texas can get richer by shipping our country's resource overseas? Does anybody understand that we have worked hard to build our businesses, protect our resources, and now feel that we are on the brink of having them virtually stolen from us? We can find other ways to meet our winter energy needs, as you've heard tonight, besides creating a noxious pipeline. Can we please be allowed to do so? Or must the freedom to make that decision also be stolen from us? What is the meaning of property rights? Is that when you get to pay taxes for the privilege of living in a town, even though your property has become, through no fault of your own, valueless, inasmuch as we can't sell it? I don't want to come across as selfish or anything, because I do like to think of myself as a generous person. However, I'm not so unselfish or generous as to give over my livelihood or life so that Kinder Morgan can line their own pockets with everything I own. I alternate between despair, exasperation, frustration, outrage, and anger. I don't know where to turn. There's no rhyme nor reason to what's happening. I think the only happy folks are those who are lining their pockets with our blood, sweat, and tears. As a token of appreciation for your coming to hear us, Senator Rosenberg, I'd like to give you a cup of delicious water from my well. We have been enjoying the quality and taste of this water for 30 years; however, it is located within 30 feet of the proposed pipeline and would, therefore, be destroyed. Can you please help us? As I said at the outset, we're scared.

SENATOR ROSENBERG: Thank you.

BOB DICKERMAN: I'm number 52, Bob Dickerman, D-I-C-K-E-R-M-A-N, from Northfield. There's two things I want to talk about. One is pollution, the other one is need. Kinder Morgan spokesman Richard Wheatley has been reported as saying there will be no emissions at NED compressor stations other than an occasional release of methane. This is absolutely untrue. The compressor station turbines are huge. To make 80,000 horsepower or 40,000, we have to burn about a thousand tons of gas a day. A huge amount of gas. It's enough to heat 20,000 or more homes in the dead of winter. Consequently, the turbines would also produce, at the smoke stacks, a huge amount of emissions, around 2,000 tons a day. Perhaps Wheatley's agents could mention these things when they openly and transparently survey residents in Wheatley's anonymous telephone surveys, which I've received one of. Secondly, need. The Berkshire Gas moratorium I want to talk about. Prospective new customers, builders, installers who want new gas installations now should call Berkshire and ask why they're not building out their liquid natural gas facility at 365 Long Plain Road in Whately. The Energy Facilities Siting Board in 1999 approved this facility to address peak demand. If you use Google Maps, you can see the two big, white LNG tanks there and a space beside them where there's room for three more that they've never built out. The three tanks were to be added when peak demand increased, but they were never added, so I think the moratorium is uncalled for, and I hope that Maura Healey will find that Berkshire's unwarranted moratorium and Wheatley's lies meet the legal definitions of coercion and fraud respectively. Thank you.

FRANK HENRY: I'm Frank Henry, from Deerfield. I am the head of school of the Bement School also in Deerfield. If the pipeline were to be built, the head's house, the playing fields, and the dormitories of the

Bement School will be within the incineration zone. At least the lives of 40 students, including perhaps the fellow who spoke to us earlier, and 20-plus adults would be lost if a catastrophe occurred. The emergency resources of Deerfield and surrounding towns are inadequate to respond to less than catastrophic events. The Tennessee pipeline does not change in any aspect of the region for the better. No permanent economic advantage for the region has been identified, no permanent improvement in employment opportunities in the region has been identified. The quality of the water supply, ambient noise, health standards will not be improved and will be degraded. Adding the pipeline a couple hundred yards north of the campus will only add hazard and potential disaster. The installation of the Tennessee Gas Pipeline presents a direct threat to the safety of the Bement School and with no discernable benefit of any sort to the school, the town, or the region. The Bement School and I strongly oppose the installation of the pipeline.

SENATOR ROSENBERG: Thank you.

JIM CUTLER: My name is Jim Cutler, C-U-T-L-E-R, and I am from Ashfield. Good evening. And, again, thank you. I thanked you at the DPU hearings, although you weren't there, and I thank you again. This truly is very much appreciated. So I am a resident of Ashfield where I serve on the Town's planning board, and my home borders on a trout stream that is a state-protected habitat, and my land also contains a parcel that is protected under Article 97. And, yes, my home is targeted for the Northeast Energy Direct pipeline to be built by Kinder Morgan. Among the various things I do as a member of my community is one that I am very proud and excited about, and that is my job as a solar coach in the Solarize Mass Program currently underway in Ashfield, Plainfield, and Buckland. I helped select the company that will install the solar systems throughout this program and assist homeowners in those towns to understand the value of solar-generated electricity in terms of savings for them, jobs for others, and the knowingness that they have brought us all one step closer to a fossil-free, toxic-spill-free, and deadly-explosion-free world. So far, 65 systems have been sold for a total of 448,000 watts of electrical production. Some say that what we are doing with solar is not enough. You may be among those -- I'm speaking now, of course, to FERC -- who think that we need more gas to lower electricity costs. If you are and you ignore the role that solar plays in the reduction of electricity needs, then you will condemn this and many other beautiful pristine areas to habitat destruction, surface and well water contamination, and a life of sickness and early death for the people who live along the proposed pipeline route. Because what you will have ignored are the following facts: Massachusetts has installed 835 megawatts of solar electrical generation since 2008. And, according to ISO New England, demand for electricity has been down every month since May 2014. So I ask you, where is the need? Solar installations are not going to stop. They are not even going to slow down. There is no credible projection that says we need more gas, especially when energy efficiency is factored in. So why the big push? Are you aware that Kinder Morgan is sending threatening letters to municipalities who refuse to allow surveying on public lands? Are you aware that Kinder Morgan is conducting telephone surveys that are filled with inaccurate and misleading information? And you should be aware of the permits for the reversal of the Maritimes and Northeast Pipeline flow, permitting of export LNG terminals in Nova Scotia, and the many statements uttered by Kinder Morgan representatives stating that they cannot control who buys their gas. All of the above and many more reasons prove that this pipeline is not needed. The people and municipalities all along the proposed route have voted overwhelmingly to reject this project and yet you continue Kinder Morgan to pursue their intentions to build it. Again, this pipeline is not needed and it is not going to be built because the Federal Energy Regulatory Commission can no longer pretend otherwise. Thank you very much.

SENATOR ROSENBERG: Thank you.

KATHERINE LEFEBVRE: It is my honor to be a voice for the students at GCC. My name is Katherine Lefebvre, L-E-F-E-B-V-R-E. I'm on Student Senate, Diversity Board, and I'm also the secretary for Phi Beta Kappa here at GCC. It is my honor, Senator Rosenberg, to welcome you here to GCC tonight and continuing the ongoing conversation concerning our state's need for additional energy. As the environmental activist who has been attracted to the Pioneer Valley, I am happy to call this place my home since relocating from the Essex County. Please consider the current programs that the White House has honored this school

here at Greenfield Community College for our solar renewable programs and our permaculture sustainability programs here tonight. These students who have come here to take a goal to further their education in promoting clean and green renewable energy. I ask you tonight to consider our local valley and our scenic areas that provide respites for the thousands of migratory species who come here for their transition to Canada and the south. I ask you, Mr. Rosenberg, to think about the land you want to leave your children and your grandchildren and for the future generations to come. Senator Rosenberg and Senator Warren's folks who are here tonight, I ask you to join with my former congressional member, Niki Tsongas, of the Essex County community area who is adamantly opposed to the construction of Kinder Morgan's pipeline. I thank you for your time and I hope you hear us truthfully and honestly.

JAIME RELOJ: Hello. Hi. I'm Jaime Relej, a citizen of Deerfield, Mass. First, thank you for organizing this event, Senator, along with your staff on this very important subject. Tonight, I really want to engage you not as much as FERC. I'm asking you to champion the intervention for this program, of stopping this pipeline build. I think that the need issue is still at the forefront of the discussion and has to be addressed. There are -- there's been a tremendous amount of testimony this evening addressing the safety, economic, and environmental issues. I think derisking those issues by taking alternatives as far as different -- building on the current routes that they have and expansion, if that's truly a need issue for capacity, is something to consider. I think it's a great opportunity -- I'll make it short because there's been a lot of great testimony supporting the claims here -- that it's an opportunity for you and your colleagues to take a bipartisan approach to really intervening now. We'll need your help. I think that's clearly the case. It's not just FERC here. I think that Kinder Morgan, since it's such a profitable venture for them to go into the international markets, will continue to fight this out. And I come from the corporate background, I understand that as long as that profit's there they'll continue to do that, unless it becomes unprofitable or they find a more profitable project. So I'm asking you and your colleagues, this would be a great time for you to be our heroes for this project. Thank you.

GREGORY BRODSKI: Number 58, Gregory Brodski, B-R-O-D-S-K-I, Engineer, Warwick Conservation Commission Co-Chairman. Mr. President, thank you very much for holding this session. My comment is not about pipeline need or fossil fuel future. We really need your help to attract FERC's attention to a high risk of irrecoverable environmental damage from the pipeline. The danger may be even greater because no one seems to know the scale of possible impact due to the lack of baseline environmental studies. Our great concern is the pipeline project is handled with no care about natural resources and with no interest to local environmental knowledge. Warwick Conservation Commission devotes a lot of effort to the study of local environment. Based on our work, we know that natural resources, as shown in official documents like DEP map layers, are significantly under-represented. The simplest proof of this statement is the fact that, based on our findings, the Massachusetts Natural Heritage and the Endangered Species Program certify several new vernal pools a year on town's territory. Almost a year ago, Warwick Conservation Commission attracted TGP's attention to this fact and offered to share the environmental information which we had available, and no interest had been expressed. During this year, we observed several changes to the proposed pipeline route but we never saw any on-the-ground environmental research from TGP. FERC and TGP always talk about mitigation measures but, unfortunately, mitigation of some impact is all but impossible. And a good example are vernal pools and perched wetlands, which can't be replaced. Needless to say, that superpowerful compressor station in Northfield, which is located next to the state forest and directly on birds' migration route. This kind of disaster can't be mitigated as well. We believe that a meaningful environmental study cannot be done in the fall as suggested by FERC. The study should be comprehensive enough to include breeding season in April/May and this is why the timeframe for Environmental Impact Statement should be extended. Also, the environmental study has to be not only comprehensive but also objective. And, unfortunately, I don't have time to go further, but I submit written comments about that. Unfortunately we have a lot of reports submitted by TGP which suggest not that accurate information, and I made a direct statement about that which I handed to your staff. I am sorry that I could not go further. Thank you.

SID SCOTT: My name is Sid Scott. I represent the Erving Board of health. Erving Board of Health looked

at this problem, as all the other boards and commissions did, and we're required to submit our comments to the scoping process. In that we requested Kinder Morgan to come to our town and talk to us about the compressor station. That took quite a while to get a response, but we got a response this week. I've sent you a copy, I've entered a copy into the record tonight, and you'll probably be seeing a copy of it in the newspapers soon. It's pretty serious. It's from their attorneys, and it's a threat, and it's not only a threat to the Erving Board of Health, it's a threat to every single board and commission in every town from the fracking fields to Dracut, Mass. And what it means is that we don't matter. We are non-jurisdictional. That federal project is so far above our local concerns that they literally don't care, and they wrote it down and they sent it to me in a letter. So here's the deal: If that's the case, if I, the lowest rung of the political spectrum, I get that; small guy, small board, three-person panel. They don't care about me. I'm elected. At what point does the elected official up that rung of that ladder matter? At what point? At what point does that person come up on the scope so that we can contact them to just ask for information. The Board of Health can't make a comment because we don't have any information, FERC doesn't require Kinder Morgan to give us any, Kinder Morgan isn't going to give us any. So the process is flawed. And so I end my comments with that. And I beg you, and I'll be in touch with your office, I trust you. We got to fix this. We got to fix this.

SENATOR ROSENBERG: Well done. And when you get the answer to that question, please let me know what it is.

DEBORAH TERICANO: My name is Deborah Tericano, Number 59.

SENATOR ROSENBERG: There is a reality here --

DEBORAH TERICANO: I'm sorry, did you have something to say?

SENATOR ROSENBERG: No, I'm just -- that is a totally appropriate question. It's a totally appropriate question, and that goes to a large part of the heart of this matter: Who actually has authority in this matter and who can influence it. That's the question.

DEBORAH TARICANO: My name is Deborah Taricano, T-A-R-I-C-A-N-O. I live in Northfield, Massachusetts. I live about a thousand feet from the proposed pipeline, so I am definitely within the incineration zone, and I will live within earshot of the proposed compressor station. It will destroy the quality of my life, my neighbors' lives and the lives of everybody that's within its path. I have a question about the list of impacts that are on here: Geology, water resources, vegetation, cultural resources, land use. Not one of them says the human impact. Nothing says anything about -- it doesn't ask me how it will impact me. That's one thing I have to say: I would like to know if that could be put in there. Also, how is it that the corporation can take land by eminent domain? How could that possibly be constitutional? A private entity taking land by eminent domain. I think we have to look at that. I don't think it's possible. So let's get our money together and let's get the lawyers, and thank you. Thanks for hearing me.

SENATOR ROSENBERG: You're welcome.

CYNTHIA LAWTON-SINGER: My name is Cynthia Lawton-Singer. L-A-W-T-O-N, hyphen, S-I-N-G-E-R. I live in Conway. I'm a professional gardener. I spend a lot of time observing nature. And I grew up in this area. I lived in New York City for 20 years, but I live here again now. And I have been noticing climate change, so my remarks are mostly in relation to that. Okay. So we are a democracy, a representative government. Our government is directed, supposedly, by the people to do the will of the people. Why are we even considering taking precious land that has been put into permanent preservation conservation and building a fossil fuel pipeline and voiding the promise, the sacred contracts with past generations to protect, preserve our land for all time. We do have a crisis. It's not a natural gas crisis. The crisis is the disaster of climate change on the entire planet. We should begin immediately to build a renewable energy structure and localize our energy production and also practice conservation. We need to move away from investing any of our precious resources including specific -- of sacrificing preserved land, woodland, farmland, watershed land and building fossil fuel infrastructure. The challenges of climate change must be addressed. The longer we continue to do business as usual, the greater the likelihood that we will leave our children and all life on

earth with a death sentence. This pipeline and all fossil fuel extraction, processing, distribution, and burning represent that business as usual that threatens life on planet earth. We are already experiencing the sixth mass extinction on this planet, right now. I love this place in Western Mass. I love the life all of us enjoy. I wish peace, prosperity, and abundance to all beings on earth. We must join together and refuse the plans of those who would continue to profit from business as usual and cannot see beyond the short-term goal, jobs and profits. We must make our livings and our work from developing a new world where human beings live in collaboration with the planet and with each other. Fossil fuel has no future. Whether FERC will proceed with the interests of public or the interests of multi-national or national corporations, that's the question. Repair the leaks. Make use of the LNG storage for peak periods.

RUDY PERKINS: Thank you, Senator. Rudy Perkins, Amherst, Mass. P-E-R-K-I-N-S I recently submitted detailed scoping comments on the EIS to FERC, copy to your office, focused on alternatives to the NED pipeline. In sketch, TGP's Resource Report 10 looks at one alternative or another and tries to dismiss it as a loan not sufficient, but that's not how the alternatives are being developed in New England. It's going to be some combination of energy strategies and technologies that are well under way, energy efficiency, demand shifting to off-peak use, whether by automatic means, smart appliances and smart grids, market means like peak-hour pricing, contracts for demand management with larger users, or voluntary means like Connecticut's Wait Until 8 Program. It's going to involve leak repair, energy storage, grid scale and building scale batteries, improved and expanded pump storage, and LNG, which as you've heard many times, GDF Suez already argued and said it's a loan sufficient to address our gas needs. Of course, renewable energy is going to play a big part. Deep Water Wind just put the first steel in the water for our nation's first offshore wind facility. You know Maine's going gangbusters on wind; that's going to be a big thing. And Canadian hydro-power imports facilitated by High-Voltage Direct's current project like TDI and the Green Line projects. Continuous vigorous expansion of solar and raising the net metering cap is essential here and obviously the legislature has a key role there. There may also be a role for bio-gas. We're already looking at that, agricultural waste and sewage being converted to energy at Jordan Dairy Farm in Rutland, Barstow's Farm in Hadley, and the Deer Island plant of the MWRA and so forth. So there's lot of details in my letter about many of these alternatives. I hope you're coming to the conclusion, like I am, that it would be really a giant waste of billions of dollars to put that money into a pipeline instead of these alternatives. Thanks.

SENATOR ROSENBERG: Thank you.

ERIK HOFFNER: Thanks for being here, Senator Stan. I live in Ashfield and am a writer for publications from the Guardian to Earth Island Journal and I've covered energy, fracking, and LNG projects around the U.S. for such outlets, so I've been watching this proposal with a lot of interest. In most cases, I've seen the economics scuttles projects and often in combination with grassroots opposition. Now, all of the pipeline proposals I've seen cancel in recent years have cited exactly that, changed economics situation that renders the project unworkable. So I wanted to share two headlines from the Financial Times in the past week with you: "U.S. shale industry suffers \$30 billion outflow as oil prices fall." "U.S. shale industry braced for bankruptcies." Couple this with the idea that existing LNG facilities in the state appear to be able to serve our needs during peak demand, and the fact that the amount of gas coming from the Marcellus Shale gas fields is going to be a lot smaller than either the industry or the government project. The Post Carbon Institute is a think tank that bought the industry databases of well production in the Marcellus, and they studied those numbers and reported that the U.S. Energy Information Administration overestimates production in that area from 6 percent to as much as 18 percent in their weekly reports and in their drilling projections. It also found that just 5 of the 70 counties that have drills going in Pennsylvania produce two-thirds of all the gas. And the increase in well productivity in those wells has peaked already, and it's declining already. Plus, New York State's fracking moratorium means a lot of gas that Kinder Morgan had planned on sending into the pipe is going to stay in the ground. Sources of mine are now guessing that the region's gas boom will be over in just seven to ten years, so you have to wonder would NED even be built by then. The rationale for the pipeline both in terms of gas supplies and the economics of getting it to market look shaky. But this doesn't mean that the company's not going to try, even if the chances are poor. So I hope you're going to press both FERC

and Kinder Morgan on these points because it would be a shame for this region to be saddled with a destructive and polluting white elephant with a trunk hundreds of miles long.

JOSEPH PFEIFER: Senator, thank you for being here. My name is Dr. Joseph Pfeifer, P-F-E-I-F-E-R. I am the director of trauma and surgical critical care services at Berkshire Medical Center. Rural Lives Matter. I'm a Navy veteran of the Persian Gulf War, the first one, Desert Storm. I feel like I'm fighting over petroleum again. There is a real question as to whether FERC has jurisdiction over this pipeline at all. This is not a natural gas pipeline. This is a pipeline that carries natural gas and toxic chemicals. According to 15 U.S. Code, Section 17a, natural gas is defined as methane mixed with natural or other artificial gases. It does not include a definition of the myriad of toxic materials that are carried in fracked gas. However, the State of Massachusetts does have regulatory authority over many of these chemicals, such as benzene, xylene, toluene, and other toxic materials in the mixed gas. I urge you to look at the legalities of that. I have experience in disaster planning and management. I will tell you that if one of these pipelines blow or a compressor station blows, and I'm from Windsor, I've got a vested interest in this. We do not have the disaster management capabilities in this region to manage the multiple casualties that will occur. These things are also terror targets and will be ineffectively protected. Kinder Morgan's financial position is far less solid than many people in the room may think. They play some interesting games with their accounting. They are a C Corp stock corporation, but they want you to believe they're still a master limited partnership. They can barely make their dividend with the cash flow given the current prices of gas and oil. Ultimately, this is a clash in values between the people of this state and region who have invested time and money in preserving and protecting our natural environment versus a representative of a business that is at its sunset. I urge you, when you return to the Senate, to beware of the Beacon Hill Institute, the Heartland Institute, and ALEC. Thank you.

FRANK CALLAHAN: Thank you, Senator Rosenberg for hosting this event tonight. For the record, my name is Frank Callahan, C-A-L-L-A-H-A-N. I'm the president of the Massachusetts Building Trades Council who represents 75,000 men and women who work in the construction industry. I'm here tonight to speak in support of the Northeast Energy Direct Pipeline Project for four simple reasons. Number one is for need. The January 2015 synapse report which was commissioned by Governor Duval Patrick estimates that by 2020, we will need an additional 600 to 800 million cubic feet per day of natural gas in Massachusetts. By 2030, that will increase to up to 900 million cubic feet per day. Massachusetts and other states are transitioning from coal and oil to cleaner energy sources including wind, solar, and yes, natural gas. This morning I was at a meeting at the Salem power plant, which is under construction, which was formerly known as one of the filthy five, a coal-fired plant; that's being converted and being rebuilt as a natural gas facility. Brayton Point, in southeastern Massachusetts, is scheduled to be retired in another two years. Vermont Yankee has shut down and there's discussions under way to shut down Plymouth nuclear power plant. We're going to need more energy. And as we're converting to natural gas, we're going to need a supply of natural gas which is cleaner than coal and oil for supply. Currently Massachusetts has some of the highest energy costs in the nation. Industrial electrical costs in Massachusetts are twice the national average. But it's not expensive because it's a shortage of energy sources in Massachusetts and the country, it's because we can't deliver it to its source to produce power. For the economy, The Mass Taxpayers Foundation, released a report just this week citing these high energy costs as a key factor on new job creation and economic development. In terms of jobs, this project will create 3,000 jobs during the construction phase alone. Jobs will go to area residents who are the most highly skilled, best trained, and safest workforce in the nation. It will also remove the drag of high energy costs I mentioned a moment ago on existing businesses, businesses looking to expand or locate in Massachusetts and, yes, lower energy costs for our residents. I urge you to support the pipeline, and I can submit this testimony in writing at a later time. Thank you.

SENATOR ROSENBERG: Thank you.

ARIEL ELAN: Ariel Elan, A-R-I-E-L, E-L-A-N, Montague. And, yes, thank you, Senator Stan for this hearing. So I'm going to invite everybody to put themselves in a little picture. Just a modest kitchen in a modest

home and dinner being served and we have a very bright, creative, smart two-and-a-half year old, and when his dinner is put on his plate, he goes over to the kitchen trash and scrapes half of it off the plate, and then eats the other half. "More Daddy." And every meal, every snack, every time this child is served food, half of it goes into the garbage and half of it he eats. Most households actually could not afford the cost of feeding a child who continually behaved this way, but what if someone else was paying for the food. And what if the more food this child scraped into the trash and ate, the more the family got paid, and the more subsidies the family received and the more tax breaks the whole family received. This child is suddenly a brilliant businessman. And, of course, this is the way our entire energy industry and all of our quote/unquote investor-owned utilities do their work every day. As of 2013, the United States as a whole wasted 52 percent of the energy produced in the United States. That made us number one in waste, even above China and India. We can do much better than this and certainly the first, easiest, lowest-hanging fruit to tell FERC we will do, as a state and as a region, instead of inviting more natural gas to come into and through the region for export, our first low-hanging fruit is simply take every human inhabited structure, factory, office, commercial building, retail, and home and completely weatherize it. And you can do this on a pay-as-you-save basis so that a percentage of what the ratepayer is now saving goes back to the lender at a modest rate, and you pay it off in as many years as it takes you to pay it off, and, meanwhile, your bills are still lower. We have a real impact to halt climate change and we have more ten thousands of jobs than you can count right here. Thank you.

REENIE CLANCY: Thank you. My name is Reenie Clancy, R-E-E-N-I-E, C-L-A-N-C-Y. I want to give an example of what lengths Kinder Morgan will go to to get their pipeline built for their profit. It's Article 97. It was established by vote in the Massachusetts legislature -- I'm sorry, the voting public -- sorry, I'm nervous -- in 1972. And this was to allow our tax dollars to be used to buy conservation land to be preserved for everyone. Kinder Morgan approached two senators -- I'm sorry, state representatives out in Pittsfield, Massachusetts to file a bill to overturn this in a different project, in a property not involved with this. This is wrong. This is totally wrong. We've already bought this land for conservation. Kinder Morgan says, Well, let's just reverse it. I don't like that. I'm asking you with your power, whatever you have, whatever -- I'm sorry. Please help us. You heard it's not needed. You've heard it's not a NIMBY situation. We're not just being western elite snobs that we want a pretty land. We don't want this anywhere and we're asking you to help us. Do not let it go anywhere. Thank you. And thank you for doing this. Thank you for coming out to DPU, all that. Thank you so much. Please continue to help us. Thank you.

SENATOR ROSENBERG: You're welcome.

CLAIRE CHANG: Hi. My name is Claire Chang, C-H-A-N-G. I'm from Gill, Massachusetts. Thank you very much, Stan. We all appreciate this effort. And we hope that you now understand that you need to take the stand, Stan, and say no. It's simple. It's the letter N and the letter zero -- or O. I'm also nervous. But what we do want, and what I've said to you a bazillion times already, and I know that you know this, but everybody needs to hear it anyway. Right now in Massachusetts we have 903 megawatts of solar PV installed and operating. We only had 3 megawatts in 2008. So we've gotten really far. We're doing really good. In fact, we're either number four or five in the country. Yah, yah. And we've got this goal of 1,600 megawatts that Patrick set for 2020. Wow, that's really fabulous, except it's blank-blank too small. 903 megawatts represents under 2 percent of our electricity demand in the state of Massachusetts. 1,600 megawatts is only 4 percent. These are not very big numbers. We all agree, right? So, what we really need is 20 percent solar energy by 2025. That's 10,000 megawatts. It's a little bit bigger than 1,600. We need to get there, we need to get there by 2025. That's ten years. That's about a thousand -- a little bit less -- megawatts a year that we need to get installed, running and operating in the state of Massachusetts to have any chance of canceling out global warming and climate chaos. Okay? So that's what we want and that's what we need, and that's what we all need to be working on. And you, the Senate, has passed Downing's bill. That's a good start. But we need to eliminate the net metering cap, get to 20 percent by 2025, start energy storage, do virtual net metering at retail so that everybody -- because 70 to 80 percent of the population can't do solar on their own roof, so we need community shared solar at a reasonable financial interest so that everybody can buy into this. And we need a valued solar study so that utilities can't keep on chomping on our back saying, "It's too

expensive. We can't afford to do it." Well, wait a minute. You're going to put the pipeline on the ratepayers and you're going to say that's not too expensive? So we get to pay for 30 to 50 years for infrastructure? I don't think so. Everybody would rather pay that money towards solar, and we all know that. Thank you very much.

PORTIA WEISKEL: I'm Portia Weiskel from Leverette, and also West Deerfield, Shelburne. P-O-R-T-I-A W-E-I-S-K-E-L. I had some other thoughts today, but since the evening has worn on, I would like to just say very quickly that there's almost no evidence for this in this room tonight, but there are people in our region who are for this pipeline. I am not among them. I'm very opposed. But I think we should also stand in solidarity with those people who want jobs, and whether Kinder Morgan is honest about its jobs or not is not relevant for this moment. What is relevant is that green technology is a tremendous job-producing machine, and we would like -- I would like all of us to reach out to the workers in this community who do need jobs and let them know that we are not against them, this is not adversarial, that we would like to work with them. So I'm just going to say something very personal tonight, and that is that there's a part of the Deerfield River that I'm very intimate with and it stretches from the Bardwell's Ferry Road bridge down to the point where the South River flows into the Deerfield. I know this very well and my times there, which have to do with -- there's two ways to get there; one is on an inner tube and the other is to go down this very dangerous path to get to the waterfall. What does this have to do with anything? This is one of my beloved landscapes, and I am certain that everyone in this room and in the region has a landscape that they think of as their beloved landscape and many of these places are in the pathway of the proposed pipeline. This is not unimportant. Because there are more ways of being a human being than using electricity. We need our sacred spaces, we need to acknowledge their very deep importance to our well being, and I plead with you to -- I know that Kinder Morgan has said that it's going to blast under the Deerfield River right where I am talking about, and I implore you to say that there are some places where this kind of activity should not be permitted. Please don't let it happen. Thanks.

JOHN WARD: I'm John Ward from Gill, Mass. Stan, thank you for being here very much. We've heard tonight a lot of reasons why we don't want a pipeline here. We heard from Claire Chang a few minutes ago what we do want. We do want -- and we've heard this from many people: We want more renewables. And that's why we have tonight, an initiative petition for a law. It is a citizens referendum petition for a vote for 20 percent of all retail electricity sales to come from solar renewable energy sources with 50 percent of those sales to come from community solar. This is the type of thing that we need to be doing. The Senate has been good about passing the Downing bill. It is not strong enough. The House has not been good about getting any type of good bill passed. Governor Baker has come out in the media looking like he's in support of renewables. That's a very empty, very shallow bill. We know what we want. You've heard that tonight. We know what we don't want. We are not going to have a pipeline through this region. We don't have Vermont Yankee anymore, that's true. We don't need it. We didn't want it. It's gone. We didn't want the twin nuclear reactors on the Montague Plains. They're no longer an issue. We didn't want Nestle coming in and taking water off of the Montague Plains. We have a very long and very proud history of standing up to the things that do not work for us here. We are standing up to them again. As a Gill selectman, I am able to say that Gill will stand in solidarity with our neighboring towns, Northfield, South Deerfield. We will put together a coalition of select boards. Maybe between us, Stan, there will be enough voices politically that can actually stand up against this. I shouldn't say "there might be." There will be. We'll do it. We'll work side by side with you, Stan. Let's keep the rural character of this area and the clean air of this area. Thank you.

SENATOR ROSENBERG: So there were two other people that signed up. Are you still here? Here we go. Terrific.

DEBORAH ANDREW: My name is Deborah Andrew from Shelburne. Spelled D-E-B-O-R-A-H, and Andrew in the usual way. Thank you so much for this evening and for your patience. I've learned a great deal, and I'm going to suggest some things that have not been spoken about before and some that may not be popular. My concern among all the others that I share with those who have spoken before me is methane and

hydrofracking. Hydrofracking is a practice that uses billions of gallons of pure life-preserving water which is then contaminated with carcinogenic chemicals. That's a start. Then the process of hydrofracking increases the release of methane into the air. Methane is far more lethal than CO2. It is not only the hydrofracking process that releases the methane; it's also released during transportation. Very -- I'm trying to summarize quickly. I'm begging you to apply the precautionary principle and the principle of "Do No Harm" when you think through these things and the suggestions that you've been given, and I will beg all of us to consider those as well. I think other things that we would be wise to consider asking ourselves, is anything that we are considering as an alternative truly sustainable. And so I'm going to come to the unpopular part of what I have to say. Both industrial wind turbines and solar panels require the mining and use of rare metals. When these are mined, they leave radioactive tailings on the ground and aquifer. They're rare. And so we know what's happened with oil as it got rare, but these are already rare. And so I think many people are writing about this but not many of us hear about it, and I think it's something to consider very seriously. There is passive solar and other options that we can take that have been taken and I'll try to send you some of these to have to look at. Thank you again, so much.

SENATOR ROSENBERG: Thank you. I think you may be the last, but not the least.

ROBIN CHABOT: My name is Robin Chabot. I live in Greenfield and I grew up in Deerfield. My parents -- my father worked on the railroads swinging a hammer his whole life for his property. He is one of the properties that would be taken by eminent domain. He is presently handicapped; he had three bypasses. He will not get any compensation for that property. Theirs and all his money goes towards medical and just trying to live and die and be in the land that he worked so hard for. I ask you, how many people are going to be homeless from this pipeline? Have you looked at those figures? How many people have worked so hard to have what they have? And I read to you the Bill of Rights Article -- the Sixth Article: "The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue" -- eminent domain through the Board of Health if somebody lives there -- "but upon probable cause, supported by the Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized." I ask you to protect the American dream of life, liberty, and to be able to pursue happiness. What kind of happiness are we pursuing here, giving more homelessness through eminent domain? Also I ask, how come they're going to make a profit and yet they can't compensate these people who are going to be homeless? And how are you going to protect these people? Is there going to be finances available? Are you going to have more churches available, more shelters available? Because that's what you're going to see. And, you know, Article 9 in the Bill of Rights: "In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be pursued" -- the right of jury; we have a right to take it to court if they're going to take your property -- "shall be otherwise re-examined in any Court of the U.S. than according to the rules of the common law." So I ask you to really, really look at this. Look at the homelessness. Look at what's happening. Eminent domain is supposed to be if it's for the good of the public. Okay. So, good of the public, making more homelessness? Good of the public, damaging waterways? Which, as you know, there's been studies of lack of water in the future. How much water is going to be taken from this pipeline? How much damage of the waterways, which is a more valuable commodity. We can live by fire, but we cannot live without water.

SENATOR ROSENBERG: Thank you. Well, I thank you all for coming out and participating, whether you were speaking or you were here for moral support of others who were. I learned a lot tonight. We've got a lot of work to do to organize all of this material, which we will be doing over the next couple of weeks, and it will help me, as I suggested earlier, not only will we summarize what we learned here tonight, but we will also be able to use it to help create a framework for questions and thoughts that we believe that they should take into account as they make their decision at FERC about this particular project and, frankly, any other gas line project in Massachusetts or in Southern New England. Because there are actually four right now. We're focused out here on one in particular, Kinder Morgan; in our office, we call it Big Kinder. But there's also Little Kinder, which is the Sandisfield project, which was referred to earlier, the Connecticut line looped through Sandisfield. And then there's the Spector, which was also referenced earlier. And then there's

one in New Hampshire that wasn't referenced at all tonight. So this isn't the only pipeline under consideration. So we'll be able to use all of this information in looking at all of the pipeline issues here in the Commonwealth. So, again, I thank you all very much for being here. It was a lot of hard work tonight and I thank you all for what you're doing to speak for yourselves, your communities, your neighbors, the future of our world. So thank you and have a good night. (Hearing concluded, 10:04 p.m.)

COMMONWEALTH OF MASSACHUSETTS

I, Sharon R. Roy, Registered Professional Reporter, hereby certify that the foregoing is a true and accurate transcript of my stenographic notes to the best of my knowledge and ability. Sharon R. Roy

{end of transcript}

20151001-5001

Julie Penney, Merrimack, NH.

I am concerned that the proposed pipeline route in Merrimack which goes down 101A to Continental Blvd will adversely affect our aquifer. I work at Home Depot, and I know that in order for them to build so close to the aquifer, they had to agree to certain conditions, 1) the concrete slab is denser and thicker than in their other stores, 2) the concrete slab is fully lined with an impermeable material that goes at least 4" up the walls, 3) they can not put fertilizer or any chemical products outside, 4) they can not use any type of ice melting substances on the parking lot or driveway, and 5) they can not put anything into the sewer system that would contaminate the water. With all these provisions in place for just one building, how is it possible for a gas pipeline with allowable amounts of leakage to run alongside this fortified structure, through the same aquifer; not to mention through Pennichuck Water Works conservation land, protected wetlands and under the Merrimack River?

20151001-5004

Rick Swanson, Wilton, NH.

POSITION OF WILTON, NH BOARD OF SELECTMEN

REGARDING THE NORTHEAST ENERGY DIRECT (NED) PROPOSED PIPELINE

Approved on September 28, 2015 by unanimous vote of the Wilton Board of Selectmen

The Selectmen of Wilton are opposed to the Northeast Energy Direct (NED) natural gas pipeline proposed by Kinder Morgan. The Selectmen have the following concerns:

1. The size of the compression station would present a significant risk to our safety, health, and quality of life.
2. The pipeline poses a risk of contamination to the aquifer that is a resource for the Wilton Water Works and private wells.
3. The potential risk is not justified because the pipeline would provide minimal benefits to Wilton or New Hampshire.
4. Our opposition is intended to join neighboring towns such as Milford, Greenville, Brookline, Mason, and Temple who are affected by the pipeline.
5. The pipeline would come as close as a few hundred feet from Wilton's town limits and could threaten our property values.
6. We oppose the use of eminent domain for takings of property or easements for private commercial gain.

20151001-5006

Virginia Gray, Greenfield, MA.

Comments regarding Kinder Morgan pipeline project in western Mass:

Although my home is not within a few hundred feet of this pipeline project as many are, I have serious concerns about the advisability of Kinder Morgan's project. Earlier this month – September 2015 – I attended a meeting of concerned citizens who spoke to Stanley Rosenberg about how this pipeline would bring environment destruction to western Mass. What impressed me about the approximately 75 speakers was their diversity. All of them were articulate, intelligent, and specific about their point of view and yet each of them had a unique perspective, resulting in 75 reasons to oppose the pipeline. To me the reason that stood out was the lack of a clear need for this pipeline and the importance of working to increase public use of alternative energy sources. I don't see that Kinder Morgan has demonstrated a legitimate need for additional gas in this area. I live in Greenfield MA which is in the heart of the area concerned.

20151001-5007

Evelyn Taylor, New Ipswich, NH.

I was at the scoping session in Rindge, NH last night and once again heard over and over how the facts about the NED pipeline illustrate there is no need nor is this for the public good. It is purely for the profits of export poorly disguised with a few carrots thrown in to try to demonstrate otherwise.

For one thing, the 41,000 + hp compressor station proposed for New Ipswich is being touted by Kinder Morgan and Tennessee Gas as being as quiet as a 55 decibel home appliance such as a dishwasher or refrigerator (last night was the first time I heard a comparison to a refrigerator. Well FERC - videos and personal testimonies all point to a tremendous amount of noise from far smaller compressor stations that can be heard a mile away. I ask you to use common sense. Can your dishwasher be heard a mile away from your home? Seriously, are you really buying this sales pitch? Are you that blind that you have approved all these other pipelines without taking issue with something as ridiculously inaccurate as this? Do you not question such matters? I say your job is to call Kinder Morgan and Tennessee Gas on this matter and let them know you will not tolerate false statements and efforts to manipulate and intentionally mislead the public. It is a serious offense to mislead the public on these matters. It is my opinion that these two companies are severely morally and technically deficient and thus cannot be trusted to construct and operate an enormously hazardous 30 inch high pressure pipeline fronted with such inaccurate and misleading comments. Such an endeavor requires utmost integrity and concern for quality and safety. To imply that 55 decibels can be heard a mile away is absolute foolishness. A request for permission to construct and operate a combustible pipeline with the equivalent power of an atomic bomb has no room for foolishness. Tens of thousands of people have been harmed or killed by pipeline and compressor station operations and 'accidents'. It is no wonder given that the FERC provides approvals while overlooking such irresponsible activities.

20151001-5008

Evelyn Taylor, New Ipswich, NH.

I live in New Ipswich, NH on Old Wilton Road where it intersects with route 45 a short distance from the proposed site of the 41,000+ hp compressor station. It is my opinion that the fact Kinder Morgan and Tennessee Gas selected that location demonstrates an irresponsible and reckless act that poses serious endangerment and lack of concern for human life. Their decision is not blocked by a no survey or no trespassing restriction or any other obstruction to keep them from realizing the error in judgment. It should be obvious to a true professional of the industry. I conclude, therefore, that the decision to site a compressor station and a 30 inch diameter high compression gas pipeline along that route is nothing short of stupidity and total disregard for the safety of hundreds of people living in this area.

I bring to your attention that should there be a failure at that site or close to it, the thermal radiation zone could block or destroy the route 45 corridor that allows transit to Monadnock Community Hospital in Peterborough. A detour is out of the question, as the available route (Old Wilton Road, Greenville Road and others) travels around the compressor station site and thus could also be destroyed or inaccessible due to the proximity to the thermal radiation zone and explosion and fire impacts.

The route to any other similar emergency treatment facility is far greater and may also be inaccessible

depending on the damage to route 45 as that is the road that would be required to be accessible to those needing care to reach Milford and Amherst facilities. Also of note that even if emergency response vehicles could approach via Old Wilton Road and route 45, both these roads are narrow. Old Wilton Road has been used as detour route for the past few years due to a landslide on a nearby parallel road and bridge construction on a nearby state road. Given the narrowness of Route 45 and the 90 degree turn to access Old Wilton Road from route 45, many a large truck has become stuck in that run attempt for 15-30 minutes, blocking route 45. Large firefighting equipment and construction vehicles are likely to also suffer such fate. This error in judgment, then, poses serious an unnecessary risk to those who can become victims of such a disaster. No one suspected San Bruno to occur. That was also a 30 inch pipeline. No one can predict where or when the next accident will occur, but the record shows, accidents will continue. Pipeline maintenance is sub-standard and most accidents are attributed to human error at some point along the path of building or working alongside a pipeline. The records also shows the pipeline industry is poorly regulated and managed. This comment is notice to the FERC to take this problem into consideration as it is of utmost seriousness and a threat to our safety and well being for a project that has no demonstrated need or purpose of common good. Senseless harm and deaths must be stopped. This pipeline must be rejected.

re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PFI4-22-000 Pre-filing for Proposed Northeast Energy Direct Project

Dear Secretary Bose:

The Townsend Conservation Land Trust appreciates the opportunity to comment on the Kinder Morgan! Tennessee Gas Pipeline Northeast Energy Direct (KM/TGP NED) pipeline proposal. The Townsend Conservation Land Trust is dedicated to preserving the natural resources and rural character of Townsend. All properties held or controlled by the Trust are exclusively for conservation, education, public recreation and scientific purposes. We stand in opposition to this pipeline project.

The so-called Fitchburg Lateral of the proposed KM/TGP Northeast Energy Direct pipeline bisects a property owned by the Townsend Conservation Land Trust (TCL T). Although we originally received a request from KMITGP for survey permission for a parcel we do not own (a Town of Townsend-owned parcel), we have denied KMITGP permission to survey the TCL T parcel that the pipeline bisects. We have received, in September 2015, another request from KM/TGP for survey of this parcel when permission has already been denied.

Additionally, please note that despite the fact that KM/TGP was notified in February 2015 of the omission, Townsend Conservation Land Trust is still not listed as an affected conservation organization in Appendix C of the July 24, 2015, release of Resource Report 1. TCL T has properties affected by the proposed Fitchburg Lateral as well as the original, now alternate, route through Townsend, MA, of the proposed main pipeline.

Please find attached a copy of the TCL T survey denial letter to KM/TGP as well as our extended comments from the FERC Scoping meeting held at Lunenburg High School on Wednesday, August 12, 2015.

Thank you for your time and consideration of this matter.

Sincerely,

Veronica Kell, President
Townsend Conservation Land Trust

Mr James D Hartman
Tennessee Gas Pipeline Company, L.L.C. 1615 Suffield St
Agawam, MA 01001

Dear Mr Hartman:

This letter is in response to the January 2015 Survey Permission request addressed to the Townsend Conservation Land Trust. The map that accompanies this Survey Permission request shows the proposed pipeline going through the Townsend Conservation Land Trust property located at Map/Block/Lot 6/7/1.

The Survey Permission request, however, is for Map/Block/Lot 6/8/0. This property is the Town of Townsend Landfill and is not owned by the Townsend Conservation Land Trust.

The Townsend Conservation Land Trust is dedicated to preserving the natural resources and rural character of Townsend. All properties held or controlled by the Trust are exclusively for conservation, education, public recreation and scientific purposes. To remain consistent with its mission, Townsend Conservation Land Trust denies Tennessee Gas Pipelines' request to survey any of its properties and specifically those at Map/Block/Lot 6/7/1 and 6/5/2 as well as those at Map/Block/Lot 17/24c/0, 26/33/0 (prior Survey Permission request from TGP dated February 10, 2014).

Please note that Townsend Conservation Land Trust has been omitted as a conservation organization in Appendix C of Resource Report 1. In addition, our mailing address is as noted above. We are not located at Townsend Town Hall.

Please contact either me or our counsel, Attorney Gene Rauhala, for any further discussion.

Sincerely,

Veronica A Kell

President of the Board of Trustees, Townsend Conservation Land Trust

Townsend Conservation Land Trust, Inc
PO Box 7834
Townsend, MA 01469

August 12, 2015

The Townsend Conservation Land Trust thanks the Federal Energy Regulatory Commission for the opportunity.

nity to comment on the proposed Kinder Morgan/Tennessee Gas Pipeline “Fitchburg Lateral “,

We are concerned, first and foremost, that this proposed pipeline is within the Squannassit Area of Critical Environmental Concern. The Squannassit ACEC is noted by the State of Massachusetts for its open spaces and habitat resources and for having highly significant drinking water resources present. All residents of Townsend drink water drawn from wells in town.

We are concerned about the effect this pipeline will have on our water supply, on wildlife habitat and on our wilderness areas.

Please scope how this pipeline is consistent with state and local policy and regulations including that of ACECs, Water Resources and the Master Plan of the Town of Townsend.

Second, what is the need for this proposed lateral pipeline? Within the past 7 years, the existing pipeline from the south to this same terminus was expanded to a 12- inch pipe (called the TGP Fitchburg Expansion Project with a certificate issued by FERC on Oct 27,2008).

Please delineate the NEW need that requires a new greenfield pipeline from the North in such a short time-frame.

Third, what alternatives, including the no-build alternative, have been considered for this pipeline lateral? If you look around this area, Townsend, North Central Massachusetts and Southern New Hampshire as a whole, what you see are solar panels appearing on more and more rooftops; solar farms in open fields.

Please analyze how other sources of energy, particularly renewables, as well as the repair of leaks in existing natural gas infrastructure, and other currently proposed gas infrastructure projects, and all of these in combination, could meet the energy needs of Central Massachusetts.

Please examine ALL alternatives to this proposed route and their viability.

Lastly, this pipeline crosses from north to south a 43-acre parcel of land from a family expecting that the parcel would be held in its natural state. The bylaws of the Townsend Conservation Land Trust states that our purpose is to “promote for the benefit of the general public the conservation of natural resources of the Town of Townsend, including water resources, marshland, swamps, woodland and open spaces and the plant and animal life therein and the conservation of land of historical and geological significance”. Who in Massachusetts would donate land for conservation purposes to a land trust knowing that a for-profit company could come in and nullify their wishes? TCL T will most certainly be sacrificing future growth should this pipeline lateral be built. In addition, TCL T will incur financial and managerial hardship policing the motorized off-road vehicle traffic that will most certainly be present on a now open corridor.

Please scope the economic impact a pipeline has on conservation organizations.

Townsend and the majority of other New England communities through which this pipeline is proposed have passed referendums unequivocally opposing it. It is ironic that the open spaces that we have worked so hard to protect are seen as the perfect path to be commandeered by a private corporation. Please ensure that our properties, our drinking water, our open space, our safety and health, are not sacrificed solely for the convenience of Kinder Morgan/Tennessee Gas Pipeline providing, for their own profit, a path for natural gas export while promising us low rates that never materialize.

Thank you.

20151001-5096

Hiel Lindquist, Fitzwilliam, NH.

During the recent scoping meeting in Rindge, NH Alan Fore from Kinder Morgan stated in person (also broadcast on WMUR TV) that my electric rates would go down by 25% once the pipeline is built. I would like FERC to investigate this and document how this is going to happen.

I expect Kinder Morgan to start offering contracts for this new electric rate, once they build the pipeline. Of course, Kinder Morgan, being an GAS DISTRIBUTION COMPANY, can do no such thing. Still, FERC

needs to include the investigation of statements like this in the scoping process.

20151001-5137

Kristi Margaritis Bradshaw, Merrimack, NH.

At the September 29th scoping meeting in Rindge, NH Allen Fore was interviewed privately in an empty hallway far away from the general public who would have asked him to back up his FALSE claims.

This interview was later aired on WMUR news. In this interview, Fore claims, “We’ve seen a variety of studies. But it’s a significant reduction. We could easily be talking 25 or 30 percent reductions or more in electric bills and gas bills and that’s meaningful to the region.”

What studies?

Who holds Allen Fore and Kinder Morgan accountable for the false information they spew to deliberately and unethically to sway the general public?

I request that the FERC look into this claim and report your findings back to us.

20151001-5261

Dr. J. Melbin, Townsend, MA.

How many compressor stations are proposed over the entire proposed NE pipeline?

What are the total daily absolute quantities of Nox, CO and UHC emitted into the atmosphere from each station?

What is the absolute daily emission of CO2 from each station?

What is the frequency range of the noise at the exterior of each structure housing compressor machinery at pressure levels above normal human detectable minimum (20 micropascals, or 0.98 pW/m² at 1 atmosphere and 25 °C.) and what are the pressure levels (Pa) and intensity levels (dB) at 100, 1K, 10K, 20K , 30K and 50KHz. at the exterior of each structure.

Do the structures housing the machinery include both electric (non ferrous) and magnetic (ferrous) shielding?

What are the levels and frequencies of EM radiation measured at the exterior of the structures housing the machinery?

How are the metering and regulating stations designed? Are they to be above ground or vaulted?

What are the Emission Factors related to each type of NED station?

20151002-5003

Diane K Hewitt, Groton, MA.

Scoping Comments for FERC

Diane and Richard Hewitt

Rindge, NH September 29, 2015

Please enter these comments into the FERC docket.

My name is Diane Hewitt, my husband and I are residents of Groton MA and affected homeowners on the original route. Our children recently purchased their first home in New Ipswich which is now located less than 2 miles from the compressor station.

Mr. Tomasi, at a previous Scoping meeting, you stated that you wished to hear from the public if we believe that Kinder Morgan is not fulfilling its stated commitments. I would like to address two critical areas that FERC can easily document and then choose to hold Kinder Morgan accountable for their egregious behavior. Both involve their blatant disregard for what many of us hold quite dear—our state constitutions.

Our MA State Representative, Sheila Harrington, First Middlesex District, testified at the earlier Dracut

Scoping meeting, that during a private meeting with Kinder Morgan, they made a firm commitment to her that they would abide by the provisions of Article 97 of the MA State Constitution. You may remember that the first sentences of Article 97 state:

“The people shall have the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose.....

Lands and easements taken or acquired for such purposes shall not be used for other purposes or otherwise disposed of except by laws enacted by a two thirds vote, taken by yeas and nays, of each branch of the general court.”

However, we now find that KM is requesting access to and easements on up to 100 parcels of land protected under Article 97. As Representative Harrington said to you in Dracut—How will you direct Kinder Morgan to honor their commitment to Massachusetts residents and uphold Article 97 of the Mass. Constitution? I believe her exact words to you were,” How will you hold their feet to the fire?”

Similarly, the New Hampshire State Constitution is now under siege by Kinder Morgan. Article 12A, was enacted on November 7, 2006 by an overwhelming majority of voters of New Hampshire and it simply states:

“No part of a person’s property shall be taken by eminent domain and transferred, directly or indirectly, to another person if the taking is for the purpose of private development or other private use of the property.”

In the March, 2015 edition of the Political Monitor, Business/Economy section the article’s lead headline was the following:

“Pipeline developer Kinder Morgan will not take any New Hampshire homes through eminent domain, company officials told lawmakers in Concord yesterday. Republican Sens. Andy Sanborn and Jeb Bradley questioned Kinder Morgan officials about their plans to use eminent domain, a concern among residents, during a presentation before a Senate energy committee yesterday.”

Kinder Morgan’s response: “At the end of the day, we’re usually 95 percent or higher on voluntary acquisitions,” said Allen Fore, vice president of public affairs at Kinder Morgan. “We will not be taking homes as part of this process, period.”

So, like so much of what Kinder Morgan says this language is merely another slight of hand. What he is actually saying is this: We won’t take your house, but we can and will take an easement on your property by eminent domain. Do remember that Mr. Fore has told us many times that best industry practices indicate that they can place a pipe in the ground as close as 20 feet from your home.

Both of these scenarios involve a serious breach of our state constitutions. They are, in fact, unprecedented in their size and scope; they blatantly disregard the will of the people and our elected officials; they trample upon our laws and even our state constitutions. I call upon FERC to seriously consider to whom they are beholding. A private company with a marginal safety record, who has yet to make a convincing case for this project and is willing to do untold damage to our citizens, our communities, our land, our water and habitats, or to the American public? Will you uphold the constitutions of our states? Will you have the courage to listen and act on behalf of the American people, by exercising the “No Build”option? FERC, Do Your Job!

20151002-5011

October 1st, 2015

Re: Docket # PF14-22-000

To the FERC,

My residence is identified through the NRPC as property ID 2A-21-2, it is less than a mile away from a high pressured gas line proposed by Northeast Energy Direct pipeline route. The latest proposals have indicated

that there is the likelihood of a metering station within this mile radius of my home. This raises many potential questions and I respectfully request that the Federal Energy Regulatory Commission ensure that all potential impacts of the proposed meter station and pipeline be thoroughly evaluated and addressed in the Commission's EIS.

1. Specifically to identify all noise-sensitive areas within a one-mile radius of the proposed meter station where my quiet setting is been an expected attribute.
2. To also identify all the equipment, procedures, and operations that may produce noise audible outside of the meter station, including the maximum noise level that can be emitted and how that noise will be measured in a consistent basis.
3. Identify in the cost analysis the reduction in property value within the radius of 1.5 miles due to the noise and other negative health impacts from the proposed metering station and pipeline.

Specifically my family and I are concerned about water and air quality issues that can arise related to leaks and gasses released, on purpose or inadvertently, by said metering station and pipeline. I would like to respectfully request that the Commission require TGP to identify and quantify in detail:

1. Any and all emissions that could be produced by the proposed metering facility and pipeline, including anything that could be anticipated for future leaks, intentional and unintentional venting of natural gas and the chemicals used in extracting and transporting.
2. Every effect to human and wildlife health and welfare in terms of the number of people who could be exposed to the emissions and the number of people who could develop adverse health effects from exposure no matter if it was for a short or long period of time.
3. Quantify the indirect costs of any treatments, preventative medicine, healthcare costs, inability to work as a result of exposure.
4. Identify in a cost analysis the reduction in property value as a direct or indirect effect of a leak or threats of a potential leak.
5. Any leaks would be allowed to continue while a repair plan is developed is unacceptable, given that my home uses a well, as well as many of my neighbors in town.
6. If a leak through the ground is discovered and chemicals enter the town, or personal residences' water supply, how will this be mitigated and what laws are in place to hold TGP accountable to mitigating the situations that can arise.

I would also request the commission identify all potential environmental impacts on personal property, such as the impact of blasting and construction zones on things such as in-ground swimming pools that can be damaged due to such activity. How this type of environmental impact will be monitored and how the damaged will be mitigated.

I would respectfully request the commission take these factors into consideration for this particular project, and compare the impacts to other pipeline expansion projects aimed to increase the amount of natural gas to the area to lower all of our electric bills by 30-35% as the Kinder Morgan representatives have led us to believe, even though more than half of the residents in southern New Hampshire are customers of Eversource (formerly PSNH) which is not a customer of this proposed pipeline.

I appreciate the commission's assistance in gathering the information from TGP regarding these anticipated impacts to my family and home.

Sincerely,

Bert Priddle
20 Seaverns Bridge Road
Merrimack NH

Map/block/lot 162.00-1,021.00

RE: Tennessee Gas pipeline Co. Northeast Energy Direct Project PL 900-1

Hello,

I oppose the installation of this pipeline through our property for the following reasons.

1. Disruption of woodland wildlife habitat. Our property received a grant through the Susquehanna Co. Conservation district - Natural resource Conservation service in the years 2009- 2011 that helped us install wildlife habitat improvements that are now well established. I have included copies of the map and plan.

Referring to the included map-

Field 12 is a semi forested area that has a wetland that feeds the pond (area 6) during high water table. This pond feed could be redirected away from the pond by an open trench or bore. With the pipelines crisscrossing our landscape there is much disruption to our woodland habitat.

The pond currently is a watering hole for local wildlife and used as a nesting area for redwing black birds, geese and ducks. Bats are often seen feeding on the bugs attracted to this water area.

Field 2 is annual planted crops for wildlife. There has been thousands of dollars spent on soil amendments to make this field fertile. Nutrient dense forage is grown here to feed wildlife.

Field 10 nut and fruit bearing trees.

Field 9 black berry brambles, nut and fruit trees, there is also a hand dug well and wetland pond by the road.

Field 11 high warm season grass, dense planting seeds of berry producing shrubs, oaks, apple trees and black berry brambles.

2. All of these areas would be needlessly impacted by this pipeline as would the forested habitat on the adjoining properties. There is a better solution.

The adjoining property to our south owned by the Petersen family farm has an existing natural gas pipeline that travels in the direction of this proposed pipeline and is located mostly in fields. Rather than spending extra money to remove trees on your planned route

“please consider using this existing pipeline right of way for your pipeline installation. This will preserve the woodland habitat on ours and the neighboring properties and makes sense financially for your pipeline installation as this area has already been cleared. Please see the maps and wildlife habitat improvement plan.

Thank you for your consideration in this matter.

PL 900-1

Dear Mr. and Mrs. Sellers,

Tennessee Gas Pipeline Company, LLC (Tennessee), has been trying to reach you either by mail or telephone communication in order to discuss the referenced project. Currently, Tennessee is preparing to conduct studies related to the Indiana Uat and the Northern Long-Eared Bat. The information gained from these studies will help the permitting authorities determine the potential impact from our proposed project at the bats referenced. We are seeking your assistance by allowing our crews access to your property to conduct these studies.

Please find enclosed a handout describing the above referenced bat studies in more detail.

From a historical perspective, Tennessee has been a part of the Pennsylvania community for more than 60 years. The Success of this project will continue to build upon this long tradition of gas transmission in the state and reflect Tennessee's commitment to serve growing markets with predictable deliveries of natural gas.

We welcome the opportunity to answer any questions you may have specifically regarding the bat studies or the project in general. Please feel free to contact me anytime at (315) 729-6210. Thank you for your time and cooperation.

Very truly yours,

Doug Carey

Washington, DC 20426

Subject: NED

Dear Chairman Bay:

This will be short. I understand that the PUG has given support for the pipeline. That, to me, makes overall approval almost a done deal. I am down to my last appeal and base it on the precious aquifer beneath us.

My understanding as a layman is that the blasting and other work on the pipeline may indeed affect the wonderfully pure and cold water we enjoy. Is it not possible that the pipeline can be diverted away from its currently planned location under Fish Hatchery Road and atop the aquifer?

Were plans to make that accommodation a reality it would be deeply appreciated by those of us who live so close to the proposed pipeline, actually within what is termed the “Incineration zone”, and atop the aquifer. Is that not reasonable?

Thank you for your attention.

Sincerely

Norman E. Woodward

Dear FERC,

I am writing to express my stringent opposition to the Northeast Expansion Pipeline Project. Not only is this project exorbitantly backward looking both financially and environmentally, it is a violence against one of this country’s pristine old growth forests and the people who have chosen to live in concert with nature’s quietude. Your organization must nurture sustainable methods of energy production if human kind is to survive on this planet. Thrusting another unnecessary pipeline through substrate is no answer to our energy problems. Short term fixes based on corporate greed breeds cynicism and, ultimately, despair. Nobody I know—and there are many—in my Massachusetts hill towns want Kinder Morgan on our land. A literal outrage sweeps through us, an opposition-cohesion which I can only liken to war against a swarming enemy. I ask you on behalf of myself, the immediate environment, the earth itself, and all my friends to reject this project.

Sincerely,

Gordon Massman

Washington, DC 20426
Docket PF 14-22

To Whom It May Concern:

I am writing to you in regard to the Kinder Morgan NED pipeline that is proposed to pass through southern New Hampshire. This should be opposed for a number of reasons. First, is the lack of real need. It is common knowledge that the majority of this gas will be used for export and Kinder Morgan has never denied this. It will not benefit New Hampshire residents in any form. Next, is the decimation to the land, families, air and water. We have aquifers, wells, children, animals, farms, food, gardens, and the air we breathe that will all be negatively impacted by this, not only during the initial construction phase, but also on an ongoing basis. Though there are many reasons to oppose this pipeline project I will end with the alternative. Going forward, if the need does present itself, we have a number of new, emerging methods to sustain our energy needs: wind, solar, and others. Even President Obama has recently taken a stance against the natural gas pipelines as a solution to our future energy needs. As we look forth into the future we need not make rash decisions that will negatively affect a great number of our citizens now and going forward. From the "frack" Relds to the pipeline routes, compressor stations, and all the negative consequences that go with this, we need to find a different solution. I urge you to deny this proposed pipeline.

Sincerely,

Mark Hutchings

Re: Docket pF 14-22; Opposition to the Tennessee Gas Pipeline use of eminent domain.

Dear Ms. Bose,

I am a concerned resident of New Ipswich, NH and am writing to you today regarding the proposed gas pipeline by Tennessee Gas Company/Kinder Morgan. This pipeline is potentially planned to run across southern New Hampshire and down into Massachusetts. This private company will be clearing a 150 foot wide path through many private residents' land. Kinder Morgan claims there is a need for this gas in New England and, therefore, is being considered to be allowed the use of Eminent Domain as a means to accomplish this project.

Ms. Bose and everyone else at FERC: I hope you understand the meaning of Eminent Domain clearly before giving approval for this project. This country, the United States of America, is the land of the free. This state of New Hampshire proudly states on all license plates "Live Free or Die". What part of Eminent domain do you consider allows the government to take the land of a private landowner for this private company's corporate gain? As you know, eminent domain has many important aspects to it and one of them is that the land is being taken to be used to benefit the public rather than specific individuals. This project does not benefit the public, plain and simple. The residents being affected by this pipeline need to have the right to say no and we are not being heard. This is not living free by anyone's standards.

This gas is not intended for the residents along the path of the pipeline. It is a transmission line, not a distribution or service line. We are being told that the gas is needed for the power plants and yet there is much conflicting evidence of this. Whether there is an energy shortage or not, there are already steps to improve energy use in place or currently being put into place such as the required change away from incandescent lights and Distrigas's recent 10 year contract for ample LNG to cover any peaks in demand through 2024. There are already pipelines in place that are not being utilized to full capacity that can be considered as well. There are better ways to deal with any need for energy rather than blasting a path through beautiful, rural, New Hampshire to install a pipeline to carry an unclean fossil fuel. The use of Eminent Domain should be sacred and used when absolutely necessary for the public's health and safety. The FERC needs to uphold the constitution and represent what it means to be a US citizen. As a New Hampshire resident and landowner as well as a law-abiding US citizen I demand that the federal government in the form of the FERC decline the application of Tennessee Gas Company/Kinder Morgan requesting to build the NED pipeline across Southern New Hampshire.

Respectfully,

Lucy Hutchings

RE: Docket PF 14-22-000

To whom it may concern,

I am writing this letter in regards to the installation of the proposed Kinder Morgan pipeline in Schoharie County. As the Stanton Family Farm LLCs certified nutrient management planner, I have concerns of the location of the proposed pipeline installation.

The Stanton Family Farm LLC is located in the Town of Middleburgh. Its operation is the largest in Schoharie County. It contributes greatly to our local economy by providing jobs, revenue and milk products to our community and New York State. This family farm milks 450 cows in addition to having calves and heifers totaling 925 animals. The farm's land base spans 1500 acres and is within a 10 mile radius of the farm. This land base is not only used to produce feed for the animals but to also spread their manure on an almost daily

basis. Every acre of this land base is essential to the farm's ability to feed their animals and manage their manure in a sustainable way. Construction of this pipeline on their prime farmland will hinder the production of feed for their animals and utilization of the manure. Over application of manure on other fields will only inhibit future manure spreading. Crop rotations will be over extended making them out of compliance with their certified nutrient management plan (CNMP).

Working with the farm on an almost daily basis, we've had multiple discussions of proposed expansions, current farmstead management and cropping plans. They are at their max in their current location and are finishing up multiple best management practices that need to be installed in accordance with their certified nutrient management plan. Their land base currently supports their farming practices but any significant changes will be detrimental to the whole plan. They strive to keep up to date. They are very proactive and progressive as they work towards being completely implemented, which is imperative to stay in compliance with their concentrated animal feeding operation (CAFO) permit.

The farm operates under the New York State Department of Environmental Conservation's (NYS DEC) CAFO permit (GP-0-9-001). This permit requires them to spread their manure agronomically correct in accordance with their certified nutrient management plan (CNMP). The CNMP is based on standards set forth by the Natural Resource Conservation Service (NRCS) standard 1 NY 312. In order to comply with the permit they are under penalty of law to follow the CNMP. The permit states that it is the farm's duty to comply (part VII, section A) with all conditions of the general permit. Any noncompliance constitutes a violation of the Environmental Conservation Law and is grounds for: an enforcement action (up to \$37,500 per day); loss of authorization under the general permit and/or denial of a permit renewal application. They file this permit yearly allowing them to farm legally in New York State. They are subject to yearly and can also have unannounced spot checks.

If and or when this pipeline goes in, it will cause a serious issue with the Stanton farm's crop rotation and manure spreading. About 130 acres of their farm will be disrupted and with the Constitution pipeline installation delayed, it will be at the very least 2-3 growing seasons. With the addition of Kinder Morgan's North-east Direct Pipeline, that could mean an additional 4-6 growing seasons. The farm has to follow their yearly updated plan or else they will be deemed out of compliance, not only with DEC but with the Natural Resource Conservation Service (NRCS) as well. NRCS holds not following a crop rotation in accordance with their conservation plan as a serious offense. If fields aren't available because of the pipeline construction it will ruin not only the crop plans for that year but subsequent years as well. It will create a domino effect on all the other fields used by the Stanton's farm.

For these reasons it would be very beneficial for the Federal Energy Regulatory Commission (FERC) to require Kinder Morgan to evaluate the 1-88 corridor route as proposed by the New York State Department of Environmental Conservation (NYSDEC). That route would provide the least restrictions to the farm, avoiding their production area. Farming is a 24 hour 365 day dynamic enterprise. It's a profession that has many risks associated with it. They have to deal with uncertain milk prices, weather, state and federal regulations, and an ever growing scrutiny by neighbors and the general public. The installation of yet another pipeline will just increase these factors and once again inhibit daily operation of the farm.

Please feel free to contact me with any questions you have on his nutrient management plan or farming operations.

Thank you,

Lisa Kuehnle, CCA
Certified Nutrient Management Planner

Typed FERC Comment form:

PERC must ensure transparency and oversight of the disposal of excavation debris that is not suitable for backfilling by fetphhg Kinder Mar (pm to pm) vide to the tmsns, and nuke accessible to the public

1. Identification of land owners at and adjacent to the proposed discharge and collection/huntation site PRIOR to submitting an application,
2. Written permission from the land owner to be collected/used,
3. Prior approval by the NH Site Evaluation Committee (SEC) of each disposal location. Locations must be away from wetlands.
4. Detailed safe hauling and handling of the debris,
5. Detailed procedures for grading and recovery of the disposal site

The classification of all excavated materials must be spelled out and the disposal method identified in the FSR application. Materials not suitable for backfilling include but are not limited to waste material, cryptic material, debris of any kind, brush, rock more than two inches (~in diameter), cinders or other corrosive material, trash, compact masses of stiff clay or other consolidated material, large stones, and boulders. Where burning is indicated (i.e. tree limbs, stumps, brush), compliance with all local, state, and federal governmental requirements relative to burning, fire prevention, and air pollution must be specified.

Penalties for unapproved (outside the design specifications) trench widths, insufficient depth, unstable structures, etc. with remedial procedures at the expense of the contractor, including time limitations and funding methods, should be spelled out in advance, as well as testing procedures to validate compliance with the design specs.

To Whom It May Concern:

I am unable to attend the scoping meeting for the Northeast Energy Direct Pipeline Project (Docket 1 PF14-22-000) in Rindge, NH, on Sep 29, 2015. I offer these written remarks to be read at that meeting, and shared in any other ways appropriate to this situation.

I live in Temple, within a few miles of the proposed New Ipswich Compressor Site. This project is an anathema to me on all levels — as a local resident, as an American citizen, and as a concerned member of the human race.

As a local resident, I know that this project puts my town - and the entire region in danger. Driving home from work along Rt. 45, by the forest site of the proposed compressor station, I see a beautiful view of Temple Mountain, and a field of cows. Just beyond is the Temple Elementary School (which is, ironically, our town evacuation site — within ‘A mile of the proposed station). Should there be an explosion — which is not unlikely; I have seen the videos of the fireballs emitted by compressor stations much smaller than the one proposed here — it could wipe out the cows, the kids, and start a forest fire that could spread for miles throughout the region. I heard the local fire chief talk about the problem at a town meeting, and all he could say was, “We’re not prepared for this.” The subtext was, there is no way to be prepared for this. And the burden of paying for the impossible preparation — and the incalculable damages — would be borne by us, the taxpayers.

There are other serious problems — potential pollution of local aquifers and atmosphere, extreme and constant noise, danger to wildlife. All these, in turn, cause serious business problems. One of our region’s main

products is its rural, remote beauty. Foliage season is just beginning, and many local businesses make much of their yearly income from the tourists who come for the quiet loveliness of the woods, the historical feel, the quaint New England atmosphere. Who will stay at a bed and breakfast from which they can hear a steady pounding from a compressor station all night? Or if they have to drive by an industrial wasteland to get to it? Temple —and many towns like it, along the pipeline route - could become ghost towns.

Our property values will go to nothing as well; we may just all have to walk away from our houses. I honestly don't know what I would do; I can't live with constant noise. Multiply me by the thousands of people affected along this rural pipeline route, and you start to see the enormity of the problem.

But that is only a start. Because, as an American citizen, I am horrified at how much property —both private lands and public - will be taken out of our control through eminent domain. Farmers won't be able to take heavy equipment across their own fields where the pipeline crosses their property. Beautiful sites in the public forests will be trashed forever. The entire watershed of the Connecticut river is endangered.

And what for? We don't need the energy; NH already has very low electric rates. And most of the rural towns along the pipeline route will never see the gas —it's just not practical to pump it that far. The bigger cities in NH already have natural gas.

The pipeline does not benefit American citizens at all, except for those who are shareholders of Kinder Morgan. The gas is earmarked for overseas sales, which is likely to drive our energy prices up. During construction, there will be a few more jobs for American workers. But as soon as the pipeline is complete, these will disappear. The compressor stations are basically unmanned —no jobs there. The trade-off isn't even worth thinking about.

As a member of the human race, I see this project seems like another nail in the coffin of sustainability. We need to be putting our creativity and our businesses into husbanding the resources we have —not destroying renewable resources, like land and trees and beauty, to extract unrenewable resources from the earth.

Thank you for listening. Say no to the pipeline and yes to people, the land, and the animals that live here —and everywhere on the planet Earth —now.

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Dear Secretary Bose:

As you are aware, five different projects are proposed that will almost double the amount of natural gas coming to New England. These projects are the Tennessee Gas/Kinder Morgan CT Expansion, Tennessee Gas/Kinder Morgan Northeast Energy Direct (NED), Spectra Atlantic Bridge, Spectra Access Northeast, and

Portland Natural Gas C2C Project. We fear that these projects are redundant with each other and with existing projects that FERC previously determined were necessary but which are now underutilized.

We respectfully request that FERC combine the proposals from Kinder Morgan, Spectra Energy, Portland Natural Gas, and their various partners into one regional Environmental Impact Statement and one coordinated FERC process. This approach is consistent with the National Environmental Policy Act (NEPA). Added together, these proposals could almost double the gas supply to New England at a time when the federal Clean Power Plan (CPP) and the MA Global Warming Solutions Act (GWSA) are demanding that we greatly reduce our consumption of fossil fuels.

Kinder Morgan admits that other projects could meet the same needs as their proposed NED project. Kinder Morgan writes: “[Without] the proposed Project, other natural gas transmission companies will be required to increase their capacity and construct new facilities to meet the existing and growing demand for the additional transportation capacity. Such action will only result in the transference of environmental impacts from one project to another but will not eliminate such impacts in their entirety.” (Resource Report 10 - Alternatives, July 2015, p. 10-2) Since Kinder Morgan acknowledges that the alleged need met by NED could be met by the competing projects, it makes sense that all the projects be analyzed together to see which one, if any, or which combinations of projects, would meet the demand while minimizing the impact to the environment and affected land owners.

On December 18, 2014, the Council on Environmental Quality (CEQ) issued guidance on the effective use of “programmatic” NEPA reviews. The guidance recommends agencies consider a programmatic review when “making decisions on common elements or aspects of a series or suite of closely related projects” and as a way to “avoid ‘segmenting’ the overall program from subsequent individual actions and thereby avoid unreasonably constricting the scope of environmental review.” (December 2014 CEQ Guidance, p.15-16) Specific actions listed in the December guidance as appropriate for a programmatic NEPA review include those that FERC and other federal agencies are now considering for several pipeline projects in New England:

Approving Multiple Actions. Decision to proceed with multiple projects that are temporally or spatially connected and that will have a series of associated concurrent or subsequent decisions. Programmatic examples include:

- Several similar actions or projects in a region or nationwide (e.g., a large scale utility corridor project); or
- A suite of ongoing, proposed or reasonably foreseeable actions that share a common geography or timing, such as multiple activities within a defined boundary (i.e., Federal land or facility). (December 2014 CEQ Guidance, p.14)

The various pipeline proposals share a common geography and timing. All have potential impacts on a range of resources and involve many local, state and regional stakeholders. Together these projects total 2.66 Bcf/d of increased natural gas capacity. Adding the recently (March 2015) approved Spectra AIM project, the total reaches close to 3 Bcf/d of additional gas capacity into New England. If Kinder Morgan elects to revert back to the 2.2 Bcf/d NED project as originally proposed, the additional capacity will be close to 4 Bcf/d.

Clearly the capacity of all these projects taken together far exceeds any potential shortfall in even the most aggressive demand scenario. They are redundant and cannot cite the same “need” or be considered independently. These projects constitute alternative solutions to the same potential need and must be reviewed as such under NEPA.

A consolidated review will allow the various agencies an opportunity to “propose standard mitigation protocols and/or operating procedures in a programmatic NEPA review and thereby provide a framework and scope for the subsequent tiered analysis of environmental impacts.” (December 2014 CEQ Guidance, p. 23) As the December 2014 guidance document states: Programmatic NEPA reviews provide an opportunity for agencies to incorporate comprehensive mitigation planning, best management practices, and standard operating procedures, as well as monitoring strategies into the Federal policymaking process at a broad or

strategic level. These analyses can promote sustainability and allow Federal agencies to advance the nation's environmental policy as articulated in Section 101 of NEPA. (December 2014 CEQ Guidance, p. 35)

Furthermore, combining the projects in a programmatic review would foster an open and transparent process, not just for the potential environmental impacts, alternatives and mitigation measures, but also for the needs analysis critical to understanding and quantifying both the No Build alternative as well as various alternatives by different gas transmission companies.

The FERC NEPA review for these combined projects needs to determine:

- What amount of gas, if any, is needed to meet the threshold of public convenience and necessity which would most certainly result in easements across hundreds of private properties? Please keep in mind that two offshore LNG "energy bridge" terminals that FERC recently determined were absolutely "necessary" for New England now sit essentially idle after the costs and environmental impacts associated with their construction have already occurred.
- What is the best way to meet any gas need while minimizing project impacts? This could be by choosing one particular project or parts of several different proposals that best meet the needs with the least impact.
- In assessing the needs of the electric generation market, the NEPA review should include the results of the study MA Attorney General Maura Healey is undertaking to determine electric reliability needs including what gas capacity we need for electricity generation through 2030. The results of that study, expected in October 2015, will show whether or not new pipeline capacity is needed to serve the electric generation market and if so, will properly define and dimension that need.
- In assessing the amount of the gas contracted through the various LDC proposals, the review should include an analysis of how much of the LDC demand is currently replacing expiring volumes already under contract? How much is for future demand? How much is to arbitrage?
- The No Action alternative should consider whether further investments by LDC's in repairing widespread and long-standing leaks in the distribution systems and providing increased incentives for people with older gas furnaces and appliances to upgrade to more efficient ones would negate the need for any new pipeline, while at the same time help meet the state's obligation under the GWSA. The No Action alternative should address the feasibility of increased use of already constructed onshore and offshore LNG facilities to cover any shortfalls, which appear to be limited to a few days per year. FERC must contrast the relative environmental impacts of construction of pipelines to this alternative, given that the construction impacts associated with the LNG terminals have already occurred.
- The EIS for a regional gas transmission study should acknowledge the specific projects proposed in response to the New England Clean Energy Plan RFP (<http://cleanenergy.com/>) and fully consider their timing and future presence in assessing the need for increased natural gas in evaluating the No Action Alternative. The No Action Alternative must also evaluate whether the import of 2400 MW of additional hydroelectric power by 2020 as proposed by Massachusetts Governor Charlie Baker fully meets or greatly reduces the need for the project in the No Action Alternative.
- The role of export in any proposed pipeline capacity expansion needs to be explicitly explained. People bearing the impacts and loss of property need to know where the gas is going. If export is identified as a "need" for increasing pipeline capacity to and through New England, an alternative that needs to be considered is serving the export market by sending gas on existing pipelines south to existing export facilities on the Gulf and Mid Atlantic Coasts.
- In comparing and contrasting the NED project and other natural gas transmission projects, the relative impacts of increased natural gas use on greenhouse gas emissions must be considered. The EIS should specifically address consistency with the federal CPP and MA GWSA. It should compare and contrast the proposed projects with increased reliance on renewable energy sources, increased effi-

ciency incentives, gas savings from leak repairs, and other ways which may be more consistent with CPP and GWSA.

- If increased natural gas is primarily a bridge fuel as many of the project components are claiming, then these projects should be considered only a potential temporary solution. The temporary nature of increased need, if in fact additional pipeline capacity is needed at all, must be taken into account in comparing the permanent loss of critical forested habitat associated with the projects to other short-term solutions, such as increased use of our currently underutilized LNG terminals using existing infrastructure.

In summary, we respectfully ask FERC to look at the larger picture of natural gas capacity in New England by combining the various proposals into a single, comprehensive NEPA review. This consolidated review will best allow FERC to fulfill its obligation to “use all practicable means and measures, including financial and technical assistance, in a manner calculated to foster and promote the general welfare, to create and maintain conditions under which man and nature can exist in productive harmony, and fulfill the social, economic, and other requirements of present and future generations of Americans” as specified in Section 101 of the National Environmental Policy Act.

Thank you for the opportunity to comment and we look forward to your response.

Sincerely,

Gordon Clark, Chairman

Nancy Hann, Winchester, NH.

For thousands of years our Pioneer Valley home has nurtured its people with beauty and a rich agricultural heritage. The attached viewshed map shows how many locations will be affected by a view of the Northfield compressor station proposed by Kinder Morgan: 12 towns in Massachusetts, 3 in Vermont, and 4 in New Hampshire. We love this Valley. A compressor station for fracked gas is not healthy, will not be clean, and should not be built. We want a clean, healthy, and beautiful Pioneer Valley for the next 1000 years.

Northfield, MA Compressor Station View Shed Map: <https://dl.dropboxusercontent.com/u/20677816/Viewshed%20For%20Proposed%20Pipeline.jpg>

20151005-5004

John Leoutsacos, Temple, NH.

During the recent scoping meeting held in Rindge New Hampshire. It was stated by Kinder Morgan rep Alan Fore (broadcast on WMUR channel 9) that my electric rates will go down by over 30% once the pipeline was built. Being a gas distribution company (the automotive equivalent of a toll road), would be like

being told the price of gas for my car will be cheaper once a highway is built. More than half of southern New Hampshire's residents are Eversource (formerly PSNH) customers, which will not be serviced by this pipeline.

How is he allowed to makeup such LIES without any repercussions?

20151005-5005

Marilynn Acker Ezell, Temple, NH.

If the natural gas that Kinder Morgan wants to bring us via the NED pipeline is really for the purpose of lowering our electricity rates, why don't they transform it into electricity in a power plant near its source and then send it to us as electricity over power lines? I would much rather have that than to have a gas pipeline and compressor station in our midst. The truth is the natural gas is not for us after all. It is for export and we are just supposed to put up with the degradation of 70+ miles of southern NH so that this private company can sell it to a different market. This is not going to lower our electric rates. Let's look for more chances to invest in renewable energy and stop ruining the environment.

20151005-5006

Aaron K Patt, Troy, NH.

To: Federal Energy Regulatory Commissioners

From: Aaron K. Patt, former Co-Chair Rockwood Brook Clean-up Committee '02, Former Troy Selectman '03-'10, former Cheshire County Commissioner '11-'12

Commissioners,

I am writing to you regarding the Kinder Morgan pipeline project that is under application for installation in southern New Hampshire. I am writing to share my experience as a person that was directly involved in the Environmental Protection Agency (EPA) Superfund site located in Troy, New Hampshire – the Troy Mills Landfill site. Extensive information on the clean-up efforts and testing can be found here: http://yosemite.epa.gov/r1/npl_pad.nsf/51dc4f173ceef51d85256adf004c7ec8/33eb2bb1688465ac85256d19005dd167?OpenDocument

The superfund site was referred to as the largest liquid waste site left in America by experts from EPA during one of our local meetings. The committee I co-chaired coordinated with the New Hampshire Department of Environmental Services (DES) and the EPA, as well as our elected officials at the State and Federal level in order to remediate the site and protect the Town of Troy water district and Rockwood Brook Pond (at that time a source of drinking water for the town). The efforts were successful and resulted in the site being listed on the National Priority List (NPL). From the NPL listing the site was funded and clean-up efforts were completed over the next several years. During this time I was elected Selectman in Troy, and continued to oversee the process on a local level.

It's not possible to share with you all of the events, emotion, and concerns that residents of Troy and myself experienced during that time. However there are several things that I believe bear relating with regard to the pipeline application by Kinder Morgan, which viewed from the vantage point of our experience dealing with the Troy Mills landfill, is a reckless and dangerous project that will expose residents of southern NH to dangers that will far outweigh any benefits touted by the companies intent on this project.

Chief among the lessons we learned is that clean-up efforts take an enormous amount of time to conduct, leave lesions that may never heal, and cost far more to a community than the economic benefits gleaned in the short term. Consider that the barrels at the site were first buried in the 1960s and that the law against disposal was not passed until 1976. From that time, NHDES kept records until 2002 when the residents of Troy formed the clean-up committed to address the direct threat to their local water resources. We are nearing the 40 year anniversary of data recording at the site. Before commencing the clean-up, EPA tested every possible spring run-off from the site in an effort to document mobility of the pollutants – the number of potential spring feeds was startling. The awareness of how moisture seeps and flows; how alive and 'transportative'

groundwater is brought a deeper level of dread with regards to the potential for the efforts to capture and clean the site completely: the entire area downstream from the site included all of the area geographically below the area that water can reach. This includes significant wetlands areas that currently intersect with the Right of Way that Eversource controls and that would be used by Kinder Morgan for their pipeline. The ROW installation plan was recently updated showing the pipeline only 122 feet away from the superfund location. The ROW directly intersects with the Bowkerville pond wetlands, which runs under Route 12 and down towards the center of Troy village. Locating a pipeline at such a close distance to the Troy Mills superfund site is, in effect, the installation of a superhighway for the mobility of latent pollutants already onsite that could not be captured by the superfund clean-up.

The cost of the superfund site was beyond the capacity of the local community to fund. Consider that Troy closed its landfill site at the cost of a million dollars and holds a 20 year bond. The superfund site was noted to have a \$14 million dollar lien from the EPA in place. If you know anything about local government funding, and its reliance on property tax in NH, you will know that the effect on local communities is that the threat of future clean-up, is a grossly unfair transfer of costs from corporations outside the State to the taxpayers in southern NH, of which most in this area are middle-class and the poor. Consider the time it took for the 'largest liquid landfill site left in America' to reach the National Priority List and you can imagine what the results will be for local communities when leaks occur in the pipeline. When, not If.

The reality of the Kinder Morgan pipeline, beyond the economic waste of having spent enormous federal funds on the protection of the town of Troy from a static source of poison (barrels of Varsol liquids), is that the pipeline in southern NH will be an active source of poison, carrying untold gallons of gas that has the potential to ruin entire communities. The ROW land is not static. Installation of a pipeline in such close proximity to people is not only foolish but represents a future adverse economic impact on the region that vastly outweighs the short-term goals purported by Kinder Morgan. The fact that recent plans updated by Kinder Morgan showing the installation moving closer to the superfund site is explanation enough that the company does not have the interests of NH and its people in mind.

We struggled mightily to preserve our future. Please be a positive part of that struggle by voting "NO" to the Kinder Morgan pipeline. We've worked closely with federal and State resources in the past and have first hand knowledge of how detrimental such a project will ultimately be to the area. Our long term vision for our communities is more important at crossroads such as these. There are better and safer opportunities available. We need a better vision for the future both in energy and

20151005-5044

In its letter to the applicant of February 27, 2015, FERC asked that Section 1.3.2.2 of the Resource Reports "fully describe the criteria for whether groundwater wells and springs within 200 feet of the construction right-of-way will be tested, the testing procedures for water quality and quantity, the timeframe for testing, and measures that would be implemented in the event that water testing indicates

an impact on a well". The applicant's response is wholly inadequate and does not even facially comply with the request:

"Tennessee is planning to test water wells within 200 feet of the construction workspace along the ROW, both before and after construction, for water quantity and quality parameters. In order for a landowner or resident to immediately qualify for post-construction testing, they must allow Tennessee access to property on which such water wells are located conduct a pre-construction test. Tennessee will conduct testing of all wells within the proposed constraints, both pre- and post-construction, unless otherwise prohibited by the resident or landowner."

The applicant's statement cannot in any way be said to fully describe the criteria. What contaminants will they test for? Will they test well flow, recovery and head? What is the timeframe? What measures will they take if testing indicates an impact on the well? What do they mean by "immediately qualify"? Does that suggest that immediate post-construction testing is what would be done?

More importantly, 200 feet is an inadequate when blasting is involved, as will likely be the case in much of Rensselaer County because of its shallow depth to bedrock. There are no public water systems in the Town of Nassau, making residential wells critical. Rensselaer County is considering a local law which would generally require blasters to offer private well testing out to one mile from the blast area. Albany County has enacted a similar law. FERC should insist that Tennessee Gas {file ends}

Attn: OEP-DG2E-Gas, PJ-11.3

RE: Docket No. PF14-22-000

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, D.C. 20426

Dear Secretary Bose:

We, the **Select Board of Plainfield, Massachusetts**, respectfully submit the following comments in regard to Tennessee Gas Pipeline Company, L.L.C.'s Northeast Energy Direct Project Docket No. PF14-22-000 as it relates to the proposed 5.5 mile gas pipeline (mileposts 21.52 - 27.07).

Northeast Energy Direct Project

Plainfield, Massachusetts: Segment G

1. There are nine proposed road crossings in Plainfield (Windsor Avenue, West Street, Prospect Street, Summit Street, West Hill Road, Rte. 116, North Central Street, North Union Street, and Grant Street). Please determine the method of construction for each road crossing and how the affected roads and surrounding areas are to be maintained during construction and restored to its preconstruction shoulder to shoulder condition. Also, indicate how traffic flow is to be maintained during construction.
2. Please indicate the presence of state and federal inspectors on site to ensure compliance with project specifications and Massachusetts, federal, and local regulations.
3. Please determine how contractors plan to access construction areas along the ROW where temporary access roads may be needed, determine those locations, and indicate how these areas will be restored to preconstruction condition.
4. Please determine how construction crews plan to transport and off-load heavy equipment and materials without doing damage to Plainfield infrastructure.
5. Please determine the method by which any Additional Temporary Workspace(s) (ATW) are to be restored to preconstruction condition.
6. According to a recent Wright to Dracut NWI Quad Mapbook (NED-G-0703) Kinder Morgan has planned a pipe yard and contractor yard in Plainfield on the Robert E. Waryjasz Trust property. Not only is this land in the Agricultural Preservation Restriction Program (APR), but the Town of Plainfield holds a lien on all of the Robert E. Waryjasz Trust property for nonpayment of taxes. Please determine who will be compensated for the use of the parcel, and how the land will be monitored for any hazardous materials and other contaminants that may damage the soil and how the land will be restored to preconstruction condition.
7. 798 (65%) of Massachusetts landowners have not granted permission to Kinder Morgan for survey purposes. Please determine the areas of no access in Plainfield which may be subject to eminent domain for access and survey purposes in Plainfield and how landowners will be compensated for the current and future loss of use of their properties.
8. Plainfield may easily be defined as "rugged terrain". Please determine the areas where blasting is re-

quired, how affected areas will be protected and restored, and how underground aquifers supplying wells and springs may be affected and indicate the water testing frequency for wells and springs.

9. Please determine the location of steep slopes greater than 30% and slopes between 15% and 30% in Plainfield and how they will be protected from erosion and subsequently restored.
10. Please determine the locations where 12 inches or more of topsoil may be removed from agricultural land, where and how it will be segregated and stored during construction, and how it will be properly restored.
11. Please determine water sources for hydrostatic testing, the length of pipe per test, and locations of water release following hydrostatic testing.
12. Please identify all cathodic protection areas.
13. Please identify the method and frequency of alternating current mitigation.
14. Please indicate the frequency of regular inspection schedules and the process by which the proposed pipeline is to be maintained.
15. Please indicate the proposed training schedules for local emergency services and the anticipated response time before Kinder Morgan (Tennessee Gas Pipeline Company, L.L.C.) crews will be on the scene in the event of an emergency.
16. The Plainfield Fire Department/EMS is a volunteer organization with limited resources. Please indicate how Kinder Morgan will provide the Town with the necessary vehicles, equipment, and supplies needed to respond to potential pipeline emergencies, during and after construction.
17. The Plainfield Center Historic District has just recently been accepted by the National Park Service, Department of the Interior for listing in the National Register of Historic Places. Please indicate how the integrity of the area is to be maintained and protected during construction.
18. In the interest of public safety, we respectfully request "Class 4" pipe, not "Class 1" as proposed, be used throughout the entire 5.5 miles of pipeline in Plainfield.

We appreciate the opportunity to comment on the proposed Northeast Energy Direct Project. Thank you for your considerations of our concerns.

Respectfully submitted,

Phillip S. Lococo

Judith Feeley

Dennis W. Mimitz

Plainfield Select Board

Scoping Hearing Comments August 11, 2015, Dracut, MA Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission (FERC)

888 First Street, NE, Room 1A

Washington, DC 20426

Re: FERC Docket Number PFI4-22, Tennessee Gas Pipeline Company, LLC.

Hello, I am Mark Andrews, Town Administrator from the Town of Pepperell. I am speaking tonight as a representative of the Northeast Municipal Gas Pipeline Coalition. Our Coalition is composed of duly appointed representatives of the following Massachusetts and New Hampshire Municipalities: Ashby, Andover, Dracut, Dunstable, Groton, Littleton, Peabody, Pepperell, North Reading, Tewksbury, Townsend, and Wilmington, MA and Brookline, NH. The Coalition is comprised of elected members of Boards of Selectmen, Town and City Administrators, and other Municipal staff. Our Mission: To gather knowledge and work collaboratively to provide representation and information to relevant government and public bodies concerning the Tennessee Gas Pipeline Project proposed by Kinder-Morgan, and its effect on our communities. Over the

last 14 months we've been meeting, our towns and the members of this Coalition have become unified in their steadfast opposition to the Northeast Energy Direct pipeline project and the overwhelming majority of our members have joined the over 70 towns and counties in Massachusetts, New Hampshire, and New York in passing town resolutions in opposition to the pipeline.

As others have mentioned, the Coalition is tremendously concerned that the project is moving far too rapidly. On July 24, Kinder Morgan released updated Resource Reports that remain woefully incomplete---there are still an estimated 10,000 TBD's. We understand that the preferred format for this hearing is to submit questions to you for further study and consideration. In effect, we are submitting all 10,000 questions - the TBD's in Kinder Morgan's Environmental Resource Reports.

Our municipalities and the members of our Coalition share significant concerns about all aspects of the proposed pipeline project, including, but certainly not limited to, the impact of the construction and operation of the pipeline on protected open spaces, federal and state rare and endangered species habitat and Article 97, water resources, forests and farm land. We question the KM NED pipeline in terms of actual need and capacity, its impact on air quality and greenhouse emissions and our archeological and historic resources. We share with the homeowners of our towns their collective concern about falling real estate values and the subsequent impact on tax revenues on our towns--and most importantly, we are seriously concerned that the NED project will negatively impact the physical health and safety of our citizens. While this is only a cursory reporting of our reservations about the pipeline, please be assured we will be submitting extensive written comments to FERC by the deadline.

Also, on a separate note, I understand that FERC will conduct an extensive economic impact statement regarding the potential financial impact to cities and towns. This statement was made minutes ago. You should review our municipal "overlay accounts" that are used to abate local taxes when property valuations New Hampshire are adversely impacted, under Massachusetts General Law Chapter 59. The overlay account is budgeted each communities: year as Town Administrators, Town Managers and Mayors grapple with budgeting scarce local revenue for many competing needs. We actually lose sleep over this complex account. My question centers upon - if we have more abatement applicants for relief due to the pipeline, how will we pay for the costs of these unknown expenses? You need to look at this problem.

Tonight, we would like to specifically and respectfully request that you postpone the proceedings until October, 2015 when the Massachusetts Attorney General will release her independent study on electricity reliability and capacity needs and determines if NED is the most cost effective means of meeting the energy requirements of the Commonwealth.

As residents of Massachusetts, all of us, through well documented past experience, are keenly aware of the pitfalls and unintended consequences of large projects such as this one. We request that you schedule additional scoping meetings to be held when the information provided by Kinder Morgan is more complete, all relevant bodies have had a chance to review it, and the Attorney General has issued her study. We cannot collectively allow the project to go forward until these significant issues have been thoroughly addressed.

Thank you for the opportunity to speak on behalf of the Northeast Municipal Gas Pipeline Coalition and for being in Dracut this evening.

Sincerely,

Mark Andrews, On behalf of the Northeast Municipal Gas Pipeline Coalition

Rebuttal to Tennessee Gas Pipeline's Response to N.H. Congressional Delegation's Letter:

I found Kimberly S. Watson's response a predictable repeat of the hype we hear at the Kinder Morgan Open Houses, their newsletters and the general purpose TV ads touting how good fracked gas is for us. One would think that the person trying to sell us and our congressional delegation on how we would benefit from the

New England Direct, the NED pipeline would come up with some concrete, truthful, transparent information, that would help them get a foot in the door.

She claimed they lengthened the route to minimize the impact on the environment! Have they looked at the environment? There is no evidence, they have put boots on the ground here. Their TBDs in their Resource Reports prove that. I read and responded to every section that was relevant to Rindge.

The real reason is low population density and their possible assumption that the perhaps less educated population of Southwestern New Hampshire would accept this project. In fact, Susan Emerson, State Rep. representing Fitzwilliam/Rindge stated at the scoping session in Rindge, "I am blessed with a very intelligent and well informed constituency." Heaven knows, the people of Massachusetts, raised such a ruckus, that they had to find an alternative, and their neighbors in southern New Hampshire unfortunately got picked.

What Kinder Morgan/TGP found with the move North, was a bunch of people willing to fight to protect a pristine environment. Kinder Morgan/TGP haven't done more than an aerial examination, because we haven't invited them on our property. I hope the impacted citizens of Southern New Hampshire stick to their resolve to deny access to their property when Kinder Morgan/TGP waves money under their noses.

Kinder Morgan, says they are going to file for regulatory approval in the 4th quarter (late October). I personally don't believe they will be able to complete their final resource reports by then. I would also like to note that the following groups/regulatory bodies have recognized the poor quality, lack of completeness, and utter lack of knowledge of the environment they are planning to disrupt: The New Hampshire Fish and Game; The Sierra Club; The Monadnock Conservancy and 35 town Conservation Commissions, among others. The most hideous example being the placement of the proposed New Ipswich compressor station without determining which way the prevailing winds blow!

Ms. Watson also restated the much used phrase about natural gas lowering New Hampshire's electric rate. I questioned Kinder Morgan's business contacts at the Fitzwilliam open house. My question was: If you don't have any power generating plants under contract in New Hampshire, how could you honestly say your gas will reduce New Hampshire's electric rates? I was told that I was missing the big picture. They were talking about lowering the rates in the New England grid! I should point out, that New Hampshire is the only power exporter in New England. So again New Hampshire is bearing the cost, but not receiving the benefit.

While the Congressional Delegation is mulling over Ms. Watson's response, I'm eagerly awaiting FERC's response. I will be surprised if the delegation hears from them, as FERC is only answerable to the oil and gas industry.

Thank you,
Jan Griska
Rindge, NH

20151005-5204

Amanda Weller, Nassau, NY.

It is nearly impossible to put into words how devastating this project would be were it allowed by FERC. My family and I, including our 4 year old daughter reside less than a quarter mile from where the pipeline is proposed to pass and less than 5 miles from the proposed site of the compressor station.

We chose to live in this area because we value nature and the creatures living on it. In the event that this project is allowed on any scale, the construction alone would risk the safety of our home and water supply. Once completed, the noise and air pollution from this type of project which would most certainly require blasting and almost constant building activity would effectively limit or eliminate the quality of life we and our neighbors sought when we moved here and enjoy now. The construction and project once completed would severely and negatively affect the wildlife in our area. Our daughter's school and our area's children will be subject to constant noise and air pollution putting them at risk for significant neurological conditions in the future. Our area's businesses will be unsustainable as residents will likely be forced to leave the area. I

am unable to see how setting a precedent which would allow Kinder Morgan and their affiliates or any other corporate giant to do as they please with no regard for the welfare of the people living on the land they will destroy is good for anyone. Please set the only responsible precedent you are in a position to do! Decline this project. Say NO to Kinder Morgan.

Barry Pfannebecker, South Deerfield, MA.

Comments on the Draft Environmental Report (Resource Reports 1 through 13) and Project Scope Update of Tennessee Gas Pipeline Company, LLC

FERC Docket No. PF14-22-000

This entire Report does not address environmental concerns, plans, or designs. Instead, it promulgates temporary roadways, construction sites, blasting, and storage of materials. It does not provide environmental guidance to FERC because it lacks design detail for construction in environmental regions or acknowledgment of environmental design constraints anywhere along its path. For example,

1. The only objective regarding the environment is in the Environmental Construction Plan for New Hampshire, Para 1.1 and states "...general Best Management Practices...before, during, and after construction to minimize erosion..." By simply "minimizing erosion", this report neglects any of the obvious environments along the proposed path in addition to those that have been provided to FERC by other individuals and groups and does not provide guidance to FERC for construction in environmental regions. This is unacceptable as an environmental report.
2. The Report states that for the majority of the "waterbodies" (i.e., rivers) the pipe will be buried a minimum of 5 feet. This is unsubstantiated by acceptable geological and environmental constraints and in no way provides guidance to FERC as to TGP's plans for construction under rivers in a way that will safeguard those environments associated with the rivers.
3. TGP states that sensitive waterbody information is defined in the Data Response Matrix, Comment ID 17, p 9. However, Appendix M as referenced therein does identify sensitive waterbodies. It does not provide guidance to FERC for specific construction at/near sensitive waterbodies as defined by local governments or organizations.
4. It is known that both temperature and pressure vary along gas pipelines. TGP has not provided guidance to FERC by identifying the temperature profile in the pipeline and the long term impact on the associated environments. This is unacceptable as an environmental report.
5. The Wetland and Waterbody Crossing Construction and Mitigation Procedures (Attachment L15 to Appendix L and which refers to Appendix H) states the Director of the Office of Energy Projects will consider a variance if "...a portion of this Plan is infeasible or unworkable based on project-specific conditions". The Report does not provide guidance to FERC by defining what may be infeasible or unworkable. This almost assures that an issue can be overridden by a government agency that does not understand the environmental impacts to New Hampshire and is unacceptable as an environmental report.
6. The Upland Erosion Control, Revegetation, and Maintenance Plan, Para I.A. allows project sponsors to specify measures they consider unnecessary, technically infeasible, or unsuitable due to local conditions. Again, this almost assures the granting of a variance without understanding its impact. It is unacceptable as an environmental report and does not provide guidance to FERC in these matters.

To summarize, this Report neglects design details by the use of empty industrial terms (i.e., general best management practices, TBD, minimize, and "to the extent practicable") and indicates a lack of knowledge or interest regarding the local environments, particularly since TGP can apply for a variance whenever they say a solution is "unnecessary, technically infeasible, or unsuitable". They are quick to define digging, building temporary roadways, blasting, and construction of storage sites without regard to the local environments. This suggests a negligent approach to construction in environmental regions and does not provide

guidance to FERC to assess construction in those regions. The project should not be allowed to proceed. There are more requirements that pertain to the construction of a house than pertain to the construction of this pipeline within the complex environments along its proposed path.

RE: Docket 8PF14-22 (Northeast Energy Direct)

Dear Ms Bose,

Please forward the attached to the members of the Commission for their review. This article points out only one problem among many that the proposed pipeline has presented to our small town of Lynnfield, MA.

I am sure that FERC has heard from many others that are opposed to this pipeline that will destroy parts of our community.

Sincerely,

Arthur E Douglas

Re: Docket 1PF14-22

As a resident of Noithfield, MA, I am opposed to the Northeast Direct Pipeline and compressor station proposal. I would like to thank the Coriimission for agreeing to accept comments from citizens regarding this project past the original deadline of 8/31/15, and to allow our State Senator Stanley Rosenberg to deliver these to you.

In a recent meeting with ten of my neighbors, Senator Rosenberg stated that FERC prefers to see Rroof rather than sentiments from citizens who would like to see this pipeline proposal denied. By now, FERC has heard hundreds of comments at scoping hearings from people potentially affected by the pipeline, and has

thousands of comments in the docket, the vast majority opposed to the project. These comments outline in detail the environmental, safety, and cultural risks and examine the potential economic benefits. Ordinary people have spent countless hours reviewing scientific studies of the hazards of natural gas fracking and distribution via pipelines. These studies form the basis for our conclusion that the NED pipeline would provide negligible benefits and unacceptable risks.

Studies of risk and need are always speculative). No one can prove that something will happen in the future. Therefore the best we can do is to present to you the overwhelming factual evidence that the risks are excessive, and the benefits too few, for FERC to reasonably approve the NED Pipeline.

The Kinder Morgan Corporation did not respond to a cry for help with energy from the people of Massachusetts and neighboring states when it began planning this pipeline. Rather, it has arrived in our towns and left us with the task of disproving a speculative need.

In today's news, Shell has abandoned its plans to drill in the Arctic, after ten years of exploration. There was massive protest against the potential environmental devastation of this project yet in the end, the bottom line of practicality and profit & son out, and the corporation's goals were proven to be untenable. This may well become the case with Kinder Morgan as the need for more natural gas to be piped in to Massachusetts is proven to be mythical. But since we cannot afford to sit aside and wait, I urge you to deny a permit to Kinder Morgan for the NED Pipeline, based on a simple risk to benefit equation, as well as the lack of need. In this instance vastly weighted on the risk side.

Sincerely,

Laura Kaye

Kathleen Gauvin, New Ipswich, NH.

I want to thank WMUR and Fred Kocher for giving our opposition to the NED pipeline project, Kinder Morgan, and Tennessee Gas an equal voice. Today our opposition and just reasons for our actions were introduced to the state of New Hampshire, from the Canadian border to the Massachusetts border, from the seacoast to the Connecticut River. Your judgment to invite this team was a fair decision.

We have long been fighting these Goliaths! The need for this pipeline and compressor station is only based on greed, the Goliaths' need to make more and more money! Already existing pipelines could easily handle transporting additional gas that would fill any need that New Hampshire and New England have both now and for years to come. The problem with using the existing pipelines is simply put. The existing pipelines are not Kinder Morgan and Tennessee gas lines. If they cannot build the NED pipeline they can't use the guise of supplying New Hampshire and thus lowering energy costs. They will not have a pipeline to transport gas for EXPORTING, therefore no EXPORT profits!

We are a highly organized, informed, courageous group of individuals who daily work long hours and give up our free time to research, write letters, attend meetings, write emails and stand united. We want to stop this pipeline and compressor station before it is built for then it will be too late! Our fears of what the future will look like, spurs us on to protect our families, our towns, and the entire southern tier of NH.

20151006-5083

Kathleen Gauvin, New Ipswich, NH.

We have been anticipating a public statement of some kind from the Mascenic School Board regarding your position on the NED pipeline project. We expect that you are fully aware that a proposed compressor station in New Ipswich will be located just under a 1 1/2 miles. The Boynton Middle School location should be of concern to you. The athletic fields off of Temple Rd. that are used by many of your sports teams are just barely outside of the 1 mile mark from the compressor station. We are quite sure that you are aware of the toxic emissions that will affect air quality in New Ipswich.

We are aware that you have an enormous work load with the School Board and yet we feel that being informed about these issues is vastly important to the health of our students and staff. We have gathered an enormous amount of information regarding the New Ipswich compressor station and the toxic emissions that will be sent into the air from this station. We also have data that has been reported in several recent Harvard research projects and by the Southwestern Pennsylvania Environmental Health Project (SWPA-EHP) and others, that reveal information about the health effects of children and adults living in compressor station areas. As noted in your "School Wellness Policy" (as seen below) you are committed to promoting wellness. This proposed pipeline and compressor station should be without doubt, a concern for the wellness of our school community.

MASCENIC REGIONAL SCHOOL DISTRICT**SCHOOL WELLNESS POLICY**

The Mascenic School District is committed to promoting wellness and academic performance in our schools through curriculum, activities, and life skills. Wellness is a result of both health promotion and disease prevention which includes intellectual health (knowledge), physical health, and social-emotional health. Modeling by adults coupled with peer reinforcement can help shape healthy habits in school children. A cooperative integrated effort between administrators, food service professionals, school nurses, physical and health educators, teachers, parents, and students is necessary.

We and any other members of the New Ipswich Task Force or the New Ipswich Pipeline Resistance group would be glad to present a short program to the Board at your convenience. Thank you for your consideration of this matter and the importance to the Mascenic School District and the children that are educated there.

Sincerely,

Kathleen and Dennis Gauvin

61 Beechwood Rd.

New Ipswich, NH 03071

878-2448

674-3697 (c)

The Mascenic School District of New Ipswich and Greenville voted to oppose the NED pipeline project on 10/5/2015.

20151006-5092

Kathleen Gauvin, New Ipswich, NH.

No one should need to worry about the water they are drinking! That said, "Granite Stators" have been watching the news of contaminated wells at Pease International Tradeport. How unfortunate that 9,000 adults and children have ingested water with elevated levels of perfluorochemicals (PFCs), 12.5 times higher than the level set by the Environmental Protection Agency's Provisional Health Advisory. The EPA notes that PFCs are a "contaminate of emerging concern". This unfortunate, exposed group has lived for over a year with the fear of what the future will bring. Now, having been tested and with their results, that same unlucky population will be living day to day with the worry of what might potentially occur in the future.

We, as your neighbors, hope that those potential health threats are never realized. The support that you are receiving from Senator Kelly Ayotte and Senator Jeanne Shaheen is commendable.

We have drinking water concerns as well! The proposed Northeast Direct (NED) pipeline snakes through 77 miles in 17 towns in the southern tier of New Hampshire. Kinder Morgan/Tennessee Gas is seeking permitting with the Federal Energy Regulatory Commission (FERC) for this project. If approved, what effect will the blasting for the pipeline construction have on our wells? Where will the blasting contaminants go? Will they end up in our water supplies; a town reservoir and our private wells? Who will protect our water? We are now worried about potentially polluted water and dealing with possible health threats. At this time, neither the Governor nor any of the NH Delegation has taken the stand in opposition to the project!

So we, fellow concerned Granite Stators, are reaching out to you, our NH neighbors, to help us stop this contaminating monster!

<http://nhpipelineawareness.org/> is a source of excellent information.

20151006-5164

{ large (44" x 34") NRPC map of pipeline path through Merrimack, NH. as of 9-18-15, omitted }

20151006-5188

Lisa Sieverts, Nelson, NH.

I write in strong opposition to the application by Tennessee Gas Pipeline/Kinder Morgan to place a natural gas pipeline in southern New Hampshire. This is the wrong project at the wrong time. There is little economic benefit to New Hampshire and an enormous environmental risk. Please reject this application.

20151006-5189

Laura or Kenneth Lynch, Temple, NH.

I am writing this in opposition of the NED Pipeline. It is an over build - for export, fracked, potent greenhouse gas pipeline that does not serve our long term health in NH - economically, environmentally, medically, culturally. Negative effects on health, industrialization, property decline near compressor stations is evident (New Ipswich compressor station would be 1/2 from us in Temple.) This compressor station will also be with in a short distance from the Temple elementary school, the Greenville Reservoir and the Catholic retreat that is a home for Nuns in NI. It is also going to be close to many homes and an Organic cattle farm that has been there for several years. Not to mention within a mile of the Villi Poni Farm, the home of the Newfoundland Pony which is an endangered and rare species. This compressor station will emit so many deadly chemicals and is going to be a health hazard to many residents as well as our lands, water. air and the many wild life in the area. I will be living with this compressor station within a mile from my home and I am so afraid of the air quality because of my COPD. Anyone with any kind of asthmatic problems are going to be effected by this. Safety Issues are increasing dramatically due to the increase in the #'s of pipelines and speed of build. Lands would be taken by eminent domain for private gain. As stated above I oppose this pipeline

20151006-5248

Nancy Askin, Shirley, MA.

I am writing to register my opposition to the construction of the Northeast Energy Direct natural gas pipeline (NED) that Kinder Morgan/Tennessee Gas Pipeline seeks to build in New England, New York, and Pennsylvania.

Construction of this pipeline would violate our rights as stewards of the land we live on through the taking of that land by eminent domain or other coercion. Gas sales from this project will only profit a private corporation and will not benefit New England or the nation. Communities within the pipeline's route, currently struggling with financially challenged budgets, will face land devaluation, less income, and absolutely no

financial benefits.

There are serious concerns about the safety record of gas pipelines in general and Kinder Morgan in particular. Gas leaks threaten sensitive aquifers, soil, and plant life. Explosions involving pipelines of this size and pressure actually occur and are catastrophic, with the fire being fed by many miles of fuel between shut-off stations, leading to prolonged, extremely high-temperature burn. Our communities' emergency response facilities are not equipped to deal with such occurrences and the cost of developing the appropriate capability would be borne by local taxpayers.

The proposed pipeline would destroy significant environmental habitats and threatens wildlife corridors on existing conservation parcels. Noise from the compressor stations would be a constant irritant and should be considered noise pollution.

I strongly urge FERC to NOT approve this pipeline.

Thank you for your consideration,

Nancy Askin

CITY OF PEABODY

24 LOWELL STREET
PEABODY, MA 01960

OFFICE OF THE MAYOR
EDWARD A. BETTENCOURT, JR.

August 27, 2015

Norman C. Bay, Chairman
FERC
888 First Street, NE
Washington, DC 20426

RE: Docket No. PF14-22

Dear Mr. Bay:

As you know, the Tennessee Gas Pipeline, L.L.C. has submitted to FERC an Application to open a pre-filing proceeding of Tennessee Gas Pipeline Company, L.L.C. under New Docket for Tennessee's Northeast Energy Direct Project under PF14-22.

As part of this project, Tennessee Gas has proposed building a spur of subsurface pipeline in an area of Peabody, Massachusetts wholly unsuited for such a utility. In a letter to FERC dated June 12, 2015, I outlined the concerns and fears so many in our community share over this pipeline proposal.

First, the area proposed for pipeline construction is home to a number of natural resources which could be jeopardized by such a large scale and disruptive project. Thanks to its vicinity to the Ipswich River, which is a primary source of the region's drinking water, the area is rife with wetlands, plants, trees, and other types of vegetation. The environmental impact of pipeline construction and siting could be devastating.

Also, the area proposed for pipeline construction runs along the Peabody Independence Greenway. Known locally as simply 'the Bikepath,' the Greenway is a favorite destination for thousands of walkers, joggers, cyclists and wildlife enthusiasts. Many of these individuals have expressed their dismay over this pipeline proposal and I share their concern for preservation of this vital community resource.

Finally, the area proposed for pipeline construction runs adjacent to one of our city's most beloved and tight knit neighborhoods. Families who live here are justly concerned about a disruptive construction project which could forever alter the landscape of their homes. Homeowners have also expressed to me their concerns relative to public safety and protection of property.

Unfortunately, despite the potential negative impact to our community, Peabody residents have been effectively excluded from FERC public hearings relative to this project. Despite the fact that many Peabody residents only learned about the pipeline proposal on April 15, 2015, FERC's final public hearing relative to the project took place on August 12, 2015. This scant four month window is simply not enough time for concerned residents — busy with work, family and social obligations, to absorb and analyze volumes of data relative to this proposal and its potential effect on their quality of life.

In addition, the nearest FERC public hearing relative to the Peabody pipeline spur took place in the Town of Dracut, Massachusetts - some 35 miles north of Peabody. Many Peabody residents who may have wanted to provide FERC with their feedback relative to the proposal were simply unable to do so due to schedule and logistic limitations.

Given these time and distance constraints, I respectfully request that FERC schedule a public hearing relative to the Peabody pipeline proposal in the City of Peabody. I am happy to offer City Hall's Wiggin Auditorium as the venue for this hearing. The auditorium seats up to 300 people comfortably. This hearing will give Peabody residents the opportunity to provide thoughtful and valuable feedback to FERC relative to this pipeline proposal. I am eager to discuss this request with you in greater detail. Please contact me directly at 978.538.5700 or Edward.bettencourt@peabody-ma.gov. Thank you.

Warmest regards,

Edward A. Bettencourt, Jr.
Mayor, City of Peabody

Please DO NOT APPROVE this pipeline as existing pipeline capacity is sufficient to supply our area. Kinder Morgan is using inflated facts to fool FERC to approve a pipeline that will be used to export LNG to Europe, not supply our area. Remember ENRON and California where a similar plan was used.

September 28, 2015

Dear Senator Shaheen,

We are writing to oppose the Northeast Energy Direct (NED) pipeline proposed by Kinder Morgan. In looking over all the information we find no benefit to New Hampshire, however, it will bring much benefit to Kinder Morgan. Corporations have too much control over our government and we have no rights.

The pipeline will break conservation easements, bring an additional tariff on our electric rates to pay for this private project, bring financial burden for landowners who lose property value or increased insurance premiums, water quality will be affected.

This pipeline will not bring fuel directly to homes for heating —this is a distribution line. Pipelines require compressor stations and they are ginormous polluters. All pipelines leak! The pipeline companies have no obligation to fix them, only to identify, categorize and monitor.

Kinder Morgan hires locals to speak positively about the pipeline in our communities and to say we are overreacting! Are we?

After doing the research I am convinced the pipeline construction process will pollute our air, contaminate our aquifers, wells and other water resources. Families will lose their homes and it will destroy conservation lands. It will harm the tourist industry and rural character of New Hampshire.

Stand up and stop Kinder Morgan from trampling your people and our state!

Most Sincerely,

{signatures not legible}

Re: Docket No. PF14-22-000
Northeast Energy Direct Project

Dear Secretary Bose;

We recognize the serious mandate FERC has been given with regard to our energy future here in New England. We know that any source of energy has environmental consequences. We know that there is a process of discernment when risks must be managed along with benefits. This we see as your mandate.

Pope Francis recently spoke before Congress. As he did, he repeatedly spoke of The Common Good. One reason used this because it reflects the tone of our U.S. Constitution. Hearing it from his mouth rang universally true with the audience in Washington, as well as across the country.

Many of us look at the myriad of decisions being made regarding our energy future and wonder about The Common Good. We see a very powerful agency regulating our energy future with tremendous benefits and trespass given to the very large corporations. The citizens of the effected towns have not, from the beginning, been identified as stakeholders.

Timelines have been accelerated and the public has done the lion's share of the project review work. We have walked the line. We have researched the claims made by Kinder Morgan. We have gathered and studied and educated others and ourselves. We even experienced FERC in the dark at the Pittsfield Scoping meeting until we demanded that the lights shine on the panel deemed responsible to listen to and hear our concerns.

The resource report, prepared by Kinder Morgan for the Northeast Energy Direct TGP Project does not reflect the seriousness of the very consequential impacts our way of life and our environment will experience. This is the source we have been given to review and respond to during the scoping process.

All too many times during our review, did we encounter the words "probable" and "unlikely" and the phrase "to be determined". How you interpret these comments is very important to the citizens and the natural world that will be impacted along the pipeline. Is it possible, in your own personal world, that issues of significant health and safety impacts would be acceptable in the context of "to be determined"?

After thoughtful reflection, we find we are unable to participate in this part of the process. To ask for more investigation when the timbre of the report is so unworthy of FERC, the activated citizenry and especially our voiceless land, air and water, the very sources of life on which we all depend, is not fitting to the task.

We implore you to raise your standards, to recognize what is at risk and how short the benefit time is. Listen to and hear what the voices of those without any vested interest have to say. We have not been shown a plausible need for the abundant amount of natural gas projected through this project for Massachusetts. We

do not need to fund through tariff a project that will cause more harm than good and ultimately be exported for corporate gain. We do not need to sacrifice our way of life for this project. The environmental damage will be irreversible. In no way will that serve the Common Good. What it will do is to continue to erode our democracy as more and more of us lose faith in our representative government. It will erode our land; contaminate our air, land and water.

We will continue to stand up for our rights. The fracking industry is projected to be shortlived and we will experience its decline. We will then be left with masses of unneeded infrastructure and permanently changed lives along with natural resource destruction. That would be another result of policy in which we direct our resources and energy to fossil fuels extraction and transportation rather than toward renewable energy and conservation. At this time in our history we need to take a long view. We need to understand how we are all connected and that we all share this one atmospheric layer. It is finite and fragile. We can't assume that we make decisions in isolation. We need to begin to understand the Commons (this planet Earth) and the Common Good (all life on this planet).

Sincerely,

Christine Stockman
Edward Stockman

Northeast Energy Direct Project
NH F&G Meeting Minutes
Concord, NH
5/19/15 Meeting

**Northeast Energy Direct Project
NH F&G Meeting Minutes**

DATE: May 19, 2015

Location: New Hampshire Fish and Game Offices, Concord, NH

TIME: 1:00 PM – 4:00 PM

Attendees

<u>Name</u>	<u>Affiliation</u>	<u>Name</u>	<u>Affiliation</u>
Carol Henderson	NH F&G	Mark Gardella*	AECOM
Kim Tuttle	NH F&G	Sergio Bonilla*	AECOM
Mike Marchand	NH F&G	Theresa Albanese*	HMM
Heidi Holman	NH F&G	Adele Fiorillo	Normandeau
Matt Carpenter	NH F&G	Sarah Barnum	Normandeau
Kasia Ingram	Kinder Morgan	Rick Simmons	Normandeau
Barry Duff*	Kinder Morgan	Harry Stewart	Normandeau
Tim O'Sullivan	AECOM		

* Teleconference

General Meeting Purpose:

Provide the New Hampshire Fish and Game Department (NH F&G) with a general overview of the Northeast Energy Direct (NED) Project. Present to NH F&G the Project Team's current understanding of the relevant NH state- and federal-listed species (including MBTA) associated with NED and communicate Tennessee Gas Pipeline Company's (Tennessee) plans to address each species and/or topic. Establish an open dialogue with NH F&G to form proactive stance in addressing NH F&G concerns. Provide NH F&G with updates regarding ongoing tasks and continue to formulate strategy to address issues related to state- and federal - listed species and associated surveys on the NED Project.

- After general introductions of those around the table in the conference room, Adele Fiorillo and Kasia Ingram present the NED Project overview. Overview discussions included describing the geographic extent of the Project, identifying the permitting agencies involved, including FERC, and bringing NH F&G up to date on the permitting process to date. Kasia noted certain survey activities kicked off on other parts of the Project last summer, but were suspended for the winter. Survey activities (wetlands, vernal pools, T&E and cultural) started back up this spring and are ongoing. Kasia also briefly described the status of the FERC pre-filing process, and the history of the Project, including the adaptation of the NY and NH Powerline Alternatives back in December, which resulted in a shift of a portion of the Project alignment into NH. Kasia explained the alignment shift allowed for a large amount of collocation with existing overhead electric transmission lines in NH and that some aspects of the Project design were still under development.
- Carol Henderson (NH F&G) stated DES has not been involved up to this point with the NED FERC calls. Kasia indicated Eric Tomasi setup and runs the FERC calls and call invitations were sent to those agencies who had expressed an interest in participating, and that she would need to check on who was on the standing invitation list for the call. Kasia added that the project team met with the DES in early April to discuss the Project and permitting expectations. Adele noted the NED Project team would ensure the SEC was made aware of the call information. Carol further notes that NH Congressional staff have been requesting more meetings regarding the NED Project. Adele notes Tennessee has held many public meetings, including the FERC open houses, and Kasia followed up noting that town meetings and other outreach meetings continued to be held and are ongoing. Project meetings will also be held as part of the SEC process, and FERC will be holding their own scoping meetings across the Project.
- Mike Marchand (NH F&G) questions if the Project would still go through SEC. Adele responds in the affirmative, further indicating that the filing date is currently targeted for early November, with application acceptance anticipated in December. Harry Stewart indicates SEC pre-filing hearings are also needed prior to the filing.
- Adele reiterates the majority of the route is collocated with existing Eversource Energy (Eversource) overhead transmission lines and that this was done to lessen impacts and to take advantage of existing utility corridors. Kim Tuttle (NH F&G) inquires as to the location of the specific areas that are not proposed for collocation. Mike Marchand follows Kim's inquiry with a request for Tennessee to provide these locations. Kasia indicated that there is a table (Table 1.1-2) within the filed draft Resource Report 1 which indicates by milepost the locations of collocation. The areas where the alignment is not collocated is limited, as there are certain areas across the alignment where minor deviations occur. This table includes the alignment and collocation information as it is currently proposed, however alternatives continue to be reviewed, and any change to the proposed alignment will be included in future filings of the environmental report and will also be communicated to F&G through updated consultations, as needed.
- Carol inquires as to the extent of the expansion of the existing active portion of the Eversource ROW. Kasia responds indicating these details are still being worked out with the utility companies. However, the current proposed pipeline alignment is proposed to be approximately 5 feet outside of the utility easement. Further discussions are in progress with the utility company to determine the locations of the utility poles within their easement and how much of the existing easement may be used. Kasia further explains the difference between the permanent easement and the size of the right-of-way (ROW) that will be needed for construction. Kasia states that the typical construction workspace is planned to be approximately 100 feet in width, however there will be variations across the alignment where there are needs for additional temporary workspace and other areas where there will be a reduction in workspace (i.e. at wetland crossings). Kasia added that the permanent easement is planned to be 50 feet in width. Adele follows up indicating that the extent of these areas is often dictated by FERC. Adele then presents information regarding environmental considerations (page two from meeting handout fully covered).
- Matt Carpenter (NH F&G Fisheries Biologist) inquires how streams are crossed. Kasia indicates that for most stream crossings the subject reach of stream bed would be isolated from the rest of the water-

body utilizing either a dam and pump or flume technique, and that the stream bed and banks would be returned to pre-construction condition following placement of the pipe. Tim O'Sullivan indicates that for some of the larger crossings, a horizontal directional drill (HDD) option may also be utilized. Kasia added that use of HDD crossings will be limited (only three HDDs are currently planned for the NH portion of the project) as there are significant workspace requirements and conditions must be suitable to such crossing methods. Kasia noted that the Souhegan River and Merrimack River are currently planned to be crossed by HDD, and that geotechnical analysis is required to further assess this crossing method at specific locations.

- Adele leads discussion on aerial photograph interpretations, noting that this activity is ongoing to begin to address no access areas. Adele further notes that the high resolution aerial photographs are being used in conjunction with LiDAR generated topography data for desktop habitat studies and other considerations and that data gaps resulting from no access will be filled in at a later date.
- Mike Marchand and Carol Henderson inquire how Tennessee will deal with data gaps in the permit applications. Carol indicates she is aware that some agencies have approved the aerial photograph interpretation method but that there is a need to ground truth the aerial photograph interpretation in some areas. Tim O'Sullivan responds that some surveys may have to be done after FERC issues the certificate. Kasia follows up indicating that access permissions continue to be acquired and that the expectation is that the aerial photography will be used to begin the permit application process where access has not been granted, however Tennessee understands that the permits will not be issued before necessary on-the-ground surveys are completed. Adele notes this will be a multi-year process.
- Mike Marchand notes he will need to understand the construction methods before he can provide recommendations on impact avoidance and minimization. Mike further notes that after seeing the picture of the cleared ROW included in the handout, his perspective on the level of impact has been changed. Kasia responds by indicating the picture is an accurate representation of upland pipeline construction. Kasia then proceeds to give an overview of the general construction sequencing for a pipeline as well as a general overview of the differences between upland construction and wetland construction where additional BMPs are utilized.
- Kim asks how big the pipe is. Kasia responds by indicating it is currently proposed as 36" (clarification: there is also a 30" option).
- Carol inquired regarding the width of the existing Eversource ROW. Kasia indicates she is unsure of the extent of the existing easement (clarification: as is Eversource) and that Tennessee is continuing to have discussions with the utility company to obtain additional information regarding their easement.
- Tim O'Sullivan indicates trees may be felled in the winter by hand/chainsaws and left in place for removal in the spring to comply with tree clearing restrictions. Mike questions why the trees would not be felled and removed at the same time. Kim agrees. Kasia indicated there is often a need to fell trees to meet restriction windows (migratory birds and bats), so the trees must be felled in the winter, however there are concerns with winter construction (largely safety as well as environmental impact), which usually necessitates felling the trees and returning in the spring to remove them. Tim indicates Tennessee will provide NH F&G with the full strategy for tree clearing and provide reasons why it is done this way as these details are further developed. Mike expressed concern that the felled timber may be desirable as potential cover or habitat for certain species and that could pose an issue if felled timber is left for removal until the spring.
- Matt Carpenter questions how leaks are detected. Kasia explains that the pressure in the system is monitored 24 hours a day and that Tennessee also conducts periodic aerial surveys and ground patrols to look for signs of encroachment or potential issues, as well as conducting periodic internal inspection of the pipeline to identify potential corrosion or defects. Additionally, isolation valves can be closed remotely in less than 60 seconds.
- Mike Marchand states he needs to see the layout of the workspace in relation to the existing habitat to

determine how much forest is to be cleared as opposed to scrub/shrub or other habitats. Adele indicates that land cover types are being interpreted from the high resolution aerial photography for the entire 400' survey corridor. Carol interjects seeking confirmation that the 400' corridor is just for survey and not for construction. Adele and Kasia indicate that is correct and the 400' corridor is being looked at in case the pipeline needs to be shifted one way or another. Kasia further notes that feedback from state and federal agencies, landowners and communities that suggest reroutes will be looked at.

- Tim O'Sullivan notes that while impacts to various habitat types will be quantified as part of the Project's permit applications and that mitigation will be discussed in the future in the context of impacts, one of the main goals for the meeting was to review the species list provided by the NH NHB and to come to an understanding with NH F&G regarding which species would require survey and what exactly that may entail. Mike Marchand states that while the EO information is important, in most cases NH F&G has not done any site specific surveys. Mike added that the area west of the Merrimack in particular has not been well studied by F&G. Tim indicates that during the course of other field survey work (wetlands/ vernal pools) Tennessee's consultants will document and report all state-listed species observations to NH F&G. Matt Carpenter states Tennessee should add wild brook trout to the list and that if Tennessee provides NH F&G with a list of streams crossed by the NED Project, NH F&G could provide them with an indication of which streams hold wild brook trout. Rick Simmons and Matt Carpenter will coordinate this effort.
- Discussion then turns to the overall T&E list provided at the meeting. Sarah Barnum discusses grassland birds (Grasshopper and Vesper Sparrow) indicating these species are documented at the Anheuser-Busch site and unlikely to occur elsewhere along the ROW. Sarah further indicates Tennessee's approach will be to assume presence given the well-documented occurrence, and abide by a time of year restriction (May 25-July 31). Sarah also raised removal of vegetation (mowing) as a potential avoidance measure, in conjunction with monitors, as needed, to allow construction to proceed into the restricted time period. Kasia added that Tennessee will need to take into consideration potential timing restrictions across the Project, as there may be areas where multiple timing restrictions are suggested that would severely limit construction. In those cases we would like to find suitable mitigation that would still meet the requirement goals, but would also allow the construction schedule to be met. Tim O'Sullivan notes this area is along the Merrimack River, which has been identified as a likely HDD site and therefore, the above-ground impacts may be lessened.
- Kim asks if Tennessee gets data regarding bird species from New Hampshire Audubon. Tim replies that we can but we usually take direction on species locations from state and federal agencies. Tim further indicates that generally speaking grassland birds receive a net benefit from natural gas pipeline ROWs.
- Sarah continues the species list discussion by indicating that since Marsh Wrens are on the list from NH F&G but do not have any legal status in NH that surveys for this species are not planned. Sarah follows this by indicating the same is true for all of the odonates on the list.
- Matt Carpenter indicates that he is less worried about the construction phase of the Project and is much more concerned about how the streams are put back together after the pipe has been put in place, further indicating that his concern also applies to the regular maintenance activities that occur. Matt goes on to state his concerns pertaining to stream restoration by indicating that too much sediment left or placed in the stream could lead to subsurface flow at times of low water, and that if the stream bed and banks are not put back together properly, it could lead to erosion. Matt concluded his remarks by stating a preference for providing as much shade as possible within 50' of the streams to better maintain cooler water temperatures. Mike Marchand asks Matt if any considerations are different for streams that contain brook trout. Matt replies Tennessee should treat all perennial streams the same.
- Matt Carpenter inquires if there are any post-construction monitoring requirements. Kasia responds that FERC requires post-construction re-vegetation monitoring that includes looking for potential issues such as erosion, subsidence and overall vegetative cover to make sure the areas are stable. Tennessee will also

continue monitoring the ROW for any other detrimental issues. Kasia also added that there are additional postconstruction monitoring requirements for wetland and waterbody crossings, and that the period of monitoring will be determined through the permitting process with USACE and the state agencies.

- Mike Marchand asks Matt Carpenter if there was a need for baseline stream surveys. Matt responds in the negative, reiterating his main concern is how the streams will be reconstructed and further stating there may be some opportunities to improve habitat in the impacted riparian zones. Kim Tuttle asks Matt if there are records for bridles shiner in the Project area. Matt responds in the negative, stating records for the species are historic.
- Carol Henderson asks if as part of the stream restoration, Tennessee could add additional “structure” to the stream channels to provide cover for aquatic species, such as logs or woody debris. Kasia responds that Tennessee would be required to adhere to the USACE, state permits, as well as FERC requirements, and that we are required to restore the stream crossing to pre-construction condition. Kasia added that certain types of habitat enhancement may be possible, however that would have to be discussed and reviewed further. Harry Stewart notes this could be part of the overall mitigation for the Project.
- Heidi Holman (NH F&G) notes there are updated records for the New England cottontail (NEC) in Hudson and Londonderry. Tim O’Sullivan inquires how we can obtain this information and asks if Heide and Sarah can coordinate on that. Heidi and Sarah agree to coordinate on this. Sarah indicates the approach for NEC will be preliminary habitat assessments and then if it is determined that suitable habitat exists, pellet survey would be performed. Tim notes that Normandeau would use Dr. Adrienne Kovach’s laboratory at the University of New Hampshire for DNA analysis of the pellets. Heidi requests that surveys be implemented early in the winter season (as soon as the snow flies), noting increased detection probability in the early winter season. Mike Marchand states Tennessee should use standard NEC pellet survey protocols.
- Rick Simmons leads discussion on freshwater mussels, indicating it is Tennessee’s intent to perform surveys for the brook floater and that the location of all mussel species would be mapped out as part of the surveys. Rick notes that we will need further data from the NH NHB and NH F&G regarding the potential locations of the Eastern pond mussel. Mike Marchand and Rick Simmons agree to coordinate on NH F&G providing location data for Eastern pond mussel to the Project. Mike indicates NH may list Eastern pond mussel as either T or E in the future. Tim O’Sullivan inquires about an overall list of survey sites for mussels. Mike responds by saying if a particular waterbody has a record(s) for these two species, NH F&G would want it surveyed, unless previous surveys have indicated the waterbody is unsuitable for these species. Rick and Mike will coordinate on generating a list of freshwater mussel survey sites. Rick indicates he can draft the list and send to Mike for confirmation. Mike indicates relocation of listed mussel species is a possibility if they are determined to be present, potentially coupled with monitoring.
- Tim O’Sullivan inquires about NH F&G’s concerns regarding banded sunfish and American eel. Matt Carpenter indicates the stream crossings are short-term impacts and these species can move out of the crossing areas and then return to restored habitats and re-colonize post construction.
- Carol Henderson asks if Tennessee has concentrated its HDD efforts on the larger rivers. Kasia Ingram responds in the affirmative, further indicating the Souhegan and Merrimack Rivers as planned for HDD.
- Discussion then turns to snakes and turtles with Sarah Barnum inquiring if NH F&G is assuming presence where the element occurrences occur and further inquires what type of additional surveys may be required. Mike Marchand responds by indicating he will need to look into it further. Mike notes he is interested in what can be done regarding BMPs to protect these species during and after construction. Mike goes on to say F&G has not done much survey work west of the Merrimack River and that Tennessee needs to reduce the likelihood of a “take”. Mike indicates short term and long term impacts need to be evaluated for snakes and turtles. Regarding turtles, Mike indicates Tennessee should work to identify nesting areas and wetlands that can support Blanding’s and spotted, further indicating that no winter work should be done in these latter areas. Tim O’Sullivan states the Project team needs to identify

overall survey areas prior to finalizing work plans/protocols and implementing surveys. Mike responds by indicating Blanding's turtle is more prevalent east of the Merrimack River but they are also present, in fewer numbers, west of the river. Mike indicates he is more concerned about the direct construction related impacts, particularly as they relate to direct mortality of turtles and snakes. Mike goes on to say if permanent wetland fills are proposed, these impact areas may need a more intensive survey effort. Kasia responds by indicating there are no permanent fills currently proposed along the pipeline alignment, and that the wetlands will be restored with the exception of cover-type conversion within the permanent easement. Mike indicates if Tennessee will be excavating in suitable Blanding's and/or spotted turtle habitat, including vernal pools, then Tennessee needs to figure out how to handle that. Tim O'Sullivan indicates that what Mike is describing are protection plans, which have been generated for these species in other states on other projects.

- Discussion then turns specifically to wood turtles (WT), with Mike Marchand indicating this species is a species of regional conservation concern and there is a new WT project in NH designed to protect this species and its habitat. Mike indicates WT is likely present in many of the streams crossed by the Project, especially in the southwestern portion of the state. Mike cites a recent study which determined approximately 95% of WT activity occurs within 250 meters (820 feet) of an occupied stream/river. Mike indicates winter work in uplands would be beneficial to this species because they over winter in-water. Mike adds that if summer work is planned, then biological monitors would be needed to perform sweeps in front of the equipment to reduce the likelihood of a "take". Mike goes on to state that post-construction management of the ROW will be important for the long term survival of the species and notes direct mortality due to WTs getting hit on roads and killed during vegetation management. Kim Tuttle asks Mike if surveying for WT overwintering habitat would be beneficial. Mike responds by indicating it would be good for Tennessee to know where WTs are overwintering. Mike indicates Tennessee should implement presence/absence surveys in areas where digging will occur in riparian zones known to support WTs. Mike goes on to say that construction impacts are his biggest concern with habitat restoration also a concern, but a lesser concern. Sarah Barnum takes action to generate WT survey area list and coordinate with Mike. Lastly, Mike notes that spring and fall are the best survey times for WTs.
- Discussion then turns to the snake species, with Mike Marchand indicating this species group is likely the most difficult on the list to survey for and to avoid with time of year (TOY) restrictions. The snake species are underground on land in the winter, with no way to identify the den sites. Mike indicates there are many den sites on utility corridors, even under some OH transmission line structures and in chipmunk borrows. Mike indicates most of the survey activity for these species has occurred from Concord to the east. Mike states that the Northern black racer (NBR) spends a significant amount of time in the vicinity of dens sites in the spring and fall and that by looking at dates and locations for specific EOs, it may be possible to locate the dens using spring and fall surveys. In summer, Mike indicates the NBR may travel a mile or more from the den site. Mike notes that many of the NBR observations NH F&G has occurred under OH electric transmission lines and that if this habitat was wiped out during construction of the NED Project, it is unlikely that the animals would persist. Tim O'Sullivan notes that only a portion of the habitat associated with the OH transmission lines would be impacted during the construction of the NED Project and that much of it will likely remain untouched.
- Tim O'Sullivan inquires if the Eastern hognose snake shows a close correlation with sandy/outwash soils in NH or if they have been observed on till as well. Mike Marchand responds by indicating while many observations do occur on the sandy soils, this species has been observed on other soil types as well. Mike goes on to say Tennessee needs to come up with a comprehensive survey area for Eastern hognose snake as well.
- Carol Henderson asks if access to the NED Project area will be limited after construction, noting that if a person's land is not posted in NH it is open to public hunting and fishing. Kasia Ingram responds by indicating Tennessee will have an easement over the land but the land would still be in private ownership (and therefore will be up to the landowner to post).

- Adele Fiorillo asks Mike Marchand to ID areas where we can avoid WTs. Mike responds by suggesting surveys to identify the better WT habitat areas associated with the Project. Mike indicates he will be looking for reports which say how we are going to avoid impacting the state-listed species and that if we determine some impacts are unavoidable, the reports should identify what Tennessee is going to do to mitigate said impacts. Mike reiterates the position that construction related impacts are NH F&G's biggest concern regarding reptiles, with habitat restoration and long term management important but slightly less significant considerations.
- Mike Marchand inquires if there are any issues with pavement on top of the pipeline. Kasia responds by indicating Tennessee will have an easement over the land, so future development will need to address the pipeline presence. Clarification: pavement would not be an issue, however, structures and trees are prohibited within the easement.
- Matt Carpenter inquires where the end of the line is and what the use of the gas will be. Kasia responds by indicating that Dracut, MA is the end of the mainline and the gas would be utilized by local distribution companies for various uses including residential and electricity generation by power plants.
- Carol Henderson inquires how Tennessee will address the Northern long-eared bat. Adele Fiorillo responds by indicating a Project wide acoustic survey is currently underway to address this species.
- Carol Henderson inquires about the possibility of compressor stations in NH. Kasia Ingram responds by indicating that there is a compressor station planned for the NH portion of the project and Tennessee is reviewing potential sites for the siting of that compressor station. Kim Tuttle inquires how large the compressor station sites are. Barry Duff responds by saying there is a separate team looking at compressor stations and that typically Tennessee likes to secure a site that is large enough to support the necessary infrastructure and that also can provide buffers for visual and noise concerns. Barry further indicates that Tennessee is looking for compressor stations sites in NH that are at least 50 acres. Barry goes on to say that a site of this size would house a compressor that would be approximately 120'x150' and would also include an area approximately 35'x100' for support buildings and associated infrastructure. Barry notes that currently there are three sites under consideration and that the one that best avoids and minimizes impacts to the environment will be selected. Update: a site in New Ipswich has been chosen as the primary site for the compressor station in NH.
- Mike Marchand asks if Bald Eagle surveys have been done. Sarah Barnum responds by providing a summary of what has been done to date for Bald Eagles (desktop and aerial nest site surveys) and what will be done in the future (winter roost site surveys). Mike notes there is a known roost site on the Merrimack River that will need to be looked at in the context of the Project location.
- Matt Carpenter inquires what would happen if there was a leak under the Merrimack River. Tim O'Sullivan responds that Tennessee would isolate that section of pipeline and then perform follow up technical investigations to determine the best path forward. Kasia follows up by providing a discussion about routine pipeline inspection, including the use of internal inspection devices to monitor for corrosion/erosion, as well as periodic aerial and ground patrols. Depending on the issue, repairs may be addressed by isolating the affected portion of pipe, excavating the pipe, and repairing or replacing the section of pipe.
- Mike Marchand asks if there has been any consideration on the part of Tennessee regarding the more common wildlife species such as migratory birds. Sarah Barnum responds by indicating Tennessee will be doing a separate analysis of migratory birds for the Migratory Bird Treaty Act. Kasia follows up by stating that once operational, FERC has requirements regarding time of year restrictions for vegetation management activities to reduce impacts during the nesting season and that routine vegetation clearing generally does not occur more frequently than every 3 years.
- Matt Carpenter inquired if Tennessee could provide pictures showing the condition of waterbody crossings before and after construction. Kasia responds by indicating that is a possibility. Kasia added that this has been a USACE permit requirement on other projects, and we have utilized environmental inspection

staff to obtain photos since they are on the ground observing construction activities. Adele notes that survey crews are photographing these resources while obtaining field survey information.

- Mike Marchand and Kim Tuttle inquire regarding what type of materials would be used in restoration, noting a preference for no materials that would entrap smaller animal species, indicating nylon netting for erosion control noted as especially harmful. Kasia responds by indicating that Tennessee takes the entrapment concerns into consideration and has avoided use of specific matting materials (certain types of curlex for instance) on past projects for this reason.
- Tim O'Sullivan inquires regarding NH F&G's concerns regarding the smooth green snake. Mike Marchand responds by indicating they are present in the proposed Project area and that some impacts to this species are expected. Tim asks if Mike's concerns for the NBR and Eastern hognose snake would transfer to this species. Mike responds in the affirmative.
- Carol Henderson inquires if there are any deer yards in the Project area and notes Tennessee should obtain this information from Dan Bergeron.
- Carol Henderson inquires if Tennessee needs to write an EIS. Kasia replies by indicating that as part of the FERC application, Tennessee will file an Environmental Report (ER), which consists of Resource Reports 1 through 13 and addresses environmental, cultural, socio-economic issues, alternatives and other topics as they relate to the Project. Kasia indicates that we are currently in the pre-filing process with FERC and that the first draft set of the resource reports were filed with FERC in March, and that a second draft is planned to be filed in July (link to the filed reports: http://elibrary.ferc.gov/idmws/file_list.asp?accession_num=20150313-5090). Kasia then provides a summary of what has been filed with FERC to date and what is anticipated in the future. Kasia also explained FERC's actions, which will include a scoping period allowing for public comment, and preparation of an EIS, in which the public and agencies will have opportunities for comment. Adele stated that FERC will also have a third-party contractor to help with the Resource Report review and preparation of the EIS. Kasia confirmed that Cardno Entrix is working with the FERC as the third-party contractor designated for the Project. The FERC application and review process will run in parallel with the SEC application and review process. Harry Stewart notes it is not uncommon for this to occur.
- A closing discussion on what the next steps are in relation to state listed species then ensues. The Project team notes that work plans/survey protocols, which include desktop data collection and defined survey areas need to be developed for all subject species and that said plans would then need subsequent approval by NH F&G, prior to implementation. Only after results of the surveys are compiled can an evaluation of impact assessment take place.
- Kim Tuttle asked if any other subcontractors would be working on the NED Project in NH. Kasia answered by indicating that HMM, AECOM Normandeau, and Louis Berger are the main subcontractors currently involved with NH, but that other subcontractors would also be working on the Project in other states.

20151007-5011

Theresa Grant, Pelham, NH.

I am vehemently opposed to the Northeast Energy Direct pipeline. I feel that it is a solution to a problem that we do not have. The information that I have read and researched I find that the purpose of this pipeline will be for export. This pipeline is an over build - for exporting fracked, potent greenhouse gas that does not serve our long term health in NH - economically, environmentally, medically, culturally. The negative effects on health, industrialization, property value, our environment (water and drinking water wells, wetlands, forests, wildlife, plants) and the rural character of our landscape are too high of a price to pay for this pipeline. Safety issues of the pipelines are increasing dramatically due to the increase in the numbers of pipelines being built and the speed in which they are built. The thought of lands being taken from property owners by eminent domain for private gain goes against every thought of our forefathers. I recommend do not build this pipeline thru the Northeast region.

Thank You,

Theresa Grant
Pelham, NH

20151007-5031

Environmental and Health Impacts of Operations

Numerous items related to pipeline operations are left unaddressed in the Resource Reports.

For example, the descaling process and its impacts have not been presented.

What is the standard for the frequency of pipeline cleaning?

What specific substances (chemical compositions) are removed from the pipes during routine cleaning? In what form are they? Where are they disposed of, and how? What are the impacts on the local environment and beyond?

What substances are introduced to the gas in the cleaning process? In what form are they? Where are they disposed of, and how? What are the impacts on local air quality?

Is water used in the cleaning process? If yes, what amounts are required, and what will be the source of the water? What are the plans for treatment and disposal of this water?

As water condenses in the pipeline, how often is it removed? What quantities are anticipated and what chemicals are dissolved in it? What are the plans for treatment and disposal of this water?

Kinder Morgan says it insures pipeline safety by numerous helicopter surveys. How much fuel is consumed in these surveys? What emissions are discharged? What is the climate change impact of these flights over the life of the pipeline?

What is the climate change impact of the loss of trees temporarily and permanently removed over the entire pipeline project, over its projected life?

What substances in addition to methane will be emitted into the air during blow-downs and compressor operations? What quantities are released? What is the chemical composition? What are the public health impacts in areas close to and removed from the compressor stations and blow-down locations?

Environmental and Health Impacts of Increased Marcellus Gas in New England

Since Kinder Morgan unabashedly touts increased availability of Marcellus shale gas to New England customers as an important benefit of its proposal, its potential cost to public health must be studied and quantified before a certificate of need and convenience can be issued. Baselines must be established and appropriate comparisons reviewed. Lack of information does not mean lack of impact.

Increased exposure to radon has been identified as a potential public health impact of increased use of Marcellus shale gas due to its higher radon content vs. traditional gas sources. It has also been argued that the reduced time to market exacerbates the problem in the northeast as the radon does not have time to dissipate before it enters households.

http://www.huffingtonpost.com/elizabeth-glass-geltman/radon-from-your-stove-why-new-york-should-enact-the-no-radon-in-natural-gas-legislation_b_7083518.html

The chemical composition of gas additives must be described, along with their residual decomposition process. How do these substances change over time and distance? What are their potential public health and environmental impacts?

Scoping Comments – RR 5

Resource Report 5 is intended to address the Socioeconomic impacts from the construction and operation of the pipeline. The documents that Kinder Morgan have submitted to date fall far short of what is needed to fully understand the impacts across this 400+ mile proposal. In addition, all cited data and studies should include a properly functioning hyperlink, either to the primary source or to a site created by the applicant to which it uploads citation content when not directly available online.

Kinder Morgan must provide all data by municipality, not by county as currently provided. As an example, all socioeconomic meaning is lost when Cambridge is lumped in with Townsend, geographically and economically far apart, but both in Middlesex County. One would think Kinder Morgan would have understood this at the inception of this project. Data should be provided at the municipal level for all information provided in all Resource Reports. The burden should be on Kinder Morgan to provide this information, not on governmental agencies.

Kinder Morgan discusses that it plans to manage the construction process by “spread.” Kinder Morgan should clarify the extent of each proposed spread, and what responsibilities the assumed “spread managers” will have for ongoing communications with individuals and municipalities before, during and after hypothetical project construction. In the recent past, Kinder Morgan failed to provide adequate means of communications with impacted parties after construction, with adverse impacts to property owners, as my own community has experienced. http://www.sentinelenterprise.com/ci_13543521 . If communication is not to occur using spread managers, an alternate plan should be disclosed to ensure a straightforward path exists to resolve socioeconomic issues.

RR5 refers to Title 49 CFR Part 192 Section 192.615 of the USDOT regulations under which Kinder Morgan has developed an emergency response plan. A footnote to RR 5 dealing with Emergency Response procedures states that “Tennessee is a wholly-owned subsidiary of Kinder Morgan, Inc. and is a member of Kinder Morgan’s pipeline group.” Please describe the implications of Tennessee Gas, LLC vs. Kinder Morgan, Inc. as the filing entity. Please specify the implications of that corporate structure as regards socioeconomic impacts.

RR5 does not address recent changes in communication technologies and practices that would impact the effectiveness of emergency response procedures. What percent of the affected populations can be contacted via landlines in an emergency, vs. what percent now rely on cell phones? What role can social media play in emergency response plans that are operating in the digital age? How does the Kinder Morgan response plan incorporate these new developments? How can Kinder Morgan insure adequate notice to stakeholders regardless of the technology they utilize?

RR5 states that “it is not anticipated that the Project will negatively impact property values outside the proposed pipeline ROW.” Although RR5 does not explicitly address values within the ROW, it goes on to mention several studies which RR5 suggests show there is no impact of the existence of a pipeline on real estate. Although RR5 provided no citations in this section with hyperlink, the most recently conducted of the studies cited, Diskin et. al (2011) was located on line via a search. It explicitly states “...our conclusions are presently limited to the dataset under study.” Additionally, this study considered four subdivisions in suburban Phoenix. https://www.irwaonline.org/eweb/upload/web_jan_NaturalGas.pdf

Based on the total lack of applicability of that study to the proposed Project area, and the fact that the remaining studies pre-date the recent rapid expansion of pipeline builds, Kinder Morgan must provide data using current information, applicable to the geographies and demographics that would be impacted by this particular proposal.

Please describe the income tax implications of easement payments granted property owners. Please describe anticipated payments to property owners for use of temporary workspace. Please describe temporary or permanent relocation payments that Kinder Morgan will pay to property owners whose homes will be unsuitable for occupancy during certain periods of construction.

RR5 states “Tennessee does not anticipate that the Project will adversely impact homeowners’ insurance rates, the ability to acquire a new homeowner’s insurance policy, or that insurance policies will be discontinued as a result of a natural gas pipeline located on the property.” It quotes three pipeline FEIS’s, in which FERC reached a similar conclusion, citing work conducted in 2006 and 2008. However the insurance industry has undergone radical change since that work, motivated by large losses in Hurricane Sandy, and the availability of new technologies to document and share specific property characteristics. Most notably, credit rating agency FICO develops a type of credit score for properties based on advanced modeling techniques. An increasing number of insurance companies are revising rates and cancelling policies based on this new algorithm, first introduced in 2008.

<http://www.fico.com/en/products/fico-property-predict-insurance-score#overview>

This trend is likely to continue. It is further likely that any risk perceived by insurance carriers from the existence of a nearby pipeline will be built into future rates. It is incumbent on either the applicant or FERC to determine the insurance industry’s future view of the risk of coverage penalties that may be assessed over the lifespan of this project, and incorporate the impact of these penalties on property owners as part of the cost.

It would also be important to learn from recent history regarding worst case pipeline disasters. Someone paid very large claims in the 2010 San Bruno pipeline explosion. How much of those claims were paid for by insurers, and then passed on to ratepayers? How much were paid for by the pipeline operator and then passed on to customers? What is Kinder Morgan’s plan to set aside funds to compensate victims in case of potential disasters? How is a contingency for these types of explosions accounted for when weighing cost vs. benefit?

RR10- Alternatives

Resource Report 10 is intended to address alternative means of meeting the benefits of the project, and to compare the environmental costs of the proposal to the environmental costs of possible alternatives.

KM’s RR10 barely meets the minimum requirements to avoid rejection of the filing as laid out in the EIR Guidance Manual <https://www.ferc.gov/industries/gas/enviro/erpman.pdf>. It is not clear on the purpose of its proposal. It dispenses with a wide range of alternatives to meet energy needs via narration rather than with citations of facts and projections. It makes no attempt to combine various potential energy solutions into a larger solution which could be very competitive with its proposal. It provides misleading comparisons of alternative routes to favor its preferred route.

Regarding the purpose of this proposal: In its pre-filing documents published in March 2015, KM rejected

all “no-action” alternatives because they would not individually provide 2.2 Bcf/d of natural gas capacity. Under that criterion, the current alternative, with a proposed capacity of only 1.3 Bcf/d would have been similarly rejected, yet KM is vigorously pursuing it. Less than half of KM’s reduced capacity is under precedent agreement (.5 Bcf/d), an amount unchanged in over a year. Alternatives should be measured against their ability to provide the equivalent energy of .5 Bcf/d, as a bridge to reducing dependence on fossil fuel over time vs. against Kinder Morgan’s ideal conception of the market. The question is not how much natural gas capacity it will take to enable “greater access to prolific supply sources such as the Marcellus (“Marcellus”) Shale Formation” as suggested in RR10. This is equivalent to asking how many lumberjacks we must employ to chop all the trees in New England in the anticipation that more wood will be needed for use for cooking and fuel. The question the KM proposal and competing pipeline proposals force us to address is how to best meet the region’s 21st century energy needs taking into consideration all the 21st century options the region has, and their implications. FERC has a responsibility to ensure that a private company does not force an inappropriate solution for this critical issue.

If shippers were unwilling to contract for long term capacity over the last year, they will be even more skittish after the announcement of President’s Clean Power Plan. This plan has received bi-partisan support in Massachusetts government, including the support of Republican Governor Charlie Baker. <http://www.wbur.org/2015/08/04/climate-plan-mass-reaction>

For the last year, KM has held steady with .5 Bcf/d under contract. This should be the level sought when evaluating alternatives to the NED project. Furthermore, the alternative studies should not merely consider each option individually. They are not mutually exclusive, and must be considered in combination. A comprehensive no-action alternative with a diverse set of energy sources must be matched against the NED proposal to compare benefits and costs over the project’s proposed lifetime.

Energy conservation measures are booming on the heels of ongoing technological advances. LED lighting alone will account for an abundance of energy savings in the life span of the proposal. Rather than present studies that reflect the state of the art thinking in energy conservation, KM used that section of the alternatives (10.1.1) to reiterate how much natural gas Marcellus is projected to produce. KM’s assertion that “curtailing energy use is a long-term goal, extending well beyond the timeframe of the proposed project” is dismissive of climate change, one of the most important challenges facing our nation and the planet. The potential for energy conservation in the target region of New England should be fully quantified using reputable studies looking out over the project lifespan. These studies are available in the academic world as well as in the conservation and environmental industries as demonstrated here : <http://acadiacenter.org/document/energy-efficiency-in-massachusetts/>

The potential effectiveness of political measures for conservation incentives should also be addressed. Massachusetts continues to provide tax credit relief to citizens for Title 5 septic compliance. Similar programs would surely bolster insulation, window replacement, upgrade of natural gas heating systems and other conservation measures. The likelihood of and ability to implement such measures over the life of the proposal is high. Their potential impact must be quantified and included in the comparison of a comprehensive no-action alternative using diverse energy sources vs. NED in the DEIR.

Consideration should be given to conservation across all energy use sectors. A conservation source ignored by KM’s analysis is the conversion of aging natural gas power generation plants into higher efficiency units in New England. Many of the older plants will be retired and replaced or repowered as part of their operators’ ongoing plans. These replacements must be projected, and a range of possible impacts must be quantified in a comprehensive no-action alternative with diverse energy sources to be compared with NED in the DEIR.

KM dismisses wind power as “not an option for providing the existing or projected power needs in the region where the Project is located.” It suggests that the transmission system is too constrained to be able to deliver power as needed. An alternative cannot be rejected on the basis of the fact that it doesn’t currently exist. In fact, KM argues for its own proposal in response to a constrained pipeline system. Later in the

Wind Power section KM acknowledges a number of transmission proposals that together can indeed “reduce pressure from the New England natural gas supply and reduce greenhouse gas emissions.” MA, CT and RI are issuing a Clean Power RFP and multiple proposals for new transmission lines are expected, all of which are projected to bring wind and/or hydropower into the region within or sooner than the NED project time-frame. KM should quantify that impact in terms of Bcf/d for input to the DEIR as part of a comprehensive no-action alternative with diverse sources.

KM dismisses all renewable resources as intermittent. Efforts across the country are dedicated to improving energy storage technologies, including an energy storage initiative announced by Massachusetts Governor Baker in May 2015. <http://www.mass.gov/eea/energy-utilities-clean-tech/renewable-energy/energy-storage-initiative> KM should provide information about the projected adoption of new power storage technologies over the lifespan of the proposed project, and quantify the impact of this rapidly developing technology on the energy markets in the target region, and include how this might contribute to a comprehensive no-action alternative with diverse sources.

KM dismisses solar power because “these systems are generally not well-suited for use as large-scale generation in the proposed Project area....” Yet, even casual observers can see the abundance of smaller scale solar installations emerging all over the region as the installed costs of solar panels become lower and lower. Clearly these installations have already had an impact on demand from traditional generating facilities, and will continue over the life span of the proposed project. This impact must be projected and quantified as part of a comprehensive no-action alternative with diverse sources.

KM dismisses use of liquefied natural gas (“LNG”) and propane/air storage and vaporization even though it acknowledges that “both alternatives have the potential to meet Project objectives.” It rejects them without any consideration, although they each have value in a comprehensive no-action alternative with diverse energy sources. Indeed, the intelligent use of LNG market commitments played an important role in maintaining gas availability at a reasonable cost during the record-setting cold winter of 2014-15. New England’s gas needs will always be driven by a handful of peak days annually. Use of LNG, with facilities already permitted and built, is far better suited to meeting New England’s needs than a new overbuilt pipeline. LNG must be considered in a comprehensive no-action alternative with diverse energy sources.

KM dismisses hydroelectric power from Canada because transmission lines require extensive review and approval processes. Indeed, the NED Project requires an extensive review and approval process as well. However, Massachusetts Governor Baker has submitted legislation requiring power Massachusetts utilities to solicit long-term contracts for clean energy generation, including 2400 MW of hydropower through which he reiterates his commitment to the greenhouse gas emission targets in the Massachusetts Global Warming Solutions Act. http://www.berkshireeagle.com/news/ci_28552168/baker-seeks-hydropower-purchased-from-quebec KM should quantify the impact of Massachusetts’ clean energy initiatives regarding hydropower and factor them into a comprehensive no-action alternative with diverse energy sources.

ISO-NE reports that just 6% of New England’s power was sourced by coal or oil in 2014. <http://www.iso-ne.com/static-assets/documents/2015/02/2015-powergridprofile-final.pdf> This suggests that the maximum amount of incremental power generation that can be sourced by natural gas without negatively impacting greenhouse gas emissions is just 1860 MW (6% of 31,000 MW installed capacity). While the 2400 MW of anticipated hydropower could more than replace this amount, KM must quantify how many Bcf/d would be required by high-efficiency gas powered generating plants to source 1860 MW. This is the upper limit that can be committed by all the competing pipeline projects towards power generation in New England under Massachusetts law. KM should describe how it will prevent violating this law if the proposal is successful.

In the alternatives analysis, KM repeatedly rejects alternatives because they cannot “provide the required natural gas pipeline transportation capacity provided by the Project.” In effect, KM is stating that there is no alternative for a gas pipeline except another gas pipeline, and that gas capacity needs are infinite. Yet, a pipeline is a secondary demand unit. Without the primary demand unit of a need for natural gas in the Northeast, there is no need for a pipeline in this region. There is much evidence suggesting that natural gas

will have diminishing value as an energy source in the future in New England based on potential changes in cost due to wellhead regulation, methane emissions regulations, and the need to reduce the overall fossil fuel use to meet greenhouse gas emissions targets. These factors are likely to contribute to the feasibility of the comprehensive no-action alternative with diverse energy sources, and they must be quantified and included in the DEIR.

As the above analysis suggests, New England is well on its way to maximizing its use of natural gas for power generation. In contrast, power generation in other parts of the country is heavily weighted towards coal. KM should justify why it would spend its scarce resources developing pipeline capacity in a region where its construction would have diminished value on the carbon footprint, vs. building capacity for the South and Midwest to enable the proliferation of clean power in that region. If the purpose of the pipeline is to “provide natural gas pipeline transportation capacity” then KM should develop an alternative which places the capacity in the South and Midwest where it is needed for projects to promote compliance with the Clean Power initiative.

KM notably omits no-action alternatives for proposed laterals. RR10 asserts that these laterals “will accommodate delivery point requests of certain Project shippers.” Yet, the identities of these shippers, and the amount of capacity they seek at the individual delivery points are not identified. KM will have eminent domain authority if a certificate is granted. FERC must demand that KM demonstrate the need for each lateral individually to allow the proper weighing of public necessity. An eminent domain taking to fulfill a business plan of an individual shipper is a drastic step which may be challengeable in court.

As is the case with the Alternatives section of Resource Report 10, in the System Alternative section KM once again failed to meet the minimum requirements to avoid rejection as laid out in the EIR Guidance Manual <https://www.ferc.gov/industries/gas/enviro/erpman.pdf> as it did not discuss the costs and benefits of each alternative, but rather provided a narrative to discount each as inferior.

Additionally, the System Alternative analysis failed to consider some critical potential system changes which would impact the overall need for the project:

KM defines a system alternative as involving “the transportation of the equivalent amount of incremental natural gas volumes by the expansion of existing pipeline systems or by the construction and operation of other new pipeline systems.” This definition is certainly challengeable in today’s energy market. Yet even under that definition, surely the replacement of antique pipelines by shippers in the target region falls into this category. https://www.bostonglobe.com/business/2013/07/31/gas-leaks-costing-mass-consumers/5nIv3FsJaZRwscJ48jGMsI/igraphic.html?p1=Article_Graphic. Such replacements would not only create capacity in the system, but would diminish the current risk borne by society in the event of an explosion. <http://clf.org/map/>. In addition, there is increasing evidence that fugitive methane emissions play a larger role than previously believed in greenhouse gas emissions. Just as power distributors are incentivized to promote energy conservation to their customers, pipeline companies could incentivize shippers to realize revenue on an increasingly greater percent of the natural gas capacity that they purchase by promoting leak repair. KM should quantify the impact of repairing these leaks, and include them as part of a comprehensive alternative with diverse energy sources.

KM dismisses expansion of its existing 200 Line via looping and compression because apparently it considered it impractical at the 1.3 Bcf/d capacity it proposes. KM’s existing 200 Line ROW is a valuable corporate asset created from land held in natural state by private citizens. It must be fully utilized before consideration of additional takings. RR10 does not provide enough detail regarding at what capacity 200 Line looping and compression becomes a feasible option. KM’s contracts have held steady at .5 Bcf/d. KM must readdress the viability of looping and compression of the existing 200 line in a lower capacity scenario, and include it as a part of a comprehensive alternative with diverse energy sources.

KM presents a list of other pipeline projects under consideration into the Northeast which could potentially serve the same purpose and demand of the Project, However, Kinder Morgan makes no attempt to assess whether one or more of these projects would eliminate the need for NED or to compare the rela-

tive environmental impacts of these alternatives.

As in the “no-action” alternatives section, FERC must ask KM to create a comprehensive system alternative in which all known proposals are candidates to fulfill some portion of the anticipated need for natural gas as a fossil fuel bridge. Furthermore, the results of the comprehensive no-action alternative with diverse energy sources described above should provide the base to determine how much of the comprehensive system alternative might be necessary to fulfill the need for natural gas as a fossil fuel bridge. Such an approach has great benefits. It can clearly demonstrate what proposals can provide the best bridge capacity at the least social and environmental costs. It will allow policy makers the ability to target conservation incentives to regions where new routes would force higher environmental costs. It will prevent overbuilding of capacity so that the pipeline rights of way of today do not follow the path of the railroads to become the bike paths of tomorrow.

20151007-5074

Franklin Regional Council of Governments

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

September 23, 2015

RE: Kinder Morgan - Tennessee Gas Pipeline - Northeast Energy Direct (NED) Project - Docket # PF14- 22-000

Dear Secretary Bose:

The Franklin Regional Council of Governments (FRCOG) submits the following initial comments on the proposed Kinder Morgan Tennessee Gas Pipeline (TGP) Northeast Energy Direct (NED) pipeline project (PF14-22). The FRCOG is the Regional Planning Agency for the 26 communities of Franklin County. The FRCOG serves the eight communities along the proposed route, as well as abutting communities, that will be impacted by the 34 miles of pipeline and large-scale compressor station proposed for our region. We have actively participated in the FERC process and have also formed a Regional Pipeline Advisory Committee, with representatives from the eight communities along the proposed pipeline route, to provide technical assistance on the FERC process.

This is the largest proposed project in Franklin County since the 1-91 interstate highway was built. The FRCOG has significant concerns about the environmental, safety and socioeconomic impacts of the NED pipeline project. The resources in Franklin County that would be directly impacted by the proposed pipeline include: public and private drinking water supplies, permanently protected open space, farmland, rare and endangered species habitats, coldwater fisheries, public infrastructure, and historic resources. The short and long-term impacts that the proposed project would have on our communities and region are profound.

It greatly concerns us that our rural communities, which are more reliant on natural resources and have less income and resources to address impacts, are being targeted for the proposed NED pipeline project. The economic and public health of rural residents is closely tied to the health and viability of the natural resource base that will be negatively impacted by the proposed pipeline. Further, the NED pipeline project is proposed to be sited in several Environmental Justice (EJ) Areas, according to a study recently completed by the FRCOG, which are areas of high poverty or minority populations. These EJ Areas include the Northern portion of Deerfield, Western portion of Erving, Non-Urban Area of Montague, and

the Northern portion of Northfield.’ Consequently, the proposed NED project in Franklin County raises a serious Environmental Justice issue if rural low income or minority populations are impacted by a project that is expected to have adverse air and water quality impacts and which may have a depressing effect on

property values given health and public safety concerns.

We ask that the FERC thoroughly evaluate the need for this pipeline, which has only 500,000 dekatherms per day under agreement with gas companies. Even with the recently proposed reduction in pipeline size to 30 inches and 1.3 Bcf/day, this pipeline project still has only 38% of its capacity committed. If the larger 36-inch pipeline with a capacity of 2.2 Bcf/day were permitted, only approximately 23% is committed. Alternatives to the proposed pipeline should be seriously considered by FERC and we hope that the DE IS process will fully explore these alternatives to meet electricity generation and natural gas demand in New England including energy conservation, renewable energy production, LNG storage, expansion of existing gas pipelines and improved operational efficiencies by other pipelines that can result in recapture of leaked gas. We request that a detailed analysis of these alternatives be included in the Draft Environmental Impact Statement (DEIS) to be developed and published for public comment by the FERC.

The FRCOG has attached detailed Study and Information Requests prepared jointly with other Regional Planning Agencies in Massachusetts and New Hampshire for inclusion in the Draft Environmental Impact Statement. In addition to the alternatives analysis requested above, our Study and Information Requests focus on the following areas:

- Protection of Water Resources (public & private drinking water supplies, rivers, lakes, ponds & wetlands)
- Protection of Air Quality
- Protection of Public Safety
- Protection of Critical Habitat Areas for Rare & Endangered Species
- Minimizing Noise Impacts
- Mitigating Impacts on Infrastructure including Roads, Bridges, Culverts and Electric Transmission Lines
- Addressing Impacts on Private & Public Property
- Avoiding Impacts on Permanently Protected Open Space
- Avoiding Impacts on Historic and Archeological Resources
- Addressing Economic Development Impacts on Heritage & Recreational Tourism and Natural Resource Based Businesses including Agriculture and Forestry
- Addressing Fiscal Impacts on Towns

The Study and Information Requests being submitted are directly related to the general headings listed in the FERC Notice of Intent dated June 30, 2015 (Pages 5-6) for the TGP NED project and will provide the level of information needed for FERC to fully evaluate the environmental, land use, public safety, historic resources, and socioeconomic impacts of the proposed project and make an informed decision. Thus far, the information submitted by the company as part of the pre-filing stage has not been sufficiently detailed to allow for meaningful public comment. Thus, it is our hope that by asking for specific studies, FERC will develop a record of decision that includes adequate detail on the proposed pipeline project so that the public can fully understand and comment on the potential impacts. We request that FERC include the data, information and findings of these Study and Information Requests in the DE IS. However, if FERC does not conduct or require TGP to perform all of these studies, we ask that FERC so notify the Regional Planning Commissions listed to provide us with adequate time to commission these studies, if funding can be secured, in advance of release of the DE IS.

¹ Regional Transportation Equity Analysis for Franklin County; Franklin Regional Council of Governments; July 2015; Environmental Justice Areas are defined as areas where minorities comprise 9% or more of the block group's total population or where at least 12% of the area's population lives below the poverty level (see Tables 1 & 2 and Narrative; Pages 6-8); These definitions have been in use by FRCOG since 2012 for compliance with Title VI of the Civil Rights Act and while the minority percentage figure is lower than the Statewide average, it is the Franklin County average reflecting our rural region; www.frcog.org

Thank you for this opportunity to provide comments and submit Information-Study Requests on the proposed Kinder Morgan Tennessee Gas Pipeline NED Project. Please contact Peggy Sloan, Director of Planning & Development (psloan@frcog.org) if you require additional information or have questions on our requests.

Sincerely,

Linda Dunlavy

FERC NOI SCOPING SESSIONS - PF14-22

**STUDIES AND INFORMATION REQUESTED AS PART OF THE ENVIRONMENTAL IMPACT
STATEMENT (EIS)**

Kinder Morgan Northeast Energy Direct Project

September 23, 2015

The following Study and Information Requests have been prepared for submission to the Federal Energy Regulatory Commission (FERC) as part of the scoping process for the Northeast Energy Direct (NED) PF14-22 project. The proposed studies and information requests pertain to information that should be included in either the Resource Reports that will accompany Kinder Morgan - Tennessee Gas Pipeline's (KM- TGP) Application for the NED project, or evaluated as part of the environmental review process in connection with preparation of the Draft Environmental Impact Statement (DEIS).

This request for studies and information has been prepared jointly by the:

*Berkshire Regional Planning Commission, Berkshire County, MA;
Franklin Regional Council of Governments, Franklin County, MA;
Northern Middlesex Council of Governments, Greater Lowell Region, MA;
Montachusett Regional Planning Commission, Western Worcester County, MA;
Pioneer Valley Planning Commission, Hampshire County, MA;
Southwest Region Planning Commission, Southwest NH; and
Nashua Regional Planning Commission, Southern NH.*

These Regional Planning Agencies serve the impacted municipalities along the proposed route of the NED project in Massachusetts and New Hampshire. The Resource Report references are to the July 2015 Resource Reports submitted by Tennessee Gas Pipeline Company (TGP) to FERC.

By way of background, these Study and Information Requests have been prepared to ensure that both KM-TGP's application and FERC's environmental review evaluate issues of significant concern to the Regional Planning Commissions, impacted communities and landowners. KM- TGP's pre-filing application lacks sufficient information about anticipated project impacts to either fully inform the public or to allow for meaningful comment on and participation in the process consistent with the National Environmental Policy Act (NEPA) and general principles of administrative decision-making.

While the study list appears extensive on the surface, it bears noting that some of the information requested and studies sought are already required of KM- TGP by FERC as part of KM- TGP's application, pursuant to Part 380 of FERC's regulations and FERC's Guidance Manual for Environmental Report Preparation, online at <https://www.ferc.gov/industries/qas/enviro/erpman.pdf>. It is our expectation that FERC will strictly enforce its regulations and deem KM- TGP's application deficient if it lacks the level of detail set forth in some of these requests, consistent with FERC regulations.

Some of the other studies that we have requested are not expressly covered by FERC's regulations, but nonetheless, are critical to fully evaluating the environmental impacts of the project. Because KM- TGP is sponsoring the NED Project, we believe that it should be responsible for either performing these studies on its own or funding studies by qualified third parties. Nevertheless, if FERC does not conduct or require KM-TGP to perform all of these studies, we ask that FERC so notify the Regional Planning Commissions to provide them with adequate time to commission these studies, if funding can be secured, in advance of the release of the DEIS.

1. Conduct detailed Alternative Route Analyses to Avoid Permanently Protected Open Space, Federal and State Rare & Endangered Species Habitat, Water Resources, Forests, and Farmland

Goal:

The goal of this study is to conduct detailed analyses of alternative routes that will reduce impacts on environmental resources and protected open space.

Context:

In Massachusetts and New Hampshire, the "Preferred Route" proposed by KM- TGP NED project will impact significant environmental resources including Permanently Protected Open Space, rare and endangered species habitat (e.g. MA Priority Habitat Areas), unfragmented forests, active farmland, coldwater fisheries, and water resource areas. The proposed route will alter and/or disrupt over 3,800 acres in Massachusetts and New Hampshire (Resource Report 1; Pages 1-45 & 1- 46), including many important natural and cultural resource areas, an increase of over 35% from the amount of land reported to be impacted in March 2015 KM-TGP Resource Report 1. The project will impact roughly 8,800 acres for the overall project (Resource Report 1; Page 1-40), an increase of 25% from the amount reported in the March 2015 Resource Report 1. The Preferred Route does not appear to prioritize the protection of environmental resources, as one would expect in order for the project to be in compliance with National Environmental Policy Act (NEPA), but rather emphasizes "constructability" and avoidance of urban congestion. As stated in Resource Report 10, Page 10-19, "The main determinants used to select the proposed route for the Project's pipeline facilities rather than the alternative routes pertained to minimizing the number of affected landowners, constructability issues and Tennessee's goal to limit the extent of disruption on the communities that will be potentially affected during construction." This statement indicates a bias against siting to protect environmental resources. It also suggests that rural low income populations and communities, that are more reliant on natural resources, are given less consideration than suburban or urban areas that may have greater income levels and resources. The economic and public health of rural residents is closely tied to the health and viability of the natural resource base that will be negatively impacted by the pipeline including groundwater, farmland, and forests. Further the alternative analyses presented in Resource Report 10 do not include key resource areas including acres of Federal or State Identified Rare, Threatened or Endangered Species Habitat, acres of Permanently Protected Open Space, miles of coldwater fisheries streams, acres of public water supply recharge areas or the number of vernal pools. While urban congestion and the number of residences are cited as key reasons why the pipeline must be sited in rural environmentally sensitive areas the Tables do not provide the number of residences only TBD (to be determined).

Requested Information:

- a. Conduct a detailed analysis of "Alternative" routes along existing pipeline routes and major highway Rights of Way (e.g. 1-88, Mass Pike) in comparison to the Preferred Route. Alterna-

tive routes that are co-located along existing gas pipeline systems or in existing major highway R.O.W.s should be prioritized for study as the preferred pipeline route rather than electric transmission lines that traverse environmentally sensitive areas or “greenfield” locations.

- b. Present a comparison of the environmental impacts in the Resource Report 10, as well as in the DE IS and FEIS of the proposed NED Wright to Dracut Preferred Route versus the proposed Spectra Energy Partners expansion of its existing system that will also serve the New England market.
- c. Conduct an assessment of the quality of the resources impacted for the Preferred Route and all alternative routes along major highways and existing pipeline routes. For example, are the wetlands along alternative highway routes well-functioning natural systems or are they already impacted by road runoff and other pollutants, or isolated man-made wetlands resulting from the construction of the road? The Resource Reports simply compile statistics on the miles, acres or lineal feet of different resource areas impacted, rather than describing the quality and integrity of the resources. The Applicant should contact State resource agencies for additional information.
- d. Provide documentation on the sources of the resource statistics and how they have been compiled. Table 10.3-4, a comparison of expanding KMTGP’s Existing 200 Line pipeline route to the “Preferred Route,” suggests that there will be more impacts to wetlands, forest and farmland by expanding infrastructure along an existing pipeline route than along the new Preferred Route from Wright to Dracut. Although the existing 200 Line pipeline route is a longer route in terms of miles (approx. 38 miles longer) than the Preferred Route, if the comparisons are based only on “desk top” data for the Preferred Route obtained from aerial photographs and/or publically available GIS datalayers, the resource impacts are likely significantly underestimated. A more thorough study is needed and impacts on critical resources including acres of Federal or State Identified Rare, Threatened or Endangered Species Habitat, acres of Permanently Protected Open Space, miles of coldwater fisheries streams, acres of public water supply recharge areas, and the number of vernal pools impacted should be included in the alternative analyses tables in Section 10.3.1 Major Route Alternatives. Land use impacts to forest, farmland, recreation areas and developed areas should be presented in terms of the acreage affected during construction rather than the number of miles.

In addition, the Cumulative Impact Analysis presented in Resource Report 3 is deficient and provides no quantitative assessment of water quality, critical wildlife habitat, or rare and endangered species impacts caused by construction and clearing of forested areas (e.g. erosion and sedimentation impacts on water quality and cold water fisheries, increased stormwater runoff and nutrient loading to water bodies, estimated increase in water temperature in cold water fisheries streams as a result of forest land cleared, acres of rare species habitat lost, etc.). Approximately 8,800 acres of land will be disturbed by the project yet on Page 3-113 of Resource Report 3, the proponent states that “The geographic extent and duration of disturbances caused by the construction of the Project will be minimal ... “.

Finally, the Cumulative Impact Analysis should be conducted at the HUC 12 subwatershed scale to provide a better assessment of the cumulative impacts not at the HUC 8 scale as presented. The HUC 12 impacts could then be aggregated within the HUC 12 and at the HUC 10 or watershed scale, as necessary. For example, impacts to the major tributaries of the Deerfield River should be evaluated at the HUC 12 subwatershed scale. The cumulative impacts to the Deerfield River Watershed (HUC 10) would be the total of the impacts to each of the HUC 12 subwatersheds. The HUC 8 watershed scale does not provide adequate data to provide a meaningful assessment of the impacts.

- e. Provide cross sections of exactly how the pipeline will be “co-located” along the electric utility R.O.W. for the Preferred Route. Resource Report 10 states that the Preferred Route is generally

co-located with Tennessee's existing pipeline or other electric utility infrastructure. Once the proposed pipeline route departs from the existing "200 Line", 77 miles will be co-located along electric transmission lines. According to Resource Report 1 (pg. 1-2) adjustments may be needed based on ongoing discussions with the electric utility which "may result in the centerline of the pipeline to be located within an existing powerline easement, less than five feet from the existing power line boundary or further than five feet from the existing powerline boundary." The Resource Reports should clearly define what "co-located" means and should provide a diagram showing the separation of the pipeline R.O.W. from the high voltage electric transmission lines that will be required for safety reasons. Such separation could result in a "greenfields" project with significant additional forest fragmentation and natural resource impacts. Identify the environmentally sensitive areas, including coldwater fisheries and habitat areas with rare and endangered species that currently exist along the electric transmission lines. In addition, the proposed co-location of the pipeline in Pelham and Hudson, New Hampshire is in direct conflict with an approved expansion of the electric transmission lines known as the Merrimac Valley reliability project. Identify the additional impacts on natural resource areas that will occur when the pipeline is rerouted from the current proposed route to avoid conflicts with the Merrimac Valley reliability project.

- f. Conduct a detailed delineation of wetland resources including an assessment of vernal pools along the proposed route. Wetland resources, particularly forested wetlands and vernal pools may be hidden by the forest canopy and are not readily identified by interpretation of aerial photographs. This can result in serious under-reporting of significant wetland resource areas.
- g. Conduct a detailed assessment of impacts to forest habitat areas that support a variety of rare, threatened or endangered species and identify specific impacts on wildlife including the threatened Northern long-eared bat.
- h. The Connecticut River is a federally designated American Heritage River and the River and its tributaries play a central role in efforts to restore Atlantic salmon runs. The Deerfield and Westfield Rivers and their tributaries in Massachusetts are designated "Coldwater Fisheries," critical to maintaining rare, threatened, or endangered fish species. Coldwater Fisheries are particularly sensitive habitat areas and changes to land or water can reduce their ability to support coldwater fish. In the Southern New Hampshire, both the Lower Merrimack River and the Souhegan River are "Designated Rivers" under New Hampshire's Rivers Protection and Management Program (RMPP) per RSA 483.

Specific construction techniques must be used that will avoid potential river contamination with drilling fluids, subterranean gas releases that will disrupt the river bed and shoreline, and fluvial erosion that could compromise the pipeline's structural integrity. FERC should require specific conditions to ensure that temporary work sites will be replanted after construction is complete, and ensure that there is no restriction on access to and use of the river as a result of this project. In addition, the DEIS and FERC should address the following issues:

- i. Clarify the timing of the release of FERC-required construction plans for water crossings.
- ii. Require that TGP's construction process includes the use of carrier sleeves for the full-length of the HDD bore.
- iii. Evaluate the adequacy of pig launch and exit locations to ensure that the rivers have successful in-line inspections at a frequency consistent with industry best practices.
- iv. Facilitate emergency planning with all community and public water suppliers nearby rivers where HDD will occur including Pennichuck Water which operates a secondary water supply on the Merrimack River in close proximity downstream to the proposed alignment.

2. Conduct a Comprehensive Analysis of the Need for the KM- TGP NED Pipeline Capacity to meet

Natural Gas Demand in New England

Goal:

The goal is to conduct a comprehensive analysis of the need for the KM-TGP NED pipeline project to support natural gas demand and electricity generation in Massachusetts, New Hampshire and New England.

Context:

To date, the proponent (Kinder Morgan) has not demonstrated that the proposed pipeline capacity is needed. According to Kinder Morgan's (KM-TGP) Resource Report 1, they have commercial commitments for 500,000 dekatherms/day versus 1.3 Bet/day of pipeline capacity. The commercial commitments represent only approximately 38% of the capacity of the proposed pipeline. Given the low amount of capacity committed to be purchased from the KM-TGP NED pipeline, if the proposed project is allowed to proceed, a significant portion of the natural gas will likely be exported and will not be used in the United States, depleting scarce domestic resources to meet overseas demand. If the pipeline is expanded to its originally proposed size of 2.2 Bet/day of pipeline capacity, there are commitments for only approximately 23% of the proposed KM-TGP. Either figure for commercial commitments represents only a small amount of the NED pipeline capacity and raises a serious issue about whether the construction of this pipeline will result in "overbuilding" in direct contradiction to FERC's established policy not to overbuild (Resource Report 10; Page 10-13).

- a. We understand that the Algonquin Incremental Market (AIM) project, an expansion of an existing Spectra Energy Partners gas pipeline, was recently approved by FERC and is expected to provide an additional supply of natural gas for electric power generation in New England, one of the key reasons ISO New England identified the need for additional gas pipeline capacity. Further, KM-TGP appears to have only one electric utility, National Grid, signed up for long term firm transportation capacity according to their list of Shippers. The other purchasers are LDC's and could be served by LNG facilities and/or could invest in reducing the leaks in their distribution systems. CLF reports (CLF; Into Thin Air; Pg. 7) that between 8 and 12 Bet of methane is leaked annually in Massachusetts alone. In its Alternative Analysis presented in Resource Report 10, KM-TGP acknowledges that the proposed capacity of alternate systems (Table 10.2-1, Pg. 10-17) also will serve the same general market. Other projects such as the Spectra Access Northeast will provide up to 1,000,000 Dekatherms per day and is expected to serve the electric utility generation market which is cited as the primary reason that additional pipeline capacity is needed by KM-TGP. In contrast, the commercial commitments for the TGP NED project will provide gas to the LDCs for residential and commercial heating and industrial uses. Further, on Page 10-2, Resource Report 10 states "Existing natural gas delivery systems may be readily expanded to meet increased demand, while minimizing impacts to the environment." This statement indicates that existing pipeline systems can be readily expanded to meet demand thereby eliminating the need for a new pipeline route that will have significant impacts on natural and cultural resource areas. A detailed analysis of the "No Action Alternative" should be conducted as part of the DEIS.

Requested Information:

- a. Conduct an independent evaluation of the proposed construction of the KMTGP NED pipeline and the expansion of the Spectra Energy pipeline system to determine if the construction of both will result in excess pipeline capacity for Massachusetts and New England.
- b. Conduct a quantitative analysis of the potential for LNG storage facilities, renewables (solar and hydro), and energy conservation to provide an alternative to the construction of the KM-TGP NED pipeline for 500,000 dekatherms of energy. Resource Report 10 provides no quantitative analysis of the potential for Energy Conservation, Renewables (solar, hydro) and LNG facilities to meet energy demands for heating and electricity. The broad conclusion that additional gas pipeline capacity is needed is unsupported by the data in Resource Report 10. This analysis

should take into account each State's Clean Power Plan goals required by the EPA as well as State and regional Clean Energy & Climate Change plans such as the Massachusetts Clean Energy & Climate Plan for 2020.

c. Quantify the benefits to the communities along the proposed pipeline route.

For instance, in Franklin County, MA the proposed pipeline is anticipated to provide little benefit to the communities directly impacted since the region is largely unserved by natural gas supplies for home heating or businesses. Only two towns along the pipeline route (Deerfield and Montague) have access to natural gas for home heating and business uses. Only five Franklin County towns are served by Berkshire Gas, which has an agreement with Kinder Morgan to purchase 36,000 dekatherms per day, or only approximately 2.8% of the proposed 1.3 Bcf of pipeline capacity. In NH, the situation is much the same with little benefit anticipated for communities impacted by the pipeline as these predominantly rural towns are unlikely to be provided with access to the natural gas being transported through their backyards. Liberty Utilities is the only LDC in NH that has contracted for capacity on the NED project. It has committed to purchase 115,000 dekatherms per day from Kinder Morgan which represents only approximately 8.8% of the 1.3 Bcf/day of pipeline capacity. In the Southwest Region planning district, none of the seven pipeline corridor communities is served by Liberty Utilities.

d. Quantify the length of time the Marcellus Shale deposits will be able to supply gas for the proposed NED expansion project and evaluate the public benefit of investing in a costly infrastructure project that may be obsolete in a relatively short time frame. In 2011, the U.S. Energy Information Administration reported that the Marcellus Shale deposits contained 410 trillion cubic feet of unproved technically recoverable natural gas, but the following year revised the estimate downwards to 141 trillion cubic feet, only an estimated six years' worth of natural gas consumption in the U.S. (Sources: U.S. Energy Information Administration; Annual Energy Outlook 2012 & Geology.com; Geoscience News and Information). An in-depth study being conducted by petroleum engineers and economists at the University of Texas in Austin is reporting even more conservative estimates with the four big shale plays, including the Marcellus, peaking in 2020 and then declining thereafter (Nature; Volume 516; December 4, 2014).

3. Conduct an Analysis of Air Quality Impacts & Greenhouse Gas Emissions Related to the Construction & Operation of the Pipeline

Goal:

The goal is to conduct comprehensive analyses of the air quality impacts of the proposed pipeline during the construction and operation of the entire facility, including the pipeline, compressor stations, metering stations and venting stations and all construction equipment.

Context:

There are serious concerns about air quality impacts during the construction and operation of the pipeline and compressor stations. The proposed project is expected to have a significant impact on air quality and some locations in the project area are already "non-attainment areas" for ozone. Although the compressor stations will likely require permits from the state regulatory authority responsible for administering the Clean Air Act, that another agency has jurisdiction over a project does not absolve FERC of its obligation to conduct an independent review to determine whether the project is in the public interest. As such, FERC requires information about air quality to be included in an application as part of Resource Report 9. A comprehensive assessment of the cumulative impacts on air quality related to the construction and operation of the pipeline and related facilities is needed, as well as the identification of potential mitigation strategies and testing requirements that will be followed to protect public health and safety.

Requested Information:

a. Identify local, state and federal air quality standards that must be complied with and the monitor-

ing requirements and other testing required to determine compliance during the construction and operation for the pipeline, compressor stations and the metering and venting stations, including monitoring required during venting of gas for maintenance procedures, accidental releases, and emergencies.

- b. Provide a detailed explanation of the air quality modeling that will be conducted and provide maps of the areas that are expected to be impacted by emissions from construction equipment and during the operation of the pipeline, compressor stations, and the metering and venting stations. The air quality modeling should be conducted under different meteorological conditions, particularly for Fall/Winter months when inversion occurs, for summer months when there are often high ozone events, and also for different times of day.
- c. Provide maps and a numerical comparison of existing and projected air quality conditions during construction and operation of the facility reflecting cumulative impacts from all of the facilities (e.g. Construction Equipment, pipeline, compressor stations and the metering and venting stations). Such maps and air quality information should provide information on existing and expected conditions during different times of day, different meteorological conditions and during different times of year.
- d. Identify all hazardous pollutants that will be emitted and the air quality monitoring and testing that is proposed to be completed on a daily, weekly or more frequent basis at the compressor stations, metering stations and venting stations during the operation of the facility to protect public health and safety.
- e. There are currently only two air quality monitoring stations in Adams and Greenfield that are somewhat near the proposed pipeline route in Massachusetts. Additional air quality monitoring stations should be installed, at least one in each community where the pipeline is proposed to be sited, with locations selected in consultation with City or Town officials, including local Boards of Health. Additional air quality monitoring stations should be located adjacent to each Compressor Station and all venting and metering stations if the NED Project proceeds. Such ambient air quality stations should be installed at least a year prior to the construction and operation of the pipeline in order to establish baseline conditions. Air quality reports should be provided to Municipal and State officials on a monthly basis. Testing should include O₃, CO, NO₂, NO_x, VOCs, SO₂, PM₁₀, PM_{2.5}, GHGs, and HAPs (Hazardous Air Pollutants).
- f. Conduct an analysis of the greenhouse gas emissions expected to be generated by the construction and operation of the proposed KM-TGP NED pipeline. Quantify the impacts of the project on each state's Climate Change initiatives and GHG reduction goals.
- g. Provide a comparison of the air quality impacts and greenhouse gas emissions expected to be generated by an electric-powered compressor station.

4. Archeological & Historic Resources Study of Pipeline Route

Goals:

The goals of this analysis would be: (1) to ensure preservation values are factored early into FERC planning and decisions, and (2) to avoid, minimize, or mitigate adverse impacts to historic properties.

Context:

Relative to cultural and historic resources, communities have noted that too often Section 106 is initiated late in the NEPA process, which threatens opportunities to avoid, minimize, or mitigate adverse impacts to historic properties and cultural resources. In addition, FERC offers guidance on evaluation of cultural resources in its Guidelines for Reporting on Cultural Resources, available online at <http://www.ferc.gov/industries/gas/enviro/culresor.pdf>.

Requested Information:

The applicant and FERC should include in Resource Report 4 of its application as well as in the DEIS:

- a. A summary of the correspondence between applicant and local heritage/historical commissions which have local knowledge of sites potentially eligible for Historic Register consideration. Although Applicants frequently file this information as “privileged,” we note that the FOIA provisions ordinarily governing inter-agency communications do not apply where the comments transmitted pertain to the environmental assessment of the project (see 18 C.F.R. §380.9).
- b. A summary of correspondence between Applicant and State Historic Preservation Officers (SHPOs), particularly in states that do not maintain comprehensive historic inventory databases.
- c. Provide more detail on the predictive model for archaeological site locations including: how the model is validated; how the model results are used specifically; and how river locations, which have a high probability of pre-historic findings, are specifically incorporated into the predictive model.
- d. For the tables of previously-identified sites, many are reported to have “Insufficient Information to Evaluate” or “Unknown.” The Applicant, working in coordination with SHPOs, should conduct additional studies to determine eligibility for National Historic Register listing. For sites that are listed as Not Eligible, the Applicant should identify the entity making that determination and the reason why each is not eligible.
- e. Provide documentation of compliance with state statutory requirements for construction impacts to federal and state-designated scenic roads.
- f. Provide detailed information on the procedures that will be followed if buried historic or prehistoric resources are uncovered during construction including notification of state agencies and Native American Tribal representatives.

5. Analysis of Private Property Real Estate Values, Homeowner and Municipal Insurance, and Municipal Tax Revenues

Municipal Tax Revenues

Goal:

The goal of the analysis is to accurately quantify the expected impact of the NED project on local tax revenues.

Context:

As part of their meetings with local communities, representatives of Kinder Morgan provided estimates of expected tax revenues that will be realized from the construction of the pipeline and related infrastructure and facilities. In Massachusetts, the Department of Revenue (DOR) establishes the actual value of the pipeline and local property tax rates are then applied to the value. The figures cited by Kinder Morgan appear to be inconsistent with data provided by DOR on existing pipelines. These numbers can be viewed through an Excel file, which shows the assessed property value of pipelines and related infrastructure in each town in the Commonwealth. It can be found on this web page: www.mass.gov/dor/local-officials/assessor-info/centrallyvalued_utilities/fy2015_PiPeline.html.

Requested Information:

- a. KM-TGP should provide a detailed analysis of the tax revenue impacts as a result of the construction of the pipeline. The methodology utilized for developing the revenue figures should be clearly explained. A detailed accounting of the property tax impacts in every community along the main line and proposed laterals should be provided. Any previous inaccuracies or misstatements made by the proponent should be corrected and explained. The calculations should include the pipeline and all related infrastructure, including the compressor stations, and metering and venting stations. To the extent that KM-TGP is unable to quantify tax benefits to communities, it should be precluded from including any contrary statements in its application and supporting

materials.

Residential Property Values

Goal:

To clearly quantify and understand the impact of the proposed project on future property tax revenues and residential property values in each community along the proposed main line and laterals.

Context:

Kinder Morgan asserts that the presence of the pipeline will not negatively impact local property values. However, there are a number of paired-sale studies that suggest that there may be long-term loss of property value due to the presence of a natural gas transmission line. It is difficult to determine the extent to which those published studies reflect transactions involving knowing buyers, who were fully aware of the presence of the pipeline. According to the Pipeline Safety Trust, one reason that there is limited available information about changes in property values is that, in the settlement of eminent domain cases, operators typically require a confidentiality agreement from the affected landowner, promising not to disclose the amount of the payment received by the landowner for the loss in value of the property. Moreover, public awareness of pipeline safety has been elevated as a result of serious accidents in September 2010 in San Bruno, California and in February 2011 in Allentown, Pennsylvania, creating a stigma relative to living in close proximity to such facilities.

According to the Forensic Appraisal Group, Ltd., the effect of a gas pipeline easement is measured by the market. Depending on the size of the pipeline, size of the easement, how it is located on the property, the size of the property, property use, etc., the impact range could be nominal to substantial.' It could be as little as 50% of the easement land value, or up to 30% or more of the whole property value. The more intrusive the easement on the land (runs diagonal across the whole property vs. just down the property line), the more impact it will have. If the property were purchased at market value with consideration for the pipeline, the owner may be able to resell it for the price previously paid; assuming overall market conditions do not diminish. Clearly, this will not be the case for most current property owners along the proposed NED right-of-way. There does not appear to be an upside to having a pipeline easement on a property. Inconvenience, restrictions on use, unsightly paths cut through wooded areas, other negative visual impacts, and potential stigma could have an adverse impact on property values.

Requested Information:

- a. The Applicant should provide in the DE IS and FEIS tangible, substantiated data to support claims made regarding the proposed project's negligible impact on local property values. Hard data should be provided outlining the impacts that other projects of this magnitude have had on residential property values and marketability. The Applicant should also disclose a list of right-of-way use restrictions that may apply to the pipeline easement which may impact property values. An assessment of the potential property value impacts in each community along the main line and laterals should be clearly outlined, and the methodology for arriving at the calculations should be thoroughly explained.

Insurance Issues

Goal:

The goal is to assess the impacts of the project on the ability of homeowners to purchase property insurance; to quantify any potential increase in premium costs for property owners; and to assess liability exposure for municipalities.

Context:

Recent anecdotal evidence provided to the Pipeline Safety Trust suggests that insurance underwriters are responding to the presence of gas transmission lines near residential properties, and raising rates, or in some instances, suggesting that insurance might not be available for a new buyer of a property where a transmission line was recently constructed. 2 While it may be true that some underwriters do not con-

sider the presence of a transmission line to be a rate factor, some do.

Gas pipeline line development also has the potential to involve municipalities in lawsuits related to the installation and operation of in-ground pipelines. Municipalities need information on the insurance coverage carried by the gas pipeline company and any exposure that the municipality may have.

Requested Information:

- a. The Resource Reports and DEIS should document the potential insurance impacts of the project on private property owners including an independent assessment by a qualified firm of whether property owners will have difficulty purchasing insurance and if insurance premiums will increase due to the presence of the pipeline. This analysis should be verified by assessing the insurance impacts on private property owners in other parts of the United State that have recently been impacted by the construction of a gas pipeline of this size and scale.
- b. Evaluate the liability exposure for every municipality along the pipeline and determine municipalities affected by the proposed project including abutting communities. Require Kinder Morgan to list affected communities as additional insured's on their liability insurance policy and provide to each affected municipality a copy of the insurance policy with the affected municipality listed as an additional insured.

6. Analysis of Potential Safety Impacts Including Identification of Hazard Zone(s) if Pipeline Fails

Potential Safety Impacts During Construction:

Goals:

The goals of this analysis are to: (1) determine the level of impact of construction activities on emergency response times in and around the project area; and (2) determine and quantify potential threats to public safety due to construction activity.

Context:

Construction will occur along a long corridor involving suburban towns, rural towns, and significant areas of protected open space in state and non-profit ownership. Much of the road network consists of rural two-lane highways and local roads with limited means of access for relatively large portions of the communities. Much of the existing development pattern consists of scattered rural homes, interspersed with agricultural and forested land and State parkland. Fire protection is provided primarily by local volunteer fire departments, with forest fire support from State agencies, and many areas do not have public water systems that provide fire protection. The preferred route crosses public drinking water supply wellhead protection and drinking watershed areas.

Requested Information:

- a. Provide an analysis of the roads that will be impacted by construction activity, such as requiring partial or complete temporary closure, in all communities including abutting communities. Determine the amount of delay or additional travel time and distance created for each impacted road for emergency vehicles to respond to incidents.
- b. Provide an analysis of the impact of construction related activity on each impacted road's condition and its ability to continue to serve local emergency management vehicles responding to emergencies due to the impact of construction related activity on the road's surface, structure, culverts and bridges. Quantify the "worst case" impacts on emergency response times if the road condition deteriorates to a level which makes it impassable for emergency response vehicles.
- c. Provide an analysis of the impact of construction related activity on each impacted road's condition and its ability to continue to serve natural resource based economic development including forestry and any other existing commercial or industrial development. At a minimum pipe materials and construction under any roadway regardless of class should be at the same standard as required of a State road.

- d. Assess the capacity of local fire departments and other public safety personnel to respond to wild-fires created by construction activities, or to respond to a construction site accident where workers may be injured. Capacity should include assessment of staffing levels, training, materials and supplies, and equipment.
- e. Determine what hazardous materials and petroleum products will be used during construction and identify threats to public health and safety that these hazardous materials potentially create.
- f. Analyze the impact of blasting necessary to remove rock for the construction project. Clearly identify areas which will be subject to blasting. Determine the area of potential concern regarding rock throw and seismic impacts due to blasting activities. Determine the people, structures and other facilities located within that area of concern. Describe the types of blasting materials that will be used. Require that the “blasting” firm hired not use perchlorate products to avoid potential contamination of drinking water supplies.
- g. Identify the locations of public drinking water supply infrastructure and determine the impact of construction activities on wells, reservoirs, aqueducts and dams, given the age and condition of the infrastructure and possible impacts due to pipeline construction activities. Identify any private wells that may be impacted by the project as a result of construction.
- h. Analyze the noise impacts of construction activities and assess those against State and local noise regulatory standards. To establish baseline noise levels, measure the existing ambient noise levels along the construction path for both daytime and nighttime and provide quantified assessments of the expected increases in noise and the potential public health impacts resulting from the increases in noise. Noise impacts analyzed should include the operation of machinery used for clearing and construction, for mechanical fracturing of rock, and for blasting necessary to remove rock.
- i. Assess the potential safety risks of trenches and the measures to be used to ensure compliance with, at a minimum, the Massachusetts Excavation & Trench Safety Regulation (Jaclyn’s Law).
- j. Assess areas of steep slope for slope failure potential during construction.
Determine all areas potentially impacted by slope failure and identify risks to the public using those areas for a variety of purposes. All structures and other facilities or areas used by the public or by private property owners in such areas should be identified.
- k. Identify and require the use of pipeline construction techniques and operation procedures designed to withstand the increased frequency of heavy rainfall events.

Potential Safety Impacts During Pipeline Operations

Goals:

The goals of this analysis would be to: (1) to reduce the possibility of a catastrophic failure of the pipeline or related facilities (compressor stations, meter stations, and main line valves); (2) to minimize risk to the public resulting from catastrophic failure; and (3) to ensure the adequacy and appropriateness of emergency response to all major and minor incidents.

Context:

The pipeline will be operated in an environment where some rural and suburban development already exists along considerable portions of the route, and homes and businesses are in close proximity in a number of instances. There will be additional development which occurs in proximity to the pipeline over the multiple decades during which it will operate. Much of the route is in communities that rely entirely on volunteer fire departments as first responders; they have limited training and equipment, and turnover in membership necessitates ongoing training and replacement of out-of-date specialized supplies and equipment.

Requested Information:

- a. Serious pipeline accidents can result from weld failures. Clearly identify the protocols for inspec-

tion of welds during construction. What is the sample number of welds to be subject to inspection by radiological testing? If radiological testing finds weak welds, will the sample number be increased along the pipeline?

- b. Since many pipeline explosions involve excavation activities by third parties, provide a detailed explanation of the measures that will be taken to clearly identify the pipeline corridor, to regulate/authorize construction activities in the corridor, and to monitor on a frequent basis for unauthorized construction in the easement.
- c. Clearly identify the location of and safety risks associated with all pipeline above ground facilities including compressor stations, valve stations, main line valves, and pig launchers and receivers. Provide a detailed explanation of the measures that will be taken to protect against those safety risks.
- d. Clearly identify the potential impact radius for potential explosions for the entire pipeline infrastructure, based on the proposed size and pressure of the pipeline, including the pipe, each compressor and valve station, each main line valve, and any potential blast hazard at pig launchers and receivers. Document the “High Consequence Areas” and the method used to determine them, including quantification used as the basis for each HCA. Identify all structures located along the pipeline and laterals, including their use, highlight public facilities and areas commonly used by the public (trails, playfields, schools, churches, parks, camping and picnic areas, etc.) within the potential impact radius.
- e. Clearly layout the ongoing inspection protocols for the pipeline once in operation. What will be the frequency of monitoring for methane and where will the natural gas be odorized? What will be the frequency of internal and external inspections for corrosion or other damage to the pipeline? What will be the standards used for determining when inspections reveal potential issues for further investigation and repair?
- f. Clearly layout the protocols for the ongoing inspection of the condition of the cathodic protection used. What will be the standards used to determine when inspections reveal potential issues for further investigation and repair?
- g. Since much of the pipeline is proposed to be in proximity to high voltage electric transmission lines and overhead (as well as underground) power lines can induce harmful disturbances on nearby metallic pipelines, assess the:
 - i. Capacitive coupling disturbances for any above ground sections of pipeline that are electrically isolated from the ground. The evaluation of this disturbance should be performed for steady-state operation condition of the power line, assuming the line operates at its maximum operational voltage.
 - ii. Inductive coupling disturbances for any pipelines facilities which are located below-ground. This disturbance should be evaluated taking into account the maximum anticipated levels of steady-state and short-circuit currents.
 - iii. Conductive coupling disturbances for underground sections of the pipeline and for any grounded above-ground sections of the pipeline. This evaluation should be performed only for short-circuit condition of the power line and taking into account the maximum anticipated level of short-circuit current.
 - iv. Under short-circuit condition, the disturbances due to inductive and conductive coupling occur simultaneously.
 - v. Assess the adequacy of proposed cathodic protection against corrosion given current research as traditional pipe-to-soil potential measurements do not guarantee efficient protection and identify the frequency of maintenance required to ensure these systems are preventing corrosion of the pipeline.

vi. What other anti-corrosion methods can be utilized?

Technology Proceedings, 2014, ISSN 2356-5608.

- h. Conduct an analysis of the appropriate depth to which the pipeline should be buried to minimize the potential of a pipeline failure based on the climate conditions for Western Massachusetts and Southern New Hampshire given its location under a high voltage electric transmission line. As outlined in Table 1.3- 1 of Resource Report 1 (Page 1-78) in normal soil conditions, only 36 inches, and in areas of consolidated rock, only 24 inches of fill is proposed to be placed on top of this high pressure gas pipeline. This depth is well above the frost line in New England and Western, Massachusetts and a significant portion of the pipeline will be above the frost line. Will KM-TGP’s “minimum” specification for depth cover which the company states it will use provide adequate protection to the pipeline from temperature changes or frost heaves? We note that failure of welds can lead to a catastrophic explosion that at the proposed pressure could impact homes, businesses and wildlife habitat areas including cold water fisheries and endangered species habitat within approximately 800 feet of the pipeline (30 inch pipeline at MOP of 1,460 psig). Not only would the gas pipeline be damaged but a major electric transmission line critical to the region could be rendered inoperable.
- i. Provide detailed information about the materials used for interstate gas pipelines constructed under electric transmission lines over the last 30 years including the type and gauge of the pipeline and materials used for cathodic protection against corrosion.
- j. Provide a summary and analysis of the safety record of interstate gas pipelines located under electric transmission lines for a period of at least 30 years.
- Provide examples of at least 10 interstate gas pipelines constructed within 100 feet of an electric transmission line and include their safety record.
- k. For the sections of pipeline that are proposed to be co-located with electric transmission lines, assess the impact a catastrophic pipeline explosion may have on the region’s electric infrastructure.

7. Analysis of Training, Equipment and Facility Needs for Local Emergency Responders

Fire Protection

Goal:

The goal of this analysis is to assess local firefighting capabilities in relation to fighting a fire caused by an incident on the proposed pipeline or at a compressor station.

Context:

Fire departments in most of the towns crossed by the pipeline rely on a volunteer call force. This creates difficulty in scrambling a sufficient number of firefighters even for routine house fires. Because these firefighters have “day jobs,” they often don’t have time to participate in trainings and exercises to keep up their skills. Purchasing large pieces of firefighting apparatus to fight even routine fires for small, rural towns is proportionately more expensive than in larger cities because the same base level of equipment is needed regardless of population size, but the tax base in a rural town is smaller.

Requested Information:

- a. Provide a detailed assessment of the ability of local emergency responders to respond to incidents involving above ground facilities and outline resources needed to keep their training, supplies and equipment up to an adequate standard to respond to those incidents.

- b. Provide a time frame for completing a plan for multi-year training and exercises for local first responders, which include provisions for offering trainings in the evenings and on weekends so volunteers may participate. The training should include training on the proper use of gas monitoring equipment.
- c. Provide a list of specialized apparatus, equipment, and personal protective equipment that local fire departments will need if the pipeline is permitted by FERC and constructed.
- d. Provide a list of all substances that will potentially be transmitted through the pipeline and the Material Safety Data Sheets for those substances. TGP should be required by FERC to notify municipal officials and local fire departments when pipeline contents change so they will have up to the minute information on what hazards they may need to respond to.
- e. Provide information on what methods will be used to ensure that the actual rights of way are delineated on the ground once the pipeline is constructed if approved by FERC and provide local Emergency Management Directors with detailed maps showing the exact location of all pipeline facilities, especially all shut off and venting valves.
- f. Clearly identify the proposed distance between valves and identify which valves will be manually, remotely, or automatically operated in the case of a pipeline system failure. Document how much fuel would be released given the type of valve and the distance between valves in the case of any failure.
- g. Provide information on how long it takes to stop a leak based on the proposed spacing and method of operation (e.g. remote or on-site) of the valves and how long it will take for all of the gas to evacuate from the pipe and dissipate to safe levels under different atmospheric conditions.
- h. Assess the ability of local fire departments to access water from lakes, fire ponds, etc. along the proposed pipeline route in the event of a large fire where water is needed to supplement the water initially brought by the fire trucks.
- i. Assess the capability of the local and regional hazardous materials response team to respond to any incidents involving hazardous materials and petroleum products?

Police Monitoring

Goal:

The goal of this analysis is to determine what kind of security measures will be taken in relation to the pipeline and the compressor stations if they are constructed.

Context:

Unlike rural fire departments, rural police departments do not rely on volunteer labor, but they have small forces.

Requested Information:

- a. Provide an outline of what security measures FERC will require TGP to undertake to prevent terrorism or vandalism events.
- b. Provide information about what routine patrolling of the gas pipeline and compressors station will be required by FERC and carried out by TGP.
- c. Provide information about whether the compressor stations will be manned or remotely monitored. If remotely monitored, specify the length of time that it will take a representative to arrive on-scene if there is an incident.

Planning for Emergency Events

Goal:

The goal of this analysis is to determine what kind of emergency planning process will be conducted before construction and in the long-term if the pipeline and compressor station are constructed.

Context:

With the lack of local public safety resources mentioned above, it is imperative that good emergency operations plans be in place and be regularly exercised with local responders if the pipeline is approved by FERC. Regional emergency planning committees and public health coalitions are integral partners in assisting local responders in preparing for emergencies.

Requested Information:

- a. Provide a time frame for completing a comprehensive emergency operations/response plan and an outline of the contents of the plan if the proposed pipeline is approved by FERC. The plan should be created with input from local and regional public safety entities and they should receive copies of the plan when it is complete and whenever it is updated. Provide a schedule for how often the plan is proposed to be exercised with local responders.
- b. Provide a time frame and information on what kind of an evacuation plan will be created if the pipeline is approved by FERC. This should include local and regional input and be exercised with local responders.
- c. Provide information on what measures will be taken to plan for evacuation of residents that will be isolated or trapped if an incident occurs.
- d. Provide information on what measures will be taken to notify the public in case of an emergency. The public notification plan should have redundant communication methods built in, especially in areas where cell phone service is not available or reliable.
- e. Provide information on how frequently contact lists, which include TGP emergency contacts and local responder contacts, will be updated and distributed to municipal officials and local responders.

8. Analysis of Impact on Heritage & Recreational Tourism and Forestr~**Temporary Disruptions to Heritage & Recreational Sites during Construction****Goal:**

The goal of this analysis is to identify all heritage and recreational sites and determine if temporary construction impacts will significantly harm the site's viability as a destination for all types of visitors.

Context:

Rural economies are supported by the region's natural, scenic, historic and open spaces resources. Certain recreational aspects of the proposal are discussed in Draft Resource Report 8, submitted by Tennessee Gas Pipeline Company. Parks, trails, tracts of land, tourist destinations, vistas, and other sites under all types of ownership exist throughout the study area. Direct economic patronage to and indirect expenditures associated with visits to these sites may be disrupted by construction activities associated with a pipeline construction project.

Requested Information:

- a. Provide an inventory of heritage and recreational sites and Federal and State Scenic Byways and National Scenic Trails along the proposed route, including their locations and extents.
- b. Provide the locations, total areas, and durations of impacts, such as temporary road closures in the vicinity of each inventoried site.
- c. Determine how the operation of sites will be disrupted as a result of temporary construction impacts through a fiscal impact analysis quantifying loss of revenue due to required closures, decreased patronage, and other disruptions.
- d. For each site impacted by the proposal, provide a mitigation plan to ensure their continued operation during any construction activities.

Long-term Disruptions to Heritage & Recreational Sites and Forestry Businesses

Goal:

The goal of this analysis is to identify all heritage and recreational sites and determine if the presence of a natural gas pipeline, its associated facilities, or rights of way will significantly harm the site's continued viability as a destination for all types of visitors. A second goal is to assess the potential impacts on forestry related business.

Context:

Direct economic patronage to and indirect expenditures associated with visits to these heritage and recreational sites may be permanently disrupted by the proposed project and its associated facilities. Changes to scenic vistas, the physical character of the land, and liabilities/restrictions on certain activities near the facilities in question will impact these sites and their public benefit. Additional fragmentation of forested areas may impact businesses relying on this resource.

Requested Information:

- a. Determine whether a site's operations and visitor attractions, Federal and State Scenic Byways or National Scenic Trails will be disrupted as a result of permanent installation of a natural gas pipeline, its associated facilities, or its rights of way.
- b. Summarize the acreage of heritage and recreational land that will be permanently impacted by the proposed facilities.
- c. Determine the occupancy of recreational and heritage sites throughout the year, and during appropriate peak times where number of visitors and human impacts on an area may be significantly higher than normal.
- d. Determine how the operation of heritage and recreational sites will be disrupted as a result of permanent construction impacts through a fiscal impact analysis.
- e. Provide a mitigation plan for heritage and recreational sites to address potential losses in views, changes to the physical character of the land, and any potential hazards due to pipeline activities.
- f. Address impacts on the safety of visitors to each heritage and recreational facility, and to assets of the facility, including insurances, emergency preparedness, and increased liabilities associated with the proposed facilities.
- g. Conduct an economic impact study showing the potential negative impacts on recreational and heritage tourism and forestry businesses in terms of lost revenue, income, and jobs as a result of the pipeline.

9. Analysis of Impacts on Private & Public Water Supplies and Water Resources related to Construction (blasting & drilling), Pipeline Operation and Hazardous Materials Storage & Use**Goal:**

Conduct a comprehensive analysis of the water quality impacts of the proposed pipeline during the construction and operation of the entire facility including the Pipeline, Compressor Stations, Metering Stations, Venting Stations, Pig Launchers and Receivers and construction equipment.

Context:

There are significant concerns about potential impacts to drinking water supplies and water resources related to the construction and operation of the proposed pipeline, compressor stations and related facilities. A comprehensive assessment of the surficial geology along the proposed pipeline route, identification of potential impacts to public and private drinking water supplies, and plans for monitoring of water quality is needed to protect public health and safety and environmental resources. This includes identification of potential mitigation strategies and testing requirements. There are locations along the proposed pipeline route where there is a shallow depth to bedrock and homes and businesses in those areas rely on bedrock wells that could be negatively impacted by blasting. There is also concern that any hazardous materials transported in the pipeline or used during the construction and operation of the pipeline and

compressor station could be released and contaminate groundwater and other water resource areas.

Requested Information:

- a. Identify local, state and federal water quality standards that must be met and the monitoring and testing requirements proposed to determine compliance during the construction and operation of the Pipeline, Compressor Stations, Metering and Venting Stations, and Pig Launchers and Receivers.
- b. Conduct a hydrologic analysis and provide a description, inventory and analysis of existing groundwater conditions and an assessment and mapping of surficial and bedrock geology, including location of bedrock faults and high transmissivity fractures. This analysis should include consultation with the State Geologists in NY, MA and NH. This analysis should focus on both surface water and groundwater and include a discussion of potential impacts to these resources as a result of the construction and operation of the pipeline, compressor stations and other above ground facilities. Identify measures to reduce or mitigate the identified impacts.
- c. Based on the assessment of the surficial and bedrock geology along the pipeline route, clearly identify locations where there are public water supply recharge areas, including Zone II areas and Interim Wellhead Protection Areas mapped and defined by State agencies (e.g. MassDEP Source Water Assessment Program), Outstanding Water Resource areas, and/or high or medium yield aquifers within Y:z mile of the proposed pipeline and compressor stations. Outline methods and testing proposed to protect public and private drinking water supplies particularly if blasting or drilling is required during construction.
- d. Based on the assessment of surficial and bedrock geology, identify locations where there is shallow depth to bedrock and identify and map all residences and businesses that rely on bedrock wells within a Y:z mile of the proposed pipeline and compressor stations. Outline methods and testing proposed to protect public and private drinking water supplies relying on bedrock wells, particularly if blasting or drilling is required during construction.
- e. In accordance with State standards for proper sampling and laboratory protocol, identify pre-construction and post-construction water quality analysis and flow rate (gpm) testing that will be conducted for each existing public or private groundwater well within 750 feet of the pipeline unless surficial geology warrants a greater testing area. Water quality testing should be completed by an independent State certified water testing laboratory and parameters to be tested should include, but not be limited to: methane, chloride, sodium, TDS, pH, arsenic, barium and strontium, radon, and a subgroup of the volatile organic chemicals (VOCs) called BTEX (benzene, toluene, etc.).
- f. Identify the locations where water quality testing will be conducted on an annual or more frequent basis to ensure that public and private drinking water supplies are adequately protected from potential impacts from the pipeline and related facilities during their operation and identify remediation strategies that will be undertaken if contamination is found.
- g. Identify all hazardous materials that could be contained in the pipeline and all hazardous materials that will be used during construction of the pipeline including drilling and blasting materials.
- h. Provide a hazardous materials handling and response plan that proposes methods to ensure that releases will not occur and identifies methods to mitigate accidental releases. Specify how the plan will be implemented by the operator, contractor and subcontractors utilizing or storing hazardous materials in excess of household quantities during the construction and operation of the pipeline and related facilities, including training that will be required for their employees.
- i. Identify FERC's requirements for the applicant, operator and or construction contractor(s) to replace or remediate contaminated drinking water supplies or to remediate releases to water resource areas (lakes, ponds, streams, and wetlands) caused by the construction or operation of the

pipeline and related facilities.

- j. Identify potential contamination pathways resulting from drilling underneath rivers and between aquifers or from Brownfield sites located along the pipeline route that could adversely impact surface and groundwater resources.
- k. Describe the water quality testing required for the water used for hydrostatic testing of the pipeline, disposal alternatives for this water, and permits required before it is released to any surface water or to groundwater.

10. Analysis of Impacts on Rare & Endangered Species

Goal:

The goal of this requested analysis is to identify what impacts the construction and operation of the pipeline will have on the vitality and long term sustainability of rare and endangered species and their associated habitat. The study should look beyond just localized impacts and consider cumulative impacts to the species' statewide or ecosystem-scale habitat.

Context:

The proposed NED right-of-way is slated to mostly fall alongside existing utility ROW corridors. In areas where this occurs, the result will be a widening of deforested areas or potential fragmentation of contiguous forestland. In other segments, the pipeline is slated to cut through undisturbed habitat supporting state and federally listed endangered species.

The Resource Report submitted by Tennessee Gas to FERC in July 2015 notes that areas converted from forest to open grassland areas due to de-vegetation "will naturally re-vegetate in 1-2 years" and will "provide additional open land habitat" (Page 3-51). It is important to note that the regeneration of a full-canopy forest takes well more than 1-2 years. The Resource Report also notes that some species are "adaptive to changing habitat conditions" (Page 3-52), but does not specify which and whether they include endangered or rare species. TGP acknowledges that its project will create the displacement of habitat and thus alter the cascade of species that depend on them: "Vegetation clearing between HDD entry and exit work spaces will be avoided if possible. Clearing of vegetation will permanently reduce available habitat cover and food sources for certain species of wildlife (i.e., those that primarily rely on forested habitats). However, following a relatively short period of regeneration within TWS and permanently maintained ROWs, there will be more terrestrial grassland and PSS habitats that provide important cover and a greater diversity and density of food sources for a different complex of wildlife species." (Page 3-51).

State regulatory agencies are charged with protection of and overseeing the recovery of rare and endangered species due to their importance to ecosystem health and biodiversity, not simply exchanging them for new types of habitat and wildlife. Because this project will remove old habitat and create new ones, studies are needed to understand how these new types of habitat, and the wildlife they support, will influence the recovery of any rare and endangered species within the counties affected.

Requested Information:

- a. Determine the location and abundance of rare and endangered species communities that will be immediately displaced by the proposed project.
- b. Determine the impact of loss of habitat on these rare and endangered species, and the potential for these impacted communities to adapt to new types of habitat.
- c. Determine the impact on new types of habitat and the wildlife they support on displaced rare and endangered species.
- d. Determine the cumulative impacts of the proposed project on the statewide or ecosystem-scale health and recovery of rare and endangered species.
- e. Determine how the loss of impacted rare and endangered species in the proposed project area will

affect other sensitive wildlife or vegetation communities in adjacent areas.

- f. Outline the mitigation that will be implemented to avoid or minimize the project's impact on rare and endangered species. Identify locations where the project will result in a "take" of a rare or endangered species and outline what mitigation will be pursued to compensate.

11. Analysis of Impacts of Construction and Equipment on Existing Infrastructure (Roads, Bridges, Culverts, Water, Sewer, etc.) and Impacts from new Access Roads and Staging Areas

Goal:

The goal of this analysis is to avoid, minimize, or mitigate impacts and adverse effects from pipeline construction on existing infrastructure (which includes access roads and staging areas).

Context:

Particular areas of concern noted by municipalities include the potential for general damage from the construction process including: damage to roads, particularly rural and Class VI roads not suitable for heavy equipment; traffic control and communication during construction; general landscape disturbances; and impacts to existing utilities, such as sewer, water, and drainage. These issues will dictate the strategies communities will need to use to replace/repair infrastructure adjacent to the proposed pipeline.

Requested Information:

The following information should be provided in the DEIS and FEIS:

- a. A table listing the new and modified access roads that are proposed for use, including the location by milepost, the size, and the type of modification required on existing roads.
- b. The expected construction start date for each segment of pipeline, pipeline lateral, and compressor stations, discuss the number of spreads and workers per spread required for the proposed laterals; clarify whether the construction workers and timeframes provided for compressor and meter stations are those required for each individual facility, or for each type of facility combined; provide the number of permanent staff anticipated during operation; and provide locations for the new operations offices or district offices that would be required for operation, or clarify that none would be needed.
- c. Specify the distance between the existing and proposed permanent rights-of-way and indicate the potential for further overlap that would allow abutting of the permanent rights-of-way. In addition, specify the maximum overlap of existing rights-of-way allowable by the law, as stated throughout Resource Report 1.
- d. Include a discussion and consideration of direct pipe trench less pipeline installation technology.
- e. Identify any deviations from the FERC Plan and Procedures, if applicable, and include the section of the Plan or Procedures for the requested deviation, the deviation itself, justification for the deviation, and how the deviation would provide equal or greater mitigation. If major modifications to the FERC Plan and Procedures are proposed, the Applicant should provide its own modified versions of the documents that would be used during construction and operation of the Project.
- f. Provide a more detailed discussion on the environmental training that would be conducted for construction personnel, if the Project were approved. Specify which construction personnel would receive training, when and how often the training would occur, and what documents would be provided (e.g., the FERC Plan and Procedures, or the TGP Plan and Procedures, as appropriate). In addition, discuss measures to ensure contractor compliance with the required mitigation including provision of an independent project monitor.
- g. Specify whether power, water, or other utility lines would be constructed for the proposed above-ground facilities.

12. Quantification of Benefits of Reduced Natural Gas Prices as a Result of the NED Pipeline Capacity

The goal is to determine the impact of the proposed project on future electricity costs for residential, commercial and industrial customers in New England, and to quantify the project's impact on economic development throughout the region.

Context:

Kinder Morgan has asserted that construction of the NED pipeline will relieve gas supply and transmission capacity deficits in the region during the winter months. This relief will lead to lower wholesale gas prices for electric generators, reducing electricity costs for businesses and residents. Kinder Morgan further contends that winter peak gas shortages cannot be addressed using any other means.

Requested Information:

a. Quantify the reduction in electric rates that residential, commercial and industrial consumers will realize once the proposed project goes online. In addition, the implications of the reduced electric rates in attracting economic development should be evaluated. Particular attention should be paid as to how well Massachusetts and New Hampshire will compete with other areas of the country, in terms of lower energy costs, due to the presence of additional natural gas supply in the region.

b. Provide documentation as to why market reforms, clean energy investments, energy conservation measures and the availability of LNG are not adequate to meet our future energy needs.

This past winter, a more diverse fuel supply mix reduced price volatility despite harsher weather. Over this time period, wholesale electric prices were 43% lower on average from December 20 14-February 2015, when compared to December 20 13-February 2014 (ISO New England).

c. Assess the potential impacts of overbuilding pipeline capacity, and assess the volatility of the natural gas market, as seen in the recent unexpected plunge in the price of LNG and oil on the global markets.

Taken together with the Access Northeast project, New England could see its pipeline capacity increase by 78%. Will electric customers be saddled with the cost of constructing the pipeline? Adding this much capacity could mean that New Englanders will pay for infrastructure largely used to transport gas to

Canada and other export markets. Kinder Morgan has already stated that they intend to reverse the direction of the Maritimes and Northeast pipeline for this purpose. Many experts have stated that increasing exports in this fashion will result in much higher natural gas prices in New England, as we suddenly find ourselves competing with consumers in other countries. Kinder Morgan should evaluate the potential impact of such an export plan on energy prices in New England and outline how they expect to finance the construction of the proposed pipeline.

13. Quantification of the Increase in Natural Gas Service that will be provided to New England as a result of the NED Pipeline

The goal is to determine benefits of the proposed project within states, regions and municipalities as a result of natural gas availability to residential, commercial and industrial customers and associated cost savings.

Context:

One of the benefits asserted by the Applicant of the NED project is that it will increase the quantity of natural gas available in New England. It is suggested that this, coupled with the lower cost of natural gas in comparison with other energy sources, will reduce energy costs and make us more economically competitive. Recent winter seasons, in particular the winter of 2013/14, demonstrate that parts of New England run the risk of severe spikes in energy costs due to shortages of fuel used to operate power plants. The NED pipeline proposes to address this situation by providing enhanced supplies of dependable, lower-cost natural gas as fuel for power plants and LDCs. Furthermore, it has been suggested that LDCs, such as Liberty Utilities in New Hampshire and Berkshire Gas Company in Massachusetts, can

construct additional lateral lines from the main NED pipeline to provide fuel for indoor heating and to benefit economic development activities in certain communities within proximity to the pipeline. It is unclear what factors drive decisions for constructing these additional lateral facilities.

Requested Information:

To assist in quantifying the benefits to be provided by installation of the NED pipeline proposal, Kinder Morgan should be required to:

- a. Provide data which indicates the natural gas demand anticipated for each New England State versus the current available supply, and describe why the proposed infrastructure project will serve the need identified better than other pipeline projects now under development or other energy alternatives, such as LNG or renewables.
- b. Indicate locations in which additional lateral pipeline facilities (beyond those identified in the proposal) are anticipated, including the geographic areas they would serve.
- c. Provide data indicating the volume of fuel anticipated for each additional lateral pipeline identified in item 13.b. above, for use in corresponding geographic areas.
- d. Conduct a cost benefits/savings analysis of reduced fuel costs via pipeline distribution for each of the above, including cost breakdowns for each geographic area along the proposed NED pipeline corridor and along the laterals it would serve.

14. Analysis of Noise Impacts from Pipeline Construction & Operation and Compression Stations (to be provided)

Goal:

Conduct a comprehensive analysis of the noise impacts of the proposed pipeline during the construction and operation of the facility including the Pipeline, Compressor Stations, Metering Stations, Venting Stations, Pig Launchers and Receivers and construction equipment.

Context:

There are significant concerns about noise impacts from the proposed pipeline given the proposed location in very rural areas with varied topography. Many towns have very low ambient noise levels (est. 20-40 dBA) and contain critical habitat areas for rare, threatened or endangered species including the Northern Longeared bat. A comprehensive assessment of the noise impacts on humans and wildlife and potential mitigation measures should be undertaken.

Requested Information:

- a. Identify local, state and federal noise standards that must be met and the monitoring requirements proposed to determine compliance during the construction and operation of the Pipeline, Compressor Stations, Metering and Venting Stations, and Pig Launchers and Receivers.
- b. Conduct studies to determine ambient noise levels at the nearest property line of a residence and any public building, school, hospital, or other High On-site Population location or at 300 feet from the nearest residence or public building, hospital, or other High On-site Population location, whichever point is closer to the pipeline and related facilities. High on-site populations are defined as the following: retirement housing; assisted living facilities; congregate living facilities; convalescent services; parks; detention facilities; day care services (commercial); hospitals; and educational facilities (public or private). Ambient noise level should be measure at a minimum every ½ mile along the proposed route. “Ambient” is defined as the background A-weighted sound level that is exceeded 90% of the time measured during the quietest part of the day or night. All testing should be done by a qualified licensed professional acoustical engineer in accordance with the professional standards of the appropriate accrediting agencies and the sound level meter used in conducting any evaluation shall meet the American National Standard Institute’s standard for sound meters or an instrument and associated recording and analyzing

equipment.

- c. Conduct modeling of expected noise impacts during construction and operation of the pipeline based on the topography of the proposed pipeline route and identify potential impacts to humans and sensitive receptors such as wildlife, including Northern long-eared bats.
- d. Identify measures that the Applicant will undertake to mitigate sound levels for humans and sensitive receptors. Identify what devices or other equipment the Applicant will employ, including the use of electric motors at the compressor stations, to mitigate sound levels to ensure that the noise level standards at residential or public buildings, hospitals or other High On-site Population locations are not exceeded and sensitive wildlife receptors are not adversely impacted.
- e. Identify noise monitoring that will be conducted once the facility is operational and a process to address noise complaints so the facility will remain in compliance with noise limits.

15. Analysis of Invasive Species Impacts during Construction & Operation of the Pipeline

Goals:

The goals of this study is to determine the types of invasive species likely to become established along the corridor and associated access roads; their impacts on surrounding habitat, particularly those of unique quality, special concern, or supporting rare or endangered species; and the long-term monitoring and control strategy needed (past construction and restoration) to combat the establishment or spread of invasive species. The impacts of any control strategies, such as application of herbicides and/or pesticides, on cold water fisheries, water resources and drinking water supplies should also be studied.

Context:

Tennessee Gas acknowledges that there is potential for the introduction of invasive or noxious weeds through this project (Page 3-116, July 2015 Resource Report 3). The disturbance of soils due to foot and vehicle traffic, as well as altering the soil composition of forest areas through clearing and compaction, can aid the establishment of invasive species, which are then notoriously difficult to eradicate or control.

Japanese knotweed, for example, can lay dormant for years after applications of herbicide before rebounding in growth, and thus requires years of vigilant attention in order to suppress regrowth. It is widely known that invasive species spread and thrive along utility corridors due to soil disturbance, increased light, and increased dispersal opportunities (such as foot traffic). Invasive species may be present along the utility corridors with which this project will co-locate. The continued spread of invasive species into forest cores and other habitats through which this project will traverse is concerning, particularly in light of a 2015 study by the New England Wildflower Society that finds 21 % of New England's native plants are already rare or endangered, and 31 % of plants are non-native."

A project of this scale and breadth can accelerate the loss of plant diversity, which is already being fueled by climate change and pesticide use, through the introduction of invasive species on land that was previously untouched or resilient. Furthermore, as this project intersects with habitats of special concern or value, the potential impacts of invasive species on these unique areas should be studied. The potential for invasive species to spread into adjacent property owned by others should also be thoroughly assessed. TGP proposes to address the treatment of invasive species through a general approach, which will meet the minimum requirements per state, Commonwealth, or local requirements. But this general approach may not adequately prevent and control individual invasive species or their effect on wildlife. In addition, the July 2015 Resource Report 3 only addresses the use of herbicides when needed to control invasive species in the new ROW and states "New areas permanently maintained during operation of the Project facilities will be maintained in an herbaceous/early successional stage of vegetation. Tennessee will not use herbicides as part of routine vegetation maintenance along the ROW except when required for the control of invasive plant species as permitted ... " (Page 3-79). Pursuant to 18 CFR 380.15, a company can use herbicide/pesticide only with consent of landowner. The Applicant should also be required to provide a "Plan B," if a landowner refuses use of herbicides, such as an organic farm

within the vicinity of the pipeline. Measures should also be planned to monitor and control invasive species that may enter nearby forested or other areas outside the edge of the ROW.

Requested Information:

- a. Create a predictive model and analysis of likely invasive species establishment along the corridor, based on existing invasive species in the project area as well as soil types, using GIS or other modeling techniques.
- b. Identify impacts that anticipated invasive species will have on surrounding habitats, with particular study of impacts on habitats of special concern or those that support rare and endangered species.
- c. Identify impacts that anticipated invasive species will have on wildlife populations along the corridor, particularly rare and endangered species.
- d. Identify necessary prevention, monitoring, and control techniques tailored to anticipate invasive species that extend beyond the edge of the new ROW and persist after construction and restoration.
- e. Evaluate and quantify the potential impacts of any control strategies such as application of herbicides and/or pesticides on cold water fisheries, water resources and drinking water supplies along the proposed pipeline route.

16. Analysis of Impacts to Agricultural Lands and Economy

Goal:

The goal of this study is to understand the impacts of the pipeline on the productivity of agricultural lands and the local and regional agricultural economy.

Context:

The July 2015 Resource Report 7 submitted by TGP outlines several prevention and mitigation measures to protect soil compaction and loss of agricultural productivity. Approximately 16% or roughly 300 acres of prime farmland along the proposed route is anticipated to be permanently lost to construction and overall 1,900 acres will be impacted by construction (Page 7-14), which is a significant amount. After several decades of declining farmland and with the current scarcity of agricultural land available for new generations of farmers, the loss of any additional farmland (particularly prime) is extremely detrimental to the agricultural economy.

TGP plans to engage in compaction prevention techniques (Page 7-11), topsoil segregation practices (Page 7-13), drainage/erosion issues, and prevention of bedrock migrating to topsoil (Page 7-9). Despite these mitigation activities, it is important to provide an analysis of potentially lost agricultural land (i.e. pipeline ROW located amid other active crops, grazing areas, rotational fields, etc.) and to evaluate the impact of the lost acreage on the viability and economy of scale of agricultural crops. Long-term crop-specific and livestock impacts of the pipeline and related activities that will impact the productivity of agricultural lands should be understood. For example, mature orchard trees lost to construction or ROW may not be replaced, despite achieving restored soil conditions.

Requested Information:

- a. Identify the types of agricultural land directly and indirectly impacted by acreage, number of owners, and soil types and anticipated radius of impact.
- b. Identify impacts of soil disturbance, altered drainage patterns, and mitigation activities on the various types of agricultural activities, including disruption of economies of scale.
- c. Identify impacts of the pipeline itself to long-term soil productivity, due to increased temperatures, altered drainage, and/or anticipated maintenance activities (such as applications of herbicides).
- d. Provide a fiscal impact study showing the value of lost agricultural productivity on the local and

regional economy, in terms of lost revenue, income, and jobs.

- e. Provide an assessment of the potential impacts on access to local food for area residents.
- f. Provide an assessment of impacts on organic farms potentially impacted along the pipeline route.
- g. Provide an assessment of the potential loss of tourism revenues for farms that host visitors (e.g. agri-tourism).

RE: PF14-22-000; Northeast Energy Direct Project Request for Survey of Notchview Reservation, LL#MA WD 115, 117, 120

Dear Mr. Hartman,

I am writing in response to your recent request to survey Notchview Reservation; a property of The Trustees of Reservations located in Windsor, Massachusetts for the following surveys: civil surveys, archaeological surveys or cultural resource investigations, wetland and stream surveys, and surveys for rare, threatened, or endangered species. The Trustees of Reservations **continues to decline permission for these surveys** to be conducted on our property.

The Trustees of Reservations was founded in 1891 as a conservation organization that preserves, for public use and enjoyment, properties of exceptional scenic, historic, and ecological value in Massachusetts. We have a responsibility to protect and steward our properties and the goals of the Northeast Energy Direct Project are incompatible with the mission of our organization and the uses of our land.

Thank you for your cooperation.

Sincerely,

Barbara Erickson

President and CEO

The Trustees

Kathleen Gauvin, New Ipswich, NH.

No one should need to worry about the water they are drinking! That said, "Granite Staters" have been watching the news of contaminated wells at Pease International Tradeport. How unfortunate that 9,000

adults and children have ingested water with elevated levels of perfluorochemicals (PFCs), 12.5 times higher than the level set by the Environmental Protection Agency's Provisional Health Advisory. The EPA notes that PFCs are a "contaminant of emerging concern". This unfortunate, exposed group has lived for over a year with the fear of what the future will bring. Now, having been tested and with their results, that same unlucky population will be living day to day with the worry of what might potentially occur in the future. We, as your neighbors, hope that those potential health threats are never realized. The support that you are receiving from Senator Kelly Ayotte and Senator Jeanne Shaheen is commendable.

We have drinking water concerns as well! The proposed Northeast Direct (NED) pipeline snakes through 77 miles in 17 towns in the southern tier of New Hampshire. Kinder Morgan/Tennessee Gas is seeking permitting with the Federal Energy Regulatory Commission (FERC) for this project. If approved, what effect will the blasting for the pipeline construction have on our wells? Where will the blasting contaminants go? Will they end up in our water supplies; a town reservoir and our private wells? Who will protect our water? We are now worried about potentially polluted water and dealing with possible health threats. At this time, neither the Governor nor any of the NH Delegation has taken the stand in opposition to the project!

So we, fellow concerned Granite Staters, are reaching out to you, our NH neighbors, to help us stop this contaminating monster!

<http://nhpipelineawareness.org/> is a source of excellent information.

The above editorial was sent to all the Seacoast newspapers

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street NE Room 1 A

Washington, DC 20426

re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Dear Secretary Bose:

Thank you for the opportunity to provide these comments during this scoping period for Kinder Morgan's Northeast Energy Direct (NED) proposal.

First of all, I would like to reaffirm the request for a consolidated review which I submitted to the docket on September 10th (#20150910-5064). This asks the Federal Energy Regulatory Commission (FERC) to carefully review in one process all the current proposals to bring more natural gas into New England including those from Kinder Morgan, Spectra Energy, Iroquois and Portland Natural Gas Transmission. FERC needs to concurrently do this to most accurately quantify cumulative impacts; avoid segmented review; and, properly consider alternatives given the true competing nature of these proposals. Added together, these projects could more than double the gas supply to New England at a time when the federal Clean Power Plan (CPP) and the MA Global Warming Solutions Act (GWSA) are demanding that we greatly reduce our consumptions of fossil fuels. Even the most aggressive demand forecasts do not call for anywhere near this level of new capacity. FERC must consider them all as a single set of alternatives.

Need

- In assessing the needs of the electric generation market, the FERC review should include the results of the study MA Attorney General Maura Healey is undertaking to determine electric reliability needs including what gas capacity we need for electricity generation through 2030. The results of that study, expected in October, will provide considerable insight into whether new pipeline capacity is really needed to serve the electric generation market and, if so, this study should properly define and dimension that need.
- In assessing the amount of the gas contracted through the various LDC agreements, the review should

include an analysis of how much of the LDC demand is currently replacing expiring volumes already under contract? How much is for future demand? How much is to arbitrage? How much can be accessed from other pipelines?

- The role of export in any proposed pipeline capacity expansion needs to be explicitly explained. People bearing the impacts and loss of property need to know where the gas is going. If export is identified as a “need” for increasing pipeline capacity to and through New England, an alternative that needs to be considered is serving the export market by sending gas on existing pipelines south to existing export facilities on the Gulf and Mid Atlantic Coasts.
- In comparing and contrasting the NED project and other natural gas transmission projects, the relative impacts of increased natural gas use on greenhouse gas emissions must be considered. The EIS should specifically address consistency with the federal CPP and MA GWSA. It should compare and contrast the proposed projects with increased reliance on renewable energy sources, increased efficiency incentives, gas savings from leak repairs, and other ways which may be more consistent with CPP and GWSA.
- If increased natural gas is primarily a bridge fuel as many of the project proponents are claiming, then these projects should be considered only a potential temporary solution. The temporary nature of increased need, if in fact additional pipeline capacity is needed at all, must be taken into account in comparing the permanent loss of critical forested habitat associated with the projects to other short-term solutions, such as increased use of our currently underutilized LNG offshore terminals using existing infrastructure or increasing local LNG storage to cover short-term demand peaks.
- Demonstration of new need must also take existing underutilized infrastructure into account, for example, the two LNG energy bridges whose use in the winter of 2014-15 avoided the gas capacity shortfalls that were experienced in the previous, milder winter of 2013-14.
- The reduced fossil fuel demand expected from implementation of increased efficiency – one of the fundamental “building blocks” in the new Clean Power Plan, must be taken into account in the need demonstration.
- The duration as well as volume of any increased gas need must be considered in the need demonstration. If the increased need for gas is indeed for a relatively short duration, other solutions might be more viable if they do not result in the longer-term impacts associated with a new massive infrastructure project. This should also be addressed in terms of long-term commitments of natural resources, including conservation of finite natural gas resources.
- Each of the NED projects proposed laterals requires consideration of its own individual No Action Alternative. The need demonstration in the Resource Reports (RR) makes no attempt to demonstrate the need for the proposed laterals, notably the Fitchburg lateral. Public statements by Kinder Morgan (KM) and its representatives have been contradictory and easily refuted. The purpose and need for the Fitchburg Lateral has still not been described despite the fact that many people have publicly raised this issue of the need for this particular part of the project to Kinder Morgan and to FERC. Kinder Morgan’s Consideration of Alternate Proposals
- The NED project is one of several competing alternatives for increased natural gas capacity into New England. While it is unclear if any of the proposed projects are needed, it is abundantly clear that all of them (which would double the region’s gas capacity) are not needed. KM’s Resource Reports (RR) acknowledges that the capacity provided by NED could be met by others but dismisses any direct comparison with the other projects by stating that the impacts associated with NED would simply be transferred elsewhere.
 - This is extremely inaccurate as the competing projects are assumed by KM to have comparable impacts, yet none of them involve even a fraction of the degree of new land disturbance, private property taking, and new right of way (ROW) creation that the NED project has.
 - The Council on Environmental Quality (CEQ) guidelines suggest that in instances where competing proposals are mutually exclusive, combining them into a single NEPA review provides the best means of

evaluating the relative benefits and impacts. As described previously, FERC must do just that with the NED project and its competing alternatives.

- The NED EIS must include a comprehensive assessment and comparison of the relative impacts of the NED project with the systems and energy alternatives which would negate the need for NED. Simple narrative dismissal of the reality of the mutually exclusive nature of the competing alternatives is not acceptable.

- Among the key criteria that must be considered in comparing not only NED's stated alternatives but the competing project and system alternatives is the number of eminent domain takings anticipated. Given the community and individual landowner reaction to the NED project, it is likely that the project will entail an unprecedented number of forcible takings of private property. The permanence of the forcibly taken easements does not justify any temporary need for additional gas capacity.

- The sheer number of what will be highly contested takings will surely result in severe project delays, perhaps beyond any potential short-term period of capacity shortfall. It is important to note that the state's Clean Power Plan greenhouse gas targets call for a fleet average greenhouse gas (GHG) emission rate well below that of even the most efficient combined-cycle natural gas-fired power plant.

- The comparison to competing projects must include a quantification of the new easements required and how many are likely to involve the eminent domain process. This criterion should also be included in evaluation of alternative lateral routes.

- While current landowner survey permission (or more specifically, lack thereof) could be used as a surrogate indicator of the number of eminent domain takings expected, it is important to note that landowners granting of survey permission does not mean they support the project and will grant an access without eminent domain takings.

Alternatives

- The No Action alternative was not fairly evaluated in the Resource Reports and must consider the the issues raised in the previous Need discussion.

- The No Action Alternative should consider whether further investments by LDC's in repairing widespread and long-standing leaks in the distribution systems and providing increased incentives for people with older gas furnaces and appliances to upgrade to more efficient ones would negate the need for any new pipeline, while at the same time help met the state's obligation under the GWSA.

- The No Action alternative should address the feasibility of increased use of already constructed onshore and offshore LNG facilities to cover any limited shortfalls, which appear to be limited to a few days per year. FERC must contrast the relative environmental impacts of construction of pipelines to this alternative, given that the construction impacts associated with the LNG terminals have already occurred.

- The EIS should acknowledge the specific projects proposed in response to the New England Clean Energy Plan RFP (<http://cleanenergyrfp.com/>) and fully consider their timing and future presence in assessing the need for increased natural gas in evaluating the No Action Alternative. The No Action Alternative must also evaluate whether the import of 2400 MW of additional hydroelectric power by 2020 as proposed by Governor Baker fully meets or greatly reduces the need for the project in the No Action Alternative.

- No Action Alternative needs to cover not just one technology or competing project but how combinations of technologies and other competing natural gas projects could meet any need.

- KM's project is sized for 1.3 bcf, yet only has 0.5 bcf under commitment and has not increased this value in over a year. The DEIS must evaluate alternate sizes in assessing whether the reduced need would be better met by alternative projects, such as increased use of LNG via existing infrastructure.

- As the true demand is considerably less than the proposed NED capacity, the conclusions in the evaluation of the alternative of increasing the size of the TGP 200 line must be revisited. Given the age of the TGP 200 line, the increased risk of NOT upgrading this line as an alternative to NED must be fully quantified and justified.

Consideration of a Reasonable Range of Route Alternatives

- The alternatives analysis contained in the RR is superficial and dependent on completely misleading and inappropriate criteria. A comprehensive comparison of main route and lateral routing alternatives must be included in the EIS, including a detailed assessment of no action alternatives that were summarily dismissed in the RR and the use of impact-based evaluation criteria.

- A range of alternatives is deemed sufficient if it can reasonably be expected that a lower impact alternative has not been overlooked. The alternatives assessment in the RR does not consider a reasonable range of alternatives. The Fitchburg Lateral alternative is a classic example. In the July Resource Reports the previously preferred route was abandoned in favor a new alignment that affects seven private and heavily forested properties within an Area of Critical Environmental Concern (ACEC) along West Meadow Road in Townsend, MA. Yet, astonishingly, the previously preferred alignment is not considered in the July Resource Reports alternatives assessment for this portion of the lateral route. The route from the December and March Resource Reports needs to be included in the alternatives analysis and the true reason why it was abandoned needs to be explained.

□ How can FERC be assured that the new alignment has less impact than the original route if it is not included in the alternatives analysis and compared to the now-preferred alternative using impact-based criteria?

□ Similarly, the alternatives analysis for this lateral only considers a single alternative (an in-street Route 31 route). While this alternative clearly has less impact than the proposed route, it was rejected using an incomplete set of misleading and inappropriate criteria (as discussed below).

□ Further, similar consideration of the alternative of placing the 12-inch line under West Meadow Road was not compared to the proposed approach of cutting a 100-foot wide swath across the forested portions of seven private parcels (entirely within an ACEC, and crossing mapped protected species habitat, permanently removing trees atop an esker which provide essential shade to the cold water fishery stream that runs along the base of the esker and protects and important wildlife migration corridor). Clearly in this instance an environmentally superior alternative has been overlooked and/or dismissed without being considered. This must be considered in the EIS.

- This is but one example; dozens of other route alternatives with lesser impact may exist along other portions of the route and the other laterals. The EIS must include a fair, honest and comprehensive evaluation of a reasonable range of route alternatives using more appropriate criteria than the oversimplified, self-serving and just plain incorrect analysis included in the RR.

□ Fitchburg Lateral Alternatives to Study: As described in a comments submitted on June 17th, Kinder Morgan has failed to identify the need for the Fitchburg lateral. The no-build alternative for the Fitchburg Lateral needs to be carefully considered as described above. The No-Build Alternative for the entire NED project and the Fitchburg Lateral is clearly the preferred and least impact option. In the interest of providing specific local information as requested at the scoping hearings, I am providing several other possible routes for all or part of the lateral line connecting a possible pipeline in New Hampshire with Kinder Morgan's proposed end-point in Lunenburg, MA. All these proposal involve laying the pipe in existing roads.

□ Rt. 31 Alternative: Come down Rt. 31 in NH and MA but rather than leave Rt. 31 to connect to the proposed Townsend route, continue down Rt. 31 to John Fitch Highway in Fitchburg to Rt 2A. Follow Rt. 2A to Pleasant Street and the Kinder Morgan pipeline easement off of Pleasant Street.

□ From crossing of Rt. 123, follow Rt. 123 south to Townsend. Follow Rt. 123 (Mason Road) south to West Elm Street and Lunenburg Road. Follow Lunenburg Road to Route 13. Follow Rt. 13 south to the Kinder Morgan pipeline easement.

□ From the crossing of Rt. 124, follow Rt. 124 south (Greenville Rd.) to Mason Road. Then follow Mason Rd. south to West Elm Street and Lunenburg Road. Follow Lunenburg Road to Route 13 south. Follow Rt. 13 South to the Kinder Morgan pipeline easement.

□ 200 Line Alternative: Kinder Morgan must more carefully consider and quantify the the alternative of

expanding its current 200 Line. The DEIS should evaluate the alternative of replacing the existing 200 Line with a new, larger diameter line.

In defining the 200 Line alternative, the expansion should begin at Segment F MP 30, not Segment G after crossing into Massachusetts.

The alternatives assessment comparison of the 200 Line expansion to the NED is misleading in that it assumes that the NED will be in existing rights of way (ROW) when, in fact, it parallels existing electric transmission ROW in NH, creating new ROW with extensive new clearing. An expansion of the 200 Line could be accomplished within the existing ROW, and not involve new land taking from private landowners. The alternatives analysis should take into account new land taking from private citizens in comparing the two alternatives.

KM determined that looping the entire line would be required to meet the perceived need for 1.3 Bcf/d of additional gas capacity. However, it did not evaluate whether looping the entire length of the 200 line would be required to meet only the 500 Dth/d of precedent agreements in place.

If one of the rationales for the project is to serve electric generators, it should be noted that several power plants are located along the 200 line's route (e.g., Berkshire Power, Millennium Power, Pittsfield, MASSPOWER) while none are located proximate to the proposed project.

In rejecting the 200 Line alternative, KM acknowledges the high level of urban congestion of that line. We would also note the 50-year old age of the line, through congested urban areas represents a material liability noting some high profile catastrophic failures of similarly aged pipelines elsewhere in the U.S.

In comparing the alternative of replacing the existing 200 Line with a new larger diameter line with the proposed Project, the resultant reduction in the risk of a pipeline accident and the increased reliability of the 200 line associated with such an upgrade should be quantified and taken into account.

Comparative Criteria

• In comparing various route alternatives as well as the alternative of upgrading the existing TGP 200 line, Kinder Morgan compares the amount of new ROW vs use of existing ROW. The comparison credits portions on the proposed preferred route that parallels existing transmission ROW as being in existing ROW. This is both inaccurate and misleading. The application of this criterion must be impact based.

Widening an existing electric transmission corridor is clearly not the same as placing an additional pipeline in an existing natural gas pipeline ROW. Even co-location within an existing electric transmission ROW may necessitate new easement agreements as the electric transmission easements may not specifically allow gas pipelines.

Additionally, along many portions of the mainline route in NH and MA as well as the Fitchburg Lateral, expansion of the cleared ROW will necessitate new easements from previously impacted landowners. The amount (miles) and number of new easements is a more accurate indicator. In many of those parallel ROW areas, landowners are now screened from visual impact of the existing transmission lines by the very swaths of trees that the NED "ROW expansion" would clear. These visual impacts need to be quantified.

• The EIS alternatives comparisons must include appropriate criteria including an accurate accounting of:

numbers of new easements,

length (miles) of new easements,

number of private parcels impacted,

amount of clearing,

secondary visual impacts resulting from the clearing.

Nature of existing conditions including quality of habitat affected. For example, transversing a wetland already filled with invasive phragmites must not be considered the same impact as transversing a mature red maple swamp in an undisturbed forested area.

- The land crossing statistics found in the analysis of the Fitchburg Lateral call into question all impact analyses provided by Kinder Morgan throughout all the Resource Reports. In the Fitchburg Lateral alternatives assessment it appears use of Route 31 is unfairly treated as equal to traversing private forested property as a new easement would be required in either case. “Crossing” by forested land in the alternative route’s roadway is hardly the same as cutting a new swath through forested land in the proposed lateral. A new easement from MassDOT or NH DOT for placement of a pipeline under the road pavement is hardly equal to cutting a swath of trees through private residential properties or critical habitat areas.

□ How can traversing forested area under the pavement of Route 31 be treated as equal to the clearcutting of a new corridor across several private, heavily forested residential properties on West Meadow Road in Townsend that are located within an ACEC, and which create a recognized wildlife migratory corridor, and which are located atop an esker that overlooks and shades a natural cold water fishery stream (Locke Brook). The fact that “miles of forested area traversed” are equal in these two examples is deliberately misleading and neither impact nor fact based.

- Degree of eminent domain taking: By all accounts of the lack of survey permission and the number of communities that have voted to oppose NED, the project could entail an unprecedented number of eminent domain takings. This could delay the NED project beyond the date of the alleged need of new capacity. Other competing projects, and route alternatives to NED itself, may entail fewer forcible takings of private citizens’ land. The NED proposal thus far has fallen far short of the clear demonstration of public convenience and necessity necessary to justify the granting of eminent domain powers. Since the number of takings needed is directly related to the project’s schedule and likelihood of permitting success, an important criterion in the assessment of alternatives is the number of miles and well as individual properties that will likely need to be forcibly taken against landowners’ will.

□ The number of property owners who have withheld survey permission is an indication for this criterion, however, it may underestimate the level of opposition. Some property owners opposed to the project may have granted permission to survey as FERC suggested.

Air Quality

- The impact of the project, including the compressor stations, on air quality must be assessed using NHDES and MADEP approved protocols.

- Emissions of criteria pollutants, air toxics, and greenhouse gases must be quantified and a demonstration that the emission levels represent Lowest Achievable Emission Rate ([LAER], for nonattainment pollutants) and Best Available Control Technology ([BACT] for attainment pollutants must be included.

- Ambient air quality impacts must be predicted using the most current version of AERMOD, and compliance with National Ambient Air Quality Standards and PSD Increments must be demonstrated. Impacts of the emission of non-criteria (toxic) air pollutants must follow individual state air toxics guidance.

- Modeling protocols must demonstrate the availability of representative meteorological and background air quality data. If existing ambient data are not deemed representative, a minimum of 1-year of onsite data must be collected, per USEPA modeling guidelines.

- Areas surrounding the compressor stations must be evaluated for the presence of qualifying Environmental Justice Communities, which are prevalent in rural Pennsylvania, New York, Massachusetts, and New Hampshire. Consistent with USEPA Region 1, 2 and 3 guidance, if qualifying environmental justice communities are present within 5 miles of a compressor station, an Environmental Justice analysis must be completed pursuant to USEPA and state guidance. The project must demonstrate that it will not adversely or disproportionately impact qualifying communities and an enhanced public participation plan must be submitted to the agencies for approval.

Greenhouse Gases

- Emissions of greenhouse gases (expressed as carbon dioxide equivalents [CO₂e]) must be quantified following USEPA and state guidelines for all aspects of the project, including:

- o Direct CO₂ emissions from compressor stations
- o Direct and indirect (leakage) emissions of methane (using the most current global warming potential indices to convert CH₄ to CO₂e) from compressor stations, meter stations, valves, etc.
- o Indirect CO₂ emissions from the permanent loss of trees to be cut along the pipeline route.
- o Indirect emissions of CO₂e from the production and combustion of gas delivered.
- The project’s consistency with the state-specific GHG emission targets in the recently promulgated Clean Power Plan (CPP) regulations as well as with statespecific programs developed independently (but which will become critical components in the states’ CPP implementation plans), such as the MA Global Warming Solutions Act must be demonstrated. The alternatives analysis, addressed above, must include compatibility with these important regulations as a distinguishing criterion.

Noise

- The project must demonstrate compliance with state and local noise standards and regulations, especially with respect to the compressor, valve and meter stations.
- The EIS must consider baseline sound levels and assess the change in sound levels predicted. This is especially important given the rural nature of the pipeline route. In such areas, baseline sound levels are very low at night, and simple compliance with absolute noise level criteria does not truly reflect impact. Rather, the Massachusetts “delta” standard that assesses impact based on the change in residual (L₉₀) sound level is more appropriate.
- Baseline noise measurements must be taken over several weeks in the winter months.
- Identify all sensitive noise receptors within one mile of all valve, meter and compressor stations including residential, educational, health care and religious structures; historic and cultural sites; and, parks and recreational areas.
- In addition to meeting standards, the project must perform a “Noise BACT” analysis to demonstrate that noise impacts (and increases in existing sound levels) have been minimized to the greatest extent feasible. This approach is consistent with that required by MADEP for industrial projects that require air permits. The number of “noiseimpacted” residents must also be included in the compressor station site alternatives analysis.

Water Resources

- In addition to quantifying the number and water quality classification of waterbodies crossed, the EIS must assess construction techniques and the resultant impact on water quality. Horizontal directional drilling should be required for all surface water crossings.
- In addition, the long-term permanent impact of loss of vegetation that provides important shading of the water bodies must be addressed, including impacts on aquatic habitat associated with loss of shade, and indirect thermal impacts on the ability of waterbodies to support cold water fisheries.
- The impact of the pipeline on subsurface hydrology must be evaluated in terms of changes in groundwater flow patterns, particularly in portions of the pipeline route that cross areas largely dependent of private wells.
- Creation of new linear features, such as pipelines, can create conduits for migration of groundwater contaminant migration. The EIS must include an assessment of areas with contaminated soil and/or groundwater traversed and the resultant impact on known or suspected contaminant plumes.

Wildlife Habitat

- The route crosses several areas that are designated as Areas of Critical Environmental Concern (ACECs). The route alternatives analysis must explore routes that avoid or at least minimize such crossings. In areas where an ACEC is crossed, such as along the Fitchburg Lateral, avoidance of ACEC impacts by locating the pipeline in existing roads or other existing cleared ROWs must be considered.

- In areas where wildlife habitat crossing cannot be avoided, the direct impacts of habitat loss must be quantified along with indirect impacts of habitat alteration on species abundance and diversity.
- Areas of mapped priority habitats must be surveyed for the presence of protected species as part of the impact analysis as well as for consideration in the assessment of route alternatives.
- The cumulative impacts of extensive tree clearing along new and expanded rights-of-way must be quantified particularly on species of bats including the northern long-eared bat, which has recently been listed as endangered by USFWS.
- Invasive Species: Indirect impacts on native plant and animal species through the introduction of invasive species must be assessed. Project plans for avoidance of the introduction of invasive species must include assessment of the historical effectiveness of those plans from previous projects.
- Habitat fragmentation: The EIS must evaluate the direct and indirect effects of habitat fragmentation in areas where forested stands will be transected by the pipeline route.

Historical and Archaeological Resources

- Section 4.4.2.3.5 indicates that only two previously recorded historic resources aged 50 or older (bridges on West Meadow , Table 4.4-44) were identified in the segment of the Fitchburg Lateral in Middlesex County. The proposed lateral would cut directly between two late 18th or early 19th century homes on Main Street. No mention was made of these two homes. At least one other home on West Meadow is also more than 50 years old and deserves investigation and it is likely that others along the route in Townsend also exist.
- No mention was made of any potentially historic properties in Worcester County on this lateral. Are there any in Lunenburg or was Lunenburg overlooked?
- In assessing impacts to all 50 year or older structures, Kinder Morgan must include visual impacts including impacts of views from the structures and impacts on vistas towards the structures.
- Since most of the proposed Fitchburg Lateral is in new rights of way on previously undeveloped areas, the project proponent should be required to complete Phase 1a and 1b archaeological investigations along the entire route.
- How come so much of the Correspondence and Overviews cited in the Resource Reports (Volume III Appendix CC, Volume III Appendix DD and Volume III Appendix EE) are contained in materials that have not been made public?
- How does lack of survey permission affect cultural resource investigations? How can cumulative impacts be determined and compared to other alternatives without understanding this critical information.

Economics and Land Use

- Kinder Morgan spokespeople have claimed that New England consumer's gas and electric bills could see a 25-30% reduction in their bills if the NED project is built. This needs to be specifically quantified and links to sources used for these projections need to be supplied.
- Socioeconomic impacts need to be provided on a community by community basis rather than the county-wide basis supplied in the Resource Reports. For example, potentially significant impacts to a small community such as Townsend, MA may be lost when the impacts are instead attributed and compared to the much larger Middlesex County, MA.
- Much of the region affected by the proposed project relies on tourism. The impact of pipeline construction on scenic, recreational and historical resources and the secondary impact on tourism must be quantified. This includes permanent impacts as well as impacts during construction.
- Kinder Morgan must quantify the number of state parks, state forests and privately conserved open spaces crossed by the route and describe and quantify the impacts to those parcels and justify why these important resources cannot be avoided.
- The EIS must describe the consistency of the project with national, state, regional and local land use plans.

- The EIS should quantify all impacts for new and expanded rights-of-way based on the underlying land use identified by the affected communities. How much of the proposed routes are in areas zoned residential, commercial and industrial? How much is in areas protected for historical, rural or visual resources?
- The EIS should identify what new development and land use regulations should apply to areas near the proposed route.
- The EIS should describe and quantify expected reductions in property value to properties along and near the proposed route including specific reductions in property value due to visual and noise impacts.
- With the increasing number of pipeline incidents over the past decade, it is likely that insurers will be reviewing cost and coverage of properties near pipelines. Kinder Morgan needs to address how potentially impacted landowners will be compensated for the increased insurance costs that may result.

Reliability and Safety

- Kinder Morgan needs to provide a quantitative analysis of the economics and safety concerns about placing the proposed pipe at just 3 feet below grade in most cases (and even shallower depths in areas of bed-rock) while MA building codes specify that building foundations and other structures should usually be a minimum of 4 feet below grade.
- The EIS needs to provide an analysis of expected depth to frost level across the route and potential impact of frost heaves on pipeline, valve, meter and compressor station facilities.
- Kinder Morgan is proposing to cut across many rural areas and the company is proposing to just meet the bare minimum standards for pipeline construction and valve station placement in these areas. Because New England is already a densely populated region and because new development is likely to occur in these now rural areas, FERC should require Kinder Morgan to meet Class 4 requirements for pipe construction and valve placement in all new and expanded rights of way.
- Kinder Morgan must address the safety improvements that could be addressed by enclosing in structures all above ground pipeline facilities including all valve, meter and compressor stations.
- Kinder Morgan must provide a detailed emergency response plan for every community along the pipeline route including all those with any land area within the potential impact radius. The emergency response plans must include
 - Advance and continued training for first responders
 - Adequate equipment and supplies for first responders
 - Evacuation routes for potentially impacted areas
 - Identification of and plan for evacuation of vulnerable or hard to evacuate people.
 - Communication plans including communications to the affected public as well as communication with local first responders and other state and local officials.

Thank you again for the opportunity to provide scoping comments. I would be happy to address any questions or provide clarification.

Most sincerely,
 Carolyn Sellars
 Townsend, MA

Federal Energy Regulatory Commission

10-7-2015

Tennessee Gas Pipeline Company's Northeast Energy Direct Project
 Docket No. PF14-22-000

To whom it may concern,

Destroy our lands to sell gas overseas? This letter is to protest the plan to construct a high-pressure natural

gas pipeline through Southern New Hampshire.

I own a house on Gap Mountain Road in Jaffrey, NHs (166 Gap Mountain Road, Jaffrey NH). My property is in close proximity of the proposed pipeline location.

This pipeline is planned to transect a number of highly sensitive environmentally unique and protected areas and an emergency situation could easily occur based on the bad track record of Kinder Morgan, the company involved in the construction of this pipeline. As a consequence a disaster could arise and not only large environmentally important areas could be destroyed and polluted with toxins but also farmland and related properties of local landowners. I also want to emphasize that the construction of the pipeline will permanently alter the rural aspect of our area and will make it look more like Eastern New Jersey.

Neither Massachusetts nor NH need more energy at this moment and this situation will only become better due to increased development of solar and wind energy. Thus, I am very surprised that the market path of this pipeline ended up traversing New Hampshire so far to the North. If the gas is coming from Mid Atlantic or Southern States, why is it not possible to ship it from a port in New Jersey or even further south?

It seems likely that this project was only possible because in Southern NH the locals are unimportant people without political clout in contrast to the people in Massachusetts, where construction of this pipeline was recently successfully prevented. It also does not help that the current governor probably was paid off by the utility companies and is not interested in helping us to veto this project. This is especially infuriating because it is obvious that this pipeline is not needed. I am aware that the construction of this pipeline is proposed, because Kinder Morgan plans to export natural gas from a base north of Boston or from Maine. Clearly, NH residents will have no benefit from this ill-conceived project, to the opposite-, our electrical bills will go up, because somebody has to pay for the construction of this pipeline.

Thus, I see the construction of this pipeline as an attempt of Kinder Morgan solely to increase their revenues by forcing people unassociated with any aspect of this project (and do not profit from it) to agree with their demands. The least one would expect is that the decision about the construction of this pipeline should be decided by a citizen's referendum.

Sincerely,

Heinz G. Remold

Professor of Medicine, Harvard University, Boston, MA

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, D.C. 20426

OFFICE OF ENERGY PROJECTS

In Reply Refer To:

OEP/DG2E/Gas Branch 3

Tennessee Gas Pipeline Company, LLC

Northeast Energy Direct Project

Docket No. PF14-22-000

§ 375.308(z)

October 8, 2015

Mr. J. Curtis Moffat

Deputy General Counsel and Vice President

Gas Group Legal

Tennessee Gas Pipeline Company, LLC

1001 Louisiana Street, Suite 1000

Houston, TX 77009

Re: Comments on the July 24, 2015 Draft Resource Reports

Mr. Moffat:

The enclosure contains the comments of the FERC staff on Tennessee Gas Pipeline Company, LLC's (Tennessee Gas) draft environmental resource reports (RRs) filed on July 24, 2015 for the planned Northeast Energy Direct Project (Project). The comments ask for clarifications of discrepancies and identify missing information that we believe necessary to begin substantive preparation of the draft environmental impact statement for the project. In addition, Tennessee Gas should address all of the comments filed in the public record by other federal, state and local agencies; as well as stakeholders regarding the draft environmental resource reports.

You should be aware that Tennessee gas needs to address all comments within the attached enclosure as well as all comments received during the scoping period. Any omission of content relevant to these comments may affect the Project schedule after the application is filed. If Tennessee Gas cannot provide the necessary information in its application, Tennessee Gas should clearly state the timing for all supplemental information.

To facilitate review of the application, Tennessee Gas should include a matrix that identifies the specific locations in the RRs (i.e., section and page number) where the information requested in these comments may be found.

When filing documents and maps, prepare separate volumes as outlined on the Commission's website at <http://www.ferc.gov/help/filing-guide/file-ceii/ceii-guidelines.asp>. Any plot plans showing equipment or piping details or other Critical Energy Infrastructure Information should be filed as non-public and labeled "Contains Critical Energy Infrastructure Information – Do Not Release" (18 CFR 388.112). Cultural resources material containing location, character, or ownership information should be marked "Contains Privileged Information – Do Not Release" and should be filed separately from the remaining information, which should be marked "Public."

Thank you for your attention to this matter. If you have any questions, please contact me at (202) 502-8097.

Sincerely,

Eric Tomasi

Environmental Project Manager

Office of Energy Projects

Northeast Energy Direct Project (Project)

Docket No. PF14-22-000

Comments on Revised Draft Resource Reports

Resource Report 1 – Project Description

1. General – Include all information listed in Resource Report (RR) 1 (or in the Responses to Comments on Draft Resource Reports matrix) listed as pending, “will be addressed in the final ER,” or “TBD” (or include a schedule for submittal) in the July 24, 2015 Resource Reports, which includes, but is not necessarily limited to:
 - a. updated aerial imagery for the Project area;
 - b. status of wetland and waterbody field surveys and site-specific waterbody and wetland plans and associated crossing techniques;
 - c. site-specific residential construction plans for all relevant areas;
 - d. detailed construction schedule showing Project components by year (e.g., 2017, 2018);
 - e. identification of additional delivery points and description of any associated metering and regulation facilities;
 - f. updated discussions between Tennessee Gas and the other utility entities regarding co-location. State specifically whether these individual entities would allow Tennessee Gas to use portions of their existing rights-of-way for construction, operation, or both and define any potential physical constraints (e.g., guy wires). Where existing rights-of-way would not be shared, indicate whether the NED Project would directly abut the existing corridor. Include a fully descriptive table, with explanations and details included that lists each area where a generally co-located Project segment would temporarily deviate away from other co-located utilities due to the existence of obstacles. Based on the results of these discussions, both for other utilities unwilling to share their right-of-way as well as for physical obstacles, indicate whether (and where) the proposed Project centerline and associated workspaces would have to be modified;
 - g. evaluations (including details of ongoing discussions with regulatory agencies) regarding the feasibility of additional horizontal directional drills (HDDs) in sites containing forested wetlands with an impact of more than 0.5-acre per crossing or in sites containing any high quality or specially designated forested wetland;
 - h. evaluations regarding the potential for using HDDs at all major waterbodies and sites where waterbody crossings would be greater than 30-feet-wide and a dry construction method is not feasible, as well as at all waterbodies listed as sensitive or high quality;
 - i. evaluations regarding whether Tennessee Gas would install communication towers as part of the Project, and, if so, describe their location and features;
 - j. updates regarding the identification and full description of any non-jurisdictional facilities associated with the Project including potential service for water, sewer, telephone, internet/data, or other utilities at aboveground facilities. If there are any non-jurisdictional facilities that would be built as a result of the new gas volumes associated with this Project, include the following detailed information for each facility:
 - i. company/owner;
 - ii. type of facility;
 - iii. dimensions (pipe diameter, length, horsepower, etc. as appropriate for pipeline and land area for other facilities);
 - iv. maps showing locations;
 - v. federal permits required and their status;
 - vi. status of local and state permits required; and
 - vii. any environmental reviews required for local, state, or federal permitting authorities.
 - k. an updated table listing the deviations that Tennessee Gas is requesting from the FERC Upland Ero-

sion Control, Revegetation, and Maintenance Plan (Plan) and Wetland and Waterbody Construction and Mitigation Procedures (Procedures) including the section number of the Plan or Procedures for the requested deviation, a description of the deviation itself, justification for the deviation, and a description of how the deviation would provide equal or greater mitigation. Additionally, provide a summary table stating how each State Environmental Construction Plan (ECP) differs from one another and from the FERC Plan and Procedures; and

1. summary of scour analysis, and a cross-reference to where the detailed scour analysis discussion is provided in appropriate RRs.
2. Section 1.1.1 (page 1-10) – Include, to the extent known, the possible uses of the Project’s end-users/ customers for the gas capacity created. If possible, break down (by delivery point) the current known customer and/or use (e.g., electric generation, residential use/consumption, local distribution, industrial/manufacturing, manufacturing precursors).
3. For each delivery lateral, identify the volumes of gas that would be delivered and identify the delivery points/customers.
4. Section 1.1.1 (page 1-10) – Include a list that identifies local distribution companies (LDCs) and their service areas that have expressed direct interest in receiving natural gas from the Project. In addition, list any other LDCs that are viable candidates to potentially receive natural gas from the Project.
5. Section 1.1.2.2.1 (page 1-30) – Identify the overall parcel size for each proposed compressor station.
6. Provide public versions of the compressor station site plans that identify workspaces, fencelines, cleared areas and general location of compressor station components.
7. Section 1.2.4 (page 1-62) – As requested in our May 15, 2015 Environmental Information Request (EIR), indicate whether forests, wetlands, waterbodies, or other sensitive resources would be affected by use of the contractor yards. Update RRs 2 and 3 appropriately.
8. Section 1.3.1.1 (page 1-83) – As requested in our May 15, 2015 EIR, describe any special measures that would be employed to prevent post-restoration slips and landslides in steep terrain. In addition, describe the process for how rocks that might roll off the construction right-of-way beyond the reach of equipment positioned on the right-of-way would be retrieved.
9. Section 1.3.1.13 (page 1-81) – As requested in our May 15, 2015 EIR, describe the source or type of source of imported soils during restoration and plans to address associated issues such as the spread of invasive plant species, soil type compatibility, and rock content.
10. Section 1.3.2.2 (page 1-84) – Confirm that pre- and post-construction testing of groundwater would include any spring (not just wells) if requested by the landowner. List the specific water quality parameters or suites of parameters that would be analyzed for wells and springs.
11. Section 1.3.2.2 (page 1-85) – Clarify how Tennessee Gas would assess and repair damage to private or public roads caused by the Project-related traffic from heavy trucks and equipment, not just from the actual road crossings themselves. Confirm that Tennessee Gas would ultimately be responsible for any Project-related damage to roads, not its contractor.
12. Section 1.3.2.5.2 (page 1-86) – As requested in our May 15, 2015 EIR, discuss whether Tennessee Gas, in certain circumstances, may be able to pull back an HDD section in sub-sections, thereby increasing flexibility, minimizing the false right-of-way, and precluding the requirement of pulling one continuous section. If feasible, identify the specific crossings where this method would be employed.
13. Section 1.3.2.6 (page 1-89) – As requested in our May 15, 2015 EIR, include a discussion regarding whether blasting would be used in areas of limestone or karst geology. Note that karst geology is not discussed in the blasting management plan and that blasting is not discussed in the karst mitigation plan.
14. Discuss the feasibility of alternate methods of rock excavation/removal other than blasting by rock type.
15. Section 1.4.3 (page 1-97) – For each cathodic protection facility, provide any identification number, as-

sociated access road (if applicable) including directional orientation to the road, approximate length and width of the facility, area affected, and associated land use type.

16. Section 1.5 (page 1-122) – As requested in our May 15, 2015 EIR, provide a description of work/upgrades that would take place at Station 319 due to the planned/proposed Susquehanna West Project.
17. It has come to our attention that areas where the pipeline would abut powerline right-of-ways may not be fully cleared of trees. Indicate if existing trees within the powerline right-of-ways would need to be cleared and indicate this additional clearing in the resource report impact tables as a separate line-item.
18. Provide updated micro-routing along the planned powerlines for areas where the pipeline would need to move away from the existing right of way due to constructability or other issues.
19. Consult with land managing agencies, state and local planning agencies, and other appropriate entities to identify past, present, and reasonably foreseeable future in the potential resource Region of Influence that could be affected by the NED Project, as indicated in the table below. The projects should include, but not be limited to: industrial or commercial facilities; mines; FERC jurisdictional projects; intrastate pipelines and compression; gathering pipelines; gas processing facilities; gas wells, industrial; infrastructure development (roads, bridges, rail, etc), housing developments, etc.

Include a table that identifies:

- the project(s) type/name and county;
- approximate distance and direction of the project(s) from the proposed NED Project facilities;
- a description of the project(s); and
- the current status and schedule of the project(s) (e.g., proposed for December 2016, under construction, completed).

Question 19 (continued)

Environmental Resource: Region of Influence

Surface Waters, Wetlands, Groundwater, Vegetation, Wildlife and Fisheries, Soils: Hydrologic Unit Code 10 Watersheds.

Cultural Resources: Overlapping impacts on historic properties.

Land Use (including visual and residential): 1/2 mile from construction work areas. For other projects that impact more than 10 acres of land, use 5 miles.

Noise - Operation: Other facilities that would impact any noise sensitive area (NSA) that is within 1 mile of a planned NED compressor station.

Noise - Construction: 1/4 mile from pipeline or aboveground facilities. Horizontal direction drill or direct pipe installation – 1/2 mile.

Air Quality - Operation: Provide an inventory of proposed and reasonable foreseeable air emission sources within 50 kilometers of the compressor stations, documenting their location, distance from the proposed project, estimated or permitted emissions for each criteria pollutant in tons per year and identify the potential incremental cumulative impacts of the Project. This does not include greenhouse gas emissions.

Air Quality - Construction: 1/4 mile from pipeline or aboveground facilities

Socioeconomics: Affected counties.

Geology: 1/4 mile from pipeline or aboveground facilities

Resource Report 2 – Water Use and Quality

20. General – Include all information listed in RR2 as pending or “TBD” (or include a schedule for submittal), which includes, but is not necessarily limited to:

- k. discussion regarding groundwater classification in the New Hampshire portion of the Project, post-consultation with New Hampshire Department of Environmental Services;
 - l. locations of new compressor stations and associated potential impacts to groundwater;
 - m. location of public and private drinking water wells and springs located within 150 feet of any Project workspace area;
 - n. avoidance and mitigation measures that would be taken around wellhead protection areas (WHPAs);
 - o. exact locations of pipe yards and contractors yards, as well as their potential resource impacts including wetlands and waterbodies;
 - p. impact avoidance, minimization, and mitigation measures for waterbodies containing fisheries resources and how timing restrictions on those waterbodies may influence the Project schedule;
 - q. locations of all potable water intakes within 3 miles downstream of any proposed waterbody crossing;
 - r. sensitive public water supply watersheds;
 - s. hydrostatic test water quantity needed, as well as discharge location;
 - t. field survey results and wetland delineation reports;
 - u. identification of wetland impacts associated with each facility;
 - v. wetland mitigation provisions;
 - w. State Wetland Classifications; and
 - x. wetland-specific crossing methods.
21. General – Include justification for all modifications to the Commission’s Procedures including but not necessarily limited to:
- y. section 2.3.5.1 (page 2-96) site-specific locations of additional temporary workspace (ATWS) within 50 feet of wetlands; and
 - z. table 2.3-12 (page 2-161) – any site-specific locations where a construction workspace greater than 75 feet would be utilized in wetlands.
22. Section 2.1 (page 2-2) – In the groundwater descriptions, include a detailed description of the aquifers in each state including the names, beginning and ending mileposts (MPs) for each crossing, confining layers, principal use, depth to water, and general water quality. Update table 2.1-2 to include aquifer name, well depth, and yield. Include a discussion on stratified drift and granite aquifers and potential impacts and mitigation.
23. Section 2.1.1.1.1 (page 2-2) – Discuss construction/operations precautions that would be implemented near WHPAs as well as any mitigation measures that may be required by WHPA managers. Provide updated correspondence with the Town of Wilmington regarding the Zone 1 WHPA that would be crossed by the pipeline.
24. Section 2.1.1.2.1 (page 2-3) –This section states that “New York also has a Wellhead Protection Program Plan (“WHPP”), which is consistent with New York policy on WHPAs, but is not a regulation.” Clarify whether Project construction and operation would be conducted in accordance with the WHPP.
25. Section 2.1.1.2.3 (page 2-7) – Define the groundwater designation ‘Class GA.’ Clarify whether this classification includes all groundwater or just potable groundwater.
26. Section 2.1.5 (page 2-16) – Define “water supply protection area” in table 2.1-2. Does this include both groundwater and surface water drinking supply areas? Be sure to specify whether the water supply protection area is for a groundwater source or surface water source.

27. Section 2.1.6 (page 2-27) – Include a discussion of potential aquifer impacts resulting from ground disturbing activities (e.g., HDD drilling, blasting). Include mitigation measures for potentially affected springs and aquifers. Identify alternative water sources if water supplies are impacted.
28. Section 2.1.6 (page 2-27) – Include a discussion on trench dewatering; include specific locations where dewatering would be required or anticipated to be required.
29. Section 2.2 (page 2-28) – Identify all surface waterbodies crossed within karst-prone areas and their crossing methods.
30. Section 2.2 (page 2-28) – Update tables 2.2-4, 2.2-5, 2.2-6, 2.2-7, and 2.2-8 showing waterbodies that would be crossed by the Project to include new information on correct crossing width, crossing method, and timing restrictions. Clarify whether crossing length and bank width are the same.
31. Section 2.2 (page 2-28) – Update tables 2.2-5, 2.2-7, and 2.2-8 to provide fishery type designations and timing restriction data for all waterbodies that would be crossed by the Project in New York, New Hampshire, and Connecticut. Include relevant citations along with an estimated timeline for the provision of this information, if it is not currently available.
32. Section 2.2 (page 2-28) – For each waterbody greater than 100 feet wide, the default construction method should be a HDD, direct pipe, or similar techniques. If one of these techniques is not feasible:
 - aa. describe why an HDD or similar method is not possible;
 - bb. provide a site-specific crossing plan; and
 - cc. provide a mitigation and restoration plan.

For crossings of major waterbodies that would be completed using in-stream and open water construction (e.g., clamshell dredging), provide the results of sediment modeling indicating the predicted fate and transport of excavated or dredged sediments. Describe the models that were used; the assumed ambient average and range of total suspended sediments in the waterbody; the anticipated direction, duration, and concentration of sediment plumes during construction; and the anticipated extent and depths of redeposited sediments on the riverbed or seabed.

33. Section 2.2.1 (page 2-28) – Provide mitigation measures for all public water supply watersheds and reservoirs including but not limited to the Pennichuck Brook Watershed, the Cobleskill Reservoir System, and the Metropolitan District Commission’s public drinking water supply watersheds.
34. Section 2.2.5 (page 2-41) – Identify all areas with known or potentially contaminated sediments.
35. Section 2.2.6 (page 2-43) – Provide a table of all public drinking water supply watersheds, surface water reservoirs, and WHPAs. In the table, include crossing length or distance of each protected surface water supply from the project. Indicate if a waterbody crossing would be within 3 miles upstream of any potable water supply intakes. Specify details regarding the public usage of each of the protected surface waters identified. Identify appropriate mitigation measures within surface water protection areas (SWPA). Identify the government entities that manage the SWPAs within the Project area. Discuss local management/protection strategies and restrictions for SWPAs.
36. Section 2.2.6 (page 2-43) – Include mitigation measures for all water supply areas within 150 feet of the Project area. Confirm whether Tennessee Gas would file a post-construction report describing any complaints received regarding water supply (aquifer, wells, and springs) quality and yield and how those complaints were resolved.
37. Section 2.2.7 (page 2-48) – Include data for hydrostatic test pressure, volume (in gallons) of hydrostatic test water by specific source location (waterbody and MP), the expected month water would be withdrawn and discharged, and source alternatives. Include proposed treatment and/or disposal method for treated discharge water. Include specific locations of the test water discharges. Include a Hydrostatic Test Plan.

38. Section 2.2.9 (page 2-52) – Provide updated information and consultations with state agencies on sensitive waterbodies and identify mitigation measures for potential impacts to sensitive waterbodies and fisheries.
39. Section 2.3 (pages 2-67 through 2-100) – Update section to include results from wetland field surveys. Provide the Wetland Delineation Reports.
40. Section 2.3 (pages 2-67 through 2-100) – Provide information regarding potential impacts on wetlands from the construction and operation of aboveground facilities, access roads, and contractor yards.
41. Section 2.3 (pages 2-67 through 2-100) – Clarify how construction wetland acreages were calculated for all construction-related tables. In each wetland table, include specific construction right-of-way widths for each wetland crossed and note any wetlands with irregular workspaces, which could expand impacts beyond merely calculating length multiplied by width.

Resource Report 3 – Fisheries, Wildlife, and Vegetation

42. General – Include all information listed in RR3 as “pending” or “TBD,” or specify when it will be filed. This includes, but is not necessarily limited to:
 - dd. all updated consultation information and documentation for information received after May 2015;
 - ee. a discussion of potential Project-related impacts on interior forest and edge forest habitats that includes acreage by forest habitat type, and figures of the interior forest blocks that would be crossed by the Project;
 - ff. results of field surveys conducted to characterize the natural landscape at the proposed Appalachian Trail crossing, as well as a crossing plan for the same location;
 - gg. a list of common or representative plant species found in the Project area;
 - hh. a list of vegetative community types in the Project area based on National Land Cover Database mapping;
 - ii. the results of vernal pool surveys conducted for the Project area with a detailed impact assessment on vernal pools potentially affected by the Project. Include the locations and timing of any ongoing and/or future vernal pool surveys;
 - jj. a discussion of potential construction and operation impacts on vegetation outside the pipeline construction right-of-way associated with any aboveground facilities and appurtenant facilities (mainline valves [MLVs], pig launchers, and receivers), temporary and permanent access roads, pipe and contractor yards, cathodic protection systems, and alternating current mitigation systems;
 - kk. the results of surveys for protected species and their habitat, including vegetative communities of special concern within the Project area, along with any updates to the locations, timing, and reporting schedule of ongoing or future surveys;
 - ll. a seeding plan (or plans) for the stabilization of construction areas;
 - mm. a discussion of the potential construction and operation impacts on migratory bird species of special concern and their habitats that contains:
 - i. an evaluation of the potential direct, indirect, and cumulative impacts on these species along with the impacts’ expected duration (short-term, long-term, or permanent);
 - ii. Project-specific conservation measures and best management practices developed in consultation with the U.S. Fish and Wildlife Service (FWS) to avoid and minimize impacts on these species; and
 - iii. documentation of the relevant consultations with the FWS.

43. General – Provide information regarding the extent of improvement (e.g., paving, widening, etc.) that would be necessary for all access roads proposed to pass through significant or sensitive wildlife habitats.
44. General – Provide a discussion of invasive insects (e.g., emerald ash borer, Asian long-horned beetle) known to be problematic within the Project area. The discussion should include a description of the insects, their occurrence within the Project area, any quarantine areas that would be crossed by the Project, any potential impacts of the Project on invasive species populations and distribution, and measures to avoid and minimize potential adverse impacts due to invasive insects associated with the Project.
45. Section 3.1.3 (pages 3-15 and 3-16) – Expand upon, and provide citations for, the discussion of the potential effects on the survival and fitness of fish and aquatic wildlife resources associated with the removal of riparian vegetation at stream crossings and the duration of these effects. Include the expected timeframe within which invertebrate populations would recolonize the crossing area to pre-construction conditions.
46. Section 3.1.4 (page 3-18) – Include a discussion about the potential effects of HDD crossing methods on riparian habitat at all waterbody crossings. Include a discussion of potential HDD crossing impacts on the floodplain forest habitat at the Farmington River.
47. Section 3.1.4 (page 3-18) – Comments from the U.S. Army Corps of Engineers and FWS (April 24, 2015 and May 15, 2015, respectively) suggest planting trees during restoration in places where forested vegetation would be removed adjacent to waterbody crossings. Clarify whether or not Tennessee Gas would comply with this request to plant trees at applicable waterbody crossings. The Project would cross more than 400 miles of vegetated land, which could cause a reduction in the populations of honey bees and other pollinators.
48. Section 3.1.4 (page 3-18) - Describe the feasibility of adding seeds that support pollinators into the mixes used to restore construction workspaces. Provide copies of Tennessee Gas' consultations with the relevant federal and/or state regulatory agencies, and update the state-specific ECPs, as necessary. Include any measures that would protect pollinators in the ECPs, which could include, but is not limited to, removal of invasive species by more manual or mechanical means rather than chemical (herbicides/pesticides).
49. Section 3.2.2.3.7 (page 3-39) – Provide an explanation regarding why the Project centerline would not be co-located immediately adjacent the existing utility right-of-way located in the Montague Plains Wildlife Management Area (WMA; i.e., the proposed Project route is separated from the existing right-of-way by an approximately 100- to 140-foot strip of primarily forested habitat). Discuss any impacts the Project would have on the use of prescribed fires to manage habitat at the Montague Plains WMA and other similarly managed areas. Discuss potential impacts that prescribed burning in the vicinity of the Project could have on Project construction and operation.
50. Section 3.2.2.5.3 (page 3-48) – Discuss the potential Project-related impacts on wildlife habitat and vegetation at Talcott Mountain State Park and explain why the proposed 120-foot crossing of this park could not be avoided.
51. Section 3.2.3.1 (page 3-51) – Include a more detailed discussion, with citations from recent literature, on the potential effects of the Project on wildlife movement and displacement, including examples of specific species that may be affected depending on the time of year, the relative sensitivity of the species, and seasonal habitat selection.
52. Section 3.2.3.1 (page 3-51) – Discuss potential impacts on wildlife associated with air pollution and heat generated from the operation of Project aboveground facilities.
53. Section 3.2.3.1 (page 3-51) – Include a more detailed discussion, with documentation from agency consultations, of the steps Tennessee Gas would take to avoid and minimize impacts on wildlife,

including but not restricted to:

- nn. minimization measures for habitat fragmentation impacts, including those on forest interior dwelling species;
 - oo. timing restrictions on tree removal and how Tennessee Gas would handle tree removal with regard to tree-clearing restrictions in the Migratory Bird Treaty Act;
 - pp. whether or not Tennessee Gas would conduct tree surveys prior to tree removal (e.g., to assess presence of nesting sensitive and/or rare species); and
 - qq. measures Tennessee Gas would take to minimize Project impacts to smaller species of wildlife (e.g., falling into or becoming trapped in open trenches).
54. Section 3.2.3.1 (page 3-51) – Discuss whether Tennessee Gas would conduct 24-hour or nighttime operations using artificial lighting that could cause disturbance to nocturnal wildlife, including bats. Identify mitigation measures to minimize impacts.
55. Section 3.2.3.1 (page 3-51) – Discuss and provide citations from recent literature:
- rr. the expected timeframes for the revegetation of Project areas that would be allowed to revert back naturally to their original condition. Include timeframes for all vegetative community types that would be impacted;
 - ss. the likely successional progression of vegetation and wildlife at the sites during these timeframes based on the restoration actions followed in Tennessee Gas’ Plan; and
 - tt. the effects of these successional changes on wildlife species that are likely to be present at the sites (i.e., pre-construction).
56. Section 3.2.3.1 (page 3-51) – Clarify whether wetland restoration plans would be developed for the restoration of wetlands affected by the Project. If so, include the plans or identify the schedule for when they would be provided.
57. Section 3.3.2.4.1 (page 3-75) – Provide the location of the Emergent Marsh – Shrub Swamp natural community system near Cheshire, New Hampshire relative to the Project and discuss potential impacts on the system, if applicable.
58. Section 3.3.2.4.1 (page 3-76) – Identify the location of the Mixed Pine-Red Oak Woodland natural community in Hillsborough County, New Hampshire relative to the Project along with a discussion of potential impacts on the community along with mitigation measures, as applicable. Clarify whether avoidance of the Red Maple – Sensitive Fern Swamp that would be crossed by the Project in Hillsborough County, New Hampshire has been considered as a measure to avoid impacts to this natural community system.
59. Section 3.3.4.1 (page 3-80) – Tennessee Gas has stated that it plans to clear all approved workspace areas. Clarify whether or not any trees within an approved workspace would be saved (i.e., not felled) and include a description of the circumstances in which this would occur.
60. Section 3.3.4.1 (page 3-80) – For felled trees that inadvertently land in waterbodies or outside of the right-of-way that cannot be removed immediately, provide measures that would be taken to prevent adverse impacts associated with the fallen vegetation from occurring to resources or landowners prior to its removal along with an estimated timeline for its removal.
61. Section 3.3.4.1 (page 3-80) – Include a discussion of the wildlife habitat that could be provided by if landowners or land-management agencies requested timber stacks and clarify whether or not the use of timber stacks is proposed as a mitigation measure to offset impacts on wildlife habitat.
62. Section 3.3.4.2 (page 3-80) – Clarify whether or not the disposal/removal of chipped woody vegetation would be held to the same state-specific and U.S. Forest Service guidelines as firewood with regards to preventing the spread of invasive insects (e.g., the emerald ash borer).
63. Section 3.4.1.3 (page 3-88) – Clarify the rationale for the assertion that no impacts would occur to

the significant natural community of the Emmond Pond Bog Preserve.

64. Section 3.4.2.1.7 (page 3-103) – Discuss measures that Tennessee Gas would implement to avoid, minimize, or mitigate impacts to eagle nests, should any nests be found during the pre-construction surveys.
65. Section 3.4.2.2.3 (page 3-106) – Identify measures that would be taken to minimize or avoid impacts on the three Massachusetts state-listed plants identified by the Natural Heritage and Endangered Species Program (NHESP) as Species A, B, and C due to their sensitivity to collection.
66. Section 3.4.2.2.3 (page 3-106) – Discuss and provide citations from recent literature on the effects electroshocking on fish may have if used as a method for relocation as suggested by the NHESP (e.g., stress response to electroshocking, effects on survival and fitness). Discuss feasible and/or preferable alternative methods of relocation.
67. Section 3.4.2.2.5 (page 3-108) – Clarify whether or not Tennessee Gas would attempt to retain large-diameter coniferous and deciduous trees to minimize long-term impacts on the hoary and silver haired bats, as recommended by the Connecticut Natural Diversity Data Base. If this measure would be implemented, discuss the process by which Tennessee Gas would determine whether to retain or remove such trees.
68. Section 3.4.2.2.5 (page 3-108) – Clarify whether or not Tennessee Gas would adhere to the Connecticut Department of Energy and Environmental Protection recommendations listed in section 3.4.2.2.5 to avoid/minimize potential impacts on the eastern ribbon snake, state-listed plants, threatened and endangered mussels, the blue-spotted and Jefferson salamanders, grassland bird species, and the pine barren tiger beetle.
69. Identify if any of the FWS offices involved (Pennsylvania, New York, and New England) have identified a lead office for consultation purposes.
70. Figure 3.2-1 (figure 4 of 11) – For the portion of the Fitchburg Lateral between MPs 5.0 and 14.0, explain the feasibility of avoiding BioMap2-mapped sensitive resources by adjusting the route to cross nearby areas with few to no mapped resources.

Resource Report 4 – Cultural Resources

71. Section 4.2.1 and Appendix DD – Include all new and previously unfiled correspondence, meeting notes, phone logs, or emails between Tennessee Gas and the State Historic Preservation Offices (SHPOs).
72. Section 4.2.2 and Appendix EE – Include all new or previously unfiled correspondence, meeting notes, phone logs, or emails between Tennessee Gas and interested Indian tribes.
73. Section 4.2.2 – Include an update on the status of on-the-ground cultural resources surveys conducted by Indian tribes along the proposed pipeline route, organized by pipeline segment (with mile-posts) including the state-county-tribe-miles inventoried and survey results. If tribal surveys are not completed in time for the application, provide the schedule for when all pending survey results will be filed.
74. Attachment 4a – File comments from the SHPOs and Indian tribes on Tennessee Gas’ Draft Unanticipated Discovery Plans, and revised state-specific plans that address those comments.
75. Include copies of the Project-specific cultural resources Overview and Survey reports that cover the entire direct area of potential effect and meet the requirements outlined in sections V. and VI. of the FERC’s Office of Energy Projects Guidelines for Reporting on Cultural Resources Investigations for Pipeline Projects (December 2002 version). Document that Tennessee Gas also submitted copies of these reports to the appropriate SHPOs, interested Indian tribes, and FERC-designated other consulting parties, and file comments on the reports. If Tennessee Gas’ surveys are not completed in time for the application, provide the schedule for when all pending survey results will be filed.

76. Include a response to the January 15, 2015 letter from the town of Wilmington, Massachusetts expressing concerns about impacts to the town-owned Colonel Joshua Harden Tavern and Museum. Indicate if the Project would affect this site, including the distance between the pipeline and the building, and discuss any necessary measures to avoid or minimize impacts.
77. Include a response to the February 5, 2015 letter from Carol Iodice of Mason, New Hampshire expressing concerns about impacts on the historic Pickity Place restaurant. Indicate if the Project would affect this site, including the distance between the pipeline and the building, and discuss any necessary measures to avoid or minimize impacts.
78. Include a response to the February 17, 2015 letter from Phoebe Bushway expressing concerns about impacts on the West Street and Hilltop cemeteries in Plainfield, Massachusetts. Indicate if the Project would affect these cemeteries, including the distance between the pipeline and the cemetery boundaries, and discuss any necessary measures to avoid or minimize impacts.
79. Include a response to the May 25, 2015 letter from Mark Wolterbeek expressing concerns about impacts on the Rindge, New Hampshire Smallpox Cemetery. Indicate if the Project would affect the cemetery, including the distance between the pipeline and the cemetery boundaries, and discuss any necessary measures to avoid or minimize impacts.
80. Include a response to the July 28, 2015 letter from the town of Northfield, Massachusetts expressing concerns about impacts on the Swan and Sites homesteads within the Northfield Bush Mountain Conservation Area. Indicate if the Project would affect these sites, including the distance between the pipeline and the site boundaries, and discuss any necessary measures to avoid or minimize impacts.
81. Include a response to the July 28, 2015 letter from Susan Williams expressing concerns about impacts on the New Ipswich, New Hampshire Center Village Historic District. Indicate if the Project would affect the Historic District, including the distance between the pipeline/aboveground facilities and the District boundaries, and discuss any necessary measures to avoid or minimize impacts.
82. Include a response to the August 12, 2015 letter from the town of Deerfield, Massachusetts expressing concerns about impacts on the historic site of Old Deerfield. Indicate if the Project would affect this site, including the distance between the pipeline and the site boundaries, and discuss any necessary measures to avoid or minimize impacts.
83. Include a response to the August 13, 2015 letter from the town of Dalton, Massachusetts expressing concerns about impacts on the Upper Housatonic Valley National Heritage Area. Indicate if the Project would affect this area, including the distance between the pipeline and the area boundaries, and discuss any necessary measures to avoid or minimize impacts.
84. The following people stated that they reside in historic houses near the pipeline route: Lawrence DeVito of Mason, New Hampshire; Kathleen Rose of Merrimack, New Hampshire; Kaela Law of Pelham, New Hampshire; Lester Garvin of Ashfield, Massachusetts; Tina Hanson of Rindge, New Hampshire; Libby Reilly of Nassau, New York; Robert Borden of Fitzwilliam, New Hampshire; Elizabeth Tatro of Lanesborough, Massachusetts; Peter LeCount of Mason, New Hampshire; Barbara Markessinis of Hancock, Massachusetts; Holly Woodward of Fitzwilliam, New Hampshire; John Angleman of Ashfield, Massachusetts; and Peter Cottrell of Stephentown, New York. Indicate if the Project would affect those houses, including the distance from the edge of the construction work area to each building, and discuss any necessary measures to avoid or minimize impacts.

Resource Report 5 – Socioeconomics

85. General – Include all information listed in RR 5 or the Responses to Comments on Draft Resource Reports matrix as pending or “TBD” (or include a schedule for submittal), which includes, but is not necessarily limited to:
 - uu. section 5.8 (page 5-12) – Environmental Justice discussion for aboveground facilities. Include a

- table that includes a breakdown of minority and low-income populations near each facility;
- vv. section 5.8 (page 5-12) – Environmental Justice discussion for both pipeline and aboveground facilities at the municipal level; and
- ww. section 5.9.1 (table 5.9-1) – Include the estimated increase in property tax revenues and the estimated yearly escalation for Hampden County, Massachusetts.
86. Section 5.1.3 (page 5-4) – The text states that there would be a peak workforce of 5,247, that 50 percent of workers would be non-local, and that none of the non-local workers would bring families. Clarify how the estimated temporary population increase of 3,000 is calculated.
87. Section 5.4 (page 5-11) – Specify the contractor yards and “Park-N-Ride areas” that would be used for parking and discuss traffic management and mitigation measures at these areas. For the public Park-N-Ride areas, discuss their capacity and their ability to accommodate the extra vehicles and still provide parking to the public.
88. Section 5.9.1 (page 5-23) and Section 5.9.2.1 (page 5-25) – Clarify the local expenditures during construction.
- xx. page 5-23 lists the estimated expenditures by non-local workers on local goods and services as \$38,027,439 and also lists the estimate for locally purchased construction materials as \$38,027,439. Confirm whether these estimates are identical and the basis for the calculations.
- yy. page 5-25 lists the estimated expenditure by workers in the local communities as \$64,713,600 during construction. Clarify the difference between this estimate and the estimated expenditure of non-local workers of \$38,027,439 that is stated in section 5.9.1. Explain how each of these estimates is calculated.
89. Section 5.9.1 (table 5.9-1) – Clarify how the “Estimated Escalation” column is calculated.
90. Develop a traffic and transportation plan that provides an estimate of the anticipated number of vehicles, trips, travel routes, and timeframes for construction. Break the construction estimate down by activity (e.g., stringing, water hauling). Describe in detail the pipeline construction vehicle traffic and potential impacts, especially when road closures would be required and an explanation of why a reasonable detour could not be used. Include a section addressing safety and how access would be provided to residences, businesses, and schools during detours and road closures.
91. Provide documentation of consultation with the various affected agencies and commercial businesses within each county impacted by construction. Describe any recommendations by the various agencies and landowners in how to alert the public of construction and any requirements regarding minimizing impacts related to construction.
92. Estimate direct tax base benefits for each township/county along the pipeline route and for above-ground facilities.

Resource Report 6 – Geological Resources

93. General – Include all information listed in RR 6 as pending or “TBD” (or include a schedule for submittal), which includes, but is not necessarily limited to:
- zz. state mine database data for Massachusetts, New Hampshire, and Connecticut;
- aaa. the completed table, discussion, and additional requested information for oil and gas wells as specified in the Responses to Comments on Draft Resource Reports matrix;
- bbb. potential blasting areas by MP;
- ccc. Unanticipated Discovery Plan (with regards to paleontological resources); and
- ddd. soil liquefaction analysis for the proposed Project in Connecticut.
94. General – Include a geotechnical review of the high-resolution aerial photographs along the Project that are known or may contain hazards resulting from steep slopes, potential landslides, and potential

karst topography. The review should be conducted by a geotechnical engineer or certified geologist to provide the extent of the areas where hazards exist (or may exist) to Project construction and operation by MP. Identify mitigation measures to avoid and minimize potential impacts of the Project on these conditions as well as avoiding and minimizing the impacts of these conditions on Project construction and operation.

95. Section 6.3 (pages 6-37 through 6-39) – Include a table and discussion of oil and gas wells located within 0.25 mile of the pipelines, ATWS, aboveground facilities, and access roads by MP. Include the following information:
- eee. the total number of active, inactive (plugged), and proposed wells that would be within 0.25 mile of the Project;
 - fff. measures that would protect any well and/or oil/gas gathering pipelines that may be located within the working area and/or located proximal to the working area; and
 - ggg. measures that would be taken if any unknown and unmapped wells are encountered during construction.
96. Section 6.4.2.7 (pages 6-49 through 6-53) – Include the following information with regards to seismic risk:
- hhh. the specific standards that Tennessee Gas would design the pipeline to meet associated with seismic hazards;
 - iii. mitigation methods and pipeline design criteria that would be used to prevent damage to the pipeline and minimize hazards from the pipeline in the event of a significant seismic event; and
 - jjj. a table of past seismic events with a magnitude of 3.0 or greater that have occurred within 100 miles of the Project, including their magnitude, date, and distance from the proposed Project by state.
97. Table 6.4-3 (page 6b-95) – Identify any quaternary or Holocene faults crossed by the proposed Project and provide a class category for the listed faults. Identify if the faults are class A, B, C, or D within the U.S. Geological Survey fault data base, and include the age and when the most recent movement or displacement occurred for each.
98. Section 6.4.4.7 (page 6-60) – Include the following information with regards to karst terrain.
- kkk. specify if blasting would be conducted in areas of karst topography and provide a discussion of potential contamination due to blasting in karst terrain and mitigation measures;
 - lll. identify who would be responsible for identifying karst features and terrain during construction;
 - mmm. specify if contractors and Environmental Inspectors would be trained to identify karst features;
 - nnn. a discussion of the affects blasting may have on deeply fractured granite aquifers, such as those located near Merrimack and Hall, New Hampshire. Include a discussion of potential contamination of fractured granite bedrock aquifers; and
 - ooo. a discussion of groundwater contamination due to blasting and the compounds used in blasting. Include a discussion of mitigation measures that would be used.
99. Section 6.4.6.4 (page 6-71) – Due to the moderate seismic hazard in New Hampshire, confirm whether the soils crossed by the Project in New Hampshire are prone to soil liquefaction.

Resource Report 7 – Soils

100. General – Include all information listed in RR 7 as pending or “TBD” (or include a schedule for submittal), which includes, but is not necessarily limited to:
- ppp. total acres that would be affected by Project construction and operation including active agricultural land, fallow agricultural land/field, managed forest land, and open field/open land;

- qqq. data regarding stony/rocky soils crossed by the Project;
- rrr. the Spill Prevention, Control, and Countermeasure Plan and Stormwater Pollution Prevention Plan;
- sss. data on soils with a low revegetation potential that would be crossed by the Project; and
- ttt. vulnerable soils tables in the state-specific ECPs.

101. General – In addition to the detailed tables provided in RR 7, include summary tables that identify soil limitations that would be impacted by construction and operation of the Project. Provide a separate table for each type of Project component including pipeline facilities, aboveground facilities (including compressor stations, meter stations, and MLVs), access roads, ATWS, and contractor yards. Include both construction impacts and operational impacts in acres for all Project facilities. Provide impacts for the following: soil limitations, potential water erosion, potential wind erosion, stony rocky soils, shallow depth to bedrock, potential soil compaction, poor revegetation potential, poor drainage potential, and prime farmlands (including farmlands of statewide importance).

Example Summary Table.

Facility	Soil Limitation	
	Const	Operat
<u>Pipeline Facilities</u>		
Loop 317-3	Total acres	Total acres
Loop 319-3	Total acres	Total acres
Wright Pipeline	Total acres	Total acres
Pipeline Total	Pipeline Total Construction Impact	Pipeline Total Operational Impact

102. General – Include the following information in each of the state-specific ECPs:
- uuu. the mitigation measures that Tennessee Gas would use in soils that have a high stone and rock content;
 - vvv. the procedures and measures developed in coordination with the appropriate state and local agencies to prevent the introduction or spread of invasive species, noxious weeds, and soil pests resulting from construction and restoration activities;
 - www. the procedures and measures developed in coordination with or recommended by the appropriate state and local agencies with regard to erosion control and revegetation specifications; and
 - xxx. the procedures and measures developed in coordination with or recommended by the appropriate state and local agencies with regards to drain tiles, irrigation systems, and grazing deferment.
103. General – Include a detailed discussion on ground heaving and frost heaving and any potential hazards it might pose to the Project. Include areas along the proposed Project where ground heaving may be encountered, frost depths along the proposed pipeline route, and mitigation measures, or pipeline design elements that would be used in locations where ground heaving is a possibility. Include a discussion of ground heaving and frost heaving at aboveground facilities.
104. General – Include a discussion of stony/rocky soils and include this soil limitation along with shallow depth to bedrock in tables 7.1-1, 7.1-2, 7.1-3, 7.2-1, 7.3-1, and associated summary tables.
105. Section 7.3 (page 7-5) – Include a summary table of impacts to prime farmlands and farmlands of state wide importance. Include total acres that would be affected by Project construction and operation for active agricultural land, fallow agricultural land/field, managed forest land, and open field/open land.

Impacts on Prime Farmlands and Farmlands of Statewide Importance (in acres) etc

{example table omitted}

106. Section 7.4.1 (page 7-7) – Include a discussion of the mitigation measures and pipeline design that would be used in the Schoharie Valley, which is known to be commonly flooded, and the Ponemah Bog Sanctuary where burial of the pipeline could disrupt drainage, and acidic conditions could affect the pipeline.
107. Section 7.5.1 (page 7-11) and Appendix K (page K-72) – This section states that erosion control barriers would be installed immediately after soil disturbance while the state-specific ECP states that erosion control such as silt fence and hay bales would be installed following perimeter brush clearing. Clarify this apparent discrepancy.
108. Section 7.5.2 (page 7-12) – This section states that phase two of soil decompaction involves use of a paratill to loosen the soil profile to a depth of 20 to 22 inches after topsoil replacement. However, section 7.5.3 (page 7-13) states that the top 12 inches of soil would be segregated and kept from mixing with subsoil. Clarify that the actions in phase two of soil decompaction would not mix topsoil with subsoil.
109. Section 7.5.4 (page 7-14) – Specify what measures Tennessee Gas would use to mitigate impacts to agricultural land and prime farmlands and identify under what conditions they would be used.
110. Attachment 7B Table 7.3-1 (page 7b-284) – Include the following information:
- yyy. soil limitation ratings for all soil limitations including potential water erosion, potential wind erosion, stony rocky soils, shallow depth to bedrock, potential soil compaction, poor revegetation potential, poor drainage potential, and prime farmlands (including farmlands of statewide importance);
 - zzz. soil limitations ratings for all soils that would be affected by Project construction, not just agricultural and residential areas;
 - aaaa. classify soils as having a poor drainage potential if the drainage potential is listed as poor or worse;
 - bbbb. classify soils as having shallow depth to bedrock if bedrock is at a depth of 5 feet or less from the ground surface;
 - cccc. classify soils as being stony/rocky if 20 percent of the surface layer consists of rock fragments greater than 3 inches;
 - dddd. classify soils as having a poor revegetation potential if soils have a capability class of three or greater, have a low water capacity, or if slopes are greater than 8 percent; and
 - eeee. specify the criteria used to determine the potential of a soil to be eroded by wind and/or water.
111. Attachment 7B (Table 7.1-1) – Several soil series including but not limited to Holly Soils, Udifluvents, cobbly, and Medisaprists have a revegetation potential listed as N/A. Confirm whether or not the revegetation potential is not applicable for each of these soil series, and, if so, identify why the revegetation potential is not applicable.
112. Appendix K, State Specific ECPs (General) – Include the mitigation measures and construction techniques that would be used when construction would take place in vulnerable soils such as fragipans (e.g., table 5.6-3).

Resource Report 8 – Land Use, Recreation and Aesthetics

113. General – Include all information listed in RR 8 as pending or “TBD” (or include a schedule for submittal), which includes, but is not necessarily limited to:
- ffff. section 8.1.3 (page 8-10) – Include locations, lengths, and any proposed improvements of additional access roads;
 - gggg. section 8.1.4 (page 8-10) – Update contractor yard information once landowner permissions are obtained;

- hhhh. section 8.1.6.2 (page 8-22 and table 8.1-8) – Include updated information on agricultural drain tile locations;
- iiii. section 8.2.1 (page 8-33 et seq.) – Include updated correspondence with planning agencies, along with information regarding locations of planned development and mitigation measures;
- jjjj. section 8.2.2 and Appendix P (page 8-40 et seq.) – Include results of field verifications of building locations and include all site-specific residential construction plans for residences within 50 feet of the construction work area;
- kkkk. section 8.3 (page 8-47) – Include updated information regarding the location, distance crossed, and affected acreage on all public and recreational lands and special land uses;
- llll. section 8.3.1 and Section 8.3.2 (page 8-48 et seq.) – Include further correspondence with agency staff regarding public conservation lands and natural, recreational, or scenic areas. Add details regarding existing resources, impacts, and mitigation measures;
- mmmm. section 8.3.2.1.2 (page 8-88) – Describe methods that would be used to avoid or minimize impacts on the Connecticut River Byway based on consultation with the Massachusetts Department of Transportation;
- nnnn. section 8.3.2.1.3 (page 8-88) – Identify the proposed crossing methods for the Westfield River and assess the land use impacts of this crossing;
- oooo. section 8.3.2.2.1 (page 8-89) – Include additional methods that would be used to avoid or minimize impacts on the Viaduct Valley Way based on consultation with the Pennsylvania Department of Transportation;
- pppp. section 8.3.2.2.2 (page 8-89) – Include results of consultation with the New York State Department of Transportation and assess impacts as appropriate;
- qqqq. section 8.3.3 (page 8-91 et seq.) – Include further correspondence with agency staff. Add details regarding existing resources, impacts, and mitigation measures based on communications with staff and any other sources;
- rrrr. section 8.3.4.1.2 (page 8-101) – Document whether the Project would affect the West Street Cemetery in Plainfield and identify mitigation if applicable;
- ssss. section 8.3.4.1.3 (page 8-102) – Specify how impacts on the Rindge Smallpox Cemetery would be avoided;
- tttt. section 8.3.4.2.4 (page 8-104) – Specify how impacts on Birches Academy Charter School would be avoided or minimized;
- uuuu. section 8.3.4.3 (page 8-104 to 8-106) – Update discussion with the results of surveys, correspondence, and discussions with state agencies and landowners related to specialty crop, organic, and tree farms. Complete table 8.3-7. Specify how Tennessee Gas would avoid or minimize impacts;
- vvvv. section 8.3.6 (page 8-106) – Include updated information regarding hazardous wastes obtained from online sources and agencies;
- wwww. section 8.4.2.2 (page 8-116) – Include a site-specific analysis of impacts from construction and operation of the meter stations, including the dimensions of new meter stations and their sites;
- xxxx. section 8.5 (page 8-117) – Include results of consultations with applicable federal and state agencies;
- yyyy. attachment 8b (Table 8.1-6) – Add information to the “Modification Required” column. Also identify the widths of new roads;
- zzzz. attachment 8b (Table 8.2-2) – Add information to the Line List/Tract and Number Building

Type columns;

- aaaaa. attachment 8b (Table 8.3-8) – Provide conclusions for those sites still under evaluation. For those sites where impacts are proposed to be unlikely, explain why they are unlikely and what measures would be implemented should impacts occur; and
- bbbbb. appendix F – Include the updated aerial imagery as noted on the alignment sheets and identify the source of the updated information.
114. Section 8.3.1.1.2 (page 8-54) – Confirm that the Appalachian Trail would be crossed using the bore method or describe how impacts would be mitigated should the open cut method be required.
115. Section 8.3.1.1 (page 8-64 and 8-72) – Specify crossing methods for both the Wapack Trail and trails within the Wind Blown Cross Country Ski Area in New Hampshire. Discuss impacts to recreation including whether or not trails would be able to remain open and include methods that would be used to mitigate these impacts.
116. Section 8.3.2.1.4 (page 8-89) – Identify any Land and Water Conservation Fund properties that would be crossed by the pipeline and describe the impacts and appropriate mitigation based on consultation with the appropriate agencies.
117. Section 8.3.3 (page 8-91) – In addition to the lands enrolled in Federal and State conservation land programs, specify the locations and acreages of all deeded conservation easements that would be crossed by the Project, and describe restrictions in the easements and whether or not the Project will comply with the easements. Discuss how effects would be mitigated if conditions in the easements cannot be met.
118. Section 8.3.5 (page 8-106) – Identify all facilities within the New York coastal zone management area.
119. Section 8.4.1 (page 8-109) – Provide the length of the pipeline route through each of the visually sensitive areas listed in section 8.4.1.1 through 8.4.1.16 and list the acreages affected by duration (e.g., temporary, long term, permanent).
120. Section 8.4.1.13 (page 8-113) – Discuss how visual resource impacts would be minimized at water-body crossing, especially scenic waterbodies such as the Deerfield River whether an HDD is successful or not at this location.
121. Section 8.4.2.1 (page 8-114) – Provide a description of the dimensions of the proposed compressor stations and the sites on which they would be located. Describe the visual characteristics and topography of the surrounding area for each site. State whether each compressor station would be visible from public vantage points or from residences and what the impacts would be from locating the compressor station in this area. Describe whether existing terrain or vegetation would screen views. Describe whether additional mitigation measures would be used to reduce the visual impacts by compressor station.
122. Section 8.4.2.1.4 (page 8-114) – Discuss why the Supply Path Tail Station would result in a change in visual quality. Describe how restoration would successfully mitigate this impact.
123. Section 8.4.2.1.5 (page 8-115) – Correct the number “1,550400,” which appears to be a typo.

Resource Report 9 – Air and Noise Quality

124. Section 9.1 (page 9.3) – Indicate the horsepower for each proposed compressor turbines, and identify at each new and modified compressor station (manufacturer, model, etc). In addition, identify all other air-emission producing equipment at the compressor stations.
125. Section 9.1 (page 9.3) – Indicate whether any compressor station is within 62 miles of a federal Class I area, and if so, discuss potential impacts and mitigation.
126. Section 9.1.2.4 (page 9-18) – Include detailed descriptions of any state or local greenhouse gas emission reduction regulations or initiatives, and how the Project would impact compliance with

them.

127. Section 9.1.2.5 (pages 9-19 to 9-23) – Include a summary of air quality regulations pertaining to construction of the pipeline for all states, or verify that no related provisions would apply to Project construction. For Massachusetts, New Hampshire, and Connecticut that have maintenance areas in the Project area, include a discussion of provisions that would be applicable within the maintenance area, or verify that no related provisions would apply to the Project.
128. Section 9.1.3.2 (page 9-25) – Provide the emission rate of criteria pollutants (NO_x, CO, SO₂, PM₁₀, PM_{2.5}, VOC), greenhouse gases (GHG), and speciated hazardous air pollutants from all the equipment at the proposed compressor stations (engines, turbines, dehydrators, generators, boilers, tanks, fugitive methane emissions, etc.) expressed in tons per year for maximum operating conditions. Include supporting calculations, emission factors, fuel consumption rates, and annual hours of operation.
129. Section 9.1.3.2 (page 9-25) – For each compressor station, estimate the number of yearly releases, the amount of volatile organic compounds (VOC) and GHG released per blowdown in tons per year, indicate whether the blowdown would be installed with a silencer and estimate the noise impact at the nearest noise sensitive areas (NSA).
130. Section 9.1.3.2 (page 9-25) – Provide an air quality screening (AERSCREEN) analysis of each compressor station demonstrating that emissions of criteria pollutants do not result in exceedance of the National Ambient Air Quality Standards (NAAQS), SILs or state standards. Include all input parameters (emission rate, stack height, stack temp, exit velocity, etc.) and justify bases for any assumptions. For any facility requiring refined modeling for an air permit using refined modeling (AERMOD or EPA-approved alternative), provide the impacts for all criteria pollutants (regardless of state permit requirements), modeling protocol, a narrative describing and justifying the modeling basis all inputs (MET data, terrain data), and all input and output files.
131. Respond to public comments regarding local human health impacts from HAPs and air toxic emissions from the planned compressor stations.
132. Section 9.1.3.2 (page 9-25) – Discuss whether odor from the compressor turbines would be detectable beyond the compressor station site and what methods Tennessee Gas would implement to prevent odor.
133. Section 9.1.3.3 (page 9-25 to 9-29) – As the construction emissions are very close to the General Conformity Thresholds for specific nonattainment areas, provide a Plan that would ensure emissions would not exceed the applicability threshold. This plan may include issues such as ensuring only newer equipment is used, tracking hours, tracking fuel use, etc.
134. Section 9.1.4.1 (pages 9-30 and 9-31) – Include specific details on:
 - cccc. how Tennessee Gas would ensure that contractors and employees minimize vehicle and equipment idling time;
 - dddd. what maximum speeds would be on unpaved roads; and
 - eeee. how Tennessee Gas would determine when application of water is warranted to control dust in active construction zones.
135. Section 9.1.4.2 (page 9-30) – Include a discussion on the potential to generate crystalline silica as fugitive dust from granite excavation and how Tennessee Gas would monitor and control such dust.
136. Section 9.2.1.2 (pages 9-32 to 9-35) – Identify the local and state nuisance-based noise ordinances and vibration ordinances for all areas in which a pipeline or compressor station would be located, and indicate how Tennessee Gas would address each one during both construction and operations.
137. Section 9.2.2 (pages 9-36 to 9-50) – Ensure that the acoustical analysis for the compressor stations includes:

fffff. step-by-step supporting calculations or identification of the computer program used to model the noise levels, the input and raw output data, far-field sound level data for maximum facility operation, the source of the data, and all assumptions in running the model; and

ggggg. sound pressure levels all noise generating equipment, and for un-muffled engine inlets and exhausts, engine casings, and cooling equipment, dynamic insertion loss for all mufflers, sound transmission loss for all compressor station building components (including walls, roof, doors, windows and ventilation openings), sound attenuation from the station to the nearest NSA, the manufacturer's name, the model number, the performance rating, and a description of each noise source and noise control component.

hhhhh. Topographic maps identifying the location of the NSAs in relation to the compressor station.

138. Section 9.2.2 (pages 9-36 to 9-50) – Include a discussion on what measures Tennessee Gas would implement to ensure that vibration impacts would not result in a perceptible increase in vibration.
139. Section 9.2.2.2.1 (page 9-35) – For the noise survey conducted on December 8 and 9, 2014 at the NSAs near Station 319, provide time of day, weather conditions, wind speed and direction, and other noise sources. Provide copies of the original contractor noise survey reports.
140. Section 9.2.5 (page 80) – Identify whether HDD activities would occur on a 24-hour basis, and the approximate time required for each drill (days/weeks).
141. Section 9.2.5 (page 9-80) – Include specific details on what measures Tennessee Gas would implement to mitigate HDD noise. State that effort would be made to mitigate noise prior to offering relocation.
142. Section 9.2.5 (page 9-80) – Include a section on blasting noise.
143. Section 9.2.6 (page 9-82) – Include a description of the frequency of anticipated blowdown events by type of blowdown (maintenance, capped, full-station, etc) as well as the likelihood of an unscheduled pipeline blowdown event. This discussion should include the cause and frequency of a blowdown event, associated noise and emissions, and the approximate time it would take to evacuate gas from the pipeline.
144. Section 9.3 (page 9-82) – Provide a discussion on climate change.

Resource Report 10 – Alternatives

145. General – Include all information listed in RR 10 (or in the Responses to Comments on Draft Resource Reports matrix) listed as pending, “will be addressed in the final ER,” or “TBD” (or include a schedule for submittal), which includes, but is not necessarily limited to:
- iiiiii. additional data categories in all alternatives comparison tables for miles or feet of expected side-slope construction (including data for both moderate and severe side slope), shallow bedrock, karst geology, landslides, numbers of landowners affected, residences located within 125 and 250 feet of any proposed work area, miles/acres of interior forest, streams with drinking water use designation, important bird areas, and Audubon forest blocks of importance;
 - jjjjj. a list of the “other shippers” mentioned in Section 10.1;
 - kkkkk. a detailed comparative analyses specifically assessing viable alternative crossing locations (i.e., viable for the proposed route) for the Appalachian Trail to minimize visual, usage interruption, and other potential impacts. Discuss and document coordination with the National Park Service and other relevant stakeholders regarding the proposed Trail crossing and alternatives;
 - lllll. a discussion regarding the feasibility of using waste heat electric generation (cogeneration) for the proposed turbines at the proposed compressor stations. Provide the rate of electricity potentially generated on a kilowatt/month basis and compare this with the amount of electricity used by the compressor station(s) per month. Describe the average load factor of the facility and any impediments that would prevent the operation of the compressor station continuously

at 60 percent minimum load. Compare the size of the electric transmission line necessary under the current proposal with what would be required under a cogeneration system with return to the electric grid;

mmmmm. a discussion of the feasibility of using electric-motor-driven compressors at the proposed new compressor stations. Provide the rate of electricity required and the number of electric motors required. Compare the size of the electric transmission line necessary under the current proposal with what would be required for the electric motors. Demonstrate why this is not feasible in areas where the planned compressor stations would be along an electric transmission powerline;

nnnnn. a comparative alternatives analysis for all of the other (non-compressor station) permanent, aboveground facilities such as meter stations and MLVs where appropriate, such as where there could be visual or noise impacts to sensitive receptors; and

ooooo. additional analyses for the Existing Line 200 Alternative combined with the New York Alternative as well as the Massachusetts Turnpike Alternative combined with the New York Alternative. Indicate the number of miles of looping, and additional compression that would be required to handle the current 1.3 bcf proposed.

2. Include a description of cumulative and/or overlapping impacts these projects and the planned NED Project would have on each environmental resource. Also include descriptions of the measures that would be implemented to minimize these impacts. Lastly, include a map showing the identified projects in relation to the planned NED Project. In addition, this cumulative discussion should include any available information on regional predictive climate change effects and the resultant cumulative impact on resources and on the planned NED Project.

146. Section 10.2 (page 10-9) – As requested in our February 27, 2015 EIR, provide a table of all of the pipeline systems reviewed in Section 10.2, including both existing (such as Tennessee 200 and 300, Millennium, Transco Leidy, Iroquois, Algonquin, M&NP/PNGTS Joint, Granite State, and M&NP) and proposed systems. Consider whether pipeline segments or facilities from different system alternatives could be combined into viable hybrid system alternatives.

147. Section 10.2 (page 10-10) – As requested in our May 15, 2015 EIR, include an evaluation of the facilities, equipment, and processes that would be required to transport a Project-equivalent volume of natural gas from the supply area to the destination locations via the alternative mode of railway. Provide this analysis, as well as the similar analysis completed for truck delivery included only in the Response to Comments matrix, within RR 10 as well.

148. Section 10.2.2 (page 10-14) – Tennessee Gas states that the Constitution Pipeline Project currently has shippers that have subscribed for 650,000 dekatherms per day (Dth/d). Tennessee Gas states that it anticipates that this transportation capacity may be increased to an additional 650,000 Dth/d, resulting in an estimated maximum transportation capacity of 1,300,000 Dth/d. However, the Constitution Pipeline Project Final EIS, states that the estimated maximum transportation capacity would be 850,000 Dth/d based on information provided by Constitution. Revise the associated discussion based on this data for maximum transportation capacity for the Constitution Pipeline Project.

149. Section 10.3 (page 10-18) – Evaluate and provide updated, comprehensive analyses of any reasonable system, major route, or minor route alternatives that was suggested by the public or agencies, as well as the feasibility of those alternatives. List and describe the rationale for any of these alternatives that were determined to be unreasonable and dismissed without evaluation.

150. Section 10.3 (page 10-18) – As requested in our February 27, 2015 EIR, evaluate the constructability of the proposed NED route where it would be co-located with existing pipelines in steep terrain and where the most suitable location for construction may already be encumbered, thereby potentially precluding co-location. Identify any such specific areas where co-location would not be possible. Further, identify and describe any other potential constraints associated with co-location with other

pipelines or electrical transmission lines including side slopes, urbanized areas, or other factors. Where the Project would be co-located, overlapping, and/or abutting with existing rights-of-way, indicate where (and for what distance) deviations away from the individual existing rights-of-way would be required due to the avoidance of constraints. As applicable, discuss how the avoidance of constraints could affect the reported co-location data.

151. Section 10.3.1.1 (page 10-20) – In May 2015, Constitution filed numerous proposed modifications to its routes with its implementation plan. Clarify whether NED has incorporated, is incorporating, or is researching these proposed modifications regarding its proposed route and identify any associated environmental, engineering, landowner, or other constraints that may be associated with NED’s general co-location with the Constitution Pipeline project.
152. Section 10.3.1.1.4 (page 10-28) – As requested in our February 27, 2015 EIR. where the proposed route deviates significantly away (at least 0.5 mile) from the original Northeast Exchange Alternative for at least 1 mile, provide detailed mapping as well as a tabular analysis and comparison of the two routes with particular emphasis regarding the avoidance of potential constraints associated with co-location with the Constitution Pipeline.
153. Section 10.3.2 (page 10-32) – As requested in our February 27, 2015 EIR, update RR 10 to include at least one alternative for each segment of the proposed Project, such as the Peabody Lateral as well as the Concord Delivery Line and Maritimes Delivery Line (outside of alternatives presented within and as part of the Wheeler Road alternatives as appropriate).
154. Section 10.3.1.10 (page 10-52) – As requested in our February 27, 2015 and May 15, 2015 EIRs, provide comparison tables that include the number of subject properties crossed as well as the total crossing length(s) for the Article 97 Avoidance and Co-location Route Alternatives, list and describe the subject properties in RR 10, and depict the subject locations in mapping as well. Clarify why in figure 10.3-12 (and in the text in section 10.3.1.10) these two alternatives do not appear to be connected to the proposed route at their western terminus instead of potentially connecting with the proposed route near MP 13. Describe the pending potential impact avoidance (such as HDD), minimization, and mitigation measures that could be used to address impacts to Article 97 properties. Report and document the status of Tennessee’s ongoing consultations with the Massachusetts agencies regarding possible mitigation.
155. Section 10.3.3 (page 10-57) – Provide updated, comprehensive tables 10.3-14 and 10.3-15 containing all stakeholder-, landowner-, and agency-requested minor route deviations. In addition, address any stakeholder comments where a minor route deviation may not be specifically requested, but where a specific resource concern (e.g., Project proximity to a home, well, spring, wetland, future residential development, etc.) is identified that would potentially benefit from a resource avoidance/impact minimization analysis by Tennessee Gas. Clarify why the two above-referenced tables contain a total of 77 assessments, but Tennessee Gas reported that they had examined over 100 minor route deviations. Evaluate and consider routing, workspace, and construction method alternatives as appropriate. Confirm that the analyses were based on direct stakeholder discussions and on-site evaluations, if the landowner was willing, and on available desktop imagery and data if landowner access was denied. Provide additional data columns for individual tract/parcel number (i.e., matching LL numbers from the list of affected landowners) and also indicating whether the stakeholder’s specific concerns have been fully resolved. If the requested reroute was rejected or if the stakeholder’s concerns have not been fully resolved, then provide a clear and complete explanation. Clarify the statement “not adopted due to co-location with powerline.” Update the status for all deviations listed as “pending” in the July 24, 2015 filing. Confirm that Tennessee Gas will provide regular updates of this table as appropriate throughout the course of the project.
156. Section 10.3.2.4 (page 10-61) – Provide the purpose and context for the Amherst, New Hampshire alternative routes. Indicate whether Tennessee Gas has finalized its pending decision regarding the

possible adoption of Amherst alternative route 1 and provide the rationale for the decision.

157. Section 10.3.2.5 (page 10-66) – Provide data comparison tables for all alternatives discussed, such as for the Wheeler Road alternatives.
158. Section 10.3.3.2 (page 10-67) – As requested in our February 27, 2015 EIR, provide documentation of consultation with Massachusetts agencies to identify and evaluate agency requested minor route deviations for Areas of Critical Environmental Concern (ACEC) and provide alternatives comparison tables. List and describe (including locations by MP and crossing lengths) the ACECs in RR 10, and depict them in mapping as well.
159. Section 10.4 (page 10-76) – The Constitution Pipeline Project has not yet begun construction. Evaluate the feasibility of a single pipeline alternative combining the NED project with the Constitution Pipeline project for the Supply Path Component, including under a theoretical scenario where initiation of construction of the Constitution Pipeline could be delayed until the fourth quarter of 2016 or the first quarter of 2017.
160. Section 10.7 (page 10-83) – Provide a detailed description, mapping, and comparative tabular analysis of at least one fully viable alternative for each compressor station site. Viability status would include at a minimum a potentially willing seller, the fulfillment of basic site requirements such as size, shape, topography, and existing use, road/utility access, and a minimal distance to the proposed route. Potential alternative sites summarily dismissed due to a lack of survey permission, inadequate size, and the lack of an existing agreement between the landowner and Tennessee Gas regarding the proposed site, for example, are not sufficient to avoid a robust alternatives analysis. Provide an alternatives environmental data comparison table for each viable potential site that includes at a minimum: parcel size, areal extent of construction, areal extent of operation, land use setting, zoning, prime farmland, protected species, cultural resources, wetlands, waterbodies, floodplains, noise sensitive areas (number, distance, and location/orientation), visibility, and any local air quality concerns.

Resource Report 11 – Reliability and Safety

161. General – Include all information listed in RR 11 (or in the Responses to Comments on Draft Resource Reports matrix) listed as pending, “will be addressed in the final ER,” or “TBD” (or include a schedule for submittal), which includes, but is not necessarily limited to the pending data regarding the location of high consequence areas.
162. Section 11.2.2 (page 11-6) – Clarify whether the natural gas in the Supply Path pipeline segment from Pennsylvania to the Supply Path Tail Station would be odorized and if not, describe why. Confirm whether or not the only other Project pipeline components that would not be odorized would be the Loop 317-3 and Loop 319-3.
163. Provide additional information on Tennessee Gas’s plans to train 1st responders and fire personnel regarding pipeline or aboveground facility incidents.
164. Indicate if Tennessee Gas would voluntarily build the pipeline to more stringent US DOT Class locations in Class I and Class II areas and/or reduce the distance between mainline valve locations.
165. Indicate the sensitivity of the leak detection equipment that would be installed for the pipeline system.
166. Indicate the feasibility of recapturing gas from unit blowdowns/blowoffs.

20151008-5005

John Leoutsacos, Temple, NH.
Laconia Citizen
Ginger Kozlowski
To the Editor

I'm writing to alert Laconia and the Lakes Region citizens about serious issues concerning the proposed Kinder Morgan / TGP / NED pipeline, slated to devastate 71 PLUS miles of southern New Hampshire. You may wonder why this matters to northern New Hampshire.

First, if approved Kinder Morgan will use the power of eminent domain to seize privately owned land for huge corporate profit! This abuse tramples traditional New Hampshire values, and is a corrupt use of federal power.

Secondly, the environmental destruction and hazards posed by pollution, fire and explosions will have catastrophic effects on an area heavily dependent upon tourism just as the lakes region.

To save New Hampshire we all need to stand strong and repel this invasion

Please call or write your elected officials and tell them to oppose the NED pipeline

20151008-5007

Rosemary L Wessel, Cummington, MA.

In my filing earlier today "Submission ID 610665", I had not previously noticed the date of the KM document filed with the recent New Hampshire Fish and Game docket filing. This was indeed during the time that the pipeline was sized at 36". Although the multiple local alternate routes currently being brought to various towns is still disconcerting, the concern over the different pipe diameter quoted in this document was indeed misplaced. Please disregard that portion of my posted comment.

20151008-5011

Evelyn Taylo, New Ipswich, NH.

The recent route change of NED through AMherst and Merrimack, NH shows total disregard for public safety. It passes through large businesses where thousands of people work, travel and shop every day. The disruption this proposal will bring is unimaginable. The choice demonstrate total disregard for proper analysis, conversation and transparency. This rush to enact this pipeline demonstrates Kinder Morgan/TGP are in a state of chaos. How can we trust a company in chaos to properly build, maintain and operate an enormous compressed gas pipeline in a responsible and safe manner? THis insanity must end. The FERC must order NO BUILD.

20151008-5012

Karen Ansaldi, Granby, CT.

This proposal, to put a natural gas pipeline on protected watershed property controlled by the MDC (Metropolitan District Commission) must NOT be allowed! This land is sacred - it ensures clean drinking water to much of Connecticut and that must never be endangered....it protects the health and safety of our citizens. CT has been vigilant in the past century about protecting our water supply and, as a result, we have very high quality drinking water. This absolutely must be preserved.

The thought of running a gas pipeline through this land is untenable. We would endanger the health of millions of CT residents simply so Tennessee Gas and Kinder Morgan can increase their profits.

Please STOP this project. DO NOT ALLOW a gas pipeline across MDC land.

20151008-5014

George W Doonan, Peterborough, NH.

Federal Energy Regulatory Commission

I would like to register my opposition to the proposed Kinder-Morgan pipeline being located in Southern New Hampshire.

I am opposed to the location of the pipeline for all the reasons already publicized i.e. safety, health concerns, and the fact that it does not serve New Hampshire in any way and was only chosen as an alternative site

after strong opposition from Massachusetts.

On a more personal level, I am opposed because the pipeline would cross a parcel of conservation land in Mason, New Hampshire known as the Doonan Conservation land donated by relatives. The land was owned by an uncle, William H. Doonan, a lifelong conservationist. As children he would invite us to join him each year as he planted thousands of tree saplings on the many parcels of land that he owned and cared and instilled in us a sense of responsibility for caring for the future of our forests.

William H. Doonan was a lifelong resident of New Hampshire, a former New Hampshire Legislator, and a well respected business and civic minded member of the Monadnock region. I am sure he would strongly oppose to the destruction and long lasting negative impact this project would have on New Hampshire.

Regards,

George Doonan

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

NED was diverted from Massachusetts into New Hampshire due to public opposition even though MA is a significant user of gas. NH hardly uses any gas, 4% of all New England, while Massachusetts uses 61% and if the pipe was deemed no good for MA then why should it suddenly be good for NH?

Thank you

Paul Stevens

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

It might interest you to know that the proposed Tennessee Gas / Kinder Morgan, New England Energy Direct (NED) pipe may not be so good for New Hampshire after all and here's why.

It was never intended for New Hampshire. It was intended for Massachusetts, but due to opposition, KM moved it north. So if it was not good for Massachusetts, why should it be good for New Hampshire?

We were told it will bring jobs. True, a pipeline will bring jobs to the region, but KM's claim of 3,000 jobs is a bit exaggerated. It's 3,000 jobs during peak construction, approx. 18-24 months, after that - five jobs.

However, a good portion of them will go to specialized workers, like pipeline welding crews from Oklahoma. Alternatively, dollar for dollar, jobs in efficiency and clean energy could provide 36,000 jobs for the same investment. LIUNA union workers are trained for clean energy and weatherization jobs as well. Some have stated they would rather work in these fields if more of them were available.

We were told the gas is for New Hampshire, but if that were true, why was the pipe planned for Massachusetts? KM states that they have 0.5 Bcf/day in contracts, but the pipeline capacity is 2.2 Bcf/day, leaving 1.7 Bcf/day extra. So where is all that extra going? They do NOT deny that they will take export contracts and new export terminals are coming online in Canada. Yet Kinder Morgan continues to deny the gas is intended for export. Furthermore, the only stated contracts in New Hampshire are with Liberty, a KM subsidiary

and even those contracts re in dispute. So is it right for KM to use eminent domain to take New Hampshire residents' land away (when most New Hampshire residents do not use gas) just so one company can sell that gas to foreign powers?

We are told that the pipe will lower domestic gas prices. However, the European market pays 2-4 times as much as US customers, and the Asian market pays 3-5 times as much. This can only drive up domestic prices.

We are told that new pipelines and gas-fired electricity plants are needed to replace the 8,300 MW of electric generation capacity that is being retired in the next few years. Ending the reign of nuclear, coal, and oil plants is a positive step, but replacing them with natural gas perpetuates dependency on fossil fuels and only gets in the way of renewables. Also, not all of the capacity retiring needs to be replaced with power plants. The cost of utility-scale solar has dropped 78% in the past five years, and renewables are now becoming economically competitive with gas.

Thank you

Paul Stevens

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

Most people would agree that war-mongering and war profiteering are bad things. Well, that's just what Kinder-Morgan wants to do. They claim the gas from NED is for New England, but such enormous capacity is only useful here a few days a year. So where is the bulk of it going?

David Goldwyn* of the Brookings Institution told the US Senate in March 2014, "This bounty (referring to the Marcellus fracked oil and gas fields) could enhance our national power by positioning our nation as a reliable supplier of natural gas to regions of the world that suffer from intimidation from their suppliers. The question before us is not whether we have this geopolitical potential, but whether we will realize it in time to help our friends and allies." Of course Goldwyn is talking about Putin riding roughshod over the Ukraine, and how leaders of Western Europe have done little to stop him because they are worried Putin will turn off the gas and oil. But think about it, we are not helping Europe by selling them more expensive gas. Rather, if they get an alternate source of gas, they may be emboldened to take a stand against Putin. And if Putin's ratings slip he may be tempted to take a few pot shots. And then we'll have to come to NATO's aid. And if you thought chasing terrorists around in the desert for years was expensive, wait until we start losing a few stealth bombers. Remember Malaysian Airlines flight 17? And don't forget that the New York Times reported on Sept. 6 2014, that the Brookings Institution receives millions in foreign funding so Goldwyn may not have American interests at heart.

Please don't let Kinder-Morgan (or anyone else) become an American war enabler. Please say no to NED.

Naturally, since the bulk of the gas is going overseas, there is little benefit to the people of New Hampshire, therefore, taking property by eminent domain is not justified. There is no greater good, only personal enrichment for gas companies and Kinder-Morgan.

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

The vast majority of the people living along the pipe route have rejected the pipe. It is morally wrong to forcibly take their land and ruin the landscape just so that a few people can get richer selling gas overseas. New Hampshire does not need or want this gas, not at this price.

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

We need to get away from fossil fuels, not add more. All that extra volume will enable war in Europe. The Pope has already called the conflict in Ukraine the seeds of WW III. Another company, Portland, has offered to use their existing capacity to feed New Hampshire's future growth needs over another route. If KM gets this pipe, their market share will grow past 25% and edge them towards monopoly, de-stabilizing the industry, allowing KM to fix prices.

Thank you

Paul Stevens

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

Please note that Distrigas has contracts that provide enough LNG to cover seasonal peaks in New England with no additional costs for new infrastructure. Also, the TGP/CT Extension pipeline and the AIM (Alconquin) pipeline are less costly, already approved, and will boost New England's supply by 10% and they are due in service by 2016, long before NED in 2018.

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

The real stuff, about safety and the taking of people's land by government is irrelevant to the Feds. The fact that there is a pipe accident almost once a week means nothing to them because pipes are presumed safe. The fact that compressor stations spew various toxins and waste gas routinely means nothing to FERC because the levels are all regulated. Just try to tell that to the hapless souls who are stuck living next to these 40,000 horsepower, jet-powered pumps. Many families will be down wind and close enough to hear this compressor station running 24/7. A group of cloistered Catholic Nuns will be right in the path of this monster. Pray for them.

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

In December 2014, Kinder Morgan chose to relocate a significant portion of the proposed 36-inch, 1460 PSI natural gas pipeline segment running from Hancock Township Massachusetts to Dracut Massachusetts out of Massachusetts and north into New Hampshire. They did this due to political pressure from the Massachusetts Governor and the Massachusetts Congressional Delegation. Consequently, the Boards of Selectmen of most towns along this new route established Task Force groups to determine the impact and need for this project. None of those groups have been able to demonstrate any significant benefit to the citizens of these towns that outweigh the detriments.

In addition, these groups generally feel that significantly extending this pipe out of Massachusetts and back into Massachusetts is gratuitous, and the taking of land for this purpose is unconstitutional especially when you consider how little of the gas (4%) will be consumed in New Hampshire, and indeed, how the majority will be exported to foreign nationals.

Thank you

Paul Stevens

20151008-5059

Paul Stevens

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

We are told it NED will bring jobs. Northeast Energy Direct will bring some temporary jobs to the region, but Kinder Morgan's claim of 3,000 is exaggerated. Maximum jobs will be during peak construction, approx. 18-24 months. However, a good portion of them will go to specialized workers, like pipeline welding crews from Oklahoma. There will be one or two permanent jobs.

We were told the gas is for New Hampshire, but if that were true, why was the pipe originally planned for Massachusetts? KM states that they have 0.5 Bcf/day in contracts (which is questionable), but the pipeline capacity is 2.2 Bcf/day, leaving 1.7 Bcf/day extra. So where is all that extra going? They do NOT deny that they will take export contracts and new export terminals are coming online in Canada. Furthermore, the only stated contracts in New Hampshire are with Liberty, a KM subsidiary. So is it right for KM to use eminent domain to take New Hampshire residents' land away (when most New Hampshire residents do not use gas) just so one company can sell that gas to foreign powers?

We are told that it is a good idea that the pipeline should leave Massachusetts, enter New Hampshire for 70 miles then return to Massachusetts when New Hampshire uses 4% of gas in New England and Massachusetts uses 61%.

We are told this is a "brownfield" development. Kinder Morgan claims the pipe is "co-located" or "under" existing power lines. In reality, a 100 foot swath of forest, 70 miles long will be clear cut alongside the power lines' right of way, doubling the width of the existing scar. Contrary to popular belief, many families live year-round along this route and their wells will be adversely affected by all that blasting though the "Granite State". The power lines will provide a convenient ignition source for any leaks in the 36" dia, 1460 PSI pipe.

We are told that the pipe will lower domestic gas prices. However, the European market pays 2-4 times as

much as US customers, and the Asian market pays 3-5 times as much. Demand from these markets can only drive up domestic prices.

We are told that a new pipeline and gas-fired electricity plants are needed to replace the 8,300 MW of electric generation capacity that is being retired in the next few years. Ending the reign of nuclear, coal, and oil plants is a positive step, but replacing them with natural gas perpetuates dependency on fossil fuels and only gets in the way of renewables. Also, not all of the capacity retiring needs to be replaced with power plants. The cost of utility-scale solar has dropped 78% in the past five years, making renewables economically competitive with gas.

We are often told gas is 'clean' but natural gas is primarily methane and when burned, it still produces CO₂, albeit less than coal or oil. However, when released directly in to the atmosphere as in a compressor station 'blow down', methane is 86 times as powerful a greenhouse gas than CO₂.

Kinder Morgan, is a Houston based company, but has purchased memberships in various New Hampshire Chambers of Commerce in an effort to gain undue influence here.

Please do the right thing and formally deny NED.

Thank you

Paul Stevens

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

The excerpt reproduced below originates from an article titled: "Natural Gas Pipeline Safety Setback" found at this location:

<http://www.xylenepower.com/Natural%20Gas%20Pipeline%20Safety%20Setback.htm>

SAN BRUNO, CALIFORNIA:

On September 9, 2010 at 6:11 PM a 30 inch diameter buried natural gas pipeline operating at a pressure of 400 psia ruptured and burned in a single family estate home residential area in San Bruno, California. San Bruno is a southern suburb of San Francisco, about 2 miles from the San Francisco airport. The homes near the rupture location each had lot sizes in excess of one acre. San Bruno had the benefit of probably the best available municipal fire fighting capacity in North America.

There was a modest delayed ignition explosion followed by a large natural gas fire that persisted for more than two hours. Secondary fires continued for more than eight further hours. The fire scene was attended by 67 fire trucks, 4 fixed wing aerial water bombers and 1 fire fighting helicopter.

Aerial photographs showing the area that burned were compared to distance calibrated Google maps. In spite of the large amount of immediately available fire fighting equipment almost all the homes (38) within a 150 m radius damage circle were completely destroyed. A further 17 homes were severely damaged and a further 53 homes sustained lesser damage."

So we ask you, where are our aerial water bombers located?

How long would it take 67 fire trucks to respond from across the region?

Thank you

Paul Stevens

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

On Monday Aug. 3 the east side of Falfurrias, TX (150 people) had to be evacuated for 12 hours after a Kinder Morgan / TGP pipe exploded, sending 2 people to the hospital. Local police were quickly overwhelmed and local border patrol people helped move residents to safety. All we can say regarding NED is I told you so!

Thank you

Paul Stevens

Re: Docket Number PF14-22

Federal Energy Regulatory Commission

Actual measurements of other Kinder Morgan, co-location pipe projects show a 175 foot wide swath of clear cut land ALONG SIDE the 100+ foot exsisting power line right of way. 71 miles of pipe in NH works out to over 1500 acres of land deforested. This is how KM defines co-location. How does FERC define co-location?

Thank you

Paul Stevens

Re: Tennessee Gas Pipeline Company, L.L.C. Dockets No. CP14-529 and PF14-22

Additional Comments of Jean Atwater-Williams, 182 Cold Spring Road, Sandisfield, MA regarding illegal segmentation of NED and CT Expansion projects by Kinder Morgan’s Tennessee Gas Pipeline Co.

This issue has been raised previously, but in light of the recent proposal for a NED segment planned to cross public and private lands in East Granby, Avon, Simsbury and Farmington, CT, this issue must be examined once again. Additionally, I am submitting maps not previously submitted in this context for the FERC’s consideration.

In the Delaware Riverkeeper Network v. FERC ruling in June 2014, the D.C. Circuit explained that an agency impermissibly segments NEPA review when “it divides connected, cumulative or similar federal actions into separate projects and thereby fails to address the true scope and impact of the activities that should be under consideration.” Delaware Riverkeeper Network v. FERC, 753 F.3d 1304 (D.C. Cir. 2014).

The court further explained that “Connected actions” include actions that are “interdependent parts of a larger action and depend on the larger action for their justification.” Id. § 1508.25(a)(1)(iii). To determine

whether actions are interdependent, the court looked to the physical, functional and temporal connection between the segments.

Although Tennessee Gas insists that the CT Expansion and the NED projects are not physically connected, the evidence demonstrates otherwise.

First of all, there is clearly a TEMPORAL connection. The CT Expansion project is still under consideration, and has not yet been approved and meanwhile, the NED project is ramping up.

Secondly, when one looks at the attached maps, you will find that there is a PHYSICAL connection between these two projects. One of the lines slated to be expanded as part of NED (East Granby, Avon, Simsbury and Farmington, CT) will directly connect to a segment being expanded as part of the CT Expansion.

In light of this, the FERC must, under federal law:

1. Deny the CT Expansion
2. Require Kinder Morgan to withdraw its pre-filing for NED

Kinder Morgan then, should they wish to proceed with this unwise and unnecessary fossil fuel infrastructure, will need to prepare a legal and appropriately comprehensive pre-filing that addresses the true scope of this project.

{2 maps, omitted}

{duplicate copy of 20151008-5081 above}

20151008-5117

Michelle Dunn, Peterborough, NH.

I am strongly against this pipeline project. It goes against the current market forces to use LESS nonrenewable resources. We have no need for this gas nor will it be available to our region. We as a country, need to turn to renewable sources of energy. Sun, wind, water and other renewable sources. Not a dirty old technology.

20151008-5120

KAMPOOSA STEWARDSHIP COMMITTEE

To restore and preserve the Bog by fostering community stewardship of the Kampoosa Bog Drainage Basin ACEC

October 7, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

Re: Northeast Energy Direct Project, Project Docket # PF14-22-000

Dear Secretary Bose:

The Kampoosa Stewardship Committee sends this letter to inform you of our grave concerns regarding two of the proposed alternatives to the Northeast Energy Direct Project, namely that of the Massachusetts Turnpike Alternative and the Existing 200 Line Alternative. Both of these alternatives would be located within the Kampoosa Bog Area of Critical Environmental Concern (ACEC) and new activity within the watershed would threaten the unique and delicate ecological habitat that our Committee has worked so hard to conserve and protect. We therefore ask that you review these alternatives with the utmost environmental consideration and with an intent to protect the long-term survival of this ecological gem.

Misnamed a bog, this wetland is the largest, most diverse and pristine Calcareous Basin Fen (S1) in Mas-

sachusetts. This type of wetland is nationally rare, being restricted to 10 states, mostly in the upper Midwest and northeast. Calcareous basin fens are considered by the Massachusetts Natural Heritage & Endangered Species Program (NHESP) as S1 Critically Imperiled in the Commonwealth, meaning that five or fewer good examples remain. This ecosystem is also relatively rare in New England (being restricted to areas such as the Housatonic River Valley where calcium-rich bedrock is abundant). The habitat includes a floating mat of vegetation but, while a bog typically would have a very acidic environment with little inflow of water and a mat of sphagnum moss, Kampoosa has inflow of mineral-rich alkaline water and sphagnum moss overlaid with a sedge mat. This unusual chemistry and floating mat supports a high concentration of highly specialized calciphilic plants, many of which are considered extremely rare and found at very few places in Massachusetts. The watershed hosts 22 rare plant species, two rare animal species and many other species uncommon in the state.

In addition to the basin fen, the watershed supports two NHESP-listed Priority Natural Communities: 1) Black Ash-Red Maple-Tamarack Calcareous Seepage Swamp (S2-Imperiled), with Kampoosa noted as one of the highest quality in the state for its large size, extensive natural buffer, and many state-listed rare species, and 2) Rich Mesic Forest, noted for their moist unusually nutrient-rich soils and diverse herbaceous layer that includes many ephemeral plant species. NHESP also considers the Kampoosa Bog Watershed as a Regional Priority Conservation Area. To further illustrate the unique natural heritage of the site, we are attaching to this letter relevant sections from A Resource Management Plan for the Kampoosa Bog Drainage Basin ACEC (1999). The cross-section map on page 10 of this report illustrates the habitats and their synergistic locations within the Bog. Also attached is the Stockbridge BioMap2 (2012), with the most relevant sections highlighted for ease of reference.

Unlike many fens across the northeast, Kampoosa Bog has never been disturbed by ditching, draining, or dam construction, and still supports distinctive plant life whose populations have been diminished or extirpated at other such wetlands. The watershed was designated as an ACEC by the Massachusetts Secretary of Environmental Affairs in 1995, recognized by the state and by wetland professionals for its exemplary conditions. The purpose of this designation is to protect and preserve resources and ecosystems of critical environmental significance. This designation also carries some regulatory protections from the ACEC regulations found at 301 CMR 12.00. It was at this time that the Kampoosa Stewardship Committee was established, bringing together a wide consortium of state and local stakeholders who could each bring their distinct resources to the table for a common, protective cause. The list of committee members is attached to this letter.

Although Kampoosa Bog has not been altered by ditching or damming, the upper watershed has been impacted by the Massachusetts Turnpike (aka U.S. Rt. 90) and Tennessee Gas Pipeline (TGP), both of which have cut wide swaths through the upper reaches of the watershed. This intrusion has allowed the introduction of a litany of invasive plant species, most notoriously of which is *Phragmites australis*, which has invaded much of the wetlands and which is the greatest threat to the sedge mat and its assemblage of rare plant species. *Phragmites* thrives on disturbance, and populations that followed the turnpike and gas pipeline corridors are the main sources of expansion. Monitoring, mapping and treatment of the Bog began in earnest in 1993, but by 2005 there were 39 distinct patches of *Phragmites* identified, ranging in size from 1/8 of acre to more than 7 acres. Rare native orchids, seen prior to this time, had disappeared. The Nature Conservancy (TNC) led scores of volunteers into the bog, valiantly and laboriously hand-applying herbicides (“clip & drip”) to *Phragmites* stands in this sensitive wetland. When funding became available, professional herbicide contractors were hired to bring the invasion to a more manageable level. The *Phragmites* stands were larger and denser on the TGP right-of-way, so mist-blower herbicide applications were conducted by the company, and within two years these stands were controlled.

By 2010, all of the most threatening patches had been treated. During this time both the Turnpike Authority (now MassDOT) and TGP joined TNC and Massachusetts Natural Heritage & Endangered Species Program (NHESP) to become active combatants in this war to control *Phragmites* and other invasives, providing technical assistance, funding and on-the-ground staff to contain invasive species within their respective

rights of way. To date almost \$1 million has been directed toward invasive species control within the ACEC, and more is needed.

Invasive species is not the only primary threat to the Kampoosa Bog's ecosystem. A detailed hydrogeochemical study of the Bog determined that groundwater and surface water chemistry is greatly being altered by road salt runoff from the turnpike), which is located up gradient of the Bog. Salt is effecting natural ion exchanges between groundwater, the water column and the peat within the basin fen. The data suggests that sodium is being retained within peat and other organic material. As these materials provide the growing medium for many of the rare plants in the Bog, it is suspected that salt contamination is further stressing sensitive plants and could threaten longterm survival of some plant assemblages. Further studies must be conducted to document and quantify such stresses.

While we believe we are winning the battle against invasive species, only time will tell if we reached a point where we can say that we've won the war. Monitoring and treatment is ongoing, but we have now attained a level of invasive species control that is deemed sustainable within the Kampoosa Bog ACEC. Where our original battles were exhausting and seemingly unattainable, our current patrols are exponentially less intimidating. Mass DOT has purchased new equipment and undertaken new operating procedures to reduce salt runoff along this section of the turnpike, but contamination will continue to be a concern.

Because of these dual and ongoing threats to the ecosystem, we are greatly concerned that any proposal to install additional natural gas pipelines within either the turnpike or TGP corridors threatens to defeat the hard-won, expensive and precarious balance of invasive species control that the partners of this Committee have been able to achieve. Laying and maintaining a large pipeline system will undoubtedly involve construction of roads and staging areas, bring an influx of soils and heavy equipment that could import invasive species, and permanently create new acreage of land disturbance. Any new outbreak or expansion of invasive species, coupled with continued salt contamination, could very well tip the balance of control out of our hands and result in additional losses of rare species.

It is for these reasons that the Kampoosa Stewardship Committee respectfully requests that you and your colleagues at FERC consider the precarious environmental condition of the Kampoosa Bog as you evaluate the environmental impacts of the Massachusetts Turnpike Alternative and the Existing 200 Line Alternative of the Northeast Energy Direct Pipeline proposal. We trust that, given our concerns and those that will undoubtedly be shared by NHESP, the forthcoming Environmental Impact Study will look with the utmost detail at the environmental impacts of a new or expanded pipeline within the Kampoosa Bog ACEC.

If you have any questions regarding the environmental significance of the Kampoosa Bog ACEC, or if you would like more information about the Kampoosa Stewardship Committee, please do not hesitate to contact co-chairs Jessica Murray Toro (jessmtorozegmail) or Lauren Gaherty (lgaherty@berkshireplanning.org).

Sincerely,

Jessica Murray Toro Lauren Gaherty

VALERIE LANG WALDIN, Averill Park, NY.

TO: Federal Energy Regulatory Commission

FROM: Dr. Valerie Lang Waldin, J.D., M.L.S., Resident of Glass Lake

DATE: October 8, 2015

RE: Docket # PF 14-22-000, Proposed Kinder Morgan Pipeline

Please accept my comment in strong opposition to the proposed Kinder Morgan fracked gas pipeline and 22 acre compressor station in the Rensselaer County area of Burden Lake. It is my understanding that this project was initially proposed for Columbia County, and not approved.

My arguments are as follows:

(1) While I do not know the reasoning behind the failure to approve this project for Columbia County, the diligent process of approval must have been followed. Thus, the refusal must have been based on environmentally sound evidence. If not, then why?

(2) Moreover, Rensselaer County is distinguished for its beautiful, healthy fresh water lakes including but not limited to Glass Lake, Crystal Lake, Crooked Lake, the Burden Lakes, the Bowman ponds, Nassau Lake, Pikes Pond, Tsatsawassa Lake, Lyons, and Smith Pond; all within a 5 mile radius of the project. It is unconscionable that this particularly unique and pristine area would be slated for a pipeline. I am convinced that if Kinder Morgan officials resided in the impacted zone, we wouldn't be having this debate.

(3) According to a UN-Water report: “Scarcity is also a question of water quality. Freshwater bodies have a limited capacity to process the pollutant charges of the effluents from expanding urban, industrial and agricultural uses. Water quality degradation can be a major cause of water scarcity.” Fracking is exempt from key federal water protections, and federal and state regulators have, perhaps unwittingly but nevertheless, allowed unchecked expansion of fracking, creating widespread environmental degradation. It is no secret that overwhelmed state regulators largely oversee the practice. Even if the laws on the books were strengthened, fracking poses too severe a risk to public health and the environment to entrust effective and rigorous

regulatory oversight to these officials.

It shouldn't be happening at all, but it is. I implore you that if this must happen, let it happen outside of our lakes.

20151009-4004

TOWN OF NASSAU, NY

OFFICE OF THE TOWN SUPERVISOR

David F. Fleming, Jr.

October 9, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE; Room 1A
Washington D.C. 20426

Re: Northeast Energy Direct Project; P11 14-22-000

Dear Secretary Bose: This letter is to provide comments during the scoping/pre-filing period on the Northeast Direct Energy (NED) pipeline project and its associated infrastructure proposed through the State of New York, and more specifically proposed through the Town of Nassau in Rensselaer County. The project is being proposed by Kinder Morgan Energy Partners, L.P. (Kinder Morgan). We are submitting these comments to you, as the National Environmental Policy Act (NEPA) lead agency, and as the agency responsible for issuing pre-filing and filing certification decisions under Section 7 of the Natural Gas Act for Interstate Gas Pipelines (determination of public convenience and necessity). We have two major comments below that we wish to be considered and addressed.

First, the Town of Nassau is a Participating Agency under the Council on Environmental Quality's (CEQ) NEPA regulations. We understand that FERC has an Interagency MOU with federal agencies to coordinate early, and the same intent applies to local agencies where pipelines and associated infrastructure are proposed to be located. FERC has the opportunity to designate the Town of Nassau as a Cooperating Agency since the town is an agency with legal jurisdiction and with special expertise with respect to environmental impact. Special expertise on the Town's part pertains to impacts related to the Dewey Loefell Superfund Site, and impacts to community character and socioeconomic resources within the Town from both the proposed pipeline and compressor station. The Town of Nassau is therefore requesting to be a "Cooperating Agency" under the CEQ's NEPA regulations.

Second, we are requesting that a thorough and exhaustive consideration of alternatives be conducted before NEPA Scoping is closed, and before the applicant is certified to file a formal application. This request has two parts:

1. We are requesting that a different alignment be selected for filing, instead of the current proposed alignment through Nassau. Therefore we are requesting that Kinder Morgan re-scope to propose a "Highway Alignment"; and
2. We are requesting that the assessment of the Highway Alignment alternative be completed correctly, unlike the current alternatives assessment that was conducted for the other Major Routes.

Specifically, the NEPA Scoping Package contains Resource Report #10, Alternatives (March 2015), which considers an assessment of Major Route alternatives. Kinder Morgan explored two alternatives that would involve the pipeline following major highway routes, instead of the residential route through the Town of Nassau. One Major Route is the 1-88 Route, and one Major Route is the 1-90 "Mass Pike" Route. Both of these routes were dismissed incorrectly in the scoping documents. In addition, another Major Route was not considered and analyzed, that would tie the 1-88 and Mass Pike alternatives together. The alignment would run from 1-88 directly to 1-90 near Schenectady in New York and follow the highway through Albany County and Rensselaer/Columbia Counties to join to 1-90 in Massachusetts. We are calling this Major Route

the “Highway Alignment” alternative. The Town of Nassau is requesting that FERC require the thorough exploration of the Highway Alignment alternative. The Highway Alignment alternative should have two sub-options, BOTH of which should be evaluated as separate alternatives: 1) be located entirely within an existing highway right-of-way, or 2) be located adjacent to a highway right-of-way.

Regarding the 1-88 alternative, we do not believe that the alternatives assessment was conducted correctly in the scoping package. Not only should this Major Route should be re-scoped to follow the correct process, but the Highway Alignment alternative assessment should also follow the correct process. Within the current 1-88 discussion on page 10-23 of the Resource Report, the document refers entirely to the recent Constitution Pipeline NEPA process:

“The NYSDOT (New York State Department of Transportation) has commented that the proposed pipeline will be required to comply with FHWA (Federal Highway Administration) policy that ‘an applicant will be required to show that no feasible alternative routes exist to obtain approval of the 1-88 from NYSDOT and FHWA’, of which the Constitution Pipeline Project route will be considered a feasible alternative”.

This section goes on to state that this is the basis that Kinder Morgan determined the NED pipeline also cannot be considered to be either located within the 1-88 right-of-way or adjacent to the right-of-way, because of the above decision regarding the Constitution Pipeline- meaning that if 1-88 isn’t good for that pipeline, it must not be good for the NED, either. Regarding the location within the right-of-way, neither NYSDOT nor FHWA actually determined that the Constitution Pipeline Project route is a feasible alternative through that project’s NEPA process. The applicant didn’t file any paperwork for the accommodation of utilities that would have led to a written decision from either agency. Therefore, the above statement and subsequent conclusion in the NED documentation is completely false. The NED pipeline scoping document cannot refer to an incomplete and inadequate analysis on another project to discount their own alternative. Therefore, the Town of Nassau is requesting that FERC require Kinder-Morgan to apply for an “Exception to the Accommodation of Non- Communication Utilities on New York State Freeway or Controlled Access Rights-of-Way” (NYSDOT 2015) through the process specified within the document. Specifically, Kinder Morgan should provide the detail necessary for a complete application, to allow the NYSDOT to make a final decision on whether or not the utility could be accommodated within the right-ofway. If NYSDOT determines that Kinder Morgan’s application meets the minimum criteria and does not conflict with NYSDOT operations, the request will then be forwarded to the FHWA for their decision. The NYSDOT does have the legal authority to approve the location of a pipeline within their right-of-way if “the accommodation will not adversely impact the design, construction, operation, maintenance, or stability of the highway and that it will not interfere with or impair future expansion of the highway”.

Regarding the location of any pipeline adjacent to a highway right-of-way, this should be a Major Route alternative that should be considered separately. This type of alternative does not require any of the above analysis or approvals from NYSDOT or the FHWA, unless construction or maintenance access is required in areas that are constricted, or in bridge areas where the pipeline would be above ground and carried by the bridge. FERC should require Kinder Morgan to consider an alternative that explores being adjacent to highways, specifically 1-90 through Rensselaer County.

Both the location of a pipeline within a highway right-of-way or adjacent to the right-of-way are considered to be “co-location” types of alternatives, and are supported by your agency through best management practices.

We understand that an alternate assessment completed by your agency considers three factors: the ability to meet the proposed project purpose (which is the transportation of natural gas), the feasibility of the alignment, and that a new alternative should provide a significant environmental advantage over the proposed route. A Major Route either within the right-of-way of the highway, or adjacent to the highway right-of-way (our Highway Alternative) meets all of your requirements for alternatives that should be considered, evaluated, and selected for filing. Our assessment is as follows:

Project Purpose: Our Highway Alignment alternative clearly meets the proposed project’s purpose and will transport natural gas.

Feasibility: Regarding the feasibility of the Highway Alternative, we understand that FERC considers technical, regulatory, and economic aspects of each alternative to determine if it is feasible. The technical aspects of construction either within the right-of-way or adjacent to the highway right-of-way are similar in nature to the current proposed route. The engineering of each route is very similar and is therefore feasible with either alternative. The regulatory aspects of the Highway Alternative regarding wetlands, air quality, etc. are considerably more permittable to regulatory agencies. Based on several recent pipeline projects permitted in New York, and several Administrative Records for how FERC processed the NEPA documentation, the overwhelming request from literally every state and federal Cooperating Agency was vastly more favorable toward an alignment either within a highway right-of-way or adjacent to a highway right-of-way. In fact, just one of many specific examples of where the NED documentation is incorrect is noted: The wetland impact assessment of the 1-90 Mass Pike evaluation in Resource Report #10 is completely flawed because it compares only acreage impact of each alternative. The U.S. Army Corps of Engineers, especially the New England District, compares functions and values of wetlands - not acreage of wetland impact- when evaluating alternatives for the least damaging alternative under the Clean Water Act. So, once again the alternatives assessment methodology is completely incorrect. FERC should not continue processing the NEPA documentation for this alternative knowing that federal regulatory agencies (agencies with expertise in these resources) have expressed that studies were done incorrectly, and that the most permittable alternative is adjacent to existing highways. Regarding the economic aspects of the “feasibility” consideration, we understand that the regulations governing the safety standards, and therefore the costs, for pipelines are different depending on the surrounding landscape. We understand that pipelines along roadways and under bridges may need thicker walls and infrastructure support than pipelines going through “sparsely populated areas”. While obviously we find that this regulation regarding safety is ridiculous because the current route is proposed to be within 10 feet of residents’ houses, we understand that Kinder Morgan does not want to explore any highway alignment because it would be an increased cost to them to purchase thicker steel walls. This reason may be called “economic” by Kinder Morgan and should not be a consideration at all by your agency with respect to determining if an alternative is feasible. The major regulatory benefits outweigh any economic complaints from Kinder Morgan.

Environmental impacts: The Highway Alternative, whether it is within the right-of-way or adjacent to the right-of-way, is considered to provide a significant environmental advantage over the proposed route that Kinder Morgan has scoped for several reasons:

1. The compressor station proposed for the Town of Nassau would not be located in the current area, which is absolutely not zoned in any way for any industrial facility. The compressor station is in direct contradiction with the zoning and with the beautiful and flawless landscape. The compressor station could instead be located in an area already receiving air, noise, and light emissions of a similar nature, since industrial areas along the 1-90 corridor already exist and are zoned for such activity.
2. The pipeline would not be located within close proximity to Dewey Loeffel Landfill Superfund Site as it is currently proposed, eliminating the potential disruption and worsening of the clean-up efforts.
3. The functions and values of wetlands that would be impacted would be significantly reduced along the Highway Alignment.
4. Blowdown emissions would occur in areas already disturbed and already receiving similar emissions if this project were located adjacent to a highway, instead of in an area that receives no emissions from any industrial activity.

5. The proposed alignment would require the permanent removal of a significant acreage of trees that are suitable summer habitat for the newly federally protected Northern Long-eared Bat, where an alignment along an existing highway would require significantly less tree removal. This bat is in a 99% population decline in New York State- substantial reductions in permanent habitat removal for a highway alternative absolutely demonstrate a significant environmental advantage.
6. Noise generated from both construction and operation of the compressor station will substantially exceed the ambient noise in Nassau. Locating the pipeline along highways that already have baseline noise levels similar to the construction and operational noise from the pipeline would significantly reduce impacts and provides a significant environmental advantage.
7. Locating the pipeline along a highway would provide significant environmental advantages related to visual impacts, since the pipeline would fit in with existing cleared right-of-way infrastructure and appearances. The cleared zone and the compressor station would be in direct contrast to the surrounding environment of Nassau and would have significant visual impacts.

In conclusion, we are recommending that FERC require the complete and thorough analysis of a “Highway Alternative” for both within the highway right-of-way, and adjacent to the highway right-of-way, that is proposed to the NYSDOT through the correct process, and that considers impacts correctly. We believe that the Highway Alternative will meet the project purpose, is feasible, and provides a significant environmental advantage over the other ajor routes.

Very truly yours,

David F. Fleming, Jr.

20151009-5006

Jean Nigro, Temple, NH.
Dear Commissioners,

I am writing to alert you to the completely negligent manner in which Kinder Morgan representatives have responded to my inquiries regarding their ability to mitigate the effects of low frequency noise (LFN) also called Infrasound. The representatives I questioned about this either had never heard of it or tried to explain to me that its levels would be “all averaged in” with the dbA readings the company uses to assess it’s sound level emissions. This second comment is absurd as LFN is not measured in decibels.

There is increasing evidence that the impact of LFN on health is significant. Exposure can actually cause cellular changes in cardiac and lung tissue. Exposure is associated with seizures, psychotic episodes and increased risk of miscarriage in pregnant women.

<http://www.citidep.pt/papers/articles/alvesper.htm>

LFN is emitted by large turbines like those utilized at gas compressor stations, and it is extremely difficult

if not impossible to mitigate. I demand that you require Kinder Morgan to investigate the effects of LFN at compressor station sites and develop a plan for protecting the public as well as their own employees from its negative effects.

Thank you

20151009-5009

Evelyn Taylor, New Ipswich, NH.

The FERC must extend the comment deadline again as Kinder Morgan brought a surprise changed map to the Council Meeting in Merrimack this evening, 10/8/2015. Worse yet is that the revised map they brought is being revised again so people now affected along this changed route don't even know it yet and will have no time to learn about it, investigate it and respond by the Oct 16 deadline. This is disgusting behavior that Kinder Morgan uses over and over again to avoid resistance to the pipeline.

20151009-5010

Evelyn Taylor, New Ipswich, NH.

I went to the Town Council comment session in Merrimack, NH this evening, 10/8/2015. Kinder Morgan/TGP surprised the Council and the public with a new map just drawn today. The map is already undergoing another change to move the portion near the Merrimack Outlets East where it will pass under the cloverleaf and alongside the highway. A Council member expressed concern as some months ago Kinder Morgan/TGP indicated it is not preferred to build alongside a highway due to excessive vibrations yet now that they have no place else to go they are saying it's safe. So is it safe or is it just convenient? It seems it was the only place left to go. The FERC needs to be sure vibrations won't cause the pipeline to fail.

20151009-5011

Evelyn Taylor, New Ipswich, NH.

I was at the Town Council in Merrimack, NH this evening with Kinder Morgan. (Oct 8, 2015)

A resident asked Kinder Morgan what the safe distance was from an accident event from this 30 inch diameter pipeline. Kinder Morgan rambled off about that being difficult to assess. Yes, and I have asked FERC and Kinder Morgan/TGP whether they would be doing that calculation all along this pipeline and they do not answer that question.

Kinder Morgan/TGP refuses to respond to our questions about safety, evacuations, and the hazards of the pipeline. They need to be made to respond. I spoke at the meeting and gave San Bruno, California, 2010 as an example of what has occurred for a 30 inch diameter pipeline. It took 67 fire trucks, two fixed wing aerial water bomber planes, one water helicopter, 8 deaths, and more than 3 dozen homes destroyed. That's what an accident along a 30 inch diameter pipeline is like.

Perhaps Kinder Morgan now has an example to offer instead of dodging the question time and time again. The FERC needs to demand that Kinder Morgan responds honestly and openly to any question. If they cannot answer these types of questions they are not qualified to construct, maintain and operate the pipeline. They have a long record of accidents to give them plenty of insight into danger zones. The problem is Kinder Morgan/TGP ignores the hazards and chases the profit at whatever cost to anyone else along the way.

Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, DC 20426

RE: Tennessee Gas Pipeline Company, L.L.C.; Federal Energy Regulatory Commission (“Commission”)
Docket No. PF 14-22-000

Dear Secretary Bose,

The Conservation Commission for the Town of Merrimack New Hampshire (MCC); a properly established Conservation Commission in accordance with New Hampshire State Law RSA 36-A, appreciates the opportunity to submit these additional scoping comments in conjunction with the pre-filing phase of the Tennessee Gas Pipeline Company’s (TGP) proposed Northeast Energy Direct pipeline (“NED Project”), Docket No. PF14-22.

These comments are in response to additional research done by the Conservation Commission, various items presented to the Conservation Commission, and a review of the TGP July 24, 2015 second draft Environmental Resource Reports.

These comments do not in any way imply the Merrimack Conservation Commission agrees there is a need for this pipeline or imply that this pipeline should be constructed within our Town or State.

Resource Report 1

In section 1.1.2.2.2 Meter Stations on page 1-30 the report states “*The work involved at new meter stations will include the installation of tap, metering, regulation, heating, flow control, and overpressure protection, as necessary unless specified otherwise.*”. The MCC believes all forms of protection are necessary especially given the proposed meter station in the Town of Merrimack noted in the report as the “West Nashua” station at milepost 25-94.

Our Town Council in a recent letter to FERC has addressed this proposed metering station. The MCC requests that TGP and FERC as part of its EIS process address these key points:

1. Air and noise quality is very important to the residents of Merrimack including all residents: humans, animal, insects, and plant life. Many of the gases associated with the transmission line have been shown to create problems for all of these residents if not properly handled. Noise from the operations of a meter station can also have adverse impacts. Understanding the types of gases involved, noise generators and types, impacts of both to the health of all residents, and how these impacts will be mitigated are key and must be included in any reports before any portion of this meter station is built.
2. Leaks of natural gas and the gases involved in the removal of natural gas from the ground concern many in our Town. In close proximity to this proposed metering station is an Eversource electrical substation that services the electrical needs of our residents and many large businesses in our Town and surrounding communities. This substation houses numerous open-air transformers, cables, wires, and control systems. Since this substation is potentially within 1000 feet from the proposed meter station, the MCC requests FERC and TGP identify how any over pressure releases from this proposed meter station will not pose a hazard to the substation, the residents of Merrimack, the environment, and those people whose place of employment also lies within 1000 feet of that meter station.

Section 1.2.7 on page 1-64 indicates that aerial photography is being used to survey areas that TGP has not performed on-the-ground surveys. Given the reluctance of TGP to act in good faith negotiations with our Town when it comes to surveys of public lands (as described to FERC in the Town of Merrimack submittal on September 4, 2015 and at the FERC scoping meeting in Nashua New Hampshire), the MCC is very concerned about the use of aerial photography to locate and plan mitigation for wetland impacts along the proposed NED route.

Proper wetland impact planning has to involve on-the-ground surveys especially when it comes to vernal pools and smaller highly sensitive wetlands as we know exist on potentially impacted Merrimack public

conservation lands. We have specific data to indicate these sensitive areas exist along the proposed route. The MCC requests that FERC requires TGP to reengage with the Town of Merrimack and accept our terms for access to our public lands. It should not be lost as to who is the owner of these lands and our Town has been very generous in this regard.

Section 1.3.2.1 on page I -83 states “*Tennessee will attempt to retain all soil and/or rock on the construction ROW in rugged topography using fencing, haybales or other containment materials, such as timber mats.*”. The use of hay bales in construction projects is a violation of best practices in the Town of Merrimack. Hay bales can introduce non-native species to an area through its inherent inclusion of seeds within the bales. The MCC requests that FERC requires TGP and its contractors to only use Straw bales if a bale is required when doing any work within the Town of Merrimack or waterways that flow into or through our Town. This same restriction is currently placed on all projects within our Town that go through our planning and permitting process.

The use of hay bales is also mentioned throughout many of the other Resource Reports. The MCC will not be directly calling out your attention to each of these other references but that does not mean we do not object to the use of hay bales in our Town and in connection with these other Resource Reports.

In this same section and page it states “*To facilitate revegetation of the ROW, restored work<space locations will be seeded, fertilized, and mulched in accordance with Tennessee’s Project-specific ECPs for each state.*” - The use and application of fertilizer is very important to the MCC given our complete reliance on ground-based water for drinking, cooking, etc. The MCC therefore recommends and our planning process requires all projects of this or similar type to perform soil testing before the application of any fertilizers to be sure the right amounts and concentrations are used given the condition of the local soils. In wet areas and along ponds, lakes, vernal pools, streams, brooks, and rivers, the MCC further requires that phosphates not be used at all. The MCC therefore asks that FERC require TGP and all its contractors to follow this requirement as well when working within the Town of Merrimack.

Section 1.4.3 speaks to “*Cathodic Protection and Alternating Current Mitigation Areas*”. It also includes Table 1.4-1 that shows these items will be needed in the Town of Merrimack with a strong likelihood of including public conservation lands. Since these conservation lands also serve the residents of our Town with numerous recreational trails, the placement of these items and the actual pipeline is a concern for the MCC. The MCC requests that FERC study these conservation lands closely and work with the MCC as FERC potentially approves any pipeline route in Merrimack. These items can limit the use of our properties and as such will have an impact to them and the wildlife on these properties. Proper planning and placement is key to the safety of the pipeline and both the wildlife and users of these recreational conservation lands.

Resource Report 2

In Section 2.1.1.4.1 on page 2-10 the reports states “*The Witches Brook Aquifer located in the Towns of Amherst, Hollis, and Merrimack is the largest high yield aquifer in the southern half of the state (ACC 2015; Mailloux 2015; Miner 2015)... however, the WHPA for this aquifer is about a mile from the proposed pipeline route (Miner 2015).* “ The aquifer provides a significant amount of drinking water to the residents and businesses in the Town of Merrimack. Given that TGP has now gone on record supporting an alternative route (Resource Report 10, 10.3.2.4 and in the Kinder Morgan letter to the Town of Merrimack dated 9/16/2015) for the pipeline that will route the pipeline through this aquifer, the MCC requests that FERC deny this alternative route due to its direct impact to our drinking water supply which if compromised would mean there would be insufficient water resources for the people of Merrimack.

Table 2.1-2 shows public and private water supply wells including some in the Town of Merrimack. It also has the word “Unknown” listed in multiple locations. The MCC wishes to inform FERC that we believe this table is preliminary at best and does not represent all public and private water supply wells that service our Town.

Section 2.2.11.1.4 talks about the Horizontal Directional Drilling method. This method utilizes bentonite as part of the fluid used for lubricating, sealing, and stabilizing the bore hole. Bentonite is known to be relatively safe for the environment when it is utilized in this manner on many projects. But as has been noted in the oil industry going back to the 1980s, bentonite clays can prevent plant growth and other natural processes in topsoil if not properly handled. It can also have an impact on small fresh water fish and other organisms as it can create a viscous gel if it makes contact with their bodies, which can limit their mobility and cause death. The MCC requests that FERC review how waste bentonite will be handled during and after the drilling process as it can have adverse effects on our wildlife habitat. This is especially concerning as bentonite will be used in and around wetlands. The waste storage of bentonite in pits prior to removal from the site should be reviewed to include lined storage pits, which will better ensure all bentonite, and other drilling fluids are removed completely at the end of the process.

Resource Report 3

In Section 3.2.2 Table 3.2-2 shows sensitive wildlife habitats including those in the Town of Merrimack. This table only lists one property in our Town. It should also list our property also noted in these Resource Reports named Gilmore Hill Memorial Forest and the other open space areas in that vicinity.

Section 3.3.2.4.3 is titled “*Vernal Pools*” and addresses these pools in the State of New Hampshire. This section fails to indicate that the Town of Merrimack also considers wetlands and vernal pools very important. As such, we have local requirements for a 25-foot no-disturb wetland buffer and 40-foot wetland building setback requirement.

Section 3.4.1.5 and Table 3.4-6 list potential New Hampshire rare, endangered, or species of special concern within the pipeline’s area of impact. The MCC believes this list to be incomplete and that TGP should re-review this data given the latest information (since June 2015) that is contained at the New Hampshire Natural Heritage Bureau and with our Commission.

In Section 3.5.2.2 on page 3-112 the report states “*By routing approximately 84 percent of the total pipeline Project to follow existing gas pipeline and utility line ROWs, the acreage offorest lands crossed by the Project will be greatly minimized, thus reducing the effects of habitat fragmentation.*”. The MCC believes this statement is categorically incorrect and misleading when referring to ROWs in New Hampshire. It is clear from TGP’s own diagrams found in these Resource Reports that significant land clearing will be part of this process as the pipeline will not be routed in these existing ROWs but instead will require new ROWs that will follow adjacent to the existing ROWs. TGP later on the next page states and reinforces the point we make when it wrote “*...widening of existing ROWs will reduce the overall patch size of adjacent interior forest habitats. Vegetation clearing of a ROW could result in long-term linear corridors or bare ground or minimal vegetation.*”.

We request that FERC require TGP to remove this misleading statement and further more clearly indicate the extent of forest that will be cleared by their proposed route in our Town and State. Without this actual information, FERC will not be able to make an informed judgment on the impact of this pipeline to our local environment.

Another item that seems to have been lost in this discussion of the current Right-of-Way (ROW) is that the creation of this Power Line ROW also created conditions that are favorable to a number of rare and threatened species that now live and consider the existing ROW to be their home, breeding grounds, and places to find and locate food. Readily dismissing current wildlife habitat in the current ROW is something that should not be allowed, as there are potential significant impacts to these species. The MCC believes this to be the case within the large conservation areas in Merrimack that have ROWs that were created over 40 years ago when environmental laws and best management practices were not in place. Note the current proposed route crosses two large conservation parcels in the Town of Merrimack that together include nearly 600 acres of protected land.

Resource Report 4

On page 4-64, Table 4.4-46 indicates only one “Aboveground Historic Resource” in the Town of Merrimack. While this designation comes from a federally managed program, the Cultural aspects of the EIS that FERC will do should also address a few other historic resources in our Town. These resources include:

1. Olde Kings Highway. This is an historic highway that predates our country and was used before, during, and after our country’s Revolutionary War. At one time this highway traversed most of our State. The proposed pipeline route will cross the highway that today can be found as a New Hampshire Class VI road in the Horse Hill Nature Preserve. Note that this road crossing is also not listed in Table 8.1-10 on page 8b-217 or 218 (RR8 Attachment b).
2. Spaulding Foundation. This is an historic home foundation that lies within the proposed impact area of the pipeline within the Horse Hill Nature Preserve. This foundation and the unique plants that can be found near and around the foundation are from an original settler family of our Town.
3. While the MCC does not have exact knowledge of the location, the MCC requests that FERC requires TGP to do an extensive historical on-the-ground survey of the land and riverbank along the Merrimack River where the pipeline is proposed to cross the Merrimack River. This river has a history going back to the early settlers and has been used for recreation, commerce, and transportation for many centuries. It is well known that locks and other structures exist within the river and the banks of the river in Merrimack. Given the current known locations, there is no reason not to believe there are potential historic and archeologically significant sites in the vicinity of the proposed river crossing.

Resource Report 6

On page 6-33 the report states, “*Tennessee will obtain all the necessary federal, state, and local blasting permits prior to construction.*”. The MCC would like to emphasize that the Town of Merrimack has very specific local regulations when it comes to blasting. These regulations have been in place and followed by many projects within our Town for many years now. The MCC would like to believe that TGP will do as it states but requests that FERC mandate that local regulations and permits be followed when TGP and its contractors have to perform blasting in our Town. Given this is the “Granite State” we believe blasting for this project in our Town is inevitable.

Resource Report 8 and Attachments 8a and 8b

Between MP 24 and MP 25 on map sheet 17 of 26 in Figure 8.3-1 of Attachment 8a there is no mention of the Gilmore Hill Memorial Forest being a public land. This map sheet shows some public recreational lands including the Horse Hill Nature Preserve (<http://www.merrimackoutdoors.org/our-properties/horse-hill-nature-preserve/>) in the Town of Merrimack (also discussed on page 8-65) but not Gilmore Hill Memorial Forest (<http://www.merrimackoutdoors.org/our-properties/gilmore-hill-memorial-forest/>).

Gilmore Hill Memorial Forest is a parcel of land that is managed (stipulated in its deed) by the MCC. The MCC has two specific concerns with this parcel including:

- This parcel has severe slopes that are granite bedrock. This bedrock rises approximately 200 feet in elevation over a distance of approximately 300 feet. Since this is a natural feature of the land, that severe slope both increases and decreases by approximately 10% over the 400 feet of potential impact by the proposed route. The MCC wants TGP to better define how it is going to deal with a slope of this nature especially given the bottom of the slope ends in a wetland and stream bed that has been reported to our State to have a threatened species living in it. Our own research shows other threatened and rare species also in this area including a unique habitat.
- This property has a strict restriction in its deed that states it is for “conservation purposes only”. In looking closer at Figure 8.3-1, we found on that map sheet that it indicates TGP plans to create an access road on that parcel. The deed forbids this type of use.

The MCC requests that FERC require TGP to remove all references, plans, and any other references to any

pipeline related construction on this property.

The access road noted in this figure and other places in the Resource Reports (NED-TAR-J- 1800) cannot possibly be built without mitigating wetlands. TGP appears to be using outdated maps and photographs as the proposed access road will be under water for most of the year and will only be able to be traversed under the driest of conditions. In contrast to the outdated maps shown in some Resource Reports, map sheet TE-SEG_J-025 shows the wetland concerns we raise here. Given the deed restriction, this access road (NED-TAR-J-1800) should be eliminated and the MCC requests that FERC uphold the deed if indeed the pipeline is allowed to enter this parcel.

This same figure also indicates an access road (NED-TAR-J-1600) is planned to enter the Horse Hill Nature Preserve near its western border. This access road is also depicted in the Market Path Component submittal on sheet 32 of 51 for Segment J. It is even more clearly shown in the map sheet TE-SEG_J-23. When you look closer at the location of this access road it actually crosses through a private farm to enter the HHNP. The MCC questions the placement of this access road especially given that Gauthier Road is crossed by the pipeline and abuts this private farm. Note that the Gauthier Road crossing is also not listed in Table 8.1-10 on page 8b-217 or 218. There are no terrain issues or slopes or other items that would preclude Gauthier Road from providing the identical access. The MCC requests that TGP be required to remove all consideration for NED-TAR-J-1600 access road and explore utilizing Gauthier Road in its place. Note that Gauthier Road is a New Hampshire Class VI road in this location where it starts at Foster Road.

While reviewing the maps and diagrams for the Horse Hill Nature Preserve (HHNP), there is an infrastructure item noted as NED-TAR-J-1700 between MP 23.5 and MP 24. This sub parcel of the HHNP was purchased utilizing EPA Superfund money. That money was granted to the Town of Merrimack from EPA through NH DES. In accepting that money for that sub-parcel (it was a distinct parcel before being joined into the overall HHNP purchase), the Town accepted certain use restrictions that EPA regularly stipulates on purchases used to mitigate superfund sites. Putting any pipeline infrastructure within the bounds of that sub-parcel is contrary to the EPA agreement and the MCC requests that FERC not allow a pipeline or any associated impacts or infrastructure in that area.

The MCC has reviewed the map sheets designated as TE-SEG_J-023 through J-025. In these sheets TGP depicts numerous “temporary workspace” and “additional temporary workspace” impacts on MCC managed parcels impacted by this proposed pipeline. These impacts are numerous and appear in these map sheets to directly impact significant wetlands on these conservation properties. The MCC requests that FERC look very closely at these impacts and encourages TGP to route the pipeline away from these wetland areas. The MCC has collected quite a bit of data on the wetlands depicted in these map sheets. We believe our information would be enlightening to FERC and encourage FERC to arrange to visit with our Commission as it prepares its EIS on this project.

Appendix H - Upland Erosion Control...

On page H-5, there is a discussion of “Winter Construction Plans”. Snow handling in our Town on construction projects is also reviewed during the planning process. The MCC regularly participates in this part of project planning as there is a potential to impact our precious drinking water if not done responsibly. We typically require all snow removal processes follow the Green SnoPro process and certification (h!1p ;,7uury.!Zug certification). The MCC requests that FERC require TGP and its contractors to only use contractors or personnel that are Green SnoPro certified for any snow handling or removal during any winter construction done in the State of New Hampshire and the Town of Merrimack.

This Appendix also addresses the use of hay bales and fertilizers. Our previous concerns should also be addressed in this Appendix when doing work in the Town of Merrimack.

On page H-12, periodic mowing is described. It is said in A.5. that mowing will not occur during the migratory bird nesting season. The MCC also believes this mowing should not be done during any period where any rare or endangered species could be impacted. Many of these species are small and not able to move or get out of the way of a mow-ing machine. The MCC requests that TGP and its contractors perform mowing

operations during the winter months after the ground has frozen and most species have migrated away or gone into hibernation.

General Items of Concern

The proposed pipeline is being studied and permitted to transport natural gas to be processed and then distributed to customers. This gas is coming directly from its point of origin in the ground. The gas will be carrying other gases generated or released during the removal process. Some of those gases may be radioactive. The MCC would like to understand and requests that FERC have TGP explain how radioactivity will be monitored and if encountered, how is its release or presence mitigated as to ensure there are no long term impacts to the pipeline infrastructure and the environment during pressure releases, leaks, and other activities in the transport process.

The pipeline is a capital item and eventually it will become obsolete, no longer have a source of natural gas to transport, or simply be abandoned for a number of other reasons. The MCC realizes that easement language can stipulate what is to become of a pipeline on a particular parcel. But what happens in general when a pipeline is abandoned? What options does a municipality have to be certain it does not become a safety issue, sink hole, or new ground water channel when we already go to great lengths to control our precious ground water resources?

Finally, the pipeline is stated to be for natural gas. The MCC would like TGP to commit to and FERC to enforce that this new infrastructure and the land it occupies only be used for natural gas. The possibility of another use introduces a whole new set of variables, consequences, and liabilities. It would be beyond the ability of FERC to properly analyze and cover those other uses in its EIS. We ask that you limit this pipeline to its intended use only.. .if in fact it has to exist at all.

It is our desire to remain an active stakeholder in the NED project. We appreciate the opportunity to provide these comments.

Sincerely,

The Merrimack Conservation Commission

Timothy Tenhave, Chairperson

ttenhave@merrimacknh.gov

As authorized by the Conservation Commission on October 5,2015.

20151009-5063

SUSAN A DUHAMEL, NEW IPSWICH, NH.

We do not want this pipeline - NO means NO. Just what is it that you do not understand ? Stop wasting our time and yours.

20151009-5072

RE: Docket No.PF14-22-000

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street NE, Room 1A

Washington D.C. 20426

Dear Secretary Bose:

The **Board of Health of Plainfield, Massachusetts**, wish to respectfully submit our comments and concerns in regard to the Tennessee Gas Pipeline Company, LLC.'s Northeast Energy Direct Project Docket No. PF14-22-000 as it affects our town along the 5.5 mile route through the town of Plainfield.

Northeast Energy Direct Project
Plainfield, Massachusetts: Segment G

1. Please determine any areas in Plainfield that will require blasting and how underground aquifers supplying wells and springs will be affected. Please determine who will be testing and monitoring these aquifers and the frequency of these tests.
2. Please determine if any hazardous materials or any contaminants that may reach any water source in Plainfield will be stored or used in Plainfield. Please determine who will monitor the use of any of these materials or contaminants.
3. Please determine what water sources will be used for hydrostatic testing, the amounts of water required for this testing and where and how this water is released. Please determine that this practice will not harm our underground aquifers, lakes, ponds and streams. Please determine who will monitor and test following the hydrostatic testing and at what frequency.

We appreciate the opportunity to comment and express our concerns on the proposed Northeast Energy Direct Project. Thank you for your considerations.

Respectfully submitted,

Ellen DuPont
David Crowell
Gale Bulissa
Plainfield Board of Health

20151009-5125

Kathleen Gauvin, New Ipswich, NH.
61 Beechwood Rd.
New Ipswich, NH 03071

October 9, 2015

Dear Governor Cuomo,

I am a citizen of New Ipswich, NH and live within a mile of the 40,000 horse power compressor station that is part of the proposed Northeast Direct pipeline project. So why am I writing to you? The NED pipeline project could be stopped if the brakes were put on the Constitution Pipeline project in New York. We in New England do not WANT TO BE THE NEXT MINISINK, NY!

We have seen how the MINISINK disaster has unraveled! We are a scared populace, as we see what will be our future! We thought we could rely on our government to protect us, but this has not happened. We do not have a single top level politician who has come out in opposition to the NED pipeline, from our governor to any of our New Hampshire delegation. They are running scared for a different reason, re-election! How do we push them to take the morally right stand? Time is running out! The FERC scoping process has taken place. The end of our filing to FERC is October 16th.

The New Hampshire Delegation has demanded that a list of their questions to be answered by FERC and Kinder Morgan, but their questions have gone unanswered, and their insistence for answers has fallen on deaf ears! To date there has been no follow up to the "deaf ears".

The governmental agencies that we thought would protect us are not protecting us. The New Hampshire Public Utilities Commission has been sucked into a corrupted permit; we expect that FERC will follow suit in the same manner! So where can we turn? At this point, we see ourselves in the Minisink, NY saga! The NED pipeline will deliver us as the victims this time around.

Governor Cuomo, Joined By Vice President Gore, Announces New Actions to Reduce Greenhouse Gas Emissions and Lead Nation on Climate Change Environment. Governor Cuomo, joined by Vice President Gore, announced four major actions to combat climate change and reduce greenhouse gas emissions

across New York State. These nation-leading environmental and clean energy initiatives will help New York homes, businesses and universities invest in clean energy, drive economic growth across the state, and protect the environment.”

Quite frankly, I can't understand how a Governor with a “no fracking” policy would be thinking that a “fracked gas transport pipeline” would be ethical and morally right. Having read all the information that has been available regarding your “no fracking” policy, this Constitution Pipeline is totally in contrast to what you know is appropriate and acceptable to your constituents. Do the right thing, Governor Cuomo! Be our champion against the Goliaths, the “fracked gas” transport pipelines that will sicken our populace and make us THE NEXT MINISINK!

Make it big news! Cuomo goes after the Goliaths of America!

Sincerely,

Kathleen Gauvin

20151009-5136

Russell Bennett, Averill Park, NY.

I have been unable to find in Kinder Morgan's Resource Reports any detailed information about the dimensions of its proposed compressor stations; yet, the FAQ it provides on its website states the approximate dimensions are:

o Compressor Station Buildings - Height: 50' at peak, Width: 120', Length: 140'

o Compressor Station Exhaust - Height: 80'

o Auxiliary Buildings - Height: 25' at the peak, Width: 30', Length: 75'

The public should be fully informed of the exact proposed dimensions of each station.

In fact the FAQ provides a great deal of information about lighting, staffing, monitoring, fencing, etc. which cannot be found in the Resource Reports. This material should be included in the Resource Reports, adherence to which I assume is made a part of any eventual permit.

Of particular concern in this regard is the Applicant's statements regarding the substances that will be transported. The FAQ and public media statements say it will transport “pipeline quality” natural gas from which benzenes “and other hazardous air pollutants” have been removed. In the Resource Reports, I find only that they will transport natural gas without any reference to prior processing or “pipeline quality”. This should be specified and the exact list of components should be stated.

20151009-5152

Theresa Crowley, Lynnfield, MA.

I am against the route of this pipe line. My personal reasons I will list below.

- a. The placing of the pipeline is very close to our water supply.
- b. To do any construction on our property due to wet lands as property owners, we were directed not fertilize our own land due to damage to the environment and the construction of this pipeline will do damage in many areas of the federal wetlands.
- c. This proposed pipeline goes thru federal flood zones or abuts in areas.
- d. The towns will be compensated in some way, but how does the homeowner in the affected towns get compensated for devaluation of their property.

In closing I find it frankly suspicious that the lack of more information to the homeowners was never done. It was left to the towns or community involved individuals to notify the public.

Sincerely,

Theresa Crowley

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE Room 1 A
Washington, DC 20426

re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22

Dear Ms. Bose:

I am writing this letter to express my opposition to the proposed Kinder Morgan Pipeline planned for Southern New Hampshire. This pipeline will destroy both open space and private property across New Hampshire, and in my opinion put the safety of residents at risk. It will also put an unfair burden on taxpayers.

Last night, Thursday Oct 8th, Kinder Morgan met with the Town Council of Merrimack, NH to discuss another proposed route change in the town. Our Town Council was prepared to address specific questions of the proposed route only to find out right before the meeting that there was another route change! How unprofessional of Kinder Morgan to not have contacted the Town Council to give them a heads up of the proposed changes. These update were to accommodate two town businesses that Kinder Morgan had supposedly met with. I use the word supposedly as I question the ethics of Kinder Morgan. It appears they like to stretch the truth by misleading the public.

New Hampshire is called the Granite State for a reason – it is identified by its rocky soil; its bedrock is rich in granite. I am concerned as to the risk of damage to Merrimack's town water supply once the blasting begins. Our aquifers will be affected by the proposed route. For the 12th year in a row, Merrimack has been awarded official Groundwater Guardian status from the National Groundwater Foundation in Lincoln, Nebraska. This program recognizes communities who are dedicated and committed to local groundwater protection to ensure a safe water supply for the future of the community. Merrimack is the only town in New Hampshire awarded this status. I would hate to lose this status! Also, residents in town that have private wells who are situated along the proposed route could potentially see significant damage to their wells.

The new revised proposed route is still under 900 feet from the Thorntons Ferry Elementary School, there are at risk businesses that may not be willing to stay in their current location (loss of revenue to the town) or are still unaware that they are affected by the pipeline, and residents who are just now made aware they will be impacted by the pipeline.

There are the environment effects, not just to Merrimack but to the state. Significant environmental risks that should be examined are: degradation of water resources; impairment of ecosystem services; diminished air quality; forest fragmentation; harm to wildlife and botanical species; permanent landscape alteration; disruption of community/state character; and threats to safety.

As I see it this proposed pipeline will provide Kinder Morgan with the ability to export natural gas. Higher gas prices on the international market will result in increased domestic gas prices. Plus how is it fair that residents will have to give up land to increase the profits of Kinder Morgan?

America is the land of opportunity and where people find their dreams. One of those dreams is the "American Dream" of owning a home and property. This pipeline will diminish property values which will result in loss of revenue to our town. Merrimack will not benefit from this proposed pipeline and neither will New Hampshire!

Sincerely,

Julie O'Brien
Merrimack, NH

Ruth Joan Unger, Tewksbury, MA.

Date: October 9, 2015

To: FERC

I am writing to make you aware that my husband, Jim Harmon and I are adamantly opposed to the pipeline. We have attended various informational meetings and have found out that:

1. There is already in existence viable route through the southern part of Massachusetts. There is no need for a second path through the northern part of the state. Google the maps, you will see them. The existing southern path ends at the same point and can be upgraded for less cost to the users than this new route. Face it, if this new pipeline is approved, we users are going to be forced to pay for this one-way or the other... We do not need it!
2. The proposed pipeline would impose a tremendous safety issue. These lines operate under extremely high pressure and are highly volatile and flammable. When they rupture, they create a blast zone of over 300-600 feet, the flying burning debris creates fires wherever it lands. Homes and lives will be lost
3. Energy needs are actually DECREASING and the pipeline is of such a large volume it is clear this line is intended to deliver gas overseas. The Solarize Mass program has had tremendous success in causing homeowners throughout the state to "solarize" and get off the grid. There are also competing Hydroelectric and Nuclear supplies applying to come down from NH and Canada. Great options to Fossil Fuels...
4. My neighbors and I love the conservation areas and protected wetlands and do NOT want them disturbed. The tract of wild land between Cardigan and Brown is an uninterrupted wildlife habitat. The KM plan will clear cut it and prevent trees from ever growing over it again. Herbicides will be sprayed on a regular basis. The Wildlife Habitat will be lost forever, Our Town is in a watershed area for 3 Rivers.
5. A Kentucky judge ruled AGAINST the pipeline stating that the project was not for the common good but to make a multi-billion dollar company even more lucrative.
6. The Merrimack River watershed, Shawsheen River Watershed and Ipswich River watershed would be involved and this supplies water to over 1,000,000 residences. It also supports the wildlife and flora in our area. We cannot allow the 30-50 foot clear cut of trees to be allowed, nor ongoing maintenance herbicides to be sprayed. The trees and vegetation here play an integral role in filtering pollutants out and providing clean drinking water into those rivers. Herbicides cannot be allowed. Those trees should not be cut down. This would only result in pollution of the Clean water which needs to be fed to the 3 vital rivers- Merrimack, Shawsheen and Ipswich...
7. Western MA has been extremely pro-active and their legislators and officials are behind them. To date 41 Towns through which this Company threatened to pass their pipeline have opposed this pipeline.
8. If you "Google" Kinder Morgan you will see about all of the deaths, illegal dealings, explosions, felonies, fatalities, spills, fires, and hospitalizations that have occurred because of this companies practices. You can also check this link: http://www.sightline.org/wp-content/uploads/downloads/2012/02/Coal-Kinder-Morgan-April-12_final.pdf
9. My neighbors and I were literally harassed by Kinder Morgan trying to get permission to survey our properties on Cardigan Road. They came in as Bullies and tried to intimidate us with threats of eminent domain. When my Lawyer asked them for more information about their intended path beyond my yard, through my immediate neighborhood, Kinder Morgan Agents refused to provide it. Clearly, they did not want homeowners to have informed discussions with each other.
10. If you look at a map of the pipeline route proposed through my back yard, you will see how narrow the area between the Cardigan Road and Brown Street Properties actually is. This is a highly developed, highly assessed residential area of valuable single family homes on 1 acre lots. Installation of the pipeline requires certain setbacks and room that does not exist here. This pipeline will also diminish the value of the homes in the area, depriving owners of their equity. The land where TGP works needs to support large and heavy

equipment, and room to excavate and remove trees in the process. This “room” that they need does not exist and therefore this pipeline should NOT be allowed.

11. I recognize the Town of Tewksbury already has numerous gas lines to service many of our residences, but those are smaller and run at a much lower pressure than the line now being proposed. This new line is not intended to service Tewksbury. There is no benefit to Tewksbury. Even if it was, the pressure is so great that it would pose a tremendous danger to our residents and should be denied even in that case. There is a great risk here, with no benefit to weigh against it. No benefit whatsoever.

12. Kinder Morgan has chosen our Town as a path because they see it as the least expensive route for them, no matter what the cost to the homeowners here.. There is no proof this line is necessary. Even if more gas is needed there are adequate alternatives which can be developed at a far lesser expense, to fill any energy void..

Please consider these things and oppose the pipeline!

Sincerely,

Joan Unger and Jim Harmon

20151009-5202

Sarah Howard, East Greenbush, NY.

New York State has banned fracking, and we do not want fracking fluids transferred through NY to Mass from Pennsylvania. Our house and land we own are within 1-2 miles of the proposed compressor station in Nassau, NY. I do not want my children exposed to the air pollutants that are emitted from these compressor stations. They are hazardous to health. Nassau is already home to a hazardous waste site that has not been cleaned up, and is not far from the compressor station (the Dewey-Loeffel Superfund Site). It is a residential area, not to mention a beautiful area. It should not be transformed into an industrial nightmare.

thank you.

20151009-5235

Dudley Baker, Hancock, NH.

Hello FERC, I am opposed to the Kinder Morgan pipeline running through southern New Hampshire.

Please listen to the residents. There is no need for this pipeline whatsoever. Thank you Dudley Baker

20151009-5264

Joseph Wasserman, West Hartford, CT.

My name is Joseph Wasserman. I am a resident of West Hartford and would like to comment on the proposed North East Direct Project gas pipeline of the Kinder Morgan –Tennessee company

I find it unacceptable that a gas pipeline is being proposed for our area and that the proposed route includes sensitive water supply areas run by the MDC. Even though the company representatives claim that they will make efforts to protect the environment and prevent leakage, we know the history of energy companies that say one thing and try and cut safety costs on the other hand. We also know that leakage has happened all too often in relationship to natural gas extraction and delivery.

The need to protect our water supply, is most critical and should not be jeopardized by this proposed gas pipeline

I also fear that the development of renewable energy alternatives and energy reduction strategies, may be put off if we become dependent on this unsafe delivery of natural gas .

I further fear the release of methane from natural gas leakage will accelerate climate change.

I did notice a significant delay in the connection needed to make this comment. The delay occurred after I clicked the request to send me the link by email. I fear that this delay hurts the public input process.

I urge you to deny this permit to the Tennessee gas company.

Thank you

RE: The Northeast Energy Direct Project (“NED Project”).
FERC Docket #PF14-22

Dear Ms. Bose:

I just submitted an eComment to FERC re this gas-line project, but was told an error had occurred in the transmission, so I am repeating my submission by snail-mail:

RE: The Northeast Energy Direct Project (“NED Project”).
FERC Docket 1PF14-22

This pipeline project is an obscene act of corporate destruction of private lives and well-being, and it should not be approved. My sister owns a lovely home and Bng on a hill in Deerfield, MA, with a gorgeous view of the Berkshires. She writes:

“After a year and a half of fighting the construction of a natural gas pipeline that Kinder Morgan threatens to traverse through eight towns in my immediate locality (including across my yard, contaminating my well and my now valueless (that is, unsellable) property, which is well within their proclaimed “incineration zone” of 900 feet (I am less than 300 feet)), I just heard (when I was writing this a few days ago) from a concerned neighbor, that yet another house has exploded (yesterday) due to a natural gas “incident.”.... mhere have been 358 natural gas pipeline “incidents” since 2000. We really need to stop this hazardous intrusion into our lives and livelihoods. Conservation land (even that which is protected under Massachusetts Article 97), organic farms, wetlands, aquifers, private properties, businesses, historical archeological digs, tourist attractions, private schools, rivers, are all threatened by this 5-billion-dollar monstrosity. And they tell us that the gauge of the pipeline will be of thinner material than it would be in an urban setting, because there are fewer of us that would be killed (prematurely incinerated) out here in the boonies.”

If this were an invasion by a foreign army we would call out the Nation Guard, but since it is a powerful corporation we allow it to wreak havoc and destruction in the name of profit.

Consider the lives and values and financial well-being of those affected, and put an end to this project.

Sincerely yours,

Horace W. Briggs

To: Kimberly Bose, Secretary

October 5, 2015

Dear Ms. Bose,

I am writing to you regarding the proposed Kinder Morgan Pipeline, part of the NED project, docket number PF14-22. I know you have received numerous letters and emails regarding this project from many of those in opposition. I wonder if there is a process to review this process with FERC? One that could help all of you FREEZE any further decisions, on any pipelines, including the one slated to rip through Southern New Hampshire. When President Obama put a freeze on foreclosures, it enabled everyone to regroup and come up with a better, more fair and financially sound process to help people stay in their homes and help the housing market too. That is what is needed here. I am not sure if the hands of FERC are tied by their own policies, I find it hard to believe that everyone at FERC, including yourself, does not care about humanity and the environment. I think that you are all caught up in a system that has a life of its own and no one there to stop it.

About Southern New Hampshire: we have no sales tax, for starters, and our mortgages and rents pay for basically everything in this state (slight exaggeration, but not by much). The other income our state has is tourism. We rely on our clean air and water, our natural beauty with safe hiking trails that are not going over or near pipelines, this is what brings people to this part of the state. This pipeline threatens a major area of our economy. It threatens our drinking water as we depend on aquifers and wells. The methane release, and other chemicals from the compressor stations, threaten our ability to breathe and creates more problems regarding global warming, worse than car exhaust I have been told. And our homes, do you want a pipeline running through your property? Especially if you have children, or care about children. And could you sell your property and make a fair enough amount of money to move if you had a pipeline in your front or backyard? Do you want it going right next to children's schools, and do you want to tell parents "I am sorry" when something happens, or they become sick from the air they are now forced to breathe at recess?

We here in Troy, New Hampshire, have a Superfund site, with hazardous and highly flammable material still in the ground (or on top of it). The pipeline is now due to run within 100 FEET of this site, and staging for whatever they need is set to be near this too. More equipment, more hazardous material near or on other already existing hazardous material.

We also share the one and only botanical garden in New Hampshire, with Fitzwilliam, and the pipeline is set to go right through it. There are numerous protected areas, conservation areas, that will all be negatively impacted by this pipeline. For what? For continuing to rely on fossil fuel, and promote fracking, which is the asbestos of our time? Why?? So we can pay for this project through our utility bills, pay for it when there are issues, pay for it with loss of home and health, and pay MORE for gas due to the increase once this gas is exported (which we ALL know it will be, and most of us know that means we will pay what Europe will pay, which is way more than what we pay now).

If there is SO much opposition, don't you think it makes sense for FERC to press a pause button and reconvene on how permits are given, and what the long term effects will be, as well as short term'? My hope is you will do something, from your heart and care for humanity, especially for our children, and for the sake of a job that should protect citizens, not violate their rights and their health.

Sincerely,

LeeAnn LaFosse, Troy, NH

October 4, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
Project: PF14-22 Northeast Energy Direct
888 First Street, NE
Washington DC 20426

Dear Secretary Bose:

As a resident of New Ipswch, NH, where Kinder Morgan subsidiary Tennessee Gas Pipeline Company wants to build a natural gas pipeline and a compressor station, I strongly urge the Federal Energy Regulatory Commission to reject the Northeast Energy Direct proposal.

New Ipswch residents spent several years developing a Master Plan to control the growth of the town, maintain Its rural character, and conserve the natural beauty of the area. Through discussions, debates, and votes, everyone was involved in shaping this Plan.

Now the town Is threatened. Pipeline construction and blasting risks damaging forested land and wildlife and polluting our aquifers and wells. For New Ipswich, the compressor station will routinely release toxins into the air and create constant noise. The risk of pipeline leaks and exploslons is not remote. The history of Kinder Morgan and Tennessee Gas Pipeline show that “significant incidents” (those resulting in fatalities or hospitalization, fires, explosions, or spills) are frequent. Kinder Morgan has been cited for many safety violations, including failing to inspect its pipelines as required.

Everyone Is stunned and horrified that this could happen to their beloved town.

How can a for-profit company be permitted to take over private property, break conservation easements, violate a carefully worked-out Master Plan developed by the town, and introduce health and safety risks to the population?

The costs are ours; the profits are Kinder Morgan’.

Towns would have to pay for increased emergency preparedness. Individuals would have to pay to have wells tested and cope with any damage to their water supply. Property values would fall.

The natural gas transported by this pipeline through New Hampshire is not meant to benefit New Hampshire; It Is likely to be exported to the global market through Canada alter connecting to an existing pipeline in Dracut MA. New Hampshire is currently an electricity exporting state and does not in any way need this massive pipeline running through Its precious small towns. Any potential shortfall could easily be filled by the expansion of existing LNG sources or pipeline projects already under way.

Thank you for listening to my concerns.

Sincerely yours,

Joan Winslow

From: Pelham Pipeline Awareness group

RE:Docket PF 14-22 Kinder Morgan Pipeline

Date: Sept 15,2015

The Marcellus Shale ffelds are pumping out frecked product and so the push is on to build pipelines to EXPORT natural gas with all the risk, but no benefit to the communities that they cross. In NY, MA and NH we are facing the Kinder Morgan Northeast Energy Direct (NED) Project.

In NH and Dracut Ma, this involves over 75 miles of pipe, two 22,000 - 44,000 hp compressor stations and valves every 10- 20 miles. In NH they plan to drill under the Meriimack River twice and the Souhegan

River 5 times, potentially unleashing the heavy metals in the sediments - consequences from the industrial activities of the mills a hundred years ago - and potentially contaminating the drinking water of towns downstream. Over 5,000 landowners are abutters and 5 times that are in “incineration zones” should an accident occur.

We cherish our rural character and culture and we are deeply concerned that our lands will be taken by Eminent Domain - all for the profit of one of the largest pipeline transport companies in the US, - Kinder Morgan, started by former executives of ENRON.

We are worried about pollution from emissions, loss of habitat, contamination of our water supplies, and destruction of local food systems as well as the unintended consequences of industrialization including noise, light and air pollution. We cannot get clear answers about what is emitted during blowdowns and leaks, and there is little research about the health effects to people, wildlife or livestock. Kinder Morgan indicates that their pipelines are safe, yet accidents have increased and their track record nation wide is extremely poor. Kinder Morgan states that this is needed, yet there are over 17 other energy projects under consideration in NE alone and energy usage is going down in NE thanks to conservation measures. Further research shows that the number of pipes that are leaking methane is enormous — large enough to keep pipe-fitters working for ten years. Greed not need is fueling this project.

The Kinder Morgan project is a bad one for NH, for the nation and for world environmental health. We Firmly oppose this pipeline project and ask that you recommend, “NO Build .

Thank you for your attention.

October 2, 2015

First

I am addressing the change in the NED route in Pelham NH. The route changed from the West side to the East side at section 39.5. This route now will directly affect the 31.3 acre prime wetland on lot 11- 103. The uplands are important in keeping the integrity of this wetland intact. The state requires that a prime wetland must have significant value that is worthy of extra protection because of its uniqueness, fragility, and unspoiled character. It must have over 50% hydric A soil and meet many other criteria. I will not go into all the criteria here. After this report was completed the town voted to have this wetland be listed as a prime wetland and the state agreeing with the report then gave it prime wetland status.

In this study it states that the wetland benefits from its natural transition into large upland areas on the South, West, and Northern boundaries. The transition is completely natural and uninhibited. A wildlife benefit is the proximity to the powerline easement which provided much Beld and brush habitat to various wildlife species. It is listed in the report that the land is in an unspoiled state. This will of course now be destroyed because the route was changed. If this pipeline goes to the east of the powerline, the uplands will be deforested and the wetland itself will be destroyed at section 40.2 and 40.3. The impact will be the greatest in this area. I have kept my land at 11-100 in a natural state to protect the wetland and was on the conservation commission to keep this land protected. Please be aware that a new line of electric lines will be on the West side and now both sides of the powerlines will be deforested instead of just one side on the West which is the way it was up until the last week of September.

I am requesting that an explanation be given as to the reasons for this change.

Second

The birdfoot violet is stated as being imperiled, and threatened by (state's criteria). It has only 9 sites in the state and is located on lot 7-11. There are three distinct areas where the plants are located on lot 7- 11. Each area has about 20-30 plants on lot 7-11. See the NH Natural Heritage site for the exact locations. Sections were verified by John Viera PWS senior project, senior ecologist - Company Vanasse Hangen Brustlin Inc.

Thank you for your consideration in these matters.

Pittsfield, MA 01201
October 2 2015

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First St., NE, Room 1A
Washington, DC 20426

Ref: Docket 1PF14-22-000 ATT: Gas Branch 3, DG2E?

Dear Ms. Bose:

I am writing to reiterate my serious concerns about the impact of the Tennessee Gas pipeline on the residents of Massachusetts and New Hampshire. Although I am deeply concerned about its impact on soil and air quality, I am going to focus on water quality in this letter.

The pipeline is scheduled to pass through the watershed of the Cleveland Reservoir which serves 50,000 people in Pittsfield and Dalton. The watershed contains a great deal of ledge, and the blasting process itself would impact the flow and quality of water. Blasting byproducts, such as percholate, and the creation of cracks and fissures in the rock would make a significant change in our drinking water.

Pipelines are notoriously prone to leaks. This pipeline is of thinner material than usual, is under high pressure and will be passing through an area that has significant frost heaves in the winter. Leaks of fracked gas would permit at least 60 known carcinogens, endocrine disrupters and neurotoxins to enter our water supply. I urge the commissioners to consider how they would feel if such a project were proposed for their areas and vote against permitting this pipeline.

Sincerely yours,
Judy Gitelson

20151013-0027

9/21/15

Kimberly D. Bose
Federal Energy Regulatory Commission
888 First St. NE, Room 1A
Washington, D.C. 20426
Docket # PF14-22 NED

I am writing to you to provide substantiated information regarding the proposed NED gas pipeline in New England. Kinder Morgan continues to spew propaganda that is factless while studies completed by competent scientists, lawyers and physicians who stand to make no money if this project were to go in or not, are being continuously published. Here is just some of what I would be much more inclined to trust as being 'the facts'.

I will address: health safety, need, export and price of gas, home value depreciation, accidents. Environmental degradation. equally important, will be saved for another correspondence.

Regarding Kinder Morgan's way of addressing concerns about health safety and the environment:

1. By Kinder Morgan's own report to FERC; "a compressor station will emit more than 100 tons of pollutants with potential health impacts. as well as almost 62,000 tons of greenhouse gases every year. Of these pollutants, many of them known carcinogens, are vented from the pipeline and compressor stations through an event known as a "blowdown" directly into the atmosphere. creating ozone and other greenhouse gas contaminants.
2. Emissions from two compressor stations (Stewart and Energy Corps). published by the Pennsylvania Department of Environmental Protection (DEP) include: MTBE, CO, benzene, toluene, formaldehyde, 2-methyl butane, ethyl benzene, naphthalene, iso-butane, methyl mercaptan, n-butane, n-hexane, n-octane, nitrogen dioxide ... and more.
3. Wilma Subra, an environmental chemist and consultant who is on the Earthworks Board of Directors, has compiled information on health symptoms experienced near compressor stations based on her research with communities concerned about health impacts. Subra has served as Vice Chair of the Environmental Protection Agency National Advisory Council for Environmental Policy and Technology (NACEPT), and recently completed a five year term on the National Advisory Committee of the U.S. Representative to the Commission for Environmental Cooperation and a six year term on the EPA National Environmental Justice Advisory Council (NEJAC) where she served as a member of the Cumulative Risk and Impacts Working Group of the NEJAC Council. Subra has reported the following health impacts in association with compressor stations:

irregular heartbeat, irritated skin, eyes, nose, throat and lungs; nosebleeds, respiratory impacts, sinus problems, allergic reactions, headaches, dizziness, light headedness, nausea, vomiting, ulcers in the mouth and thyroid problems

Chronic conditions include:

damage to liver and kidneys, damage to lungs, damage to cardiovascular system, damage to developing

fetus, reproductive damage. Mutagenic impacts. developmental malformations, leukemia aplastic anemia. changes in blood cells. impacts to blood clotting ability, leukemia.

4. Director of the Institute for Health and the Environment at the University at Albany David Carpenter, who participated as a researcher in the DEC's hydraulic fracturing study, calls compressor stations among the worst of all the fracking infrastructure. "Our previous studies showed that some of the most serious air pollution came from the compressor stations .." Carpenter notes a DEC study that included five states where fracking is allowed, showed more than 40 percent of air samples from compressor stations exceeded federal regulations for certain chemicals like methane, benzene and hydrogen sulfide.

This from a memorandum of Dr. Qavid Carpenter: "As of July 2015, the American MedicaAssociation has resolved to support legislation requiring comprehensive health impact assessments of all gas pipeline proposals. It is realized that significant adverse health impacts are being overlooked in regard to chemical and radioactive emissions associated with compressor stations, metering stations and the entire natural gas infrastructure that is part of hydraulic fracturing. The pipeline infrastructure exposes humans and animals to the same chemical and radioactive emissions as those released at drilling sites, which include dangerous mixtures of contaminants such as carcinogens, mutagens, endocrine disruptors. neurotoxins, respiratory irritants mucocutaneous irritants and toxins, hematological and cardiovascular toxins; all of which are especially damaging to the development of embryos, fetuses and children as well as the reproduction and survival of livestock. poultry and wild animals."

5. In the Minisink NY study, recently released, they found that spikes in air toxins around the compressor coincided with residents' adverse health symptoms. The study involved 3S residents, who were surveyed using a well-tested survey method, including interviews by a physician. Speck monitors were use to measure fine particulate matter in air near residences. Participants additionally used special canisters to capture air samples during "odor events," periods when the compressor emitted strong odors. Asthma, nosebleeds, headaches, and rashes were common among the 3S participants in eight families living within one mile ofthe compressor.

6. At the website hm~;ljwww .• marccll.us-~hale.qs/.M<lr(;.c!.I.!~s-g.IS-(.l(i!itic~.h.~!J.1 residents living near compressor stations or wells in Pennsylvania are warned to get urine and blood tests because many are experiencing symptoms from exposure to toxic chemicals. It also notes fatalities of pets and livestock. The Madison County N.Y. Board of Health report to FERC would support this based on their study measuring chemicals detected downwind from compressors. [https://vV1:vw.IHADtsorlfounty.ny.gov/sites/default/files/pu bltcinformatlon/madison__\(: \(Ill nty_d o IU;\(1 III ments, -_d\(lcket_11o._t'p ! 4-4 9 7 -000 .pd f](https://vV1:vw.IHADtsorlfounty.ny.gov/sites/default/files/pu bltcinformatlon/madison__(: (Ill nty_d o IU;(1 III ments, -_d(lcket_11o._t'p ! 4-4 9 7 -000 .pd f)

7. Officials in DISH, TX commissioned a study of compressor station emissions in its vicinity. Wolf Eagle Consultants performed whole air emissions sampling for VOCs. Chemicals identified as exceeding Texas's ESLs include: benzene, dimethyl disulfide, methyl ethyl disulphide, ethylmethylethyl disulfide, trimethyl benzene, diethyl benzene, methyl-methylethyl benzene, tetramethyl benzene, naphthalene, 1,2,4-trimethyl benzene, em&p xylenes, carbonyl sulfide, carbon disulfide, methyl pyridine, dimethyl pyridine ...

8. concerning Perchlorate-

Much of the NED pipeline will be buried underground, which will require blasting and drilling under water features. The blasting itself carries the risk of release of perchlorate into ground water. Blasting can disrupt underground rock structure and aquifers, allowing perchlorate to enter the water system. At high concentrations perchlorate can affect the thyroid gland by inhibiting the uptake of iodine. A maximum contaminant level has not been set, while a guidance value of 6 ppb has been suggested by Health Canada. The presence of perchlorate in drinking water aquifers and its toxicological properties make perchlorate an emerging chemical of concern. (Srinivasan, Asha. and Thiruvengkatachari Viraraghavan. "Perchlorate: Health Effects and Technologies for Its Removal from

Water Resources." IntemationalJournal of Environmental Research and Public Health 6.4 (2009): 1418-1442. PMC. Web. 13 Sept. 2015.) Additionally, according to the Environmental Protection Agency, perchlorate is considered a "likely human carcinogen".

Some data from the EPA on some of the toxic materials listed above, known to be contained in hydraulic fracturing fluid:

Benzene- a potent known carcinogen. It can also cause anemia and a decrease in platelets by its effect on the bone marrow. The MCLG (maximum contaminant level goals) for benzene is zero. EPA has set this level of protection based on the best available science to prevent potential health problems”

Toluene-toxic to the nervous system, kidneys or liver. The MCLG for toluene is 1 mg/L or 1 ppm. EPA has set this level of protection based on the best available science to prevent potential health problems.

Xylene- is as a solvent, which is used in gasoline in gasoline as part of the BTX component (benzene-toluene-xylene). It is toxic to the nervous system. Xylene is present at a concentration of 3mg/l in hydraulic fracturing fluid (HFL). The MCLG for xylenes is 10 mg/L or 10 ppm. EPA has set this level of protection based on the best available science to prevent potential health problems.

Formaldehyde- Additionally, it has been demonstrated that formaldehyde, another carcinogen, has been found in high concentrations in the air at distances as high as 355 m from compressor sites. (Environmental Health 2014,13:82)

9. One hundred leading medical and scientific experts. “Physicians, Scientists and Engineers for Healthy Energy, petitioned the White House in December 2012 to halt fracking and, in particular, the expanded export of natural gas, stating, “there is a growing body of evidence that unconventional natural gas extraction from shale, that is, fracking, may be associated with adverse health risks through exposure to air, water and soil.”

10. In February 2012, Bernard D. Goldstein, MD, a physician and toxicologist, from Pennsylvania testified before the U. S. House of Representatives Energy and Environment Subcommittee, urging Congress to fund studies that would advance scientific understanding of mixtures of tracking compounds. Comparing the number of fracking sites to the number of Superfund sites, Dr. Goldstein stated it is a “virtual certainty that adverse health effects will be statistically associated with (hydrofracking] activities.”

11. A blowdown is the act of releasing natural gas from a section of pipeline so work can be done safely. The loud noise occurs when the natural gas, which is compressed into the pipe at very high pressure, escapes through the opening. The natural gas is compressed at 5,500 to 9,650 kilo Pascals (800 to 1,400 pounds per square inch) and makes a loud roaring sound as it rushes out through the valve .. As the natural gas rushes through the blowdown valve, a gas plume extends upward of 100 to 200 feet. The first 30 to 60 minutes of the blowdown are the loudest, but the entire blowdown may last up to three hours. <http://www.t.ranscanada.com>

Please explain to me how this complies with the President’s plan to reduce emissions of methane gas from oil and gas operations? It is obvious these greenhouse gases, from over 1,000 compressor stations across the country, play an accelerating role in the earth’s warming.

This gas pipeline is not ‘needed’.

12. In the 5/8/15 ISO Net Energy Load Report the following was stated: “Electricity usage in all of New England is going down compared to the same month a year ago -- at the rate of 1.2% a year. The decline is a bit steeper during the winter months December -March at 1.4% but is still 1.0% for the rest of the year.” The average drop in usage from May 2014 to April 2015 was 2.5% <http://goo.gl/PYjWG>

13. The Department of Energy recently determined that nationally, from 1998 to 2013, 46% of existing pipeline capacity went unused and points out that higher use of existing capacity is more cost effective than building new pipelines. (Jonathan Peress Environmental Defense Fund).

14. Also this past winter: “ISO’s Ninth FOI Award Capacity Auction posted GOQ.Q., News For New England” and “New England Winter Energy “Crisis” Fizzled this year”. Are two articles documented by Christopher Courchesne and Jerry Elmer respectively, both Harvard Law at the Conservation Law Foundation.

15. May 5, 2015_S 8~rkshire Eagle: Solar Array System designed to save 2 Million kW a year; enough to power 274 homes in Pittsfield for a year.

16. And, May 7, 2015 Berkshire Hathaway: Solar Array planned for Betner industrial park, expected to produce 650 kw of energy at peak generation.

17. and “It appears that savings of 2GW from LED lights and 3GW of renewables that will be in place in NY /New England by 2017 will take the biting edge out of any possible summer shortage”.

18. “The very facts surrounding the need for additional gas capacity are highly disputed,” Attorney General Maura Healey stated. 9/19/15. “DER’s proposal to authorize Electric Distribution Companies (EDCs) to enter into the long-term capacity agreements to facilitate pipeline expansion with the costs and risks of such long-term obligations borne exclusively by electricity ratepayers - suffers from numerous factual and legal infirmities.” In fact, the risks assumed by the electric ratepayers would be significant. because the volatility of natural gas pricing is well known.

19. Massachusetts currently has underutilized infrastructure. In 1999, Berkshire Gas added a permanent LNG storage facility to its system, at 369 Long View Road in Whately, MA, originally comprised of two 70,000-gallon LNG tanks. Berkshire had originally planned to add three additional LNG tanks to alleviate pressure, capacity and peaking issues, scheduled for 2003, 2011 and 2018, with the installation taking place over these twenty years “as needed to meet projected [gas] sendout requirements”, according to the EFSB. But in 2006, Berkshire Gas still only had two 70,000-gallon LNG tanks at its Whately LNG facility, with space for three more LNG tanks. Berkshire Gas seems to be ignoring this possible local capacity upgrade to “maintain adequate operating pressures during peak or near peak periods” until 2019, and to “meet projected [gas] send out requirements.” <http://www.environmentalactionfund.org/sites/default/files/2015-09/20150915%20Berkshire%20Gas%20LNG%20Storage%20Facility%20Investigation%20Report.pdf>

Pipeline Leak Rates-

20. It is known that pipelines leak over time. However, based on data from the U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration, the leak rate from newly installed pipelines now exceeds that of pipelines from the pre-1940’s era.

Robert Hall, director of the NTSB’s Office of Railroad, Pipeline and Hazardous Materials Investigations, noted in a Sept. 1 2015 interview that the rapid construction of pipelines in the U.S. is likely a contributing factor to “people ... out there possibly taking shortcuts or not being as diligent” as they would be if the pace of construction were less fervent. In light of the increased leak rate from new pipelines, it is reasonable to be concerned that materials transported in the NED pipeline are also at risk of leaking.

Incidentally, this increase in leaks beginning in the 2010 decade correlates to the time period when Kinder Morgan became the largest pipeline operator in the US, with 84,000 miles of pipeline. While correlation is not causation, it remains an open question as to the safety and integrity of Kinder Morgan lines.

21. Methane is leaking from natural gas infrastructure in Boston and the surrounding region at rates two to three times higher than government estimates, scientists at Harvard University and other institutions found. 1/28/15

22. Published in the journal proceedings of the National Academy of Sciences last week, the researchers’ paper is the first peer-reviewed study that quantifies emissions of methane, a powerful greenhouse gas, from natural gas installations in urban areas-including pipelines, storage terminals and power plants. The amount of methane lost over a year in the study area is worth \$90 million, the authors wrote.

Evidence that Export will raise the price of gas locally

23. LNG exports will raise domestic prices -LNG exports increase demand for domestic gas from foreign buyers who will pay higher prices, thus resulting in higher domestic prices. A 2014 study by the Energy Information Administration (EIA) concluded that, on average, gas bills for residential, commercial, and industrial consumers will increase significantly. depending on the volume of gas exported.

24. According to Tyson Slocum, if even a simple majority of the LNG terminals that have been approved by DOE are actually built and export the volumes of gas for which they are authorized, “such exports will likely overwhelm domestic supply and demand capacity” - causing steep price hikes. - Mary Stewart Doug-

las is an environmental lawyer who has worked at the Environmental Protection Agency, private firms, and, most recently, with an association representing the state and local administrators a/the Clean Air Act.

25. Currently there are twenty applications for permits to build liquefied gas export facilities.

26. The Goldboro LNG project: consists of an LNG processing facility, storage tanks and marine works. The facility will be located at the Goldboro Industrial Park in Guysborough County, Nova Scotia, Canada. The natural gas supply feeding the project is to be delivered via the existing Maritimes & Northeast Pipeline, located directly adjacent to the project. The target markets for the LNG produced at the Goldboro LNG project are Europe, South America and Asia. Goldboro LNG is a Pieridae Energy Canada project. <http://goldborolng.com/>

Depreciation of home value:

27. Homeowners living near the Millennium Pipeline Company's 15,000 horsepower compressor station on Hungry Hill Road in Hancock, New York have seen the value of their homes decline by as much as 50 percent since the industrial facility was constructed in the midst of what used to be a quiet, rural community. In May 2014 several Hungry Hill residents sought real estate tax relief citing the adverse impact of the compressor station on their property values. The Town of Hancock, denied the tax grievances, but Catskill Citizens for Safe Energy subsequently offered to fund homeowner appeals. On August 25, 2014, small claims hearings were held in the Hancock Town Hall. Two homeowners, a certified Real Estate Appraiser, and a representative of Catskill Citizens testified that the compressor station was responsible for heavy truck traffic, noxious odors, persistent low-level vibrations, and air contamination. The witnesses also asserted that the facility presented a safety threat and recounted how a Millennium employee suddenly knocked on the door of a house late one evening and urged the family to quickly evacuate their home. Finally, it was alleged that blasting during the construction of the compressor station had cracked the foundation of one house, which in turn led to an unsafe spike of radon levels. (Pre and post-construction radon tests conducted by Professional Home Inspection Service of Binghamton, New York showed that radon levels in the home jumped from 3 pCi/L to 6.1 pCi/L, which is above the EPA recommended action guideline of 4.0 pCi/L.) In light of the evidence proffered, the Town of Hancock tax assessors agreed to decrease the assessed valuation and real estate taxes on two homes by 25 percent. The assessed valuation and taxes on a third home, the one that had been physically damaged, were cut by 50 percent. Hearing Officer John Creech, who presided over the settlement, was familiar with the compressor station and remarked, "I WOULdn't want to live next to it." After the tax assessors agreed to the 50 percent tax cut he told the owners, "You have a good lawsuit here." For further information contact: info@minisinkmatters.org

28. In Pavilion, WY, where the EPA has linked groundwater contamination with fracking, Louis Meeks saw the value of his 40-acre alfalfa farm all but disappear completely. In 2006, his land and home were appraised at \$239,000. Two years later, as ProPublica reported, "a local realtor sent Meeks a coldly worded letter saying his place was essentially worthless and she could not list his property. 'Since the problem was well documented ... and since no generally-accepted reason for the blowout has been agreed upon,' she wrote. 'buyers may feel reluctant to purchase a property with this stigma: ..

29. In Minisink N.Y. property values are plummeting and locals are complaining of chronic nosebleeds, rashes, migraines, and dizzy spells. The smell in the air can range from rotten eggs to burning paint. Minisink's nosedive in quality of life is the handiwork of the Millennium Pipeline Company, which runs two 6,000-horse power natural gas compressors in town limits. <http://www.minisinkmatters.org/?p=233>
some of the accidents-

30. Compressor stations have their own serious concerns, as illustrated by an explosion and fire at a Williams compressor on May 14, 2013 (Kohut 2013). A very recent fire at the Williams compressor station in West Windsor, NY on Jan. 7, 2014 (WBNG 2014) brought back memories of an explosion caused by a lightning strike at the same site in the summer of 2012 (Mahoney 2012).

31. The use of lesser quality pipe for pipelines in areas with lower-density rural housing concentrations, provides for higher short-term profits at huge environmental and health costs. Pipeline and compressor

accidents range from fires in above ground facilities to major underground explosions similar to the December 2012 blow-up of a pipeline underlying I-77 in West Virginia (Brinks 2013). The US Department of Transportation's Pipeline and Hazardous Safety Administration monitors incidents concerning pipelines on a yearly basis. The ten year average of "significant" incidents (causing damage over US\$50,000 per incident) was 282 per year, with property damages averaging us \$517,451,428 (USDOT 2014).

With this information so abundant and from so many reputable sources; why would anyone believe the unsubstantiated, self-serving rhetoric of the fossil fuel industry? This appears to be no different than the debacle of the tobacco industry.

New England has a different level of appreciation for clean air and water than some of the other areas of the country you may have dealt with. We understand that money cannot compensate the contamination of drinking water, or increasing levels of carcinogens in our air. We need only look west to see what we would be in store for. NO THANK YOU. The time for fracking is done because educated, informed Americans are coming together. a groundswell rising, all across the country. We will not accept this and we will stop It

Mamie & Bob Meyers

**Conservation Commission
Richmond, New Hampshire**

October 6, 2015

Jeffrey Taylor, Chairman
Richmond Conservation Commission
105 Old Homestead Highway
Richmond, NH 03470

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E., Room IA
Washington, D.C. 20426

Re: Comments relative to the proposed Northeast Energy Direct Project, Tennessee Gas Pipeline, LLC, Docket No. PF14-22-000.

Dear Secretary Bose,

Richmond, a small, rural town located in the hilly region of southwest NH is unique as we do not have the usual expected modern conveniences such as a post office, stores, gas stations, or restaurants.

Many people are attracted to and live here for Richmond's primary assets which include our undeveloped landscape of rolling forested hillsides, pristine streams, ponds, and abundant wildlife. This magnificent landscape offers us peace, security, and a "sense of place" an escape from the pressure of urbanization.

The majority of the residents of Richmond have expressed their sincere concerns and fear that the Northeast Energy Direct Project, Tennessee Gas Pipeline, LLC, Docket No. PF14-22-000, poses an unreasonable threat their quality of life and the natural resources and rural character of Richmond. The people of Richmond feel they have to sacrifice their comfort, security, and sense of place without any benefit from the proposed project.

The Richmond Conservation Commission has been extremely frustrated with the lack of detail provided for the exact location of the proposed pipeline and other alternative routes in Richmond that have been mentioned at public meetings. This lack of transparency by Kinder Morgan has made it difficult for this commission to assess the potential impacts on the towns' natural resources.

The Richmond Conservation Commission clearly understands the concerns and opposition to this proposed

project expressed by the majority of our residents and wishes to present the additional following comments to FERC.

The commission is very concerned about the potential negative impacts to the following important resource areas within the alleged pipeline route:

- o Headwater streams and tributaries of Tilsey, Brickyard, Sprague, Roaring, Rice, and Tully Brooks which support naturally reproducing Eastern Brook Trout.
- o Sandy Pond and its unnamed tributary
- o Stratified drift aquifer between Old Homestead Highway and Fish Hatchery Road
- The possible taking of land protected by conservation easements such as the Quint Preserve, and Little Monadnock Family Trust.
- Invasive Plants — strong potential to introduce and spread from construction vehicles and moving of soil infested with seed.
- Stabilization of rocky, steep slopes during and after construction regarding soil erosion and possible stream sedimentation.
- Concerns for wetland impacts, remediation, and mitigation.

Please give serious consideration to the aforementioned potential impacts and concerns to Richmond's natural resources. Should this project be approved the Richmond Conservation Commission respectfully requests, that a third party, State of New Hampshire qualified environmental professional, be present on site during construction activities to monitor compliance with all applicable federal, state, and local permits.

Thank you for the opportunity to comment on this project.

Sincerely,

Jeffrey M. Taylor, Chairman
Richmond Conservation Commission

Cc: Carol Jameson, Chair, Board of Selectmen

**Boulder Hills
Senior
Condominium Association
Pelham, New Hampshire 03076**

October 6, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E., Room IA
Washington, D.C. 20426

Dear Secretary Bose,

We, the undersigned, are residents of Boulder Hills, an age-restricted, active, Senior townhouse community in Pelham, New Hampshire. Many residents are in their 80's and 90's. We are retired, continuing in a career, or volunteering in our town.

What we especially hold in common is our opposition to the Kinder Morgan/Tennessee Gas, Northeast Energy Direct (NED) Pipeline project (FERC PF14-22-000). We are abutters to the proposed pipeline. In effect, the pipeline's route would take open and forested space while crossing our boundaries. All twenty-four townhouses are within 1,000 feet of the proposed pipeline's placement and dangerously close to construction. YET, our Association President has never been notified of the pipeline's destined proximity to our homes.

The construction will require the clear-cutting of many “Wetland Conservation District” tagged trees. What becomes of their Conservation “No Cut, No Disturbance” status? The views we now enjoy will disappear. No longer will we hear the songbirds that visit our backyards. Animal visitors, which include deer, fox, wild turkeys, and endangered animals, such as the New England Cottontail, will lose habitats and their lives to the destructive pipeline construction.

We moved to Boulder Hills to enjoy a quiet, less worrisome way of life. After raising families and spending many years in various careers, we looked forward to tranquility and a healthy living environment. However, we now face many dangers and challenges to the quality of life we sought.

What becomes of our air quality, with a pipeline spewing toxic chemicals and vapors into the environment through leakage and by the use of chemicals during construction and operation? Some Senior residents already have respiratory challenges without the introduction of hazardous elements into our pristine neighborhood.

High noise levels expected to be emitted from a compressor station merely one mile away need to be measured to determine negative health impacts. Loss of sleep, resulting from high decibels not previously heard, has been reported by medical professionals to cause anxiety, heart ailments, digestive issues, psychological symptoms, and a general feeling of ill health. Not how one would expect the quality of life needed for enjoying activities in retirement!

Probably the most important negative result (though there are many others) of pipeline construction would be the contamination of our water supply. Water is life! Who would be responsible for the lack of potable water for our Seniors? How could you possibly replace well water and its distribution system for our twenty-four (24) homes and the Senior occupants. Can you replace water for drinking, personal cleanliness, and cooking? Who will pay for well testing long after the blasting and bulldozers have left the area? Oh, by the way, our well (aquifer supplied) is within 1,000 feet of the proposed pipeline!

Some final points:

1. Would anyone want to live out their years under the dark shadow of being in an “INCINERATION ZONE” ? Boulder Hills has eight (8) underground propane gas tanks used for home heating and cooking. All tanks would be compromised by construction of this “NO NEED, NO NECESSITY” pipeline.
2. Would anyone want to learn that their home, their earned equity for retirement, as well as a possible inheritance for their children and grandchildren, might not be able to be sold? Insurance not available, or very costly? Your home, your investment, your refuge taken by eminent domain for a pipeline’s gas destined for foreign markets. Destined to enrich strangers who have never met you. Strangers who will never understand why we need the FERC to deny the application of Kinder Morgan/Tennessee Gas for the NED pipeline project.

Finally, “IF” the FERC should grant approval for the Kinder Morgan/Tennessee NED pipeline project to proceed, we, the undersigned Senior residents of Boulder Hills, MUST be granted consideration for mitigation resulting in an alternate route that by-passes our homes.

Thank you for your consideration.

Washington DC, 20426

Subject: Northeast Energy Direct
FERC Docket # PF14-22-000
Proponent: Tennessee Gas Pipeline

Please find attached our formal comments related to the Northeast Energy Direct Pipeline.

The overall limited and vague information provided so far, makes it difficult to determine the exact or complete impacts of the project on the rural Town of Hinsdale. We have attended sessions and workshops and read the materials presented but we still have concerns and questions about the proposed pipeline. Hopefully your review of this project will provide some answers to our concerns and questions.

Yours truly,

Laurel Scialabba
Selectman
Town of Hinsdale, MA

TOWN of HINSDALE, MA

1. Background: Town of Hinsdale

The Town of Hinsdale is a rural community in the hilltowns of the Berkshires. The population is around 1800 residents year round but grows to around 5,000 in the summer months due to camps and second home owners. The Town is well known for its lakes and recreation. The residents of the Town and the summer population come here for the rural quality and quiet lifestyle. A concern of the citizenry is that the pipeline will disturb the main attractions of the Town and its rural quality and quiet atmosphere. Citizens are concerned that proximity to the pipeline will affect both the appraised values and sale prices of their residences.

2. Construction

All General Construction Standards must be met and all local permits should be obtained. Kinder Morgan should agree to notify the Town of any problems, violations or complaints regarding the construction of the pipeline. All work permits required in the Town must be obtained by Kinder Morgan. Overall agreements with the Town must be in place before any construction activities begin. Kinder Morgan should provide the Town with indemnification and hold harmless agreements to protect the Town from any damage to property as a result of the construction, including roadways. There is significant concern with blasting in the area of construction considering the nature of the ground in this area (Le. ledge rock, large boulders, etc.). Protections during blasting operations need to be defined and guaranteed to the Town. We do not have enough information on the compressor station which is near Hinsdale so that we can discern if there are any impacts to our Town. Work on the project should be limited to the hours between 7AM and 7PM. During construction and operations all noise levels must comply with Mass DEP certified regulations. Where will meters and valves be located and what will be their impacts and requirements? What will be the guarantees that blasting will not impact, wells, dams, streams and water supplies that feed the nearby reservoirs and homes? What will be the protections to the Town for hazardous materials, leaks from machinery and blasting by-products? What are the long term effects of pipeline construction on the general area? What type of security will be provided to protect the pipeline during and after construction? Kinder Morgan should assure the Town that there will be no impact to the pipeline from its adjacency to the high tension wires and the power station. Some consideration needs to be taken to assure that the depth of the pipeline itself will survive the frost in the ground during the winter months.

3. Issue: Public Safety

The Town of Hinsdale has a small volunteer Fire Department. The Fire Department also runs the Ambulance service for Hinsdale, Peru, Middlefield, and part of Washington. The Fire Chief is concerned that, after traveling and researching the route, it would be very difficult for current equipment to access the pipeline for either fire or emergency services. Knowing that access roads must be built for the pipeline, will those access roads be adequate or remain for the fire and EMS services before, during and after construction? The Department does have some equipment that could be used to service emergencies along the pipeline but they do not have a small enough vehicle that can be used on the trails that lead to the current high tension area. Since forest fires are a main concern with the pipeline the Department may not have the proper equipment to handle a large scale incident. The Fire Department would most likely need Wild land PPE, an off road extinguishment vehicle, forestry hose and stockpiles of class A foam to be replenished by the pipeline operator. Also gas meters, compatible with the expected product, for each response vehicle as well as yearly maintenance of such meters paid by the pipeline operator. Is Kinder Morgan prepared to provide such equipment? We would need to know whether the construction company doing the work will have the proper emergency equipment and personnel in case of any confined space or cave-in incident that may occur. There needs to be either assurance that equipment and personnel are available or Kinder Morgan needs to supply both to the EMS service in Town. More complete training needs to be provided to the Fire Department and Ambulance Service on the types of emergencies inherent on the pipeline process for both construction and maintenance. They also need training to go along with equipment needed. The Town would need better identification of the meters and valves involved in the pipeline.

The impact of road closures and detours on emergency vehicles must also be determined as well as the impacts to residents for those closures or detours.

The Emergency Management staff has concerns for the residents and property surrounding the proposed pipeline as well. They feel that they will need training and equipment to handle a major incident. Equipment such as: gas meters, portable radios that interface with the various town, state and federal agencies, road barriers, cones, tape and a battery with charger. Will the pipeline operator supply this equipment?

The Police Department has expressed no major concerns with the pipeline but also would need training on handling a major incident with the pipeline.

All concerned with public safety would want to meet with the construction companies prior to any activity to be sure training was completed. The Construction Company should also plan to meet with them on a regular basis during construction.

4. Roads

The Highway Department for the Town of Hinsdale has expressed significant concerns surrounding the proposed pipeline. The proposed route must be more clearly defined especially the location of access roads, pipe yards, contractor yards, etc. so that exact impacts to the roads can be ascertained. The routes to and from the sites must also be more exact in order to identify the impacts to those routes as well. All roads affected must be inventoried for condition, including subbase, culverts and bridges for the ability to handle heavy equipment and loads. Roads and bridges must be clearly identified to handle the loads of equipment and delivery of various construction needs and the method proposed to construct the pipeline along these roads or bridges must be clearly defined. The costs for repair or improvements needed to use the roads must be borne by Kinder Morgan and an insurance bond to the Town of Hinsdale should be provided by Kinder Morgan. Since Hinsdale is a rural community and the pipeline is proposed along the high tension wire route there are few roadways along this route that are built to handle this kind of traffic. These roadways are Adams Rd., Old Windsor Road, Frank Schnopp Rd. and New Windsor Rd. Use of these roads and crossings to this rural area must be clearly defined as well as precautions to protect owner's lands and rights and the condition of the roads must be returned to "normal" or better by Kinder Morgan after the construction of the pipeline is complete. The condition of the roads after construction must be evaluated by the Town for the agreement that the roads are in repair. Any access roads built to the site must also be evaluated for emer-

agency vehicles to access the pipeline itself and the roads must continue to be maintained by Kinder Morgan. Any detours must be determined and impact considered to the residents of the area. The impact of the heavy winter snows and ice must also be considered and addressed.

5. Conservation and Wetlands.

The proposed route of the pipeline goes through Hinsdale which has significant wetlands and brooks in the area. Crossing of the wetlands and particularly the two brooks is of significant concern to the Town. There is almost no area of the proposed pipeline that does not affect some form of protected area. Portions of the route include the FEMA 100year floodplain, a Public surface Water Supply Protection Area, a nearby Public Surface Water Supply, Fresh Water Wetlands, two brooks and Protected and Recreational Open Space. The entire construction would be done in a DEP designated Area of Critical Concern. A Notice of Intent to the Hinsdale Conservation Commission must be filed and approved. The methodology of crossing the wetlands and brooks must be explained and approved. A Wetlands Consultant and Environmental Monitor would need to be hired by the Town at the expense of Kinder Morgan in order to assure all wetlands, brooks, etc. are protected and regulations complied with during construction. Erosion controls will need to be defined, installed and maintained to DEP and Town requirements along the corridor, staging areas and construction storage facilities. Restoration procedures must be defined. We need more information about refueling, prohibitions for water supplies and the area mitigation following construction. Has the impact of the proposed route been reviewed by Natural Heritage and Endangered Species group?

6. Water Quality

Both public and private water resources, in the construction area and nearby, need to be identified and protected. Water quality testing should be done before and after construction to assure the results are the same or better. Septic systems must also be checked for disturbance. Guarantees need to be provided to the Town and property owners that there will be no negative impacts on water supply, wells or septic systems. All construction methodology must be developed to avoid any alteration to the existing local aquifers to the private well systems.

20151013-0079

**FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, DC 20426**

October 9, 2015

OFFICE OF THE CHAIRMAN

Honorable James P. McGovern

U.S. House of Representatives

Washington, D.C. 20515

October 9, 2015

Dear Congressman McGovern

Thank you for your August 31, 2015, letter regarding Tennessee Gas Pipeline Company, L.L.C.'s (Tennessee Gas) planned: Vortheast Energy Direct Project (Docket No. PF14-22-000).

During the pre-filing process, numerous environmental surveys and studies are being performed concurrently by the applicam. Additionally, FERC staff is reviewing the information and requesting additional information from Tennessee Gas. The purpose of the pre-filing process is to increase the applicant's and staff's understanding of the issues that should be addressed in the formal application and in the subsequent environmental impact statement (EIS) for the project. The EIS will analyze the environmental issues you raise, and will not be issued without the Commission having all of the information necessary to determine the potential impacts associated with constructing and operating the project.

With regard to your request for other scoping meetings, we held an additional scoping meeting in Rindge,

New Hampshire on September 29, 2015. Additionally, the Commission announced in a September 3, 2015, Supplemental Notice that it would extend the comment period for the project until October 16, 2015. Commission staff will continue to accept comments on the project after the end of the formal comment period and these comments will be considered within the EIS. After the draft EIS is issued, the public will have opportunities to comment on the adequacy of the EIS.

As in any Commission matter, please be assured that we strive to make our review of proposals both accessible and transparent to the public. If I can be of any further assistance in this or any other Commission matter, please let me know.

Sincerely,

Norman C. Bay
Chairman

20151013-0081

FEDERAL ENERGY REGULATORY COMMISSION

WASHINGTON, DC 20426

October 9, 2015

OFFICE OF THE CHAIRMAN

The Honorable Ann McLane Kuster
U.S. House of Representatives
Washington, D.C. 20515

October 9, 2015

Dear Congresswoman Kuster:

Thank you for your September 2, 2015, letter regarding Tennessee Gas' roposed Northeast Energy Direct project (Docket No. pF14-22-000).

During the pre-filing process, numerous environmental surveys and studies are being performed concurrently by the applicant. Additionally, FERC staff is reviewing the information and requesting additional information from Tennessee Gas. The purpose of the pre-filing process is to increase the applicant's and Commission staff s understanding of the issues that should be addressed in the formal application and in the subsequent environmental impact statement (EIS) for the project.

The EIS will analyze the environmental issues you raise, such as impacts on environmentally sensitive areas, public safety, and alternative pipeline routes and compressor station locations. The document will not be issued without the Commission having all of the information necessary to determine the potential impacts associated with constructing and operating the project. With regard to your concern that pipeline could impact important recreation and conservation areas within New Hampshire, and the routing of pipeline near educational facilities, the EIS will include a discussion of socioeconomic impacts, land use, and impact on public safety, including educational facilities situated in proximity to the planned pipeline route.

As in any Commission matter, please be assured that we strive to make our review of proposals both accessible and transparent to the public. If I can be of any further assistance in this or any other Commission matter, please let me know.

Sincerely,

Norman C. Bay
Chairman

Town of Berne, NY 12023

Dear Councilman Jordan:

Thank you for your August 31, 2015, letter regarding Tennessee Gas' proposed Northeast Energy Direct Project (Docket No. PF14-22-000).

As you are aware, Commission staff issued the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings on June 30, 2015. The meeting locations and dates, including the July 16 Schoharie meeting, as well as the July 14 and 15 meetings in Rensselaer County, were selected to be convenient for the greatest number of people who might be interested in the project, while recognizing the available resources of the Commission to conduct such meetings. As stated in a September 3, 2015 Supplemental Notice, the Commission has extended the comment period for the project until October 16, 2015.

During the pre-filing process, numerous environmental surveys and studies are being performed concurrently by the applicant. Additionally, Commission staff is reviewing the information and requesting additional information from Tennessee Gas. The purpose of the pre-filing process is to increase the applicant's and Commission staff's understanding of the issues that should be addressed in the formal application and in the environmental impact statement (EIS) for the project. Commission staff will continue to accept comments on the project after the end of the formal comment period and these comments will be considered within the EIS. I encourage you and your constituents to continue to participate in the review of the project, and to file any comments that you believe will help the Commission consider this matter.

The EIS will analyze the environmental issues you raise, such as impacts on water quality, public health, and public safety. The document will not be issued without the Commission having all of the information necessary to determine the potential impacts associated with constructing and operating the project. Comments on the draft EIS may be submitted to the Commission either in writing by filing them in the docket, or verbally at public comment meetings that will be held in the project area. After consideration of the comments received on the draft EIS, a final EIS will be issued. The Commission will consider the findings of the final EIS, as well as issues such as the need for the project, before making its decision on whether or not to authorize this project.

As in any Commission matter, please be assured that we strive to make our review of proposals both accessible and transparent to the public. If I can be of any further assistance in this or any other Commission matter, please let me know.

Sincerely,

Norman C. Bay

Chairman

20151013-0084

FEDERAL ENERGY REGULATORY COMMISSION

WASHINGTON, DC 20426

October 9, 2015

OFFICE OF THE CHAIRMAN

The Honorable Kelly Ayotte

United States Senate

Washington, D.C. 20510

Dear Senator Ayotte:

Thank you for your September 10, 2015, letter regarding Tennessee Gas's planned Northeast Energy Direct Project (Docket No. PF14-22-000), which raises concerns with our review process for natural gas pipelines. On October 2, 2014, the Commission approved Tennessee Gas's request to begin the pre-filing review for this project. The Commission's pre-filing process is designed to engage stakeholders to identify and resolve environmental issues before the formal filing of an application with the Commission. Engaging the public early in the process enables the Commission to fulfill its obligation under the National Environmental Policy Act in the event an application is filed. Because Tennessee Gas has not yet filed an application, the Commission is not in a position to make a determination on the public need for the project.

Once Tennessee Gas files its application, Commission staff will prepare a draft environmental impact statement (EIS), which will analyze the project's environmental impacts, including those related to pipeline safety. The EIS will be published and distributed for public comment. After consideration of the comments received on the draft EIS, a final EIS will be issued. The final EIS will address any comments received on the draft EIS. The Commission will consider the findings of the final EIS, as well as the public comments received on the need for the project, before making its decision on whether or not to authorize this project.

The Commission issued a Statement of Certificate Policy Statement on September 15, 1999, in Docket No. PL99-3-000. This document provides guidance for evaluating proposals to certificate new construction by establishing criteria for determining whether there is a need for a proposed project and whether the proposed project will serve the public interest. The Certificate Policy Statement explained that in deciding whether to authorize the construction of major new pipeline facilities, the Commission balances the public benefits against the potential adverse consequences. When evaluating new pipeline construction, the Commission's goal is to give appropriate consideration to the enhancement of competitive transportation alternatives, the possibility of overbuilding, subsidization by existing customers, the applicant's responsibility for unsubscribed capacity, the avoidance of unnecessary disruptions of the environment, and the unneeded exercise of eminent domain.

With regard to your concerns regarding pipeline safety, the Department of Transportation (DOT) has the exclusive authority to promulgate federal safety standards used in the transportation of natural gas. FERC's regulations in Title 18, Code of Federal Regulations, § 157.14(a)(9)(vi) require that an applicant certify that it will design, install, inspect, test, construct, operate, replace, and maintain the facility for which a Certificate is requested in accordance with DOT federal safety standards and plans for maintenance and inspection. Lastly, as a matter of policy, Commission staff continues to fully evaluate any comments received during and after the close of the formal comment period. I encourage you and your constituents to continue to participate in the review of the projects and to file any comments that you believe will help the Commission consider this matter.

As in any Commission matter, please be assured that we strive to make our review of proposals both accessible and transparent to the public. If I can be of any further assistance in this or any other Commission matter, please let me know.

Sincerely,

Norman C. Bay
Chairman

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, DC 20426

October 9, 2015

OFFICE OF THE CHAIRMAN

The Honorable Ann Kuster

U.S. House of Representatives

Washington, D.C. 20515

Dear Congresswoman Kuster:

Thank you for your September 10, 2015, letter regarding Tennessee Gas's planned Northeast Energy Direct Project (Docket No. PF 14-22-000), which raises concerns with our review process for natural gas pipelines.

On October 2, 2014, the Commission approved Tennessee Gas's request to begin the pre-filing review for this project. The Commission's pre-filing process is designed to engage stakeholders to identify and resolve environmental issues before the formal filing of an application with the Commission. Engaging the public early in the process enables the Commission to fulfill its obligation under the National Environmental Policy Act in the event an application is filed. Because Tennessee Gas has not yet filed an application, the Commission is not in a position to make a determination on the public need for the project.

Once Tennessee Gas files its application, Commission staff will prepare a draft environmental impact statement (EIS), which will analyze the project's environmental impacts, including those related to pipeline safety. The EIS will be published and distributed for public comment. After consideration of the comments received on the draft EIS, a final EIS will be issued. The final EIS will address any comments received on the draft EIS. The Commission will consider the findings of the final EIS, as well as the public comments received on the need for the project, before making its decision on whether or not to authorize this project.

The Commission issued a Statement of Certificate Policy Statement on September 15, 1999, in Docket No. PL99-3-000. This document provides guidance for evaluating proposals to certificate new construction by establishing criteria for determining whether there is a need for a proposed project and whether the proposed project will serve the public interest. The Certificate Policy Statement explained that in deciding whether to authorize the construction of major new pipeline facilities, the Commission balances the public benefits against the potential adverse consequences. When evaluating new pipeline construction, the Commission's goal is to give appropriate consideration to the enhancement of competitive transportation alternatives, the possibility of overbuilding, subsidization by existing customers, the applicant's responsibility for unsubscribed capacity, the avoidance of unnecessary disruptions of the environment, and the unneeded exercise of eminent domain.

With regard to your concerns regarding pipeline safety, the Department of Transportation (DOT) has the exclusive authority to promulgate federal safety standards used in the transportation of natural gas. FERC's regulations in Title 18, Code of Federal Regulations, § 157.14(a)(9)(vi) require that an applicant certify that it will design, install, inspect, test, construct, operate, replace, and maintain the facility for which a Certificate is requested in accordance with DOT federal safety standards and plans for maintenance and inspection.

Lastly, as a matter of policy, Commission staff continues to fully evaluate any comments received during and after the close of the formal comment period. I encourage you and your constituents to continue to participate in the review of the projects and to file any comments that you believe will help the Commission consider this matter.

As in any Commission matter, please be assured that we strive to make our review of proposals both accessible and transparent to the public. If I can be of any further assistance in this or any other Commission matter, please let me know.

Sincerely,

Norman C. Bay
Chairman

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, DC 20426

October 9, 2015

OFFICE OF THE CHAIRMAN

The Honorable Frank Guinta
U.S. House of Representatives
Washington, D.C. 20515

Dear Congressman Guinta:

Thank you for your September 10, 2015, letter regarding Tennessee Gas's planned Northeast Energy Direct Project (Docket No. PF14-22-000), which raises concerns with our review process for natural gas pipelines.

On October 2, 2014, the Commission approved Tennessee Gas's request to begin the pre-filing review for this project. The Commission's pre-filing process is designed to engage stakeholders to identify and resolve environmental issues before the formal filing of an application with the Commission. Engaging the public early in the process enables the Commission to fulfill its obligation under the National Environmental Policy Act in the event an application is filed. Because Tennessee Gas has not yet filed an application, the Commission is not in a position to make a determination on the public need for the project.

Once Tennessee Gas files its application, Commission staff will prepare a draft environmental impact statement (EIS), which will analyze the project's environmental impacts, including those related to pipeline safety. The EIS will be published and distributed for public comment. After consideration of the comments received on the draft EIS, a final EIS will be issued. The final EIS will address any comments received on the draft EIS. The Commission will consider the findings of the final EIS, as well as the public comments received on the need for the project, before making its decision on whether or not to authorize this project.

The Commission issued a Statement of Certificate Policy Statement on September 15, 1999, in Docket No. PL99-3-000. This document provides guidance for evaluating proposals to certificate new construction by establishing criteria for determining whether there is a need for a proposed project and whether the proposed project will serve the public interest. The Certificate Policy Statement explained that in deciding whether to authorize the construction of major new pipeline facilities, the Commission balances the public benefits against the potential adverse consequences. When evaluating new pipeline construction, the Commission's goal is to give appropriate consideration to the enhancement of competitive transportation alternatives, the possibility of overbuilding, subsidization by existing customers, the applicant's responsibility for unsubscribed capacity, the avoidance of unnecessary disruptions of the environment, and the unneeded exercise of eminent domain.

With regard to your concerns regarding pipeline safety, the Department of Transportation (DOT) has the exclusive authority to promulgate federal safety standards used in the transportation of natural gas. FERC's regulations in Title 18, Code of Federal Regulations, § 157.14(a)(9)(vi) require that an applicant certify that it will design, install, inspect, test, construct, operate, replace, and maintain the facility for which a Certificate is requested in accordance with DOT federal safety standards and plans for maintenance and inspection.

Lastly, as a matter of policy, Commission staff continues to fully evaluate any comments received during and after the close of the formal comment period. I encourage you and your constituents to continue to participate in the review of the projects and to file any comments that you believe will help the Commission consider this matter.

As in any Commission matter, please be assured that we strive to make our review of proposals both accessible and transparent to the public. If I can be of any further assistance in this or any other Commission matter, please let me know.

FEDERAL ENERGY REGULATORY COMMISSION

October 9, 2015

OFFICE OF THE CHAIRMAN

The Honorable Jeanne Shaheen
United States Senate
Washington, D.C. 20510

Dear Senator Shaheen:

Thank you for your September 10, 2015, letter regarding Tennessee Gas's planned Northeast Energy Direct Project (Docket No. PF14-22-000), which raises concerns with our review process for natural gas pipelines. On October 2, 2014, the Commission approved Tennessee Gas's request to begin the pre-filing review for this project. The Commission's pre-filing process is designed to engage stakeholders to identify and resolve environmental issues before the formal filing of an application with the Commission. Engaging the public early in the process enables the Commission to fulfill its obligation under the National Environmental Policy Act in the event an application is filed. Because Tennessee Gas has not yet filed an application, the Commission is not in a position to make a determination on the public need for the project.

Once Tennessee Gas files its application, Commission staff will prepare a draft environmental impact statement (EIS), which will analyze the project's environmental impacts, including those related to pipeline safety. The EIS will be published and distributed for public comment. After consideration of the comments received on the draft EIS, a final EIS will be issued. The final EIS will address any comments received on the draft EIS. The Commission will consider the findings of the final EIS, as well as the public comments received on the need for the project, before making its decision on whether or not to authorize this project. The Commission issued a Statement of Certificate Policy Statement on September 15, 1999, in Docket No. PL99-3-000. This document provides guidance for evaluating proposals to certificate new construction by establishing criteria for determining whether there is a need for a proposed project and whether the proposed project will serve the public interest. The Certificate Policy Statement explained that in deciding whether to authorize the construction of major new pipeline facilities, the Commission balances the public benefits against the potential adverse consequences. When evaluating new pipeline construction, the Commission's goal is to give appropriate consideration to the enhancement of competitive transportation alternatives, the possibility of overbuilding, subsidization by existing customers, the applicant's responsibility for unsubscribed capacity, the avoidance of unnecessary disruptions of the environment, and the unneeded exercise of eminent domain.

With regard to your concerns regarding pipeline safety, the Department of Transportation (DOT) has the exclusive authority to promulgate federal safety standards used in the transportation of natural gas. FERC's regulations in Title 18, Code of Federal Regulations, 157.14(a)(9)(vi) require that an applicant certify that it will design, install, inspect, test, construct, operate, replace, and maintain the facility for which a Certificate is requested in accordance with DOT federal safety standards and plans for maintenance and inspection. I encourage you and your constituents to continue to participate in the review of the projects and to file any comments that you believe will help the Commission consider this matter.

As in any Commission matter, please be assured that we strive to make our review of proposals both accessible and transparent to the public. If I can be of any further assistance in this or any other Commission matter, please let me know.

Sincerely,

Norman C. Bay
Chairman

20151013-5004

Roy Pincus, Lynnfield, MA.

This project is not about providing natural gas to New England. If it was, why is there a 24" pipeline being planned from Dracut, MA to the shoreline? This fracked natural gas is clearly intended to be sold overseas for a major profit. Not only does our area not need the capacity, but we certainly do not need a pipeline of this size and under such high pressure. So why does Kinder Morgan want to put in such a high pressure pipeline through our state and then have a lateral line through the north shore of the state to the shoreline? The answer is obvious: so they can get it on ships to export overseas. So this is not a pipeline carrying natural gas for public use. This is for corporate profit. Period! And if not for public use then eminent domain cannot be used. And that means the pipeline cannot go through private property. If this pipeline was really to help increase natural gas capacity in our area, why not just stop the pipeline in Dracut, MA and limit any more damage that will be done to our environment, wetlands, and private properties? There is no need for the Lynnfield Lateral from Dracut to the shoreline. Please do the right thing and stop this monstrosity from ruining so much that is good about Massachusetts. Please put the concerns and safety for the people of our state ahead of the corporate greed and profits of Kinder Morgan.

For the record, I have denied Kinder Morgan their request to survey my property for this project and a copy of the denial letter is on hand with the Lynnfield Police Department.

20151013-5011

Leonard Cohen, Bloomfield, CT.

I am vehemently opposed to the planned pipeline expansion project. I am a lifelong resident of the area and currently own property that borders the MDC reservoir where the project is planned. I have traversed the area dozens of times in my life, including along the pipeline. To start, I can tell you without doubt that there is no way that the project could not disrupt the local environment, including but not limited to the wildlife of the area, particularly given the size of the area and its importance to the surrounding towns as undeveloped forest. Second, the company has a poor track record for safety. In fact, a quick online search does not turn up one good word about them except that put out there by the company itself. The potential threat to the surrounding environment is too great given the size of the land, its role in providing fresh, clean drinking water to the area, and its proximity to residential areas. In short, "not in my backyard." Finally, despite the company's claims of providing better service to area residents, I have never heard anyone here ever say we need more gas, improve our service. TNG is misleading in this area, and the expansion is unnecessary and threatening to this area.

20151013-5012

Evelyn Taylor, New Ipswich, NH.

My frustration with FERC over the Kinder Morgan/TGP Northeast Direct Pipeline (NED) proceedings within FERC is beyond words.

Your process is unjust and ineffective for many reasons. You have determined there will be no more scoping sessions despite the fact that what we have had to comment on thus far is NOT what we will get from this pipeline. The route changed TWICE on October 8. I saw a map at the Merrimack, NH Town Council Comment session with Kinder Morgan on Oct 8 that was drawn after a morning meeting with Fidelity Investments, Inc. and other businesses that morning yet during the presentation of that map to the Council Kinder Morgan described other changes that were also needed. This leaves the town of Merrimack and other surrounding towns who know NOTHING of this new map or changes to it at a serious and grave disadvantage and hopelessness of a fair and just process for the evaluation of this pipeline.

Further, your list of what the FERC does includes: "Ensures the safe operation and reliability of proposed and operating LNG terminals;"

I do not see anything on your list indicating you ensure the safe operation and reliability of proposed and

operating natural gas or fracked gas compressor station or pipeline operations, so if you have no role in that, how is it that you are qualified to participate in this evaluative process and fairly and honestly review and make a decision about this NED proposal?

20151013-5014

Julie OBrien, Merrimack, NH.

With regard to another revised NED Pipeline route traversing through Merrimack, NH I am requesting that the Scoping Comment Deadline be officially extended out from October 16, 2015 by at least another 2 weeks. Bringing the deadline to October 30, 2015.

20151013-5016

Evelyn Taylor, New Ipswich, NH.

My frustration with FERC over the Kinder Morgan/TGP Northeast Direct Pipeline (NED) proceedings within FERC is beyond words.

The FERC process is unjust and ineffective. The FERC has determined there will be no more scoping sessions for NED despite the fact that what we have been able to comment on thus far is NOT what we will get from this pipeline. The route changed again TWICE on October 8. I saw a map at the Merrimack, NH Town Council Comment session with Kinder Morgan on Oct 8 that was hastily drawn after meetings with Fidelity Investments, Inc. and other businesses earlier on that same day yet during the presentation of that 'new' map to the Council Kinder Morgan described other changes that were also needed. This leaves the town of Merrimack, who had done great due diligence to review and comment on a prior changed map, and other surrounding towns who know NOTHING of these new changes, at a serious and grave disadvantage and hopelessness of a fair and just process for the evaluation of this pipeline. Maps of a specific town are not relevant to only that town. I live in New Ipswich, NH, just a short walk to the compressor station site and I drive through and near the proposed pipeline route through New Ipswich, Greenville, Wilton, Milford, Amherst, Hollis and Merrimack to reach my work destination at Fidelity Investments in Merrimack so the extensive presence of the pipeline surrounding my life in all directions day and night for what may be the rest of my life is of great relevance to my well being. Because I am not on the pipeline route, I am left with financial ruin and certain bodily harm, particularly from the compressor station.

Despite Kinder Morgan's and Tennessee Gas Pipeline's claims of no significant property depreciation and no impurities in the gas expected to travel through this pipeline, we know otherwise. Local realtors are refusing to accept listings or are having unsuccessful efforts selling homes near the pipeline route, saying buyers are simply not interested because of the pipeline and science and federal legislation does not agree with statements by Kinder Morgan and Tennessee Gas, L.L.C. of no impurities in the gas.

Is FERC investigating those statements?

Further, the list of what the FERC does on its web site includes: "Ensures the safe operation and reliability of proposed and operating LNG terminals;"

I do not see anything on that list indicating the FERC ensures the safe operation and reliability of proposed and operating natural gas or fracked gas compressor stations and pipeline operations, so if the FERC has no role in that, how is it that the people working there are qualified to execute a fair and honest evaluative process and make a correct decision about this NED proposal or any other?

The fact that we are now cut off from scoping the real proposal is of immense concern. The people of New Hampshire are forced buyers of this project. It is not free. We are paying with our homes, our businesses, our jobs, our families, our schools, our historical landmarks, our pure and only drinking water supplies, our health and our human right to live without the torture of hundreds of hazardous chemicals and other pollutants doused upon us by the TON. Our human right to ensure our children are safe from harm is being violated. Our right as citizens of the United States to be offered fair and just proceedings is being violated.

As if that was not enough, we must then pay again with tariffs and taxes and community and social destruc-

tion of the financial structures within our towns as people are forced to leave by either eminent domain or to escape a harmful environment. How do we pay our debts for building new schools that are no longer occupied? What happens to us and our families as we must file for bankruptcy? Great people who have worked and paid their bills responsibly for decades are now facing a choice of defaulting on their mortgage as the only option to provide a means to bring themselves and their families out of harm's way. Why must we choose bankruptcy to escape from harm? Why must these injustices be on our backs while Kinder Morgan and TGP make billions of dollars at our expense?

IS KINDER MORGAN/TGP RESPONSIBLE TO COMPENSATE THESE LOSSES SO PEOPLE CAN ESCAPE FROM HARM?

Even if they did, no one can re-purify a poisoned aquifer. Pure drinking water is not a frivolous matter. It is essential to life. My brain cannot comprehend the disregard to the very basic needs of life that this and similar projects bestow. Such destruction is documented with direct cause to compressor station or pipeline activities either during construction or during operations. The truth is present as evidence.

My brain cannot comprehend how we, as a civilized and supposedly well-educated segment of the human species on Earth, can pursue energy needs using these methods. Any non-renewable supplies should be used with extreme frugality, if at all. Proliferating use of non-renewables hinders the transition to renewable alternatives. The FERC's mindset remains stuck far in the past and has not progressed as science has proven the errors made. The FERC's proceedings are outdated and promoting destruction of ecosystems and allowing harm to continue to be bestowed upon the health and well being of all living things.

Please tell me what the exact role of Landowner Help is, because thus far, given the FERC's record of approving all but one submission, and given the permissions granted to pipeline companies to construct a path of destruction, I can only surmise that all those persons who have come before FERC for this and other pipelines never had a chance of fairness.

The FERC record of response to submissions is far outside the normal curve of probability calculations. It screams reason to suspect either superior performance, which the comments received for PF14-22 don't uphold, or imbedded manipulation or corruption.

20151013-5023

Gina Goff, Sharon, NH.

To leaders at FERC: The NED pipeline is, simply, a terrible idea. The New Hampshire towns and villages the proposed pipeline will impact are beautiful...small and rural. The compressor station is planned for very near an elementary school (so wrong) and local firefighters are all volunteer -- if you are watching the news, the incidence of pipeline explosions is pretty frequent. Volunteers couldn't handle a fire or an explosion here. Many of us (including me) are concerned by the "blowdowns" when toxic chemicals will be released into the air we breathe. Many others (also including me) are concerned about the environmental impacts, including on local well-water supplies. The fracked gas in the pipeline is -- mostly -- bound for export overseas. The project won't boost our local economy (past the construction phase, which will, by the way, require out-of-state workers mostly) nor does it promise to lower energy costs.

It's the wrong project, in the wrong place, at the wrong time. It's also an old technology that we, as a country, should be abandoning in favor of clean power such as solar, wind and geothermal.

Please, please please deny approval to the NED pipeline project. Thank you for listening and for including my comments in your deliberations.

20151013-5026

Roy Pincus, Lynnfield, MA.

Why is it that trying to get information out of Kinder Morgan is like pulling teeth? I have never experienced a less transparent company than Kinder Morgan. When they are requested to come and speak to our town or neighboring towns, they are a no show. What is it they don't want to tell us? Or are they afraid to face the

overwhelming opposition to this project and are hoping that they can get this project approved without having to face the people whose property and lives they intend to destroy? But I guess I shouldn't be surprised when their CEO is a former Enron Executive. Anything, any way, any how to make a buck. I wouldn't trust Kinder Morgan from here till tomorrow. They are as shady as shady gets.

Please stop this project. Town after town after town in our state is against it. I have seen no support for it. It is not needed. Please listen to voice of the people as we are the ones who will suffer. DO NOT approve this project and disregard and disrespect the people of Massachusetts! Since when are the wants of a corporation put ahead of the people who will be most affected by their work?

20151013-5028

Eli Gonell, Haverhill, MA.

To whom it may concern,

As a concerned resident and taxpayer of Massachusetts I disapprove of any new gas pipelines, in particular, in residential zones across this state. As we move closer to the 22nd century, the United States and the world will focus more on Green Energy, bringing the aggregate gas consumption down, not up. Furthermore, technologies centered in clean, alternative energy are continuously working on consumer scalability, which in turn will allow everyone to reap the benefits of cheap, reliable, and clean energy. In addition, residents of this state will not stand to see their lands destroyed and altered so that big business can make profits. Once the pipelines are installed, ecosystems and natural habitats for wild animals will be destroyed. This is our land and we worked our tails off for our properties.

I repeat, there is no need for new pipelines!

Thank you!

20151013-5029

Sally S Rieger, Simsbury, CT.

I am writing in my position as the **Chair of the Lower Farmington River Wild and Scenic Study Committee**. I am requesting that Kinder/Morgan Tennessee Gas Pipeline Company be required to provide more information to the public, and to interested environmental and community groups, information specifically related to the proposed crossing of the Farmington River in Windsor, CT within our Wild and Scenic Study area. To date, how Kinder/Morgan intends to cross the river remains unclear.

Our group has been charged with defining and understanding the Outstandingly Remarkable Values of the river in the Study Area. These Values are Geology, Water Quality, Biodiversity, Cultural Landscape and Recreation. We suspect that the best option for the river would be horizontal directional drilling but we cannot comment in a meaningful way without more information. All ten towns in the Study Area and many organizations, including Stanley Black and Decker, local land trusts and other conservation organizations and businesses, support designation. The Farmington River is a valuable and treasured local resource.

Kinder/Morgan Tennessee Gas Pipeline Company has held two recent public meetings in our area, one in August, a time when many people are not in town to attend. I received notification of that meeting on the day of the meeting through another local group. The information was so poorly distributed by Kinder/Morgan that when I forwarded the information to Rivers Alliance of CT, it was the first news of the meeting that organization had received. Rivers Alliance of CT is widely recognized in CT as a strong and respected advocate of river and drinking water protection. If Kinder/Morgan was doing its best to notify interested parties, as they have stated, then their "best" is most inadequate.

At the more recent meeting in West Hartford, CT on October 7, a meeting held at the request of the MDC which supplies drinking water to over 400,000 people in CT, there was not an opportunity to get any detail about the Farmington River crossing. Thus, we need an informational meeting related to that question. The Farmington River crossing is of interest to all ten towns in the Wild and Scenic Study, Avon, Bloomfield,

Burlington, Canton, East Granby, Farmington, Granby, Hartland, Simsbury and Windsor.

We appreciate the opportunity to have you address our concerns.

Sincerely,

Sally Rieger

Chairman

Nancy Carney, Fitzwilliam, NH.

Docket no. PF14-22

Kinder Morgan Proposed Natural Gas Pipeline

From

Fitzwilliam Fire Department and Emergency Management

During Construction of Proposed Pipeline -

- What is your emergency response plan? When will we receive a copy of it?
- Will Kinder Morgan be installing an Active (CO2?) or a passive fire suppression system?
- Will Kinder Morgan Install gas leak detectors at the Compression station if one is installed in the town?
- Will you provide and pay for initial and ongoing Training for all first responders (police, fire, ambulance, emergency management and highway)? How often will training take place? Is there a point at which training would end? If so, what is that point?
- Will Kinder Morgan supply emergency responding personnel with Pipeline Safety Education to the level of Technician? Training in accordance to meet or exceed OSHA 1910.120.
- Are you providing Trench Rescue and Confined Space rescue training for all personnel along the pipeline corridor? Is there a maximum number of personnel you will train or will all currently employed and/or volunteer workers be trained
- What kind of Special protective gear is needed for first responders at an incident? Please list any and all specific equipment. Will Kinder Morgan provide and maintain it or replace if damaged, as long as it is needed?
- How many personnel will respond from Kinder Morgan in case of an incident?
- What security monitoring will be implemented during the construction along the length of the pipeline (alarms, fences, manpower, cameras, and patrols)? How many systems? Who will monitor them? Where will tapes and images be kept? How long will they be kept? Who will assess them? Will information be available to all departments?
- What access will the Emergency Responder's have to the pipeline and compression stations? Will they have access 24 hours a day seven days a week? If not, how will access be conducted and by whom? Who will be the immediate contact?
- Will Kinder Morgan provide an ATV or like vehicle for access to the pipeline by emergency responders? Will we have keys to unlock newly installed gates or other restrictions at the Eversource Row and Kinder Morgan row to have emergency access?
- Will evacuation routes be maintained during construction? What plans are there for the Town due to the

fact that three major evacuation routes out of town are crossing over the pipeline during construction?

- How often will meetings with compressor pipeline operator or designee be held?
- How often will you supply a detailed site plan?
- Will Kinder Morgan provide Medical equipment for a mass casualty incident?
- What is the plan to protect the pipeline from a Soft Terrorism threat?
- Will Kinder Morgan provide a messaging system for notification of an incident or training (including message boards)?
- How is the lack of 24 hour police coverage going to be addressed?
- The all fire department and EMS services are call departments with minimal manpower during the day-time. This needs to be addressed.
- Will Kinder Morgan maintain road access to the compression stations and Pipeline? This would include snow removal and roadway maintenance and upkeep so that emergency vehicles can respond.
- What will the state involvement be in an incident? Who will be contacting the state departments in case of an incident?
- Where the closest service field rep located and what is the response time to any individual town?
- What are the plans for a wide spread emergency affecting more than one town at the same time?
- Where does funding come from to reimburse for emergency response (including alarm activations and full blown incidents) and how soon is it available?
- Will Kinder Morgan be paying for security details for surveyors and workers during the initial phases of the project?
- Access for Emergency Agencies into homes and neighborhoods that have one way in and out. That the pipeline will directly under the only access to these places.
- Warning Systems Locations, How are they activated and what is the time lapse for activation?

20151013-5033

Nancy Carney, Fitzwilliam, NH.
Docket no. PF14-22

Kinder Morgan Proposed Natural Gas Pipeline

From

Fitzwilliam Fire Department and Emergency Management

During Operations

- Will Kinder Morgan be installing an Active (CO₂?) or a passive fire suppression system?
- Will Kinder Morgan Install gas leak detectors at the Compression station if one is installed in the town?
- Will you provide and pay for initial and ongoing Training for all first responders (police, fire, ambulance, emergency management and highway)? How often will training take place? Is there a point at which training would end? If so, what is that point?
- Will Kinder Morgan supply emergency responding personnel with Pipeline Safety Education to the level of Technician? Training in accordance to meet or exceed OSHA 1910.120.
- Are you providing Trench Rescue and Confined Space rescue training for all personnel along the pipeline corridor? Is there a maximum number of personnel you will train or will all currently employed and/or volunteer workers be trained
- What kind of Special protective gear is needed for first responders at an incident? Please list any and all specific equipment. Will Kinder Morgan provide and maintain it or replace if damaged, as long as it is

needed?

- How many personnel will respond from Kinder Morgan in case of an incident?
- What security monitoring will be implemented during the construction along the length of the pipeline (alarms, fences, manpower, cameras, and patrols)? How many systems? Who will monitor them? Where will tapes and images be kept? How long will they be kept? Who will assess them? Will information be available to all departments?
- What access will the Emergency Responder's have to the pipeline and compression stations? Will they have access 24 hours a day seven days a week? If not, how will access be conducted and by whom? Who will be the immediate contact?
- Will Kinder Morgan provide an ATV or like vehicle for access to the pipeline by emergency responders? Will we have keys to unlock newly installed gates or other restrictions at the Eversource Row and Kinder Morgan row to have emergency access?
- How often will meetings with compressor pipeline operator or designee be held?
- How often will you supply a detailed site plan?
- Will Kinder Morgan provide Medical equipment for a mass casualty incident?
- What is the plan to protect the pipeline from a Soft Terrorism threat?
- Will Kinder Morgan provide a messaging system for notification of an incident or training (including message boards)?
- How is the lack of 24 hour police coverage going to be addressed?
- The all fire department and EMS services are call departments with minimal manpower during the day-time. This needs to be addressed.
- Will Kinder Morgan maintain road access to the compression stations and Pipeline? This would include snow removal and roadway maintenance and upkeep so that emergency vehicles can respond.
- What will the state involvement be in an incident? Who will be contacting the state departments in case of an incident?
- Where the closest service field rep located and what is the response time to any individual town?
- What are the plans for a wide spread emergency affecting more than one town at the same time?
- Where does funding come from to reimburse for emergency response (including alarm activations and full blown incidents) and how soon is it available?
- Will Kinder Morgan be paying for security details for surveyors and workers during the initial phases of the project?
- Access for Emergency Agencies into homes and neighborhoods that have one way in and out. That the pipeline will directly under the only access to these places.
- What plans are there for the Town due to the fact that three major evacuation routes out of town are crossing over the pipeline during an incident?
- Warning Systems Locations, How are they activated and what is the time lapse for activation?
- With both the primary and secondary Emergency Shelters being within the hot zone in case of an incident, what will Kinder Morgan due to mitigate the situation and relocate the shelter out of the hot zone.

Decommissioning Comments

- What is the time frame for the use of the pipeline and what is the process of decommissioning the pipeline.
- What are the phases of decommissioning the pipeline and the time frame for each phase?
- What are the long term environmental emergencies for the decommissioning of the pipeline?

- What happens to the pipeline and all equipment following the decommissioning?

20151013-5039

Barrett S. Robbins-Pianka, Middletown, CT.
Regarding FERC Docket Number PF 14-22

I am writing to comment on the proposed expansion of the Kinder Morgan/Tennessee Gas Natural Gas Pipeline in West Hartford, Connecticut. It should not be allowed.

I am fortunate to live in Middletown, CT where an Aquifer Protection Area serves to protect our drinking water from hazardous, although always claimed to be perfectly safe, incursions by gas and oil pipelines. Unfortunately, the West Hartford MDC has no such over-riding protection for its Class I and Class II watershed lands. You do not miss your watershed water until it is contaminated. You do not miss your natural, forested landscape until the no trespassing signs are posted.

The MDC lands of the West Hartford reservoirs not only protect drinking water, they are a natural resource in close proximity to a large population that takes advantage of them for healthy, outdoor recreation. People treasure this area and want to conserve the lands for future generations of hikers, bikers and walkers. A National Scenic Trail is a prominent feature of the MDC. Photography and wildlife viewing opportunities draw large numbers of the public to these lands. To endanger this resource, taking the “easiest and cheapest” route for TNG, when alternatives have not been fully investigated, is not in the best interest of the public. Consider the costs to society when something goes amiss.

Thank you for the opportunity to comment on this proposal.

Sincerely,

Barrett S. Robbins
Middletown, CT

20151013-5040

deborah pomerleau, Londonderry, NH.
please do something. this pipeline is not needed.
future generations need us to start doing the right thing.
Do the morally right thing now.
protect the future. protect our world
everyone can see this.

Craig Altemose Executive Director, Better Future Project. Emerging Reality of Gas Infrastructure: Destination Export. Posted: 07/10/2015 2:26 pm EDT Updated: 07/10/2015 2:59 pm EDT. in Huffington Post.

from article “Over the last few weeks, we’ve gotten new evidence that the ultimate goal of these pipelines is export. Spectra and Kinder Morgan keep canceling the parts of their projects that would actually go to homes.”

from article “Kinder Morgan and Spectra swear up and down that their pipelines are desperately needed to meet local demand. But their claims simply don’t match reality.”

do something!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

John J Serio, Stephentown, NY.

Cardno: Associated with, questionable, industry friendly conclusions?

The Environmental Consultant FERC is using for this project appears to be associated with a firm (Cardno ChemRisk) whose scientific analysis practices are being questioned. (Please see the web links below.)

If this is the case, for appearance purposes alone, FERC should engage a different firm to provide guidance on environmental questions prior to issuing any determination on this project.

John Serio, Stephentown

20151013-5045

Leslie J Carey, Averill Park, NY.

I am writing with grave concerns about the NED. I recently attended a public comment meeting with the Rensselaer County Legislature regarding the Drinking Water Protection Law. This law was passed unanimously in Albany County, and the people of Rensselaer County are asking our representatives to pass it as well.

Our water is at risk both directly and indirectly. We own property on both sides of the National Grid right-of-way. The proposed Kinder Morgan pipeline would be placed less than 300 feet from the stream that feeds our well. In addition, we are less than four miles away from the proposed compressor station, and pollution (blow down) would be brought by wind to our property.

Several Kinder Morgan employees attended the meeting. Of the group of who were opposing the Drinking Water Protection Law, only one had the courage to speak. This was Mitch Green, a blaster from New Hampshire. He essentially said that he opposed the law because his company would not accept liability for damaged wells or water quality.

At no point did he or the Kinder Morgan representatives ever discuss how our water would be kept safe, or how they would help landowners should a water supply or well become damaged.

Kinder Morgan is stridently lobbying our Legislators. We constituents fear the kind of influence that this billion dollar business may exert. This company is not ethical. My first experience with Kinder Morgan was when I found three surveyors on my property without permission, cutting down my trees. The project manager, Peter Crave, gave ridiculous and then conflicting excuses, was rude, and then threatening. This company is seeking to line their pockets with billions of dollars, with no benefit to New York, but a tremendous cost for the citizens.

If Kinder Morgan is not going to damage our water, then why do they oppose the proposed Law on grounds of liability?

I have many other concerns. There are a tremendous number of abandoned homes already in Rensselaer County. What will happen when property values dive and people have to abandon their homes due concerns about their health? The mental health of my neighbors is being impacted horribly as they struggle with the potential loss of lifestyle, financial stability, and health. There is significant research that reflects that the kind of industry proposed by Kinder Morgan negativity impacts mental health. The cost of mental health care is high. Those who already have a mental health challenge will have their condition exacerbated by the stress, leading to impaired functioning and mental health crises.

I implore you to work with Kinder Morgan on finding a less populated and more suitable area for their pipeline. Better yet, discourage this kind of energy project and promote green energy options.

20151013-5046

Sean Radcliffe, Temple, NH.

The Souhegan River crosses Route 31 in Wilton, NH. I suspect they will be attempting horizontal drilling to go under the Souhegan river and Route 31 in Wilton, NH. Of course Kinder Morgan have not stated what they are doing so it is hard to estimate our concerns. The Souhegan River forms a very deep valley where it crosses Rt 31. If they attempt horizontal drilling to go under the Souhegan and Route 31 in Wilton, they will have to start very far back from the road and river. What do they do if they experience granite while horizontal drilling? Will they blast under the river? What happens if the blasting under the river disturbs the river? What happens if the river begins to collapse into the horizontal channel. On the eastern side of route 31 where the power lines cross is a very steep hill that is conserved and all wooded. How will they jack up through that steep inclined hill?

20151013-5047

Sean Radcliffe, Temple, NH.

In the New Ipswich, NH and through the Mason, NH area, I have heard of sightings of Blandings turtles around the power lines. I have heard people report finding Yellow Lady Slipper orchids in this area. I don't think anyone has scientifically confirmed these are on power line lands. Could someone do study on these lands to identify the endangered species so we know what to look for and save? We certainly wouldn't want the pipeline project to injure an endangered species.

20151013-5049

Sean Radcliffe, Temple, NH.

The proposed NED pipeline would be built upon many aquifers that that serve many rural wells. How many aquifers are being crossed? How many private wells are being served by aquifers that are being crossed and/or touched by the NED pipeline construction? The aquifers can be larger than 150 feet and wells can be affected that are further than 150 feet from the pipeline. If a well is affected due to a disturbed aquifer, what is the remediation for a disturbed aquifer?

How will Kinder Morgan know of the state of wells before construction?

How will Kinder Morgan know of the state of wells after construction?

How will Kinder Morgan know of the state of wells 10 years after construction?

20151013-5050

Sean Radcliffe, Temple, NH.

If the US Congress makes a mistake, they can make a new law, change laws or remove laws. If the US Congress continues to make a mistakes, the people can choose to elect new representatives (and we have). If the US President makes mistakes, the people can elect a new president (and we have). If the US Supreme court makes mistakes, they reverse previous decisions (and they have).

What is the peoples recourse if FERC makes a mistake?

How does FERC identify when it makes mistakes?

What is the FERC's internal process of identifying and preventing mistakes of the FERC?

What does FERC do when it identifies it made a mistake?

How many mistakes has FERC made?

What governmental organization reviews the actions of FERC?

20151013-5051

John Leoutsacos, Temple, NH.

On October 5th at the New Hampshire Energy Summit, 1 minute 28 seconds into his speech, Curtis Cole, Kinder Morgan's director of business development stated that New England burns 81% of all of the fuel oil in North America.

How is he allowed to blatantly lie to our New Hampshire officials, without FERC ever saying a word?

20151013-5052

John S Leoutsacos, Temple, NH.

The light pollution from the compressor station will destroy the view of our night sky that we pay for in New Hampshire property taxes. It is our choice to pay for this peace and tranquility, and is not Kinder Morgan's to take from us.

Say no to this pipeline

20151013-5053

Peggy Huard, Hudson, NH.

I finally ended up taking a minute to do the math!! TGP/Kinder Morgan's application is promising to provide 2.2 BILLION CUBIC FEET/DAY to meet the needs of Northern US/NE. Yet when I use a converter to convert this to dekatherms I come up with approximately 2 MILLION dekatherms!! This is more than this region needs.

Liberty Utility recently asked for and was given the approval for only 100 to 115 THOUSAND dekatherms off of NED.

So where is the rest of it going????

I also pulled information on EXPORTING LNG! I found the Office of Fossil Energy authorized Boston Gas issued in 2014 along with the approval of Dominion's Cove Point to expand and reverse the flow for EXPORT of LNG.

Why is NED capacity in cubic feet and not dekatherms to begin with? Is this an indication that NED is going to be used for export in LNG form?

20151013-5055

Mary Raven, Merrimack, NH.

Dear FERC

On Thursday, October 8, 2015 the town of Merrimack, NH had a meeting with Kinder Morgan to discuss their proposed pipeline route. At that meeting, Kinder Morgan unveiled many changes to the route.

Therefore, I request that you extend the comment period by at least a month until Nov. 16, 2015 so that my town can assess the impact of this new route.

Thank You.

20151013-5058

Marsha R. Cohen, Ph. D., West Hartford, CT.

Dear Sir or Madam, I am strongly opposed to adding an additional gas pipeline at MDC Reservoir 6 and several towns in the Hartford, CT area. The map of the gas pipeline from the pipeline company shows that the section proposed for CT will act as a "lateral" or "loop". It will not replace the existing gas pipeline. What is the purpose of a lateral or loop? In some places, it has been used to move gas while the old pipeline is used to store hazardous materials. The company involved has a poor safety record. For Connecticut, there is only risk and no benefit. Construction itself will cause disruption through noise, dust, and pollution.

What would happen if there was an accidental spill or explosion? I am sharing some references that document the issues that I have mentioned:

<http://i2.wp.com/www.nofrackedgasinmass.org/notgp/wp-content/uploads/2015/08/ProjectMap-300.jpg>

<http://www.courier-journal.com/story/tech/science/environment/2015/04/09/tennessee-gas-pipeline-poor-safety-record/25543049/>

<http://www.courier-journal.com/story/tech/science/environment/2015/04/09/new-pipeline-plan-draws-fire-across-kentucky/25532167/>

Please do not approve the pipeline proposal for Connecticut from the Tennessee Gas Pipeline Company (Kinder/Morgan). It creates an unnecessary risk to my drinking water and the environment where I live. Thank you.

Sincerely,

Marsha R. Cohen, Ph.D.

20151013-5080

Andy Sanborn, Concord, NH.

RE: Docket No. PF14-22-000

Thank you for giving me the opportunity to have Mr John Keiley read my letter for the record, as I am out of state and unable to be present for this meeting.

I also appreciate the many meetings with representatives from all entities involved in this proposed pipeline, and I look forward to a continuing open dialog where we can discuss the concerns residents have, and the solutions to insure we protect this great state and the people in it.

Never the less, I do want to comment on this matter tonight before FERC due to the significant potential impact on the residents in the district and to all those who enjoy the natural beauty of New Hampshire.

This project is projected to cross miles of the most conserved, pristine, traditional land in this wonderful state, and the prospect of disturbing this habitat is alarming and appears unnecessary. The thought that to accomplish this task, people will be vacated from their family home against their will only adds insult to all those who treasure traditional NH values.

Acknowledging you will hear much tonight concerning many existing issues and challenges which need to be addressed prior to a meaningful consideration of a project like this. Due to my 3 minute limit, I wish to focus my comments on the fundamental need to protect people from eminent domain "takings" as authorized by your agency.

Frankly, there is no issue more precious than the right of people to safely own and manage their land, free of the fear that their government will come take it away. The concept of a Government empowered to take, by legislative proxy, their home, defies the most basic sanctity of "rights" of people in America.

To protect individual and property rights, New Hampshire has worked hard to create a fair, level, process where projects like this can and should be given robust consideration through existing legislative intent and the recently enacted Site Evaluation Committee.

There continues to be confusion as to what role, if any, the NH SEC plays in this project and I do believe FERC needs to clearly confirm if it intends to fully and faithfully comply with the SEC process, findings and recommendations.

I am formally requesting that FERC publically state, to what extent it will support and follow recommendations put forth through the SEC and under what conditions, if any, it may choose to preempt local statues.

Clarification of FERC's position on this issue will help NH residents better understand to what extent the federal government and its regulating agencies will respect NH laws.

I believe that it is incumbent upon FERC to clearly express its position on this critical issue.

Thank you for your time.

Best to you all

State Senator Andy Sanborn
New Hampshire Senate

20151013-5085

Alison Jaskiewicz, Mason, NH.

Please study the impact of the proposed export pipeline on the health and well being of the thousands of people impacted. Please include in that study the impact of the simple threat of the export pipeline since it was proposed, during which time people have devoted thousands of stressful hours learning about pipelines and their impacts, and opposing the export pipeline, all time and energy which otherwise would have been given to their families and communities and their jobs.

Please study the impact of an export pipeline proposal made prior to any need ever being assessed.

Realtors and property owners report that NO ONE will even look at properties which are along the export pipeline route. This means, in effect, that those property values have dropped to ZERO. For most people their homes and properties represent their largest investment. Just the threat of a proposed export pipeline has destroyed all that value in an instant. Although KM paid lackeys state that property values are not impacted, their statements, no matter how many times repeated, fly in the face of facts on the ground. Repeating falsehoods over and over and over does NOT make them true. I request that FERC research property value changes in every impacted town, comparing pre and post proposed export pipeline, and working with local realtors with absolutely no ties to KM or any part of the fossil fuel or energy industry.

Additionally please research the impact upon all affected towns of this drop in property values on their over all tax structure and the ensuing tax impact on properties not directly affected by the proposed pipeline but within pipeline impacted towns.

Laws exist as long as most members of a society agree with the benefit or are not intimidated into compliance. Once any perceived benefit no longer exist then it is the right of the people to speak up against the application of such laws and for changing the laws. I guarantee that the people of NY and New England potentially impacted by this export pipeline, and in fact already vastly impacted by even the suggestion of it being built, do not believe there is public benefit to this export pipeline or to eminent domain proceedings on the scale possible with the NED. The only benefits are to a private, for-profit company and it's stockholders. I ask that you address and study the environmental impact of citizens the length of the NED direct export pipeline project placing themselves, hand in hand, men, women and children, young and old, across the path of KM/TG destruction equipment?

The concept of mitigation is permission to destroy with the question merely being how much destruction. Prevention of destruction = the least environmental impact = NO BUILD. Please study how real estate values will rebound and tax structures of towns return to normal, stress levels will lift and people will once again be able to devote time and energy to families and communities.

I request that a detailed environmental impact study be made comparing the impact of the proposed export pipeline on all environmental factors essential to human health and well being (air, water, food, etc) vs the impact of not building the pipeline. This should include data from existing pipelines, data gathered independent of the fossil fuel industry.

I request that you study the effects of high tension electric lines on pipelines of all gauges proposed for use in this project and up to 1/4 mile away and for up to 30 years, all such studies to be completely independent of the fossil fuel industry. Please study the impact of a pipeline accident knocking out power to the region. Please study the likelihood of leaks, explosions and other accidents occurring during the 20 -30 year lifetime of this proposed export pipeline and their impact.

Please study the environmental impact of building a lateral for which even Kinder Morgan and TN Gas have

never stated any need – the Fitchburg lateral. All laterals for which there is no need should be dropped from the project.

I request that you study the environmental impact of the mythical collocation of the export pipeline with electric power lines in NH, a myth perpetuated by KM/TN Gas to try to hide the fact that this is a greenfield project for its entire length. Greenfield project impacts must please be studied for the entire length of the proposed export pipeline.

Please consider the environmental impact of FERC commissioners failing to explain in detail their reasons for their ultimate decision. Lack of explanation and justification is unacceptable.

20151013-5090

Leslie J Carey, Averill Park, NY.

In spite of the efforts of Kinder-Morgan's open houses, TV ad underwritten by them and other outreach efforts, the total e-comments sent to the Federal Energy Regulatory Commission as of the end of August numbered 5,411, 4,705 of them were opposed to the NED pipeline. Kinder Morgan's public relations offensive looks as if it is ineffective and its message viewed with skepticism in the affected communities.

The mantra of Kinder-Morgan, heard on radio, TV and in print is "we have safely provided gas to New England for 60 years." Since Kinder-Morgan was founded in 1997 by Richard Kinder, COO of Enron, it appears it is employing a form of revisionist history. Its contention, in reference to the Tennessee Gas Pipeline, which it acquired in 2012, is patently misleading..

In 2011, the U.S. Pipeline and Hazardous Materials Safety Administration (USPHMSA) cited Kinder-Morgan for these safety violations: failing to maintain update maps showing pipeline locations, failing to test pipeline safety devices, failing to maintain proper firefighting equipment, failing to inspect its pipelines as required, and failing to adequately monitor pipes' corrosion levels. Close examination of USPHMSA's incident reports for Kinder-Morgan's onshore gas transmission pipelines shows that faulty infrastructure caused 45 percent of onshore gas transmission pipeline significant leaks. Failure of the pipe, cracked welds, and faulty pipeline equipment together accounted for 28.3 percent of pipeline leaks, and corrosion of the pipe caused 16.8 percent. Throughout the U.S. since 2003, Kinder Morgan and its subsidiaries' pipelines have been responsible for at least 180 spills, evacuations, explosions, fires, and fatalities in 24 states.

USPHMSA found that pipelines installed since 2010 leak at a higher rate than pipelines installed before 1940. The majority of pipeline leaks detected from 2003 to 2013 came from pipes installed after 2010. Robert Hall, director of the NTSB's Office of Railroad, Pipeline and Hazardous Materials Investigations, noted in a Sept. 1 interview that the rapid construction of pipelines in the U.S. is likely a contributing factor to these leaks. It is of interest that the decade of 2010 is when Kinder-Morgan became the largest pipeline operator and builder, with 84,000 miles of pipeline. According to its annual report, it spends \$0 on research and development.

BLOWDOWN HAZARDS

Declarations of adherence to environmental health and safety standards are also misleading. The NED will carry carcinogenic hydraulic fracturing chemicals, such as benzene, toluene and formaldehyde, along with methane. At the very least, these chemicals will gain access to the environment during compressor operations called blowdowns, which release large volumes of pipeline contents when lines are depressurized for maintenance and in emergencies. Published studies by Dr. David Carpenter, director of the Institute for Health and Environment of SUNY Albany, and colleagues, have shown that these chemicals are found in high concentrations in the air at distances as high as 355 m from compressor sites in a five-state study (Environmental Health 2014, 13:82). Compressors of 41,000 hp are to be located in Windsor and Northfield, and Nassau, N.Y.

During construction, blasting with high explosives will be employed to create the 6' trenches in which the pipeline will be buried. High explosives contain perchlorate, and blasting carries the risk of releasing of perchlorate into ground water through disruption of rock structure and aquifers. According to the Environ-

mental Protection Agency, perchlorate is considered a “likely human carcinogen” and can affect the thyroid gland by inhibiting the uptake of iodine. A guidance value of 6 ppb has been suggested by Health Canada. For the NED, blasting will occur in proximity to the water supplies of several communities. The presence of perchlorate in drinking water aquifers and its toxicological properties make perchlorate an emerging chemical of concern.

The pipes are subject to cathodic degradation and corrosion due to the strong electromagnetic field surrounding high-tension lines along which NED is proposed to run. An explosion from an undetected leak has the potential to disrupt the main electrical transmission trunk from New York to New England.

Kinder-Morgan also states there is insufficient gas to meet demand. Yet U.S. gas supplies are at maximum capacity and prices are at historic lows. The electricity price spike of last winter was a false alarm, caused by anticipation of a gas price increase which never materialized and was relieved by Liquid Natural Gas (LNG) tanker shipments.

In a March 23 Boston Globe article, Greg Cunningham, director of the clean energy program at the Conservation Law Foundation and Frank Katulak, chief executive of Distrigas, in Everett, stated that its facility could supply the entire demand in New England with LNG. Even Kinder-Morgan likes LNG tankers — it bought five convertible tanker ships for \$961 million in 2014. It has not disclosed whether these are intended for export use.

Since Kinder-Morgan appears to be welcoming closer scrutiny of NED, it might start by explaining to the public what chemicals exactly, and in what quantity, are to be carried in the pipeline besides methane gas. And, how does it propose to provide safe services with the troubling facts of hastily and poorly constructed infrastructure. These are critical issues for the health of all of us in.

20151013-5092

Mary Mahoney, Lynnfield, MA.

I want to voice my opposition to the proposed natural gas pipeline planned to be built by Kinder-Morgan through various towns in Middlesex and Essex Counties of Massachusetts. I have been a resident of Lynnfield, Massachusetts since 1977, and I believe that one of the benefits of living in my neighborhood has been the absence of any natural gas pipeline. Other areas of Lynnfield have gas pipelines and many years ago there was a leak in one which was dangerous to the people in the area, most of whom needed to be evacuated until the problem was fixed.

In addition to my personal objection relative to my hometown, I believe this pipeline is not only unnecessary but is not the appropriate energy source for the country at this time.

The gas that would flow through this pipeline is obtained from several states through “fracking” and the “fracking” process has been implicated in contamination of groundwater and destabilization of the soil. Some of that destabilization has resulted in earthquakes in parts of the United States which had never been prone to earthquakes.

The route of the local pipeline in Middlesex and Essex counties runs through or close to our water supplies. Clean, drinkable water is essential for life and in communities in which water was contaminated, normal life is not sustainable. Water must be rationed and imported.

Furthermore, building such a pipeline is a giant step in the wrong direction for our nation’s energy policies. Fossil fuels such as coal, gas, and oil should be phased out and emerging technologies such as solar, wind, or even hydroelectric power should be promoted.

It seems that the major beneficiaries of the construction of this pipeline are the owners and stockholders of the Kinder Morgan companies. Enriching corporations while destroying water supplies, natural wetlands, animal habitats, and the comfort to the people living and enjoying their chosen surroundings is abominable and should not be permitted.

Please vote to terminate this project before it goes any further in its destruction of our local cities and towns.

I do not know the Docket number for this Kinder Morgan gas pipeline, but I hope my comments can be applied to the appropriate case. I have selected two dockets that may be related to the issue about which I am writing.

Mary G. Mahoney, 20 West Tapley Road, Lynnfield, MA 01940 (mary.mahoney334@gmail.com)

20151013-5093

Lisa McLoughlin, Northfield, MA.

I am a landowner who will be within hearing distance of the compressor station once built (based on proposed sound levels at the compressor station property line and distance to my property), and who also will hear the construction and maintenance of the pipeline and compressor station (based on my ability to hear the construction of new high tension wire poles in the co-located right of way for the proposed pipeline).

1. I would like to know what affect the compressor station and pipeline (during construction and once built) will have on the monetary value of my land (using neutral studies which have not, e.g. been sponsored by the gas industry), and including the fact that I live off-grid, and anyone wanting to buy my property would likely also place a premium on seclusion and quiet.
2. Light and noise pollution from the running of the compressor station and the construction/maintenance of the pipeline and compressor station would interfere with the peaceful enjoyment of my property and the freedom of my religious practices which require natural sounds and dark sky. In 2007, UNESCO (the United Nations Educational, Scientific and Cultural Organization) affirmed that: “An unpolluted night sky that allows the enjoyment and contemplation of the firmament should be considered an inalienable right equivalent to all other socio-cultural and environmental rights. Hence the progressive degradation of the night sky must be regarded as a fundamental loss.” (http://www.starlight2007.net/index.php?option=com_content&view=article&id=185&Itemid=80&lang=en accessed 10/13/15)
3. If the compressor station is built within hearing or sight distance it will interfere with my work (I am a writer/researcher who works from home) and life to the extent that I will have to relocate, and I would like to know if anyone is going to reimburse me for the loss of my home and peace.
4. Further, I would like to know how I can protect my forest so that it will still be here once the pipeline and compressor station have been decommissioned (even if I will not still be here), and how Kinder Morgan et al are going to remove their equipment and attempt to restore the natural environment once they are done with it.
5. The native historic and pre-historic cultural resources in Northfield, MA have been characterized by the Massachusetts Historical Commission as extensive, largely unexplored, and under threat from pipeline development. (Massachusetts Historical Commission. Reconnaissance Survey Town Report: Northfield. Boston, MA: Massachusetts Historical Commission. 1982; and Massachusetts Historical Commission. Historic and Archaeological Resources of the Connecticut River Valley: A Framework for Preservation Decisions. Boston, MA: Massachusetts Historical Commission. 1984, 1988, 2007). I do not believe these resources to be adequately protected in the proposed plans.

20151013-5112

Daniel J Spilman, Nassau, NY.

United Neighbors Concerned About GE and the Dewey Loeffel Landfill (UNCAGED) implore FERC to include in its analysis for this permitting process the effects of the Tennessee Gas Pipeline Route 66 compressor station in Malden Bridge, NY has had on the landslide into the Kinderhook Creek across the street from this operation. This area that is known to locals as “Honey Suckle Rock”, has long been a summer hangout and swimming hole, but has now been fenced off with “No Admittance” signs posted after the shale gave way in this area. It is expected that this small landslide was due to the operation of the 10,000 horsepower compressor station across the street.

With this information, UNCAGED has grave concerns about the close proximity of the proposed 41,000

horsepower compressor station for Clarks Chapel Road to the Dewey Loeffel Landfill, which is a US EPA superfund site. UNCAGED has been working for a long time to get this toxic mess, that is a super fund site 50 years in the making, cleaned up by the responsible parties. Having the potential for a new compressor station located fairly close to the Dewey Landfill, and the underground toxic plume that is already moving through fractured bedrock away from the site, could expand the problem, if what has happened at Malden Road is any indication. What would be even more devastating, is if the responsible parties for the super fund clean, primarily General Electric, are given a legal avenue to escape complete responsibility for the cleanup of the site and underground plume. With GE's legal team, any potential contribution to the expansion of the super fund foot print by the compressor station, could be a potential out for General Electric.

UNCAGED would expect that the proximity of the proposed compressor station to an EPA superfund site would move this evaluation to a higher level of scrutiny, by state and federal departments. The Dewey Loeffel superfund is an unlined landfill with a 30 year old slurry wall, and a large underground toxic plume extending from the landfill. The vibration seen at the much smaller Malden Road facility could have devastating consequences on this site. The proposed compressor station should not be approved without thorough evaluation of this situation.

Sincerely,

Kelly Travers-Main
President - UNCAGED

Re: Tennessee Gas Pipeline Company, LLC
Docket No. PF14-22-000
Northeast Energy Direct Project

Dear Secretary Bose,

Please find below an expanded version of my testimony, with accompanying footnotes, submitted into the record at the FERC Scoping Session held in Rindge, NH on September 29, 2015.

Good evening. My name is Vince Premus, P-R-E-M-U-S, from Pepperell, MA.

I begin by saying that, Mr. Tomasi, I am disappointed to see that the issue of need is missing from your list of the top concerns raised by citizens who have submitted testimony at these scoping sessions. I have attended several of these sessions, and I know that the issue of need is the principal concern of these citizens.

The issue of need is the cornerstone of Federal Energy Regulatory Commission Docket # PF14-22-000, in the matter of Tennessee Gas Pipeline Company's Northeast Energy Direct project. Yet it plays no part in your charter to develop an Environmental Impact Statement. Need typically falls under the purview of "credentialed" industry stakeholders. The public is dismissed as unqualified to contribute, as we can be "fickle and recalcitrant," according to Ben d' Antonio, staff attorney for the New England States Committee on Electricity.[1]

The case for need is generally predicated on the winter peaking problem. Winter is a time when the weather can be dangerous. People are vulnerable.

It's a scenario screaming for exploitation by an opportunistic businessman looking to export natural gas

to global markets.

Now I am not “credentialed.” But, last month at the Lunenburg scoping session, I testified that New England’s winter peaking problem is a 1% problem.[2] One percent of the region’s annual demand of 889 Bcf. Just 10 Bcf.

It turns out that this was independently confirmed last year by ICF International 3—and as we all know, they are indeed credentialed. ICFI provides expert consulting services to public- and private-sector clients on comprehensive energy strategies. Their clients include Kinder Morgan, GDF Suez, and ISO New England.

In November, 2014, ICFI published a study for ISO New England that examined near-term, interruptible gas supply available to serve electric generation through the year 2020. They took into account twenty years of historical temperature data, planned retirements, and a model for unplanned outages. Their analysis projected the region’s median annual winter gas supply deficit through the year 2020 to be 10.7 MMDth, or 10.7 Bcf. Their worst case estimate was 22 MMDth, or 22 Bcf.

A 1% problem. Two percent worst case.

You do not build a privately owned export pipeline, capable of moving 800 Bcf of Marcellus shale natural gas each year to markets in Europe and Asia, on the backs of these New Hampshire and Massachusetts homeowners, to fix a one percent problem.

Especially when you plan to steal their land via eminent domain—while telling them it’s for the greater good—to do it.

Google “dekatherm” and you will find that it is a unit of energy equivalent to about 1,000 cubic feet of natural gas. One million dekatherms requires about 1 billion cubic feet of natural gas to produce. Google “LNG tanker” and you will find that the average tanker can hold the equivalent of 3 Bcf of gas.[4]

If ISO were serious about a Winter Reliability Program that serves the ratepayer, at the January 2014 peak average natural gas price of \$20 per dekatherm,[5] they could augment interruptible gas supplies by subsidizing 3 tankers worth of LNG each winter for the next 30 years before exceeding the cost to build this \$5.5 Billion dollar pipeline.

Not a long term solution, but a viable bridge for the few years it will take for renewable, distributed generation and battery storage to have matured to the point of serving the region’s grid-scale, base-load power demands.

The credentialed stakeholders have demonstrated that they cannot be trusted to advance a strategic energy policy that balances demand against the impact to our homes, health, and the environment. The subject of need deserves to be deliberated in a transparent and quantitative manner, with the direct participation of informed ratepayers, like us, who understand the math as well as the personal cost of this project.

FERC needs to convene a formal public hearing specifically dedicated to an assessment of the Northeast Energy Direct pipeline need. One in which the “NO BUILD” option is also on the table.

Respectfully submitted,
Vincent E. Premus, Ph.D.

Re: Denying Property Access

As the owner of the property located at:

25 North Hill Dr

Lynnfield, MA 01940

I am denying permission to the Tennessee Gas Pipeline Company, LLC (a Kinder Morgan Company), its representatives, contractors, sub-contractors, or associates to enter my land or to perform surveys, or for any purpose in furtherance of a pipeline infrastructure project. Any such physical entry onto my property from the date of this letter forward will be considered unauthorized, and treated as trespass.

Roy L. Pincus

20151013-5172

Members of FERC

As a land owner where the NED pipe line is planed as being “ co-located with the power transmission lines Right of way” I would like to inform you what the term to be co-located means to be 60 to 65 feet from the transmission lines. And then have the vegetation as in trees remove 50 feet either side of the pipe line.

This would put the pipe line as close as 15 feet from my home and effectively remove all the trees from my property leaving it with out shad in the summer that aids in keeping my home cool thus raising the price I need to pay to keep my home comfortable.

It will also adversely effect the appearance of my property and lower its value making what I have worked so hard for over 20 years worthless.

Add to the fact that the gas that is being transported through this line would primarily be used for export make this pipeline an unnecessary inconvenience and would violate my rights to enjoy my land and the land of any one that this pipe line crosses.

There are other pipeline projects in the northeast that have have already received approval and supply all the gas that this area needs and more.

I therefore recommend that FERC rejects this project

RE: Quicker, cheaper solution to the 50-day winter energy crisis - it is Yankee Ingenuity.

Many propose new gas pipelines will reduce electric and natural gas rates.

A few weeks ago, the NH PUC suggested electric ratepayers should have tariffs to pay for all the proposed new pipelines. That same week, a company named Skipping Stone released a report stating no additional pipelines are needed. Moreover, additional pipelines would be not cost effective to ratepayers.

The Skipping Stone report claims, “The most important fact to remember about New England’s ‘gas problem’ is that it is a Deep Winter, peak demand deliverability problem, not a year-round capacity crisis. As a result, building more pipelines, which would provide a year-round supply of gas—whether it is needed or not—and is simply not a cost-effective solution.”

The report demonstrates using imported LNG during deep winter peak demand is cheaper for ratepayers. “... building more pipelines, which would provide a year-round supply of gas — whether it is needed or not ...is simply not a cost-effective solution.” The report includes all the details supporting this finding and looks out to the year 2030. Their suggested alternative is a “Winter LNG Pipeline” that strategically imports LNG as needed.

Who is Skipping Stone? Although they have offices around the USA and Japan, they are New England based, offering professional services in energy markets. They have done work for hundreds of energy companies such as Exelon, GDF Suez, NRG, Entergy, ConocoPhillips, Duke Energy, Constellation Energy, even FERC (Federal Energy Regulatory Commission).

Anyone can try to solve a problem by simply throwing more resources at it; more money, people and in the case of New England’s “winter energy crisis,” natural gas. Throwing resources at a problem does not guarantee a good solution; frequently it backfires and wastes those resources. The Skipping Stone Winter LNG pipeline is a true Yankee Ingenuity solution that addresses the problem without increasing rates, adding unnecessary expensive infrastructure, or taking people’s private property. We should utilize Stone’s Winter LNG Pipeline strategy this winter and put the pipeline projects on hold until proven absolutely necessary.

Executive Summary

For 50 days a year, New England has a gas problem – not enough natural gas is available to meet demand. In the winter of 2013-14 this problem led to dramatic spikes in the price of natural gas and the cost of electricity. How to solve that problem has been the source of political, economic and environmental debate over the past 2 years. One proposed solution is to “flood the market” with new gas via one or more new pipelines, with the multi-billion dollar cost to be borne by electric ratepayers. The other solution, one that the Conservation Law Foundation has promoted, is to maximize the use of existing infrastructure in both the delivery and storage of natural gas. This solution addresses the supply problem during that limited 50 day period in the winter, saves industrial, commercial and residential customers millions of dollars and avoids the need for costly and enormously inefficient infrastructure that will ultimately undermine efforts to meet the challenge of climate change.

As currently managed, New England’s natural gas delivery system – its pipelines, storage and import facilities do not deliver sufficient quantities of natural gas to meet demand during the limited winter peak period. During these peak periods of demand, when high volumes of gas are consumed to simultaneously meet the region’s heating and electric power generation needs, management and operation of the current system fails to make the necessary gas deliverable. Numerous corporate and governmental entities are urging a large infrastructure solution: building more pipelines into and across New England to increase regional pipeline capacity. New pipelines, they argue, are needed to address a structural problem of constrained gas supply and the high wholesale energy prices experienced during the winter of 2013-14.

But New England does not have a structural pipeline capacity problem, and not only are new pipelines not the only solution – they are also the least cost-effective one. For the majority of the year, the region’s natural gas system of pipelines and LNG deliverability already operate at less than 50% capacity. On those portions of the 50 coldest winter days each year when the near-simultaneous and high demands of regional heating and electric generation loads are not being met efficiently, New England has what in the natural gas industry is considered to be an issue of “deliverability,” or the ability to provide a certain quantity of gas to a certain location at a certain time.

Once New England’s current “gas problem” is properly understood as one of deliverability, rather than insufficient pipeline “capacity,” the solution that most efficiently and cost-effectively enhances deliverability in New England would be increased use of the region’s existing LNG infrastructure.

We reach this conclusion based upon the “cost of use” of each alternative. That is, the cost of new pipeline capacity in an area like New England, with a peak-only supply deficiency and where other peak-only supply alternatives already exist must be analyzed on the basis of use. So when additional deliverability of gas is needed over discrete days of the year rather than on a year-round basis, the overall cost of the pipeline should be measured as a cost on only the days during which it will actually be used to serve the residences and businesses who will pay for it through their gas or electric bills, rather than measuring that cost as artificially spread out across the entire year – the vast majority of which it would not be used or, if used, will cause another existing asset to go unused.

A cost of use comparison demonstrates that adding additional pipeline capacity is the most expensive and least effective means of addressing New England winter-peak deliverability. The process of building new gas pipelines takes years and does nothing to help us address winter deliverability in the interim. There is also substantial risk that a new pipeline built today will become the ratepayer-funded, stranded cost of tomorrow. Moreover, investing in a new pipeline is unlikely to produce the assumed lower gas prices, as currently stranded Marcellus/Utica gas supply and its artificially low existing prices will more likely rise as numerous planned pipelines to other regions and for export move those prices to that of the Henry Hub. Finally, environmental regulatory regimes, such as the federal Clean Power Plan and existing New England state mandates to aggressively reduce greenhouse gas emissions, create a strong disincentive for any significant increase in natural gas consumption.

For New England, the best means of solving the winter gas issue from a cost of use approach is better utilization of existing natural gas infrastructure and specifically, existing LNG infrastructure. We call this the Winter-Only LNG “Pipeline” approach. This approach suffers from none of the weaknesses of a year-round pipeline capacity solution.

New England has both LNG vaporization capacity from large import terminals as well as from LNG storage facilities owned by the local gas distribution utilities, or “LDCs.” If LDCs were to contract for a baseload level of LNG vaporization during the December 15 - March 15 winter period, and for more frequent truck refills of their existing LNG storage facilities, local gas reliability could be maintained while freeing up existing pipeline capacity for sale on the secondary market to power plants.

Not only is this approach technically feasible, a Winter-Only LNG “Pipeline” strategy would provide LNG deliverability throughout New England that would save LDCs and their ratepayers initially over \$340 Million a year and as much as \$4.4 Billion over twenty years, as compared to a new pipeline proposal, while providing peak deliverability that will lower winter wholesale electricity prices on a scale comparable to new pipeline capacity additions. As outlined more fully in Appendix E to this paper, the role that LNG can play in ensuring gas deliverability and driving down spot market gas prices was meaningfully demonstrated in New England in the winter of 2014-2015, when a 4% increase in total gas deliverability from LNG reduced spot gas prices by 43%.

For these reasons, the Winter-Only LNG “Pipeline” outlined in this paper would be less costly and more effective than new gas pipeline capacity. Such an approach requires a break from the currently prevailing pipeline-centric management and regulation of New England’s gas transmission and distribution system. Our alternative approach has the promise to address immediately the problem at hand, and to do so efficiently, effectively, and without complex regulation. Consequently, state regulators should direct LDCs to implement the Winter-Only LNG “Pipeline” option immediately. Thereafter, relatively small adjustments can be made to the market incentives and associated reimbursement rules regarding LNG storage and resale – distinguishing the winter period from the rest of the year – in order to make the LNG solution a permanent feature of the New England energy market.

LANESBOROUGH VILLAGE FIRE AND WATER DISTRICT

20 Bridge Street PO Box 1504
LANESBOROUGH MA 01237
(413) 442-5916 lfwd@verizon.net

October 12, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A

Washington, DC 20426

RE: Northeast Energy Direct – Docket No. PF14-22-000

Dear Secretary Bose:

The Lanesborough Village Fire and Water District submits the following comments on the proposed Kinder Morgan Tennessee Gas Pipeline (TGP) Northeast Energy Direct (NED) pipeline project (PF14-22). The proposed NED project would pass through the center of the Water District and would have significant impacts on the District's natural resources and public infrastructure. Through the coordination of the Berkshire Regional Planning Commission, the Water District has joined with the City of Pittsfield, Massachusetts, the Towns of Cheshire, Dalton, Hinsdale, Lanesborough, Lenox, Pittsfield, Richmond, Washington and Windsor, Massachusetts, the Dalton Fire District, Rensselaer County, New York, and the Towns of Nassau, Stephentown, and Schodack, New York to identify common impacts and requested mitigation measures. Those items are specified in comments submitted by the Berkshire Regional Planning Commission, letter dated October 15, 2015. The Lanesborough Water District endorses and incorporated herein by reference, the comments submitted by the Berkshire Regional Planning Commission.

Respectfully,

Lee Hauge

William Prendergast

Aaron Williams

Board of Water Commissioner

**PIPELINE IMPACT ON WATER DISTRICT
INPUT TO THE FERC ENVIRONMENTAL IMPACT PROCESS
FERC DOCKET # PF-14-22-000**

October 6, 2015

The Water District is impacted by the subject pipeline on several levels;

- Risk to our water source.
- Risk to our infrastructure.
- Cost to the District to protect ourselves from this threat to our resources and investments.

Specific mitigation measures we are requesting are provided at the end of this document. The preferred mitigation is to route the pipeline away from Water District assets and it is believed that there is a way to do this without adverse impacts on others. If this turns out not to be feasible, then the other listed mitigations must be accomplished.

Oral inputs were provided at the public hearing on July 28, 2015. This document is an expansion on that input.

RISK TO THE WATER RESOURCE

The proposed pipeline path crosses the zone two of the aquifer supplying both of the wells which provide all the District water. Contamination of this aquifer would leave our 850 customers (950 Equivalent Dwelling Units, 2,000 people) with no water. Also contamination of either well would create system outages and a water shortage. Concerns are for both the construction phase and the operation phase. Specifically:

- The District has two wells which both draw water from the same source, the Town Brook aquifer. The Miner Road well has a pumping capacity of 600 Gal/Min, and the Bridge St. well has a capacity of 320 gal/min. The Bridge St well capacity is not adequate to meet peak demand during the summer, so contamination of the Miner Rd. source would create an emergency shortage. The district draws approximately 70 million gallons of water per year. The zone II for the two wells is well defined, and the proposed gas pipeline crosses the middle of it.
- Protection of this aquifer is critical because there are no good options left within Lanesborough if it becomes contaminated. Ground water in the valley to the east of the Town Brook aquifer is contaminated

by the sewage plant at the Berkshire mall, in the valley to the west by the a PCB contaminated area which is a superfund site undergoing remediation (The Rose Site) as well as the abandoned Town dump which has contaminated neighborhood wells, to the north our extensive aquifer exploration has shown no suitable source, and to the south there is Pittsfield which we have connected to in an emergency, but there is not adequate supply from their reservoirs to supply both Lanesborough and Pittsfield in the long term.

- Analysis of data from pumping tests of our wells has led to the conclusion that there is a deep underground aquifer under the shallow Town Brook aquifer, and there is interchange between these two systems. Therefore it is likely that contamination of the shallow Town Brook aquifer would also lead to contamination of this deep underground aquifer which could have impacts far beyond the Lanesborough Water District.
- During construction it will be necessary to take extraordinary measures to protect the aquifer from spills or any other source of groundwater contamination. The District is not in a position at this time to suggest specifics to impose on the installer of the pipeline, rather we believe that funding needs to be provided to hire the expert help we need to either develop those requirements or to evaluate the adequacy of proposals suggested by the installer.
- During operation we believe that extraordinary measures need to be taken to protect the aquifer. One possibility is a dual containment system similar to what is used with gasoline storage systems: build a high strength pipe to carry the gas and surround it with another containment pipe and an interstitial monitoring system so that any leak will be contained and detected so it can be corrected before spills of the unknown and very suspect constituents of the fluid in the pipe are released into the ground. Again we cannot afford to provide or evaluate specifics, but need to be funded to be assured that adequate protection is being implemented.
- The composition of any material which would be released into the ground in case of a pipeline break is not known and is a primary reason for our concerns. It is crucial that knowledgeable scientists not acting in the interest of the pipeline installer be involved and be informed of the makeup of this material so they can provide credible risk assessments and guide us in designing and evaluating preventative measures to protect the resource in case of release of material being carried by the pipeline.
- Damage to the geologic structure surrounding the wells is another concern. In particular, blasting during pipeline installation could open fissures providing a path for contaminated water to enter the well water. The geology of the region is particularly susceptible to this damage, as the underlying limestone has many natural fissures, and any new ones resulting from stress during pipeline installation could have long distance impacts.

RISK TO THE INFRASTRUCTURE

Watermains, water storage tank, and the two production wells are all near the pipeline path, and clearly the construction process could endanger these infrastructure investments. Steps need be taken to protect these investments, specifically:

- The water distribution system includes many miles of watermains, some of them as old as 75 years (they were installed shortly after the District was first organized in 1938). Technologies and materials in these old mains are far more susceptible to damage than those used today. Materials used in these old lines include asbestos pipes and brittle cast iron pipes with “leadite” sealed joints which have become very susceptible to breakage when disturbed even slightly. The unusually heavy equipment traversing roads where waterlines are buried and the shock loads from nearby blasting are of great concern for damaging these old pipes. Even the more modern installations of ductile iron and PVC plastic pipe could be damaged by the severe loading which will occur during construction. The installation process must include the capability to repair breaks introduced during installation and to evaluate and repair damage which increases susceptibility to future breaks. A fund should be established which would pay for all waterline breaks which occur during installation and in the future for some period of time such as 20 years.

- The District recently invested in a new 750,000 gallon storage tank (to replace the 1930's tank which failed) and this tank is within the powerline right of way where the gas pipeline is being installed. Heavy construction in this area raises significant concerns and appropriate precautions must be taken to avoid damage or degradation to the tank or the geological structure which supports it. Access to the tank is through a right-of-way shared with Verizon and others, and this access road will undoubtedly be utilized by the pipeline installers, so an additional concern is that we continue to have access during the construction, and that it be restored to its previous condition after construction.
- The District's wells are maintained by periodic (10-15 year intervals) major refurbishment to the underground structure and surrounding minerals and gravel to maintain high yield. A significant investment of \$45,000 was made in 2014 to refurbish the Bridge St. well, and similar action was taken about 15 years ago to do the same for the Miner Road well. The disruption of the construction and blasting in the vicinity of the wells could accelerate the need for this work and possibly shorten the life of the wells.
- It is mandatory that we have two operational wells so that periodic minor maintenance can be done on one and water supplied by the other. Our long range plan is to install a third well into the deep underground aquifer to protect ourselves from loss of one of the existing wells. Now, loss of one of the wells will result in water outages during maintenance activities on the remaining well, even routine minor maintenance work.

RISKS TO PRIVATE WELLS NEAR THE PIPELINE INSTALLATION

There are many private properties in areas adjacent to the District which have wells that are probably much more susceptible to damage than the District wells because they may be closer to the blasting and some may be located in more sensitive geologic environments. Clearly the District would be obligated to expand and supply water to these properties should their water source become unusable. Such expansions would be very expensive on a per customer basis because of the dispersed locations. Monitoring of these wells must be done before and after pipeline work, and if problems arise appropriate actions to expand the District must be taken. The pipeline installer must be under obligation to take these precautions and fund corrective actions whether it is District expansion or some other remedy.

COST TO SUPPORT ACTIONS TO PROTECTING THE DISTRICT DURING THE PIPELINE PLANNING PROCESS

The Water District is a small entity with one full time employee (the superintendent), a half time assistant, and administrative staff comprised of part time and volunteer personnel. All are dedicated to providing reliable and safe water service to our members at an affordable costs. Despite the frugal management approach, our customers pay over \$500 per year for water in order to defray our \$500,000 annual operating and capital budget. Any additional costs stretch our finances and risk the financial viability of the entity.

- Because we don't have the technical resources to understand and react to threats to our system from the development of the pipeline, the District has joined with other affected municipalities and districts to fund the Berkshire Regional Planning Commission to guide us in understanding the risks to our system from this venture, and to understand what actions we can and need to take to protect the interests of our members. These costs may seem insignificant (about \$6000 per year for FY 2015 and 2016 so far) but they use up a great deal of our contingency funds. The total reserve fund for the year which is budgeted to handle unexpected costs is \$15,000. The effort also consumes an inordinate amount of the time of all District personnel which detracts from our ability to plan and manage ongoing District operations.
- It is clear to us that we need help from expert consultants to evaluate and develop measures to protect the District from potential deleterious impacts of the pipeline work.

The District has nothing to gain from this project yet we are burdened by costs to protect ourselves. It seems only fair that the entity which stands to profit from development of the project should defray costs imposed by the project on third party entities such as the Water District.

COST TO PROVIDE ALTERNATIVES IF THINGS GO WRONG

It is critical that the District take action in advance to be able to react to developments which endanger operation of the water system. The following are some specifics:

- The District has identified a site for a third well and has bought property and drilled a test well yielding positive results. This is located on Bull Hill Road near Pontoosuc Lake, and it is a deep well (500 feet) which accesses a deep underground aquifer protected by a deep impervious layer. The test well is only a 4 inch uncased hole not suitable for a production well which would need to be at least 18 inches. If the pipeline project proceeds the District must develop this well site so that the loss of one of our two existing wells or contamination of the aquifer would not leave us without resources to supply our customers.
- Damage to the ancient, and even the new watermains is likely from construction near their location. Advance action needs to be taken before and during construction, including stockpiling material needed for repair, assessment of the most susceptible lines and possibly upgrading any found to be of especially high risk. Funds need to be provided to repair breaks which occur during construction and after because of stress incurred during the construction.
- Clearly the water tank is at risk. Without expert help no specifics can be suggested at this time.

REQUESTED MITIGATION MEASURES

- **Alternate pipeline route** Require TGP to evaluate alternate routes which avoid the resource areas critical to the District. Using a route established decades ago for a powerline has little bearing on what the best route is today for a gas pipeline as the pipeline is far more disruptive to the environment, and a great deal has changed in the intervening years since the powerline route was selected. Using a straight line between the source and the destination for the natural gas would probably make as much sense as using the powerline in choosing the best path. Ideally the process should involve identification of critical resources which would be endangered by the pipeline, and choosing the path which best avoids these areas.

In this case it is likely that a more northerly route could be identified which would avoid groundwater recharge areas and our distribution system infrastructure. This is not a suggestion to just pass the problem onto our neighbors to the north, but to find a path which affects neither them nor us. Also, the Dalton Water District has suggested similar action, and they have even gone to the length of suggesting a specific route. It is likely that a northerly route through Lanesborough and Cheshire would be more compatible with the proposed Dalton route (which is north of the powerline route) than it is with the powerline route.

In the absence of success in finding an alternate route which avoids critical areas in Lanesborough, the following mitigation actions must be taken; LANESBOROUGH VILLAGE FIRE AND WATER DISTRICT

- **Funding during planning and construction phases** Provide funding so the District can hire the scientists, engineers, and legal counsel needed to ensure the best decisions are made and precautions are taken to protect our interests. This is critically important as the District does not have the resources needed to fight the massive resources available to TGP to have their way and maximize their profits at our expense. A skeptical view of the pipeline route selection process is that optional routes are identified not because of environmental impact differences between alternates, but to bypass communities which have the resources to fight TGP, so the route will be chosen primarily to pass it through communities lacking the resources or the resolve to protect themselves. This seems to at least be a factor in the latest route change which selected the powerline right-of-way instead of the more southerly path through Berkshire County. Cost estimate is several tens of thousand dollars.
- **Develop alternate well** Because of the high probability of damaging one of the existing wells and the impossibility of getting an alternate on line in a timely manner, the development of a production well on the Bull Hill test well site is required before pipeline installation. Estimated cost is \$1,500,000.

- **Water main replacement** The most susceptible of our watermains will almost certainly be damaged by the stresses caused by the heavy equipment used for pipeline installation, so when plans for the installation are developed and roads being used are identified, watermain upgrades must be performed on those mains at high risk. The Old Cheshire Road is certainly to be one of the roads used, and the asbestos/cement line in that road will have to be replaced. Estimated cost is \$800,000 for that line alone. There will likely be other mains identified as needing upgrade when the plans for pipeline installation are more completely defined.
- **Implement extraordinary measures to protect the water resource** All possible actions must be taken both during construction and operation to avoid contamination of the aquifer. A dual containment system with interstitial monitoring should be employed to provide maximum protection on a continuing basis during operation of the pipeline.
- **Implement all the requested mitigation measures for public supply distribution systems listed in the BRPC comments document.**
- **Implement all the mitigation measures for small public and private wells listed in the BRPC comments document.**

Respectfully,

Lee Hauge

William Prendergast

Aaron Williams

Board of Water Commissioners

20151013-5208

I've been interested in plant conservation since I moved to my rural property in Mason, New Hampshire over 5 years ago. I have a particular interest in trees in population decline. I've been involved with groups like The American Chestnut Foundation and spent some time collecting trees like the American Chestnut and Butternut, which are both in decline due to invasive blights. A few years ago I heard about a tree called *Torreya Taxifolia* (commonly known as Stinking Cedar). Its native range is a short stretch of the Appalachian River on the border of Georgia and Florida [1]. The tree is what's known as a glacial relic species and for an unknown reason it was unable to move northward, back into the Appalachian Mountains at the end of the last glacial period [2]. Though its range was small, it was numerous until the 1950s when the tree experienced a sudden population crash [3]. It's theorized the cause of the crash was due to climate change [4]. Some scientists believe the only way to save this tree is to plant them north of its current range [4]. With only around 500 individual trees left in its native range, it's the most critically endangered tree in North America [5]. All of the remaining trees are now only stump sprouts and are no longer able to mature enough to produce seed [6].

During my research, I came across a private conservation group called the *Torreya* Guardians who were working to save the tree from extinction. Connie Barlow founded the *Torreya* Guardians in order to organize the assisted migration of *Torreya Taxifolia* to the forests of the Appalachian Mountains because all efforts to save or even slow the decline of *Torreya Taxifolia*'s population were failing. Connie Barlow wrote a paper, which was co-authored by the late Paul S. Martin, arguing that the only sustainable solution for *Torreya Taxifolia* was to plant it north of its currently accepted native range [4]. To that end, Connie Barlow and the other *Torreya* Guardians started collecting seeds from the few trees that were planted on private properties prior to the tree's population decline. Almost all the seeds and seedlings they have collected are from trees in the state of North Carolina. They then distributed the seeds to private land owners in areas which may have been prehistorically favorable to the plant, prior to the last glacial period.

The *Torreya* Guardians are in the process of trying to discover the northern limit for *Torreya Taxifolia*. A few years ago *Torreya Taxifolia* had been planted successfully in places as far north as Ohio. Some *Torreya Taxifolia* specimens are known to have survived temperatures as low as -17°F undamaged [7]. In light of all that and considering that *Torreya Taxifolia*'s habitat during peak glacial times was much like New England today [8], I decided to get involved in the group as there was no one else in New England involved in

the project. The other *Torreya* Guardians agreed that my property would be a good place to plant *Torreya Taxifolia*. After discussing the idea with Connie Barlow, she sent me seeds. I now have *Torreya Taxifolia* seedlings planted in many different locations around my property in Mason, NH.

This brings us to the issue at hand. Kinder Morgan (KM) thinks that my property is a good property to cross with the Fitchburg Lateral. They recently altered the route slightly (in the July 24th update to their filing) to avoid my neighbor's horse farm, but according to data from KM, the pipeline will still cross my property. Both the previous route and the current route will result in the destruction of several *Torreya Taxifolia* specimens. Additionally, *Torreya Taxifolia*'s seed dispersal is thought to be assisted by box turtles (*Terrapene carolina*) [9], which are known to exist in Mason, NH [10]. Both the old and the new routes for the lateral would result in destruction of much of the wetland habitat on my land and other nearby properties, which would decrease the likelihood of box turtles being in close enough proximity to assist the *Torreya Taxifolia*'s seed dispersal. Also, if the pipeline easement is near the area *Torreya Taxifolia* resides, KM will have to destroy any new seedlings which germinate on the easement in order to protect the pipe from the tree's root system. Obviously, this is a problem. The lateral would also fragment the habitat and further reduce the likelihood of success.

Recent research indicates that global warming (exacerbated by projects like this one) has delayed or even completely circumvented the next glacial period [11]. The magnitude of the predicted warming is greater than the necessary cooling that would be needed to trigger another Glacial Period [11]. We are entering another warming period like the Earth hasn't seen since the end of the last glacial period, which is forcing many species to move even further north of their current ranges! Evidence has shown that plants like *Torreya Taxifolia* will need to migrate up to a mile north every year to keep up with the warming [12] and that will only keep up with their current range. Glacial relics like *Torreya Taxifolia* will be the hardest hit by this. *Torreya Taxifolia* is in the most critical state of all and is already way behind other species.

It's thought that the climate of *Torreya Taxifolia*'s currently accepted native range was similar to modern New England's current climate during the last glacial maximum [8]. Reflecting on that, the location of my property, being in central New England, could be of critical importance for the future survival of the species! However, saving *Torreya Taxifolia* is impossible if experimental plantings like mine are being impacted and destroyed by pipelines and other projects. On top of which my property is the only location in New England where *Torreya Taxifolia* has been planted at this time, making it and the surrounding habitat of even more critical importance to the overall survival of the species.

Considering the state of *Torreya Taxifolia*'s current population, every single tree could decide the future and ultimately the fate of the species. To put it into perspective, it would be as if the entire population of humanity on earth was reduced to the number of people in the small town I live in (less than 2,000 people). Every individual becomes very important. The actions of any individual could save or doom the species. As you can see, the purposeful destruction of any one tree is simply unacceptable! There is no way to "mitigate" the impact of destroying individual trees. If several specimens on my property are destroyed, their genetic diversity will be lost forever. On top of which replacing the trees would require receiving and germinating more of a very limited quantity of seeds, reducing the possible places the trees could be planted overall, which in turn will have a direct impact on the potential survival of the entire species.

Questions for FERC:

- 1) What is FERC's overall plan to PREVENT the destruction of ANY of these trees and their habitat?
- 2) Reflecting on the fact that EVERY individual *Torreya Taxifolia* tree matters in the long run and that some of these trees lie in the direct path of the Fitchburg Lateral, what mitigation practices or avoidance measures could KM possibly take to avoid impacting the survival of *Torreya Taxifolia*?
- 3) What mitigation measures can be taken to minimize the impact to supporting wetland habitats that may assist the propagation and dispersal of *Torreya Taxifolia*?
- 4) Taking into consideration that engaging in commerce with *Torreya Taxifolia* across state lines is prohibited by Federal law [13], that every individual tree really does matter and that any individual plant can't

simply be replaced with any amount of money; how would KM be able to offset any destruction of one or several *Torreya Taxifolia* before and after construction of the pipeline in the vicinity of the plants?

- 5) How would KM be able to measure the affect of the pipeline on each individual *Torreya Taxifolia*?
- 6) How would KM mitigate or prevent any negative effects on individual *Torreya Taxifolia*?
- 7) Considering the reproductive rate and capacity of *Torreya Taxifolia* is largely unknown, how would KM measure and compensate for any reduction in reproductive capacity of the population, including any impact on the reproductive velocity of the population and the viability of any potential future offspring?
- 8) How long will KM be required to monitor the plants for the negative effects of the pipeline?
- 9) What rules and practices will FERC set in place to insure all these variables are taken into consideration?
- 10) What penalty will be placed on KM if they disregard or are unable to follow any of the rules set down in part or fully?

- Daein Ballard, Mason NH

20151013-5211

Please address the following regarding methane and the possibility of leakage:

What does FERC determine as the maximum acceptable leakage?

How will leakage be monitored?

What actions will be taken if emissions exceed the standard?

How frequently will emissions be measured?

What will happen if wells and wetlands and aquifers become infested with methane leakage? Will wells be tested before construction? Will the burden of proof be the responsibility of homeowners, town leaders that the leakage is the result of pipeline construction?

20151013-5313

Dear Sir or Madam,

RE: Docket Number: PF14-22-000

It was brought to the attention of the town of Merrimack, New Hampshire and the residents of Merrimack at the town meeting with Kinder Morgan on Thursday October 8, 2015 the latest change to the route of the proposed gas pipeline. This was a major departure from the previous proposed route and has left us with little time before filing occurs on Friday October 16th to make any comments and objections.

However, I have a concern about the pipeline crossing through the pristine forest and wetlands bordering the west side of the land owned by Fidelity and Pennichuck Waterworks. This proposed route will go through a large heron nesting area, which has been there for at least 40 years, to my knowledge. Also it will disrupt the protected, endangered lady slipper orchids which abound in the forested area proposed in the new route. Other fauna and flora will also be adversely impacted by the deforestation and destruction of wetlands proposed by the building of the pipeline.

Another concern that I have is the proximity of the southern portion of the proposed route to the houses along Thornton Road West, Merrimack, NH. I would highly recommend reverting to the original proposal to run the pipeline along the existing high voltage power line easements. This is a straight shot and will cause much less destruction environmentally and otherwise.

Sincerely,

Patricia Ansdell MD
17 Thornton Road West,
Merrimack, NH 03054

CONCORD, NEW HAMPSHIRE 03301-6397

JOSEPH A. FOSTER
ATTORNEY GENERAL

ANN M. RICE
DEPUTY ATTORNEY GENERAL

October 9, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE
Washington, DC 20426

Re: Northeast Energy Direct Project, Kinder Morgan Pipeline Docket No. PF 14-22-000

Dear Ms. Bose:

Thank you for the opportunity to provide comment with respect to the Northeast Energy Direct (NED) Project (Docket No. PF 14-22-000). Please be advised that the New Hampshire Director of Charitable Trusts exercises all of the common law and statutory rights, duties and powers of the New Hampshire Attorney General in connection with the supervision, administration and enforcement of charitable trusts. New Hamp-

shire RSA 7:20.

The donation in whole or in part of an interest in real estate to a charitable organization or a governmental entity may create a charitable trust. We understand that the NED project proposal would cross land parcels with donated property interests. Accordingly, I write to make FERC aware of the existence of these donated property interests along the proposed route of the NED project that are subject to charitable trust principles. I also write to clarify the role of the Charitable Trusts Unit with respect to these real estate interests. Finally, I write to request that Kinder Morgan supply FERC with sufficient documentation to identify the location and type of charitable trust restrictions on land affected by the proposed NED project.

This letter will discuss with some specificity the two types of donated property interests encountered along the route of the proposed NED project: the conveyance of a fee (ownership) interest and the conveyance of an easement interest.

Donated Fee (Ownership) Interest

An owner of real estate may decide to donate (or to sell at a discounted price) a parcel to a charitable organization or governmental entity. Under New Hampshire law, if the deed or gift instrument contains language that the real estate is to be used for some charitable purpose, such as for preservation of wild land with unique natural features or for conservation of forest land or for park use, that conveyance creates a charitable trust. The entity that accepts the gift of property then must act in a fiduciary capacity to assure that the donor's intent is carried out.

The Charitable Trusts Unit does not maintain a database of every real estate parcel located along the proposed NED project route subject to a charitable purpose or restriction. It is aware that some properties held by the State of New Hampshire, including certain of the Rhododendron State Park parcels and the Russell-Abbott State Forest, were donated to the State and with specific deed restrictions.

In those cases where restrictions appear in a deed or in a gift instrument, the State of New Hampshire, a municipality or a land trust has a fiduciary duty to see that the land is used in accordance with the stated restriction. The Charitable Trusts Unit may investigate and take action against landowners that do not abide by the restriction. This authority even extends to departments of the State of New Hampshire that own land. Should the holder of such property seek to modify or extinguish all or part of any restriction, it must petition the probate court for cy pres relief. See, New Hampshire RSA 547:3-d. The standard for granting relief is high: the charitable purpose must have become impossible or impracticable or illegal or obsolete or ineffective or prejudicial to the public interest to carry out. The Director of Charitable Trusts is a necessary party to any such cy pres action.

The cy pres requirement is in addition to any other process that the charitable trust landowner may be required to follow in conveying an interest in the property. Therefore, the statutory process for the State of New Hampshire to dispose of any of its property, or for a landowner to dispose of property acquired in part with Land Conservation Improvement Program funds, is not a substitute for the cy pres process.

Donated Easement Interest

Similarly, an owner of real estate may decide to donate in whole or in part an easement for conservation, recreation, agricultural, historic or park purposes to a governmental entity or to a charitable organization. See, New Hampshire RSA 477:45 -- 47. These conveyances are typically referred to as conservation easements and they create a charitable trust. The donor may have also received a charitable deduction for the donation, which means that the transaction met very specific requirements under the Internal Revenue Code relating to its permanence and the absence of private benefit. The entity that accepts the gift of an easement then must act in a fiduciary capacity to assure that the donor's intent is carried out as reflected in the easement deed.

The Charitable Trusts Unit does not maintain a database of every real estate parcel along the proposed NED project route that may be subject to a conservation easement. It is aware of several, however, including the Fifield Tree Farm in Mason, upon which the Town of Mason Conservation Commission holds a conserva-

tion easement.

Again, where a conservation easement is donated to the State of New Hampshire, a municipality or a land trust, that entity has a fiduciary duty to make sure that the use of the land does not violate any of the terms of the easement. The Charitable Trusts Unit may investigate and take action against easement holders that do not enforce easements they hold. Should the easement holder of such property seek to amend the easement terms, it must first consult with the Charitable Trusts Unit. Depending on the risk level of the proposed amendment, the easement holder may also be required to petition the probate court for cy pres relief, as described above. The Director of Charitable Trusts is a necessary party in any such proceeding. The Charitable Trusts Unit has published Guidelines for New Hampshire Easement Holders that deal with the amendment process. A copy of the Guidelines is enclosed.

The consultation with the Charitable Trusts Unit and the potential cy pres requirement is in addition to any other process that the conservation easement holder may be required to follow to convey an interest in the property.

Conclusion

Some of the parcels along the proposed NED project route are subject to restrictions that create charitable trusts and therefore require the involvement of the Charitable Trusts Unit before a change of use. The restrictions donors place on land parcels vary greatly, although generally the donor wanted the land to be managed so as to preserve its natural or conservation values. The Charitable Trusts Unit cannot determine, in advance, how it will approach a specific request to amend a conservation easement or to modify or extinguish a restriction. The Charitable Trusts Unit expects that the owners of restricted parcels or the holders of conservation easements will in the first instance act in accordance with their fiduciary duties of loyalty, care and obedience in considering any such request.

To make sure that no land subject to a restriction for a charitable purpose is overlooked, the Charitable Trusts Unit requests that Kinder Morgan conduct sufficient research and submit maps showing all parcels along the proposed route that are subject to any restriction for charitable purposes, and including all supporting documentation, whether it be contained in a deed, gift instrument or probate document. The Charitable Trusts Unit also requests that the map and supporting documentation be included in the draft environmental impact statement.

Very truly yours,

Thomas J. Donovan
Director of Charitable Trusts

Amending or Terminating Conservation Easements: Conforming to State Charitable Trust Requirements

Guidelines/or New Hampshire Easement Holders

These Guidelines are designed to define and describe the role of the Attorney General as a necessary party and, where applicable, the role of other state agencies in those situations where an amendment to or termination of a conservation easement is contemplated.

I. Introduction

- A. Conservation Easements in General
- B. Conservation Easements as Charitable Trusts

II. Amendment of a Conservation Easement

- A. Step One - Seven Principles
- B. Step Two - Review Process

1. When Conservation Easement Does Not Contain an Amendment Provision

- (i) "Low Risk" Amendments
 - a. Definition of Low Risk Amendments
 - b. Attorney General Review of Low Risk Amendments.
- (ii) "More Risk" Amendments
 - a. Definition of More Risk Amendments
 - b. Attorney General Review of More Risk Amendments
- (iii) "High Risk" Amendments
 - a. Definition of High Risk Amendments
 - b. Attorney General Review of High Risk Amendments

2. When Conservation Easement Contains an Amendment Provision

III. Attorney General Review

IV. Termination of a Conservation Easement

V. "Orphaned" Conservation Easements

I. INTRODUCTION

A. Conservation Easements in General

When a land trust or a government entity acquires a perpetual conservation easement, it promises the grantor, the community, and (if applicable) financial contributors that the easement will be upheld in perpetuity. The land trust or government entity becomes legally bound to enforce the easement according to its stated terms and purpose. Given that, how is it possible to contemplate amending perpetual conservation easements?

It is impossible to predict all the circumstances that may arise in the future. Even the most well-drafted conservation easement may need to be amended at some point, for example, to clarify terms, add land, improve enforceability, resolve disputes, or address unanticipated land uses.

Nevertheless, amendments should be rare. When they are contemplated, the holder of the conservation easement should embark on the path of amending only after becoming thoroughly informed regarding the proper legal and ethical principles and processes.

An excellent source of guidance regarding conservation easement amendments is *Amending Conservation Easements: Evolving Practices and Legal Principles*, published in 2007 by the Land Trust Alliance (“Amending Conservation Easements”). The information contained in this publication is essential reading for conservation easement holders, be they charitable organizations (typically land trusts) or government entities, before considering an amendment.

B. Conservation Easements as Charitable Trusts

The New Hampshire Attorney General considers any perpetual conservation easement donated as a charitable gift in whole or in part to a charitable organization or a government entity to constitute a charitable trust and thus to be subject to charitable trust principles.[1] The comments to the Uniform Trust Code, which was adopted by New Hampshire in 2004, explain:

Even though not accompanied by the usual trappings of a trust, the creation and transfer of an easement for conservation or preservation will frequently create a charitable trust. The organization to [which] the easement was conveyed will be deemed to be acting as trustee of what will ostensibly appear to be a contractual or property arrangement. Because of the fiduciary obligation imposed, the termination or substantial modification of the easement by the “trustee” could constitute a breach of trust.[2]

Perpetual conservation easements purchased at fair market value, exacted as part of development approval processes, or acquired in the context of mitigation may also be subject to similar equitable principles.’ Accordingly, perpetual conservation easements, regardless of how acquired, should not be amended (or terminated) without consideration of and compliance with applicable charitable trust principles. It is, therefore, the more prudent course to assume that the same notification, review, and approval principles that apply to conservation easements donated in whole or in part apply to all perpetual conservation easements, regardless of how they were acquired.

II. AMENDMENT OF A CONSERVATION EASEMENT

A. Step One - Seven Principles

As the first step in considering any proposed amendment, the holder should make sure the amendment complies with ALL of the following seven principles (see *Amending Conservation Easements* at 32):

The proposed amendment must:

1. Clearly serve the public interest and be consistent with the easement holder’s mission.
2. Comply with all applicable federal, state, and local laws.
3. Not jeopardize the holder’s tax exempt status or status as a charitable organization under either federal or state law (if the holder is a land trust or other charitable organization).

4. Not result in “private inurement” or confer impermissible “private benefit” (as those terms are defined for federal tax law purposes and N.H. RSA 7:19-a).
5. Be consistent with the conservation purpose(s) and intent of the easement.
6. Be consistent with the documented intent of the donor, grantor, and any direct funding source.
7. Have a net beneficial or neutral effect on the relevant conservation values or attributes protected by the easement.

B. Step Two - Review Process

If a proposed amendment is found to comply with each of the seven principles specified in step one, the holder should next determine whether the conservation easement contains an amendment provision. The standard “amendment provision” is a provision included in a conservation easement deed that expressly grants the holder the discretion to agree to amendments that are consistent with or further the purpose of the easement.[4] As described below, the review process for amendment proposals will differ depending on whether the holder is granted the discretion to amend the terms of the conservation easement in the form of an amendment provision, and the extent of that grant of discretion. (In some cases grantors customize the standard amendment provision to preclude certain types of amendments, such as those that would increase the level of residential development permitted by the express terms of the easement.)

In very rare cases, a holder may wish to proceed with an amendment that clearly does not comply with the seven principles specified in step one. Such an amendment is by definition “high risk” and must comply with the review process specified below for high risk amendments.

1. When Conservation Easement Does not Contain an Amendment Provision

If the conservation easement does not contain an amendment provision, the holder should consult with the attorney general regarding any proposed amendment. However, the level of attorney general review will depend on whether the amendment is appropriately characterized as “low risk,” “more risk,” or “high risk” (see *Amending Conservation Easements* at 53-56, discussing these various risk categories).

(i) “Low Risk” Amendments

a. Definition of Low Risk Amendments

Low risk amendments are those that satisfy each of the following requirements:

- The amendment clearly and unquestionably complies with all of the seven principles listed in step one.
- The amendment either does not affect or has only positive effects on the conservation purposes of the easement and the conservation values (attributes) of the property.
- The holder clearly has the commitment and the capacity to enforce the easement’s restrictions.
- There are clearly no private inurement issues (as that term is defined for federal tax law purposes and N.H. RSA 7: 19-a) because no “insider” associated with the holder is involved.
- There is clearly no private benefit (as that term is defined for federal tax law purposes) provided to any person as a result of the amendment.
- The amendment is consistent with any solicitations for donations toward the purchase of the easement made by the holder when the easement was acquired.
- The amendment is consistent with local law and meets current zoning and similar requirements.
- The amendment is simple and easily understood.
- The amendment is approved by all necessary persons, such as holders of any contingent rights or executory interests and the owner of the encumbered land.
- There is a low probability of relevant funders, the easement grantor, the grantor’s heirs, neighbors, or members of the community objecting to the amendment.

- The amendment has been reviewed and approved by the holder’s board of trustees or board of directors.
- The amendment has been reviewed by relevant experts or such review is clearly not needed.

Examples of low risk amendments include those that:

- Correct scrivener’s errors (typographical errors, etc.).
- Add more land to a conservation easement, provided such addition is consistent with the purpose of the easement.
- Add new restrictions that are clearly consistent with the purposes of the easement.
- Eliminate reserved rights (such as reserved house sites, cabin sites, access roads, etc.).
- Replace an antiquated property description with a new description resulting from a recordable survey.
- Correct boundary line errors resulting from an inaccurate property description, survey, or otherwise.

In each of the above situations, it is assumed that the proposed amendments are simple and easily understood and that there is no quid pro quo being provided in exchange for the amendment. In other words, these amendments are clearly consistent with or further the conservation purpose of the conservation easement, and the owner of the land is receiving nothing in return (other than the potential of an additional income tax benefit based on the value of a new donation).

b. Attorney General Review of Low Risk Amendments

If an amendment clearly and unequivocally falls into the low risk category, the easement holder should notify the Attorney General, Charitable Trusts Unit that the amendment is being proposed.^[5] The notification should (i) be provided to the Attorney General at least thirty days prior to the execution of the amendment, (ii) clearly describe how the proposed amendment complies with the seven principles set forth in step one, qualifies as a low risk amendment, and is consistent with the holder’s organizational amendment policy, (iii) include a copy of the existing conservation easement and the proposed amendment (including identification of all places where changes are made by color marking, through a document comparison program, or other means if the easement is being amended and restated), and (iv) include copies of any relevant maps, surveys, deeds, photos, or other documents that help explain the amendment.

Once the amendment is executed and recorded, a copy of the recorded amendment should be provided to the Attorney General.

(ii) “More Risk” Amendments

a. Definition of More Risk Amendments

More risk amendments require more review. These amendments are more complicated, may involve trade-offs, and could have the potential to create private benefit or other complications. They differ from low risk amendments in that they:

- May affect the conservation purposes both positively and negatively (i.e., some conservation purposes or attributes may benefit at the expense of others); these are generally referred to as “trade-off” amendments.
- May involve a private inurement (as that term is defined for federal tax law purposes).
- May involve private benefit (as that term is defined for federal tax law purposes).
- May not be consistent with the mission of the easement holder.
- May not be consistent with third party rights in the easement (executory or contingent interest holders).

- May be objected to by the grantor, the grantor’s heirs, or neighbors, who are either aware of the proposed amendment and have expressed concerned or have not been consulted.

Examples of more risk amendments include those that:

- Clarify ambiguous easement terms and address disputes over the meaning and intent of the easement restrictions.
- Relocate reserved rights, such as reserved house sites.
- Add new reserved rights in exchange for the termination or reduction of existing reserved rights (i.e., involve trade-offs).
- Improve easement enforceability by removing “excessive” restrictions that provide de minimis or no conservation benefit.

b. Attorney General Review of More Risk Amendments

More risk amendments present potential problems and must be carefully examined. In these situations, there is a potential that an amendment would violate charitable trust rules if not properly designed and approved. Such amendments may also violate the federal tax law perpetuity requirements.[6]

Since more risk amendments have the potential to impact the laws regarding charitable trusts, the Attorney General should review each more risk amendment proposal to assess whether the amendment complies with the seven principles listed in step one. The Attorney General may offer suggestions to the holder on how to address any potential problems with such an amendment. If the Attorney General believes the proposed amendment requires review by and approval of the probate court, this will become apparent during consultation.

When to initiate consultation with the Attorney General is a key question. In general, when a holder perceives that a proposed amendment may be more than “low risk,” the holder should contact the Attorney General as early in the process as possible. The holder should first gather all the important facts and determine that, in its estimation, the proposed amendment complies with the seven principles listed in step one. The holder should then send a letter to the Attorney General that (i) describes how the proposed amendment, in the holder’s estimation, complies with the seven principles set forth in step one and the holder’s organizational amendment policy, (ii) details the issues that make the proposed amendment more risk (as opposed to low risk), (iii) includes a copy of the existing conservation easement and the proposed amendment (including identification of all places where changes are made by color marking, through a document comparison program, or other means, if the easement is being amended and restated), and (iv) includes copies of any relevant maps, surveys, deeds, photos, or other documents that help explain the proposed amendment. If the proposed amendment is supported by the easement grantor, the grantor’s heirs or assigns, funders, the holder of any executory or back-up interest, the local government, state agencies, or other public entities, their concurrence should be indicated in the letter. (It may be necessary to later supply the Attorney General with letters of endorsement.)

A meeting with the Attorney General may be needed to clarify the facts, explain complex language or survey plans, and provide additional information.

Consultation with the Attorney General regarding more risk amendments may lead to several possible outcomes. The Attorney General may find that the proposed amendment fits within the low risk category and send the holder a “no action” letter indicating that the Attorney General will not oppose the amendment. Alternatively, the Attorney General may find certain changes that could be made to improve the amendment and, if the amendment proposal is revised accordingly and resubmitted to the Attorney General, the Attorney General will issue a “no action” letter. However, if it is determined that there are significant issues relating to the common and statutory law of restricted charitable gifts and charitable trusts, the Attorney General will likely recommend that the proposal be submitted to the probate court for review. The submission to the probate court will generally take the form of a petition for instructions (RSA 564-B:2-201(c)) or a petition for deviation (RSA 547:3-c, RSA 564-B:4-412), although in some

cases it may take the form of a petition for cy pres (RSA 547:3-d, RSA 564-B:4-413(a)).

(iii) “High Risk” Amendments

a. Definition of High Risk Amendments

High risk amendments require review and approval by the probate court under either the doctrine of deviation (RSA 547:3-c, RSA 564-B:4-412) or the doctrine of cy pres (RSA 547:3-d, 564-B:4-413), as the case may be. These amendments may involve complex issues, trade-offs of restrictions, possible harm to the conservation purposes of the easement, or removal of more than a de minimis portion of the land from the easement’s restrictions (which constitutes a partial termination or extinguishment of the easement).

High risk amendments differ from low and more risk amendments in that they may, for example:

- Result in significant harm or change to the original conservation purposes of the easement or conservation attributes of the easement property.
- Alter the basic provisions or protections of the easement.
- Involve private inurement (as that term is defined for federal tax law purposes).
- Confer a private benefit (as that term is defined for federal tax law purposes).
- Conflict with the charitable or public mission of the easement holder.
- Be contrary to solicitations made to the easement grantor or donors of funds to the holder that were used to purchase the easement..
- Be contrary to local ordinances or other requirements.
- Not be supported by the community, neighbors, the easement grantor, the grantor’s heirs, or other interested parties.
- Lack appropriate scientific or expert review that is clearly needed.
- Be highly complex and difficult to explain.

Examples of high risk amendments include those that:

- Release a restriction without obtaining offsetting conservation benefits elsewhere on the easement property.
- Remove more than a de minimis portion of the land from the easement, whether or not in exchange for the protection of other land (abutting, nearby, or elsewhere) or other compensation, and regardless of whether the removal is characterized by the parties as a swap, amendment, adjustment, boundary resolution, release, extinguishment, termination, or otherwise. De minimis means so small as to be of no consequence. No exact size can be set because a de minimis portion of a 10-acre easement is necessarily smaller than a de minimis portion of a 100-acre easement or a 1,000-acre easement. Nevertheless, for this purpose, any removal of land from a conservation easement larger than one acre cannot ever be considered de minimis, and removal of land that is smaller than one acre may be more than de minimis depending on the circumstances of the easement and land. Removal of more than a de minimis portion of the land from an easement, however characterized, constitutes an extinguishment of the easement with respect to the land removed.
- Permit prohibited subdivision or residential or commercial development of the land.
- Release a restriction as part of a proposal to settle a violation dispute.
- Are made in exchange for cash.

There are a host of potential situations that could be considered high risk. A good rule of thumb is that if the holder of the easement believes that the proposed amendment does not clearly comply with the seven principles listed in step one, or that a reasonable case could be made that the proposed amendment does

not comply with one or more of those principles, the holder should anticipate a thorough review by the Attorney General and possible review by the probate court.

Amendments that are not consistent with the purpose of a conservation easement, which may include amendments that permit prohibited subdivision and development of the land or remove more than a de minimis portion of the land from the protection of the easement (a partial extinguishment), require court approval in a cy pres proceeding. The Attorney General must be given notice of and is a necessary party to any such a proceeding.

b. Attorney General Review of High Risk Amendments

High Risk amendment proposals require consultation with and review by the Attorney General and most likely subsequent review and approval by the probate court. A holder proposing a high risk amendment should be prepared for a potentially lengthy process.

The holder should first gather all the important facts and determine that, in its estimation, the proposed amendment complies with the seven principles listed in step one. The holder should then send a letter to the Attorney General that (i) describes how the proposed amendment, in the holder's estimation, complies with the seven principles set forth in step one and the holder's organizational amendment policy, (ii) details the issues that make the proposed amendment high risk (as opposed to low risk or more risk), (iii) includes a copy of the existing conservation easement and the proposed amendment (including identification of all places where changes are made by color marking, through a document comparison program, or other means if the easement is being amended and restated), and (iv) includes copies of any relevant maps, surveys, deeds, photos, or other documents that help explain the proposed amendment. If the proposed amendment is supported by the easement grantor, the grantor's heirs or assigns, funders, the holder of any executory or back-up interest, the local government, state agencies, or other public entities, their concurrence should be indicated in the letter. (It may be necessary to later supply the Attorney General with letters of endorsement.)

A meeting with the Attorney General may be needed to clarify the facts, explain complex language or survey plans, and provide additional information.

The better job the easement holder does in preparing the amendment proposal letter for the Attorney General's review, the less likely it is that there will be substantial delays in the review process. High risk amendments are, however, questionable by their very nature, and no holder should expect that the Attorney General will consent to such an amendment or issue a "no action" letter, or that the court will approve such an amendment.

2. When Conservation Easement Contains an Amendment Provision

If a perpetual conservation easement contains a provision granting the holder the discretion to agree to amendments that are consistent with or further the purpose of the easement, it will not be necessary for the holder to obtain Attorney General review in low risk and many more risk cases. If the holder determines that the proposed amendment (i) complies with the seven principles set forth in step one, (ii) is consistent with the holder's organizational amendment policy, and (iii) clearly falls within the discretion granted to the holder pursuant to the amendment provision included in the easement deed, the holder may agree to the amendment. Once the amendment is executed and recorded, the following should be provided to the Attorney General: (a) a copy of the original conservation easement, (b) a copy of the recorded amendment or the recorded amended and restated easement (including identification of all places where changes are made by color marking, through a document comparison program, or other means if the easement was amended and restated), and (c) a letter explaining the holder's determinations with regard to (i), (ii), and (iii) in the previous sentence.

In the case of high risk amendments, Attorney General review (and, where appropriate, court approval) should be obtained regardless of the presence of an amendment provision in the easement deed pursuant to the procedures described above.

Should the holder have any doubts regarding whether a proposed amendment (i) complies with the seven principles set forth in step one, (ii) is consistent with the holder's organizational amendment policy, (iii) falls within the discretion granted to the holder pursuant to the amendment provision included in the easement deed, or (iv) is high risk, Attorney General review is advised.

III. ATTORNEY GENERAL REVIEW

The recommended process for communicating with the Attorney General regarding amendments is for the easement holder to write a letter addressed to:

Office of the Attorney General
Charitable Trust Unit
33 Capitol Street
Concord, NH 03301-6397

Attn: Conservation Easement Amendment

The letter should include all of the information requested in the relevant section above.

The Attorney General Division of Charitable Trusts oversees thousands of charitable organizations in New Hampshire. While there will be times when case load may result in longer response times, it is the intent of the Division to respond to most amendment review requests within twenty-one days. Proposals that fall into the high risk category, otherwise have complex issues, or lack the required supporting documentation may require a longer review period. A land trust or other easement holder that does not receive a response within four weeks should contact the Division to determine the status of the review request.

The Attorney General can most efficiently and effectively review an amendment proposal if the holder gathers all necessary information, follows its organizational amendment policy, satisfies itself that the proposed amendment complies with the seven principles listed in step one, and provides sufficient information to the Attorney General to support the holder's determination that the amendment is necessary, prudent, and otherwise appropriate. The more clearly and precisely the holder states its case in the letter to the Attorney General, the more timely, efficient, and effective the Attorney General's review will be.

When contemplating proposed amendments, easement holders should bear in mind that it is better to seek review than ask for forgiveness after the fact. *The Attorney General has the authority to petition the court to request that an improper amendment be invalidated and will do so in appropriate cases.*

The Attorney General cannot provide legal or tax advice to private parties or warrant that a proposed amendment will satisfy (or not be in violation of) the requirements under federal tax law. Holders should consult with competent legal counsel regarding the federal tax law ramifications of a proposed amendment, including possible loss of taxexempt status or status as an eligible donee of tax-deductible conservation easements.

IV. TERMINATION OF A CONSERVATION EASEMENT

The release, extinguishment, or other termination of a conservation easement, whether in whole or in part, requires court approval in a cy pres proceeding. The Attorney General must be given notice of and is a necessary party to such a proceeding.

V. "ORPHANED" CONSERVATION EASEMENTS

An orphan conservation easement situation can arise when an easement holder abandons its responsibility to monitor the easement or when a land trust organization dissolves without transferring its easements to another party for monitoring and enforcement. This situation should be reported to the Attorney General as soon as possible.

- 1 Perpetual conservation easements are donated in whole or in part as charitable gifts to charitable organizations and government entities to be used for a specific charitable purpose—the protection of the particular land burdened by the easement for the conservation purposes specified in the deed in perpetuity. In New Hampshire, a gift made to a charitable organization or government entity to be used for a specific charitable purpose creates a charitable trust. See, e.g., *Trustees of Protestant Episcopal Church v. Danais*, 108 N.H. 347 (1967) (testamentary devise to the trustees of a designated church of certain premises to be used as a rectory for the parish of such church and “to be occupied by the rector ... and his family and by them only” created a valid charitable trust); *Keene v. Martin*, 96 N.H. 504 (1951) (bequest to pay for and establish a set of chime bells to be installed on the public library or some other building in the city constituted a charitable trust); *State v. Federal Square Corp.*, 89 N.H. 538 (1938) (land and buildings thereon conveyed to a city to be used as a public library created a charitable trust); RSA 7:21 (defining a charitable trust under New Hampshire law as “any fiduciary relationship with respect to property arising under the law of this state or of another jurisdiction as a result of a manifestation of intention to create it, and subjecting the person by whom the property is held to fiduciary duties to deal with the property within this state for any charitable, nonprofit, educational, or community purpose.”). See also Restatement (Third) of Trusts (2003) § 28, cmt. a (“An outright devise or donation to a ... charitable institution, expressly or impliedly to be used for its general purposes, is charitable but does not create a trust A disposition to such an institution for a specific purpose, however, such as to support medical research, perhaps on a particular disease, or to establish a scholarship fund in a certain field of study, creates a charitable trust of which the institution is the trustee “). Even in jurisdictions in which a gift made for a specific charitable purpose is not characterized as a technical “trust,” the substantive rules governing the administration of charitable trusts, including the doctrine of cy pres, nonetheless apply. See, e.g., *St. Joseph’s Hosp. v. Bennett*, 22 N.E.2d 305,308 (NY 1939); Restatement (Second) of Trusts § 348.1, cmt f. (1959).
- 2 Uniform Trust Code § 414, cmt. The sections of New Hampshire’s Uniform Trust Code concerning the modification or termination of charitable trusts for the most part merely codified or replaced already existing New Hampshire common and statutory law. Michelle M. Arruda, *The Uniform Trust Code: A New Resource for Old (and New!) Trust Law*, 46 N.H.B.J. 6, 9 (2006). See also Uniform Conservation Easement Act, § 3, cmt. (“because conservation easements are conveyed to governmental bodies and charitable organizations to be held and enforced for a specific public or charitable purpose—i.e., the protection of the land encumbered by the easement for one or more conservation or preservation purposes—the existing case and statute law of adopting states as it relates to the enforcement of charitable trusts should apply to conservation easements”); Restatement (Third) of Property: Servitudes § 7.11 (2000) (recommending that the modification and termination of conservation easements be governed by a special set of rules based on the charitable trust doctrine of cy pres). See also Nancy A. McLaughlin & W. William Weeks, *In Defense of Conservation Easements: A Response to The End of Perpetuity*, 9 Wyo. L. Rev. 1 (2009).
- 3 See *In re Village of Mount Prospect*, 522 N.E.2d 122,125 (Ill. App. 1988) (land dedicated to Village “for public purposes” was held upon an express charitable trust and could not be sold without court approval in a cy pres proceeding).
- 4 See Amending Conservation Easements at Appendix C-2 for sample amendment provisions.

- 5 The term “Attorney General” as used herein refers to the Attorney General’s Charitable Trusts Unit. To the extent that any parties including the N.H. Fish and Game Department, the Council on Resources and Development, the Division of Cultural and Historical Resources, etc. are represented by another bureau, the appropriate Attorney General representative from that bureau should also be contacted.
- 6 In a 2005 report on The Nature Conservancy (TNC), the Staff of the Senate Finance Committee explained that “[m]odifications to an easement held by a conservation organization may diminish or negate the intended conservation benefits, and violate the present law requirements that a conservation restriction remain in perpetuity.” See United States Senate Committee on Finance, Report on The Nature Conservancy, Executive Summary at 9 available at <http://finance.senate.gov/sitepages/TNC%20Report.htm>. The Staff noted that modifications made to correct ministerial or administrative errors are permitted under present federal tax law. *Id.* at 9 n. 20. But the Staff expressed concern with regard to trade-off amendments, which both negatively impact and further the conservation purpose of an easement, but on balance are arguably either neutral with respect to or enhance such purpose. See *id.* at Pt. II 5. The Staff provided, as an example, an amendment to an easement that would permit the owner of the encumbered land to construct a larger home in exchange for restrictions further limiting the use of the land for agricultural purposes. *Id.* The Staff explained that trade-off amendments “may be difficult to measure from a conservation perspective,” and that the “weighing of increases and decreases [in conservation benefits] is difficult to perform by TNC and to assess by the IRS.” *Id.* {end of 20151013-5361}

20151013-5397

Nancy Hann, Winchester, NH.

I would like to have you research if there a link to natural gas fracking and honeybees. Colony Collapse Disorder, especially in the states of Pennsylvania and Oklahoma, are two states that have the highest incidence of CCD, 60% in the past two years, are also the states where most natural gas fracking is extracted in the United States. Is this “the canary in the coal mine”?

“If the bee disappeared off the surface of the globe then man would only have four years of life left. No more bees, no more pollination, no more plants, no more animals, no more man.” – Albert Einstein

Thank you, Nancy Hann

20151013-5432

Maria Cruz, Dalton, MA.

Dear FERC,

As a resident of the Town of Dalton in Western Massachusetts I am writing to you in opposition to the Northeast Energy Direct project that would send a natural gas pipeline through Western Massachusetts (Tennessee Gas Pipeline Company, L.L.C. under New Docket for Tennessee’s Northeast Energy Direct Project under PF14-22.).

There are two main reasons that I oppose this project. The first relates to the possible contamination of our regions water, soil, and air from a very possible leak in this system and from normal daily functioning of the system. The pipeline would pose a risk to our health via respiratory issues and through our food and water supply. The proposed geographical path for the pipeline runs through our town of Dalton’s only organic food CSA. This land is invaluable to our health as it supplies high quality nourishing food, and compost to grow food, to our community. Not only could the pipeline chemicals, which may leach into our soil, ground water and air, potentially harm people, but also the lawsuits could astronomically damage our daily quality of life. As a dietitian I have dedicated my life to promoting health through nutrition, and organic locally grown food is imperative for all people to remain as disease free as possible, as well as a human right. It’s old news that toxins in our food and water cause disease. That’s why we are trying so hard to change the way we create and use energy, because our current fossil fuel based systems are making the Earth and us sick.

This brings me to my second reason for opposition, and that is the pipeline goes against all of the alternative energy efforts that our region, and our government, have been trying to promote and implement for years. It goes against common sense to create another system to use fossil fuels when we are facing global warming at catastrophic levels. Have you read the book *The Sixth Extinction* by Elizabeth Kolbert? If you haven't, it will be well worth your time. It's about how humans are causing the 6th extinction of our planet. It only makes sense that a living organism, such as the Earth, can only stand so much of its insides sucked out, and spewed as toxic chemicals over its surface before it dies. Unfortunately, we won't just kill us, and everything that lives on top of the Earth; we will kill the Earth as well.

So, please reject the Northeast Energy Direct project that would send a natural gas pipeline through Western Massachusetts proposal, for the betterment of a small community that is committed to finding ways to create alternative energy sources to fossil fuels, and to growing nourishing, chemical free food that will keep us healthy and using fewer resources all together; and for the health of our planet. Remember, it is your responsibility to protect the communities of this country from environmental hazards and harms.

Sincerely,

Maria Cruz, MEd, RDN, LDN

SEBASTIAN E BARTHELMESS, New Ipswich, NH.

How does Kinder Morgan / Tennessee Gas Pipeline Company, LLC plan to mitigate mental and emotional distress and resultant higher stress levels of those within 1/2 radius of the compressor station in New Ipswich, NH? Keep in mind these are consequences which need no baseline to hold up in the court of law as harassment.

Thank you.

Regards,

Sebastian Barthelmess

20151013-5468

Richard J Goettle, IV, Fitzwilliam, NH.

Kinder Morgan (KM) justifies the need for the NED Project by creating a large imbalance between New England's (NE's) demand for natural gas and its access to and supply of it. The peak shortfall, measurable in months rather than days, arises from their overestimation of demand and their underestimation of supply. In a KM-commissioned analysis (http://www.kindermorgan.com/content/docs/NED_CapacityOutlook.pdf), ICF, Inc. projects increasing natural gas demands from NE's households and businesses that are generally in line with those from the US Energy Information Administration's (EIA's) Annual Energy Outlook 2015 (AEO 2015). [It should be noted that NE's residential, commercial and industrial demands in 2013 and 2014 are only marginally higher than in 1997 so both ICF and EIA could well be overestimating future demand.] ICF next projects an unprecedented 0.8% per annum growth in NE's electric load. This is more than three times NE's annual average growth of 0.23% from 1990-2013 and twice the projected annual average growth of 0.4% per annum in AEO 2015. Neither KM, ICF nor ISO New England (ISO-NE) provides details on just how much of this future load will be fueled by natural gas. What is clear is that these three project future NE demands for natural gas across all users that are well in excess of the historic high of 2.55 billion cubic feet per day (bcf/d) annual consumption observed in 2011. ICF's overestimations lead to peak gas demands in 2035 of 6.7 to 8.3 bcf/d depending on weather conditions. In analyzing winter peak NE gas demands, ICF projects supplies in the range of 4.0 to 4.5 bcf/d including LNG. This is implausibly low. EIA places current net inflow capacity into NE from New York and Canada slightly in excess of 3.9 bcf/d. Add to this 2.0 bcf/d from current and projected peak-shaving resources and better physical and contractual use of Distrigas' Ev-

erett MA LNG import potential (as well as generally unused offshore LNG import terminals) and almost 0.5 bcf/d from Algonquin Gas Transmission's AIM and Atlantic Bridge projects and the overestimated demand shortfall virtually disappears. Under more plausible demand estimates, winter peak demands easily could be met even in weather extremes. There are two competing analyses from Energyzt Advisors, LLC that firmly reject NE's need for the NED Project. In contrast to KM's supporting analyses, the Energyzt assessments are more richly detailed, thoroughly documented and logically and compellingly argued. I urge FERC to take a hard and serious look at: <http://nepga.org/2014/10/energyzt-report-on-winter-reliability/> and http://www.gdf-suezna.com/media/files/files/908b26be/ENERGYZT_Report_Winter_Reliability_Analysis_FINAL_082015.pdf

20151013-5475

Richard J Goettle, IV, Fitzwilliam, NH.

Kinder Morgan (KM) contends that the NED Project is “not anticipated” to “negatively impact property values outside the proposed pipeline ROW” (Resource Report 5, Socioeconomics, p 5-17). Please note that the studies cited in support of this claim are seriously flawed. The PGP Valuation Inc. (2008) analysis link is no longer active. In comparison to those discussed below, the Diskin et al (2011) analysis is without detail or rigor. In Allen et al (2001) and Hansen et al (2006), the pipelines in question had been operational for 30 to 40 years prior to their sample periods. Thus, any effects – negative or positive – would have long since been capitalized into observed asset prices. So their conclusions of no impacts should not be surprising. Fruits (2008) is the only citation whose sample period examines property values pre- and post-pipeline construction. However, his hedonic pricing model omits independent variables that would measure any direct effects on the levels of prices, including only those that interact with distance from the pipeline. While the latter are statistically insignificant, they are negative. But because Fruits' model specification is incomplete so too is any conclusion derived from it. Hansen et al (2006), methodologically the best among the citations, show econometrically that property values are adversely affected by a pipeline accident, the statistically significant impacts decaying with distance and time. The latter helps explain why current adverse price effects are not observed for pipelines constructed many years prior to the valuation assessments. In the end, KM offers no evidence that property values or marketability will not be negatively affected by the NED Project. Moreover, no evidence of adverse price effects is vastly different from evidence of no adverse price effects, the latter of which is what homeowners most want.

20151013-5500

SEBASTIAN E BARTHELMESS, New Ipswich, NH.

How does Kinder Morgan / Tennessee Gas Pipeline Company, L.L.C retribute for lost lives from pipeline accidents - both of workers and non-workers? Recall restitution is the principal of paying back for losses in excess of that which was destroyed, stolen, or damaged. We would like to know the exact price of human life for the record. Also does this value differ for children? Yes, we are asking for an exact USD amount, a variable answer or range will be considered unanswered.

20151013-5522

SEBASTIAN E BARTHELMESS, New Ipswich, NH.

Kinder Morgan / Tennessee Gas Pipeline Company, L.L.C. have publicly stated that the alternative route along the “Massachusetts Turnpike” (herein referenced as Mass Pike) is longer than the original proposed New Hampshire route. We ask this now be revisited due to MULTIPLE changes to the route through New Hampshire. Even if it is still determined the route is longer, it has been undeniably determined, the Mass Pike route will have less impact to landowners and will not involve eminent domain from private citizen landowners and taxpayers. Furthermore access to the pipeline for repairs and rescue and egress due to imminent pipeline failure will be safer and more accessible with close access to the highway. Lastly both Boston AND Worcester medical centers are within proximity to the Mass Pike and the route which will aid

in the case of catastrophic pipeline or compressor failure.

We firmly request the route be provisioned back to this route as the safest, overall cheapest, and most maintainable pipeline route if the need is determined to build this pipeline at all. If this is not the case, then a thorough and complete cost analysis and rebuttal is required.

20151013-5525

Katie Padalino, Averill Park, NY.
10/13/2015

I strongly oppose the proposed pipeline in Rensselaer County (PF14-22-000). As a homeowner of 2 homes in the area that would be involved I fear for the safety of my two small children. As a school nurse of one of the local elementary schools that would be affected, I fear for the safety of my 400 students I care for daily. I thank you in advance for considering my opposition.

Sincerely,

Katie Padalino

Re: Tennessee Gas Pipeline Company/Northeast Energy Direct Project
Docket No. PF14-22-000

Dear Mr. Tomasi:

After reviewing the (rather copious) material in Kinder Morgan/Tennessee Gas Pipeline's most recent resource reports, I would like to comment further on Resource Report 10, Alternatives.

In light of the fact that the vast bulk of gas transported in this pipeline would either be exported or be used in the lower tier of New England, I believe that alternatives which place the infrastructure closer to its intended users would be a better alternative. To that end, Proposed Alternate Routes along the I-90 (Mass Pike) and Route 2 corridors in Massachusetts present a much more direct route and place the burden of the infrastructure on the state accruing the largest benefit. I would strongly encourage FERC to insist that these alternatives be fully vetted – as thoroughly as the current NY/NH Powerline alternative has been – before being dismissed by the applicant. Simply dismissing these two alternatives out-of-hand is hardly what any reasonable person would consider “due diligence”. One would think that locating the ROW along a major roadway would be a net benefit in terms of access.

In terms of the Fitchburg lateral, the alternate route of following NH Route 31 also requires full vetting. The Route 31 corridor represents a pre-existing right-of-way with largely commercial/industrial use. It would be far more appropriate than a greenfield route which crosses difficult terrain, exposed bedrock, mature forest, wetlands, and a stratified drift aquifer. These properties include LCHIP (state-funded) conservation lands, land in Current Use, and residential properties which would require a raft of eminent domain takings.

As with the I-90 and Route 2 alternatives above, a major benefit of the Route 31 alternative is access to the ROW. As proposed, the Fitchburg lateral would be largely located in forested areas with poor access in case of an emergency, or even for required maintenance. The ROW would become inaccessible during the winter months (except, perhaps, by snowmobile or dogsled). Locating along the Route 31 corridor would provide year-round access to the ROW.

Thank you for your attention to this matter.

Sincerely,

Lisa M. Senus

Re: Tennessee Gas Pipeline Company/Northeast Energy Direct Project
Docket No. PF14-22-000

Dear Mr. Tomasi:

These comments are regarding the socio-economic impact of the Northeast Direct (NED) pipeline project, and need to be thoroughly addressed in the appropriate section of the EIS.

The applicant, Kinder Morgan/Tennessee Gas Pipeline (KM/TGP), has consistently stated that the presence of a pipeline does not cause a diminution in property value for the affected landowners. Common sense dictates otherwise. Anecdotally, local realtors have stated recently that it has become nearly impossible to sell properties that are at risk of being encumbered by easements for the NED project. Directly, I can attest that I have watched in dismay as the monthly report on my property from Zillow shows that its value has been steadily decreasing since June 2015.

Regarding the right-of-way easements and eminent domain takings, it is important to remember that the easements include not only the permanent 50-foot wide pipeline easement itself, but also any temporary easements used during construction. This renders the effective easement at least 75-150 feet wide, leaving a much larger scar on the affected properties than the applicant would acknowledge for purposes of determining compensation. Undisclosed internal construction "Requirements" on the part of the applicant obscure the true amount of property encumbered by the formal easement.

Further, I direct your attention to the attached decision by the US Court of Appeals for the First Circuit in the case of *Portland Natural Gas v. 19.2 Acres of Land in Haverhill* (No. 02-1369, decided January 31, 2003). That decision determined that the portion of land subject to the permanent easement was devalued by 75 percent of its market value. Further, the additional temporary easement areas required for construction, according to the gas pipeline company's "Requirements", were devalued by 10 percent. The judge in this case determined that any rational purchaser, given a choice of two equal properties, one encumbered by a pipeline easement and the other not, would either select the unencumbered property or use the presence of

the easement to negotiate a significant discount on the purchase price.

All of the above is an indication that there will be significant economic impacts to the landowners being asked to host the pipeline. One's home is frequently one's single largest investment, the foundation of the retirement nest-egg. Devaluation of this investment could easily jeopardize a landowner's financial security. Thank you for your attention to this matter.

Sincerely,

Lisa M. Senus

Decided January 31, 2003.

James T. Finnigan, with whom Rich May, PC was on brief, for appellants.

James D. Masterman, with whom Richard D. Vetstein and Masterman, Culbert & Tully, LLP were on brief, for appellee WBC Extrusion Products, Inc.

Before BOUDIN, Chief Judge, TORRUELLA, Circuit Judge, and CYR, Senior Circuit Judge.

TORRUELLA, Circuit Judge.

1

The Fifth Amendment permits the federal government to take personal property for public use, but requires payment of "just compensation." Plaintiffs-appellants, Portland Natural Gas Transmission System and Maritimes & Northeast Pipeline, L.L.C. ("the Pipeline Companies"), took by eminent domain temporary and permanent easements on land in Haverhill, Massachusetts owned by defendant-appellee, WBC Extrusion Products, Inc. ("WBC"), to construct, operate and maintain a pipeline as permitted by the Natural Gas Act, 15 U.S.C. § 717f(h). A bench trial was held in the United States District Court for the District of Massachusetts to determine the amount of compensation due. The court determined that WBC was entitled to \$152,677 plus interest. The Pipeline Companies appeal, claiming that the amount is not justified by the evidence produced at trial. We affirm.

I. Background

2

The facts of this dispute are detailed in the district court's opinion, *Portland Natural Gas Transmission Sys. v. 19.2 Acres of Land*, 195 F.Supp.2d 314, 316-19 (D.Mass. 2002), and we repeat only those necessary to our decision. At the time of the taking, WBC owned two parcels totaling approximately

seventy-six acres. Parcel 1 was divided into eight lots to be used for an industrial park; Parcel 2 was a non-buildable vacant lot. WBC occupied Lot 7 in Parcel 1, and the other seven were empty and for sale. The permanent gas pipeline easement is fifty feet wide and runs through Lots 1 and 8 on Parcel 1 and through Parcel 2, encumbering approximately 2.37 acres total. The temporary easement ran along a similar path, reaching approximately 2.10 acres total.

II. Standard of Review

3

We review the district court's findings of facts, including the amount of compensation due, for clear error. Fed. R.Civ.P. 52(a); *S. Nat. Gas Co. v. Land*, Cullman County, 197 F.3d 1368, 1372 (11th Cir.1999) ("This court reviews the district court's determination of just compensation for clear error."); *Puerto Rico Ports Auth. v. M/V Manhattan Prince*, 897 F.2d 1, 3 (1st Cir.1990). Our job is not to weigh the evidence anew, but simply to determine whether the decision reached by the trial court is "plausible in light of the record viewed in its entirety." *Anderson v. City of Bessemer City*, 470 U.S. 564, 574, 105 S.Ct. 1504, 84 L.Ed.2d 518 (1985). The fact that the ruling was substantially based on physical or documentary evidence, rather than credibility determinations, does not alter our deferential analysis. *Id.* Any rulings of law are subject to de novo review. *United States v. Mass. Water Res. Auth.*, 256 F.3d 36, 47 (1st Cir.2001).

4

As this case is fact intensive, we note that the appellant has a difficult task of overcoming the trial court's findings. Determining the value of real estate is not a science, and the decision of a lower tribunal is ordinarily not disturbed unless "grossly inadequate or excessive." 4A Julius L. Sackman, *Nichols on Eminent Domain* § 17.1[4], 23.01 (rev.3d ed.2001) (hereinafter *Nichols on Eminent Domain*).

III. Discussion

5

The land taken by the Pipeline Companies is in Massachusetts, and the district court applied Massachusetts law to determine the just compensation to which WBC was entitled. As the parties do not contest this choice of law and there is no indication that it makes any difference as to any of the contested issues, we accept this premise without necessarily endorsing it.¹ Under Massachusetts law, just compensation is defined as

6

the value [of the land] before the recording of the order of taking, and in case only part of a parcel of land is taken there shall be included damages for all injury to the part not taken caused by the taking or by the public improvement for which the taking is made.

7

Mass. Gen. Laws ch. 79, § 12 (2002). Therefore, although the easement did not abrogate all of WBC's bundle of rights, WBC is entitled to compensation for the decrease in value of the land encumbered by the easement as well as the decrease in value of the other land on the lots, or the "remaining land." In addition, WBC is entitled to compensation for the temporary easement, or the two years when the Pipeline Companies were using part of WBC's land for construction of the pipeline. The compensation awards for these three areas — the encumbered land, the remaining land, and the land temporarily taken — are the subject of this appeal.

A. Encumbered and Remaining Land

8

In 1998, the Pipeline Companies promulgated "Requirements for Construction On or Near Company Facilities" (the "Requirements") to protect their pipelines from encroachment and disturbance caused by

construction activity on or near the easement. WBC claimed that the easement together with the Requirements rendered the permanent easement area worthless.² The Pipeline Companies' expert testified that the encumbered land was still useful and retained fifty percent of its value. The district court found that the Requirements diminished the value of the encumbered land beyond the Pipeline Companies' suggestion of fifty percent. The court found that "a potential buyer who has read [the Requirements] would be likely to fear a substantial degree of infringement on the land encumbered by a permanent easement," and determined that the encumbered land was reduced in value by seventy-five percent. *Portland Natural Gas*, 195 F.Supp.2d at 324. The court also determined that the Requirements reduced the value of the remaining land by ten percent because "[a] reasonable buyer, after reading the [Requirements], would almost certainly anticipate that building in the vicinity of the easement areas of Lots 1 and 8 would involve extra administrative 'hassle,' and possible extra construction expenditures." *Id.* at 324. The Pipeline Companies argue that the diminution of the encumbered land is only fifty percent and that there is no diminution of the remaining land. The Pipeline Companies claim that (1) the damages theory employed by the district court was not litigated and therefore constituted unfair surprise, and (2) there was no evidence that the Requirements diminished the value of the encumbered or remaining land.

1. Unfair Surprise

9

The Pipeline Companies claim that the effect of the Requirements on the value of the land was not litigated and was not considered an issue by the Pipeline Companies, and that they were therefore unfairly surprised and prejudiced when the district court awarded damages based on the Requirements. Appellants assert that the unfair surprise necessitates a new trial and that the district court lacked authority to enter judgment on the issue because it had not been squarely litigated.³

10

The record indicates that the parties addressed the Requirements issue in their motions and papers before the court. WBC stated that the Requirements diminished the value of the land in question, while appellants emphasized that the effect of the Requirements can only be determined on a case by case basis. A motion in limine discussed and included the Requirements.

11

The Requirements issue also consumed extensive time at trial. In his opening statement, WBC's counsel stated that the Requirements would be discovered by a reasonably prudent buyer, and that the "nub of the dispute" was what that buyer would do when faced with the Requirements. The Requirements were introduced into evidence without objection and outlined by Franklin Gessner, a witness for appellants. The Pipeline Companies' expert, Steven Foster, had not been provided with the Requirements before making his estimation of damages, and stated that his figures might have been different had he considered the Requirements. The judge directly asked Foster several questions about a possible diminution associated with the increased construction costs and the hassle of dealing with the Pipeline Companies due to the Requirements. Foster responded that "on a rational level... there would be [diminution]," although stating that he did not have market data to verify the judge's intuition. Finally, during appellants' closing argument, the judge stated that "the ordinary and reasonable person reading [the Requirements] would read them and say: I've got to worry about them." With the plethora of evidence to the contrary, the Pipeline Companies' argument that they were prejudicially surprised when the court determined diminution in value based on the effect of the Requirements must fail.

2. Impact of the Requirements

12

Under Massachusetts law, WBC is entitled to recover for all incidental effects of the public improvement that impair the value of its land. *Roman Catholic Bishop v. Commonwealth*, 378 Mass. 381, 392 N.E.2d 829, 831 (1979). This includes not only the lost value of the encumbered land, but any "damages

to the remainder that are to be reasonably anticipated from use of the property for the purpose for which the condemnation is made.” Nichols on Eminent Domain § 14A.06[3]. Eminent domain is a concept of equity and fairness, and the law attempts to make the landowner whole. Id. at 14.02[1][a].

13

The district court found the encumbered land to be diminished by seventy-five percent, based in part on the effect of the Requirements. The court also determined that the Requirements reduced the value of the remaining land on Lots 1 and 8 by ten percent. This was based on the court’s view that “[p]otential buyers may reasonably fear that the presence of underground pipelines on their property may make commercial construction more costly and inconvenient on the adjacent land.” Portland Natural Gas Transmission Sys., 195 F.Supp.2d at 325. Appellants claim that there was no basis for determining by what precise amount or percentage the Requirements adversely affected the value of the land.

14

The trier of fact is “authorized to determine damages in an amount to which no expert testified by rejecting the precise amounts to which each expert testified.” Nichols on Eminent Domain § 17.1; see also *Loschi v. Mass. Port Auth.*, 361 Mass. 714, 282 N.E.2d 418, 419-20 (1972) (upholding a jury verdict in excess of expert testimony because fact-finder could also consider photographs and other witness testimony). The judge was entitled to reject the experts’ valuation and to use her independent judgment to determine value. *Piemonte v. New Boston Garden Corp.*, 377 Mass. 719, 387 N.E.2d 1145, 1152 (1979). The court considered the Requirements themselves, photographs, and expert and lay testimony in determining that the value of the Requirements had a negative impact on the value of the land. Its decision as to the extent of the resulting diminution in value was not clearly erroneous.

15

A reading of the Requirements supports the court’s determination that the Requirements would decrease the price a reasonable buyer was willing to pay for the land. The Requirements provide that the encumbered land may not be used for structure, storage, or trees. Further, a landowner must submit proposed plans to the Pipeline Companies for authorization before beginning any work on or near the easement. Approval is also required for many other uses that would commonly be undertaken on a vacant industrial lot, including grade reduction, movement of heavy equipment across the easement, installation of electrical cables, power lines, and telephone lines, and blasting and excavation. Finally, the Pipeline Companies “reserve[] the right to set forth additional requirements if deemed necessary.”

16

The Pipeline Companies assert that the Requirements do not impact the land’s value because prospective buyers may choose to use the land in a way that conforms with the Requirements. We find the existence of such a buyer doubtful given the breadth of the Requirements and appellants’ discretion to modify them as it wishes. In addition, prospective owners would have to deal with the added burden of obtaining approval from the easement holder before undertaking any work on the vacant lot. The inference that the Requirements impact the property’s value is common sense: if a similarly-situated industrial lot exists that is free from the pipeline easement and the Requirements that go along with it, a potential buyer will likely forego the WBC lot in favor of the unencumbered lot. Therefore, WBC must lower its price to attract buyers. This is a logical consideration, and the fact that no expert spelled out this exact argument does not mean the judge could not arrive at it on her own.

17

The court heard conflicting evidence regarding the extent of the impact of the easement and Requirements on the land. The Pipeline Companies’ expert testified based on “experience and judgment” that the encumbered land was reduced in value by fifty percent, although he admitted that there is no standard in the industry for determining diminution and that he had heard of different valuations in other cases, ranging from forty to seventy-five percent. This expert, however, did not have the benefit of the

Requirements when making his estimate, as they were not provided to him by the Pipeline Companies. A witness for WBC stated that he believed the Requirements negatively impacted the land. Witnesses also debated what administrative burden the Requirements would place on a landowner.

18

In light of all the evidence, the district court, acting as fact-finder, “made its determination[] based on its reasonable assessment of the conflicting evidence before it.” *Northeast Drilling, Inc. v. Inner Space Servs., Inc.*, 243 F.3d 25, 34 (1st Cir.2001). The court’s determination was not clearly erroneous.

B. Temporary Easement

19

WBC’s expert opined that the temporary easement effectively delayed the sale of, and any development on, the lots for the full two-year period. He testified that developers had verified this hypothesis, stating that so long as unencumbered lots were available, buyers would go elsewhere. The Pipeline Companies urged the court to simply award the rental value for those sections of each lot taken temporarily. The court did so but also awarded six months rental value for all of Lots 1 and 8. The Pipeline Companies challenge this additional award.

20

Compensation for a temporary taking is generally determined by “(1) ascertaining the value of the property for the period it is held by the condemnor; (2) ascertaining the difference in the value of the property before and after the taking; or (3) looking at the fair market rental value of the property during the time it was taken.” *Nichols on Eminent Domain* § 12E.01[1].

21

We find the district court’s determination a reasonable ascertainment of the value of the property taken. The court heard testimony that prospective buyers desire to begin construction within twelve months, and the court found that construction on WBC’s land generally would begin within eighteen months of purchase. Because the Pipeline Companies required access to a portion of the land, development likely could not begin until the end of the temporary easement. Thus, a potential buyer would wait until six months after the temporary taking had begun before purchasing the property, or would adjust his offer to reflect this waiting time.

IV. Conclusion

22

We affirm the decision of the district court determining just compensation. Costs are granted to appellee.

Notes:

1

The federal eminent domain statute involved here provides that “[t]he practice and procedure in any action or proceeding for [eminent domain] in the district court of the United States shall conform as nearly as may be with the practice and procedure in similar action or proceeding in the courts of the State where the property is situated.” 15 U.S.C. § 717f(h). Perhaps surprisingly, several circuits have read the phrase “practice and procedure” to encompass state substantive law as well as formal practice. See, e.g., *Columbia Gas Transmission Corp. v. Exclusive Natural Gas Storage Easement*, 962 F.2d 1192, 1194-99 (6th Cir.1992). For the reasons indicated, we need not pursue this interesting subject in the present case.

2

The district court’s determinations that the highest and best use of Lots 1 and 8 is industrial use, and the highest and best use of Parcel 2 is open land, as well as its determination of the per acre value of the land, are not challenged

3

We note, without reaching the issue, that appellants’ failure to ask for a continuance may be fatal to their

claim of unfair surprise See *United States v. Díaz-Villafañe*, 874 F.2d 43, 47 (1st Cir.1989) (suggesting that unfair surprise may usually be cured by a request for a continuance).

Aimee Petras, West Hartford, CT.
Kimberly D. Bose,
Secretary Federal Energy Regulatory Commission
888 First Street, NE, Room IA
Washington, DC 20426

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/ Kinder Morgan (FERC Docket No. PF14-22-000)

I strongly oppose the proposed Tennessee Gas Pipeline (TGP) Project that will be going through the Class I and II Protected Watershed lands of the Metropolitan Commission' lands. TGP has proposed the installation of a 24" inch diameter pipeline next to the existing 16" pipeline across the MDC's watershed land in West Hartford and Bloomfield. The pipeline will stretch across 5.7 miles of MDC land (and, of course, through many other private, municipal, and public lands in surrounding communities as well). With a construction Right of Way (RoW) of 90 feet, the project will disturb over 62 acres of Class I and Class II watershed land at the MDC.

Connecticut law provides the highest protections in the nation for drinking water. First, no water body that has received a waste discharge can be used for public supply of potable water. Second, water utility land hydrologically linked to drinking-water reservoirs must be kept as natural open space and cannot be disturbed in any way other than certain limited permitted actions necessary to maintain operations. By statute the protected lands are termed Class I (closest to the source) and Class II (also impacts the source).

Protection of Class I and II lands is the highest priority in our state water policy. To violate this protection would set a precedent that would put at risk Connecticut's drinking water sources. The state's standards for drinking water are uniquely high (only Rhode Island has similar standards). These high standards are increasingly justified as science reports document the myriad new pharmaceuticals, plastics, pesticides and other toxins in ordinary wastewater. Existing treatment methods cannot adequately define or manage this array of toxins.

I strongly believe that is is not worth the risk of exposing 400,000 people to contaminated drinking water (the number of customers that MDC provides drinking water for) just to increase the amount of natural gas flowing through Connecticut. Federal tax dollars would be better spent helping the consumers of electricity to be more efficient.

This proposal is foolish. We already have a pipeline, and we don't need any more gas.

20151013-5589

SEBASTIAN E BARTHELMESS, New Ipswich, NH.

Two questions regarding the compressor station:

- 1) Please give a detailed explanation as to why an Electric Compressor station has not been considered to reduce pollution and noise in New Ipswich, NH and the other stations along the proposed NED route? This would include total ROI, maintenance cost, fatality rates at compressor stations in the industry between gas vs electric stations, and overall cost and efficiency comparisons (both in installation and at 10, 20, and 30 year increments).
- 2) What is the exact makeup of the proposed gas under normal operating conditions, that will pass through the pipeline. This should include but not limited to any dyes or odor additives, methane, trace benzene and formaldehyde, etc. We request BOTH PPM and overall percentage readings. If NED is approved and KM

can actually afford to build it and make it operational, we request daily reporting on content and spectrometer readings of all gas entering and leaving the compressor station.

20151013-5637

Heather Grieco, Averill Park, NY.

Regarding Docket Number:#PF14-22 Northeast Energy Direct Docket

I OPPOSE the NED pipeline and Compressor station in Nassau, NY!!!

A comprehensive health assessment should be conducted before any new pipeline infrastructure is permitted in NYS.

Studies are now indicating that natural gas is not as clean as once thought and is contributing to climate change. Fracking, storage of methane gas, and the operation of the pipelines and compressors are associated with the delivery of natural gas have serious health, environmental, and safety consequences. The noise pollution, light pollution, and toxic emissions threaten health and safety and the value of property.

Kinder Morgan has not indicated who will receive the gas piped through Nassau, and, in fact, it's likely to be exported, which would likely drive up the cost of natural gas in the US. Studies have now shown a correlation between the toxins released from compressors and respiratory illness, cancer, birth defects, and a variety of other health conditions. Toxins from pipelines and compressor stations could leak into the ground water contaminating our wells and lakes. Pipelines Explode. The standards for pipelines in rural areas are less stringent than those applied in urban areas.

Please, for our environment and our lives. DENY them entry to this area!!!

20151013-5641

Farmington River Watershed Association, Inc.

749 Hopmeadow Street, Simsbury, CT 06070

(860) 658-4442 Fax (860) 651-7519 www.frwa.org

October 12, 2015

Comments to FERC in response to scoping meeting for the Northeast Energy Direct Project

The Farmington River Watershed Association strongly opposes the proposal by Tennessee Gas/Kinder Morgan to install a natural gas pipeline through the Class I and Class II watershed land owned by the Metropolitan District Commission (MDC). A gas pipeline installation on this land has potential to impact a high quality drinking water source. Also, granting permission for a new pipeline through this land undermines Connecticut's current protections for drinking water.

CT General Statute 25-32 requires a change of use permit from the CT Department of Public Health for projects like this one. Furthermore, it restricts the use changes that are allowable. The existing gas pipeline and easement on the MDC property pre-date the statute. A proposal now, to install new pipeline and enlarge the permanent right-of-way, is inconsistent with the letter and intent of CGS 25-32.

Regardless of the degree of threat posed by this particular pipeline, allowing an exception to the statute sets a dangerous precedent, paving the way for other encroachments on water supply land. Connecticut's standards for drinking water quality are second to none in the country. They are important in maintaining public health and quality of life in our state. While other regions face increasing threats from contaminants in their drinking water sources, Connecticut's protective legislation stands out as a model and should not be compromised.

The first drafts of the NED Environmental Reports submitted to FERC contained an erroneous statement that the proposed pipeline route is not located within any public drinking water or aquifer protection areas. In the recent public forum held by Kinder Morgan in West Hartford on October 7 (held after an emphatic request by the MDC) it was clear that Tennessee Gas/Kinder Morgan has every intention of putting more pipeline through the MDC's drinking water supply area. During the question and answer session, alternate

routes were dismissed as impracticable.

FRWA urges FERC to require a description of alternate pathways for this pipeline before considering approval of the route through the MDC's land. That said, we realize that alternate routes will have their own share of impacts on the Farmington River watershed. As a private, non-profit watershed protection organization, FRWA is concerned with a wider array of issues than protecting the MDC's drinking water supplies. We will no doubt comment on the impacts of alternate routes as well, including (for example) possible impacts to wetlands, forest cover, and other aquifers.

If this pipeline goes forward along any route, impacts to the Farmington River Watershed's land and water resources are inevitable. We urge FERC to consider, early on, whether the entire project is necessary; the legality and safety of a route through Class I and II watershed land; alternate routes and their impacts; and what mitigation projects in the watershed would be appropriate to require as offsets.

Thank you for this opportunity to comment.

Eileen Fielding
Executive Director

20151013-5643

Attilio J Qualtieri, Lynnfield, MA.

The Kinder Morgan Gas Pipeline is an ill-conceived plan set forth by a company that is run by a former high-ranking executive on now-defunct Enron Corporation, Richard Kinder. Although the main argument is that the pipeline is providing a great benefit to the citizens of the Northeastern United States, the Lynnfield/Peabody Lateral is an "export pipeline" as opposed to being a pipeline that benefits public use. I ask that this matter be investigated thoroughly and that the true intent be revealed by Kinder Morgan, in detail. To the extent that eminent domain is taking land from property owners for public use, an export pipeline being disguised by Kinder Morgan as being for the citizens of New England is just plain wrong. Furthermore, this action would be unconstitutional under the Fifth Amendment.

Kinder Morgan has a terrible track record with safety and soundness. According to an article from the Wall Street Journal, an investment analyst charged the company with starving its pipelines of routine maintenance spending to increase shareholder dividends/buybacks. This is poor prioritization of capital from Kinder Morgan, and it has shown through in its poor accident and safety results. From 2003-2014 alone, Kinder Morgan experienced 36 "significant incidents", resulting in fatalities or hospitalization, fire, explosions or spills. There are countless examples through the years on a state-by-state basis.

It has come to my attention that there is a concern about not having enough natural gas in the Northeast. However, by avoiding redundancies and using already established pipelines – many of which are not nearly being utilized to capacity – part of this concern can be alleviated. With this in mind, redirecting flow on existing routes is an option, as well as energy efficiency, fixing gas leaks, renewable resources, etc. Indeed, according to ISO New England, electricity use from the grid has plummeted by almost 6% from 2015 to 2014 due to greater efficiency of TVs, light bulbs, etc. These advancements should only continue.

One final point: additional gas is already on the way to New England. This includes the Williams Rockaway Lateral, scheduled for completion in 2015, as well as the Spectra NJ-NY expansion and the KM Northeast Upgrade. There are a flurry of other projects that are FERC/NEB-approved including expansions Marcelus to Canada, Constitution/IRQ/PNGTS, Algonquin Incremental Market, and gas storage in Nova Scotia (2018).

I live at 18 North Hill Drive in Lynnfield, MA and am directly impacted by the pipeline. My wife and I purchased the home in late 2014, and now find ourselves in the path of this enormous, dangerous, carcinogen-inducing pipeline. Regardless of where we live, the KM pipeline (and in IN PARTICULAR the Lynnfield/Peabody lateral) is absolutely flawed and needs to be viewed at critically by FERC on behalf of the citizens of Massachusetts and New England.

Thank you for your consideration,
Attilio Joseph Qualtieri

20151013-5649

Marilyn S. Griska, Rindge, NH.

Please note, while this letter was originally addressed to the Governor of N.H. and sent to N.H.'s legislative body and the local news papers. Most importantly, it is aimed at KM/TGP and FERC. South Western N.H. has a long memory, we will remember who brought us this pain.

The two sides of Maggie Hassan:

The words of Governor Maggie Hassan regarding our environment and fighting against pollution are impressive. The following statements were made by her upon learning the NH Supreme Court had upheld a 236 million dollar fine imposed two years ago on gas giant Exxon Mobil for contaminating thousands of ground water wells with the additive MTBE. It will result in the state receiving its biggest cash payout from an environmental law suit ever. "New Hampshire's natural resources and beauty are critical to our high quality of life and our economy, a defining characteristic of what makes our State a special place to live, work and visit." Further she went on to state, "Today's decision is an example of the State's vigilance in fighting pollution that damages and threatens the health of our people."

We the people of Southwestern NH feel abandoned by our Governor, and elected Federal officials regarding their stand on the looming NED natural gas pipeline. Asking for studies and calling for transparency are a tight rope walk and stand for all of them. No one on that level, except two Executive Counselors, have come out in sheer opposition of this very egregious and polluting project. The rhetoric of Kinder Morgan is nauseating when they plan to place a Compressor Station with known harmful emissions but a 1/2 mile from the Temple Elementary School.

Former Massachusetts Governor Duval Patrick took a definitive stand against having this monster in his State, even though they are the ones who truly need the energy. With all of the opposition there, the project was moved further north and is now planned in our State.

Now our Governor has declared her candidacy for US Senator. As we gather to go to the polls next fall, let's hope all voters in Southwestern NH will remember her hollow words.

We are the sad recipients of a project from which we'll receive no benefit, but will indeed take our lands, pollute our air, and endanger our children, our future.

Good luck, Maggie and all other tight rope walkers seeking reelection, we, who are screaming from under the bus, will remember!

And beware Kinder Morgan! Our next Governor may well go after you if your pollution damages and threatens the health of our people. Presently, Southwestern NH is teaming with natural resources and beauty which makes it a fine place to live, work and visit. That's why we chose to live here.

Marilyn Griska,
Rindge, NH

20151013-5689

SEBASTIAN E BARTHELMESS, New Ipswich, NH.

There are several stone walls on our property that have been here for centuries. These will be repaired if there is any damage during construction or blasting?

There will be no blasting, only drilling at all for the NED pipeline or compressor station through New Hampshire correct? We have to protect the brownfield lead from being disrupted which is well within 1000 feet from the proposed compressor station. This is non-negotiable. This has all been mitigated and accounted for correct?

Who currently owns the option to exercise on the SKAT property where the proposed compressor station is cited. How is Kinder Morgan / Tennessee Gas Pipeline Company, L.L.C. going to handle the brownfield mitigation on that property which has been estimated may cost in excess of \$1,000,000?

Who is responsible for any health effects that occur within 1yr, 2year, 5 year, and 10 year timeframes from initial construction of the pipeline and compressor station? This includes pets and animals effected, property and land effected, plants and fauna, and any humans effected. We require a corporate name, address, telephone contact information, and named person to speak with directly.

We have buried several pets on our property, the current proposed path may interfere with these, we require assurance in writing that they will be carefully removed and buried elsewhere at cost to Kinder Morgan / Tennessee Gas Pipeline Company, L.L.C.

RE: Comment on a Filing

Project Docket No. PF14-22-000

Dear Ms Bose;

This letter is being provided to voice our opposition to the installation of the NED Kinder Morgan Inc. / Tennessee Pipeline Co which is designed to be installed through southern New Hampshire.

This pipeline was not originally designed to help provide an alternate source of energy for the people of New Hampshire.

One must remember that the original location for this pipeline was rejected by the Governor of the Commonwealth of Massachusetts and its' residents for all the same concerns that we, the residents of New Hampshire, have.

Kinder Morgan has no concern for the people of New Hampshire. Kinder Morgan has no concern for the natural beauty of our state. Kinder Morgan has no concern for the natural habitats of the many species of wild life that abound in this region of our country.

Their only concern is to get the pipeline from point A to point B with the least resistance from the people whose lives this pipeline will forever change.

No towns along the path have access to the NLG being transported in this pipe. These towns are being forced to give up their home land and way of life so that this very powerful company can expand this pipeline system for its' own benefit and the benefit of the gas and oil companies whose product will be transported to points outside of the United States.

It is not now nor ever was designed to benefit the people of New Hampshire.

Therefore we request that this be taken into consideration to REJECT the proposed pathway of this pipeline through New Hampshire.

Sincerely,

Robert A. Maiocco
Marji L. Maiocco

Re: Comments on Docket PFI4-22-000 - Tennessee Gas Pipeline Company, LLC, Proposed Northeast Energy Direct Project

To Whom It May Concern:

Thank you for the opportunity to comment on the proposed Northeast Energy Direct Project (“NEDP”). These comments are submitted by Pennichuck Water Works, Inc. (“PWW”), a regulated water utility headquartered in Merrimack, New Hampshire. PWW maintains water resources, distribution systems and customers in southern New Hampshire, including the Towns of Amherst, Hollis and Merrimack, through which the NEDP pipeline would run under recent versions of the proposed NEDP pipeline route. Accordingly, PWW has a strong interest in the NEDP as it is proposed to pass the pipeline through its regulated utility franchise service territory and the Towns of Amherst, Hollis and Merrimack, New Hampshire.

The proposed location of the NEDP has the potential to impact PWW’s water supply and facilities as follows:

- I. NEDP proposes to locate its pipeline through parts of the Pennichuck Brook Watershed. The Pennichuck Brook Watershed provides approximately 70% of the drinking water supply for 39,000+ customers (over 150,000 people) in the greater Nashua, New Hampshire region. PWW believes that the NEDP pipeline can be installed and operated in a manner that is not harmful to the water quality of the surface and ground water supply of the Pennichuck Brook Watershed, but only if the following concerns relating to construction, operation and maintenance of the NEDP pipeline are addressed as part of the approval of the pipeline by the Federal Energy Regulatory Commission (“FERC”):
 - (a) Ground disturbance associated with the trenching required for the NEDP could result in erosion of the ground surface and the release of sediments into the surface water. Best management erosion and sediment control practices need to be specified, installed and maintained throughout the construction process. The erosion and sediment control devices must be properly maintained until an erosion proof ground cover has been established over the areas disturbed during the installation of the pipeline by the NEDP. PWW requests that if the NEDP project is constructed that it have the opportunity to review and comment on the proposed erosion control plan and that it be allowed access to the ongoing construction, in the presence of NEDP staff, to inspect and confirm the proper installation and maintenance of the erosion control facilities.
 - (b) Any portion of the NEDP pipeline crossing of a surface water resource or a wetland and any associated buffers shall be accomplished using directional boring technology, as opposed to open cut trenching, in order to eliminate any disturbance of surface water resources and wetlands. Surface water and wetlands crossings shall have the natural gas pipeline installed inside a carrier casing. The purpose of the carrier casing is to:
 - (i) allow for future pipeline replacement without disturbance of the surface water, wetlands and buffers; and
 - (ii) ensure that should a pipeline leak occur that the leaking gas be released to soil and the atmosphere above the ground water table which is outside of the surface water and/or wetlands.

Where any natural gas leakage from the pipeline above the ground water table will be released to the atmosphere through the soils, rather than into the ground or surface water, the threat of contamination of the water supply will be minimized provided all NEDP pipeline crossings of wetlands and surface waters are installed in carrier sleeves that extend a minimum of 50' beyond the edge of the high water mark of the surface water or wetlands.

PWW is very concerned, based upon discussions with the NEDP representatives, who have indicated that the pipeline would be bored under wetlands and surface waters and not sleeved, whereby the representatives have stated that "natural gas is not soluble in water."

The statement that natural gas is "not soluble in water" is not factual and, we believe, is incorrect. Natural gas contains approximately 3.2% (mole %) of ethane. Ethane, while not highly soluble in water does have a degree of solubility (see attached solubility curves) of about 100 parts per million (ppm) in water with a temperature of about 50 degrees Fahrenheit. Ethane, when combined with chlorine (which is used by PWW as its primary disinfectant), forms I, I-dichloroethane and 1,2-dichloroethane which are both on the Safe Drinking Water Act's Candidate Contaminant List. These contaminants over time, and in the presence of chlorine, convert to 1,1, I-trichloroethane and I, I, 2- trichloroethane. Both the trichloroethanes referenced above are regulated as primary contaminants under the current Safe Drinking Water Act at maximum contaminant levels of 0.2 ppm and 0.005 ppm, respectively. A release of natural gas into surface or ground waters that are chlorinated and used as a drinking water supply could result in contamination of the drinking water supply that would exceed the Safe Drinking Water Act standards by 500 to 20,000 times the current Maximum Contaminant Levels for the trichloroethanes. In order to protect the drinking water supply of the greater Nashua region. it is imperative that the installation of the NEDP under any wetlands or surface water be installed in a carrier casing.

- (c) The construction equipment used to install the NEDP operate using fuel and hydraulic fluids. The leakage of fuel and hydraulic fluids from the construction equipment presents a threat to both the local groundwater and surface water. In order to protect against this threat of contamination, all construction equipment should be inspected daily for leakage. When not in use, all construction equipment should be stored as far away from standing water and wetlands as possible. No temporary fuel tanks should be stored within the watershed boundaries unless the tanks are properly diked and aproned to keep any leakage from entering into the groundwater or surface water regimes.
 - (d) The maintenance of the pipeline right of way should be accomplished by mowing. There must be no defoliant or herbicides used to control growth within the pipeline right of way that are located within the Pennichuck Brook Watershed.
2. The NEDP is proposed to cross the Merrimack River about 5,600 feet up river from PWW's Merrimack River Intake which provides the remaining 30"10 of the drinking water supply to the greater Nashua, New Hampshire region. PWW believes that the NEDP Merrimack River crossing can be installed and operated in a manner that is not harmful to the water quality of the Merrimack River provided the following concerns in regards to construction, operation and maintenance of the NEDP are addressed:
- (a) PWW concurs with the entirety of comments submitted by the Lower Merrimack River Local Advisory Committee (LMRLAC) in its August 24, 2015 letter to FERC about the NEDP Merrimack River crossing relative to the "Construction Issues" of the pipeline under the Merrimack River. A copy of the referenced letter is attached for quick reference purposes. PWW requests that FERC incorporate all the recommendations made by the LMRLAC regarding potential construction issues into its findings regarding the NEDP application.
 - (b) The sleeving of the NEDP is essential to avoid the contamination of the Merrimack River should a leak develop in the pipeline under the Merrimack River. The impact on the water quality of

natural gas leaking up through the River in the event of a leak under the River is as defined in paragraph I(b)(ii) above and is a great concern to PWW.

3. The NEDP is proposed to be located in close proximity to PWW's Bon Terrain water storage tank located in Amherst, New Hampshire. This tank provides the storage of domestic and fire protection water for the Town of Amherst in the vicinity of Route 101A. The current proposed location of the NEDP is about 740' from the Bon Terrain Tank. This is the minimum distance of the NEDP from the Bon Terrain tank that PWW would not object to. If the proposed location of the NEDP were closer to the tank, a failure of the NEDP pipeline would likely result in a failure of the Bon Terrain storage tank and a loss of stored fire protection water at a critical point in time. PWW has included the following information regarding the impact of the NEDP on the Bon Terrain tank for FERC's information, in support of PWW's concerns:
 - (a) a study performed on its behalf by H.L. Turner Group Inc. dated August 2015 and titled "Letter Report on Kinder Morgan Proposed Natural Gas Pipeline;" and
 - (b) a memo from SFC Engineering Partnership, Inc. updating the H.L. Turner Group letter report based on a proposed relocation and design change to the NEDP that occurred after the initial letter report had been completed.
4. The NEDP is proposed to pass through PWW's property within an easement in the Town of Merrimack adjacent to Continental Boulevard. PWW does not object to the proposed installation of the NEDP across its land adjacent to Continental Boulevard in Merrimack, but only under the following conditions:
 - (a) that the criteria for the installation of the NEDP and for the maintenance of the NEDP easement be in accordance with paragraphs I(a), I(b), I(c) and I (d) detailed above; and
 - (b) that the pipeline does not cross the conservation easement granted by PWW and/or Pennichuck Corporation to the Society for the Protection of New Hampshire Forests ("SFPNHF") unless the SFPNHF freely consents to allow the NEDP to be installed through the conservation easement.

Conclusion

PWW appreciates the opportunity to provide these comments on the NEDP. PWW believes the conditions expressed in this letter are absolutely required to protect the fundamental interests of PWW, its water supplies, and the health and safety of its customers. PWW respectfully requests that any consideration of the NEDP by FERC expressly incorporate the conditions set forth above in order to protect the interests of PWW, its water resources and its customers.

If you have any questions regarding this letter or any of the attachments, please do not hesitate to contact me at 603-913-2330 or via email at donald.ware@pennichuck.com.

Very truly yours,

DOCKET NO. PF14-22-000 Re: Tennessee Gas Pipeline Company, LLC, Proposed Northeast Energy Direct Project

Secretary Bose,

The Lower Merrimack River Local Advisory Committee (LMRLAC) welcomes the opportunity to comment on the proposed Northeast Energy Direct (NED) Project. The Lower Merrimack River, which this Project, if approved, would cross, is a Designated River subject to the provisions of Chapter 483 (River Management and Protection) of Title L (Water Management and Protection) Of the Revised New Hampshire Statutes. As a Designated River, the Lower Merrimack is also a protected waterway under the provisions of the federal Public Utilities Regulatory Policies Act, section 210 0)(2),16 USC sections 824a-30)(2).

The LMRLAC, which I chair, is charged by the State to advise all relevant government agencies on matters pertaining to the management of the Designated River, including the Corridor that extends Yo mile inland from each river bank. The protected status of this Designated River compels the use of best practices to protect the attributes of the River, including fisheries, wildlife, vegetation, and public access, during and after any construction projects within 114 mile of the river banks.

Construction Issues

Because the NED Project, if approved, would constitute the first crossing of this Designated River by a major natural gas pipeline, and considering the environmental sensitivity of the corridor, we hereby submit the following observations and recommendations as pertains to the specifics of the proposed crossing of this protected waterway;

LMRLAC acknowledges the importance of Kinder Morgan's reported decision to bore under the river as a "best practice", rather than trench across the river. However the FERC requires that " the project sponsor shall file with the Secretary for the review and written approval by the Director a detailed, site-specific construction plan and scaled drawings identifying all areas to be disturbed by construction for each major waterbody crossing. LMRLAC has not yet been provided such detailed plans and reserves the right to submit additional comments once such plans become available for review. The following comments should therefore be considered preliminary in nature.

At the proposed crossing looationjust above Cromwell's Falls, the river is more than 300' wide with a median flow of 6800 cfs that peaks as high as 25,000 cfs after major storms. This highly variable flow, when coupled with the soft soils in the area, is conducive to bank and bottom erosion and shifting of the stream-bed.

On this basis, and in view of the environmental sensitivity of the corridor and the tendency of the riverbed to migrate laterally, albeit slowly, as a result of abnormal flooding, LMRLAC asks that additional steps be taken to:

1. Increase the overburden requirements above the bore hole by a suitable percentage to further limit the chance of the pipeline being dislodged by exceptional flows

2. Ensure that the entry and exit points are set back sufficiently far from the current shorelines to minimize the threat of exposure from future scouring and riverbed migration.
3. Ensure the river crossing section of the pipeline can be inspected frequently and rapidly and rapidly isolated if a problem develops.
 - To this end as a minimum the River should be protected by “guard valves” on each side of the watercourse that can be remotely activated by on-site personnel who are assigned a monitoring function during periods of abnormal high flow in accordance with an Emergency Action Plan (EAP) of the type that FERC requires for hydropower dam operation. This monitoring function should include a procedure for verifying the integrity of the overburden that protects the pipeline from direct exposure to the river flow.
 - Even better would be a requirement to install automatic shutoff valves (ASVs). The PHMSA has recommended such valves for the protection of not just highly populated “High Consequence Areas” (HCAs), but also for liquid pipelines in environmental areas of particular sensitivity. It seems reasonable to request that this concept be extended to the NED project where it crosses the protected Merrimack. As a minimum TGPIKM should fund an extension of the study performed by ORNL that led to the recommended use of ASVs for pipelines crossing environmentally sensitive areas such as the Merrimack River. [1]
 - Additionally, internal inspection of the pipe condition should be required under the river more frequently than in other sections of the pipeline. This in turn would seem to require the installation of pig entrance and exit ports closer to the River than envisioned in the recent TGP Draft Environmental Report.
4. Consider installing the river crossing section of the pipeline in a ‘sleeve’ such that repairs could be effected with minimal disruption

Economic Issues

1. The installation and maintenance of a major pipeline across this sensitive river will perforce adversely impact the recreational, and therefore economic, benefits that the River Corridor currently provides to the public. This may include restrictions on access to, and the use of, riverfront property that otherwise could be developed or used for public access to the river for fishing and other recreational activity, including shoreside hiking and biking. Both the State of New Hampshire and the riparian towns and cities have long standing policies that encourage both increased public access to the river and the establishment of a section of the NH Heritage Trail along this section of the Merrimack. Should this proposed NED crossing be permitted, then the TGP should be required to mitigate this loss of public amenities by funding alternative access arrangements including shoreside trail development.
2. Because the NED Project would constitute a major change to the Lower Merrimack River Corridor, TGP should take responsibility for financing the preparation of the revised Corridor Management Plan (CMP) that the LMRLAC will be required to prepare.

Cordially,
Gene Porter
Chairman

SUBJECT: Risk Analysis Due to Proposed Natural Gas Pipeline
Bon Terrain Water Tank
Amherst New Hampshire

Attached please find the result of our engineering team's risk analysis to the Pennichuck Water Works (PWW), Bon Terrain Water Tank located in Amherst, New Hampshire due to a natural gas (NG) pipeline failure. The NG pipeline is being proposed by Kinder Morgan (K-M) and is estimated by K-M to be 36 inches in diameter with an approximate working pressure of 1,800 pounds per square inch.

The attached report evaluates various risk scenarios and resultant probable damage to the water tank at various distances to the natural gas pipeline. Also identified in the report is the risk to the buried water pipes that feed to and discharge from PWW's Bon Terrain Water Tank.

The results of the risk analyses determine that based on the location of the natural gas line relative to the water tank, significant and likely irreparable damage to the PWW water tank will occur due to a rupture and subsequent fire at the NG pipeline. We therefore recommend that Kinder Morgan be contacted with the results of this report and that follow-up discussions occur with respect to the precautions that KM need to provide in the NG pipeline infrastructure to minimize if not eliminate damage to the PWW water tank and pipes.

The Kinder Morgan Project Manager that our team has communicating with is Barry Duff. He is reachable by cell phone at 832-833-1751 or by e-mail at [barry_duff@kindermorgan.com](mailto:atbarry_duff@kindermorgan.com).

Please contact me if you should have any questions

Sincerely,

THE H.L. TURNER GROUP INC.

Pennichuck Water Works
Bon Terrain Water Tank
Amherst, New Hampshire

Scope

SFC Engineering Partnership, Inc. (SFC) has been engaged to complete a review of risk scenarios that have the potential to adversely impact the operation of the Bon Terrain water tank in Amherst, operated by Pennichuck Water Works (PWW). The storage tank is a 900,000 gallon welded steel plate, dome-roof 'standpipe' tank that provides water storage and head pressure vital to fire suppression systems in the local area. The as-built drawings for this tank indicated it was built by Hydrostorage Inc. in 1984. In light of the recent proposal to construct a natural gas pipeline in the vicinity of the tank, this report will discuss the possible impact a rupture of this pipe, and subsequent fire, may have on the water tank.

Heat model at 80 feet

In order to assess the possible heat damage a rupture of the proposed natural gas (NG) pipeline could do to the PWW Bon Terrain tank, a thermal radiation heat transfer model has been used.

The methodology for this assessment is based on industry standard modelling developed by C-FER Technologies outlined in the paper A Model for Sizing High Consequence Areas Associated with Natural Gas Pipelines. Stephens, M. J. 2000. The methodology outlined in this paper forms the basis for the calculation of a pipeline's potential impact radius (PIR) appearing in 49 CFR 192 Subpart 0, which is the governing regulation for large gas pipelines.

Some of the parameters and assumptions associated with this model:

- The fire is modelled as a steady state heat source.
- The NG pipe assumed to fail with a fissure size approaching the diameter of the pipe, with gas flowing to the fissure outlet from both directions. Historic data has shown that use of this mode of failure in modeling is most accurate to gas release rates observed in previous incidents.
- The heat flux calculation simplified to allow for calculation of a single point value.
- Model considers application of this heat flux to a 1 meter by 1 meter area at the thinnest point on the PWW water tank.
- The model does not account for heat transferred from the steel to water contained within the tank (assumed tank is empty). Note: The reason for this is that the hottest part of the tank will be at the top of tank where the wall joins the roof. This part of the tank does not contact the water stored within. 'The roof of this tank

forms a structural diaphragm. As such any failure of the roof, or the joint between the roof and the wall could result in significant integrity loss.

- Model assumes steel absorbs the 95% of the heat flux calculated based on absorption factors for steel and painted steel.

The input parameters for the model are such that the pipe is a 36 inch NG line, operating at 1,200 psi, at 80-ft away from the tank surface. For the purposes of this study, a value of 959°F (515°C) is considered as the point at which the steel in the water tank would begin to soften and lose integrity. The model estimates that the jet plume associated with an ignited pipeline rupture would apply a heat flux of 3.8 BTU/s.~ (43.1 kW/m²) on the water tank. This will result in sections of the water tank (likely at the top of the tank facing the fire) to reach 959°F in under 5 minutes. Please see the attached spreadsheet containing this numerical assessment (Appendix A).

This 5 minute time frame may seem short, and it is conservative, but considering that the PIR for this NG pipe rupture fire is 854 feet (this is the radius at which human death, injury and ignition of wooden structures is probable). The NG pipeline would cause a large, high-energy fire. Once sections of the water tank have reached 959°F (or near it) structural movement due to heat, plastic deformation and loss of functionality are probable.

Distances beyond 80 feet

The following considers the effect of placing the NG pipeline at distances larger than 80 feet from the PWV tank in order to evaluate probable effects on the PWV tank at these distances.

200-ft

This is the distance that would be applicable if the NG pipe was placed on the opposite side of the power line right-of-way. At this distance the heat flux model shows that sections of the water tank will begin to reach integrity-loss temperature in 29 minutes.

350-ft

At this distance the model predicts that it will take 85 minutes for the water tank to reach integrity loss. It will also take approximately 85 minutes for a 36" NG pipe rupture to release 515.5 ton (467.7 tonne) of gas (assuming steady flow and behaving as an ideal gas). This is the maximum amount of gas that would reside between two valve stations that are 8 miles apart. The significance of this is that this is the distance at which an NG pipe rupture will run out of gas before the integrity-loss temperature is reached at the PWV Bon Terrain tank.

Note 1: this assumes the valve stations shut-off immediately at the time of pipe breach. A delay in valve shut-off will increase the volume of gas available to the fire, increasing the potential for tank damage.

Note 2: for a 13 mile separation between valve stations, this volume limited separation goes to 450-ft.

854-ft

This is the potential impact radius calculated as per the methodology described in Title 49 CFR 192. At this distance wood and plastics will potentially be damaged. However major damage to the steel water tank is unlikely in this scenario.

Damage from pressure wave

Modeling the pressure wave (shock from blast) associated with a natural gas plume ignition resulting in explosion or deflagration is difficult to give realistic figures for. Wind, gas flow rate and many other variables can widely vary the outcome of plume ignition; however empirical methods relating blasts to TNT equivalent explosions can be performed. It is possible that a gas release could rapidly ignite and create a pressure wave that would mechanically damage the Bon Terrain tank. Having stated this, the likelihood of an explosion or deflagration producing a pressure wave of a magnitude that would damage the tank is very unlikely even in the event of a full rupture and fire.

Regardless, the rapid pressure release at the point of a natural gas pipe rupture would significantly mechani-

cally damage any equipment of infrastructure that is close to the rupture point. As such, it is deemed that a NG pipe rupture will definitely dislodge and/or otherwise fail the adjacent underground water pipe as currently proposed. This is likely to result in a rapid emptying of the water tank.

Project Memorandum

To: Gerry Blanchette

From: Nick Cricenti, Doug Fountain RE: Fire Modelling

CC: File

Project: PWW Bon Terrain

Date: 09122/15

This memo is to serve as an update to SFC's previous report, dated 10/04/15, regarding the proximity of Pennichuck Water Works (PWW) Bon Terrain water tank to a proposed natural gas pipeline. We have been asked to reassess the fire analysis that featured in the original report in light of the following new information:

- Clearance between gas pipe and water tank moved from 80-ft to 740-ft.
- Gas pipe diameter reduced to 30 inches from 36 inches.

The model developed for the previous assessment is based on industry standard modelling developed by C-FER Technologies outlined in the paper A Model for Sizing High Consequence Areas Associated with Natural Gas Pipelines, Stephens, M. J. 2000. The methodology outlined in this paper forms the basis for the calculation of a pipeline's potential impact radius (PIR) appearing in 49 CFR 192 Subpart 0, which is the governing regulation for large gas pipelines.

At 740-ft clearance, the fire model developed to assess the close range radiation heat transfer is no longer a good indicator of material damage caused by a rupture in the gas pipe. The distance is too large. This is because, relatively, the heat radiation reaching the tank will be low in magnitude and therefore difficult to reliably gauge over a large distance. The effect of confounding factors such as air movement and ambient temperature differences are larger at this range, reducing the accuracy of the model significantly. Additionally, this proposed gas pipeline position creates a 40-ft vertical clearance between the PWW tank and the

pipe itself. This will mean that a significant quantity of heat radiation is absorbed by the hill upon which the tank rests. This will further reduce the accuracy of the model's predictions.

Considering this, a qualitative assessment can be made by looking at the potential impact radius for the pipe. The PIR is a conservative estimate of the significant impact area in the event of a release. The PIR for a 30 inch diameter pipe at 1,460 psi maximum operating pressure is 791 feet. This means that the PWW tank would be approximately 50 feet inside the rim of this calculated impact zone.

It is reasonable to say that at this range, light wooden buildings and people may be at risk from a pipe release; however the damage to the Bon Terrain tank would be minimal. Possible blackening of paint or damage to plastic components on the tank are probable outcomes. But, it is our opinion that significant deformation of the tank's steel due to heat absorption is implausible.

For any questions concerning this work, please contact us.

Douglas C. Fountain Project Engineer

Kimberly Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

Re: Tennessee Gas Pipeline Company's Northeast Energy Direct Project
DOCKET NO. PF14-22-000

ENVIRONMENTAL IMPACT STATEMENT ISSUES

Dear Ms. Kimberly Bose,

Dear FERC Commissioners,

It would be beneficial and prudent to both the applicant and the communities of Southwestern New Hampshire if FERC seriously evaluates the environmental and socioeconomic impacts of gas pipeline project PF14-22-000 and own up to the fact that the project is NOT in the public interest, convenience, or a necessity to the people of southwestern NH. I have been a resident of the Monadnock Region for 30 years and a licensed subsurface designer and wetland scientist in the southwest region of NH for twenty years. I prepare environmental permit applications, plans, and reports on behalf of residential property owners to the State of NH Dept of Environmental Services regarding how a landowner's construction project has been designed to avoid and minimize impacts to the environment. What has flabbergasted me the most about FERC's due process and procedures regarding proposed Gas Pipeline projects is that they do not require the Gas Line Company (the applicant) proposing a construction project of this magnitude and risk across land that they do not even own to provide the most basic preliminary research on the environmental impacts and consequences of the construction and maintenance. Instead, you expect the landowners being victimized to provide this information.

1. Soils, Geology, and Topography

NH is called the Granite State. What that means is that we have granite bedrock and glacial tills. "Ledge" and "rock outcrops" are a problem. We have shallow soils to bedrock. Where we do have soils they are predominantly "perched water table soils" which means that 2—2.5' below the surface is a hardpan. The hardpan resulted from glacial forces in the past. The seasonal high water table from precipitation (rain and snowmelt) sits on top of the hardpan and follows the topography- it is not static. If the water table is not at the toe of the slope it is also not at the sides and top of the slope. The water table is always there within 2' of the surface. We

are a mountainous region. We have stony soils and glacial erratic boulders. And although you might find it laughable- NH still experiences seismic activity and tremors. We do not have “artesian wells”- we have bedrock drilled wells. The average drill depth is 300’500’ or household use. The southwest region of the state is on private wells. Most municipal water supplies (the few that exist) are town wells or surface water reservoirs. After a well is drilled 350’ and still no water —the well is Sacked to create fissures. This creates problems for other private wells in the vicinity because the fissures in the bedrock feeding their wells are impacted whether it be in yield or carrying contaminants. The construction of a gas pipeline in this region will necessitate blasting which will severely impact the private drinking water wells.

Regarding further discussion related to soils: 9(P/o of the people in the southwest region of the state are on septic systems. No one is allowed to build or develop property until they can meet all the state and local regulations around private wells and septic systems. These regulations are to protect public health and groundwater supplies. The construction of a gas pipe line poses just as much risk if not more risk to groundwater and drinking water supply and contamination.

In addition, due to the topography, slopes, and soils in this region, any construction and excavation poses tremendous erosion control risks. Flash Flooding is a frequent problem. Due to topography and water runs downhill, any swathes of excavation and deforestation will cause sedimentation into our lakes and streams impacting water quality and aquatic life. Our groundwater and surface water supplies are interdependent.

What erosion control methods has the applicant proposed during construction of this pipe line and for the maintenance and stabilization of the site after work? In NH we use vegetation to stabilize the site. It is my understanding that these gas pipe line routes cannot have vegetation. What is Kinder Morgan proposing as an alternative?

It is obvious to me that the proponents of this proposed path have done no research into the soils topography, and geology. There is not an inch of soil here that they can put their gas pipeline through that will not require blasting through bedrock or sitting in the seasonal high water table contaminating our groundwater. How can the federal government even consider an application of a project of this magnitude and not require any research into the suitability of the landscape for its construction?

2. Water Resources and Wetlands

Since I have already discussed groundwater, drinking water wells, geology, soils, topography and erosion, I will mention surface water and wetlands in southwestern NH. The definition of a wetland here is if the water table is within 12” of the surface for two consecutive weeks out of the year which is determined through soils vegetation and hydrology. Our rainy seasons are the spring and the fall. The southwest region has more lakes ponds streams and rivers than the Lakes Region of the State. The Lakes Region is simply more accessible to the urban areas on the coast via Interstate Highways. The NH Department of Environmental Services oversees and permits all applications regarding surface water and wetland impacts. Shoreland Water Quality Protection Act (SWQPA) regulates all construction and ground disturbance within 250’ of public waters. Forested vegetated buffers are required within 150’ of surface waters. Our waterfurnishing properties and water quality of our lakes is important as a tax base for our small towns since property values are the sole tax base for revenue in NH. Tourism (especially in our region) is the 2~ largest “industry” in the State of NH. Our tourism is dependent on maintaining the clean water quality and aesthetics of our region. Many people come here just to see the covered bridges. Guess what, our covered bridges are over our streams and rivers. In addition to SWQPA, DES passed new stringent stream rules in 2012. It includes seasonal streams. The level of engineering and hydrological analysis required to get a permit regarding crossing a stream is based on watershed size. Again, this is a mountainous region, water goes down hill. Do you have any idea the size of the watersheds our streams carry? As mentioned previously, Flooding and flash flooding is a very big problem here. What will the proponents of this pipeline do to prevent that? In NH applicants have to hire an engineer to do hydrological and watershed analysis to just put in a culvert. Our state government requires residential property owners to do hydrological analysis on what impact a culvert might have on water resources and aquatic life. Shouldn’t an Energy Company proposing construction of 7 miles of a gas pipeline be required to do

some hydrological impact analysis? The NH Department of Environmental Services wetland regulations are very strict. Out of state people who move here are often shocked at how heavily regulated we are and how difficult it is to obtain wetland permits. Because the southwest region is one of the most undeveloped areas in the State, we have pristine environments and clean water and it is important to us to keep it that way. Are you going to require NED to obtain all state and local approvals and respect our regulations? You are the federal government. How can you not in good conscience respect our State and local regulations that were founded in the Clean Water Act?

For that matter, why are you allowing a gas pipeline to go through a pristine out of state mountain region to transmit gas to Dracut MA instead of an already developed and accessible route like Route 2 and the Massachusetts Turnpike?

3. Vegetation, Wildlife, and Aesthetic Impacts

We are heavily forested. It is our heavily forested mountains and fall foliage that not only protects our water quality and our soils but provides habitat for the wildlife in this region and is the mainstay of our tourism and quaint New England charm. The Society for the Protection of NH Forests was formed originally to protect the deforestation of our mountains and the visual and aesthetic impacts when tourism to the state decreased due to clear cutting swaths on the mountains in the late 1800's. Today, around Mount Monadnock, the surrounding towns need to be notified if any town proposes any development that might impact the views to the surrounding towns of the mountain.

The proposed gas pipeline "path" is right through the Wapac range and in New Ipswich, the Wapac Trail and a cross country ski resort. Not to mention Rhododendron State Park and several conserved lands. Do you really think people are going to come to NH to hike the gas pipeline route or gaze upon the aesthetic beauty of its path from the surrounding mountains and consider it a wilderness experience or connecting with Nature?

I am assuming that you will hear from the wildlife conservation groups in our areas and the diversity of wildlife habitat in our region that will be affected but I am shocked that you do not even require the proponents of this pipeline to do the most preliminary screening of the state and federally ~species before a pathway is proposed. Residents here have to screen every permit applied for with the Natural Heritage Bureau. Federally there is IPaC to screen too, this is US Fish and Wildlife. Have you even required them to screen on IPaC the miles of the 150' wide "path" they intend to deforest for the gas pipeline not to mention the access roads they will need to construct to determine what wildlife habitat they are destroying and impacting? The day of the Tuesday night public scoping session in Rindge NH, I received two phone calls from the Boston Regional Office of Army Corps of Engineers inquiring if a town wetland permit to repair an existing culvert in an existing road would require cutting any trees because the area has long eared bat habitat. I was chastised for not checking IPaC first to address this issue. Do you mean to tell me that the federal government needs to know if one single tree is cut for a culvert repair project but doesn't need to know if a 7 mile gas pipeline project is going to cut down any trees that destroy long eared bat habitat for a 150' wide gas pipeline swath throughout our region??

4. CULTURAL AND SOCIOECONOMIC RESOURCES

I simply can't write any more about the Environmental Issues that you intend to ignore and pretend do not exist. It is incomprehensible that a gas transmission pipeline that has NO market demand in rural NH is being constructed through southwestern NH, called a "Market Path" by Kinder Morgan when it is to provide peak energy demands to the east coast and overseas for export. It is even more incomprehensible and reprehensible that if these landowners don't "submit" and FERC approves this that you will take these people's land away through eminent domain and give it to the gas company. We bear the costs of construction, the permanent impacts to our environment, our economy, our property values, our way of life, our health, our safety, our children, our farms, forests, water,... Rural lives and Rural Landscapes Matter. We are not collateral. Most of our livelihoods are dependent on this land and preserving and maintaining the aesthetics and natural resources. Our culture and economics are all land based to our surroundings whether it be through organic farms, apple orchards, eco-tourism, foliage tours, maple syrup, inns, tourism, bird watching, deer hunting,

clean lakes, forestry and logging, snowmobiling, hiking, artist and meditation retreats, excavation and home building etc etc. You cannot impact our land without impacting our livelihoods economically. We are a people who have deep socioeconomic interdependent roots in the land and with one another.

The southwestern part of NH consists of 40 towns that surround Mount Monadnock in Jaffrey, NH and consider themselves the Monadnock Region. We are intelligent, compassionate, hardworking, caring, creative communities who respect the natural environment and one another. We are Yankees into permaculture and sustainable living, holistic health and traditional health, we embrace diverse viewpoints, insist on aesthetic, artistic, and personal freedoms, we do not lock our doors, we believe in free range chickens and free range children. We are a people who recognize our interdependence with the land and being a part of the community. We know that WE are the Cultural Resource that will be permanently impacted if you approve this gas pipeline project through our region.

Mount Monadnock in Jaffrey, NH is our namesake. Mount Monadnock is the most climbed mountain in the world. Why is it the most climbed mountain? Because there are no auto roads. For that matter, there are no cell towers or transmission lines etc. The Vision Statement for Monadnock State Park is "To Maintain the Integrity of the Natural Environment and Respect the Cultural Landscape". People in the Monadnock region share that vision. It is what attracts them to live here and brings tourism to our region. Mount Monadnock means "the mountain that stands alone". It is the geologic reference for what a monadnock is. The geological definition for a monadnock is "an isolated hill or ridge or erosion resistant rock rising above a peneplain." Like the glaciers did in geologic past, I suggest you chose an alternate path for the pipeline that is not through our region and leave us alone. We will resist.

I have included two of our local newspapers, The Monadnock Ledger Transcript dated October 1 and October 6. To be included in the official record of comments on Environmental Impacts to Cultural Resource. Why the newspapers? Well, I want you to know who we are through pictures, names, places, events, whether it be the police log, our weekly calendar of what's happening where, our viewpoints, our news articles, advertising etc. Our local newspaper only comes out twice a week and the subject matter is solely local news so it is a very accurate portrayal of our culture and way of life.

FERC, Please do the Job you were appointed to do. Do not approve the Tennessee Gas Pipeline Company's Northeast Energy Direct Project. Docket PF-1422400.

Sincerely,

SHARON MONAHAN

20151014-5000

Diane Hebenstreit, West Hartford, CT.

I am very concerned about the proposed installation of a pipeline going through the Class 1 and Class 2 watershed lands of the West Hartford Reservoir. This is the source of drinking water for myself and the rest of West Hartford. I believe these lands should receive special protection for this reason.

I am also concerned about the impact on wildlife living in that area.

Who is this proposed pipeline serving? I have heard that Connecticut already has an adequate supply of natural gas. I urge you to table this proposal.

20151014-5002

H John Fisher, Plainfield, MA.

My name is H. John Fisher. I live at 268 West Street in Plainfield, Massachusetts on a property that abuts the proposed path of the NED pipeline, which I oppose for a number of reasons – not the least of which being its potentially destructive effect on an area that is one of our state’s most significant natural resources and the lack of any proof that the proposed pipeline would constitute the most effective and least costly mechanism for meeting the region’s energy needs.

I am writing today to expand on the brief testimony that I gave at the Scoping Hearing sponsored by Massachusetts Senate President Stanley Rosenberg in Greenfield, Massachusetts on September 10, 2015.

At the time I spoke briefly about how quickly the field of alternative energy has changed over the past few years, taking me by surprise – as underlined by the dramatic change in my personal energy costs since my wife Sebern and I have realized since we installed solar panels. To perhaps underline what I said then, I am appending a recent Bloomberg News article on the economic changes brought about by the growing role played by “alternative” energy sources in our overall energy picture.

I would also direct you to a Boston Globe article reporting on a recent Harvard University study of methane leaks from gas lines and gas storage facilities in the city of Boston that estimated that 2.7% of the natural gas delivered to the region was being lost to leaks – a figure that is significantly higher than previous state estimates of 1.1% (see <https://www.bostonglobe.com/metro/2015/01/22/natural-gas-leaks-boston-area-are-far-more-extensive-than-thought/5BykQrnaGRr2XLtxpHqLIM/story.html>)

Quite simply, if the state’s utility ratepayers are going to be forced to pay for the shortfalls of an ageing infrastructure, it would be far more desirable for us to upgrade that infrastructure as a means of addressing occasional winter gas shortages than it would be to construct an unneeded and disruptive pipeline to bring in more natural gas to be leaked into the environment. I would also suggest that the jobs created by moving aggressively to upgrade an existing infrastructure would have more value to the local economy than the few temporary jobs that might be briefly created by the destructive process of building the proposed NED pipeline.

In light of these shifting realities, I also suggest that it might be time for you to take a deeper look at your role as a regulatory agency. When you were created, the best approach for meeting the nation’s energy needs was clearly the long-distance distribution of centrally-produced energy sources. Today’s reality is, however, rapidly changing to a more energy-efficient, distributed model. In effect, by applying yesterday’s assumptions to today’s needs, you run the risk of encouraging existing providers to continue wasteful and increasingly-outmoded practices that can create both immediate and long-term degradation to the environment. Might this not be the time for FERC to move to truly become an energy regulatory agency by denying this ill-considered project outright?

Here’s the Bloomberg article:

Solar and Wind Just Passed Another Big Turning Point

Tom Randall, Bloomberg Business, 10/6/2015

Wind power is now the cheapest electricity to produce in both Germany and the U.K., even without government subsidies, according to a new analysis by Bloomberg New Energy Finance (BNEF). It’s the first time that threshold has been crossed by a G7 economy.¹

But that’s less interesting than what just happened in the U.S.

To appreciate what’s going on there, you need to understand the capacity factor. That’s the percentage of a power plant’s maximum potential that’s actually achieved over time.

Consider a solar project. The sun doesn’t shine at night and, even during the day, varies in brightness with

the weather and the seasons. So a project that can crank out 100 megawatt hours of electricity during the sunniest part of the day might produce just 20 percent of that when averaged out over a year. That gives it a 20 percent capacity factor.

One of the major strengths of fossil fuel power plants is that they can command very high and predictable capacity factors. The average U.S. natural gas plant, for example, might produce about 70 percent of its potential (falling short of 100 percent because of seasonal demand and maintenance). But that's what's changing, and it's a big deal.

For the first time, widespread adoption of renewables is effectively lowering the capacity factor for fossil fuels. That's because once a solar or wind project is built, the marginal cost of the electricity it produces is pretty much zero—free electricity—while coal and gas plants require more fuel for every new watt produced. If you're a power company with a choice, you choose the free stuff every time.

It's a self-reinforcing cycle. As more renewables are installed, coal and natural gas plants are used less. As coal and gas are used less, the cost of using them to generate electricity goes up. As the cost of coal and gas power rises, more renewables will be installed.

The virtuous cycle has begun.

Source: Bloomberg

Wind and solar have long made up a small fraction of U.S. electricity—about 5 percent in 2014. But production has been rising at an exponential rate, and those two energy sources are now big enough to influence when coal and natural gas plants are kept running, according to BNEF.²

There are two reasons this shift in capacity factors is important. First, it's yet another sign of the rising disruptive force of renewable energy in power markets. It's impossible to brush aside renewables in the U.S. in the same way it might have been just a few years ago. "Renewables are really becoming cost-competitive, and they're competing more directly with fossil fuels," said BNEF analyst Luke Mills. "We're seeing the utilization rate of fossil fuels wear away."

Second, the shift illustrates a serious new risk for power companies

20151014-5003

William Moylan, Temple, NH.

This is a request to DENY the application of Tennessee Gas Pipeline Company's Northeast Energy Direct Pipeline.

The current application has significant environmental, health and safety issues for this pristine, rural area of the East Coast. It would severely alter our ecology and quality of life.

Further, the location of the compressor station so near our elementary school places our children in peril. As the building is also our emergency shelter, it places our small town in a position of needing to identify and establish a new shelter, at considerable expense. Further, the emissions from the compressor station is toxic; to expose our children to this is unthinkable.

I urgently request FERC's support of our region by denying this proposal as it currently exists.

If this pipeline is truly needed--and many believe it is now, after considerable research--I respectfully request a new route for the pipeline be established. A more direct route through Massachusetts is far more appropriate, and would place the pipeline in the state that stands to benefit from the arrival of this gas.

Thank you for your consideration of the people of New Hampshire, our environment, our schools and our future. Please vote NOT TO APPROVE this application.

Thank you.

Kathy Chapman, Mason, NH.

On February 26, 1972, the Buffalo Mining Company allowed enough coal sludge to be dumped onto a valley in West Virginia to destroy homes, lives, and whole communities. The owner of the Buffalo Mining Company, the Pittston Coal Company, tried to limit its liability by hiding behind the corporate veil of the Buffalo Mining Company. In other words, Pittston tried to protect its assets, and meanwhile shortchange the affected individuals, by limiting the victims' recovery to the assets of the Buffalo Mining Company. After many years elapsed and much money was spent in legal fees, the victims were able to recover a small sum from the Pittston Coal Company. It is unlikely that any of the victims would consider \$13,000 a sufficient compensation for the loss of loved ones, homes, businesses, and general life disruption, and they were considered to have WON!

Fast forward thirty-eight years. In 2010, BP dumped millions of gallons of oil into the Gulf of Mexico. BP's first line of defense was to hide the real story, and in doing so they increased the environmental damage by an untold amount. Then BP tried to blame its contractors. Finally, when BP was held accountable, the company spent years in court attempting to limit its liability, which it has so far successfully done. True compensation to the citizens, the businesses, and especially the environment will never happen.

A quick glance at the Securities and Exchange Commission's Kinder-Morgan listing provides a bewildering array of businesses. Since the Buffalo Creek Disaster, and since BP, companies such as Kinder-Morgan seem to have gotten smarter about fancy organization systems that will almost certainly be effective at limiting Kinder-Morgan's liability for any mass casualties to zero. Any reliance on the large company, Kinder-Morgan, to make things right is probably misplaced. This fact of corporate denial should be weighed carefully before entering into a potentially hazardous deal involving a corporation that has no real interest in the well-being of the citizens where the corporation is pillaging the environment.

From the two Open Houses, the two scoping sessions, and the town meeting with Kinder-Morgan I have attended, I can say unequivocally that Kinder-Morgan and Tennessee Gas Pipeline have no real or even feigned interest in the well-being of me or my town, Mason, which is projected to have both the large pipeline and a smaller lateral pipeline. Questions about disruption of aquifers, private wells, wetlands, and sugar bushes have been summarily dismissed. One Tennessee Gas Pipeline person said to me, "we've been to this rodeo before, the pipeline will get approved and we'll run pipe through the wetlands". To call this statement and attitude a callous disregard for everything from my attachment to my town to the livelihoods and tranquility of me and my neighbors is an understatement.

So my concern stands. If something bad happens, who will be there to hold accountable? Who will replace buildings, businesses, roads, bridges, and other infrastructure that falls in the path of an exploded pipeline? You can bet that Kinder-Morgan has covered its corporate rear mightily, and Tennessee Gas Pipeline has done the same.

There are other options to fulfill the energy needs in New Hampshire: use reduction, renewables, and other projects that are in the approval process. Spending the money that would be used to build the pipeline on patching the leaks in existing pipelines, providing cost-saving LEDs to homes and businesses, and strengthening the incentives to use renewables (e.g. solar panel tax rebates) would clearly go a longer way to reducing electric bills NOW than some speculative future supply of natural gas that MIGHT be used to generate electricity. Reminder: there are NO electricity generators in New Hampshire signed up to receive the gas from the NED pipeline, so ANY claim of reduction in electricity costs is PURELY SPECULATIVE. Reminder #2: based on that pure speculation, Allen Fore of Tennessee Gas Pipeline stated in the Monadnock Ledger that people would see a 40% reduction in electric bills. Do you think a company that condones what could arguably be found to be fraudulent will actually come forward to foot the bill for the recovery from a mass casualty? The answer to that question is simple: no.

20151014-5005

Timothy Somero, New Ipswich, NH.

We have practical experience when drilling wells in town that shallow wells run dry.

My grandfather dug an 11-foot well on the adjacent property to mine and this well served the house that he built for nearly 100 years.

During the drilling process of an artisan well nearly 1/4-mile away, my grandfathers well ran dry.

When the construction process begins along the entire NED pipeline, please measure the refresh rate of all shallow wells within 1/4- to 1/2-mile because as I understand the construction process, there is a process for drilling deep holes for the technical earth grounding system.

We didn't ask for this project, so the company should assume all the costs for evaluating the flow of water to each shallow well before, during, and after construction including any remediation needed.

By the way on the topic of remediation, if the company has to pig in water as a remediation and a house water tank is empty prior to a snow storm, what will they do if a family has no water for up to 5- to 7-days when the roads are impassable? Will the company be liable for any health and medical problems when a family has no potable water?

We are routinely seeing natural events such as snow storms like these. This is practical experience, indeed.

20151014-5006

Timothy Somero, New Ipswich, NH.

How about weather inversion that we see regularly through practical experience?

The opportunity for photography is marvelous on winter days when smoke from wood burning stoves does not pass above the tree line for hours and days. It's a precious day to experience a sunrise on a day like this in the woods. These happen all the time, from practical experience.

Tell me, how will the company reconcile the fact that formaldehyde, toluene, benzyne, and a plethora of trade-secret, toxic substances from fracking will be gassing our children, wildlife, elderly, and American citizens during a weather inversion?

Seems reasonable to me that all gas transport should cease and desist during a weather inversion, because I would not imagine that gassing humans is an intention of the company that is trying to invest in the states, communities, and American people along the pipeline route.

20151014-5007

Timothy Somero, New Ipswich, NH.

Out of state guests, tourists who fuel much of the economy in New Hampshire, marvel when they look into our forests and gasp, 'Look at those rock walls!'

We teach our children to not disrupt the walls and when they ask why, 'Some of these rocks and stone walls were commissioned by the King of England centuries ago.'

Tell me, what will the company do to preserve, respect, and honor the tradition of stone walls that traverse the wilderness along the entire NED path? Is there no legal standing for the protection of disruption of our historical artifacts?

From practical experience, we stop our children from using these ancient stones from our age-old walls for their playful construction.

It's illegal.

20151014-5008

Timothy Somero, New Ipswich, NH.

I hope that you get the point, dear readers, Mr Tomasi and the guy who noticed that I write with sharpies

“We the people of America do not support this project.”

I tried. I tried mightily. Why in my back yard? I’m a WIMBY.

We prefer a reduction in fossil fuel use in a rebalancing so that consumer-based, non-essential energy is served from renewables such as solar energy.

Disrupt and recreate the concept of net metering. Let a free market help us invest personally in solar so that we charge our electronic devices from the sun, not the fossil fuels.

Let critical infrastructure use fossil fuels.

Why would technology giants want to compete for fossil-fuel based energy needed for their data centers with their customers?

Their investors demand growth, why would they compete against their customers?

Let’s support job creation, real job creation, by adding an extra 6- to 8-inches of insulation in all of our attics or replacing windows with air-tight ones?

The alternative that I’m proposing is not a different patch of America to steam roll through and devastate men, women, and children - compressor stations built today cause nose bleeds in children, do I need to say any more?

Let’s reduce demand pressure on existing infrastructure.

Let’s face the obvious that the fossil fuel supply is being rapidly depleted.

We are asking a simple question, ‘When will we the people turn the faucet off on fossil fuels?’

How bad do things have to get to see that the Dick Cheney contrived consumption dynasty turned the faucet on too far for fossil fuel use? Unrestricted and unregulated and horrible for all of us?

This comment is for a socio-economic concern with a simple alternative that I previously stated.

The alternative is to separate all energy use into two categories: critical infrastructure and non-essential.

Renewables supply non-essential.

Fossil fuels supply critical infrastructure.

Do the world-wide math and see that the rebalancing affects all companies in the entire industry and the current infrastructure is over-capacity. I could just imagine KM/TGP pounding the table when this proposal makes sense to its investors.

Net result for us who are bewildered by the NED project?

No build.

There is no reason for building NED. Go away.

20151014-5009

John Leoutsacos, Temple, NH.

The blasting necessary to install this pipeline will forever damage or destroy the wells and aquifers for miles around the actual blast site.

Remember this is the granite state.

20151014-5010

John Leoutsacos, Temple, NH.

The Weirs Times

Brendan Smith

To the editor

I'm writing to my fellow New Hampshire neighbors concerning the proposed Kinder Morgan NED pipeline. The Lakes and Monadnock regions BOTH heavily depend tourism as critical elements of their local economy's. Tourism rooted in a fundamental connection to nature and the enjoyment of outdoor activities in a pristine wilderness. The proposed NED project would threaten all of these values and more. Construction would destroy thousands of acres of forest, wetlands and conservation land. During operation both deliberate and accidental release of carcinogenic and radioactive fumes pose serious risk's to people, animals, water and the environment.

New Hampshire needs to stand STRONG together in opposition to this pipeline.

Please write your elected officials and make your voice heard!

20151014-5011

John Leoutsacos, Temple, NH.

Why is it up to the citizens of New Hampshire to educate FERC on the fact that this pipeline is dangerous on several levels? And we don't need or want it!

FERC in particular (the FERC counsel), being appointed never should have allowed it to reach this level if they or their elected; appointing officials even remotely listened to the thousands of voices vehemently opposing this project.

20151014-5063

NRPC

NASHUA REGIONAL PLANNING COMMISSION

October 15, 2015

Kimberly D. Bose,
Secretary Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

Comments of the Nashua Regional Planning Commission, Merrimack NH

Re: Tennessee Gas Pipeline Company, L.L.c. ("TGP")

Docket No. PF14-22-000: Proposed Northeast Energy Direct ("NED")

Dear Ms. Bose:

The Nashua Regional Planning Commission (NRPC} serves 13 municipalities in southern New Hampshire, including Nashua, Hudson, Amherst, Brookline, Hollis, Litchfield, Lyndeborough, Mason, Merrimack, Milford, Mont Vernon, Pelham, and Wilton. The Commission focuses on developing and implementing innovative planning strategies that preserve and improve the quality of life of the residents and is dedicated to promoting the orderly development of the region.

Nine of the 13 NRPC member communities are directly impacted by the Proposed Northeast Energy Direct ("NED") pipeline. Many of these communities have taken a position or made a public statement to oppose the proposed pipeline. NRPC needs to obtain more information to help our communities to evaluate risks and potential benefits of the NED proposal and impacts to the orderly development of the region. Attached please find a copy of the NRPC "Status Report and Summary of Findings as of September 16, 2015 Relative to The Proposed Northeast Energy Direct Pipeline" which sets forth some of the issues that we believe must be addressed by Kinder Morgan and considered by FERC going forward. In addition, we respectfully request the project applicant address and FERC consider the following questions and concerns.

1. The proposed co-location of the pipeline in Pelham and Hudson, New Hampshire is in direct conflict with an approved expansion of Eversource electric transmission lines known as the Merrimack Valley Reliability Project. Please have Kinder Morgan provide alignment sheets or other design drawing that describe exactly how the pipeline will be "co-located" along the permanent electric utility right-

of-way as it will be laid out to accommodate the Merrimack Valley Reliability Project.

2. Please have Kinder Morgan quantify the reduction in electric rates that residential, commercial and industrial consumers will realize should the proposed project go online. In addition, please have Kinder Morgan evaluate implications of the reduced electric rates in attracting economic development. Particular attention should be paid as to how well New Hampshire will compete with other areas of the country, in terms of lower energy costs, due to the presence of additional natural gas supplies in the region.
3. Please have Kinder Morgan justify the need for a lateral through the town of Mason, New Hampshire. The proposed lateral is intended to provide gas to the Fitchburg Massachusetts area, however it is our understanding that no end-customer has committed to purchasing the gas at this time. NRPC strongly urges FERC to require that Kinder Morgan justify in detail this lateral or see that gas needs in the Fitchburg area are met through other projects in Massachusetts. NRPC further requests that Kinder Morgan justify the need to locate this lateral through undisturbed land as opposed to existing right of ways through the area.
4. Require Kinder Morgan to provide a detailed assessment of the ability of local emergency services to respond to incidents involving gas pipeline facilities, and to outline resources needed to keep their training, supplies and equipment up to an adequate standard to respond to those incidents.
5. Kinder Morgan should quantify and FERC should consider the direct economic benefits to the communities in New Hampshire along the proposed pipeline route. For instance, in Hillsborough County, NH the proposed pipeline is anticipated to provide little benefit to the communities directly impacted since the region is largely unserved by natural gas supplies for home heating or businesses. To our knowledge, Liberty Utilities is the only LDC in NH that has contracted for capacity on the NED project. It has committed to purchase 115 dekatherms per day from Kinder Morgan which represents only approximately 8.8% of the 1.3 Bcf/day of pipeline capacity.
6. Kinder Morgan should provide and FERC should consider a detailed analysis of the tax revenue impacts as a result of the construction of the pipeline. The methodology utilized for developing the revenue figures should be clearly explained.
7. The proposed pipeline would cross a variety of types of roadways, including un maintained "Class VI" roads. While "Class VI" roads in New Hampshire are not maintained, it is critical that they not be viewed as "not used". Any roadways in NH, including those classified as "Class VI" can be - and in some cases are regularly - used by fully-loaded logging trucks which are of substantial weight. The NRPC concurs with the 15 towns of the NH Municipal Pipeline Coalition and request's FERC require that Kinder Morgan:
 - Use construction techniques across all roadways in New Hampshire, including all unmaintained "Class VI" roads that will account for the heavy loads presented by logging trucks or emergency vehicles.
 - We ask that, at a minimum, this includes using pipe under all roadways consistent with that required of a state road.
8. Finally, the NRPC requests Kinder Morgan provide and FERC consider a thorough explanation of the need for the project and the justification for the project to be located in New Hampshire.

Given the unprecedented scale of the project and magnitude of potential impacts to the region the NRPC respectfully requests a response to the questions and comments outlined in this letter.

Sincerely,

Tim Roache, Executive Director

Michael Fimbel, Vice Chair-Town of Mont Vernon

Dan Kelly, City of Nashua

James Battis, Town of Hudson

Karin Elmer, Treasurer-Town of Merrimack

Susan Ruch, Town of Amherst

Thomas Young, Town of Litchfield

EXECUTIVE SUMMARY

NRPC convened an Energy Facilities Advisory Committee (EFAC) in response to the proposed Tennessee Gas Pipeline Company’s proposed Northeast Energy Direct (NED) natural gas transmission pipeline that would traverse eight towns in the NRPC region. EFAC is comprised of representatives appointed by each town’s elected board who are charged with general fact-finding in order to inform recommendations to the full Commission.

EFAC began its schedule of regular weekly meetings on February 27, 2015. During that time, EFAC has completed an extensive review of published information, had conversations with industry subject matter experts, and hosted a number of speaker presentations from Kinder Morgan, Liberty, other competing utilities, FERC, the NH SEC, academia, industry, and public opposition groups.

The working draft whitepaper is essentially a factsheet reflecting the information gathered during these activities. The FERC decision-making philosophy is presented for overall context. Next is a brief examination of natural gas need from the point of view of industry and academia, which is then contrasted with relative to key impact areas related to economic factors, construction, historic resources, infrastructure and safety, general environmental impacts, and rivers. During the course of its involvement EFAC has captured anecdotes that summarize the groundswell of opposition to the NED, which is also reflected in the relative unanimity of opposing actions taken by municipalities. Lastly, EFAC is closely monitoring processes at the federal and state levels that will initiate at the close of the FERC pre-filing stage. It should be noted that EFAC began its process from a neutral standpoint. On June 5th, 2015, the EFAC passed a motion to issue the following opinion statement:

The Nashua Regional Planning Commission Energy Facilities Advisory Committee (EFAC) has significant concern that the impacts of the proposed Northeast Energy Direct project outweigh its perceived benefits based on the information received to date.

Over time, EFAC strengthened its articulation of various concerns and drafted a draft Resolution of Opposition for consideration by the Full Commission at the September 16th, 2015 meeting. This whitepaper, therefore, should be considered direct supporting documentation for the conclusions made in the Draft Resolution.

INTRODUCTION

Background

At the request of the NRPC Executive Committee the NRPC formed an Energy Facilities Advisory Committee in late winter 2015. This Committee was a response to our communities’ collective concerns regarding the challenges of obtaining objective and trustworthy information relative to the proposed Tennessee Gas Pipeline Company’s (TGP) Northeast Energy Direct (NED) project. The proposed NED pipeline project would introduce approximately 35 miles of 30/1 transmission main through eight communities in the NRPC region as well as five miles of a smaller 14/1 lateral that would flow south from the mainline through Mason into Massachusetts.

EFAC Charge

The formation of EFAC stems from the NED project, however the EFAC charge is written without reference to any particular energy project. Therefore, the EFAC could reconvene as necessary to consider other energy initiatives as they are brought forward.

NRPC Energy Facilities Advisory Committee

Established:

There is hereby established a temporary, Energy Facilities Advisory Committee (EFAC).

Membership:

Membership of the EFAC shall consist of a maximum of 13 members: one representative from each of the Commission’s member municipalities including a chairman.

The representatives shall be appointed by their respective governing bodies. In the absence of a new appointment from a governing body, the Executive Committee will appoint an NRPC Commissioner to represent that community’s interests.

Members should be able to fully participate in committee meetings, and are expected facilitate the flow of information and ideas between the committee and their respective communities.

Charge of Committee:

To conduct fact findings regarding the impacts of construction and operation of energy facilities in the region will have on local land use, economy, and employment, and the effects on the orderly development of the region; and to report findings and recommendations to the full NRPC Commission. Energy facilities could include proposed construction or retirement of natural gas facilities such as pipelines, electrical facilities such as transmission lines, or other energy facilities including but not limited to wind, solar, hydro, or geothermal renewable sources.

Duties:

The duties of the EFAC shall include the following:

1. Identify the issues related to energy facilities impacts and benefits to local land use, environment and economic development.
2. Obtain information through in-person meetings, reports or other sources, from industry, citizen groups, and appropriate government agencies.
3. Analyze the information with respect to consistency with the Regional Plan.
4. Provide a progress report to the Full Commission at its March 18, 2015 meeting.
5. Provide a compilation of the information collected, with an executive summary of the analysis.
6. Develop a white paper of findings that analyzes the impacts of the energy facilities on the orderly development of the region, including the impacts the project will have on local land use, economy and employment that includes recommendations or next steps for consideration by the Full Commission.

Timeline:

The EFAC will meet between February and June of 2015 and report progress at the June 17, 2015 Full Commission meeting. The Executive Committee will conduct a special Full Commission meeting if action is needed prior to June 2015.

Meetings:

The EFAC shall meet as often as necessary to fulfill their duties. Meetings will be posted per NRPC public meeting protocol under RSA 91:A. The proceedings of the subcommittee are open to the public.

Quorum:

A quorum for committee action shall be a majority of its members. The Committees shall take action by vote of a simple majority.

EFAC Membership

<u>Town</u>	<u>Member</u>	<u>Lead Responsibility</u>
Amherst	Eric Hahn	Infrastructure and Safety Impacts
Brookline	Tad Putney	Economic Impacts
Hollis	Kat McGhee	Demand Need Analysis
Hudson	Elvis Dhima	Infrastructure and Safety Impacts
Litchfield	Thomas Young	Construction Impacts

Lyndeborough	Vacant	
Mason	Steve Wells	Demand Need Analysis
Merrimack	Tim Thompson	Historic Impact
Milford	Mark Bender	Construction Impacts
Mont Vernon	Vacant	
Nashua	Sarah Marchant	Economic Impacts
Pelham	Hal Lynde	Historic Impacts
Wilton	Kermit Williams (Chair)	

Additionally, the NRPC staff of Tim Roache, Sara Siskavich, and Karen Baker provided support for EFAC admin, GIS, and analysis of environmental impacts.

EFAC and NRPC Summary of Activities

- Subscribed to FERC docket to keep up with project changes, other inputs.
- Created lead teams to focus investigation on areas of concern. The teams were staffed by EFAC members as described in the table, above.
- Established a Dropbox for EFAC members to store and share information and documents with each other.
- Joined bi-weekly agency conference calls with FERC to track progress of project.
- Consulted with various agencies and bodies including:
 - o Kinder Morgan (presentation)
 - o Liberty Utilities (presentation)
 - o Eversource and Spectra Gas (presentation)
 - o Portland Natural Gas Transmission System (PNGTS) (presentation)
 - o NH Office of Energy and Planning (meeting)
 - o NH Public Utilities Commission (meeting)
 - o FERC (conference calls and on-site presentation)
 - o ISO-New England (meeting)
 - o Prof Mike Mooiman, Franklin Pierce University (presentation)
 - o Ken Hartlage, NH Pipeline Awareness Network (presentation)
 - o New Hampshire Business Association (BIA) (meeting)
- Passed a motion to articulate a statement of concern that that the impacts from the NED pipeline outweigh any perceived benefits, based on information gathered to date. This statement of concern has been further developed into a detailed Draft Resolution for consideration for adoption by the Full NRC Commission.
- Applied for a US Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) Technical Assistance Grant (TAG) to potentially bolster the activities of EFAC, specifically in the areas of public process involvement and pipeline safety awareness related to the permitting and operation of new and existing pipelines in the region.
- Publicized the EFAC document collection as an online public-facing resource using Zotero.
- Submitted a letter to FERC on the NED docket requesting an extension of the formal comment period.
- Created a Quick Guide to Commenting on the FERC Docket for distribution at Old Home Days and for publication on the NRPC Pipeline webpage.
- Distributed comment cards at Old Home Days, Town Halls, and Libraries to offer a direct communications channel between NRPC and the general public.

- Attended and testified at both the Nashua and Milford FERC scoping meetings.
- Partnered with Massachusetts Regional Planning Agencies and Southwest Region Planning Commission to author technical justification language for for additional scoping studies to be considered by FERC during FERC's drafting of their Environmental Impact Statement (EIS).

THE FERC DECISION-MAKING PHILOSOPHY

- The Federal Energy Regulatory Commission (FERC) is an independent federal regulatory agency that:
 - o Regulates the interstate transmission of natural gas (siting & rates);
 - o Regulates electricity and oil (rates only);
 - o Reviews proposals to build interstate natural gas pipelines and liquefied natural gas (LNG) terminals, and natural gas storage fields.
 - o Licenses and inspects non-federal hydropower projects. [1]
- Energy Policy Act of 2005 names FERC lead agency for National Environmental Policy Act (NEPA) review and coordinator of all federal authorizations. [2]
- The phases of FERC project review include:
 1. Marketing and Preliminary Project Design: the applicant working on its own
 2. Pre-Filing: FERC staff work with the applicant and stakeholders before the filing of an application.
 3. Application Review: FERC prepares NEPA document that is reviewed by cooperating agencies prior to public issuance for comment
 4. Post-Authorization: FERC works to ensure compliance with conditions to the FERC approval. [3]
- Currently the NED is in the Pre-Filing stage of project review. A Notice of Intent is imminent, after which scoping meetings will be scheduled. FERC expects TGP to file the application in the October, 2015 timeframe. [4]
- FERC follows analytical steps to balance the public benefits against the potential adverse consequences of an application for new pipeline construction. In summary these steps are:
 - o Whether the project can proceed without subsidies from their existing customers
 - o Whether the applicant has made efforts to eliminate or minimize any adverse effects the project might have on the existing customers of the pipeline proposing the project, existing pipelines in the market and their captive customers, or landowners and communities affected by the route of the new pipeline.
 - o If the project has no adverse effects relative to the three interests above, no balancing of effects is necessary and the Commission would proceed to issue a final order or preliminary determination;
 - o If the project does have any adverse effects Commission will proceed to evaluate the project by balancing the evidence of public benefits to be achieved against the residual adverse effects. This is essentially an economic test. If the result of the balancing is a conclusion that the public benefits outweigh the adverse effects then the next steps would be the same as for a project that had no adverse effects. [5]

DEMAND & NEED

The Broad Picture [6]

- The factors that should be considered in any energy policy or recommendation operate at a geography beyond anyone city or town, planning region, or even the entire state.
- There is general agreement on the fact that there is a natural gas crunch in New England.
- The characterization of need is intertwined an increasing call for natural gas power generation in New

England.

- Failure to not complete energy projects will lead to increased consumer costs, particularly electric default rates.
- The gas crunch will likely be solved through the intersection of various major factors including
 - More pipelines to provide more capacity
 - Regulatory changes that will influence changes in planning
 - Market changes that will influence pricing
 - Influx of Canadian hydro
- Counter-measures such as the following may not play a significant factor in solving the immediate gas crunch
 - Energy efficiency measures: rely on individual altruism, generally unlikely on a broad scale
 - Renewables: have their own sets of challenges relative to permitting, manufacturing, and pricing.
- Over-reliance on a single energy source would be prevented with a portfolio approach that is more balanced.
- The New Hampshire Business and Industry Association is New Hampshire's statewide chamber of commerce. The BIA has chosen not to endorse or oppose particular energy projects. Their energy policy acknowledges an energy crisis in New Hampshire and encourages both short and long-term cost-reducing energy solutions. [7]

Liberty Utilities [8]

- Liberty Utilities has electric and gas distribution companies; the natural gas distribution company has 87,000 customers serving 31 communities.
- In the NRPC region, the Liberty Utilities gas service territory includes the towns of Milford, Amherst, Hollis, Merrimack, Litchfield, Hudson, and the City of Nashua. There are a total of 38,437 Liberty gas customers in the NRPC region, 72% of which are in the City of Nashua.
- The majority of gas servicing the NRPC region is supplied by the Concord Lateral of the Tennessee Gas Pipeline system (106,833 Dth/day) that originates from the hub in Dracut, MA; Liberty's portfolio also includes LNG (22,800 Dth/day), propane (34,600 Dth/day), and gas for the Berlin, NH service area from the Portland Natural Gas Transmission System (1000 Dth/day).
- Liberty projects that ahead of NED, they will have a deficiency of resources to serve customers in NH by winter 2016/2017.
- Under the initial NED petition Liberty would replace 50,000 Dth/day of supply sourced from Dracut; 65,000 Dth/day would be incremental supply devoted to system growth.
- Under an executed Amendment to the Precedent Agreement negotiated by Liberty and NHPUC staff, Liberty would be authorized to exercise a no-cost option to reduce the 115,000 Dekatherms commitment down to 100,000 Dth/day if projected growth doesn't materialize, leaving 50,000 Dth/day for growth. It also puts in place target growth incentives that if met would ensure Liberty's cost-recovery for costs from the NED pipeline through the Company's winter rate. [9]
- To tap NED directly, Liberty will need to site new metering facilities along the NED route; the new metering location(s) has not yet been determined.
- Liberty cites the following benefits of NED:
 - With an alternate feed, the reliability of the Liberty system will improve
 - Gas sourced from Dracut is expensive; NED gas would be cheaper, and those savings would be passed on to existing Liberty Utilities customers
 - Additional gas capacity could potentially avoid a growth moratorium.

- o Additional gas capacity could allow growth in the Liberty system without an expansion of the Concord Lateral (which is at capacity).
- In terms of system growth in the NRPC region, Liberty’s growth is driven somewhat organically through developer interest; Liberty does have strategic interest in supplying natural gas to its propane air system in Keene.
- Several new development projects in the NRPC region will be on the Liberty system (note, units are Dth/year)
 - o Merrimack Commercial Conversion (47,213 Dth/year)
 - o Merrimack New Two Phase Residential/Commercial Development (25,925 Dth/year)
 - o Nashua New Two/Phase Residential Commercial Development (47,000 Dth/year)
- Until growth on the system is achieved, the excess gas capacity on the Liberty system will be sold to gassupplied electric generators who do not enter into long-term supply contracts.

Other pipeline expansion projects are in various stages of FERC process to address the region’s demand for additional gas:

Access Northeast and AIM [10]

- Access Northeast is a partnership between Spectra, Eversource, and National Grid to increase the capacity of the Spectra System. The project would increase natural gas supplies to power plants by .9 Bcf/day, with a planned in-service date of November 2018.
- As opposed to using “greenfield construction,” the Spectra Access Northeast project would install a 42/1 pipe within the existing spectra pipeline trench; 70% of the project is co-located within existing gas pipeline ROW.
- Access Northeast is distinctly different from the TGP NED project in that the design of the project is to meet the growing needs of gas-fired electricity generation.
- As the NED appears to be positioned to address the needs of LDCs, the Access Northeast project is not necessarily a directly competing project, as their markets are distinct.
- Additionally, Spectra Energy’s Algonquin Incremental Market (AIM) project would expand their existing Algonquin Gas Transmission system pipeline from 24 to 42/1 and enhance compression to deliver an additional 342,000 Dth/day to the Algonquin City Gates, just south of Boston, by an in-service date of November 2015.

Portland Natural Gas Transmission System (PGNTS) Expansion Potential [11]

- The Portland Natural Gas Transmission System operates approximately 300 miles of 24/1 and 30/1 pipe through NH, MA, and ME. All pressure is provided upstream by TransCanada. Currently PNGTS’ major markets are located outside of the NRPC region.
- The traditional supply area for PNGTS is western Canada; however the lower cost of Marcellus shale supply is causing a shift in emphasis for connecting gas to markets.
- IIC2C/I is a IINo Build” expansion project on the Portland Natural Gas Transmission System. Through an increase in upstream compression, the increased volume on the PGNTS system is planned for 100,000 Dth/day. C2C lists an in-service date of November 2017.
- Because the PGNTS system is not yet operating at maximum, the Company says it could theoretically ramp up to as much as 500,000 additional Dth/day in 100,000 Dth/day increments along the existing pipeline from Wright, NY to Dracut, MA via Canada and Pittsburg, NH. PNGTS added that one benefit of this potential capacity is that it would require no construction or looping; it would be accomplished by adding compression facilities along the route.

Demand and Need, In Summary

- FERC relies on an applicant's secured contracts to demonstrate demand.
- EFAC has been working to document the perceived need for NED at a regional and overall domestic level. The three largest anchor shippers in New England have filed requests for approval for the following incremental and replacement gas commitments.

LDC	Regulatory Authority	Filing	Incremental	Replacement gas	Total firm commitment
National Grid	MA Department of Public Utilities	3/31/15 [12]	0.108	0.079	0.187
Liberty Utilities	NH Public Utilities Commission	12/31/14 [13]	0.065*	0.050	0.115*
Columbia Gas	MA Department of Public Utilities	3/31/15 [14]	0.061	0.052	0.114
Total			0.234 bcf/d	0.181 bcf/d	0.416 bcf/d

- Liberty is the only NH LDC that has made a firm commitment to the project. Project demand includes commitments all along the pipeline, not just NH.
- Export of natural gas is allowed by FERC, but it is unclear if that demand is given the same consideration as domestic demand.

* Under an executed Amendment to the Precedent Agreement negotiated by Liberty and NHPUC staff, Liberty would be authorized to exercise a no-cost option to reduce the 115,000 Dekatherms commitment down to 100,000 Dth/day if projected growth doesn't materialize, leaving 50,000 Dth/day for growth.

AREAS OF IMPACT

Economic

- With respect to real estate valuation, sale data indicates that property values may decrease in the short-term due to construction impacts; over longer timelines, the pipeline must be very close to an external structure for significant impact on property values to occur. For neighboring property owners (i.e. the pipeline is within 100-ft of the property boundary), impact is minimal to negligible. [15]
- In the region there is historical evidence of disagreement between pipeline operators and municipal assessors as to the rate of depreciation of pipeline assets over time; a court found in favor of the municipal argument that depreciation is more modest than was argued by the pipeline operator. [16]
- Pelham and Hudson are the communities in the NRPC region that have pipeline assets. [17] Neither town received additional fire or safety equipment upon installation of the pipelines; however Hudson receives free annual fire safety training from the pipeline operator. [18]
- Job creation and economic stimulus related to the project would be likely felt only in the shortterm due to construction; TGP will add three permanent jobs as a result of the project. [19]
- It is possible that the availability of more low-cost natural gas may encourage growth in the manufacturing sector or other high energy use businesses, but EFAC at present has no information to support this.
- The following table is an NRPC summary of the estimated annual tax revenue from the NED pipeline; these estimates were provided by Kinder Morgan [20] the basis of this estimate is undocumented, and the numbers may not reflect what a town may actually receive annually.

Town	Proposed Mileage	KM Estimated Annual Tax Revenue
Amherst	4.03	\$510,000
Brookline	2.73	\$441,472
Hudson	2.48	\$260,033
Litchfield	2.68	\$281,153
Mason	8.98	\$492,000
Merrimack	4.49	\$530,000
Milford	3.11	\$428,000

Pelham 5.45 \$495,000

Construction

- The following table describes the NED Project road crossings in the region and their associated mile-posts. [21]

Town	Road Crossings	Cul-de-sacs and dead-ends	Class VI roads
Mason	n=4		Mitchell Hill Rd MP 11.3
Mason	n=7		
Lateral			
MilfordW	n=1		Mile Slip MP 12.1
Brookline	n=3		Hutchinson Hill MP 13.5
Milford E	n=6	Bear Ct MP 16.7; Wildflower Way MP 16.9	
Amherst	n=9	Sunshine Way MP 18.5	
Merrimack	n=12		Gauthier Rd MP 22.5; Old Kings Road MP 23.5
Litchfield	n=3	Hamel Ct MP 27.3-4	
Hudson	n=6		
Pelham	n=7	Tina Ave MP 38.8	Briarwood Rd MP 40.1

- The proposed NED will cross the F.E. Everett Turnpike at MP 25.5
- The proposed NED will cross the F.E. Everett Turnpike at MP 25.5• Particular areas of concern noted by our communities include the potential for general damage from the construction process including damage to wells and roads, traffic control and communication during construction, and general landscape disturbances.
- Specific recommendations to concerned parties include the following:
 - o Request TGP bond all roads, bridges, and railroad crossings
 - o Monitor TGP’s evaluation and proposed use of epoxy coatings, abrasion-resistant overlays, concrete coatings, cathodic protection, etc.
 - o Request that the pipeline be protected within a tube that extends under the entire roadway including shoulders at all road and railroad crossings completed with either standard open cut or conventional boring methods.
 - o Monitor TGPs proposed locations of remote controlled valves (RCVs) and sectionalizing block valves as they relate to protecting neighborhood locations
 - o Request TGP designate all residential neighborhoods along the route as Class 3 locations, which would require an incremental increase in wall thickness for the pipe.
 - o Plant fast-growing trees to restore tree-lined borders along ROW.
- All pipeline project facilities must comply with FERC and USDOT regulations under the Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards and Siting and Maintenance Requirements. [22]
- Additionally, Tennessee Gas Pipeline Company, L.L.c. has stated in the March 2015 Environmental Report, Northeast Energy Direct Project, Resource Report 1, General Project Description [23] that they would comply with The Upland Erosion Control, Revegetation and Maintenance Plan; The Wetland and Waterbody Construction and Mitigation Procedures; Unanticipated Discovery Plan for cultural resources; Waste Management Plan; and typical construction workspace layout drawings.
- Despite these regulations and assurances, many construction details are IITBD - to be determined” as

noted in the March 2015 Environmental Report, Northeast Energy Direct Project, Resource Report 1, General Project Description (ER RR1). Many of these details will be resolved as surveys are completed and the route, if the project is approved, is finalized.

Historic Resources

- The Federal/Section 106/1 project review is the process of assisting federal and state agencies and their applicants in determining whether or not their projects will affect significant historic properties. This process allows for consideration of alternatives that may avoid or reduce any potential effect while the projects are still in the planning stages. [24]
- The following table describes historic sites and locally-designated scenic roads near the NED Pipeline. [25]

	Mile		
Town	Post	Item	Notes
Mason	8.4	Pickety Place - 1786 cottage	1800' south of pipeline
Mason	3.54	Jackson Rd crossing	Scenic road
Milford	12.1	Mile Slip Rd. crossing	Scenic road
Milford	15.2	James Johnson House - historic building, circa 1800	0.25mi north of pipeline
Milford	16	Timothy Coburn House - Historic building - 1803	0.48 mi south of pipeline
Milford	16.34	Federal Hill Rd. crossing	Scenic road
Milford	16.34	Moses Foster Homestead -Historic building - 1788	600' north of pipeline
Milford	16.4	Daniel Goodwin house - historic building - 1790	850' north of pipeline
Milford	16.4	Nehemiah Barker Homestead - Historic building - 1782	1200' south of pipeline
Milford	17.14	Ponemah Hill Rd. crossing	Scenic road
Amherst	18.32	Hollis Rd. crossing	Scenic road
Amherst	20.5	Boston Post Rd. crossing	Scenic road
Merrimack	23.5	Old Kings Hwy	Historic road
Litchfield	26.1	Cromwells Trading Post	0.25 mi south of the pipeline
Litchfield	26.27	Smoll Site	2000' south of pipeline
Litchfield	26.3	Nesenkeag Site	0.25 mi south of pipeline

- Specific recommendations to concerned parties include the following:
 - o Ensure that local heritage commissions, historic district commissions, or historical societies are aware of the proximity of historic or potentially historic resources to the proposed pipeline route;
 - o Ensure that all appropriate local public hearing processes and state statutory requirements for construction impacts to state-designated scenic roads are adhered to; and
 - o Monitor and provide feedback as applicable to the Federal+Section 106/1 project review, which is the process of assisting federal and state agencies and their applicants in determining whether or not their projects will affect significant historic properties. This process allows for consideration of alternatives that may avoid or reduce any potential effect while the projects are still in the planning stages (The review process is administered by the Advisory Council on Historic Preservation, an independent federal agency, with assistance from the State Historic Preservation Office).

Infrastructure and Safety

- Existing pipeline assets in the NRPC region include a 20" and a 12" main along an approximately seven-mile trench in Pelham, and four miles of 8" main in Hudson. [26] There have not been any significant failures along the existing TGP pipelines in Pelham and Hudson. [27]
- The proposed pipeline now calls for a 30 inch-diameter pipe that will carry gas at a pressure as high as fourteen hundred (1,400) pounds per square inch. The proposed depth of the pipe will vary based on soils and will have a minimum cover of two feet over ledge area and three feet over soils other than ledge. The projects calls for automatic pressure sensor shut offs along the route, which would be in-

stalled at (twenty) 20, twelve (12) and eight (8) mile increments based on the population density. The construction and pipe thickness will also vary based on population density. [28]

- Particular areas of concern noted by our communities include how the proposed pipeline will clear existing utilities such as sewer, water, and drainage, the strategies communities should use to replace/repair infrastructure adjacent to the proposed pipeline, the risk of material failure and associated safety consequences, and how to obtain Emergency Response Plans and Evacuation Route plans in case of failure.
- Specific recommendations to concerned parties would be:
 - The towns should be allowed to witness construction within their right of way.
 - A sleeve should be installed if the proposed pipeline is installed over existing utilities.
 - Towns should request traffic control and detour plans prior to construction.
 - TGP should be required to submit bonds for every right of way crossing.
 - Towns should request contact information during construction and post-construction.
 - Towns should request that TGP provide Emergency Response Plans and Evacuation Route Plans in case of failure.
- The following table describes schools and daycares within the vicinity of the NED Pipeline. [29]

Town	Mile Post	Item	Notes
Amherst	18.36	Sonshine Inn - pre school	300' south of pipeline
Amherst	19.28- 19.34	RFSC Academy/Summit school	200' west of pipeline at closest point
Amherst	20.5	Souhegan HS, Amherst MS	1000' east of the pipeline
Litchfield	27.65	Tiny Turtles Child Care	1700' south of pipeline
Pelham	39.12	Perfect Place Day Care	1100' SW of pipeline

Environmental Impacts - General

Major impacts to the NRPC communities vary across the proposed route of the NED. Noted issues of concern range from proximity to neighborhoods and schools (Litchfield, Milford, Amherst), impacts to natural resources (Amherst, Merrimack), impacts to water supplies (all towns and particularly Merrimack, Pelham), impacts on town-owned land (all towns and particularly Brookline), and disproportionate overall pipeline mileage (Mason).

Specific impacts to the region with respect to environmental impacts include, but are not limited to, the following: [30]

- Within a 660-ft corridor along the NED route there are 283 structures, all but a handful of which are classified as residential structures in the NRPC GIS.
- The proposed NED pipeline would transect stratified drift aquifer resources in every town along the route in the NRPC region.
- The proposed NED pipeline would transect town-owned land in every town along the route in the NRPC region.
- There are over 200 private wells within 300-ft of the route
- There are two public drinking water wells and 13 wellhead protection areas within 300 ft. of the proposed alignment
- There are 16 Natural Heritage locations within a .25 radius of the alignment, plus the route transects two prominent and large nature preserves.
- The route makes five Designated River Crossings in the NRPC region.
- Both new and existing pipeline facilities in the region traverse areas of high population density.

- An NRPC growth model based on zoning predicts suggests that certain areas along the proposed NED route, particularly Southern Merrimack, Hudson, and Pelham, NH have a high potential to support future residential growth and development, in terms of number of new structures.
- The following table describes detailed environmental impacts in the vicinity of the NED Pipeline in more detail. [31]

Additionally, the NH Office of Energy and Planning noted that the lands permanently protected by the LCHIP program are impacted by the current route in Amherst, Mason, Try, and Richmond. These lands are held in public trust and the State law specifies that the sale, transfer, conveyance, or release of such land is prohibited, absent legislative action. [32]

{full page complex chart omitted; full report can be downloaded at: }

<http://elibrary.ferc.gov/idmws/common/opennat.asp?fileID=14012838>

Environmental Impacts - Rivers as a Special Concern

- In the NRPC region, both the Lower Merrimack River and the Souhegan River are “Designated Rivers” under New Hampshire’s Rivers Protection and Management Program (RMPP) per RSA 483 [33]
- Artifacts of construction and operation of a pipeline may compel revisions of the affected rivers’ Corridor Management Plans (CMPs).
- Concerns expressed by the Lower Merrimack River Local Advisory Committee (LMRLAC) that pertain to both the Souhegan and Lower Merrimack Designated Rivers include potential river contamination with drilling fluids, gas release under the river and disruption to the river bed and shoreline, effect of riverbed and shoreline scouring on the pipeline’s structural integrity, the fact that temporary work sites will not be replanted after construction is complete, and potential restrictions on access to and use of the river. [24]
- It is clear from the literature that Horizontal Directional Drilling (HDD) provides far better environmental protection for the River Corridor than does alternate construction techniques; the most recent NED Environmental Report establishes the NED project’s intent to use HDD to cross the Merrimack and Souhegan rivers. [35]
- On the issue of Rivers, the EFAC suggests the following:
 - Clarify the timing of the release of FERC-required construction plans for water crossings
 - Request TGP’s construction process includes the use of carrier sleeves for the full-length of the HDD bore.
 - Monitor the adequacy of pig launch and exit locations to ensure the rivers have successful in-line inspections at a frequency consistent with industry best practices.
 - Facilitate emergency planning with Pennichuck Water who operates a secondary water supply in close proximity downstream from the proposed alignment.

Impact on the Orderly Development of the Region

- NH RSA 162-H:16, IV (a)-(c) compels the NH Site Evaluation Committee to determine that a project: *Will not unduly interfere with the orderly development of the region with due consideration having been given to the views of municipal and regional planning commissions and municipal governing bodies.*[36]
- “Orderly Development” is not formerly defined under NH State Law. Under the SB99 Rulemaking a working group attempted to clarify criteria to define “orderly development” but failed to reach a consensus. [37]
- The NRPC Regional Plan highlights the problem of high electricity costs being a barrier to economic growth and suggests that the expansion of natural gas pipelines should be balanced in an energy

portfolio which includes renewables. The Plan also suggests that many residents in the region would be interested in greater access to natural gas, presumably for home and/or commercial use. At the same time, the Plan underscores that the region places high value on the preservation of natural, agricultural, recreational, and historic resources. [38]

- Planned Developments within .5 miles of proposed route include the following: [39]

Town	Planned residential subdivisions	Planned commercial or industrial developments
Wilton	none documented	Area is within Research and Office Overlay is designed to attract Research, Office, and light manufacturing activities
Amherst	16-unit affordable housing unit development abuts the route	none documented
Merrimack	none documented	four large commercial developments planned including Anheuser Busch additions, Merrimack Outlets Phase II and Pad site, and Eversource Eagle Substation
Litchfield	Hamel Ct Subdivision Map 15	none documented
Pelham	Garland Woods, 46-unit subdivision; 8-unit development on Dutton Road	Mixed Use Zoning Overlay District represents a significant percentage of remaining developable land in Pelham for large commercial projects

PLAN-NE AND GENERAL PUBLIC OPPOSITION

- PLAN-NE, of which NHPLAN is a part, is a multi-state citizen group that opposes NED. PLAN-NH is an intervenor on the NHPUC Liberty docket for approval of its “precedent agreement” with TGP. [40]
- NHPlan speculates strongly that excess NED capacity is destined for liquefaction and export, based upon Kinder-Morgan’s interests in the LNG industry. [41]
- In NH only 25% of impacted landowners have granted survey access to TGP and this percentage has been relatively stable; as some landowners have recently approved access, about an equal number have rescinded prior approvals. [42]
- FERC has indicated that the NED Pre-filing docket may set a new record for total comments filed, [43] the overwhelming majority of which are critical of or state outright opposition of the project.
- Sentiment from the public and elected official at both the Nashua and Milford FERC scoping meetings agrees with the docket filings, with testimonies in favor of the project extremely few. [44][45]

SUMMARY OF MUNICIPAL ACTIONS TO DATE

Town	Municipal Task Force Exists	Crosses any Town-Owned Land?	Actions on Permission for Survey Town Land	Expression of Board/Council Position	Regular Warrant Articles	Experts Retained
Mason	Y	Y	Explicitly denied	Board unanimously opposes Signed coalition letter	1) \$80K funding 2) Resolution of Opposition	In process
Brookline	In process	Y	Explicitly denied	Board unanimously opposes Signed coalition letter.	\$80K funding for • Env. Impact • Land appraisal	Env. experts

- Hydrological
- Legal

Milford	Y	Y	Denied, then rescinded to allow access	Opposed 4-1		
Amherst	Y	Y	Board opposes current route	Become an Intervener		
Merrimack	N	Y	Prelim v, negotiating on terms	Opposed; Signed Coalition Letter	None	<ul style="list-style-type: none"> • Drummond/Woodsum -Atty • Env. consultant for CC • Engineering consultant for Wastewater Division • Eng/Geotechnical consultant for District
Litchfield	N	Y		Opposed; Signed Coalition Letter		
Hudson	N	Y		BOS Opposed		WSE analysis of public well impacts
Pelham	N	Y		Opposed; Signed Coalition Letter		

Note: The City of Nashua has not taken any formal position on the NED project.

Federal FERC Process [46]

- FERC has extended the pre-filing Formal Comment Period to October 16, 2015.
- FERC has scheduled their final project scoping meeting in Rindge, NH on September 23, 2015.
- At this point Tennessee is expected to file their formal application with FERC on October 23, 2015. [47] The formal application ends the pre-filing period. At that point the Pre-filing Agency calls will end.
- FERC will continue to accept public comment through eComment and eFiling throughout the duration of the project.
- FERC will hold additional public meetings and accept comments on the draft Environmental Impact Statement (EIS) on a schedule TBD.
- Details on filing for Intervener Status: [48]
 - o Parties who are materially-affected by FERC decision
 - o Parties are then granted the right to challenge FERC in court.
 - o Must serve the other intervening parties in the case
 - o Deadline is 10 days following FERC’s Notice of Application; FERC allows interventions for a limited time after it releases Draft EIS.

NH Public Utilities Commission (PUC) Hearings

- In order to issue a “Certificate of Public Convenience and Necessity” FERC requires binding “Precedent Agreements” between the pipeline applicant and “Project Shippers”, These longterm agreements to ship specific quantities of gas are used as evidence of a “need” for a pipeline. Kinder Morgan/Tennessee Gas Pipeline has listed Liberty Utilities in New Hampshire as one of the “Project Shippers” for its NED project. [49]
- Public utilities require approval of their state Public Utilities Commissions before they can sign such binding Precedent Agreements. The state PUC determines whether such an agreement would be in the best interests of the consumers. In the case of Liberty Utilities, the New Hampshire Public Utilities Commission (NH PUC) is the relevant commission. [50]

- The PUC hearings on the market path component of the project concluded in early August; Pipeline Action Network (PLAN), the Office of Consumer Advocacy, and the PUC staff attorneys all stated their cases. [51] The Commission is still in deliberations and therefore the PUC decision is pending. [52][53]
- The PUC hearings on the supply path component will follow in September/October timeframe. [54]
- The NH Municipal Pipeline Coalition may intervene on hearings relative to the supply path component of the project. [55]

State of NH SEC Process [56]

- The National Gas Act likely grants federal pre-emption over authority over state-level permitting; however, FERC encourages applicants to comply with state-level energy permitting processes. [57]
- Kinder Morgan/TGP has indicated they will seek application with the NH SEC concurrently with their application to FERC.
- Once initiated, the NH SEC process will involve Pre-Application Public Information Sessions, Post-Filing Public Information Session, and Post-Filing Joint Public Hearing with other “agencies with interest.” Like FERC, the NH SEC will also accept written public comments throughout proceeding.
- Details on Become an Intervener
 - o Rights, duties, privileges, immunities or other substantial interests might be affected by the proceeding. NH CODE OF ADMINISTRATIVE RULES, SITE 202.11
 - o Interests of justice and the orderly and prompt conduct of the proceedings will not be impaired. NH CODE OF ADMINISTRATIVE RULES, SITE 202.11

**CONNECTICUT
Land Conservation Council**

October 14, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline LIC/Kinder Morgan (FERC Docket No. PF14-22-000)

On behalf of the Connecticut Land Conservation Council (CLCC), thank you for the opportunity to submit the following comments on the above-referenced project (referenced herein as “the proposed project” or “the proposed pipeline”).

As the umbrella organization for the state’s land conservation community, CLCC works with land trusts (now numbering over 137), other conservation and advocacy organizations, government entities and land-owners to increase the pace, quality, scale and permanency of land conservation in Connecticut while assuring the perpetual, high quality stewardship of conserved lands in the state. Consistent with our mission, ensuring the permanent protection of lands valuable for conservation purposes is a priority for our organization.

It is our understanding that the route of the proposed pipeline will cross: (1) critical and highly protected public water supply watershed land near drinking water reservoirs on the property of the Metropolitan District Commission (MDC) in Hartford; (2) land owned and preserved by the Wintonbury Land Trust in Bloomfield; and (3) the New England National Scenic Trail in several locations. For the following reasons, CLCC shares the concerns raised by conservation organizations and individuals about the potential adverse impacts from the project to each of these valuable natural and recreational resources.

Impacts to Highly Protected Class I and” Watershed Lands

According to the MDC (letter dated June 26, 2015) and maps of the project area, the pipeline could potentially disturb 250+/- acres of MDC property, running 5+ miles through the Class I and Class” water company land. Pursuant to state water policy and law, such lands are protected and preserved to safeguard the quality of our state’s water resources. Accordingly, transactions involving Class I lands are severely restricted and those involving Class II lands are limited. The law furthermore provides that because these are lands

located closest to water supply sources they require a state Department of Public Health permit to transfer or change their use.

Permitting the project to move forward will serve to undercut the strict protections on these lands currently accorded under state law, not only posing a risk of adverse impacts to highly valuable water supplies, but also setting a dangerous precedent for further erosion of such laws in the future.

Impacts to the Wintonbury Land Trust's Speer Preserve

We are also concerned about the potential adverse impacts of the proposed project on the Speer Preserve in Bloomfield. Donated by private landowners and The Nature Conservancy to the Wintonbury Land Trust, this 13.9 acre preserve, featuring a mix of evergreens and hardwoods, some of which are upwards of 150 years old, is considered by the land trust as its most treasured upland preserve.

It is our understanding that the project's expansion of the existing gas right-of-way on the Speer Preserve will result in a clear cutting of a width of 90' for the entire 390' length of the Preserve, severely diminishing the existing habitat and leaving the land vulnerable to erosion and invasive - species.

Perhaps more critically, the Speer Preserve was donated with the intent that it be permanently preserved and held in public trust by the Wintonbury land Trust, a charitable land trust. Expanding the existing pipeline to the extent proposed would, at a minimum, undermine that charitable intent and the associated public purpose and trust in permanently protecting the land.

Impacts to the New England National Scenic Trail

The New England National Scenic Trail (NET) is a 215-mile hiking trail route that has been in existence for over half a century. The NET travels through 41 communities in Connecticut and Massachusetts featuring long-distance vistas, historical landmarks, and a diversity of ecosystems and natural resources. With the route of the proposed pipeline crossing the NET in several places (Bloomfield, Farmington, Simsbury and West Hartford), CLCC shares the concerns raised by the Connecticut Forest & Park Association regarding the nature and extent of disruption to the recreational and scenic purposes for which the NET was created.

For the foregoing reasons, we contend that a project of this magnitude, proposed in an area rich with protected natural, scenic and recreational resources, should be subject to the highest and most comprehensive degree of scrutiny.

Thank you for your consideration.

Very truly yours,

Amy Blaymore Paterson

Executive Director

Connecticut Land Conservation Council (CLCC)

West Hartford, CT 06117

RE: Docket #PF14-22-000

Date: October 14 2015

I stand with the West Hartford, CT Town Council in opposing FERC docket #PF14-22-000 proposed by Kinder Morgan/TGPC for a gas pipeline that would run from Granby, CT through Bloomfield and West Hartford, CT. The 5+ miles of MDC property within W. Htfd. are directly contiguous to vital public drinking water as well as invaluable public recreation and wildlife habitat areas.

The pipeline would result in major clear-cutting of wooded land adjacent to the reservoir, 1) presenting visual pollution in a natural, relatively unspoiled area widely enjoyed by the public, 2) possible erosion affecting the reservoir, wildlife, and the recreational use, and 3) the potential for serious contamination of the public water supply.

The project would also have a major negative effect on the Metacomet Trail, an integral part of the New England National Scenic Trail that includes areas of unique ecologic, historic, and geologic interest.

Kinder Morgan/TGPC's record of safety incidents and pipeline spills leads me to believe that allowing them to build a major pipeline through these valuable lands presents a substantial danger to our public drinking water as well as wildlife and the environment.

I also object to the manner in which this proposal has been handled with regard to informing the public. There has been a near-complete lack of publicly available information. Only one public hearing was held in West Hartford (10/7/2015), with less than a week's notice to the town. I received the information only one day in advance through news media, and was unable to attend due to a prior commitment. With so much at risk for so many, the lack of public information and outreach is appalling. It leads me to believe that Kinder Morgan/TGPC may be interested in keeping this project out of the public eye until it would be too late to take any action.

It also seems disingenuous that the initial environmental survey "incorrectly states that the project area is not located within any public drinking water or aquifer protection areas." according to MDC President and CEO Scott Jellison. The MDC is Central Connecticut's primary public water utility. Their concerns need to be appropriately addressed. Clearly an accurate accounting of the situation is needed for discussion and consideration.

The communities that would be majorly affected by PF14-22-000 deserve better treatment than this. The disruption, the destruction, and the threat to our resources and lifestyle are immense. And for what? We are as a country in the midst of an enormous change in our approach to energy production and use. As renewable energy technologies blossom, projects like this one present increasingly greater risk and less reward. Wreaking havoc on the environment and endangering vital resources is a long term negative representing an old-fashioned & outmoded response to our energy needs. Other than profit for the few, this project provides little in the way of benefit and a great deal of high risk for the communities affected.

20151014-5087

Zellene Sandler, Bloomfield, CT.

I am writing to strongly oppose the proposed Kinder Morgan pipeline through West Hartford and Bloomfield CT for the following reasons:

The proposed pipeline would go through the Class 1 protected watershed of the Metropolitan District Commission. This could adversely affect the drinking water of 400,000 residents.

The MDC reservoirs provide habitat for many species of birds, plants and animals. For example, the Blue-winged Warbler, a species of special concern, breeds in the unique habitat of the reservoir. A major population of this bird breeds in this location and destruction of its habitat could result in major decline of the species.

The proposed pipeline would go through the Wintonbury Land Trust's Speer Preserve. Two community wells are within close proximity. Disruption of groundwater through blasting and/or excavating could pollute our wells and render our neighborhood without potable water.

I frequently hike the Metacomet trail in this area. This national scenic trail will be affected by construction if the pipeline runs through the reservoir.

Although I am writing as an individual, I am past president of the Hartford Audubon Society, a member of the Bloomfield Conservation Committee and a hike leader for the Appalachian Mountain Club.

Thank you for the opportunity to comment.

20151014-5097

Kathryn Deane, West Hartford, CT.

I am a concerned resident in West Hartford, where the Tennessee Gas Pipeline is potentially going to be placed through our MDC reservoir, by which our town drinking water supply is located. I'd like to express my opposition to the TGPC project in its current form and request that alternative options are explored and further research conducted to ensure that this proposed project in West Hartford guarantee protection of drinking water, the impacted lands, and our West Hartford community. This company has a noted history of safety issues and spills with other projects and at the meeting in West Hartford on Oct. 7, TGPC acknowledged that it has had safety incidents and pipeline spills at sites throughout the country. This is extremely disturbing considering it will directly impact our drinking water here in West Hartford. Additionally, back in June, the MDC President and CEO Scott Jellison sent a letter to the Secretary of the Federal Energy Regulatory Commission (FERC) stating that the initial environmental survey indicates "incorrectly states that the project area is not located within any public drinking water or aquifer protection areas." This shows not only a lack of safety and awareness on the part of TGPC, but also indicates that they are not operating in an ethical manner if they are not even acknowledging the truth about the safety implications of this project. Lastly, I'd like to state that this project has been not been made public until it is almost too late for residents to understand it or express any concerns or ask questions. The fact that our town government has no legal say in the approval of something like this is highly disturbing as well. I respectfully urge you to put a hold on this project until further research can be conducted to ensure the safety of our drinking water and environment. Thank you for your consideration of this matter.

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/
Kinder Morgan (FERC Docket No. PF14-22-000)

October 14, 2015

Dear Secretary Bose:

I am a member of the Wintonbury Land Trust in Bloomfield, CT and a former legal director (retired) for the Connecticut Department of Public Health. I am writing in my capacity as a concerned citizen of Connecticut to strongly oppose the proposal by Tennessee Gas/Kinder Morgan to install a natural gas pipeline through the Class I and Class II watershed land owned by the Metropolitan District Commission (MDC). A gas pipeline installation on this land has potential to impact a high quality drinking water source. Also, granting permission for a new pipeline through this land undermines Connecticut's current protections for drinking water.

Connecticut General Statutes section 25-32 requires a change of use permit from the CT Department of Public Health for projects like this one. Furthermore, it restricts the use changes that are allowable. A proposal to install new pipeline and enlarge the permanent right-of-way, is inconsistent with the letter and intent of CGS § 25-32.

Regardless of the degree of threat posed by this particular pipeline, allowing an exception to the statute sets a dangerous precedent, paving the way for other encroachments on water supply land. Connecticut's standards for drinking water quality are second to none in the country. They are important in maintaining public health and quality of life in our state. In my role as a public health lawyer for over 22 years with the state of Connecticut, I am aware of how carefully Connecticut regulatory agencies have protected Class I and II lands. While other regions face increasing threats from contaminants in their drinking water sources,

Connecticut's protective legislation stands out as a model and should not be compromised.

As a member of Bloomfield's Wintonbury Land Trust I oppose the route proposed through the Speer Preserve. It is my understanding of the total impact of land taking for this proposed pipeline that the WLT will end up with a clear cut swath through our Speer Preserve of 90' across by 390 feet long. There must be serious consideration of the impact of defacing this old growth preserve in the FERC's determination.

I urge FERC to consider, early on, whether the entire project is necessary and the legality, safety and impact of a route through Class I and II watershed land and the Speer Preserve.

Thank you for this opportunity to comment.

Marianne Horn

20151014-5122

Kaitlyn A Qualtieri, Lynnfield, MA.

Dear Ms. Kimberly Bose,

I am writing in respect to Project Docket PF-14-22-000, the Tennessee Gas Pipeline Northeast Energy Direct (NED) Project. This project includes the Lynnfield Lateral, which will essentially run through my backyard and neighborhood alike in Lynnfield, Massachusetts.

I have significant concerns about this project such as the potential destruction through my neighborhood and those that are surrounding, the destruction of woodlands and farms and of course the safety, health and environmental risks that cannot be alleviated. Furthermore, I worry about the devastating effects on home owners and home values.

The pipeline will run near our existing electrical lines, dramatically increasing the amount of usable land which we pay very high taxes for already. Not only that, this right of way will be treated with herbicides and being so closely located to our water supply, can be so harmful to the hundreds of thousands who depend on water from the Ipswich River Water Shed. Polluted wells, polluted soil, and the spreading of toxins can easily occur through the digging and implantation in this right of way. Water quality can also be affected as blasting can disturb wells and water tables.

Kinder Morgan has a poor safety record to add as well. In 2011, Kinder Morgan was cited for a few of the following safety violations: failing to maintain updated maps showing pipeline locations, failing to inspect its' pipelines as required, failing to adequately monitor pipe's corrosion levels. Most notably, underground gas pipes can explode and spread fire quickly. In Texas from 2003 to 2014, Kinder Morgan experienced 36 significant incidents resulting in fatalities or hospitalization, fires, explosions, or spills. Throughout the United States, since 2003, Kinder Morgan and its' subsidiaries' pipelines have been responsible for at least 180 spills, evacuations, explosions, fires and fatalities in 24 states. The town of Lynnfield already has the most number of gas leaks in the state per square mile. Digging up our streets is only going to make these matters worse. Explosions do happen and can happen easily.

Furthermore, what will the value of my home now be, having a high powered gas line abutting? A pipeline that could explode, whose wells and soil can be contaminated, which is also near a compressor station, (this station that is to be located on a street lined with multi-million dollar homes). Who will pay for these hazard-related illnesses as well as the devaluation of my home?

Pipeline construction and maintenance can cause property values to decrease for numerous reasons. The pipeline company is not required to restore the property to anything close to its original condition. The destruction of any curb appeal is imminent, as many trees will be removed, leaving us little if any privacy from our neighbors who live behind us. Although trees can be restored (after decades of maturation) most of the easement must be kept clear of any deep-root vegetation such as shrubs and trees.

My husband and I plan on starting our family soon, and are terrified at the thought of the retributions of this pipeline being so close to our home. Although the main argument is that the pipeline is providing a great benefit to the citizens of the Northeastern United States, the Lynnfield/Peabody Lateral is an "export pipe-

line” as opposed to being a pipeline that benefits public use. I ask that this matter be investigated thoroughly and that the true intent be revealed by Kinder Morgan, in detail. To the extent that eminent domain is taking land from property owners for public use, an export pipeline being disguised by Kinder Morgan as being for the citizens of New England is just plain wrong. Furthermore, this action would be unconstitutional under the Fifth Amendment.

Could you please review all facts and findings for this case? What Kinder Morgan is doing seems morally wrong. I am not so sure they would be selling the pipeline so vehemently if it were running through one of their properties.

Thank you very much,

Kaitlyn A. Qualtieri, Lynnfield MA.

Re: Tennessee Gas Pipeline Company, LLC
Docket No. PF14-22-000
Northeast Energy Direct Project

Dear Secretary Bose,

I have been following the proposed Northeast Energy Direct project, PF14-22-000, for about a year now. I have attended five FERC scoping sessions for this project that were held in my home state of New Hampshire and in the neighboring state of Massachusetts as well. I have observed as a record number of comments, nearing 6,000, have been submitted on this docket number.

I have noticed that too many of these comments have been misfiled or assigned to incorrect states, towns, entities, etc. I have subsequently been informed that all of these comments are administrated by a third party contractor based in Australia. As it has been explained to me, there was a Texas based contractor who was initially administrating the comments on this docket number but the contract was reassigned to an Australian contractor after a request was filed under the ‘Freedom of Information Act’. Please confirm or correct me on this issue.

Numerous New Hampshire legislators and government officials have themselves made comments on docket number PF14-22-000 calling for transparency and engagement in the process. How are we to believe that our comments have any import with your commission based upon the less than stellar administration of them thus far?

I have reviewed copious comments on this docket regarding threatened watersheds, aquifers, flora and fauna. After much careful consideration, the most threatened aspect in this entire permitting process is the public trust in the FERC and the hundreds of thousands of citizens who have found that your commission may very well be yet another instance of regulatory capture.

I respectfully suggest that the denial of Kinder Morgan/TGP’s application for the Northeast Energy Direct project would be a significant first step in regaining some of the public trust that has been lost along the way.

Cordially,
Elisa Benincaso

Washington, DC 20426

Re: Project Docket Number PF14-22-000

Dear Chairman Bay:

We are writing to you regarding the Northeast Energy Direct (NED) pipeline being proposed by Kinder Morgan/Tennessee Gas Pipeline.

We are extremely concerned that FERC approval process is rigged in favor of the oil and gas companies that fund the commission. FERC has apparently only denied one pipeline project, ever. Citizens in New Hampshire alone have put in thousands of hours over the past months educating themselves and writing and speaking to FERC about the negative health, financial, and environmental problems this project would create. But, with a track record of approving almost all past pipeline projects, history demonstrates that FERC doesn't in all honesty weigh both sides equally. We fear that FERC will not give any real credence to all these public comments during its hearings. KM/TGP have submitted incomplete plans filled with "To Be Determined" information, yet the public comment period will close before we learn what those new TBD points will be. How is this process fair and impartial?

New Hampshire citizens are extremely frustrated with the ongoing dishonesty of Kinder Morgan/TGP officials who continue to smile and tell us that we have nothing to be concerned about, hoping we will eventually believe them if they repeat it enough. We are concerned that almost all the fracked gas this pipeline would carry would never be used in New Hampshire, but would instead be exported to Canada where it would be converted into Liquid Natural Gas and exported to European and Asian buyers at higher prices.

Yet, company officials claim there is a shortage of supply here and that our electric bills will be lower. It makes no economic sense to us that if there is a smaller supply of fracked gas remaining after having exported most of it, that the companies will sell it to us at a lower price, or that our electric rates will be lower once we start paying an additional new tariff to cover KM/TGP's costs for building this pipeline. Why aren't they paying for their project? New Hampshire is already a net exporter of electricity to the rest of New England and our state currently has several environmentally sound energy proposals on the table for hydro, wind, and solar with virtually none of the frightening long term health and environmental issues the KM/TPG fracked gas pipeline would bring.

We are extremely concerned about the noise and health hazards that the proposed 40,000 to 80,000 horse-

power compressor station would bring to our particular area. This compressor station would regularly blow off poisonous gas and toxic carcinogens into the air, all within shouting distance to our elementary school, hazardous emissions that never have to be disclosed to the public by the company. The company officials just tell us they are highly regulated and that even though they have never built a compressor station this large, they know the compressors really won't produce that much noise and that the emissions during daily operations and blow-offs are really nothing for us to worry about. We wonder why the company will have no personnel working on-site if it's so safe. If a major explosion or disaster occurs, how long will it take for the company to first realize it and then to send response crews from Texas?

It's incredulous that in America five FERC commissioners have the power to allow a for-profit company to take over hundreds of both longtime family owned and publicly conserved properties using the eminent domain process that was once strictly reserved for truly public sector projects such as interstate highways. After our state and communities have worked for decades to protect environmentally fragile lands for perpetuity, how can just five people have the power to approve a project that will forever negatively impact our lives, property, and environment all for the purpose of steering billions of dollars of profit to corporations whose leaders have repeatedly shown us they have no intentions of doing "what's right"?

We respectfully ask that you, Chairman Bay, and each commissioner of FERC conduct this project review with the utmost integrity, honesty, understanding, and empathy for those of us who do not have deep corporate pockets, but who have instead, put our hearts and souls into doing "what's right" raising our families and bettering our communities in this beautiful unspoiled part of America. We are the people will be forever negatively affected by this project.

Respectfully,

Steven and Niki McGettigan

20151014-5162

Jennifer Scillia, West Hartford, CT.

Regarding docket #PF14-22-000 Tennessee Gas Pipeline coming through Metropolitan District Commission watershed area. My concerns are simple: we are expanding the pipeline exponentially via a company that has known accidents on its record, with poor response. All of this through a large population's watershed area. My understanding is that a large number of trees would need to be cut down. There are wetlands impacted by this. Not enough concern has been given to the natural surroundings nor the potential impact on the drinking water of tens of thousands of homes.

20151014-5174

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission

Washington, D.C. 20426

October 14, 2017

Re: Tennessee Gas Pipeline Company L.L.C/ Kinder Morgan
Docket No. PF14-22-000
Northeast Energy Direct Project

Secretary Bose,

I'm writing this letter to let you know that I strongly oppose the Kinder Morgan pipeline through our town of Merrimack and through the state of New Hampshire.

Report after report shows that there is no energy shortage in New Hampshire. In fact our energy prices have dropped significantly this year. NH has smart, innovative people working to be sure we don't need to rely on fossil fuels.

Report after reports shows that the gas pumped through the pipeline is not for New Hampshire, the majority of it will be exported and sent to foreign markets. To say that the people of New Hampshire will benefit from this is an untrue marketing ploy.

The proposed pipeline goes through our town well heads, I have concerns about that. One sink hole and 80% of the town will be dry. After a taste test of New Hampshire tap water last week, Merrimack Village District Water Works placed first for best public water of 17 contestants from around the state. I fear that if a pipeline goes through our water supply, we will lose this distinction as well as the town's water supply. A dry town is not a town that most people would want to move to or even continue living in.

I have a well, granted I live a few miles from the proposed pipeline but I still have concerns about whether my well will be affected by the constant blasting that will occur as a result of sinking a 30 – 36 inch pipeline in a state that is nicknamed “The Granite State.”

The current proposed pipeline path comes within 1000 of an elementary school's playground in Merrimack. As a Special Education Advocate I have great concerns about school years filled with blasting for those students who have sensory issues.

In order to place the pipeline, Kinder Morgan is going to have to cut a 71 mile swath through New Hampshire – over 4 miles of that in Merrimack. I have concerns about the wildlife, the plants, and water runoff once that many trees have been removed.

I have concerns about my neighbors who are going to have their personal property seized by a private corporation. I was at the scoping meeting in Nashua when an older man broke down in tears – he was counting on selling his house for his retirement. Who would buy a house near a pipeline? He asked the panel.

I know I wouldn't.

I'm concerned about the fact that Kinder Morgan tried to pass off outdated maps of the Merrimack route at a recent Merrimack open house. They seem to specialize in being deceitful and withholding information.

I'm concerned about leaking gas and “incidents” (read explosions.) Our town is not equipped to handle an explosion and it worries me that leaks are common and yet undetected and perhaps more importantly aren't fixed.

I worry about the quality of our air if a meter station is put in our town.

I worry about the culture of our community which will move from a rural to an industrialized town.

I am also dismayed and greatly alarmed to learn that FERC is funded by the companies it regulates. When Kinder Morgan pays your paycheck, it seems like a very pro-Kinder Morgan decision will be reached. I question the authenticity and fairness of FERC.

I have now seen at least 7 versions of the proposed pipeline through Merrimack. Every single pathway affects private home properties, town properties, town water supplies, private wells, conservation land and public streets and highways.

The town of Merrimack is too populated to put in such a devastating transfer pipeline. We have aquifers, wetlands, massive amounts of ledge, schools, neighborhoods/cul-de-sacs, historical buildings, and businesses that will all be adversely affected by this pipeline.

But perhaps the biggest reason the pipeline should not be here is because there is no documented need for this pipeline in NH.

Consider me yet another voice among many who say that the Kinder Morgan pipeline gives all of the risk to New Hampshire without any benefit (and plenty of disadvantages.) From what I can see, New Hampshire is simply being used as a highway for a private company to gain profit.

Wendy Thomas
10 Wildcat Falls Road
Merrimack NH 03054

20151014-5175

Mark Ziarnik, Hartland, CT.

I strongly urge you to prevent the Kinder Morgan/Tennessee Gas Pipeline Company from constructing a natural gas pipeline through Class I and II lands owned by the Metropolitan District Commission (MDC) in West Hartford. Allowing this pipeline to be routed through MDC lands would set a terrible precedent that would put Connecticut's drinking water sources at risk.

As President of The Hartland Land Trust and resident of Hartland Connecticut, I have a strong vested interest in this matter. Hartland is home to a substantial portion of the MDC Barkhamsted Reservoir which is the primary source of drinking water for the city of Hartford and its surrounding communities. As such, one of our top priorities is the protection of both Class I and Class II lands to ensure our reservoirs do not become contaminated. Allowing the construction of pipelines or other industrial projects within these and similar protected zones puts our state's entire drinking water protection system in jeopardy. Please do not let that happen.

20151014-5177

Kathleen Gauvin, New Ipswich, NH.

Part 1 of 2 Filed for Will MacPhee, my grandson, as he asked me to handle this for him.

Dear Governor Hassan,

My name is Will MacPhee. I was born in Temple, NH and eventually ended up living in Peterborough, NH from the seventh grade through the end of high school. My family currently resides there, with my sister Allie a junior in high school, as I attend Harvard College in Cambridge, Massachusetts. I am extraordinarily honored to be one of the few representatives of our fine state at this institution.

For me, it has always been not just a fine state but a great state. New Hampshire is the quintessential place in which one would want to safely raise a family. The high sense of security that even causes some to leave their cars and doors unlocked, the wonderful sense of community that resonates in neighborhoods, and the beautiful diversity of summer, autumn, winter, and spring cause many to see New Hampshire as a wonderful home.

But there's this problem. The people of our state are being threatened by an alien entity, an alien entity that seeks corporate profit at the expense of ordinary people. The Kinder Morgan/Tennessee Gas pipeline that is set to snake through southern New Hampshire is this entity. Naturally, as a corporation in our industrialist, consumerist, and capitalist society, Kinder Morgan/Tennessee Gas is seeking to make a profit by supplying a service to the greater people of this planet. In doing so on American, and specifically New Hampshire land, it is supposedly true they would be supporting our domestic economy. Furthermore, you specifically have claimed that our state needs more fuel, notably in the form of natural gas .

However, it seems clear that this natural gas provided by the Kinder Morgan/Tennessee Gas Northeast Energy Direct pipeline would be benefitting other areas much more than it would be benefitting New Hampshire. And particularly, it would be benefitting the people inhabiting the lands most affected by the pipeline even less.

In an 1859 speech at Cincinnati, Ohio, Abraham Lincoln proclaimed that slavery was wrong, "morally and politically". This plain declaration made the moral wrong parallel with the political wrong. This parallel was a necessary step in the elimination of slavery. Slavery was such an ingrained aspect of southern culture that it seemed impractical, perhaps even impossible, to eradicate. Politically, economically, and socially it was an extremely daunting task, and still today the problem has not been solved completely. But when Lincoln decided to boldly put this political issue on moral grounds, just as Senator Gene McCarthy did with the Vietnam War in his 1968 presidential campaign, the conversation changed. People became empowered to not just see an evil in our world but to seek change, regardless of how politically and economically difficult, how politically and economically impossible, it may have seemed. This process of putting politics on a moral level is beautiful to me.

So, I continually hope we can solve these moral problems in the political sphere, but time and time again find flaws in our society that we avoid fixing. A common flaw I observe is how we seem to often value corporations over people. This flaw was evident in the Citizens United vs. FEC Supreme Court case (2010) that ruled corporations may donate unlimited funds to support political campaigns due to their right to free speech, thus overpowering the true free speech of citizens. This flaw is evident in the horrid ways factory workers are treated and paid as corporate executives rake gluttonous profits. This flaw is evident, finally, in our pressing issue of the Northeast Energy Direct pipeline that is invading the homeland of many New Hampshire citizens, people whose homes will be desecrated in the name of corporate freedom.

As someone who will probably end up majoring in Computer Science, Applied Mathematics, Economics, or Physics, I am generally all about the analysis of numbers. I could go into detail with numbers that display why I strongly dislike the pipeline project in southern New Hampshire, but I'd rather focus on a couple personal situations instead.

My great grandmother lives in New Ipswich, as she has since the 1930s. Her home is a house where she spent 60-odd wonderful years with her husband and is just down the street from where she was raised during World War II. In this house, she has raised four children and hosted many grandchildren and great grandchildren in their youth. I remember kindergarten days when I'd be in her living room playing with her special blocks and I'd suddenly hear the rumbling of a truck coming down the road. I'd sprint over to the picture window and boost my eyes over the sill, without an inch to spare. It would be a plain old Waste Management truck, but it would mean so much more to me – it displayed their logo that conveyed my very own initials. Now I sometimes contentedly sit in Nana's living room, looking at that window, and smile as I recall these passed times. They are an essential part of me, these moments with family; they are what got me to where I am now. Many of these moments with family occurred in that house. Many more occurred nearby.

20151014-5178

Kathleen Gauvin, New Ipswich, NH.

Part 3 of 3

with its even more famous beaches and cultural life.

Hopefully, I won't need to look outside of New Hampshire. Hopefully, Peterborough, the Monadnock Region, and New Hampshire as a whole will retain its beautiful image of community and prosperity surrounded by the leaves of peak foliage. Hopefully they will retain the images that draw my two Californian suitmates to a New England college like Harvard – the image of auburn and crimson leaves settled on a green yard, the image of a fluffy quilt of snow covering the steps of our redbrick library. They were not drawn by the image of muddy snow scraped into an icy pile alongside Massachusetts Avenue with its blue industrial salt providing an alien color. Nor one of the brown, polluted Charles River running nearby amongst the eternal smell of sewer, nor one of the snakes of smoke rising in the background above the city, nor one of the trash that litters the Yard.

Please keep New Hampshire New Hampshire.

Please stop the pipeline.

Thank you ever so sincerely for all you do in service to our citizens and state. I am extraordinarily grateful.

With best regards,

Will MacPhee

20151014-5179

Town Council of West Hartford, CT, West Hartford, CT.

On October 13, 2015 the Town Council of West Hartford, Connecticut adopted the following resolution.

By request of the Town Council, the verbatim minutes of their debate will also be transmitted as a separate

eComment.

RESOLUTION OPPOSING TENNESSEE GAS PIPELINE COMPANY PROPOSAL

WHEREAS, the Tennessee Gas Pipeline Company (“TGPC”), a subsidiary of Kinder Morgan Energy Partners, has proposed the expansion of a gas pipeline in response to increased demand for natural gas in Connecticut; and

WHEREAS, the proposed project includes 14.8 miles of pipeline from East Granby to Farmington, including 5.7 miles routed through Metropolitan District Commission property; and

WHEREAS, TGPC hosted a public forum on the project in West Hartford on October 7, 2015; and

WHEREAS, TGPC acknowledged that it has had safety incidents and pipeline spills at sites throughout the country; and

WHEREAS, TGPC representatives expressed that the project can be implemented without impacting local wildlife, recreation areas and watersheds for drinking water, among other concerns; and

WHEREAS, many members of the public have expressed skepticism about the project, including representatives of the Metropolitan District Commission (“MDC”), Connecticut Sierra Club and the Connecticut Forest and Park Association; and

WHEREAS, members of the West Hartford Town Council share similar concerns about the potential impact of the project and whether TGPC has performed adequate due diligence, including exploring the possibility of alternative locations that do not impact Class 1 and 2 watershed lands; and

WHEREAS, local municipalities, including West Hartford, have very limited zoning oversight with respect to this project, with the project only requiring wetland approval from the West Hartford Town Plan and Zoning Commission, meaning that the project will never be subject to review by the West Hartford Town Council; and

WHEREAS, the proposal will be officially filed with the Federal Energy Regulatory Commission (“FERC”) within the next few months, and FERC is accepting public comments on the proposal until October 16, 2015.

NOW, THEREFORE, BE IT RESOLVED, that the West Hartford Town Council hereby expresses its opposition to the TGPC project in its current form and requests that TGPC representatives explore alternative options and conduct further research to ensure that this and any other proposed project in West Hartford guarantee protection of drinking water, the impacted lands and our West Hartford community.

BE IT FURTHER RESOLVED that this resolution be communicated to TGPC, Kinder Morgan Energy Partners, FERC, MDC, the Connecticut Congressional delegation and the Office of the Governor.

Certified true copy adopted by the Town Council of

West Hartford at its meeting on October 13, 2015.

Which remains unchanged and in effect as of this date.

TO: Federal Energy Regulatory Commission

RE: Tennessee Gas Pipeline Company, L.L.C./Kinder Morgan, Docket No. PF 14.22.000, Northeast Energy Direct Project (NED)

DATE: October 14th, 2015

We support our Merrimack, NH Town Council’s opposition of proposed Northeast Energy Direct (NED) pipeline project. While Kinder Morgan has repeatedly asserted that the NED pipeline “could” ultimately save New Hampshire and New England residents billions of dollars in energy costs, we firmly believe

the adverse impact of any such pipeline, including its construction, its compressor stations, the products it would be used to transport (including its overwhelming volume capacity), and its long-term structural integrity far outweigh any existing or long-term energy needs the state or the region may have or purported benefits it may bring to our community.

FERC has been and will no doubt continue to be in receipt of commentary and data regarding the broad range of impacts the proposed NED pipeline stands to have upon southern NH communities, business and private property owners, natural resources such as wildlife, water resources including those for human consumption, nature preserves and landscape impacts due to the necessary clearing of trees, etc. Locally, we applaud the on-going efforts our Merrimack Town Council, Conservation Commission, Village District (water), and related local governing entities have tirelessly undertaken attempting to communicate transparently and factually with Kinder Morgan. Unfortunately, following our Town Council's recent public hearing with representatives from their firm on October 8th, 2015, it has become crystal clear that it is not Kinder Morgan's practice to cooperate in kind, and instead operates solely in its own self-serving interests.

We were shocked and dismayed, as were most attendees, when Kinder Morgan presented themselves at the aforementioned meeting, which was purposely designed to discuss recent modifications to re-route the NED pipeline through our community, by displaying a map with even further modifications to the route; modifications to which no one in the room besides themselves had been privy. Their explanation, naturally, was that the route planning process is fluid and will continue to be so even as they move into formal project filing during the 4th quarter, but as the already extended comment period for the pre-filing process draws to a close (October 16th, 2015), how are well-intended entities such as our Town Council and similar governing bodies supposed to coherently respond, much less conduct a meeting, when they are essentially tasked with nailing Jell-O to a tree? Never mind newly affected businesses and private landowners who, once again, have been unwittingly placed at a tremendous disadvantage in terms of becoming informed to where they can sufficiently address their interests in a timely manner regarding this constantly changing proposition.

In 2012/13, the Town of Merrimack engaged in drafting its latest Master Plan, as required once every 10 years by NH RSA. Formally adopted in early 2014, it now seems unfortunate this document had to be crafted prior to any insight into the challenge currently laid before us in the form of the proposed NED pipeline. NED certainly would have become part of the dialogue during the drafting process, and perhaps even a consideration which impacted certain outcomes in the final report. We can only begin to hope that parties from Kinder Morgan and FERC take time to review public documents like Merrimack's Town Master Plan, as the components comprising it are extensive and were not undertaken lightly. In fact, they were quite intentional and purposeful. As detailed in the opening Community Vision (1.1) and Land Use and Community Design Goals (1.2), Merrimack does, indeed, cherish its rural character, provide an excellent environment in which to raise a family, encourage proper balance between residential, commercial and industrial development while protecting historic, environmental, and rural interests, and seeks to protect existing residential neighborhoods, among other things. In 2013, the year the Master Plan reached its final draft, Merrimack was listed as #23 on CNN Money Magazine's list of the best places to live in the United States--a concept to which the community remains committed.

That said, Merrimack is a unique New England community; one that has more than quadrupled in size since the 1960s. Now the eighth largest municipality in NH, we are still ultimately a bedroom community nestled between NH's largest cities (Manchester to the north and Nashua to the south); one which does not have a traditional downtown area or town center. We are largely residential (41% + 3% of land for single and multi-family residential use, as per Master Plan Figure 2-1), therefore heavily reliant upon the economic base we do have situated on existing commercial, industrial, and mixed use zoning areas (less than 12 % combined, as per Master Plan Figure 2-1). This balance is focused largely along the Daniel Webster Highway corridor through town, as well as the length of Continental Boulevard and its adjoining juncture along Highway 101A, the latter of which the NED pipeline is presently proposed to almost entirely traverse. This stands to impact a major portion of Merrimack's largest business entities and employers, including but not

limited to PC Connection, Home Depot, Fidelity Investments, the Merrimack Premium Outlets, Elbit Systems, Anheuser-Busch InBev, as well as countless other smaller businesses and some residential areas. If so much as one of these large commercial or corporate entities were to become sufficiently alienated by the proposition, much less the construction of the NED pipeline, to the point of reconsidering their commitment to Merrimack resulting in departure, the negative economic impact to the Town, its residents and its property owners would easily become far-reaching and perhaps long-lasting.

While it is true Kinder Morgan has recently exercised to consult with several large businesses such as Fidelity Investments, the Merrimack Premium Outlets and Anheuser-Busch InBev in an effort to amenably relocate the proposed pipeline within and/or adjacent to those properties, that which is “preferable” is not necessarily desirable so much as it is the lesser of evils. Anheuser-Busch InBev is not only a long-standing, major local employer with potential plans to expand, they are also a tourist attraction, being home to only one of two US locations housing their iconic Clydesdale horses. Yet every re-route thus far proposed by Kinder Morgan seems fixated on crossing the Merrimack River via that industrial parcel for unknown reasons. New re-routing efforts publicly presented October 8th across the Fidelity Investments campus may lessen the project’s impact to that firm’s existing and potential future structures, but in no way lessens the impact to the adjacent 3-acre parcel of property owned by the Merrimack School District; a parcel which Merrimack voters approved to transfer to the Town in November 2009 for the express purpose of building a much-needed larger south fire station. In its current form, the proposed pipeline route would completely preclude construction there, and ultimately would require taxpayers to find and fund another parcel for south station—a station which would surely prove essential in the event of an accident, leak, or incident with the pipeline along that corridor.

It is further distressing that Kinder Morgan--by its own admission--is neither in the natural gas nor energy business--only in the transmission of such products--therefore they do not have direct impact on such energy costs, yet they continue to speak openly of the cost savings the NED pipeline stands to bring consumers. While their statements may be based upon experience, they cannot guarantee NH or New England residents any resulting energy cost-savings in either the short or long term, or even that transported product will remain in New England, meanwhile the expense of this proposed project stands to be incurred by consumers via their energy bills. While our household is presently a consumer of natural gas, we firmly believe endeavors designed to meet existing and future energy needs for NH and New England should be focused on clean and renewable resources. We further find it concerning that Kinder Morgan has publicly stated that, once constructed, the NED pipeline, while initially intended for the transmission of natural gas, could someday be repurposed (Merrimack public hearing, March 26th, 2015); a statement their representation managed to contradict on October 8th, acknowledging that the “writing is on the wall” regarding fossil fuels like natural gas, offering up that future repurposing of such a pipeline would almost certainly be cost prohibitive anyway. If they themselves foresee the long-term viability of natural gas use as relatively limited, NH residents and officials must inherently question Kinder Morgan’s motivation behind this project.

In short, we strenuously oppose the NED pipeline either through our community, our state or frankly any other, and believe the greater good would be served by seeking long-term solutions vested in clean and renewable energy sources. Thus far, the pre-filing process alone for this proposed pipeline has cost our community representatives and those of many neighboring southern NH communities untold amounts of time and energy, our taxpayers and property owners their hard-earned money, and has created a palatable level of stress because the onus seems to be on the unwitting residents impacted by this proposed project to provide testimony, documentation and cooperation rather than upon Kinder Morgan to conduct adequate due diligence and research in advance, much less cooperate professionally with local officials. As of October 8th, the concept of trust over this project proposal has largely gone out the window in Merrimack, NH. We do not wish to pay to become a transmission corridor which “could” potentially save money on energy bills, but will certainly cost us dearly in other respects, even though it stands to make billions for entities like Kinder Morgan and the energy industry. Although on October 8th Kinder Morgan representatives publicly maintained they are not trying to ram their proposal down anyone’s throat, as far as those NH citizens pres-

ent during that meeting were concerned, nothing could be further from the truth.

Thank you for your time and consideration.

Respectfully,

Gerald B. & Tracy L. Bull & family
Merrimack, NH

20151014-5231

Elizabeth Forrest, West Hartford, CT.

I have a few concerns over the Northeast Expansion Pipeline that Kinder Morgan/TN Gas is constructing in our town of West Hartford, CT. My main concern is that this pipeline (which will increase capacity by 200%) runs right in our drinking water supply watershed -- literally feet away in some places. This new pipeline would also directly permanently create a much wider treeless swath that coincides with several stretches of the recreational Metacomet trail. In addition to losing trees, it affects the local bird population, especially the Blue Warbler. Additionally, Kinder Morgan pipelines have a history of leaks which can affect our drinking water -- and isn't it true that fracked gas has a much greater likelihood of leakage than liquid NG? Since the big driver appears to be money, as can be construed by Kinder Morgan choosing this path, alongside a current pipeline, I worry that they will cut other corners when it comes to environmental safety. It came out at the public meeting that Kinder Morgan failed to report to the Federal Energy Regulatory Commission that this project goes through a public drinking water watershed/ reservoir area - MDC ACTUALLY CALLED THEM OUT ON THIS. One of the attendees presented a 30 page list of incident reports attributed to Kinder Morgan! This really doesn't bode well for the future of our town, state, etc if it goes through as proposed.

Mr. Allen Fore

Vice President, Public Affairs

Kinder Morgan Energy Partners

8 Anngina Drive

Enfield, CT 06082

Dear Mr. Gavin and Mr. Fore,

Please be advised that, on June 2, 2015, the Erving Board of Health voted unanimously to hold an open meeting regarding immediate health concerns and long term health impacts to the residents of Erving, regarding the proposed High Pressure gas line and Compressor Station Kinder Morgan/Tennessee Gas Pipeline Co. plan to operate within Erving and close proximity lands in Northfield MA.

You are asked to adhere to this decision, and we respectfully request that Kinder Morgan appear before us

on Thursday, September 24, 2015 at 7 p.m., for a public hearing at the Erving Senior/Community Center, 1 Care Driver, Erving, MA. To confirm that you will appear at this meeting, please contact Betsy Sicard Board of Health Clerk at 413 4222800 X 101.

The format for this meeting will be as follows:

- An opportunity for Kinder Morgan representatives to present information on this project as it relates to the health and the science around and studies on carcinogens and toxic output, noise, spills and odor complaints from the proposed High Pressure gas line and Compressor Station.
- Questions and comments for Kinder Morgan representatives from members of Erving's Board of Health.
- Questions and comments from any Erving and Northfield resident, who wishes to speak that evening.
- In advance of this meeting, the Erving Board of Health would also like to request from you GIS data associated with the proposed pipeline route through our town and Northfield.
- Any material data sheets on toxic disbursements. Location map of Compressor station and proximity to Erving.
- Lists of any and all gas, releases, time, duration, amount of disbursements and impacts to air quality, within 7 miles.

Sincerely,

Erving Board of Health

Re: Board of Health June 17,2015 Letter

To Whom It May Concern:

This firm represents Tennessee Gas Pipeline Company, L.L.C. ("Tennessee") in connection with the portion of the proposed Northeast Energy Direct Project (the "NED Project") located in Massachusetts. I am writ-

ing in response to your July 17,2015 letter to Tennessee. We have been attempting to set up a meeting with your Town Counsel to discuss the contents of your July 17,2015 letter but have not been able to schedule a meeting as of the date of this letter. We are hopeful that after you have reviewed this letter, we can discuss the issues raised herein with you and/or Town Counsel.[1]

The Federal Energy Regulatory Commission (“FERC”) will be the government agency responsible for reviewing Tennessee’s application for a certificate of public convenience and necessity to construct the NED Project located in Massachusetts. As part of the review process, FERC will, inter alia, evaluate the proposed siting of the pipeline and the proposed construction methodology.

It is Tennessee’s position that the Town of Erving Board of Health lacks authority to issue health regulations concerning the siting or construction of the NED Project, a federally regulated natural gas pipeline project. Under the authority vested in FERC by the Natural Gas Act, 15 U.S.C. § 717 et seq., the federal government through FERC maintains “exclusive jurisdiction over the transportation and sale of natural gas in interstate commerce for resale.” *Schneidewind v. ANR Pipeline Co.*, 485 U.S. 293, 300-01 (1988). FERC exercises this jurisdiction through the permitting authority vested to it by Congress, including the requirement that a petitioner obtain a certificate of public convenience and necessity prior to commencing construction of facilities in connection with an interstate natural gas pipeline. 15 U.S.C. § 717f(c)(1)(A). Multiple state and federal courts have held that state and local government regulations concerning siting or construction of an interstate pipeline are preempted because jurisdiction is exclusively occupied by FERC’s permitting authority. See, e.g., *Islander E. Pipeline Co. v. Blumenthal*, 478 F. Supp. 2d 289,294 (D. Conn. 2007), quoting *Nat ‘I Fuel Gas Supply Corp. v. Pub. Servo Comm ‘n of the State of NY*, 894 F .2d 571, 579 (2d Cir. 1990) (“Because FERC has authority to consider environmental issues, states may not engage in concurrent site-specific environmental review”); *N Nat. Gas Co. v. Munns*, 254 F. Supp. 2d 1103, 1110 (S.D. Iowa 2003) (“The breadth of [federal statutes and regulations governing environmental and land use issues], when combined with extensive safety regulations applicable to pipeline construction, compel the conclusion that Congress has occupied the field of interstate gas pipeline regulation, including land maintenance and restoration standards”).

The FERC permitting process facilitates state and local authorities raising concerns about a proposed project. As such, the Town of Erving and its citizens may participate in the FERC review of the proposed NED Project during the pre-filing process and the certificate application process by, inter alia, submitting comments to FERC and attending open houses conducted by Tennessee and scoping meetings conducted by the agency. We encourage the Town of Erving to raise any concerns it may have regarding the NED Project with FERC.

Additionally, to the extent the siting and construction of the NED Project is not within the exclusive jurisdiction of FERC, it is Tennessee’s position that Erving does not have authority to issue health regulations concerning the siting and construction of the NED Project because Chapter 164 expressly delegates the regulation of natural gas pipelines to the Department of Public Utilities (“DPU”). See G.L. c 164, § 1 et seq. Municipalities such as the Town may only adopt local ordinances to exercise “any power or function which the [Legislature] has the power to confer upon it, which is not inconsistent with the constitution or the laws enacted by the [Legislature] in conformity with the powers reserved to the [Legislature] by [Section 8 of the Home Rule Amendment].” *Town of Wendell v. Attorney Gen.*, 394 Mass. 518,523 (1985) (internal notations omitted). See also G.L. c. 43B, § 13 (“Nothing in this section shall be construed to permit any city or town ... to exercise any power or function which is inconsistent with any general law enacted by [the Legislature] ...”). The Legislature has delegated to DPU the authority and responsibility to regulate and oversee natural gas pipeline companies, to the extent that regulation is not within the exclusive jurisdiction of federal authorities. G.L. C. 164 §§ 72, 75C, 75D. See also *Boston Edison CO. V. Town of Bedford*, 444 Mass. 775, 781 (2005) (“We have stated that the purpose of [Chapter 164] ... is to ensure uniform and efficient utility services to the public. We have also concluded that, given the comprehensive nature of [Chapter 164], the Legislature intended to preempt local entities from enacting legislation in this area.”) (internal citations and quotations omitted).

Lastly, the Board of Health does not have authority to issue an order concerning the siting or construction of natural gas pipelines under G.L. c III, §§ 31 or 143. Section 31 only permits a Health Board to issue “reasonable health regulations,” not to make siting decisions of infrastructure projects, much less infrastructure projects that reach beyond a municipality’s geographic reach. Similarly, Section 143 only permits a Health Board to assign trades or occupations to a particular site, or prohibit them entirely. Section 143 does not permit a Health Board to make siting decisions of infrastructure projects that reach beyond a municipality’s geographic reach.

In light of the foregoing, Tennessee is electing not to participate in the pipeline hearing scheduled for September 24, 2015 and expressly reserves all of its rights. Tennessee certainly encourages the Town of Erving and its citizens to participate in the FERC process and to provide its input through that interactive deliberative process. Tennessee is available to discuss the NED Project with town officials or appear at an informational town meeting and I would appreciate the opportunity to meet with your Town Counsel prior to the scheduled September 24th hearing.

Please feel free to call me.should you have any questions.

[1] This letter is not intended to comprehensively address the grounds set forth herein, or to identify all of the reasons Tennessee contends that the Town of Erving Board of Health may not regulate the siting and construction of the NED Project. Tennessee reserves all rights and remedies to set forth additional grounds and reasons.

Sincerely,

James L. Messenger

PROCEEDINGS

(Video demonstration.)

MR. SCOTT: As we’re looking at that scene that you just saw is the technology used to put the pipe under

the rivers. That particular pipe -- these are done out in the Midwest. This is a company video. There's your swah and the flat land, so that's the amount of space they're going to be looking at.

There is also an access road on the side that as you can see. So this is them in the process. Obviously this is after they've been approved by FERC. They obviously commenced to digging. And then this large capacity pipeline that we're talking about. There's the welder guys that show up and pick it. So this gives an idea.

Now, the diameters change, right, so as we hit ledge, they'll go wider. As we hit water and we have the land area, they go wider. It will depend on the parameters that FERC sets for them and in accordance answer with how the project is determined in the environmental impact statement. We'll come up with all of that.

You can see the access. They need to still lay that pipe in a real flat area. So my plan was to kind of show, like I said, ten minutes of video. Hopefully we'll get the conversation kind of started at least if we can ask the questions. If we watch the video and it comes up with a question and we ask the question here on the record. The Board of Health thought it will be a great opportunity to get that sent to FERC you as citizens of the town are being impacted by this specific project are the ones that need to be heard by FERC.

A lot of people didn't go on-line. A lot of them people didn't have the opportunity to go to a meeting. I figured I would take it upon the Board of Health shoulders to do our job and basically inform you as best we could.

Could you look up Titan 250 compressor?

As I searched around trying to find information on out-gassing, blowdowns, all the stuff that the Board of Health is concerned about, I came across and was just looking at these videos. There's a hundred of them. Most of them are really long, especially watching blowdowns. It's too long for me to watch.

What I did find is the Titan 250 compressor station. The Titan is what is proposed for Northfield. That is the model. These guys are very proud. I was pointing out to somebody today that it's probably the best device ever devised by man to move liquefied natural gas from one place to another. It's an amazing machine. Is it a machine you necessarily want in your backyard.

So this is their sale video to industry professionals to hopefully -- that's the inside of it.

(Video demonstration.)

That's the inside of the building. That's the outside or some of the outside. I would like you to hear this gentleman speak so you're getting an idea of the size of the compressor station.

Now, the compressor station obviously is a unique compressor station in that it's also a power generating station, so it's not just a compressor station. They actually make a model, it sounds like from what I've done my research on, that they made a model that actually is just a power station. So it's kind of a unique and interesting machine. I wish I could show you a little more. Has everyone seen a blowdown?

AUDIENCE MEMBER: No.

MR. SCOTT: Let's go back into basic YouTube. This is about a minute video.

(Video demonstration.)

MR. SCOTT: You get an idea of how loud it is going to be. We didn't touch the volume. We need to turn it down.

As the pipelines move liquefied natural gas through the pipeline, there's all sorts of chemicals from the fracking process. There are chemicals that are actually leached out of the ground. Naturally occurring chemical that has been studied is radon. Radon is naturally occurring in the ground pulling out of the ground, and the natural gas starts to accumulate.

So what happens is what better place than where you're building up a lot of pressure to let it all accumulate. Some of them are unknown. They're proprietary chemicals used in the extraction process of the

natural gas, and we're not allowed to know what they are because they're trade secrets.

We don't know what those chemicals are. We do know that the Titan measures its out-gassing in a yearly operating procedure in tons of gas. So the CO₂s are in the realm of 380 tons per year, just CO₂. Then the list goes down through carcinogens of certain sizes of five microns and larger or 2.5 microns or smaller, which are very, very dangerous. They're really, really small.

As the Board of Health, right? We are here in Erving and the things may not even be in our town. Kinder Morgan told us that. It was not going to be in your town. That's one of the reasons we're not talking to you.

The air is the air, right? What is in the air in Northfield is in the air in Erving, so that's a silly kind of argument, but I really want them to say, Hey, there's nothing to worry about. Check out the signs behind these compressor stations, and they blew me off, so I had to do my own research, and the more I did I saw blowdowns and started to do research on what was coming out of these things.

The list is massive. I can't pronounce most of the names and as soon as that happens, it scares me a little bit. I run into brick walls. And I made the joke today to Curt.

Do you want to see if Curt is home on Skype?

MS. WESSEL: When Kinder Morgan came with all the guys in blue shirts at JCC. Maybe a year or so ago we asked the question specifically, What's coming out of there? How much? And they said, Oh, it's within federal limits.

MR. SCOTT: Right, and here is the interesting thing. When I first got on the conservation commission, I had my role mixed up, and I contacted -- not to pick on Erving Paper, but I was new to town and I thought it was really nasty smelling and I really wanted to know why it smelled like it did, and I kind of pushed my way up into the offices in Boston by phone using -- I'm a conservation person, and I think they humored me and let me talk to them, and they basically said, We have three sniffer trucks in the state of Massachusetts that's smelly air.

I'm not picking on Erving Paper. It turned out to actually not be Erving Paper. So I thought it was them. They said, Here's the deal. You call up Erving Paper and you say, Hey, I want to test your smoke-stack. They get 72 hour's notice to say whether they let you on their property or not.

If they decide to, wouldn't they clean up their act? Then on that three days, you come in and put your thing in their smokestack and you test what is coming out of the smokestack for a day or whatever. Then you bring that science back to the lab and analyze it. You say, Okay, these 15 carcinogens came out.

Now you got to come back to the air in Erving. Now we got to suck some air up and test that air. Then I got to prove that those particles are the same particles that came out of the smokestack when they could easily have somebody argue it was Rodney Hunt. It's not us. It's the factory right down the road. The wind is blowing.

So when you come up against the federally -- I hate it pick sides on this whole thing, but I feel like federally bulldozed project we don't have any say, and they pull it away from you. It's almost like the carrot. Hey, can you give us some comments? Can you be involved?

Then you go, Yeah, we want to know. Then they go, Wait, no. I feel like the tobacco industries. It's like, What's coming out of them? Well. Keep the balls in the air.

So when I did the research on the Titan -- the Titan runs in different ways, so that's depending on cubic feet of gas per minute. So if it's 8 billion cubic feet of gas per minute that travels down the line, then X number of carcinogens are going to drop out, theoretically. Then X number of carcinogens would be out-gassed, theoretically, at a certain interval. Right? But you're never going to run at full capacity, so now we're going to run it at half capacity. Now we're running at a quarter.

So never will you get accurate, 100 percent science because never is the whole system going to be run-

ning at 100 percent or 30 percent or 40 percent all the time. It's going to be variable. That's when you get into the whole lot of ball of wax dealing with the Nescos of the world. So they're kind of controlling who is generating what and how much power.

MS. WESSEL: The point I want to make is Senator Rosenberg at the last hearing listened carefully and I respect him, but he was not going to focus so much on health and safety. He said the most important thing to prove is no need.

MR. SCOTT: Right, and I get that argument, and here's why. If you can nip it at the bud, so that's where he's like, why fight health impact, because that's sort of giving in? Let's say there is absolutely no need for it and stop it before it's built. I get that. I totally get that. That's why I think many of us have to attack this bohemia. What was of the old Arabic saying? "Death by a thousand cuts." I'm totally fine with that, and that's the way it has to be, because you just keep slicing away at this big monster that's rolling through your town that isn't going to listen, and that's when I get upset because I felt like we didn't demanded anything of Kinder Morgan.

They didn't have to send their spokesperson, maybe just a couple of scientists. I can't find the scientists. I spent weeks on the phone. I talked to UMass in Worcester and in Amherst and I can't find a scientist one way or the other to say it's really good or really bad. The science is inconclusive.

We were able to get Curt here. What I said just recently to you in the past few minutes that him and I talked about today, and it's one of those things that someone like him -- he had an issue. I knew that he's a resident, an on-call resident pediatrician on-call at Boston City Hospital. It's highly possible he got called in to work.

AUDIENCE MEMBER: He's on-line.

MR. SCOTT: Great. Why don't you dial him?

(Curtis Nordgaard, M.D. attends via Skype.)

MR. SCOTT: We have a small crowd here, but we have an enthusiastic crowd. We were talking and the question was, What comes out of one of those blowdowns?

DR. NORGAARD: Have you answered that question already?

MR. SCOTT: No. You're just in time. First of all, just for the record, because we have a stenographer here, can you introduce yourself and give us your credentials and then kind of move into what comes out of the compressor?

DR. NORDGAARD: My name is Curt Nordgaard. I'm nearing the end of my training as a pediatrician at Boston Children's Hospital and Boston Medical Center. I have a medical degree and Master's degrees in biology and psychology, and I'm here to help us talk about the possible health consequences of compressor station emissions.

So in Massachusetts we have a state law which is similar to the Freedom of Information Act, and through that we can request the records from the Department of Environmental Protection, and I did that and requested the records relating to emissions from the Hopkinton compressor station.

And so what I do know is that these stations, simply looking at that, they release carbon monoxide, ammonia, nitrogen oxide, sulfur oxides, particulate matter and something called.

AUDIENCE MEMBER: We can't hear him.

MR. SCOTT: Volume better now?

AUDIENCE MEMBER: Yes.

DR. NORDGAARD: So I was able to obtain records from the Massachusetts Department of Environmental Protection, and they reported that the compressor in existing compressor stations in Hopkinton on another Kinder Morgan pipeline releases carbon dioxide, ammonia, nitrogen oxide, sulfur oxides, particulate matter, and volatile organic compounds.

So what I've been doing since I learned about those emissions are studying a couple of them in particular. Particulate matter, volatile organic compounds and to a lesser extent nitrogen oxides, they all have implications for health, but those are the ones that I think there's a lot of data on, and particulate matter is especially something that I'm working to measure from existing compressor stations.

So I'm happy to either talk about those things or anyone has specific questions about those emissions, I can answer them.

MR. SCOTT: Is there a specific question? I know one person had signed up to speak. Do you have a question.

AUDIENCE MEMBER: He's answering it right now.

DR. NORDGAARD: Let me start by addressing the question of how much of these pollutants are coming out of the compressing stations. The Massachusetts Department of Environmental Protection keeps track of annual releases that they measure in tons.

If you already talked about blowdowns, then you know that annual report in tons doesn't tell you very much about what's happening on a day-to-day basis. And, in fact, to know how many tons are being released by the station doesn't even tell you how those pollutants are being distributed.

A lot of what we know about the health implications of pollutants are measured in concentrations and not in terms of tons released per year. So it's very hard to draw a parallel between the data they get from regulatory agencies and what we know about the health consequences of these pollutants.

You can also get data from the Department of Environmental Protection on-line, and I looked at few of their compressor stations and compared them to the data from Hopkinton compressor and what you can see is there is a lot of variation between compressor stations and between the same compressor station from year to year, and that is not an area of expertise.

I think my understanding is that it probably has to do with the properties of the gas being burned by the compressor station, as well as obviously things like the size of the compressor station.

Another thing that I noticed is that between 2009 and about 2013, the emissions from the Hopkinton station increased dramatically between three and six fold, and during that time, Kinder Morgan had secured new contracts to transmit more gas through their pipeline.

So that's another factor, that compressor stations will have compressors of certain capacity, and they may or may not be releasing at their full capacity and it all depends how much gas they're sending through in the contracts.

So one thing that people have tried to do is measure not just in terms of the annual tons that we get in the reports, but actually go to the compressor station and measure what is being released.

There's a huge shale play in Texas, the Barnett shale, and some of the monitoring there shows benzene in particular and can be detected at very high levels some distance from the compressor station. The data that I'm thinking of, although I don't have it for that particular measurement and exact distance, is probably on the order of 500 meters.

The other thing that people have done -- there is a group in Pennsylvania which has tried to measure the particulate matter and volatile organic compounds near the compressor stations, and they didn't find quite elevated levels of formaldehyde 800 meters from the compressor stations.

And for both the benzidine and formaldehyde, these are compounds that fall in the class of all organic compounds, and both of those things at high concentrations have both general health consequences in terms of respiratory symptoms and neurological symptoms and also cause cancer.

The other thing that this group has done is try to measure levels of particulate matter. What they found in a study in New York that was recently completed by them is their level of particulate matter over the course of a couple of months were significantly elevated above federal standards, and they measure them one-to one-and-a-half kilometers. Really that's about the limit of the data that I've been able to find in

terms of what is measured that's released from compressor stations.

The other approach a few people have taken is to try and take what we know about the annual releases of different pollutants and use complicated atmospheric modeling systems and try to provide an estimate of where the pollutants might go and how far out it might spread. Again, there have been only a couple of studies about that and some of them have been criticized for their methods, so I think it's very challenging to use those data to try to answer the question of how far pollution from a particular station that might travel.

Another thing that people have done is to try to measure health symptoms in people living near compressor stations. I've only been able to find one study that used this approach, but the residents who took part in this community survey did report a number of symptoms that were based on pollutants, including headaches, sinus irritation, nose bleeds, and that was on the order of distance from 500 meters to 1500 meters from the compressor station.

So as far as I've been able to tell, that's the limit of data that we know that is specific to compressor stations. And so what I can talk more about is what we know about the pollutants themselves in a general sense, and those are things like the particulate matter.

At the beginning of this, did you talk at all about what the different pollutants are? I can get back to that.

MR. SCOTT: Please do. I'll be honest with you, a lot of them are beyond my vocabulary range. Some of those chemicals are multi syllabic.

DR. NORDGAARD: I can break here, so if people have questions about the studies I mentioned, the releases from different compressor stations, or those studies. Does anyone have a question?

MR. SCOTT: I think you're shocking us all. We'll think of them all in the car home.

So here is something, when I was looking at what this compressor, more specifically at least at this point talking about is this Titan 250 compressor generator, the idea that they're going to tap into the liquefied natural gas, use that to run the compressor itself and generate its own power.

In those blowdowns which are periodical, as you said, covers a wide range of chemicals, when we talk about microns, sizes -- right? Those are the size of the particles, but can you talk a little about the 0.5 micron size and the 2.5, and the very, very tiny below 2.5 micron size?

DR. NORDGAARD: I'd be very happy to. We're talking about microscopic particles. If you think about smoke or a cloud of dust, these things are obviously not microscopic. Those are suspended particles in the air, and those larger particles, especially something on the order of dust, when you breathe those in, because they're so big, relatively speaking, they can be trapped at the beginning of our airway which actually starts at the entry to our nose.

And so those larger particles will get filtered out through nose hairs, all of the structures inside your nose. The air goes down in your throat. Even as the air keeps going down your throat towards your chest, that is still our main airway and the lining of that airway is also filtering out larger particles, but the smaller ones, because they're so finely suspended in the air, they are able to travel farther down into our lungs. The smaller the particle, the farther it gets into your lungs.

So the different sizes that people use are like the ten micrometers, which is like the coarse size particles, the 2.5 micrometers which is the fine particulate matter, and then there is the 0.5, the ultra fine particulate matter.

And, again, because I am interested in measuring the level of 2.5 micrometers particulate matter, and it also seems to be very wrong for our health. I spent most of my time reading about that.

There was a very extensive scientific literature on this topic. It's very well studied because, again, there are very clear relationships between these very small microscopic particles and human health. Those particles, depending on what generates them, they may have different elemental carbon or iron or other metals in them. They might have harmful pollutants in them. Like benzene, for example, if the particles

are generated from burning fossil fuels, like natural gas.

Then the particle delivers itself down into the lungs and gets absorbed into the body. So a lot of the health consequences of breathing in high levels of particulate matter, whether it's from burning fossil fuels, like a fixed industrial source or even from traffic -- cars release particulate matter -- or from some other industry process.

Some of the things that have been associated with particulate matter, for a longer term exposure, diabetes, different kinds of heart disease, like stroke and heart attack and asthma.

Within the studies of particulate matter, there are those that look at the long-term consequences and those that look at what happens if there is a short-term burst in the level of the particulate matter. That's really relevant for compressor stations because during a blowdown, there will be much higher levels of particulate matter.

The other thing is even when the station is operating on a basic level, the distribution of pollutants will vary a lot depending on the weather. So at some point in time the weather will really distribute the pollution widely and the other is when the air is still, the pollution will stay concentrated within the compressor station and then the level will be higher.

It turns out that if there are peaks in the particular matter, then it's more likely to lead to emergency room visits or asthma attacks and heart attacks. A lot of studies take the approach of asking if we look at the relationship between levels of particulate matter and different measurements of health, like Health. Coms and you can create estimates, and say if the levels of particulate matter go up by X amount, what are the consequences?

And some of the studies that I reviewed which are published in the peer review scientific literature shows that if you increase the levels of particulate matter by ten, which just the unit is ten micrograms per cubic meter, then -- this one study found that the level of death due to heart disease goes up by one and a third percent from a lung condition called COPD or chronic obstructive pulmonary disease. Lower respiratory infections like pneumonias go up one and a third percent.

The other thing that's concerning is pre-term birth and low birth weight are also associated with levels of particulate matter, so using a similar approach.

I know another study showing that if the level of this 2.5 micrometers particulate matter goes up ten micrograms per cubic meter, then the odds of low birth way go up by 5 percent and all pre-term birth goes up 5 percent.

MR. SCOTT: Can I ask you to put context ten micrograms per cubic meter? How can I get my mind around what that is? Do you know what I'm saying?

DR. NORDGAARD: Yes. So it is hard because, again, the measurements that we get are often on the order of the tons released per year, but there is a group in Pennsylvania doing the research that I referred to earlier, and some of the peak levels that they measured were on the order of one or two hundred micrograms per cubic meter. The background levels at several homes near compressor stations ranged from six to 20 micrograms per cubic meter.

The federal standards right now, the annual average of the acceptable limit for the 2.5 micrometers particulate matter is 12 micrograms per cubic meter. So then this home that I referred to where it had a measurement of 20, that exceeds the federal accepted standards. And, again, some of piece they measured were going up to one and two hundred.

There are consumer level devices you can buy to measure particulate matter. I recently purchased one, and if you cook in the house, actually the particulate levels go up quite high, and that's simply a matter of fact that cooking or frying releases aerosols, and what's in those little particles are not the same as what you get from burning natural gas. It's not quite the same, but even something like cleaning your house can raise levels of particulate matter, not for a persistent period of time, obviously. Does that help at all?

MR. SCOTT:· It does.· I want to quickly introduce Rosemary Wessel from No Frack Gas in Massachusetts.

MS. WESSEL:· It's great to see you through Skype again.· What I hear from you is very much in line with a study that was just published in Litany Reader last week about the Minisink compressor station in Minisink, New York. Particulate counts up there when it's high is 460 at times, but they tended to hove around 17 to 20 micrograms per cubic meter of the particulate matter of 2.5.

And aside from the other problems you cited, there was also an increase in autism from women who were exposed in the third trimester. Their children had an increase in autism.· And there is a high level of nose bleeds in children in that area as well that lived within a mile of the compressor station.· So that basically corroborates a lot of what he's just given you.

DR. NORDGAARD:· The thing that we can't answer is, What were the levels before?· So in these studies the levels measured are about 20 and beforehand they were ten.· Then we're talking about the order of magnitude of the study I just referred to where they look at changes of what happens if you increase the level or the concentration by ten micrograms per cube meter.

MS. WESSEL:· The study went further out, a couple of miles further out, and the average was 6.3 per micrograms as opposed to 17 to 20 within a mile of the compressor stations.

DR. NORDGAARD:· The other thing anyone can do is if you are able to find the right EPA website, which I'm happy to point it to you. You can request a public access account which allows you to download the data from any of the federal air quality monitoring stations.

And so I just got access myself and I was looking over a period of a couple months in the Boston metro area the levels were around the order of six, which is well below the federal standards, but certainly much lower than what we're talking about near some of these compressor stations.

MS. WESSEL:· Another thing that's possible that would happen here in Erving is a main line valve in the pipeline which has a remote blow-off valve as well, so it would be off-gassing unburned natural gas.· I was wondering if you have any insight as to the particulate matter of unburned natural gas versus the burned natural gas from the compressor engines.

DR. NORDGAARD:· My expectation is that before it's burned, you would be looking at more compounds release fewer particulate matter or less particulate matter.· The reason is that some of the volatile organic compounds are consumed through the consumption process by burning the gas in the compressor.· So when you just have a straight release of the gas, then you're potentially getting more of those, which are also quite hazardous and less of a particulate matter.

And, again, some of the things that have been measured from gas that's produced by the fracking process are the venting formaldehyde, Ethel, things that are very well-established to be toxic and carcinogenic.· From the little bit that I've been able to understand about volatile in a compounded gas, I believe the process is that as the gas comes out of the fracking well it's probably the site that has the highest level of volatile organic compounds.

Some compressor stations have something that's called -- where they take off the volatile organic compounds and store them in tanks. It's the methane that burns as our natural gas and not things like benzene even though that might be consumed in the process.· A whole other issue about compressor stations is not just the engine itself but what is on the property along with it.

The compressor station at Hopkinton at one point had a fuel source chain that was, I believe, used in case they needed to use a back-up generator, and a lot of the ones in Pennsylvania and Texas have these condensing tanks that release in some cases the level of benzene that are well over a hundred times the limit.· That's known to increase the risk of cancer.

And so we focus mostly on the engines themselves because that is what is releasing a lot of the pollution, but that's not the only thing. You mentioned the remote blow-off valve.· There are other things that come along with the industrial infrastructure that are also potential sources of pollution.

MR. SCOTT:· It gets you thinking, right?· So when you talk about the micron sizes, there is different

micron sizes, those can be any of the chemicals, right? Can they all break down into different sizes or certain chemicals, like can benzene be of those very tiny particles as well as some of the proprietary chemicals that we don't know about yet that are trade secrets? Can those also be of that size?

DR. NORDGAARD: Yes. And what I do know about particulate matter is, as I said, some people break it down to, again, the elemental and the organic carbon, which is just a way of saying like metallic kinds of components of the particulate matter and the complex molecules. They really are a mixture, and so the particulate matter will have pieces of both, and that's part of why scientists think that they're harmful to us because they're delivering both the levels but also the toxic chemicals that produce in the body.

In order to sort out what is in those particles takes pretty specialized equipment and that research is being done in general for particulate matter, but we're very far away from having that kind of knowledge about compressor stations.

There is just such an absence of almost any kind of data on what's coming out of the compressor stations and how those pollutants are being distributed and across what distance. We know far less about them than I would like. It makes me very uncomfortable.

MS. WESSEL: One of the few studies that I know of that was done on compressor stations emissions was done in Dish, Texas. It's the town of Dish. I actually gave a copy of that report to Cyd. It did find a tremendous amount of chemicals, but, of course, there's some they were not allowed to report because of the gag rule on natural gas companies from natural gas companies.

MR. SCOTT: Those chemicals aren't trade secrets.

MS. WESSEL: Right.

MR. SCOTT: When I was talking to Curt earlier today, I feel like as an elected health official, I get the low end of the ladder here, but I feel like we're the ones who are cautious because we're concerned about the implications and yet the industry moves forward and looks at maybe there will be some implications. We'll worry about that later.

There's a two-tier approach to the same problem, and one is cautionary and one is kind of haphazard. I'm kind of probably preaching to the choir here, but can you just share your own personal opinion about how this whole process plays out?

DR. NORDGAARD: You know that I am a pediatrician. I have taken care of many sick babies at Boston Children's Hospital and Boston Medical Center and Brigham. I've taken care of many children with bad asthma. You know that's hard for me. Of course, it's my job and I love taking care of children, but that's tough and I'm not even a parent, and I'm not the parent whose child is affected by this. I'm also not the adult whose parents has had a heart condition or has a stroke or has a heart attack.

This is real, and I can't tell you exactly what anyone's risk will be because the data are not good enough, but I do know what's being released by compressor stations, and I do know these chemicals that are very well known have health consequences. In my position as somebody who is interested in protecting health and not just treating people after they've already gotten sick, I'd much rather try and prevent some of these illnesses that I'm seeing.

I just don't see that building this infrastructure justifies the risks that we're talking with our health. What we do know is there is just such a huge spectrum of what is being released and we really just don't have the data to really understand and to answer the question, Is this going to harm us or not? We just don't know that.

I think talking to people who live near sites that are developed or are scheduled to go through development. They're often very concerned. I think that's very reasonable to be concerned. It's possible that the levels of pollutants are low enough that there may not be any significant consequence for any individual. That's possible, but I just don't see the risk of things that we're talking about justify building this pipeline when we can't even answer the question if we even need the gas in the first place. For me, it's a frustrating topic.

MS. WESSEL:· That's one of the worst reasons why this is a bad project.· It is the impact to health and also to environment.· Once you start digging up that trench, you can't put soil back once you dig up a trench.· You can't put soil back the way it was.· You can't fix that kind of damage and it takes years for those kinds of chemicals, as far as I understand, to process and leave.· I don't know how much they leave the environment after facility is shut down.· How long do they stay in our air or water?

We do live in an area where there are temperature conversions.· One of the favorite things that engineers like to say about blow-downs is methane is lighter than air.· It just goes up into the atmosphere.· We have temperature conversions where the cooler air pushes down and traps things at ground level from time to time and that's when blow-off facilities, blowdown facilities can trap these gases right at ground level.· They're heavier than air elements in them and that gets into ground water and gets into the soil around these areas.

MR. SCOTT:· I would ring that bell again because that came up at one of the Board of Health meetings was that.· Today, for example, if anybody was out this morning, which I had the pleasure to bring my daughter to school early this morning, it was thick fog, those kinds of barriers that stay in those nooks and crannies and valleys.

If you've ever been on a hike to the location where the compressor station is going to go, it overlooks the great swamp and it overlooks Great Swamp Road.· That's a serious little valley. I've seen that many times very, very foggy, and my question is -- we don't get the answer -- but I have to look and go, What happens when that hits that fog?

MS. WESSEL:· Of course, Northfield has the distinction of being at the top of the watershed too.· It's on top of a mountain.· It's at the top of the entire watershed that comes into this valley as well.· So anything that gets trap in the air and water comes right downstream and ends up here eventually.

MR. SCOTT:· Then we're talking about buildup in the body, right?· Then we are talking about prolong exposure, because that is one of the concerns I had asked Kinder Morgan -- I'm addressing you Curt -- that, you know, I said to Kinder Morgan, Can you talk to us about long-term and short-term? We get the short-term.· Okay?· It's gas in the air. It's toxic.· What about long-term, cumulative effects?

Now, in your research, has that come up where we can say, Well, hypothetically, because I don't have any research, but an increase of compressor stations and an increase of illness around those compressor stations, could they potentially be grafted out to maybe show a correlation?

DR. NORDGAARD:· So you're talking about doing a study of some sort to look at the long-term effects of the compressor stations?

MR. SCOTT:· Yes.· So if you live next to a compressor station for 20 years and you have a kid there for 20 years and that kid ends up staying four years and has another kid so you got generations now, that buildup in the body, especially the mother, is that something we can could draw a line maybe just at some point, this may be just speculative, but over time the accumulative factor could be a serious, cancer-causing agent, right?· If you're ingesting carcinogens over a long period of time, theoretically you're chances of getting cancer would go up, right?

DR. NORDGAARD:· So, again, if I go back to some of the volatile organic compounds like benzine, some of the studies have measured levels of benzine that are in the order of -- let me go to a slide to get the exact number here -- 46 parts per billion of benzine that is like some distance removed from the compressor station, and what you would need to know is what is the kind of background level of benzine.· If the level of benzine is 45 and those units are micrograms per cubic meter.

If a population of \$10,000 people are exposed to a low level of benzine at 45, then one out of those 10,000 individuals will get cancer from the exposure to benzine.

For formaldehyde, for the same numbers, it's a level of eight and the units are somewhat arbitrary here, but my point is these are federal data from EPA data base of toxic substances and disease registry that say if from what we do know about the published science on these chemicals, if you expose a certain

number of people over a lifetime, here's what we would expect for additional cases of cancer.

There are similar data about short-term and long-term exposures to chemicals. For example, again, with benzene, it is well-known benzene damages the bone marrow where a lot of our blood cells are made, and that is not cancer per se but it's a side effect. It's a toxic effect of benzene. So if you're exposed to that over a long period of time, it's more likely to happen. Is that the kind of thing you're thinking about?

MR. SCOTT: Yes. It's speculative science because we don't know firmly, but my question, again, was only to Kinder Morgan, because they're the holders of the keys, what research did they have for long-term health effects? Because, like I said, we can talk about what's happening in the air, but there has been compressor stations for 15 years now, so somebody must have compiled that research at some point. Like we're talking to big tobacco whose like, We know that's smoke. Well, no, it doesn't. Maybe it's just a little bad for you.

MS. WESSEL: A little aside, Kinder Morgan's PR guy used to work for tobacco.

MR. SCOTT: It doesn't shock me at all.

MS. WESSEL: That and the Heritage Foundation. So, yeah, but I think some of that would be based on whether or not there were base level studies before the compressor station to see what the difference was once they started operation, and that's one thing that we're hoping to get done with air quality and water quality in communities, if we can find a way to do it to get a base level of what is going on now, so if this is built and becomes operational we know what the difference is so we can say, Yes, it's probably coming from there.

And I wonder if there's any evidence that you found, Curt, of the change in health rates from communities that didn't have compressor stations that later on had them.

DR. NORDGAARD: No, I don't. I think the companies themselves -- I think it's very likely that they have data about the pollutants that they're releasing. They may have some circumstantial evidence about the health effects that arose in communities where compressor stations had been built. I don't think they would have gone out of their way to do any health-related measurements.

Again, they might have been interested in looking at pollution levels. I just don't give them credit to think much or care much beyond that. And in terms of before and after studies of health symptoms, I can only find one good study or one reasonable study of health symptoms and that was in a place where a compressor station had already been built.

What they tried to do there is look at the pattern of symptoms people report based on how far away they live from the facility as kind of a way to get at the question of: The closer you live, the more pollution you get exposed to. So the people who live closer report more symptoms. That part did hold true if you lived within 750 meters of a compressor station. People report more of the symptoms, you would expect, from exposure to compressor station emissions.

MR. SCOTT: Just out of curiosity, this just popped into my head, we watched the video on the Titan 250 on-line on YouTube, and that particular facility was in Ontario, Canada, I think. It was extremely remote and they used that term specifically, and they said, Well, we also do air quality testing but we're extremely remote.

And I wondered if that's almost a way to limit exposure. So if you choose a very remote location that doesn't have a lot of population, now your tests are very hard to even compile. You can't compile data necessarily on four or five families that live within a mile of a house.

So all of a sudden it dawned on me why that part of Erving was potentially or Northfield potentially so valuable because it's in the middle of really nowhere.

David Brule walked into the room. David and I have hiked that mountain and it's out there. You're either hiking on the M&M trail or you're out there. So in order to limit their exposure, not exposure like us, their liability exposure. They put themselves potentially in a remote location.

MS. WESSEL:· I've been to the site in Windsor as well.· There's another compressor station also 41,000 horsepower.· It's in Windsor, Massachusetts.· It is very remote.· There is one unfortunate house directly across the street.· Otherwise, you're looking at about a quarter mile, at least, to any other houses.· Most of the other houses are a half mile or more away.· The hardest part for them is Massachusetts is the third most populous state in the country.· We have a really high per square mile percentage, which is why they're running through these rural communities.· It's the least dense amount of population, which let's them build a cheaper pipeline.· They only need class one pipeline through most areas.

There are more places like these to site compressor stations, but the difference between the Northfield compressor station and the one in Canada is it's probably not sitting on top of somebody's watershed.

MR. SCOTT:· Absolutely.· My point is none of this stuff happens by accident.· There are individuals who sit in offices who get big, fat paychecks to figure out what we in this room are potentially going to do and either head us off or nip it in the bud before we even get rolling.

Just as you're pointing it out and I'm thinking about volatile organic compounds in the air.· If a tree falls in the woods and nobody hears it, right?· So if a compressor station blows down in the woods and nobody hears it, did it really blow down?

MS. WESSEL:· Probably be at least a mile away they're pretty loud.

MR. SCOTT:· I mean, I guess from the video we saw it was pretty loud.

AUDIENCE MEMBER:· What was the distance on that video?

DR. NORDGAARD:· My answer to that it's possible.· It seems like Kinder Morgan is doing a better job -- trying to build one in North Weymouth which to me is ludicrous, but my rebuttal to that is, Don't we all matter?· Isn't each of us a meaningful and worthwhile individual who deserves our concern, and I don't care if it's ten people or a hundred or thousands.· I don't think anyone should be exposed to air pollution that is avoidable.

MR. SCOTT:· We had two questions.

AUDIENCE MEMBER:· In the blowdown video, how far away was the person filming that with that sound?· I have no idea.

MR. SCOTT:· I showed a video of a blowdown I found on You Tube.· It looked to me to be about a hundred yards away.· What I had done is I looked at multiple videos to find one that would at least go with the size compressor we're looking at, because I also had another video which was actually kind of funny.· It was like a guy with a GoPro in, I swear to God, a backyard compressor station surrounded by a big fence and he's walking around and the video is the compressor shuts down and I had the starter, and so he goes out, fires this thing up, opens up a valve and he out-gassed the thing and then you hear the sound of the out-gassing kind of change, and then he walks over and turns it off because now I guess the volatile VOCs are gone and now it's just natural gas.· It makes a different noise.

So he shut it off and he went over and fired up the machine and then made some complaints about the fact that the thing was in rough shape, when I looked down on the comment on You Tube channel.· It was just very matter of factly.· I mean, it was just an amazingly, casual job, and to look at that very small machine, one guy on a wrench, to then look at the Titan 250, which you guys saw that video.· They're inside a three-story warehouse.· They have huge piping coming in that.· Were you here for that, Bill?

MR. BEMBURY:· Yes, I was.

MR. SCOTT:· So we're not talking about a small backyard compressor.· This is much larger.· When I got that video, I was wanted something that looked like that, so that was about a hundred yards away.

MS. WESSEL:· There's another video that somebody just brought to my attention last week of a couple in Florida that lived near a main line valve which is what you probably have off of Old State Road if this gets built.· They drove up to it, sort of a square of a block.· You start hearing it when they're probably about three-quarters of a mile away, and by the time they passed it, it's maybe -- I would say based on

the length of my driveway -- a good hundred feet away from the road. It's a deafening noise. It was the second blowdown within three months.

That's the other thing about it. We tried finding out if there was a regular period which these things tend to off-gas, or when they need to blow down. It depends on so many different factors you can't predict. They are supposed to notify, but they seldom do. The folks in this neighborhood had no idea this was going to be happening until they heard the jet engine sound of gas escaping from the main line valve.

MR. SCOTT: Did you have a question, Bill?

MR. BEMBURY: I did.

MR. SCOTT: This Bill Bembury. He's a select board member of Erving.

MR. BEMBURY: Can the state or cities and town require Kinder Morgan to do testing of pollutants as it comes from compressor stations or remote blow-off valves? And if they can't, can the town do it and require Kinder Morgan to pay for that kind of testing?

MS. WESSEL: There are a lot of ways you can approach it. Right now is a good time to try to demand that because it's the scoping period. The scoping comments are due on October 16, so now would be a good time to file.

MR. SCOTT: They're actually happening right now as you speak. That's why we have our stenographer here. Everything you say is going into the record. So if you want to say that right at this minute.

MS. WESSEL: It should be something that they need to monitor. They're the ones bringing these chemicals and infrastructure into your community.

AUDIENCE MEMBER: But the problem is is that government can roll over the state and community and it happens. It's there.

MS. WESSEL: You start by making --

AUDIENCE MEMBER: You still need to do something to protect yourself.

MS. WESSEL: You start by making the request of FERC to make that a condition of their permit, so if the permit gets built and if FERC listens to you and insists, that becomes a condition of the permit, that they need to do the testing so that they know when it's time to mitigate. Of course that doesn't happen because we know FERC isn't the most responsive agency out there, put it very lightly. Then it could be a case of the town going ahead and then suing the company to try and recover those costs.

MR. SCOTT: Any other questions?

MS. WESSEL: There's also another legislative way to do it to try for force changes with the way FERC operates and the way PHMSA, the Pipeline and Hazardous Materials Safety Administration -- they oversee safety on pipelines -- and change the rules at that level, but that takes a lot of pressure our Congress people because it's at the federal level that needs to be done long-term so it applies to all pipeline, unless you play wack-a-mole with each pipeline and say, We managed to get it for this and these folks are struggling with these awful rules.

MR. BEMBURY: So do we know of any way that successfully stops the compressor station because of health issues?

MR. SCOTT: Here's the way, and you guys can correct me if I'm wrong. I have found in my homework no one has successfully stopped a pipeline; however, pipelines have been withdrawn from the FERC process. So once they're approved, their bulldozer, forget it, they're not turning around, but if you can stop them in the process that we're at right now; comments, the science, prove the need, all the stuff that we've been talking about tonight, it's possible to stop it.

Cooler heads can prevail if we use our time wisely, because I feel like the support or the support against this pipeline is incredible -- if I can be oxymoronic there for a minute -- but it is incredible and I think that even Kinder Morgan was surprised in their response. This meeting had gotten redesigned from the letter sent to the Erving Board of Health from Kinder Morgan's attorney just asking for the informa-

tion, and in that letter they basically point out -- and this answer is slightly to your question, Bill -- we are non-jurisdictional. They're a federal project. Get off my -- you know, and I feel like that is kind of where it's at.

MS. WESSEL: Interesting point. I submitted my scope and comments to 22 different elected leaders. It's great to cc'd them. They know what your concerns are as well. Nothing is worse than doing all this fighting and then hear from your representative or the Governor, Oh, I never heard anything about it. So I sent a letter and got one back from the Governor saying, Thank you for your concern on this. I understand your concern, but this is a federal project and it isn't in our purview. It's not a federal project until Kinder Morgan gets a certificate for public convenience and necessity. That's why the letter they sent to you was ridiculous saying there is no point in challenging this because we have the ability to override state and local regulations.

MR. SCOTT: I couldn't believe it.

MS. WESSEL: Not until they have that certificate and go through the eminent domain process, do they?

MR. SCOTT: Are they a federal project? Right. So this showed, and I said this to Stan Rosenberg, and I also put a quick shout-out to Stan Rosenberg and Mr. McGovern's office, that had it not been joint letter -- I believe Representative Ripley was involved -- they followed up because we cc'd them on the letter. They followed up with Kinder Morgan, and we're really, I think, the hammer that forced Kinder Morgan to go to those attorneys and write us that letter. Go ahead.

MS. WESSEL: You were also not the only community that got that tone of letter. Nearly identical letters went to at least three other communities usually for denial of survey permission on town land. Yours was the most ridiculous because all you did was ask them to come talk. You got a threatening letter: Give up all hope. We're going to come in any way. So nothing you can do will stop us.

MR. SCOTT: Which I felt and like others in my family and as well as the community were like, Isn't this a public relations nightmare? Isn't this the kind of thing that you just don't want to tell us to take a flying leap? Even the platitude of just sending a spokesperson here to say, Well, we have this. It's inclusive. Even to just pay the guys or the women to come here and sit and instead go to the extreme of paying the attorneys, probably not small money, more than I probably made this week, and they write us this letter to threaten us, to sort of scare us away.

I think what it did and I think what it did for others, when I said that to Stan Rosenberg, is that it drove home the idea that -- I said this to Stan -- that elected officials, and it doesn't seem to matter. Like if you look at elected officials as rungs in the ladder, president, all the way to the top, we're way on the bottom. Right?

If we don't count, okay, we go up one rung, and then if they don't count, we go -- okay? We keep going up. At what point in that ladder does some elected official matter, that they actually go, Hold on, hold on, you tell me what's going on? And they listen.

And the sad reality is I think Stan Rosenberg admitted it. Nobody knows. No one has any idea who that individual is, and I don't think they exist. I it's like my best buddy, Jonathan, says, It's the okie dokie. A couple guys go in a room and say, Okie dokie, we're going to do this. To hell with everybody else because they made the deal and the chips will fall where they may.

So I think it just kind of made us a little bit more aware of how Kinder Morgan was willing to play, and that's why I wanted to have this meeting, and the rest of the Board agreed that we would have the meeting anyway and enter everything into the record as our scoping process.

So your questions and everything that we said tonight will now be sent to FERC, which we hope they'll listen, and, you know, listen to our elected officials to just ask for the information, and if we don't get the information, ask for some jurisdiction. If we don't about get some jurisdiction then tell us why we don't have any jurisdiction and follow through completely from beginning to end. That is a pretty simple process, I think, but that's my many soapbox. Do you have anything you'd like to add, Curt?

DR. NORDGAARD:· No.· I had a couple of my choice statements.· Unless there are more questions, I'd be happy to answer more questions.

MR. SCOTT:· I think the room is quiet.· Curt, I want to thank you so much for taking time out of your day or your evening to come Skype with us.

DR. NORDGAARD:· It's a pleasure. There's some benefits and also some challenges to doing this by Skype.· Of course because of work, I couldn't come in-person, but certainly if anyone wants to pass on to you any questions or to get in touch with me, I would be happy to follow up on anything.

I am going to be coming either late October or November to speak in Northfield, and then Rose, I'll probably be in touch with you too.

MS. WESSEL:· I think there are a couple other towns that may want to hear from you while you're out here.

DR. NORDGAARD:· Windsor is on the list.

MS. WESSEL:· Great.

MR. SCOTT:· You're going to be on tour.

DR. NORDGAARD:· I'm well overdue to visit the Berkshire area.

MR. SCOTT:· Thank you very much.

DR. NORDGAARD:· Good luck everybody.

MS. WESSEL:· Thank you.

MR. SCOTT:· Do you have anything you want to end with?

MS. WESSEL:· It sounds like we covered pretty much everything we need to know about.

AUDIENCE MEMBER:· Can we talk about what the Town of Erving's position, what is the Board of Health's role, what is the conservation commission's role at this point?

MR. SCOTT:· Sure.· The conservation commission and let me talk and David can follow up because David is the chair, we're a permitting body, right?· Our whole role in the process of you coming to your building a house is you make up your plan. You buy your property.· You do all the stuff that you almost have done just before you put a nail in a hole in the ground, and then you come to us and say, Hey, maybe I got some wetland.· Maybe you don't.· We sign off on it and you build your house.· How do I build my house around this wetland without violating the Wetland Protection Act and still get my house? Sometimes the answer is no.

Like when Haddie first interviewed David and I way back when -- and I love watching that video because I'm so naive -- I said to her, Oh, this is ridiculous.· I said, How could they possibly come and just -- they're going to pound some pipe under the river.· I said, We would never permit that.· That's crazy talk.

And then I started to do homework and I found out they had done it all over the country. And then when I talked to an engineer in a room with an engineer, I said, Hey, what do they do when they come to these places that are like impassable?· You can't get passed it.· The guys, they start drooling. They can't wait to get into the room and figure out how they're going to get from Point A to Point B, under the swamp, over the swamp, through the river, through the rocks.· It doesn't matter.· It's Point A to Point B.· It's a challenge.· If I was an engineer, I totally would get that.· I understand that.

MS. WESSEL:· I noticed when I went to a scoping meeting in Sandersfield for the Connecticut expansion and I asked them how they planned to cross the river there, whether it would be horizontal drilling or it would be wet trenching where they block off half of the river, start digging out underneath, and when they get that part finished, block off the other half of the river and work through there, or sometimes they just scoop through the river and lay down pipes into the wet trench.

As soon as I those out those terms, they just lit up.· Have you ever seen horizontal drilling?· We have to go way back thousands of feet, up the hillside, and then start burrowing down under, and they really lit

up.

So to an engineer, this is a great puzzle and it's hard to impress on them that this is our lives. This is our homes. And when you try to say, If that was your yard that was being drilled into -- most of the time it bounces right off. Sometimes you see it sink in for a second because that's the kind of level of conversation that I've seen people bring up, and it's a courageous one to take up. Sometimes you see this little glimmer but their job is on the line there, not to quote the union's favorite catch phrase. It's in their interest to keep going even though they know somewhere in the back of their mind --

MR. SCOTT: Let me just finish one second. Let me finish her question. The Board of Health, right? Slightly different, right? So as the conversation commission is a permitting body, the Board of Health is kind of more like a clean-up crew. Do you know what I'm saying? We don't run around and look for problems. A problem occurs and then the Board of Health responds, right? So again, like the conservation, we don't go out looking for project to do. They come to us, right?

So we're the Board of Health. The pipeline rolls into town and that kind of just lands on our plate, I could, as the elected official, like I think a lot of elected officials do, and just go, It's out of my jurisdiction. And I'm done, right? Maybe I get re-elected the next year because I didn't make any waves. Or I can look myself in the mirror and say whatever, the 55 people that voted for me actually deserve me to do my job.

MS. WESSEL: Preemptively. Preemptively is the hard part. If we didn't get out in front of this when we did, we'd never stall things as much as we already have.

MR. SCOTT: Yet we're not really supposed to do that because this FERC process really whitewashes us out, right? I think it made me angry, personally. It offends me personally, so that makes me want to get out there and have a meeting where I can say, Let's look at the science. I said this also at one of the scoping meetings. I say, Hey, comments? FERC says, Give us your comments, right? My comment can be, This thing sucks, and that's the end of it. Okay? All right. Well, good for you. The guy is real smart. Or you can get up and say, I think this thing is wrong. Here's the science. Here's the health implications. Here's the need factor. Here's the reasons based on reason, not to be redundant, why we don't need it. Not just because I don't like it. That's easy.

I felt like at some of those meetings there was almost an element of just get up and stay you don't like it. That's really all we want to hear. That's all that really matters because we're just going to move on anyway. Giving you the science just encourages you. Do you know what I'm saying?

MS. WESSEL: You mean the open house?

MR. SCOTT: Yes. It just encourages you to continue bothering us and asking us for information.

MS. WESSEL: The open house meetings are definitely a sales pitch. When you go, there is a pipeline staff there and they always talk fuzzy aspects, generally pleasantries basically of the positives. This is going to bring jobs. They don't tell you how many jobs. They estimate a high number, but we've already known a hole bunch of those aren't from people in the area, so that's not a real number.

When you talk about health implications, there were never problems with health. We've been operating for 60 years and there's never been a health problem. Well, how did they know? They don't track those numbers.

MS. WESSEL: And if they do, they're not telling us.

MS. WESSEL: Exactly.

MR. SCOTT: Do you have a question?

AUDIENCE MEMBER: I want to make a couple comments. One is that the town of Deerfield has some real good serious lawsuits going on, and one of them they decided through the Board of Health that they are not going to allow Kinder Morgan into their town because the process would be a hazard to the people of Deerfield. As far as I know, I have not heard they have gone into the town at all.

Northfield adopted the same language that Deerfield did to keep the surveyors out. And at first Northfield came out with trying to keep the surveyors out and Kinder Morgan's lawyers came back with, These are all the reasons that you can't. And the town counsel for Northfield says, Yes, we can.

Now, they are not allowed to go into Northfield as of now. They haven't challenged it yet, so the Northfield police would have to arrest them if they came into the town.

MR. SCOTT: I thought about that myself.

MS. WESSEL: Actually, the town of Andover early on had a restraining order against Kinder Morgan people going door to door trying to get surveys. They'd become so aggressive in trying to get phone calls repeatedly, knocking on doors repeatedly that they had a Cease and Desist Order.

AUDIENCE MEMBER: They can't knock on the door. They really can't literally do anything. So there's some rights that towns have and they got to find those avenues to pursue. So today we were going back and forth. They can't come into the town, so they're doing aerial stuff.

The other thing is that Stan Rosenberg, yes, he has done a couple of things, but he has never gotten to the place where -- and there's plenty of evidence that we do not need this gas there. Is if he did nothing but fix the leaks, we're there. We don't need this gas, and that is documented. That's coming out of the City of Boston. The biggest leak is next to the corner of the State House and in the Boston Globe it's just well-known, but Stan Rosenberg, we got him to tour Northfield. We got him up in a cabin at Alexander Hill where the national scenic trail is, which is going to be if it goes -- and all different commissioners from the town spoke to him about the watershed, the sacred sites, whatever you can think of. Everything was there, and they were there with maps and all kinds of back-up.

And at the end of that -- there were eight of them that testified to him. And at the end of that he said to the people there, You have to prove to me that we don't need this gas. That is totally absurd. We don't have to prove it. It's proven.

The other thing is Maura Healey is doing a study, which we hope will come out showing we don't need this gas. If we do, fix the damn leaks before anything. Fix those leaks. And Stan Rosenberg has not said anywhere publicly, that I have heard, we need to wait for Maura Healey's study.

MS. WESSEL: I think he did say that. When it broke, Kinder Morgan filed the resource report in the middle of the scoping hearing schedule. Not only did he say we need more time to absorb, but we really should wait until that study comes out. That he did say.

MS. WESSEL: But that is something we should real be demanding. Our Attorney General is somebody.

MR. SCOTT: You think that would be a rung in the ladder that would matter.

AUDIENCE MEMBER: Something like that. The other thing is the Attorney General and the Conservation Law Foundation -- I'm not here on suing the DPU, but the DPU really should be representing us.

MS. WESSEL: Actually the Attorney General isn't suing the DPU. She is going ahead to FERC and trying to fight it there. Conservation Law Foundation and Plan for the Northeast are suing to be able to --

AUDIENCE MEMBER: We have to support those lawsuits. Why is our DPU doing this? Why in the world? Our DPU really has to be outed in every way possible, and the Attorney General is doing that just by saying we have to bypass them and go directly to FERC.

So I don't think we should feel we are powerless, and I think that Stan Rosenberg really reacted to a lot of pressure from us. We wrote letters to the editor and the Greenfield Reporter headlined it: Senator, where are you? Because he was not anywhere. He was not opening his mouth.

And letter after letter with that kind of headline: Where are you, Senator? We need your voice. And so he did do something. It's not enough. It's really, you know.

MR. SCOTT: I think we have to pressure them.

AUDIENCE MEMBER: What I always say to people is write to Stan Rosenberg and also support and thank Maura Healey and Representative Coolick and Representative Paul who are there. Coolick is putting

something into the legislature -- he may have already -- to say to the DPU, You can't do this.

MS. WESSEL:· It's to just change the rules so DPU can't automatically shut out elected officials when they're trying to get into --

AUDIENCE MEMBER:· Our intervenors, our elected officials by the DPU, you know, saying no.

MS. WESSEL:· Do you have a question?

AUDIENCE MEMBER:· I have a comment.

MR. SCOTT:· Can you say your name for the record so it gets into the FERC record?

MS. ELAN:· This is going to FERC? Part of this discussions seems to be more private and strategic.· Anyway, my name is Ariel Elan from Montague.· So the question is, because everyone here knows I'm a stickler for accuracy, one of the things you said, Haddie, let's say a while back.· Which was it?· Sorry.· It just left my mind.

Anyway, the other that I was going to say about DPU is it's very clear -- so it's really not just the DPU.· Governor Baker has been getting away with pretending to be neutral and a little bit discouraging about the pipeline in a lot of general public comments, but I've track his energy secretary around to all of these semi-public, elite policy-making utility kinds of forums and panels and conferences, and some of them are private.· You can't track them there.· You can track them at these semi-public gatherings.

And, honestly, the energy secretary is saying that he's speaking for the Governor.· It is always the gas, all the pipelines, full steam ahead, gas, gas, gas.· The people should not take seriously any statement from the Governor and his press secretary that he's really not in favor because within the policy-making elites, he's totally in favor of all of the pipelines.

MS. WESSEL:· He actually went up to Canada to a panel up there to talk about creating more jobs for Canadians in the natural gas sector with New England energy policy.

MS. ELAN:· By exporting to Canada.

MS. WESSEL:· Exactly.

MS. ELAN:· So, yeah, we have to call his bluff.· But there was a question about something you had said before, Northfield.· My understanding was that Kinder Morgan cannot go on Northfield owned public property, but not that they cannot enter the community of Northfield on a public roadway. I never saw or heard that.

AUDIENCE MEMBER:· That seems to be what Deerfield has, that they can't go into the town.· In Northfield they can now, as of today -- I got this e-mail from the select board -- they can't survey on the public land, which up until today they were saying they had the right to do.· I want to get that clarified.· They can still walk into Northfield and have a coffee.

MS. WESSEL:· The state law says they can be on public roadways.· Anyone can be on public roadways, but Deerfield does take things a notch further.· That's why they're considered a little rogue by other communities.

AUDIENCE MEMBER:· I have a friend in Deerfield.· The land engineer was there every third day.· Now he calls her and says, Would you meet me in Greenfield because I can't go into Deerfield?

MS. WESSEL:· That's conducting business for the pipeline going onto private property and knocking on doors.

MR. SCOTT:· I just want to shift gears for just a minute.· I sent an e-mail and I don't know if you have had an opportunity to look it up.· Did anyone catch the fact that there was a New York legislature who, I guess, passed through the house of limit on blasting near Brownfield.· Okay? This struck me as I was driving down Route 2.

I picked on Erving Paper a minute ago, maybe a few minutes ago.· Erving Paper Mill is in charge of the dump on the edge of the Millers River, which is on the slope hanging over the Millers River which

is less than a quarter of a mile from where the blasting will be through the bedrock and on both sides of Millers River as well as into Erving and coming from Millers. Now, this struck me as yet another opportunity to focus on a legislator, whether it's Rosenberg or whoever, to introduce --

MS. WESSEL: Ask her to take one step further in this direction

MR. SCOTT: This is what we need. As I'm looking at that landfill, it's absolutely precarious as it is, and there is one on the other side in Wendell as well. They're like these two twins.

MS. WESSEL: There's a few along the route in New Hampshire as well that I've been familiar with.

AUDIENCE MEMBER: It's not safe.

MR. SCOTT: That guy, Mr. Housen -- is that guy going to be liable when or if, hypothetically, they shook the ground, that thing slid into the Millers River. God knows what's in there. Right? Is that going to be the land owner? Is he the guy who is going to be on the hook?

MS. WESSEL: A few points of perspective. New York has a different political structure than we do. They have county legislatures which are like mini state legislatures and that was voted in by the Albany County legislature. It's a big deal there. It's like getting statewide here. Rensselaer County is looking to adopt the same sort of blasting protections, and Paul Mark is looking at those examples to see if he can get something put in statewide. That's one point.

As far as Mr. Housen, he's also on the Board for the coalition to lower energy cost. I don't know if you are familiar with that organization.

MR. SCOTT: I'm not.

MS. WESSEL: If you've seen commercials about how the pipeline will solve all our problems, they fund that. It's a coalition put together by Kinder Morgan's lawyer that represents them in Maine, and they're basically a pro-pipeline marketing agency and he's on the Board for that.

AUDIENCE MEMBER: He's on that but --

MS. WESSEL: It doesn't mean you shouldn't talk to him.

MR. SCOTT: As the town representative, as I'm listening to this radio interview with this guy, I'm thinking, Well, we have one of those dumps. Is that a Board of Health issue? Is it a Mr. Housen issue? Is it a Kinder Morgan issue? Is it a let's-wait-and-find-out-if-something-happens issue? And that's what I felt like as I was driving down the road. That's going to be the response, Oh, you know, nothing has fallen in the river yet. Do you have a question?

AUDIENCE MEMBER: Are we talking about that sludge field on Route 2?

MR. SCOTT: Yes. That the power line that goes over your head is the pipeline road.

AUDIENCE MEMBER: I was going to ask that. There's three different sections where there are transmission lines, and I have not been able to figure out which one they're heading towards; i.e., how far are they going to go up Old State Road.

AUDIENCE MEMBER: The west end, I believe.

MS. WESSEL: I just sent you the detailed maps earlier today. There's like five maps of aerial shots. You can see where it's supposed to go. They are a little disorienting because they only take, I think, a half mile or a mile for each map and they're all turned different ways. They don't point north in the same direction each way, but you can see the satellite view of the town and see where the route goes.

MR. SCOTT: Just if you're interested, if you go up into Millers and head up from Millers Falls towards the Wendell State Forest, just as you come around, there is like a section where there's a number of houses in there. You kind of come out around those houses, someone has painted a yellow marker on the road that will show you where the pipeline is actually going to be, and then you could actually move up a little farther from where that yellow marker is and you'll be able to look directly down the powerline route and see where the pipeline is going to go.

Also, do you remember the town forest you asked me about?

AUDIENCE MEMBER:· That's what I mean. I thought what part of the town forest.

MR. SCOTT:· If you went up to the top of the hill in the town forest, right?· You would have that powerline that cuts?· Right there.

AUDIENCE MEMBER:· I thought that's conservation property at the top of the ridge there.

MR. BRULE:· David Brule for the conservation commission.· If you are on Route 2 going towards Boston and Erving Center, the very first powerline after Christina's Restaurant, that's it.· That is where it's going to go.

So Cyd and I and a couple of other people have a couple of comments just to throw in the mix because Cyd is going to be really thorough. So we went up to the top of the conservation land that we own and we hiked up the top looking for both -- as conservation commission people and historic commission people, we were looking for Native American sites, and so we found sites up there, but then we came down the hill to where the maintenance road for the powerlines are.

So anecdotally, we are walking towards the Millers River, we get to a ledge that was about 30 feet high and the road ended because you look down and way down you can see Route 2, and what we were talking about with the engineers, they're just rubbing their hands together.· This is going to be so cool to solve this problem because the powerline comes up across the Millers River up the hill and then you've got a 30-foot ledge, and how are they going to get their pipeline through that?· That's one thing that they're going to have fun with but to localize it.· That's where we are at.

MS. WESSEL:· They're going to blast. They're going to destroy --

MR. SCOTT:· Absolutely.

MR. BRULE:· And the hydrology, which is right over there.· So we're talking about --

MR. SCOTT:· It's just over this hill.

MR. BRULE:· -- and the elementary school, for example.· And so Cyd did leave that message on my phone this afternoon about Brownfield, but we have had, as conservation people, concerns over of the years because there was an active sludge up there, and then as he pointed out kind of obliquely across the river in Wendell there is a dump there that actually was migrating towards the Millers River and about to just shut the Millers River out.· It is very unstable until the DEP stepped in and tried to mitigate some of that. So you do have twin dumps there within a half mile of each other.· When I wrote my comments to DPU, I pointed out that I know from some of the old timers in town here that when blasting was going on for the Northfield Mountain Project that we had on Mineral Mountain on the Montague side, we had landslides.

So the shock waves and this fall carried over to the ridge line on the Montague side had collapsed part of that hill down a rock.· So there is a ridge line.· There's fault lines we're talking about.

The thing I just would toss out here is Cyd and I were involved in this.· What I've been trying to keep track of is what the federally recognized tribes are doing about this, so just for your information.· You may or may not know.· But there is whenever federal permits and dollars are involved, there is a thing called Section 106, which means that federally recognized tribes have the right to be present and consulted on whether or not there are sacred burial or ceremonial landscapes. It's called Section 106.

As far as we know there has been a real runaround that firsthand and secondhand information FERC has been really reluctant to actually respect that process.· It's a federal law, but they have kind of pussy foot around it by saying, We're a commission.· We're not an agency, so that doesn't really apply.

So Cyd and I and some people who know what we were looking at found significant Native American stone landscapes.· We found stones that carried a lot of religious significance in a very important spot right along the route.

So we had our camera, GPS information, that is now in the hands of the Narragansett Indian tribe who

have taken it where it is supposed to go. There's that kind of information out there. The tribes are very reluctant. They cannot say they're against the pipeline, but they can be in favor of protecting their cultural sources, so that's where some of us are. That's the direction we're going in.

MS. WESSEL: That's the same tone of the discussion I've had with some other tribal members, so, yeah.

MR. SCOTT: "Death by a thousand cuts." Did somebody say that?

MS. WESSEL: As of federally recognized other nation, they have to be careful about the stance that they actually take. There are some folks as well that work with federal agencies protecting rivers and they have to be careful to just talk about the river itself and not a political stance on approving or disapproving of the project. It's very frustrating, but that's the reality.

MR. BRULE: We were told by the president we cannot get up and publicly declare a pipeline stance because, as you said, we were -- eventually, for what it's worth, they're going to have to come to Erving conservation commission with their request for permits, and they let us know that they didn't really have to obey it, these whole wetland laws or any state laws if they didn't feel like it, but what we're trying to do in the scoping process is to make sure that they look at what the concerns are at least FERC. My understanding is that FERC puts pressure on the proponents to respect what we're talking about.

AUDIENCE MEMBER: Is the newly acquired piece up there in the pathway?

MR. SCOTT: As far as the Erving Forest?

MR. BRULE: Part of it, yes. So when we went up off of Old State Road, climbed up all the trails laid out, you get up to the top, which is quite a stiff climb, they found standing stones, found manatee stones up there. Then we came down to where the access road is and we walked that land and over that, so it's going to be on the west side of the high tension, I guess.

So we started scoping that out and it was good. We're going to go back to do that. That's on the downslope coming this way. We have checked out Popular Mountain, and the parcel that Mount Grace owns is on the other side also of that place where we haven't --

AUDIENCE MEMBER: But not in the direct pathway?

MR. BRULE: It would be in the direct pathway, yes, but that remains to be investigated by us.

AUDIENCE MEMBER: That should be under the Chapter 97 protection then?

AUDIENCE MEMBER: I don't believe it is a conservation restriction, is it?

AUDIENCE MEMBER: The town forest is Article 97. The added piece of property is about Grace.

MR. SCOTT: They fulfill all their obligations to do that paperwork?

MR. BRULE: Whatever they have in their possession, I'm not sure right now, but I'm sure there's protections that should be in place. It might be 97. I know there's no conservation restriction on it right now, yet because we obtained the land prior to the 50 acres at Mount Grace had its home in, because that was under a self-help program, that meant that this Chapter 97 kicked in, so that's covering that.

I always thought we should put a conservation restriction on it also, but I was told what I've already gotten protection, but I just assume to pursue that, but whatever Mount Grace has obtained in the last three or four months, I mean, they know what we have and I don't.

AUDIENCE MEMBER: They took a hike up there.

MR. BRULE: Yes. We went up with Matias.

MS. WESSEL: But the Native American says that's not a matter of Article 97. That's a whole other set of protections, actually stronger protections.

MR. BRULE: If we can get the FERC commission to really enforce that. A lot of people, probably the same people that you know as I know, have been working really, really hard to get them to understand and accept the responsibilities under Section 106, and my sense is it's been convenient for them to really not know too much about that section.

So you can look it up. It's on-line. Basically the first couple of paragraphs is all you need to know; otherwise, there is a lot of legalese. It's kind of under the radar because this is the tribes trying to deal with FERC but also trying to protect their actual resources.

And as we know and you may have heard the history starting with the Farley Cliffs all the way to parts of Northfield that has significant cultural landscape for tribal people going back to just after the glaciers. There's all kinds of legends about the caves and the bad breath coming out of the caves because there's the giant in there who slayed the beaver at Mount Sugarloaf. All this is intricately tied in.

MS. WESSEL: Do you know which tribe?

MR. SCOTT: Pocumtuc, but Hobbamock appears throughout.

MR. BRULE: Abenaki. You name it.

MR. SCOTT: That's funny, that particular story. One particular group of people find him as a benevolent protector spirit, another group not so much. So it's very interesting to see how the same name is culturalized by individuals.

MR. BRULE: What's interesting is Cyd turned up stories about this person in Farley up on cliffs, and the people in Northfield that we connected with had the same kind of story and we had never talked to them about that. So we've been talking to the Nipmucs who are still here and probably were the Pocumtucs. There are a lot of Indian names kicking around, but the stories are all the same and the locations recount similar stories. It's pretty fascinating.

MS. WESSEL: It will be great to know that we reached out to each individual organization because I know, for instance, the Nipmucs have two different organizations within their own tribe versus the Nipmuc and historical Nipmuc that each have their own organizations. If every one of them is interacting with FERC, that becomes a stronger pushing point, and Pocumtuc, of course, as well.

MR. BEMBURY: Bill Bembury, Town of Erving selectman/chair. I want to add that October 6 at the Town of Erving town hall at 7 p.m., we have a special town meeting, and one of the articles on the agenda is an article for \$13,750 to fund the legal issues addressing the pipeline. So if people want to see that article pass and go through, we need bodies there, people who are interested in that.

Not everybody is interested in it, not everybody really cares about it, and I, like everyone else, has to be enlightened and come to a point where you have to listen. You have to listen to your conservation commission, your historical commission. That's what they're there to do, give us information and guide us and help us, help us along the road, but we do need people, if you're an Erving resident, to come out.

If you're concerned about this issue and you know people that are concerned about the issue, you need to come to that meeting, and that is a special town meeting and vote that article forward so that we do have legal funds to the towns and communities to fight. Thank you.

MS. ELAN: I want to clarify something being from Montague. Ariel Elan from Montague. We have a similar article, two articles on our special town meeting on October 1. The one you're describing is not so much to fight it's to get legal and consulting services through the counsel of government, the county government, in order to present the most thorough kind of information that you're talking about into the process and ultimately if the pipeline is forced upon communities to protect communities to the maximum, to mitigate. So it is important. I'm not saying it is not important, but it is not quite accurate to say it is to fight the pipeline. There are other processes afoot to just plain say no.

MR. BEMBURY: We're all on the same page.

MS. ELAN: Yeah.

AUDIENCE MEMBER: October 25, it looks like Sunday afternoon at three o'clock, we are having Curt come to Northfield and everybody will be invited, and we're putting out that information and finalizing it. And I don't know if anybody doesn't know what No Frack is in Mass., cards, please take one and support Rose and the No Frack people who have really generated a movement in this state with their

expertise and their website and always being available for information.

MS. WESSEL: The important part of that card is the website address. We compile all the information we can. Right now there's a process of breaking down the resource report by town and putting a town page up with all the information that I can find that applies to that town. So I just uploaded the next for Erving before I got here and I'm plowing through Northfield and going west from there after that, so you should have stuff up in a few days on the Erving page.

MR. SCOTT: I want to thank you for coming. I know I goofed up and didn't give you the accurate directions or even tell you where to go, so it is one of those things. I'm a juggler. I can do four balls, but then I get to six and drop them, so I apologize. If anybody else has anything that they want to add into the FERC record, let's do that now or we can let the stenographer go. Does anybody have anything specific to enter into the record?

That said, thank you for coming out to Erving we appreciate your time and energy.

(Whereupon, the town meeting was concluded at 9:06 p.m.)

Re: Tennessee Gas Pipeline Company, LLC

Docket No. PF14-22-000

Northeast Energy Direct Project

Dear Secretary Bose,

Our family has a commercial vegetable and blueberry farm located about one mile from the proposed compressor station in New Ipswich, NH that would be a part of the NED pipeline. We have been operating this farm for 30 years following organic practices.

First, I want to state my complete opposition to this project. As has been amply demonstrated, this pipeline is unneeded. Only the most compelling public benefit could justify the environmental destruction and degradation, the endangering of people's lives, including the lives of the children, teachers and staff in the Temple Elementary School, which is located in dangerous proximity to the proposed compressor station in New Ipswich, and the taking of private property. Kinder Morgan has in no way shown that their pipeline satisfies a profound public need. Lacking that, FERC has no justification to approve their application and I

trust they will not.

However, as FERC is still seeking information about the environmental impact of the proposed pipeline, I submit the following.

Inasmuch as there is sufficient documentation that compressor stations emit various toxins and possible carcinogens I request that FERC require Kinder Morgan and Tennessee Gas Pipeline to show how they will prevent the accumulation of toxins in our soils, air, and water, and in the event that such a build-up should occur, KM/TGP should show how they will mitigate such accumulation and prevent any further accumulation in the future.

To accomplish this, prior to the construction of the pipeline and compressor station, Kinder Morgan and Tennessee Gas Pipeline should be required to have soil samples taken from several agreed upon locations on our farm prior to the construction of the pipeline. These samples should test for the presence of those substances known to be emitted by similar compressor stations to establish a baseline for comparison in future years after the construction and operation of the compressor station in New Ipswich.

A timeline should be established, such as every three years, when KM/TGP will test our soils to monitor for a build-up of emitted toxins and possible carcinogens in our soils. If toxins are found then KM/TGP should be required to implement their mitigation plan and demonstrate how they will prevent further accumulations.

In addition, our farm and our livelihood are dependent on clean air as well as clean soil. Right now the air quality in our town and region is very good. This is essential to the health of the plants, animals (above and below ground), and people who contribute to the success of our farm. KM/TGP should be required to test the air quality over a period of time prior to the construction of the pipeline, the results to be used as a baseline against which to measure air quality after the construction and operation of the compressor station and pipeline. KM/TGP should be required to maintain the air quality at the same level as it now. Any degradation in quality that results from the compressor station should lead the station to be shut down until the air quality can be returned to its known condition prior to operation of the station and only be restarted when the means to prevent the lowering of air quality are put in place by whatever means necessary.

Finally, our farm is also dependent on clean water from a pond for irrigating and on a shallow dug well for washing produce as well as drinking water. FERC should require that KM/TGP take water tests prior to the construction of the pipeline and compressor station to establish the baseline presence or absence of those toxins and possible carcinogens known to be emitted from compressor stations and then perform tests periodically in following years to assure that there is no harmful build up in our pond or well. In the event a build up is found KM/TGP should be required to mitigate the accumulation and prevent any further build-up.

Our living depends in good measure on our vegetable farm. Right now we have clean air, clean water, and clean soils that are essential for the success of the farm. KM/TGP, if they gain approval to lay a pipeline and construct a compressor station in our region, **MUST BE REQUIRED** to maintain the high quality of our air, water and soil. Anything less is unacceptable.

Thank you for your consideration,

Tim Winship

Engineering tk Construction
Algonquin Gas Transmission, L.L.C.
Suite 100
Norwood, MA 02062

Re: Request from Algonquin Gas Transmission, LLC for Access to Municipal Property; Proposed Pipeline Facilities for Proposed Access Northeast Project

Dear Mr. Gessner

Thank you for your letter dated September 17, 2015, in which you request that the Town reconsider its previous decision not to grant Algonquin access to Town land.

The Town appreciates the differences in scope and purpose between the Atlantic Bridge (AB) and the Access New England (ANE) projects. However, the ANE project is nevertheless dependent upon the construction of the Weymouth Compressor station as part of the AB project. If FERC elects not to permit the AB project, the ANE project will have to be redesigned and reconfigured. Specifically, the ANE project does not include construction of a compressor facility at the Weymouth site, but rather an increase in the total capacity of the facility constructed as part of the AB project. By segmenting these projects and ignoring the links between them, Algonquin is able to mask the true environmental consequences of constructing the Compressor.

As I noted in my September 8 letter, Algonquin's efforts to move ahead with the Access Northeast project are contrary to the Town's best interests, and I will not agree to facilitate those efforts by providing access to Town property as requested.

Yours truly,

Susan M. Kay
Mayor

To Whom It May Concern:

I received the following message from a friend in Deerfield, Mass. yesterday which says,

“After a year and a half of fighting the construction of a natural gas pipeline that Kinder Morgan threatens to traverse through eight towns in my immediate locality (including across my yard, contaminating my well and my now valueless (that is, unsellable) property, which is well within their proclaimed “incineration zone” of 900 feet (!am less than 300 feet)), I just heard (when I was writing this a few days ago) from a concerned neighbor, that yet another house has exploded (yesterday) due to a natural gas “incident.” She didn’t know where it happened, but when I Googled “explosion today,” I found this: <http://www.cbs19.tv/storv/12618303/second-deadlv-uas-oioeline-exnision-in-2-davs-intexas> —I know not whether it was “today-today” or whether it was September 22 of another year, but I do know that there have been 358 natural gas pipeline “incidents” since 2000. We really need to stop this hazardous intrusion into our lives and livelihoods. Conservation land (even that which is protected under Massachusetts Article 97), organic farms, wetlands, aquifers, private properties, businesses, historical archeological digs, tourist attractions, private schools, rivers, are all threatened by this 5- billion-dollar monstrosity. And they tell us that the gauge of the pipeline will be of thinner material than it would be in an urban setting, because there are fewer of us that would be killed (prematurely incinerated) out here in the boonies.

This is in regards to Docket 1 PF 14-224!00 and it is the “Northeast Knerav Direct Project” !!I

Please note there must be other options than to go forth with this project k, possibly destroy land 4, lives! Ask yourself this.....Would I want this pipeline uoiuu through my nronertv???? The reasonable response would be ‘NO’!!! Please stop the insanity before it’s too late!

Thank you,

Mrs. Sondra E. Dailey

Kimberly Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

Dear Secretary Bose:

Please accept this letter as a statement of serious concern regarding the Kinder Morgan proposed Northeast Extension Pipeline project (FERC docket #PF14-22.) The environmental, health, and safety risks associated with this dangerous project are many and documented, and I would like to formally add my name to the list of all who oppose it.

There are many reasons to oppose this ill-conceived and dangerous Northeast Extension project, and I trust you have heard them all over and over again, beginning with the fact that the need itself is suspect. We know from permit applications that much of this gas is destined to be exported, that little of the fracked gas will actually serve New Englanders. We also know that by fixing the many known leaks in the existing distribution system of pipelines and by moving toward newer sources of clean renewable energy, there is no urgent shortage of energy in New England. To continue with these invasive pipeline projects locks us into many more years of reliance on fracked gas and the pipelines that carry it. These pipelines do not serve as a mere bridge to renewable energy systems; they serve to line the pockets of shareholders and investors. This particular project, with its miles and miles of pipeline and numerous compressor stations invades acres and acres of conserved land, threatens our water supplies, and endangers the health of many citizens.

Chemical exposures and VOCs: Beyond the question of need is the concern with chemical exposures. It is my understanding that the turbines from the compressor stations alone produce enormous quantities of exhaust fumes and noise, that the raw gas that would be vented from the stations and possibly leaked by the pipelines contains in addition to methane many VOCs, and that the methane turns into formaldehyde, a known carcinogen. To move forward with this project puts thousands of people at risk of exposure to these chemicals. I am a poster child for what can happen to those of us who are exposed. Ten years ago, I was an active, successful college professor. In August of 2005, I used a can of Interior oil-based paint to paint our cottage in Northfield, Massachusetts that, unknown to me, contained toxic amounts of VOCs, including the very same benzene and formaldehyde that will be emitted from the compressor station. The paint came with the typical obligatory warnings in very small print that overexposure could cause damage to the central nervous system. The clerk at Sherwin Williams handed me the can with a paint stirrer, never mentioning any danger. Immediately after using that can of paint, I became ill and have never recovered; I had to take early retirement. In 2007, the regulations on the paint toxicity were changed and it can only be sold in small quantities. It is now considered hazardous waste. That was too late for me. I am unable to work or drive as I continue to have seizures when coming into contact with petroleum-based products, which are ubiquitous in our lives. Again, the very toxic chemicals in the paint that have harmed me are the same toxic chemicals that would be emitted from compressor stations. I URGE you to seriously consider my experience. The dangers to human health are real. The only way to lessen any environmental impact from this project is to prevent it from happening at all. Focus on fixing the leaks in the existing distribution system and work to support conservation and renewable sources of energy. How many pipelines do we need? You have promised to take a hard look at these proposals: I urge you to stay true to your word.

Thank you for considering my comments

Re: Kinder Morgan Proposed Northeast Energy Direct (NED) Pipeline Project
Docket No. PF14-22-000

Dear Secretary Bose:

Please find enclosed the September 2015 Rindge Pipeline Task Force Report regarding impacts of the above-described proposed pipeline upon the Town of Rindge, New Hampshire.

Very truly yours,

Jane H. Pitt

Rindge Town Administrator

Cc: Allen Fore, Director

Public Affairs

Kinder Morgan

3250 Lacey Road, Suite 700

Downers Grove, IL 60515

Tennessee Gas Pipeline Company, LLC

1615 Suffield Street

Agawam, MA 01001

**RINDGE PIPELINE TASK FORCE
REPORT — SEPTEMBER, 2015**

Members of the Rindge Pipeline Task Force:

Jane Pitt, Town Administrator

Todd Muilenberg, Chief of Police

Ricard Donovan, Fire Chief, Emergency Management Director

Mike Cloutier, Director of Public Works

Dave DuVernay, Assessing Clerk

Kirk Stenersen, Planning Director

Bill Preston, Conservation Commission

Professor Catherine Koning, Franklin Pierce University

Holly Koski, Community Representative

Bill Thomas, Community Representative

The Task Force Charge:

To gather information regarding the proposed Kinder Morgan/Tennessee Gas natural gas pipeline for the purpose of assessing its potential impacts on the Town of Rindge.

- To assess the public safety impacts of the pipeline both during and after construction.
- To assess the impacts of construction of the pipeline on the Town's roads and traffic patterns.
- To assess the impacts of the pipeline on land use patterns.
- To assess the impacts of construction and operation of the pipeline on Rindge's environmental assets including wetlands and aquifers.
- To assess the economic impact of the pipeline on the Town of Rindge

Impacts of NED Pipeline on the Public Safety and Infrastructure in Rindge, NH

By Chief Todd Muilenberg, Chief Rick Donovan, Mike Cloutier

Construction:

The proposed pipeline route in Rindge, as described in the most recent Tennessee Gas Pipeline Environmental Report, crosses the entire width of Rindge covering eight (8) miles. There are a minimum of 10 road crossings including crossings of US Route 202 and NH Route 119 which are major transportation routes running north to south and east to west. These road crossings will involve traffic delays and road closings. The Town imposes weight limits on roads for approximately six (6) weeks in the spring to minimize damage during "mud season". These weight limits must be honored by KM/TG. The Town should also consider

requiring road bonds from KM/TG so that any damage to roadways will be repaired at KM/TG's expense. KM/TG construction vehicles should be prohibited from crossing the Wellington Road Bridge.

Given the substantial presence of bedrock in Rindge along the route of the pipeline, blasting will be inevitable. Security for blasting areas to ensure the safety of the public will require Police/Fire details, warning signage, public notification of blasting schedules and road closures. Safe transport of blasting materials and secure storage of these materials will be required.

New Hampshire is known for high levels of arsenic and radon in well water. Blasting may increase the frequency of this problem. In addition, detonators and explosives do not fully combust with blasting and residue could leech into the groundwater. KM/TG should conduct pre and post blasting well testing of all wells within 400 - 500 feet of the blasting area. There should also be arrangements made for the emergency provision of potable water in the event wells are damaged.

Hours of construction should be regulated so as to minimize noise and disruptions to residential neighborhoods. Proper procedures should be put in place for dust control. KM/TG must inform the Town of its construction schedule and routes as well as where construction staging and stockpile areas will be located. Appropriate security should be provided by KM/TG for these areas.

The pipeline construction will result in an influx of workers who do not reside in Rindge. A plan for housing these workers as well as transporting them to and from the job sites must be developed by KM/TG in consultation with the Town. Pipeline construction in other parts of the country has utilized "man camps" which are group workforce complexes to house pipeline workers. The presence of "man camps" in other parts of the country has resulted in the need for more police protection.

Emergency Management During Construction:

As set forth above, blasting will be inevitable if the pipeline is to be buried. Police and fire details will be necessary as well as warning signage, public notification of blasting schedules and road closures. During construction, police details may be necessary for traffic control.

Emergency Management After Construction

It will be imperative to have an up to date emergency contact list of all KM/TG responsible parties as well as outside resources and logistical support in case of a pipeline accident/emergency. In addition, the Town should develop an emergency evacuation plan which includes primary and secondary shelter points. HAZMAT training should be provided for all emergency personnel, including highway personnel. There should be also close coordination with the Keene, Nashua and Fitchburg HAZMAT teams. The pipeline must be accessible during all seasons thereby necessitating the use of 4x4 vehicles, quads and snow mobiles.

It will be necessary to establish an effective public emergency notification system which will include electronic message boards, sirens or horns and telephone contact.

Impact of the NED Pipeline on Rindge's Environmental Assets

Environmental Impacts on Groundwater and Wells:

By Catherine Owen Koning, Ph.D., Professor of Environmental Science, Franklin Pierce University

Existing Resources: The proposed pipeline route, as outlined in the Environmental Report Northeast Energy Direct Project Resource Report (ER), will run directly across two important stratified drift aquifers in Rindge (one near Abel Rd., and another south of Hubbard Pond). The proposed pipeline will run directly adjacent to a large, high-transmissivity aquifer near Converse Meadow, which has been identified as a potential future water source for the town. Most of the town's residences and businesses depend on private wells, and many of these are bedrock wells. Over 200 private wells are within 1/4 mile of the pipeline route shown in the ER.

Impacts: According to Brandon Kernen, of the NHDES Drinking Water Source Protection Program, the pipeline would not affect the direction or quantity of flow in these aquifers, since even if installed under-

ground, the pipeline is too small to impede flow because, by definition, aquifers are thick and have a lot of flow, so a narrow pipeline wouldn't have much impact. Because the pipeline carries natural gas, a spill would not affect water quality (no pollutants would be released into the water). Natural gas leaking into the air would contribute to global warming, since methane is a heat-trapping gas, and climate change is expected to have negative effects on water quality, particularly water temperature and dissolved oxygen.

However, there are other sources of contaminants that may come from the operation of a natural gas pipeline. One source reports that, inside the pipeline, "Exotic mineral-based scales may also form zinc, lead, arsenic or mercury. Furthermore, if the gas is even slightly wet and sour conditions are present, sulfide scales will form" (Wylde, 2011). Hydrostatic testing of the pipeline, using pumped water, can lead to accidental release of these contaminants. Cleaning of these contaminants during pigging may lead to an accidental release of these materials. Chemicals such as co-solvents, surfactants, dispersants and other chemicals are used during pipeline cleaning (Coastal Chemical 2005), and any of these could be accidentally released if a leak occurred. If the pipeline carried other materials, such as fuel oil or hazardous hydrocarbons including benzene, then a spill would contaminate the groundwater. NHDES wellhead protection guidelines state that 400 feet around any public well should remain free of contaminants, and the sanitary protective radius for bedrock wells serving the public is 1300- 4000 ft. (NHDES 2009).

The construction of the pipeline could contaminate the aquifer if fuel oil or other construction fluids were spilled from vehicles and equipment involved in the installation process. In addition, because the bedrock is very close to the surface throughout most of the Town of Rindge, blasting would be needed to install the pipeline in many locations. Blasting may cause contamination from blasting chemicals (NHDES 2010), particularly nitrate, nitrite, and volatile organic compounds. It may also cause small particles and solids to enter into the well (total suspended solids, also known as turbidity), making the water appear cloudy. There may also be an increase in metal ions, which are found in the bedrock. Changes in the amount of gases or trace elements may also occur (including methane, carbon dioxide, helium, hydrogen sulfide and radon), major ions (sodium, potassium, calcium, magnesium, sulfate, chloride, fluoride and bicarbonate) and trace elements (mercury, radium, uranium, lithium, strontium and barium) (Gascoyne and Thomas 1997). In rare cases the blasting may open or close fractures in the rock, thus affecting the amount of water flowing into the well (Hawkins 2000), although some sources indicate that the blast would have to be very close to the well for this to happen (35 feet) (Geosonics, Oregon Dept. of Transportation). Many of these effects are temporary.

Recommendations:

- The draft ER should include all of the aquifers (it does not mention any of them), and the location of all of the private wells.
- The draft ER should make it clear whether this pipeline can be used for transport of other materials besides natural gas.
- The pipeline should not be routed through or within 400 feet of any major aquifers.
- The pipeline should not be located within 50 feet of any private well.
- Private wells within 400 feet of the pipeline installation should be tested before, and several times after, the pipeline is constructed. Testing parameters should include suspended solids, nitrates, nitrites, iron, sulfate, lead, arsenic, mercury, acidity and any of the chemicals that are typically used during cleaning/pigging of the pipeline.
- Best management practices for rock blasting should be followed (for example, see NHDES 2010).

Environmental Impacts on Streams, Wetlands and Wildlife:

By William C. Preston, Ph.D., Ecologist, Rindge Conservation Commission

Existing Resources:

Wetlands: The proposed pipeline route, as described in the most recent Tennessee Gas Pipeline Environmental Report, crosses the entire width of Rindge along an open “U-shaped” pathway. There are a minimum of 17 wetland areas, as listed by the National Wetlands Inventory, which will be crossed along this pathway. Most are open areas, with varied proportions of emergent and shrubby wetland vegetation. Several are at the margins of stream sections that have been dammed by beavers or human agency. In addition to these recognized wetlands, there are numerous smaller pockets of standing water which appear seasonally. These are currently being evaluated for their status as “vernal pools,” which are significant breeding habitat for several local amphibian species. There also appear to be 4 streams, all part of the Millers River watershed, that will be crossed by the pipeline route. The only ponds to be impacted are dammed sections of these streams, as described above.

Wildlife: In the southwestern part of town the pipeline will run through wetland and upland habitats ranked by the NH Wildlife Action Plan as having highest value in the state or highest value in the biological region, as well as supporting habitats for these areas. Several rare and threatened species of reptiles (wood turtle, Blanding’s turtle, spotted turtle) have been observed here, and this area deserves the maximum protection that we can achieve. At least 2 nesting sites of Osprey occur along the pipeline route. While Osprey populations have recovered significantly in recent years, they are still sufficiently rare to be actively monitored by wildlife agencies. None of the impacted streams seem to support widely exploited fisheries, in part because of lack of public access and/or navigability, although both warm-water and cold-water species of gamefish have been reported. Some of the wetlands support waterfowl hunting in season. No rare or imperiled plant species are reported from the wetlands areas.

Streams: The proposed pipeline route will cross two named streams, Tarbell Brook and Lord Brook, and three unnamed streams, one below the west side of Town Hill and one below the south side of the hill, and another from the outlet of Crowcroft Pond to Lake Monomonac. Populations of native brook trout have been reported in some of these streams.

Impacts: Wetlands are fragile ecosystems with high value in terms of ecological services. One of the primary impacts of pipelines in wetlands is alteration of surface and subsurface hydrology. In forested wetlands, for example, a pipeline may block normal water flow, thus raising the water table on the upslope side and altering tree growth and/or survival. Soil compaction in the pipeline trench and the associated work corridors alters hydrology and water storage capacity. Effects such as higher bulk density, lower depth of

refusal and lower soil moisture have been measurable at least 8 years post-construction (Olsen & Doherty, 2012). Disturbances associated with pipeline construction have also been shown to alter the structure of wetland plant communities in terms of species diversity and quality. Occupation of disturbed wetlands by invasive species is another likely impact, despite efforts to control them. Species such as Reed Canarygrass, can colonize wetlands and convert them to virtual monocultures (Marlor, et al., 2012). Comingling of soils extracted during excavation of the pipeline trench would affect the regeneration of wetland structure and function. Disposal of material from the de-watering of the pipeline trench or from hydraulic testing may create problems of siltation in wetlands.

Wildlife impacts: The pipeline will create more fragmented habitat in an area that has already been chopped up with roads and developments. Forested areas will have additional strips of open habitat, which may benefit “edge” type species such as deer, raccoons, and skunks, but will have a negative impact on more sensitive species such as broad-winged hawks, pileated woodpeckers and fishers. In addition, once opened up, these areas are more likely to be used by all-terrain vehicles and snowmobiles, which have a negative impact on plants and wildlife. Rare turtles are more likely to experience difficulty in moving through their home range, as they are more exposed due to the lack of vegetative cover. They will also encounter more disturbances from invasive species, off-road vehicles,

Streams: Stream crossings, which might be accomplished by any of several methods cited in the Resource Reports, do not seem likely to create significant or long-lasting impacts for wildlife during construction. This assumes that the BMPs described in the TGP Resource Report are actually followed. However, post-construction issues with significant erosion and alterations of stream channels have occurred very frequently following storm events and before streamside vegetation has regenerated (Robson 2015). Erosion and ensuing sedimentation can harm fish populations according to the American Fisheries Society. Both Lord Brook and the outlet of Crowcroft Pond flow into Lake Monomonac, which is an impaired water as a result of excess phosphorus. Any additional sedimentation resulting from construction or subsequent erosion could exacerbate these conditions.

Recommendations:

- The wetlands along the pipeline route and several hundred feet on either side, should be evaluated in terms of their ecosystem functions. The survey, classification and documentation of vernal pools should be completed.
- In wetland areas, removal of plant material from the construction corridor should be limited to above ground materials to avoid disruption of root systems outside of the actual pipeline trench.
- If at all possible, the highly ranked habitats should be avoided by rerouting the pipeline, particularly areas with rare turtle species or other prey. Adequate mitigation for damage to these areas is problematic, since there are no comparable areas in town to be protected. However, several large tracts of land in town have been identified as conservation targets, and funds to obtain and protect one or more of these target parcels might satisfy mitigation requirements.
- Pre-construction surveys for invasive plant species should be done along the entire pipeline corridor, but are especially critical in wetland areas where monocultures can become established quickly in disturbed sites. Post-construction monitoring and management should be employed to make sure invasive species do not invade the wetlands, and to remove them if needed.
- Special attention should be paid to the restoration and monitoring of stream banks at crossing sites. A monitoring and management plan should be in place, and funds should be placed in escrow for future repair of streams damaged by pipeline crossings.

Planning and Land Use Impacts:

By Kirk Stenersen, Planning Department

Blasting may impact properties within 500 feet. All structures within that area should be surveyed and all wells within that area should be tested before and after blasting. The Town should consider enacting a blasting ordinance to establish best management practices for this activity.

Consideration should be given to establishing setbacks from the pipeline for new development. The Town should also consider whether certain uses should be prohibited within a certain distance of the pipeline.

Economic Impacts:

By Dave DuVernay, Rindge Assessing Clerk

A major economic impact on the Town of Rindge will be the payment by KM/TG of local property taxes. A review of *Tennessee Gas Pipeline Company v. Town of Hudson* (12/28/2000), No. 97-862, provides us some idea of the level of taxes which may fall to the Town of Rindge if the pipeline is constructed here. The Hudson pipeline was only 3 miles long and only 8" in diameter; Hudson also had a metering station and 20 acres of easements; it was assessed in 1995 at \$900,000.

The Rindge pipeline is approximately 9 miles in length and is now 30" in diameter. The current KM/TG plans show a mainline valve facility at mile 22.6 which is adjacent to Robbins Road. The pipeline promises to carry 2.2 billion cubic feet of gas per day (AECOM 1/26/15 letter). We should be able to tax the land over which the pipeline travels except for land held by private owners which we can tax as the pipeline company's easements. We also may have to abate some taxes to land owners who are forced to grant easements to TGP. Additional study will be necessary to determine the valuation method for the mainline valve facility.

In the above cited case, the Supreme Court allowed Hudson to assess Tennessee Gas Pipeline Company (TGP) at replacement/ construction cost less physical depreciation, denying TGP any offset for functional or economic depreciation. The Court also allowed Hudson to tax TGP for property easements over which the pipeline ran, but might have allowed the owners themselves to file for tax abatement.

We should not jump to the conclusion that our 9 miles of pipeline will be valued at only \$2.7 million (3 times Hudson's 3-mile stretch) because our pipeline is 30" in diameter (Hudson's was 8") and construction costs may be considerably higher.

First

I am addressing the change in the NED route in Pelham NH. The route changed from the West side to the East side at section 39.5. This route now will directly affect the 31.3 acre primewetland on lot 11- 103. The uplands are important in keeping the integrity of this wetland intact. The state requires that a primewetland must have significant value that is worthy of extra protection because of its uniqueness, fragility, and unspoiled character. It must have over 50% hydric A soil and meet many other criteria. I will not go into all the criteria here. After this report was completed the town voted to have this wetland be listed as a primewetland and the state agreeing with the report then gave it primewetland status.

In this study it states that the wetland benefits from its natural transition into large upland areas on the South, West, and Northern boundaries. The transition is completely natural and uninhibited. A wildlife benefit is the proximity to the powerline easement which provided much field and brush habitat to various wildlife species. It is listed in the report that the land is in an unspoiled state. This will of course now be destroyed because the route was changed. If this pipeline goes to the east of the powerline, the uplands will be deforested and the wetland itself will be destroyed at section 40.2 and 40.3. The impact will be the greatest in this area. I have kept my land at 11-100 in a natural state to protect the wetland and was on the conservation commission to keep this land protected. Please be aware that a new line of electric lines will be on the West side and now both sides of the powerlines will be deforested instead of just one side on the West which is the way it was up until the last week of September.

I am requesting that an explanation be given as to the reasons for this change.

Second

The birdfoot violet is stated as being imperiled, and threatened by (state's criteria). It has only 9 sites in the state and is located on lot 7-11. There are three distinct areas where the plants are located on lot 7- 11. Each area has about 20-30 plants on lot 7-11. See the NH Natural Heritage site for the exact locations. Sections were verified by John Viera PWS senior project - Company Vanasse Hangen Brustlin Inc.

Thank you for your consideration in these matters.

Dear People:

I'm writing to object to the Kinder-Morgan pipeline route through our town of Lanesboro, MA — and to strongly urge you to reject this project.

There are many reasons to reject the project — but the most important one for the town of Lanesboro is the almost certain probability of destroying our town aquifer system — effectively destroying the town.

All the residents of Lanesboro depend on water from a large, high-quality aquifer — whether the water is delivered through town wells or individual wells. Pollution of the aquifer would literally leave the town high and dry, with no effective replacement alternative — except for trucking in water individually to each home and business.

The KM pipeline design guarantees that in the event of a pipeline leak, no response would be possible in time to prevent the complete pollution of the town's aquifer.

Obviously, this would destroy the property values and tax base for the town, make homes unsaleable, and require millions of dollars from the State of Massachusetts.

Allow me to make it more specific by putting a dollar cost on this. What is the financial value of our water? Hydro-geological surveys show that Lanesboro can pump at least 1.2 million gallons per day with no negative impact on our aquifer system. This is 4,380,000 gallons per year of high-quality water. “High-quality” means no need to filter or treat the water.

A nearby international bottling company would pay 1 cent/gallon today for this water — \$4.38 million dollars per year. This is today's sales value of this resource.

To look at it from the other side, replacement cost — the nearest truck-water source cost today would be 5 cents/gallon — or \$22,000,000 per year. This is what the State of Massachusetts would have to assume if the aquifer is polluted.

Kinder-Morgan has a terrible track record nationwide for design, construction, supervision and maintenance of its other pipelines — and also a terrible record for its responses to previous pipeline disasters.

There are many reasons to reject this pipeline — but for the town of Lanesboro, destruction of our sole water source is the most important deal-breaker.

Re: DOCKET # PF14-22-000

Kinder Morgan/Tennessee Gas Pipeline Co. Northeast Energy Direct Project

To Whom It May Concern,

We are William & Nancy Buckley from East Dracut Massachusetts, and are writing to you in reference to the Northeast Energy Direct Project pipeline project.

We purchased our house in Dracut over 30 years ago. Our area of Dracut is a quiet, beautiful location. Our house is located within a 1/2 mile radius of the proposed compressor station, which puts us in the “INCINERATION” zone. It is also very close to where the pipeline route will destroy many of our neighbors' backyards. How can you allow such a station to be built so close to residential and commercial properties? In addition, it appears that one of our Fire Stations on Jones Avenue is within this “INCINERATION” zone, and our only Police Station is right on the edge. They are first responders! What happens in the event of a catastrophic event?

Living next to a risk as great as this so that a large corporation can profit is unacceptable. No matter what

Kinder Morgan says about its'afety measures, it is still an unacceptable risk. Technical failures, natural disasters, or acts of terrorism are all uncontrollable causes of events that could cause a pipeline or compressor station explosion killing hundreds.

We are deeply concerned about the effects on our health, safety and property value.

In addition to the destruction it would cause in our neighborhood, the pipeline would cut through pristine lands, including at least 15 miles of conservation trust lands. We are opposed to any project that undermines the great legacy of conservation that the majority of Massachusetts residents hold dear. Many experts are saying that this gas is not needed in this area, and will probably be used for export to foreign buyers. The town of Dracut will receive no direct benefit from this pipeline project.

We are both retiring in 2015, and hope to live out our retirement years in the same beautiful location we have enjoyed for the last 30 years.

Please withdraw all support for this project, and do anything within your power to ensure that this pipeline is not built!

Thank you for your attention to this issue,

William & Nancy Buckley
62 Colonial Drive
Dracut, MA 01826

FERC Comment form; Mr. Robert F. Fink, 1264 N? Averill Park Rd, Nassau, NY 12123: opposing.

I purchased this property almost 20 years ago when I was married. We liked it so much because it was out of the way from things, nice & quiet, & had plenty of wildlife around. And now, they want to drop a Compression Station right across the road from my house which will destroy every reason I bought the house for in the first place. Deer run back & forth from my property & the property across the road. Turkeys roost almost every night right across the road & walk across my yard constantly. Seen several bears in my yard too. I hear the frogs & lots of owls at night from across the road all the time & there are several different species too, mostly the Great Horned Owl. The nights are beautiful. The sky is so clear & it's nice & quiet. In the past several years I've noticed the grand appearance of Bald Eagles. Never saw one around this area before in my life. (I'm 52 & born & raised here). Most of the times when I've seen them, they either came from the other side of the road or are flying to the other side of the road. I have a feeling they maybe nesting over there somewhere. One day I saw one chasing a hawk out of that area, usually it's the other way around, the little bird chasing the bigger bird and also is a sign there could be a nest in the area. If that Compression Station goes in, you can kiss most of those animals good-bye & what a loss that would be. I heard it will go right through one of the top Nature Preserves in the state too. It'll do that area wonders. Bye-bye to the nice clear sky at night. With the light pollution that's going to give off I might as well move to the city. There goes the quietness too. From what I hear, these things are very loud. Animals are not going to put up with that & I sure as Hell don't want too. Let's not forget the wonderful gases this station will be spitting into the air for all around to breathe in. They will tell us that they are at safe levels though. So comforting. No level is safe in my book if I have to live near it, especially these gases. I guess after the Benzene gives me Cancer, the undertaker won't need a real lot of Formaldehyde, one plus.

So what this does for us in the area is pollute our air with chemicals & noise pollution. Flood the night sky with light pollution. Won't see those stars or hear those owls anymore. Probably drive most of the wildlife away. Drive property value down, who's going to want to live near that thing. I know I won't & I will get a lot less for my house if I'm able to sell it. So far, nothing but pluses. It doesn't benefit anyone around it because it's just passing through to go to MA, & then over seas to make money for the corporation who don't care what they do to people & their lives as long as they get the Almighty Green Bucks in the end. Why not put it where it's already noisy & bright all the time, like near a city. Oh wait, it's too dangerous for that incense it explodes some day, that's right. That's just wonderful. Why is NY even considering this if we'e

supposably a state against fracking7!?! 12!7 At least that's what I hear from good old Mr. Cuomo. I'm sure there must be quite a few people about to make some big money on this, that's why. Too bad it just screws the little guy along the way. I'm sure the State government will make out too, they always do.

CC: Amherst Board of Selectmen

Dear FERC,

I am a resident of Amherst NH in the rural neighborhood of Ponemah adjacent to the Bon Terrain Industrial Park at the south end of town. I know that you have received an environmental assessment from our town's Conservation Commission which highlights potential environmental concerns associated with the construction and operation of the North East Direct natural gas pipeline proposed by Kinder Morgan. There are several issues raised in this document including disturbance of the Ponemah Bog Sanctuary, two public conservation lands, wetlands, and four crossings of the meandering Souhegan River through fluvial soils.

This report, also had a discussion of the importance of the large aquifer comprising an area of 13.1 square miles or 39% of the town's area and preserving water well yield and quality. What it does not include, however, is the information that the current path of the NED pipeline crosses a primary recharge area of the aquifer. This land was denuded of topsoil and a stream crossing it several decades ago by the owners and exhibits surface soil that appears to be sand above the aquifer.

The Bon Terrain Industrial Park is in the middle of this recharge area and has been cited by our Board of Selectmen as the location of a metering station for the pipeline.

I believe you should include the details surrounding the location of the pipeline relative to the aquifer recharge area and soil studies there in your environmental impact study.

Thank you for providing an avenue for citizen input.

Best regards,
Jack Conaway

Docket Number PF14-22-000

Tennessee Gas Pipeline Company's Northeast Energy Direct Project proposed by Kinder Morgan

During careful, ongoing study of the Northeast Direct Pipeline & Kinder Morgan's first proposed route in New York State and Massachusetts through the current proposed route that also includes New Hampshire, it has been very obvious that this gas pipeline would be of benefit primarily to Kinder Morgan and that the these northeastern states and towns are expected to accept Kinder Morgan's plan; should trust the company's "studies"; not worry about potential destruction of individual and public water supplies & leaks or the fact that rural towns would have diminished safety regulations involving pipeline gauge or distance between shut-off gates; and not even question the need for the gas. Regarding need, recently Kinder Morgan has been forced to realize that they have not been able to receive commitments from enough users in these states to support the type and size of pipeline they had originally proposed. Exportation of the gas would be their savior, as was probably planned to begin with. There are other routes & which they can export.

Opposition to this pipeline is not a nimbby event. Across all three states, a large number of federal senators and representatives, state senators and representatives, and whole towns, all of whom have studied the proposal in its 'vague presentation and/or have met with Kinder Morgan representatives, have stood in strong opposition to this pipeline. Representatives have requested extension of scoping meetings for time to study the very recently changed proposal. Northeast Energy Solutions and others have challenged the financial model of the project. ISO's original forecast of New England's electricity load for 2015 was so inaccurate that New England Power Pool voted not to support it. New Jersey-based Northeast Energy Solutions recently rightfully questions why UIL Holdings Corp., parent company of Berkshire Gas Company, is enforcing a moratorium on adding new natural gas customers in parts of its coverage area while pledging to lift the moratorium if the gas pipeline is built, without disclosing their own financial investment in the pipeline. This certainly is cause for concern about public interest and public trust of a utility subject to regulation. Will the expense of building this project be passed on to National Grid customers, keeping energy costs high? Is National Grid's parent company also making financial investment in the pipeline or have they made secretive deals?

A look at settlement in the rural town of Hancock, MA, using the U. S. Geological Survey map, reveals that within 1/2 mile (mostly within 1/4 mile) of the proposed route lies the closest concentration of homes in the town — the whole village: 72 dwellings, the town library and the town's only church. Three of the town's earliest, stately homes, eligible for listing in the National Register of Historic Properties, would be within yards of the rural-regulation thinner-gauge pipeline. Safety concerns about destroyed individual water wells and springs from possible gas leaks, and possible explosions from a weaker pipeline than is required in cities are of high priority. In fact, Hancock is only one of the many small towns expressing these worries.

Wide-spread safety and possible drinking water contamination concerns across all the involved states must be weighed heavily against the supposed but questioned need for gas & this proposed pipeline. It is these

utmost conctxns that have united a whole region that seldom agrees as strongly as this on, any topic or. project. Yes, the northeast is a more expensive place to live and do business when it comes to the cost of energy. Has it not always been? Are individuals, tjowns, and representatives clamoring to create shor-term jobs and to get the energy cost down with a pipeline? No. Are renewable energy projects blossoming'? Yes. The excuse for building this pipeline came &om elsewhere, not &om these affected states. For the sake of the people living in New York, Massachusetts and New Hampshire and not for the pockets of Kinder Morgan and its investors, please reject this pipeline proposal

s/Marjorie Feathers

20151015-4001

Mr. Mills and Mr. Tomasi,

I am writing to add my name to the list of Franklin residents who have bee requesting a community meeting for our town. Several New Hampshire [Milford, Rindge, Mason] and other New England towns located along the proposed NED pipeline have had community meetings, or are scheduled for one.

We feel that Franklin also should have such an information meeting with Kinder-Morgan. Especially since Franklin has been selected as a potential site for a compressor station and a purchase agreement has been entered into with the landowners on the proposed NED supply pipeline.

The meetings held in this area of New York State were only "open house" type meetings where questions were answered one-on-one at display tables. We are requesting an open meeting format where questions are asked and answered so all attending can hear the same answer. It is obvious that not everyone will have the same questions!

FERC should refrain from acting upon the Kinder-Morgan filing until all communities proposed for locating a compressor station have an opportunity to openly ask questions about industrial developments [pipeline, compressor station, control valves, radio towers, etc.] that could greatly impact the rural nature of the community.

Thank you for your time, and I hope Kinder-Morgan as a responsible company can have the courage to honor our request.

FEDERAL ENERGY REGULATORY COMMISSION

Meeting Summaries

Massachusetts, New Hampshire

Tennessee Gas Pipeline Company, LLC

Docket No: PF14-22-000

NORTHEAST ENERGY DIRECT PROJECT

October 15, 2015

Meeting Summaries

On **September 28, 2015**, Office of Energy Project staff, and members of its third-party contractor Cardno, met with council members from the Town of New Ipswich, New Hampshire. The meeting included a visit to the proposed compressor station site for the Northeast Energy Direct (NED) Project near New Ipswich and a tour of the area to view other sites proposed for the project route. OEP staff attended the New Ipswich Town Council Meeting after the site visits and answered questions from the Council regarding the FERC process and status of the NED Project.

FERC-OEP and Cardno attendees: Eric Tomasi (FERC), Jennifer Wallace (Cardno), Sara Holmes (Cardno), Oliver Pahl (Cardno), Bruce Hart (Cardno), Lindsey Postaski

On **September 29, 2015**, Office of Energy Project staff, and members of its third-party contractor Cardno attended a meeting with the Southwest New Hampshire Regional Planning Commission in Keene, New Hampshire. Topics discussed regarding the NED Project included the FERC Environmental Impact Statement (EIS) process, pipeline construction and routing, and information sources for the project.

FERC-OEP and Cardno attendees: Eric Tomasi (FERC), Oliver Pahl (Cardno)

On **September 30, 2015** Office of Energy Project staff, and members of its third-party contractor Cardno the FERC attended a meeting with the Berkshire Regional Planning Commission in Pittsfield, Massachusetts. Topics discussed regarding the NED project included the FERC EIS process, involvement of federal, state, and local agencies in the process, regional planning concerns, and post-construction compliance monitoring.

FERC-OEP and Cardno attendees: Eric Tomasi (FERC), Jennifer Wallace (Cardno), Bruce Hart (Cardno), Jason Dickey (Cardno), Doug Mooneyhan (Cardno)

September 23, 2015

RE: Kinder Morgan - Tennessee Gas Pipeline - Northeast Energy Direct (NED) Project - Docket # PF14-22-000

Dear Secretary Bose:

The Franklin Regional Council of Governments (FRCOG) submits the following initial comments on the proposed Kinder Morgan Tennessee Gas Pipeline (TGP) Northeast Energy Direct (NED) pipeline project (PF14-22). The FRCOG is the Regional Planning Agency for the 26 communities of Franklin County. The FRCOG serves the eight communities along the proposed route, as well as abutting communities, that will be impacted by the 34 miles of pipeline and large-scale compressor station proposed for our region. We have actively participated in the FERC process and have also formed a Regional Pipeline Advisory Committee, with representatives from the eight communities along the proposed pipeline route, to provide technical assistance on the FERC process.

This is the largest proposed project in Franklin County since the I-91 interstate highway was built. The FRCOG has significant concerns about the environmental, safety and socioeconomic impacts of the NED pipeline project. The resources in Franklin County that would be directly impacted by the proposed pipeline include: public and private drinking water supplies, permanently protected open space, farmland, rare and endangered species habitats, coldwater fisheries, public infrastructure, and historic resources. The short and long-term impacts that the proposed project would have on our communities and region are profound.

It greatly concerns us that our rural communities, which are more reliant on natural resources and have less income and resources to address impacts, are being targeted for the proposed NED pipeline project. The economic and public health of rural residents is closely tied to the health and viability of the natural resource base that will be negatively impacted by the proposed pipeline. Further, the NED pipeline project is proposed to be sited in several Environmental Justice (EJ) Areas, according to a study recently completed by the FRCOG, which are areas of high poverty or minority populations. These EJ Areas include the Northern portion of Deerfield, Western portion of Erving, Non-Urban Area of Montague, and the Northern portion of Northfield.[1] Consequently, the proposed NED project in Franklin County raises a serious Environmental

Justice issue if rural low income or minority populations are impacted by a project that is expected to have adverse air and water quality impacts and which may have a depressing effect on property values given health and public safety concerns.

We ask that the FERC thoroughly evaluate the need for this pipeline, which has only 500,000 dekatherms per day under agreement with gas companies. Even with the recently proposed reduction in pipeline size to 30 inches and 1.3 Bcf/day, this pipeline project still has only 38% of its capacity committed. If the larger 36-inch pipeline with a capacity of 2.2 Bcf/day were permitted, only approximately 23% is committed. Alternatives to the proposed pipeline should be seriously considered by FERC and we hope that the DE IS process will fully explore these alternatives to meet electricity generation and natural gas demand in New England including energy conservation, renewable energy production, LNG storage, expansion of existing gas pipelines and improved operational efficiencies by other pipelines that can result in recapture of leaked gas. We request that a detailed analysis of these alternatives be included in the Draft Environmental Impact Statement (DEIS) to be developed and published for public comment by the FERC.

The FRCOG has attached detailed Study and Information Requests prepared jointly with other Regional Planning Agencies in Massachusetts and New Hampshire for inclusion in the Draft Environmental Impact Statement. In addition to the alternatives analysis requested above, our Study and Information Requests focus on the following areas:

- Protection of Water Resources (public & private drinking water supplies, rivers, lakes, ponds & wetlands)
- Protection of Air Quality
- Protection of Public Safety
- Protection of Critical Habitat Areas for Rare & Endangered Species
- Minimizing Noise Impacts
- Mitigating Impacts on Infrastructure including Roads, Bridges, Culverts and Electric Transmission Lines
- Addressing Impacts on Private & Public Property
- Avoiding Impacts on Permanently Protected Open Space
- Avoiding Impacts on Historic and Archeological Resources
- Addressing Economic Development Impacts on Heritage & Recreational Tourism and Natural Resource Based Businesses including Agriculture and Forestry
- Addressing Fiscal Impacts on Towns

The Study and Information Requests being submitted are directly related to the general headings listed in the FERC Notice of Intent dated June 30, 2015 (Pages 5-6) for the TGP NED project and will provide the level of information needed for FERC to fully evaluate the environmental, land use, public safety, historic resources, and socioeconomic impacts of the proposed project and make an informed decision. Thus far, the information submitted by the company as part of the pre-filing stage has not been sufficiently detailed to allow for meaningful public comment. Thus, it is our hope that by asking for specific studies, FERC will develop a record of decision that includes adequate detail on the proposed pipeline project so that the public can fully understand and comment on the potential impacts. We request that FERC include the data, information and findings of these Study and Information Requests in the DE IS. However, if FERC does not conduct or require TGP to perform all of these studies, we ask that FERC so notify the Regional Planning Commissions listed to provide us with adequate time to commission these studies, if funding can be secured, in advance of release of the DE IS.

Thank you for this opportunity to provide comments and submit Information-Study Requests on the proposed Kinder Morgan Tennessee Gas Pipeline NED Project. Please contact Peggy Sloan, Director of Planning & Development (psloan@frcog.org) if you require additional information or have questions on our

requests.

1 Regional Transportation Equity Analysis for Franklin County; Franklin Regional Council of Governments; July 2015; Environmental Justice Areas are defined as areas where minorities comprise 9% or more of the block group's total population or where at least 12% of the area's population lives below the poverty level (see Tables 1 & 2 and Narrative; Pages 6-8); These definitions have been in use by FRCOG since 2012 for compliance with Title VI of the Civil Rights Act and while the minority percentage figure is lower than the Statewide average, it is the Franklin County average reflecting our rural region; www.frcog.org

FERC NOI SCOPING SESSIONS - PF14-22

**STUDIES AND INFORMATION REQUESTED AS PART OF THE
ENVIRONMENTAL IMPACT STATEMENT (EIS)**

Kinder Morgan Northeast Energy Direct Project

September 23, 2015

The following Study and Information Requests have been prepared for submission to the Federal Energy Regulatory Commission (FERC) as part of the scoping process for the Northeast Energy Direct (NED) PF14-22 project. The proposed studies and information requests pertain to information that should be included in either the Resource Reports that will accompany Kinder Morgan - Tennessee Gas Pipeline's (KM- TGP) Application for the NED project, or evaluated as part of the environmental review process in connection with preparation of the Draft Environmental Impact Statement (DEIS).

This request for studies and information has been prepared jointly by the:

*Berkshire Regional Planning Commission, Berkshire County, MA;
Franklin Regional Council of Governments, Franklin County, MA;
Northern Middlesex Council of Governments, Greater Lowell Region, MA;
Montachusett Regional Planning Commission, Western Worcester County, MA;
Pioneer Valley Planning Commission, Hampshire County, MA;
Southwest Region Planning Commission, Southwest NH; and
Nashua Regional Planning Commission, Southern NH.*

These Regional Planning Agencies serve the impacted municipalities along the proposed route of the NED project in Massachusetts and New Hampshire. The Resource Report references are to the July 2015 Resource Reports submitted by Tennessee Gas Pipeline Company (TGP) to FERC.

By way of background, these Study and Information Requests have been prepared to ensure that both KM-TGP's application and FERC's environmental review evaluate issues of significant concern to the Regional Planning Commissions, impacted communities and landowners. KM-TGP's pre-filing application lacks sufficient information about anticipated project impacts to either fully inform the public or to allow for meaningful comment on and participation in the process consistent with the National Environmental Policy Act (NEPA) and general principles of administrative decision-making.

While the study list appears extensive on the surface, it bears noting that some of the information requested and studies sought are already required of KM-TGP by FERC as part of KM-TGP's application, pursuant to Part 380 of FERC's regulations and FERC's Guidance Manual for Environmental Report Preparation, online at <https://www.ferc.gov/industries/qas/enviro/erpman.pdf>. It is our expectation that FERC will strictly enforce its regulations and deem KM-TGP's application deficient if it lacks the level of detail set forth in some of these requests, consistent with FERC regulations.

Some of the other studies that we have requested are not expressly covered by FERC's regulations, but nonetheless, are critical to fully evaluating the environmental impacts of the project. Because KM-TGP is sponsoring the NED Project, we believe that it should be responsible for either performing these studies on its own or funding studies by qualified third parties. Nevertheless, if FERC does not conduct or require KM-TGP to perform all of these studies, we ask that FERC so notify the Regional Planning Commissions to provide them with adequate time to commission these studies, if funding can be secured, in advance of the release of the DEIS.

1. Conduct detailed Alternative Route Analyses to Avoid Permanently Protected Open Space, Federal and State Rare & Endangered Species Habitat, Water Resources, Forests, and Farmland

Goal:

The goal of this study is to conduct detailed analyses of alternative routes that will reduce impacts on environmental resources and protected open space.

Context:

In Massachusetts and New Hampshire, the "Preferred Route" proposed by KM-TGP NED project will impact significant environmental resources including Permanently Protected Open Space, rare and endangered species habitat (e.g. MA Priority Habitat Areas), unfragmented forests, active farmland, coldwater fisheries, and water resource areas. The proposed route will alter and/or disrupt over 3,800 acres in Massachusetts and New Hampshire (Resource Report 1; Pages 1-45 & 1-46), including many important natural and cultural resource areas, an increase of over 35% from the amount of land reported to be impacted in March 2015 KM-TGP Resource Report 1. The project will impact roughly 8,800 acres for the overall project (Resource Report 1; Page 1-40), an increase of 25% from the amount reported in the March 2015 Resource Report 1. The Preferred Route does not appear to prioritize the protection of environmental resources, as one would expect in order for the project to be in compliance with National Environmental Policy Act (NEPA), but rather emphasizes "constructability" and avoidance of urban congestion. As stated in Resource Report 10, Page 10-19, "The main determinants used to select the proposed route for the Project's pipeline facilities rather than the alternative routes pertained to minimizing the number of affected landowners, constructability issues and Tennessee's goal to limit the extent of disruption on the communities that will be potentially affected during construction." This statement indicates a bias against siting to protect environmental resources. It also suggests that rural low income populations and communities, that are more reliant on natural resources, are given less consideration than suburban or urban areas that may have greater income levels and resources. The economic and public health of rural residents is closely tied to the health and viability of the natural resource base that will be negatively impacted by the pipeline including groundwater, farmland, and forests. Further the alternative analyses presented in Resource Report 10 do not include key resource areas including acres of Federal or State Identified Rare, Threatened or Endangered Species Habitat, acres of Permanently Protected Open Space, miles of coldwater fisheries streams, acres of public water supply recharge areas

or the number of vernal pools. While urban congestion and the number of residences are cited as key reasons why the pipeline must be sited in rural environmentally sensitive areas the Tables do not provide the number of residences only TBD (to be determined).

Requested Information:

- a. Conduct a detailed analysis of “Alternative” routes along existing pipeline routes and major highway Rights of Way (e.g. 1-88, Mass Pike) in comparison to the Preferred Route. Alternative routes that are co-located along existing gas pipeline systems or in existing major highway R.O.W.s should be prioritized for study as the preferred pipeline route rather than electric transmission lines that traverse environmentally sensitive areas or “greenfield” locations.
- b. Present a comparison of the environmental impacts in the Resource Report 10, as well as in the DE IS and FEIS of the proposed NED Wright to Dracut Preferred Route versus the proposed Spectra Energy Partners expansion of its existing system that will also serve the New England market.
- c. Conduct an assessment of the quality of the resources impacted for the Preferred Route and all alternative routes along major highways and existing pipeline routes. For example, are the wetlands along alternative highway routes well-functioning natural systems or are they already impacted by road runoff and other pollutants, or isolated man-made wetlands resulting from the construction of the road? The Resource Reports simply compile statistics on the miles, acres or lineal feet of different resource areas impacted, rather than describing the quality and integrity of the resources. The Applicant should contact State resource agencies for additional information.
- d. Provide documentation on the sources of the resource statistics and how they have been compiled. Table 10.3-4, a comparison of expanding KMTGP’s Existing 200 Line pipeline route to the “Preferred Route,” suggests that there will be more impacts to wetlands, forest and farmland by expanding infrastructure along an existing pipeline route than along the new Preferred Route from Wright to Dracut. Although the existing 200 Line pipeline route is a longer route in terms of miles (approx. 38 miles longer) than the Preferred Route, if the comparisons are based only on “desk top” data for the Preferred Route obtained from aerial photographs and/or publically available GIS datalayers, the resource impacts are likely significantly underestimated. A more thorough study is needed and impacts on critical resources including acres of Federal or State Identified Rare, Threatened or Endangered Species Habitat, acres of Permanently Protected Open Space, miles of coldwater fisheries streams, acres of public water supply recharge areas, and the number of vernal pools impacted should be included in the alternative analyses tables in Section 10.3.1 Major Route Alternatives. Land use impacts to forest, farmland, recreation areas and developed areas should be presented in terms of the acreage affected during construction rather than the number of miles.

In addition, the Cumulative Impact Analysis presented in Resource Report 3 is deficient and provides no quantitative assessment of water quality, critical wildlife habitat, or rare and endangered species impacts caused by construction and clearing of forested areas (e.g. erosion and sedimentation impacts on water quality and cold water fisheries, increased stormwater runoff and nutrient loading to water bodies, estimated increase in water temperature in cold water fisheries streams as a result of forest land cleared, acres of rare species habitat lost, etc.). Approximately 8,800 acres of land will be disturbed by the project yet on Page 3-113 of Resource Report 3, the proponent states that “The geographic extent and duration of disturbances caused by the construction of the Project will be minimal ... “.

Finally, the Cumulative Impact Analysis should be conducted at the HUC 12 subwatershed scale to provide a better assessment of the cumulative impacts not at the HUC 8 scale as presented. The HUC 12 impacts could then be aggregated within the HUC 12 and at the HUC 10 or watershed scale, as necessary. For example, impacts to the major tributaries of the Deerfield River

should be evaluated at the HUC 12 subwatershed scale. The cumulative impacts to the Deerfield River Watershed (HUC 10) would be the total of the impacts to each of the HUC 12 subwatersheds. The HUC 8 watershed scale does not provide adequate data to provide a meaningful assessment of the impacts.

- e. Provide cross sections of exactly how the pipeline will be “co-located” along the electric utility R.O.W. for the Preferred Route. Resource Report 10 states that the Preferred Route is generally co-located with Tennessee’s existing pipeline or other electric utility infrastructure. Once the proposed pipeline route departs from the existing “200 Line”, 77 miles will be co-located along electric transmission lines. According to Resource Report 1 (pg. 1-2) adjustments may be needed based on ongoing discussions with the electric utility which “may result in the centerline of the pipeline to be located within an existing powerline easement, less than five feet from the existing power line boundary or further than five feet from the existing powerline boundary.” The Resource Reports should clearly define what “co-located” means and should provide a diagram showing the separation of the pipeline R.O.W. from the high voltage electric transmission lines that will be required for safety reasons. Such separation could result in a “greenfields” project with significant additional forest fragmentation and natural resource impacts. Identify the environmentally sensitive areas, including coldwater fisheries and habitat areas with rare and endangered species that currently exist along the electric transmission lines. In addition, the proposed co-location of the pipeline in Pelham and Hudson, New Hampshire is in direct conflict with an approved expansion of the electric transmission lines known as the Merrimac Valley reliability project. Identify the additional impacts on natural resource areas that will occur when the pipeline is rerouted from the current proposed route to avoid conflicts with the Merrimac Valley reliability project.
- f. Conduct a detailed delineation of wetland resources including an assessment of vernal pools along the proposed route. Wetland resources, particularly forested wetlands and vernal pools may be hidden by the forest canopy and are not readily identified by interpretation of aerial photographs. This can result in serious under-reporting of significant wetland resource areas.
- g. Conduct a detailed assessment of impacts to forest habitat areas that support a variety of rare, threatened or endangered species and identify specific impacts on wildlife including the threatened Northern long-eared bat.
- h. The Connecticut River is a federally designated American Heritage River and the River and its tributaries play a central role in efforts to restore Atlantic salmon runs. The Deerfield and Westfield Rivers and their tributaries in Massachusetts are designated “Coldwater Fisheries,” critical to maintaining rare, threatened, or endangered fish species. Coldwater Fisheries are particularly sensitive habitat areas and changes to land or water can reduce their ability to support coldwater fish. In the Southern New Hampshire, both the Lower Merrimack River and the Souhegan River are “Designated Rivers” under New Hampshire’s Rivers Protection and Management Program (RMPP) per RSA 483.

Specific construction techniques must be used that will avoid potential river contamination with drilling fluids, subterranean gas releases that will disrupt the river bed and shoreline, and fluvial erosion that could compromise the pipeline’s structural integrity. FERC should require specific conditions to ensure that temporary work sites will be replanted after construction is complete, and ensure that there is no restriction on access to and use of the river as a result of this project. In addition, the DEIS and FERC should address the following issues:

- i. Clarify the timing of the release of FERC-required construction plans for water crossings.
 - ii. Require that TGP’s construction process includes the use of carrier sleeves for the full-length of the HDD bore.
 - iii. Evaluate the adequacy of pig launch and exit locations to ensure that the rivers have success-

ful in-line inspections at a frequency consistent with industry best practices.

- iv. Facilitate emergency planning with all community and public water suppliers nearby rivers where HHD will occur including Pennichuck Water which operates a secondary water supply on the Merrimack River in close proximity downstream to the proposed alignment.

2. Conduct a Comprehensive Analysis of the Need for the KM- TGP NED Pipeline Capacity to meet Natural Gas Demand in New England

Goal:

The goal is to conduct a comprehensive analysis of the need for the KM-TGP NED pipeline project to support natural gas demand and electricity generation in Massachusetts, New Hampshire and New England.

Context:

To date, the proponent (Kinder Morgan) has not demonstrated that the proposed pipeline capacity is needed. According to Kinder Morgan's (KM-TGP) Resource Report 1, they have commercial commitments for 500,000 dekatherms/day versus 1.3 Bet/day of pipeline capacity. The commercial commitments represent only approximately 38% of the capacity of the proposed pipeline. Given the low amount of capacity committed to be purchased from the KM-TGP NED pipeline, if the proposed project is allowed to proceed, a significant portion of the natural gas will likely be exported and will not be used in the United States, depleting scarce domestic resources to meet overseas demand. If the pipeline is expanded to its originally proposed size of 2.2 Bet/day of pipeline capacity, there are commitments for only approximately 23% of the proposed KM-TGP. Either figure for commercial commitments represents only a small amount of the NED pipeline capacity and raises a serious issue about whether the construction of this pipeline will result in "overbuilding" in direct contradiction to FERC's established policy not to overbuild (Resource Report 10; Page 10-13).

- a. We understand that the Algonquin Incremental Market (AIM) project, an expansion of an existing Spectra Energy Partners gas pipeline, was recently approved by FERC and is expected to provide an additional supply of natural gas for electric power generation in New England, one of the key reasons ISO New England identified the need for additional gas pipeline capacity. Further, KM-TGP appears to have only one electric utility, National Grid, signed up for long term firm transportation capacity according to their list of Shippers. The other purchasers are LDC's and could be served by LNG facilities and/or could invest in reducing the leaks in their distribution systems. CLF reports (CLF; Into Thin Air; Pg. 7) that between 8 and 12 Bet of methane is leaked annually in Massachusetts alone. In its Alternative Analysis presented in Resource Report 10, KM-TGP acknowledges that the proposed capacity of alternate systems (Table 10.2-1, Pg. 10-17) also will serve the same general market. Other projects such as the Spectra Access Northeast will provide up to 1,000,000 Dekatherms per day and is expected to serve the electric utility generation market which is cited as the primary reason that additional pipeline capacity is needed by KM-TGP. In contrast, the commercial commitments for the TGP NED project will provide gas to the LDCs for residential and commercial heating and industrial uses. Further, on Page 10-2, Resource Report 10 states "Existing natural gas delivery systems may be readily expanded to meet increased demand, while minimizing impacts to the environment." This statement indicates that existing pipeline systems can be readily expanded to meet demand thereby eliminating the need for a new pipeline route that will have significant impacts on natural and cultural resource areas. A detailed analysis of the "No Action Alternative" should be conducted as part of the DEIS.

Requested Information:

- a. Conduct an independent evaluation of the proposed construction of the KMTGP NED pipeline and the expansion of the Spectra Energy pipeline system to determine if the construction of both will result in excess pipeline capacity for Massachusetts and New England.

- b. Conduct a quantitative analysis of the potential for LNG storage facilities, renewables (solar and hydro), and energy conservation to provide an alternative to the construction of the KM-TGP NED pipeline for 500,000 dekatherms of energy. Resource Report 10 provides no quantitative analysis of the potential for Energy Conservation, Renewables (solar, hydro) and LNG facilities to meet energy demands for heating and electricity. The broad conclusion that additional gas pipeline capacity is needed is unsupported by the data in Resource Report 10. This analysis should take into account each State's Clean Power Plan goals required by the EPA as well as State and regional Clean Energy & Climate Change plans such as the Massachusetts Clean Energy & Climate Plan for 2020.
- c. Quantify the benefits to the communities along the proposed pipeline route. For instance, in Franklin County, MA the proposed pipeline is anticipated to provide little benefit to the communities directly impacted since the region is largely unserved by natural gas supplies for home heating or businesses. Only two towns along the pipeline route (Deerfield and Montague) have access to natural gas for home heating and business uses. Only five Franklin County towns are served by Berkshire Gas, which has an agreement with Kinder Morgan to purchase 36,000 dekatherms per day, or only approximately 2.8% of the proposed 1.3 Bcf of pipeline capacity. In NH, the situation is much the same with little benefit anticipated for communities impacted by the pipeline as these predominantly rural towns are unlikely to be provided with access to the natural gas being transported through their backyards. Liberty Utilities is the only LDC in NH that has contracted for capacity on the NED project. It has committed to purchase 115,000 dekatherms per day from Kinder Morgan which represents only approximately 8.8% of the 1.3 Bcf/day of pipeline capacity. In the Southwest Region planning district, none of the seven pipeline corridor communities is served by Liberty Utilities.
- d. Quantify the length of time the Marcellus Shale deposits will be able to supply gas for the proposed NED expansion project and evaluate the public benefit of investing in a costly infrastructure project that may be obsolete in a relatively short time frame. In 2011, the U.S. Energy Information Administration reported that the Marcellus Shale deposits contained 410 trillion cubic feet of unproved technically recoverable natural gas, but the following year revised the estimate downwards to 141 trillion cubic feet, only an estimated six years' worth of natural gas consumption in the U.S. (Sources: U.S. Energy Information Administration; Annual Energy Outlook 2012 & Geology.com; Geoscience News and Information). An in-depth study being conducted by petroleum engineers and economists at the University of Texas in Austin is reporting even more conservative estimates with the four big shale plays, including the Marcellus, peaking in 2020 and then declining thereafter (Nature; Volume 516; December 4, 2014).

3. Conduct an Analysis of Air Quality Impacts & Greenhouse Gas Emissions Related to the Construction & Operation of the Pipeline

Goal:

The goal is to conduct comprehensive analyses of the air quality impacts of the proposed pipeline during the construction and operation of the entire facility, including the pipeline, compressor stations, metering stations and venting stations and all construction equipment.

Context:

There are serious concerns about air quality impacts during the construction and operation of the pipeline and compressor stations. The proposed project is expected to have a significant impact on air quality and some locations in the project area are already "non-attainment areas" for ozone. Although the compressor stations will likely require permits from the state regulatory authority responsible for administering the Clean Air Act, that another agency has jurisdiction over a project does not absolve FERC of its obligation to conduct an independent review to determine whether the project is in the public interest. As such, FERC requires information about air quality to be included in an application as part of Resource

Report 9. A comprehensive assessment of the cumulative impacts on air quality related to the construction and operation of the pipeline and related facilities is needed, as well as the identification of potential mitigation strategies and testing requirements that will be followed to protect public health and safety.

Requested Information:

- a. Identify local, state and federal air quality standards that must be complied with and the monitoring requirements and other testing required to determine compliance during the construction and operation for the pipeline, compressor stations and the metering and venting stations, including monitoring required during venting of gas for maintenance procedures, accidental releases, and emergencies.
- b. Provide a detailed explanation of the air quality modeling that will be conducted and provide maps of the areas that are expected to be impacted by emissions from construction equipment and during the operation of the pipeline, compressor stations, and the metering and venting stations. The air quality modeling should be conducted under different meteorological conditions, particularly for Fall/Winter months when inversion occurs, for summer months when there are often high ozone events, and also for different times of day.
- c. Provide maps and a numerical comparison of existing and projected air quality conditions during construction and operation of the facility reflecting cumulative impacts from all of the facilities (e.g. Construction Equipment, pipeline, compressor stations and the metering and venting stations). Such maps and air quality information should provide information on existing and expected conditions during different times of day, different meteorological conditions and during different times of year.
- d. Identify all hazardous pollutants that will be emitted and the air quality monitoring and testing that is proposed to be completed on a daily, weekly or more frequent basis at the compressor stations, metering stations and venting stations during the operation of the facility to protect public health and safety.
- e. There are currently only two air quality monitoring stations in Adams and Greenfield that are somewhat near the proposed pipeline route in Massachusetts. Additional air quality monitoring stations should be installed, at least one in each community where the pipeline is proposed to be sited, with locations selected in consultation with City or Town officials, including local Boards of Health. Additional air quality monitoring stations should be located adjacent to each Compressor Station and all venting and metering stations if the NED Project proceeds. Such ambient air quality stations should be installed at least a year prior to the construction and operation of the pipeline in order to establish baseline conditions. Air quality reports should be provided to Municipal and State officials on a monthly basis. Testing should include O₃, CO, NO₂, NO_x, VOCs, SO₂, PM₁₀, PM_{2.5}, GHGs, and HAPs (Hazardous Air Pollutants).
- f. Conduct an analysis of the greenhouse gas emissions expected to be generated by the construction and operation of the proposed KM-TGP NED pipeline. Quantify the impacts of the project on each state's Climate Change initiatives and GHG reduction goals.
- g. Provide a comparison of the air quality impacts and greenhouse gas emissions expected to be generated by an electric-powered compressor station.

4. Archeological & Historic Resources Study of Pipeline Route

Goals:

The goals of this analysis would be: (1) to ensure preservation values are factored early into FERC planning and decisions, and (2) to avoid, minimize, or mitigate adverse impacts to historic properties.

Context:

Relative to cultural and historic resources, communities have noted that too often Section 106 is initiated

late in the N EPA process, which threatens opportunities to avoid, minimize, or mitigate adverse impacts to historic properties and cultural resources. In addition, FERC offers guidance on evaluation of cultural resources in its Guidelines for Reporting on Cultural Resources, available online at <http://www.ferc.gov/industries/gas/enviro/culresor.pdf>.

Requested Information:

The applicant and FERC should include in Resource Report 4 of its application as well as in the DEIS:

- a. A summary of the correspondence between applicant and local heritage/historical commissions which have local knowledge of sites potentially eligible for Historic Register consideration. Although Applicants frequently file this information as “privileged,” we note that the FOIA provisions ordinarily governing inter-agency communications do not apply where the comments transmitted pertain to the environmental assessment of the project (see 18 C.F.R. §380.9).
- b. A summary of correspondence between Applicant and State Historic Preservation Officers (SHPOs), particularly in states that do not maintain comprehensive historic inventory databases.
- c. Provide more detail on the predictive model for archaeological site locations including: how the model is validated; how the model results are used specifically; and how river locations, which have a high probability of pre-historic findings, are specifically incorporated into the predictive model.
- d. For the tables of previously-identified sites, many are reported to have “Insufficient Information to Evaluate” or “Unknown.” The Applicant, working in coordination with SHPOs, should conduct additional studies to determine eligibility for National Historic Register listing. For sites that are listed as Not Eligible, the Applicant should identify the entity making that determination and the reason why each is not eligible.
- e. Provide documentation of compliance with state statutory requirements for construction impacts to federal and state-designated scenic roads.
- f. Provide detailed information on the procedures that will be followed if buried historic or prehistoric resources are uncovered during construction including notification of state agencies and Native American Tribal representatives.

5. Analysis of Private Property Real Estate Values, Homeowner and Municipal Insurance, and Municipal Tax Revenues

Municipal Tax Revenues

Goal:

The goal of the analysis is to accurately quantify the expected impact of the NED project on local tax revenues.

Context:

As part of their meetings with local communities, representatives of Kinder Morgan provided estimates of expected tax revenues that will be realized from the construction of the pipeline and related infrastructure and facilities. In Massachusetts, the Department of Revenue (DOR) establishes the actual value of the pipeline and local property tax rates are then applied to the value. The figures cited by Kinder Morgan appear to be inconsistent with data provided by DOR on existing pipelines. These numbers can be viewed through an Excel file, which shows the assessed property value of pipelines and related infrastructure in each town in the Commonwealth. It can be found on this web page: www.mass.gov/dor/local-officials/assessor-info/centrallyvalued_utilities/fY2015_PiPeline.html.

Requested Information:

- a. KM-TGP should provide a detailed analysis of the tax revenue impacts as a result of the construction of the pipeline. The methodology utilized for developing the revenue figures should be clearly explained. A detailed accounting of the property tax impacts in every community along

the main line and proposed laterals should be provided. Any previous inaccuracies or misstatements made by the proponent should be corrected and explained. The calculations should include the pipeline and all related infrastructure, including the compressor stations, and metering and venting stations. To the extent that KM-TGP is unable to quantify tax benefits to communities, it should be precluded from including any contrary statements in its application and supporting materials.

Residential Property Values

Goal:

To clearly quantify and understand the impact of the proposed project on future property tax revenues and residential property values in each community along the proposed main line and laterals.

Context:

Kinder Morgan asserts that the presence of the pipeline will not negatively impact local property values. However, there are a number of paired-sale studies that suggest that there may be long-term loss of property value due to the presence of a natural gas transmission line. It is difficult to determine the extent to which those published studies reflect transactions involving knowing buyers, who were fully aware of the presence of the pipeline. According to the Pipeline Safety Trust, one reason that there is limited available information about changes in property values is that, in the settlement of eminent domain cases, operators typically require a confidentiality agreement from the affected landowner, promising not to disclose the amount of the payment received by the landowner for the loss in value of the property. Moreover, public awareness of pipeline safety has been elevated as a result of serious accidents in September 2010 in San Bruno, California and in February 2011 in Allentown, Pennsylvania, creating a stigma relative to living in close proximity to such facilities.

According to the Forensic Appraisal Group, Ltd., the effect of a gas pipeline easement is measured by the market. Depending on the size of the pipeline, size of the easement, how it is located on the property, the size of the property, property use, etc., the impact range could be nominal to substantial.^[1] It could be as little as 50% of the easement land value, or up to 30% or more of the whole property value. The more intrusive the easement on the land (runs diagonal across the whole property vs. just down the property line), the more impact it will have. If the property were purchased at market value with consideration for the pipeline, the owner may be able to resell it for the price previously paid; assuming overall market conditions do not diminish. Clearly, this will not be the case for most current property owners along the proposed NED right-of-way. There does not appear to be an upside to having a pipeline easement on a property. Inconvenience, restrictions on use, unsightly paths cut through wooded areas, other negative visual impacts, and potential stigma could have an adverse impact on property values.

Requested Information:

- a. The Applicant should provide in the DE IS and FEIS tangible, substantiated data to support claims made regarding the proposed project's negligible impact on local property values. Hard data should be provided outlining the impacts that other projects of this magnitude have had on residential property values and marketability. The Applicant should also disclose a list of right-of-way use restrictions that may apply to the pipeline easement which may impact property values. An assessment of the potential property value impacts in each community along the main line and laterals should be clearly outlined, and the methodology for arriving at the calculations should be thoroughly explained.

Insurance Issues

Goal:

The goal is to assess the impacts of the project on the ability of homeowners to purchase property insurance; to quantify any potential increase in premium costs for property owners; and to assess liability exposure for municipalities.

Context:

Recent anecdotal evidence provided to the Pipeline Safety Trust suggests that insurance underwriters are responding to the presence of gas transmission lines near residential properties, and raising rates, or in some instances, suggesting that insurance might not be available for a new buyer of a property where a transmission line was recently constructed.[2] While it may be true that some underwriters do not consider the presence of a transmission line to be a rate factor, some do.

Gas pipeline line development also has the potential to involve municipalities in lawsuits related to the installation and operation of in-ground pipelines. Municipalities need information on the insurance coverage carried by the gas pipeline company and any exposure that the municipality may have.

Requested Information:

- a. The Resource Reports and DEIS should document the potential insurance impacts of the project on private property owners including an independent assessment by a qualified firm of whether property owners will have difficulty purchasing insurance and if insurance premiums will increase due to the presence of the pipeline. This analysis should be verified by assessing the insurance impacts on private property owners in other parts of the United State that have recently been impacted by the construction of a gas pipeline of this size and scale.
- b. Evaluate the liability exposure for every municipality along the pipeline and determine municipalities affected by the proposed project including abutting communities. Require Kinder Morgan to list affected communities as additional insured's on their liability insurance policy and provide to each affected municipality a copy of the insurance policy with the affected municipality listed as an additional insured.

6. Analysis of Potential Safety Impacts Including Identification of Hazard Zone(s) if Pipeline Fails**Potential Safety Impacts During Construction:****Goals:**

The goals of this analysis are to: (1) determine the level of impact of construction activities on emergency response times in and around the project area; and (2) determine and quantify potential threats to public safety due to construction activity.

Context:

Construction will occur along a long corridor involving suburban towns, rural towns, and significant areas of protected open space in state and non-profit ownership. Much of the road network consists of rural two-lane highways and local roads with limited means of access for relatively large portions of the communities. Much of the existing development pattern consists of scattered rural homes, interspersed with agricultural and forested land and State parkland. Fire protection is provided primarily by local volunteer fire departments, with forest fire support from State agencies, and many areas do not have public water systems that provide fire protection. The preferred route crosses public drinking water supply wellhead protection and drinking watershed areas.

Requested Information:

- a. Provide an analysis of the roads that will be impacted by construction activity, such as requiring partial or complete temporary closure, in all communities including abutting communities. Determine the amount of delay or additional travel time and distance created for each impacted road for emergency vehicles to respond to incidents.
- b. Provide an analysis of the impact of construction related activity on each impacted road's condition and its ability to continue to serve local emergency management vehicles responding to emergencies due to the impact of construction related activity on the road's surface, structure, culverts and bridges. Quantify the "worst case" impacts on emergency response times if the road condition deteriorates to a level which makes it impassable for emergency response vehicles.

- c. Provide an analysis of the impact of construction related activity on each impacted road's condition and its ability to continue to serve natural resource based economic development including forestry and any other existing commercial or industrial development. At a minimum pipe materials and construction under any roadway regardless of class should be at the same standard as required of a State road.
- d. Assess the capacity of local fire departments and other public safety personnel to respond to wildfires created by construction activities, or to respond to a construction site accident where workers may be injured. Capacity should include assessment of staffing levels, training, materials and supplies, and equipment.
- e. Determine what hazardous materials and petroleum products will be used during construction and identify threats to public health and safety that these hazardous materials potentially create.
- f. Analyze the impact of blasting necessary to remove rock for the construction project. Clearly identify areas which will be subject to blasting. Determine the area of potential concern regarding rock throw and seismic impacts due to blasting activities. Determine the people, structures and other facilities located within that area of concern. Describe the types of blasting materials that will be used. Require that the "blasting" firm hired not use perchlorate products to avoid potential contamination of drinking water supplies.
- g. Identify the locations of public drinking water supply infrastructure and determine the impact of construction activities on wells, reservoirs, aqueducts and dams, given the age and condition of the infrastructure and possible impacts due to pipeline construction activities. Identify any private wells that may be impacted by the project as a result of construction.
- h. Analyze the noise impacts of construction activities and assess those against State and local noise regulatory standards. To establish baseline noise levels, measure the existing ambient noise levels along the construction path for both daytime and nighttime and provide quantified assessments of the expected increases in noise and the potential public health impacts resulting from the increases in noise. Noise impacts analyzed should include the operation of machinery used for clearing and construction, for mechanical fracturing of rock, and for blasting necessary to remove rock.
- i. Assess the potential safety risks of trenches and the measures to be used to ensure compliance with, at a minimum, the Massachusetts Excavation & Trench Safety Regulation (Jaclyn's Law).
- j. Assess areas of steep slope for slope failure potential during construction. Determine all areas potentially impacted by slope failure and identify risks to the public using those areas for a variety of purposes. All structures and other facilities or areas used by the public or by private property owners in such areas should be identified.
- k. Identify and require the use of pipeline construction techniques and operation procedures designed to withstand the increased frequency of heavy rainfall events.

Potential Safety Impacts During Pipeline Operations

Goals:

The goals of this analysis would be to: (1) to reduce the possibility of a catastrophic failure of the pipeline or related facilities (compressor stations, meter stations, and main line valves); (2) to minimize risk to the public resulting from catastrophic failure; and (3) to ensure the adequacy and appropriateness of emergency response to all major and minor incidents.

Context:

The pipeline will be operated in an environment where some rural and suburban development already exists along considerable portions of the route, and homes and businesses are in close proximity in a number of instances. There will be additional development which occurs in proximity to the pipeline over the multiple decades during which it will operate. Much of the route is in communities that rely entirely on volunteer fire departments as first responders; they have limited training and equipment, and

turnover in membership necessitates ongoing training and replacement of out-of-date specialized supplies and equipment.

Requested Information:

- a. Serious pipeline accidents can result from weld failures. Clearly identify the protocols for inspection of welds during construction. What is the sample number of welds to be subject to inspection by radiological testing? If radiological testing finds weak welds, will the sample number be increased along the pipeline?
- b. Since many pipeline explosions involve excavation activities by third parties, provide a detailed explanation of the measures that will be taken to clearly identify the pipeline corridor, to regulate/authorize construction activities in the corridor, and to monitor on a frequent basis for unauthorized construction in the easement.
- c. Clearly identify the location of and safety risks associated with all pipeline above ground facilities including compressor stations, valve stations, main line valves, and pig launchers and receivers. Provide a detailed explanation of the measures that will be taken to protect against those safety risks.
- d. Clearly identify the potential impact radius for potential explosions for the entire pipeline infrastructure, based on the proposed size and pressure of the pipeline, including the pipe, each compressor and valve station, each main line valve, and any potential blast hazard at pig launchers and receivers. Document the “High Consequence Areas” and the method used to determine them, including quantification used as the basis for each HCA. Identify all structures located along the pipeline and laterals, including their use, highlight public facilities and areas commonly used by the public (trails, playfields, schools, churches, parks, camping and picnic areas, etc.) within the potential impact radius.
- e. Clearly layout the ongoing inspection protocols for the pipeline once in operation. What will be the frequency of monitoring for methane and where will the natural gas be odorized? What will be the frequency of internal and external inspections for corrosion or other damage to the pipeline? What will be the standards used for determining when inspections reveal potential issues for further investigation and repair?
- f. Clearly layout the protocols for the ongoing inspection of the condition of the cathodic protection used. What will be the standards used to determine when inspections reveal potential issues for further investigation and repair?
- g. Since much of the pipeline is proposed to be in proximity to high voltage electric transmission lines and overhead (as well as underground) power lines can induce harmful disturbances on nearby metallic pipelines, assess the:
 - i. Capacitive coupling disturbances for any above ground sections of pipeline that are electrically isolated from the ground. The evaluation of this disturbance should be performed for steady-state operation condition of the power line, assuming the line operates at its maximum operational voltage.
 - ii. Inductive coupling disturbances for any pipelines facilities which are located below-ground. This disturbance should be evaluated taking into account the maximum anticipated levels of steady-state and short-circuit currents.
 - iii. Conductive coupling disturbances for underground sections of the pipeline and for any grounded above-ground sections of the pipeline. This evaluation should be performed only for short-circuit condition of the power line and taking into account the maximum anticipated level of short-circuit current.
 - iv. Under short-circuit condition, the disturbances due to inductive and conductive coupling occur simultaneously.

- v. Assess the adequacy of proposed cathodic protection against corrosion given current research as traditional pipe-to-soil potential measurements do not guarantee efficient protection and identify the frequency of maintenance required to ensure these systems are preventing corrosion of the pipeline.
- vi. What other anti-corrosion methods can be utilized?

References: "Electrical Risks in Transmission Line-Pipeline Shared Rightsof-Way": Jose R. Daconti, Power Technology, Newsletter Issue 96, October 2004.

"AC Corrosion Induced by High Voltage Power Line on Cathodically Protected Pipeline": Ouahdah M'hammed, "Zergoug Mourad, Ziouche Aicha, Touhami Omar, Ibtlouen Rachid, Bouyegh Saida, and Dehchar Cherif, International Conference on Control, Engineering & Information Technology Proceedings, 2014, ISSN 2356-5608.

- h. Conduct an analysis of the appropriate depth to which the pipeline should be buried to minimize the potential of a pipeline failure based on the climate conditions for Western Massachusetts and Southern New Hampshire given its location under a high voltage electric transmission line. As outlined in Table 1.3- 1 of Resource Report 1 (Page 1-78) in normal soil conditions, only 36 inches, and in areas of consolidated rock, only 24 inches of fill is proposed to be placed on top of this high pressure gas pipeline. This depth is well above the frost line in New England and Western, Massachusetts and a significant portion of the pipeline will be above the frost line. Will KM-TGP's "minimum" specification for depth cover which the company states it will use provide adequate protection to the pipeline from temperature changes or frost heaves? We note that failure of welds can lead to a catastrophic explosion that at the proposed pressure could impact homes, businesses and wildlife habitat areas including cold water fisheries and endangered species habitat within approximately 800 feet of the pipeline (30 inch pipeline at MOP of 1,460 psig). Not only would the gas pipeline be damaged but a major electric transmission line critical to the region could be rendered inoperable.
- i. Provide detailed information about the materials used for interstate gas pipelines constructed under electric transmission lines over the last 30 years including the type and gauge of the pipeline and materials used for cathodic protection against corrosion.
- j. Provide a summary and analysis of the safety record of interstate gas pipelines located under electric transmission lines for a period of at least 30 years. Provide examples of at least 10 interstate gas pipelines constructed within 100 feet of an electric transmission line and include their safety record.
- k. For the sections of pipeline that are proposed to be co-located with electric transmission lines, assess the impact a catastrophic pipeline explosion may have on the region's electric infrastructure.

7. Analysis of Training, Equipment and Facility Needs for Local Emergency Responders

Fire Protection

Goal:

The goal of this analysis is to assess local firefighting capabilities in relation to fighting a fire caused by an incident on the proposed pipeline or at a compressor station.

Context:

Fire departments in most of the towns crossed by the pipeline rely on a volunteer call force. This creates difficulty in scrambling a sufficient number of firefighters even for routine house fires. Because these firefighters have "day jobs," they often don't have time to participate in trainings and exercises to keep up their skills. Purchasing large pieces of firefighting apparatus to fight even routine fires for small, rural towns is proportionately more expensive than in larger cities because the same base level of equipment is needed regardless of population size, but the tax base in a rural town is smaller.

Requested Information:

- a. Provide a detailed assessment of the ability of local emergency responders to respond to incidents involving above ground facilities and outline resources needed to keep their training, supplies and equipment up to an adequate standard to respond to those incidents.
- b. Provide a time frame for completing a plan for multi-year training and exercises for local first responders, which include provisions for offering trainings in the evenings and on weekends so volunteers may participate. The training should include training on the proper use of gas monitoring equipment.
- c. Provide a list of specialized apparatus, equipment, and personal protective equipment that local fire departments will need if the pipeline is permitted by FERC and constructed.
- d. Provide a list of all substances that will potentially be transmitted through the pipeline and the Material Safety Data Sheets for those substances. TGP should be required by FERC to notify municipal officials and local fire departments when pipeline contents change so they will have up to the minute information on what hazards they may need to respond to.
- e. Provide information on what methods will be used to ensure that the actual rights of way are delineated on the ground once the pipeline is constructed if approved by FERC and provide local Emergency Management Directors with detailed maps showing the exact location of all pipeline facilities, especially all shut off and venting valves.
- f. Clearly identify the proposed distance between valves and identify which valves will be manually, remotely, or automatically operated in the case of a pipeline system failure. Document how much fuel would be released given the type of valve and the distance between valves in the case of any failure.
- g. Provide information on how long it takes to stop a leak based on the proposed spacing and method of operation (e.g. remote or on-site) of the valves and how long it will take for all of the gas to evacuate from the pipe and dissipate to safe levels under different atmospheric conditions.
- h. Assess the ability of local fire departments to access water from lakes, fire ponds, etc. along the proposed pipeline route in the event of a large fire where water is needed to supplement the water initially brought by the fire trucks.
- i. Assess the capability of the local and regional hazardous materials response team to respond to any incidents involving hazardous materials and petroleum products?

Police Monitoring**Goal:**

The goal of this analysis is to determine what kind of security measures will be taken in relation to the pipeline and the compressor stations if they are constructed.

Context:

Unlike rural fire departments, rural police departments do not rely on volunteer labor, but they have small forces.

Requested Information:

- a. Provide an outline of what security measures FERC will require TGP to undertake to prevent terrorism or vandalism events.
- b. Provide information about what routine patrolling of the gas pipeline and compressors station will be required by FERC and carried out by TGP.
- c. Provide information about whether the compressor stations will be manned or remotely monitored. If remotely monitored, specify the length of time that it will take a representative to arrive on-scene if there is an incident.

Planning for Emergency Events

Goal:

The goal of this analysis is to determine what kind of emergency planning process will be conducted before construction and in the long-term if the pipeline and compressor station are constructed.

Context:

With the lack of local public safety resources mentioned above, it is imperative that good emergency operations plans be in place and be regularly exercised with local responders if the pipeline is approved by FERC. Regional emergency planning committees and public health coalitions are integral partners in assisting local responders in preparing for emergencies.

Requested Information:

- a. Provide a time frame for completing a comprehensive emergency operations/response plan and an outline of the contents of the plan if the proposed pipeline is approved by FERC. The plan should be created with input from local and regional public safety entities and they should receive copies of the plan when it is complete and whenever it is updated. Provide a schedule for how often the plan is proposed to be exercised with local responders.
- b. Provide a time frame and information on what kind of an evacuation plan will be created if the pipeline is approved by FERC. This should include local and regional input and be exercised with local responders.
- c. Provide information on what measures will be taken to plan for evacuation of residents that will be isolated or trapped if an incident occurs.
- d. Provide information on what measures will be taken to notify the public in case of an emergency. The public notification plan should have redundant communication methods built in, especially in areas where cell phone service is not available or reliable.
- e. Provide information on how frequently contact lists, which include TGP emergency contacts and local responder contacts, will be updated and distributed to municipal officials and local responders.

8. Analysis of Impact on Heritage & Recreational Tourism and Forestry~

Temporary Disruptions to Heritage & Recreational Sites during Construction

Goal:

The goal of this analysis is to identify all heritage and recreational sites and determine if temporary construction impacts will significantly harm the site's viability as a destination for all types of visitors.

Context:

Rural economies are supported by the region's natural, scenic, historic and open spaces resources. Certain recreational aspects of the proposal are discussed in Draft Resource Report 8, submitted by Tennessee Gas Pipeline Company. Parks, trails, tracts of land, tourist destinations, vistas, and other sites under all types of ownership exist throughout the study area. Direct economic patronage to and indirect expenditures associated with visits to these sites may be disrupted by construction activities associated with a pipeline construction project.

Requested Information:

- a. Provide an inventory of heritage and recreational sites and Federal and State Scenic Byways and National Scenic Trails along the proposed route, including their locations and extents.
- b. Provide the locations, total areas, and durations of impacts, such as temporary road closures in the vicinity of each inventoried site.
- c. Determine how the operation of sites will be disrupted as a result of temporary construction impacts through a fiscal impact analysis quantifying loss of revenue due to required closures,

decreased patronage, and other disruptions.

- d. For each site impacted by the proposal, provide a mitigation plan to ensure their continued operation during any construction activities.

Long-term Disruptions to Heritage & Recreational Sites and Forestry Businesses

Goal:

The goal of this analysis is to identify all heritage and recreational sites and determine if the presence of a natural gas pipeline, its associated facilities, or rights of way will significantly harm the site's continued viability as a destination for all types of visitors. A second goal is to assess the potential impacts on forestry related business.

Context:

Direct economic patronage to and indirect expenditures associated with visits to these heritage and recreational sites may be permanently disrupted by the proposed project and its associated facilities. Changes to scenic vistas, the physical character of the land, and liabilities/restrictions on certain activities near the facilities in question will impact these sites and their public benefit. Additional fragmentation of forested areas may impact businesses relying on this resource.

Requested Information:

- a. Determine whether a site's operations and visitor attractions, Federal and State Scenic Byways or National Scenic Trails will be disrupted as a result of permanent installation of a natural gas pipeline, its associated facilities, or its rights of way.
- b. Summarize the acreage of heritage and recreational land that will be permanently impacted by the proposed facilities.
- c. Determine the occupancy of recreational and heritage sites throughout the year, and during appropriate peak times where number of visitors and human impacts on an area may be significantly higher than normal.
- d. Determine how the operation of heritage and recreational sites will be disrupted as a result of permanent construction impacts through a fiscal impact analysis.
- e. Provide a mitigation plan for heritage and recreational sites to address potential losses in views, changes to the physical character of the land, and any potential hazards due to pipeline activities.
- f. Address impacts on the safety of visitors to each heritage and recreational facility, and to assets of the facility, including insurances, emergency preparedness, and increased liabilities associated with the proposed facilities.
- g. Conduct an economic impact study showing the potential negative impacts on recreational and heritage tourism and forestry businesses in terms of lost revenue, income, and jobs as a result of the pipeline.

9. Analysis of Impacts on Private & Public Water Supplies and Water Resources related to Construction (blasting & drilling), Pipeline Operation and Hazardous Materials Storage & Use

Goal:

Conduct a comprehensive analysis of the water quality impacts of the proposed pipeline during the construction and operation of the entire facility including the Pipeline, Compressor Stations, Metering Stations, Venting Stations, Pig Launchers and Receivers and construction equipment.

Context:

There are significant concerns about potential impacts to drinking water supplies and water resources related to the construction and operation of the proposed pipeline, compressor stations and related facilities. A comprehensive assessment of the surficial geology along the proposed pipeline route, identification of potential impacts to public and private drinking water supplies, and plans for monitoring of water

quality is needed to protect public health and safety and environmental resources. This includes identification of potential mitigation strategies and testing requirements. There are locations along the proposed pipeline route where there is a shallow depth to bedrock and homes and businesses in those areas rely on bedrock wells that could be negatively impacted by blasting. There is also concern that any hazardous materials transported in the pipeline or used during the construction and operation of the pipeline and compressor station could be released and contaminate groundwater and other water resource areas.

Requested Information:

- a. Identify local, state and federal water quality standards that must be met and the monitoring and testing requirements proposed to determine compliance during the construction and operation of the Pipeline, Compressor Stations, Metering and Venting Stations, and Pig Launchers and Receivers.
- b. Conduct a hydrologic analysis and provide a description, inventory and analysis of existing groundwater conditions and an assessment and mapping of surficial and bedrock geology, including location of bedrock faults and high transmissivity fractures. This analysis should include consultation with the State Geologists in NY, MA and NH. This analysis should focus on both surface water and groundwater and include a discussion of potential impacts to these resources as a result of the construction and operation of the pipeline, compressor stations and other above ground facilities. Identify measures to reduce or mitigate the identified impacts.
- c. Based on the assessment of the surficial and bedrock geology along the pipeline route, clearly identify locations where there are public water supply recharge areas, including Zone II areas and Interim Wellhead Protection Areas mapped and defined by State agencies (e.g. MassDEP Source Water Assessment Program), Outstanding Water Resource areas, and/or high or medium yield aquifers within Y:z mile of the proposed pipeline and compressor stations. Outline methods and testing proposed to protect public and private drinking water supplies particularly if blasting or drilling is required during construction.
- d. Based on the assessment of surficial and bedrock geology, identify locations where there is shallow depth to bedrock and identify and map all residences and businesses that rely on bedrock wells within a Y:z mile of the proposed pipeline and compressor stations. Outline methods and testing proposed to protect public and private drinking water supplies relying on bedrock wells, particularly if blasting or drilling is required during construction.
- e. In accordance with State standards for proper sampling and laboratory protocol, identify pre-construction and post-construction water quality analysis and flow rate (gpm) testing that will be conducted for each existing public or private groundwater well within 750 feet of the pipeline unless surficial geology warrants a greater testing area. Water quality testing should be completed by an independent State certified water testing laboratory and parameters to be tested should include, but not be limited to: methane, chloride, sodium, TDS, pH, arsenic, barium and strontium, radon, and a subgroup of the volatile organic chemicals (VOCs) called BTEX (benzene, toluene, etc.).
- f. Identify the locations where water quality testing will be conducted on an annual or more frequent basis to ensure that public and private drinking water supplies are adequately protected from potential impacts from the pipeline and related facilities during their operation and identify remediation strategies that will be undertaken if contamination is found.
- g. Identify all hazardous materials that could be contained in the pipeline and all hazardous materials that will be used during construction of the pipeline including drilling and blasting materials.
- h. Provide a hazardous materials handling and response plan that proposes methods to ensure that releases will not occur and identifies methods to mitigate accidental releases. Specify how the plan will be implemented by the operator, contractor and subcontractors utilizing or storing hazardous materials in excess of household quantities during the construction and operation of the pipeline

and related facilities, including training that will be required for their employees.

- i. Identify FERC's requirements for the applicant, operator and or construction contractor(s) to replace or remediate contaminated drinking water supplies or to remediate releases to water resource areas (lakes, ponds, streams, and wetlands) caused by the construction or operation of the pipeline and related facilities.
- j. Identify potential contamination pathways resulting from drilling underneath rivers and between aquifers or from Brownfield sites located along the pipeline route that could adversely impact surface and groundwater resources.
- k. Describe the water quality testing required for the water used for hydrostatic testing of the pipeline, disposal alternatives for this water, and permits required before it is released to any surface water or to groundwater.

10. Analysis of Impacts on Rare & Endangered Species

Goal:

The goal of this requested analysis is to identify what impacts the construction and operation of the pipeline will have on the vitality and long term sustainability of rare and endangered species and their associated habitat. The study should look beyond just localized impacts and consider cumulative impacts to the species' statewide or ecosystem-scale habitat.

Context:

The proposed NED right-of-way is slated to mostly fall alongside existing utility ROW corridors. In areas where this occurs, the result will be a widening of deforested areas or potential fragmentation of contiguous forestland. In other segments, the pipeline is slated to cut through undisturbed habitat supporting state and federally listed endangered species.

The Resource Report submitted by Tennessee Gas to FERC in July 2015 notes that areas converted from forest to open grassland areas due to de-vegetation "will naturally re-vegetate in 1-2 years" and will "provide additional open land habitat" (Page 3-51). It is important to note that the regeneration of a full-canopy forest takes well more than 1-2 years. The Resource Report also notes that some species are "adaptive to changing habitat conditions" (Page 3-52), but does not specify which and whether they include endangered or rare species. TGP acknowledges that its project will create the displacement of habitat and thus alter the cascade of species that depend on them: "Vegetation clearing between HDD entry and exit work spaces will be avoided if possible. Clearing of vegetation will permanently reduce available habitat cover and food sources for certain species of wildlife (i.e., those that primarily rely on forested habitats). However, following a relatively short period of regeneration within TWS and permanently maintained ROWs, there will be more terrestrial grassland and PSS habitats that provide important cover and a greater diversity and density of food sources for a different complex of wildlife species." (Page 3-51).

State regulatory agencies are charged with protection of and overseeing the recovery of rare and endangered species due to their importance to ecosystem health and biodiversity, not simply exchanging them for new types of habitat and wildlife. Because this project will remove old habitat and create new ones, studies are needed to understand how these new types of habitat, and the wildlife they support, will influence the recovery of any rare and endangered species within the counties affected.

Requested Information:

- a. Determine the location and abundance of rare and endangered species communities that will be immediately displaced by the proposed project.
- b. Determine the impact of loss of habitat on these rare and endangered species, and the potential for these impacted communities to adapt to new types of habitat.
- c. Determine the impact on new types of habitat and the wildlife they support on displaced rare and

endangered species.

- d. Determine the cumulative impacts of the proposed project on the statewide or ecosystem-scale health and recovery of rare and endangered species.
- e. Determine how the loss of impacted rare and endangered species in the proposed project area will affect other sensitive wildlife or vegetation communities in adjacent areas.
- f. Outline the mitigation that will be implemented to avoid or minimize the project's impact on rare and endangered species. Identify locations where the project will result in a "take" of a rare or endangered species and outline what mitigation will be pursued to compensate.

11. Analysis of Impacts of Construction and Equipment on Existing Infrastructure (Roads, Bridges, Culverts, Water, Sewer, etc.) and Impacts from new Access Roads and Staging Areas

Goal:

The goal of this analysis is to avoid, minimize, or mitigate impacts and adverse effects from pipeline construction on existing infrastructure (which includes access roads and staging areas).

Context:

Particular areas of concern noted by municipalities include the potential for general damage from the construction process including: damage to roads, particularly rural and Class VI roads not suitable for heavy equipment; traffic control and communication during construction; general landscape disturbances; and impacts to existing utilities, such as sewer, water, and drainage. These issues will dictate the strategies communities will need to use to replace/repair infrastructure adjacent to the proposed pipeline.

Requested Information:

The following information should be provided in the DEIS and FEIS:

- a. A table listing the new and modified access roads that are proposed for use, including the location by milepost, the size, and the type of modification required on existing roads.
- b. The expected construction start date for each segment of pipeline, pipeline lateral, and compressor stations, discuss the number of spreads and workers per spread required for the proposed laterals; clarify whether the construction workers and timeframes provided for compressor and meter stations are those required for each individual facility, or for each type of facility combined; provide the number of permanent staff anticipated during operation; and provide locations for the new operations offices or district offices that would be required for operation, or clarify that none would be needed.
- c. Specify the distance between the existing and proposed permanent rights-of-way and indicate the potential for further overlap that would allow abutting of the permanent rights-of-way. In addition, specify the maximum overlap of existing rights-of-way allowable by the law, as stated throughout Resource Report 1.
- d. Include a discussion and consideration of direct pipe trench less pipeline installation technology.
- e. Identify any deviations from the FERC Plan and Procedures, if applicable, and include the section of the Plan or Procedures for the requested deviation, the deviation itself, justification for the deviation, and how the deviation would provide equal or greater mitigation. If major modifications to the FERC Plan and Procedures are proposed, the Applicant should provide its own modified versions of the documents that would be used during construction and operation of the Project.
- f. Provide a more detailed discussion on the environmental training that would be conducted for construction personnel, if the Project were approved. Specify which construction personnel would receive training, when and how often the training would occur, and what documents would be provided (e.g., the FERC Plan and Procedures, or the TGP Plan and Procedures, as appropriate). In addition, discuss measures to ensure contractor compliance with the required mitigation including provision of an independent project monitor.

- g. Specify whether power, water, or other utility lines would be constructed for the proposed above-ground facilities.

12. Quantification of Benefits of Reduced Natural Gas Prices as a Result of the NED Pipeline Capacity

Goal:

The goal is to determine the impact of the proposed project on future electricity costs for residential, commercial and industrial customers in New England, and to quantify the project's impact on economic development throughout the region.

Context:

Kinder Morgan has asserted that construction of the NED pipeline will relieve gas supply and transmission capacity deficits in the region during the winter months. This relief will lead to lower wholesale gas prices for electric generators, reducing electricity costs for businesses and residents. Kinder Morgan further contends that winter peak gas shortages cannot be addressed using any other means.

Requested Information:

- a. Quantify the reduction in electric rates that residential, commercial and industrial consumers will realize once the proposed project goes online. In addition, the implications of the reduced electric rates in attracting economic development should be evaluated. Particular attention should be paid as to how well Massachusetts and New Hampshire will compete with other areas of the country, in terms of lower energy costs, due to the presence of additional natural gas supply in the region.
- b. Provide documentation as to why market reforms, clean energy investments, energy conservation measures and the availability of LNG are not adequate to meet our future energy needs.

This past winter, a more diverse fuel supply mix reduced price volatility despite harsher weather. Over this time period, wholesale electric prices were 43% lower on average from December 20 14-February 2015, when compared to December 20 13-February 2014 (ISO New England).

- c. Assess the potential impacts of overbuilding pipeline capacity, and assess the volatility of the natural gas market, as seen in the recent unexpected plunge in the price of LNG and oil on the global markets.

Taken together with the Access Northeast project, New England could see its pipeline capacity increase by 78%. Will electric customers be saddled with the cost of constructing the pipeline? Adding this much capacity could mean that New Englanders will pay for infrastructure largely used to transport gas to Canada and other export markets. Kinder Morgan has already stated that they intend to reverse the direction of the Maritimes and Northeast pipeline for this purpose. Many experts have stated that increasing exports in this fashion will result in much higher natural gas prices in New England, as we suddenly find ourselves competing with consumers in other countries. Kinder Morgan should evaluate the potential impact of such an export plan on energy prices in New England and outline how they expect to finance the construction of the proposed pipeline.

13. Quantification of the Increase in Natural Gas Service that will be provided to New England as a result of the NED Pipeline

Goal:

The goal is to determine benefits of the proposed project within states, regions and municipalities as a result of natural gas availability to residential, commercial and industrial customers and associated cost savings.

Context:

One of the benefits asserted by the Applicant of the NED project is that it will increase the quantity of natural gas available in New England. It is suggested that this, coupled with the lower cost of natural

gas in comparison with other energy sources, will reduce energy costs and make us more economically competitive. Recent winter seasons, in particular the winter of 2013/14, demonstrate that parts of New England run the risk of severe spikes in energy costs due to shortages of fuel used to operate power plants. The NED pipeline proposes to address this situation by providing enhanced supplies of dependable, lower-cost natural gas as fuel for power plants and LDCs. Furthermore, it has been suggested that LDCs, such as Liberty Utilities in New Hampshire and Berkshire Gas Company in Massachusetts, can construct additional lateral lines from the main NED pipeline to provide fuel for indoor heating and to benefit economic development activities in certain communities within proximity to the pipeline. It is unclear what factors drive decisions for constructing these additional lateral facilities.

Requested Information:

To assist in quantifying the benefits to be provided by installation of the NED pipeline proposal, Kinder Morgan should be required to:

- a. Provide data which indicates the natural gas demand anticipated for each New England State versus the current available supply, and describe why the proposed infrastructure project will serve the need identified better than other pipeline projects now under development or other energy alternatives, such as LNG or renewables.
- b. Indicate locations in which additional lateral pipeline facilities (beyond those identified in the proposal) are anticipated, including the geographic areas they would serve.
- c. Provide data indicating the volume of fuel anticipated for each additional lateral pipeline identified in item 13.b. above, for use in corresponding geographic areas.
- d. Conduct a cost benefits/savings analysis of reduced fuel costs via pipeline distribution for each of the above, including cost breakdowns for each geographic area along the proposed NED pipeline corridor and along the laterals it would serve.

14. Analysis of Noise Impacts from Pipeline Construction & Operation and Compression Stations (to be provided)

Goal:

Conduct a comprehensive analysis of the noise impacts of the proposed pipeline during the construction and operation of the facility including the Pipeline, Compressor Stations, Metering Stations, Venting Stations, Pig Launchers and Receivers and construction equipment.

Context:

There are significant concerns about noise impacts from the proposed pipeline given the proposed location in very rural areas with varied topography. Many towns have very low ambient noise levels (est. 20-40 dBA) and contain critical habitat areas for rare, threatened or endangered species including the Northern Longeared bat. A comprehensive assessment of the noise impacts on humans and wildlife and potential mitigation measures should be undertaken.

Requested Information:

- a. Identify local, state and federal noise standards that must be met and the monitoring requirements proposed to determine compliance during the construction and operation of the Pipeline, Compressor Stations, Metering and Venting Stations, and Pig Launchers and Receivers.
- b. Conduct studies to determine ambient noise levels at the nearest property line of a residence and any public building, school, hospital, or other High On-site Population location or at 300 feet from the nearest residence or public building, hospital, or other High On-site Population location, whichever point is closer to the pipeline and related facilities. High on-site populations are defined as the following: retirement housing; assisted living facilities; congregate living facilities; convalescent services; parks; detention facilities; day care services (commercial); hospitals; and educational facilities (public or private). Ambient noise level should be measure

at a minimum every % mile along the proposed route. “Ambient” is defined as the background A-weighted sound level that is exceeded 90% of the time measured during the quietest part of the day or night. All testing should be done by a qualified licensed professional acoustical engineer in accordance with the professional standards of the appropriate accrediting agencies and the sound level meter used in conducting any evaluation shall meet the American National Standard Institute’s standard for sound meters or an instrument and associated recording and analyzing equipment.

- c. Conduct modeling of expected noise impacts during construction and operation of the pipeline based on the topography of the proposed pipeline route and identify potential impacts to humans and sensitive receptors such as wildlife, including Northern long-eared bats.
- d. Identify measures that the Applicant will undertake to mitigate sound levels for humans and sensitive receptors. Identify what devices or other equipment the Applicant will employ, including the use of electric motors at the compressor stations, to mitigate sound levels to ensure that the noise level standards at residential or public buildings, hospitals or other High On-site Population locations are not exceeded and sensitive wildlife receptors are not adversely impacted.
- e. Identify noise monitoring that will be conducted once the facility is operational and a process to address noise complaints so the facility will remain in compliance with noise limits.

15. Analysis of Invasive Species Impacts during Construction & Operation of the Pipeline

Goals:

The goals of this study is to determine the types of invasive species likely to become established along the corridor and associated access roads; their impacts on surrounding habitat, particularly those of unique quality, special concern, or supporting rare or endangered species; and the long-term monitoring and control strategy needed (past construction and restoration) to combat the establishment or spread of invasive species. The impacts of any control strategies, such as application of herbicides and/or pesticides, on cold water fisheries, water resources and drinking water supplies should also be studied.

Context:

Tennessee Gas acknowledges that there is potential for the introduction of invasive or noxious weeds through this project (Page 3-116, July 2015 Resource Report 3). The disturbance of soils due to foot and vehicle traffic, as well as altering the soil composition of forest areas through clearing and compaction, can aid the establishment of invasive species, which are then notoriously difficult to eradicate or control. Japanese knotweed, for example, can lay dormant for years after applications of herbicide before rebounding in growth, and thus requires years of vigilant attention in order to suppress regrowth. It is widely known that invasive species spread and thrive along utility corridors due to soil disturbance, increased light, and increased dispersal opportunities (such as foot traffic). Invasive species may be present along the utility corridors with which this project will co-locate. The continued spread of invasive species into forest cores and other habitats through which this project will traverse is concerning, particularly in light of a 2015 study by the New England Wildflower Society that finds 21 % of New England’s native plants are already rare or endangered, and 31 % of plants are non-native.[3]

A project of this scale and breadth can accelerate the loss of plant diversity, which is already being fueled by climate change and pesticide use, through the introduction of invasive species on land that was previously untouched or resilient. Furthermore, as this project intersects with habitats of special concern or value, the potential impacts of invasive species on these unique areas should be studied. The potential for invasive species to spread into adjacent property owned by others should also be thoroughly assessed. TGP proposes to address the treatment of invasive species through a general approach, which will meet the minimum requirements per state, Commonwealth, or local requirements. But this general approach may not adequately prevent and control individual invasive species or their effect on wildlife. In addition, the July 2015 Resource Report 3 only addresses the use of herbicides when needed to

control invasive species in the new ROW and states “New areas permanently maintained during operation of the Project facilities will be maintained in an herbaceous/early successional stage of vegetation. Tennessee will not use herbicides as part of routine vegetation maintenance along the ROW except when required for the control of invasive plant species as permitted ... “ (Page 3-79). Pursuant to 18 CFR 380.15, a company can use herbicide/pesticide only with consent of landowner. The Applicant should also be required to provide a “Plan B,” if a landowner refuses use of herbicides, such as an organic farm within the vicinity of the pipeline. Measures should also be planned to monitor and control invasive species that may enter nearby forested or other areas outside the edge of the ROW.

Requested Information:

- a. Create a predictive model and analysis of likely invasive species establishment along the corridor, based on existing invasive species in the project area as well as soil types, using GIS or other modeling techniques.
- b. Identify impacts that anticipated invasive species will have on surrounding habitats, with particular study of impacts on habitats of special concern or those that support rare and endangered species.
- c. Identify impacts that anticipated invasive species will have on wildlife populations along the corridor, particularly rare and endangered species.
- d. Identify necessary prevention, monitoring, and control techniques tailored to anticipate invasive species that extend beyond the edge of the new ROW and persist after construction and restoration.
- e. Evaluate and quantify the potential impacts of any control strategies such as application of herbicides and/or pesticides on cold water fisheries, water resources and drinking water supplies along the proposed pipeline route.

16. Analysis of Impacts to Agricultural Lands and Economy

Goal:

The goal of this study is to understand the impacts of the pipeline on the productivity of agricultural lands and the local and regional agricultural economy.

Context:

The July 2015 Resource Report 7 submitted by TGP outlines several prevention and mitigation measures to protect soil compaction and loss of agricultural productivity. Approximately 16% or roughly 300 acres of prime farmland along the proposed route is anticipated to be permanently lost to construction and overall 1,900 acres will be impacted by construction (Page 7-14), which is a significant amount. After several decades of declining farmland and with the current scarcity of agricultural land available for new generations of farmers, the loss of any additional farmland (particularly prime) is extremely detrimental to the agricultural economy.

TGP plans to engage in compaction prevention techniques (Page 7-11), topsoil segregation practices (Page 7-13), drainage/erosion issues, and prevention of bedrock migrating to topsoil (Page 7-9). Despite these mitigation activities, it is important to provide an analysis of potentially lost agricultural land (i.e. pipeline ROW located amid other active crops, grazing areas, rotational fields, etc.) and to evaluate the impact of the lost acreage on the viability and economy of scale of agricultural crops. Long-term crop-specific and livestock impacts of the pipeline and related activities that will impact the productivity of agricultural lands should be understood. For example, mature orchard trees lost to construction or ROW may not be replaced, despite achieving restored soil conditions.

Requested Information:

- a. Identify the types of agricultural land directly and indirectly impacted by acreage, number of owners, and soil types and anticipated radius of impact.

- b. Identify impacts of soil disturbance, altered drainage patterns, and mitigation activities on the various types of agricultural activities, including disruption of economies of scale.
- c. Identify impacts of the pipeline itself to long-term soil productivity, due to increased temperatures, altered drainage, and/or anticipated maintenance activities (such as applications of herbicides).
- d. Provide a fiscal impact study showing the value of lost agricultural productivity on the local and regional economy, in terms of lost revenue, income, and jobs.
- e. Provide an assessment of the potential impacts on access to local food for area residents.
- f. Provide an assessment of impacts on organic farms potentially impacted along the pipeline route.
- g. Provide an assessment of the potential loss of tourism revenues for farms that host visitors (e.g. agri-tourism).

20151015-4014

Mr. Eric Tomasi
Federal Energy Regulatory Commission

Re: PF 14-22

Dear Mr. Tomasi,

It is imperative that FERC understand New England's energy needs accurately, rather than as they have tended to be portrayed since 2013/14.

New England's energy needs have already been met for the next 10 years.

New England's winter peak demand will be covered by 10 year LNG contracts with Distrigas, already signed by utilities. No additional energy is needed!

Last winter's high electric rates were not due to scarcity. They were set in the fall, assuming a scarcity based on the 2013/14 winter's problems. But those deficiencies were caused by poor preparation and grid mismanagement by ISO-NE which gave the false impression that there was a lack of adequate energy.

A month after the rates were set, last fall, prices fell. In spite of an even colder winter than 2013/14, by January wholesale prices fell 60%....without a single new pipeline and after the retirement of 2 more power plants!

In April, ISO-NE reported the lowest demand for electricity in 12 years....and electricity wholesale prices were lower than they've been in 16 years!

That was without any new pipelines and with the retirement of 4 major power plants, VT Yankee, Mt Tom, Salem Harbor, and Norwalk Harbor!

The "energy crisis was overblown"- president of the NE Power Generators Assoc.

Additional – EXTRA - natural gas projects are already in line for NE:

1. Portland Natural Gas Transport System – less costly for rate payers.
2. AIM and TGP/CT pipelines, already approved by FERC could begin construction in 2016- less costly than NED
3. Access Northeast/Spectra/Eversource/National Grid - also less costly than NED

Each project above would be in service sooner, cost ratepayers less, and not bring the level of harm to the environment and health of New Englanders that NED would.

Therefore, I request that FERC deny the Certificate of Public Necessity and Convenience for the Northeast Energy Direct proposal.

Beverly Edwards, Temple, NH

fyi

it has been impossible to file online this afternoon. There has been a temporary technical issue for more than an hour. For that reason, I am sending this comment via email:

15 October 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE, Room IA
Washington, DC 20426

Re: Proposed Northeast Energy Direct Project, Tennessee Gas Pipeline L.L.C/
Kinder Morgan (FERC Docket No. PF14-22-000)

Dear Secretary,

Park Watershed is a 501c3 urban-suburban watershed stewardship organization for Park River regional watershed, which stretches east of the Metacomet Ridge through MDC reservoir properties to the Connecticut River. West Hartford, Hartford and Bloomfield as well as parts of Newington, New Britain, Farmington and Wethersfield are within the Park River watershed. Our organizational goal is to improve the water quality and ecosystem health of water courses and water bodies that enhance neighborhood character even within high-density urban development. Park Watershed is currently focused on green infrastructure for stormwater management, as we work on implementation of the North Branch Park River Watershed Management Plan, which was approved in 2010 by US Environmental Protection Agency.

The Northeast Energy Direct (NED) project (FERC Docket No. PF14-22-000) proposed by Kinder Morgan

would cross through headwaters of the Park River regional watershed. Park Watershed is opposed to new pipeline construction through Class I and Class II land that protects our exceptionally pure drinking water. With a population that exceeds two hundred and fifty thousand, the seventy-eight square mile Park River regional watershed is one of the most densely developed metropolitan areas in the state of Connecticut. Well-managed landscapes of the MDC reservoir system have considerable cultural and recreational value, because most other areas of the Park River watershed have been extensively developed. The landscapes along the Metacomet Ridge also host habitat for wildlife and migratory birds, and significant cultural heritage features, such as the New England National Scenic Trail.

In addition, Park Watershed seriously questions the ethics of a pipeline for gas extracted with problematic “fracking” methods that negatively impact human, environmental and community health. In the future, clean water will surely increase in value. The NED project threatens to undermine the integrity of the historic MDC reservoir system and the clean water that it provides to Connecticut residents. As a federal agency, we recommend the Federal Energy Regulatory Commission prioritize preservation of local cultural assets, especially our drinking water reservoirs.

Sincerely,

Mary Rickel Pelletier
Founding Director

October 14, 2015

Dear Governor Hassan,

We have been told to let the FERC process take place. You asked that FERC be transparent. You asked that you were keeping an eye on how the FERC commenting period would unfurl.

Last Friday, Eric Tomasi, project manager for the NED pipeline project sent his NED Draft Resource Report comments to Kinder Morgan/Tennessee Gas. This took place on October 9, 2015, 7 days before the final closing of FERC comments by the public.

Is this an example of how the FERC process works?

Sincerely,

Kathleen Gauvin

20151015-5001

Joy Stevens, Lynnfield, MA.

I wish to express my extreme opposition to the Kinder-Morgan Tennessee Gas Pipeline Company's, Lynnfield Lateral. This project would cause extreme damage to the environment, wetlands (which are supposed to be protected) and local neighborhoods. The company is definitely not considering any of the above issues based on their proposed route for the pipeline. A pipeline of this size (24") would be under high pressure yet would be going through residential areas which would be destroyed in case of a leak or explosion. The damage to wildlife and waterways would be extensive. The pipeline is going to the coast which means at some point the gas would be exported providing the company with a profit but the area of the pipeline with nothing but destruction of property values and long term environmental damage.

20151015-5005

pegviglione@comcast.net, Greenville, NH.

As a resident of Greenville, NH I am aware of the issues surrounding the proposed Kinder Morgan/Tennessee Gas/NED Pipeline project. I have educated myself about pipelines, compressor stations, fracked gas and FERC, the federal agency and process by which these projects are evaluated and approved. I attended four FERC Scoping sessions and one Kinder Morgan Open House. I won't repeat the numerous "concerns" as FERC labels them dealing with health and environmental risks, safety hazards, legal and financial questions. Others more eloquent have laid these out.

I wish to express my anger and frustration at both Kinder Morgan and FERC. I suspect when KM looked for an alternative pipeline route to the original northern MA option they saw a vast, forested, thinly populated area ripe for plundering. They anticipated little if any resistance from what they mistakenly saw as an unsophisticated, uneducated array of small towns. What they didn't see was the depth of passion New Hampshire citizens have for our land, our love of pristine wilderness, our fierce independence and sense of fairness. They forgot that NH was one of the original 13 colonies who refused to bow to oppression, and that our state motto is "Live Free or Die." Maybe they assumed we took that off a coffee mug. Well, they hit that bee's nest with a stick! To date this project has the highest number of anti-pipeline comments recorded by FERC in its entire history. We held the only Scoping session at which not one comment in favor was registered. There is continued and growing massive resistance along the entire proposed pipeline corridor.

As I watched I became absolutely convinced that the process is rigged in favor of the gas companies. FERC is charged to "address" every concern registered - but what does address mean? Essentially nothing. They are obligated to listen but not to actually do anything. Scoping meetings only pay lip service to the requirement for public input. They result in an Environmental Impact Statement which FERC can ignore, make token changes or offer inadequate "mitigation." Since 1935 they have denied only two submitted pipeline applications. Meanwhile Kinder Morgan is fronting an invasion they have designed, waged and won for decades. They move into a target area, join the local Chambers of Commerce, make civic donations to court favor. They wage a carefully calculated media campaign of misinformation and deception, promising lower energy costs and access to natural gas. They submit a plan full of items "to be determined" which serves as a shell game to deliberately confuse. I had a KM rep tell me at their Open House that "there is nothing harmful in the pipeline gas. It's all scrubbed at the well heads." They showed carefully crafted drawings of park-like compressor stations surrounded by lovely green grass and foliage - so opposite from the reality of the scarred, blighted sites they create.

I was recently made aware of the term "regulatory capture," a theory associated with George Stigler, a Nobel laureate economist. Regulatory capture happens when a regulatory agency, formed to act in the public's interest, eventually acts in ways that benefit the industry it is supposed to be regulating, rather than the public. <http://www.investopedia.com/terms/r/regulatory-capture>. The big energy corporations have become so powerful that our state politicians sidestep direct opposition despite the deafening outcry from their constituents. They call for transparency and more Scoping meetings - a token resistance designed to appease voters, and guaranteed not to jeopardize their future big energy campaign contributions.

I feel a deep sense of betrayal as this fight goes on. First from our federal government for allowing FERC to become subverted to serving companies like Kinder Morgan rather than acting for the common good of the people. The government has failed to adapt national energy policy to reflect the need for and facilitate the transition to clean, renewable energy strategies. Instead it continues fostering the creation of unnecessary fossil fuel infrastructure. Second, betrayal by our elected state officials, with a few notable exceptions such as David Wheeler, who have refrained from blocking this project. New Hampshire cannot afford to allow a flawed federal agency following obsolete energy strategies to usurp private land for corporate profit, inflict devastating damage across our state and then require us to pay for that project with no benefit to us. Please write or call your legislators and demand that they oppose the pipeline now.

20151015-5007

Suzanne Martin, Averill Park, NY.

I live within 1 mile of where the NED compressor station is said to be placed by Kinder Morgan. I am sincerely scared of the effects of the station and this pipeline to my family, local community, environment, and it's wildlife. Not only are the health effects bad for us, but they will be dire to those in PA.

I am very opposed to this pipeline running through NY State. I don't understand why this is happening when fracking was banned in our state and should be banned nation wide. It is detrimental to our environment and it's people. Maybe the idea is that since it's the pipeline portion running through NY it is not breaking the law, but regardless the risks associated and negative health effects from a pipeline and compressor station are also not good.

Please help us keep our water clean, our wells safe, our people and animals healthy, our lakes and rivers swimmable, etc.

In the end, I am realistic that pipes and stations may have to be run...but there is no reason this should ever happen in a residential neighborhood. There are houses directly across from the site, and hundreds of homes within just 1 mile. It is absolutely immoral and wrong.

20151015-5009

Christine Kossuth, Merrimack, NH.

As a concerned resident of the Town of Merrimack, NH, I am writing to document my opposition to the natural gas pipeline.

I am one of the many homeowners whose property is in the path of the proposed pipeline route who rely upon private wells for water. One of the reasons for my opposition to the pipeline is because of the risk to our well water from blasting, natural gas leaks, and the repeated application of chemicals to prevent trees from growing along the pipeline.

I am also opposed to the pipeline due to the risk of odorless leaks and explosions, as documented in Congress's 2013 study which can be found at the following link: http://www.markey.senate.gov/documents/markey_lost_gas_report.pdf. My health, my life and my property should not be endangered.

Finally, I am opposed to the pipeline for fiscal reasons. The decrease of property values and the increase of home insurance costs will cause a significant financial loss to homeowners.

I have a question: How will leaks be classified and which classification of leaks will be repaired?

Sincerely,

Christine Kossuth

20151015-5012

Mark Bastille, Peterborough, NH.

I am writing to express my concern about routing a gas pipeline through NH. Specifically I am writing to express my objection to the pipeline purposed in Docket No. PF14-22-000 Northeast Energy Direct Project,

Tennessee Gas Pipeline Company, L.L.C.

Emissions

I am very concerned about the emissions that would come from the compressor station. It is my understanding that the volume of material would be unregulated and contains many nasty chemicals that are known to be very hazardous to the environment and our health.

The proposed location of the compressor station is very near a school in Temple and is just on the other side of the ridgeline from my home. I cannot imagine a worse place to put something like that. Such a careless disregard exemplifies to me that profits and not the well-being of our communities is driving this project.

I live in NH because the air is cleaner up here. I live in NH because I want to get away from pollution. To have pollution exported to my backyard and so near a school for someone else's profit really makes me mad.

Beautiful Spaces

I am very concerned about the potential devastation to our natural treasures here in NH. NH is blessed with beautiful natural spaces that people come to enjoy from around the world. Mt. Monadnock is the second most climbed mountain in the world and that is just one of the many treasures we have in this area. Tourism is significant part of our local economies and is driven by the ability to experience these beautiful settings. It is my understanding that the proposed pipeline route will affect 8 miles of state forest/park lands, 18 rivers, 116 bodies of water and 155 wetlands.

Again the careless disregard for affects that this pipeline would have on communities is appalling.

Renewable Energy Sources

As a single planet, as a country and as a region we are clearly better off in the long run pursuing renewable energy solutions for our growing needs. It makes common sense, financial sense and it is the right thing to do. There has been a lot of momentum gained in this region over the last few years. Wind farms are popping up everywhere. Solar panels are becoming common place on residential homes.

Creating this pipeline would only encourage more use of non-renewable energies, drive more money towards the horror show that is fracking and drain valuable resources away from renewable energy movement that is beginning to work.

We don't need this pipeline. We don't want this pipeline. The pipeline is neither a good short term nor long term plan for this region and will only serve to put profits in the hands of people that don't need them at the cost of our kid's health, our beautiful scenery and our local economy.

Please don't allow this project to continue.

Thank you,

Mark Bastille
717 Wilton Road
Peterborough, NH

20151015-5013

joseph padalino, averill park, NY.

10/14/15 in regards to PF 14-22-000 I am strongly opposed to this pipeline traveling through our area. I own 2 properties, 1 with a well, and 1 with drinking water from Glass Lake. The thought of contamination is very scary. I have 2 small children and do not want them exposed to unknown chemical that could be seeping into our ground water. Our local elementary school is also on a well close to the area in question, putting 400 plus young children in danger. If our Local Lakes, Burden, Glass, Crooked, were affected what would happen to our great fisheries. We have moved to the country setting to avoid noise pollution. How would a 90,000 horsepower compressor station add to peace and quiet of our neighborhood? We have lots of bird life, even sometimes a bald eagle, my concern with all this new noise from the compressor station it would scare away the beautiful creatures. As an avid hunter, fisherman, and bird watcher, how would this

company not disrupt the land surrounding our great natural resources?

Thank you for this opportunity to be heard

Joseph Padalino
Sand Lake Town Resident

20151015-5014

Katherine Wadsworth, Farmington, CT.

October 14, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE Room 1-A
Washington, DC 20426

PF14-22 - Morgan Kinder, Tennessee Gas Pipeline Proposed Project
Hartford County, Connecticut.

For Kimberly Bose,

I am a very concerned citizen when it comes to compromising clean air, clean water and clean dirt in our environment. We in Connecticut, and in other parts of the Northeast, are being threatened with a high potential for the contamination of our water resources. Our local public water supply provider, the Metropolitan District Commission, is so concerned for its property, which contains several reservoirs and a large watershed to supply them for the 400,000 citizens it serves, that it called for and publicized a town hall meeting in West Hartford, CT last Wednesday the 7th of October. I'm sure the Commission felt that most people whose water supply is under threat were not hearing about the so-called informational meetings being held around Connecticut this past year... I am a person who pays attention to this kind of issue and I had not heard of any. And, there were two in my home town of Farmington, CT. the first was not very well attended, not sure about the second.

It is not surprising that the general public does not trust a corporate energy giant like Morgan Kinder which tells them all they want to hear about the safety of their project while being installed and while up & running (60 years of history in our neighborhood); about their concern for & protection of the environment as they install & maintain their pipelines; and about how they adhere to all regulations and requirements pertinent to the work in sensitive areas, whether they be wildlife habitats, residential neighborhoods, historical & cultural sites or, as in this case, designated Class I and Class II public drinking water resources (reservoirs and their watersheds). Morgan Kinder, in order to install this 24" high pressure gas pipeline through this highly sensitive area says it is "only" asking to expand an existing 30' easement to a 60'+ permanent easement AND, on top of that, a 'temporary' easement of another 25' or so as a work area. That's a big swath of disturbed land with most of it staying a big swath into perpetuity. But, the most frightening of all is that this new pipeline trench will have to be blasted along this entire length of reservoir property which is located on a trap rock ridge. The distance between the existing gas line & the new 24" line is not all that great and that existing line, from what I understand, is 60 years old. Morgan Kinder has said it is co-locating this new pipeline on an easement it already holds. No, it is asking for another easement to make a new line for natural gas transport. Back when that first line was installed in the 1950s there weren't the regulations or restrictions covering such installations & disturbances of these irreplaceable and life sustaining resources that the State of Connecticut has in place currently. I cannot believe that the Federal Government would over-ride this State's laws protecting its own natural resources by eminent domain or other mechanism.

I have taken a look at the reports regarding presentations made to certain business focused and economic development organizations or associations over these past months about the positive impacts this project will have on those concerns here in our State. That may or may not be true, depending on who would get the contracts for the labor, materials and transport in the end. Statistics have been offered that our energy needs in Connecticut could be more efficiently & less expensively served with more 'natural gas' coming our way.

Some people say we don't need to add any more, they have studies too. Some people saying that enough energy can come from more sustainable technologies. That is yet to be seen. But one thing is for sure, a contaminated water system because of a mishap, or worse, adversely effects the health and welfare of hundreds of thousands of individuals.

Just because this can be done, & bigger powers than us are pushing for it with all kinds of corporate founded salesmanship type justifications, doesn't mean it has to be done. Especially when the public welfare would be so obviously at risk.

Thank you for your consideration.

Katherine Wadsworth
Farmington, CT

20151015-5015

Michael J Dailey, Merrimack, NH.

Ferc Comment submitted on 10/14/2015 @ 10:06PM (est)

I'm generally opposed to the proposed PF14-22 Pipeline project for the following reasons:

- (1) Its construction is paid for whole or in some large part by the electric ratepayers of NH. If Kinder Morgan is so keen on completing this project then they should pay entirely for it from their own funds. Otherwise NH RatePayers, are in effect, are being taxed without representation.
- (2) A large % of the gas transported by this pipeline will be sold offshore, and therefore will NOT, on the whole, benefit those NH residents which use natural gas nor will it be primarily used to benefit Gas Turbine Electric Generation utilities, and therefore will not benefit NH electric rateholders. This contradicts how Kinder Morgan had been pitching this project as beneficial to NH electric rateholders, including vague statements made at a televised Merrimack Town meeting.
- (3) Its construction and continued long term presense will cause degradation to adjacent properties. This proposed pipeline requires a 50' wide right of way that must be logged and cleared. This same right of way will, if past practices of Kinder Morgan are followed, will be maintained with chemical defoliant rather than mechanical means. Such defoliant will be of detriment to sensitive wet lands and forest areas adjacent to the right of way. Even if mechanical means were used to maintain this right of way, it will leave a scar upon our NH lands.
- (4) It will lower residential property values of real estate adjacent to the pipeline's right of way. Whereas commercial property owners have financial means and legal representation to ensure that their interests are understood and preserved, the same is not true for those of us holding private, residential property that is some short distance from this proposed pipeline.
- (5) Some right-of-way land must be seized from private property owners by eminent domain proceedings.
- (6) Finally, safety is a concern, as having a 30" high pressure natural gas pipeline situated in a residential area and through densely traveled highway: NH Route 101A.

I thank you for your time and kind attention.

Regards,

Michael J Dailey

20151015-5016

Roy Pincus, Lynnfield, MA.

Why is it that Kinder Morgan has not agreed to meet with those who will be directly impacted by the pipeline in Lynnfield, MA until after the comment period with FERC has passed? The deadline to submit comments to FERC is Oct 16th. Kinder Morgan has not agreed to meet with the Lynnfield residents for an open forum until Oct 29th. How convenient! What are they trying to hide and do not want us to know until it is

too late to comment about it?

I am outraged by their lack of transparency and the shadiness in which they operate.

20151015-5017

Susanne Riemer, New Ipswich, NH.

Dear FERC,

I am opposed to this project and request that you deny this application for the following reasons:

1. The emissions from the proposed compressor station are exempt from the Clean Air Act, yet are known to have carcinogenic emissions, among other toxic/poisonous components.
2. The compressor station is to be located less than 1/2 mile from a public school.
3. The compressor station will be disturbing the peace and quiet of our small, rural town with an unacceptable noise level.
4. Contrary to Tennessee Gas statements, this project will not benefit New Hampshire, as New Hampshire is an energy exporting state.
5. The proposed pipeline is expected to use 30 inch pipe because it will be traveling through a rural area. However, southern New Hampshire is the most populated part of the state, so contrary to Tennessee Gas statements, the danger of pipeline explosion would actually endanger many people.
6. The proposed pipeline construction will destroy wetlands, conserved lands, and recreational lands, all of which drew my family to live in this area in the first place. We are concerned about destruction of aquifers and how this will affect wells and drinking water in the area.
7. We do not want this pipeline, and do not endorse the corporate greed that is driving this project.

Thank you.

20151015-5018

David Baram, Bloomfield, CT.

Dear Sir,

As State Representative for Bloomfield and Windsor, CT, I am writing to ask that the comment time and investigation period be extended to allow residents, municipalities, and organizations an opportunity to learn more so they can comment intelligently.

I also ask that the Applicant, Tenn. Gas Pipeline Company, LLC and Kinder Morgan be required to submit all applications to the State of CT for a complete review, and to the local municipalities for zoning and wetland permitting.

Furthermore I ask that a complete environmental and toxicological study be conducted to determine any risks to public health and the environment, particularly in light of the fracking extraction that has led to documented health hazards and detrimental environmental impacts.

It is also requested that information be made public verifying what the capacity is of the existing Tenn. Gas Pipeline in CT, how much is being used, and what the unused capacity consists of that might accommodate expansion without a second pipeline.

All routing and construction plans need to be made subject to local permitting by the applicable zoning and in-land wetland's commissions and to obtain building permits. All public safety hazards, road and train crossings, underground and above ground water reservoirs/aquifers, and environmental habitats must be identified and analyzed.

Finally, I ask that Tenn. Gas provide alternate route options that avoid populated areas and sensitive environmental habitats.

The above information is necessary to determine if a Certificate of Need is appropriate and justified. Con-

cerns need to be addressed, and routing should be reviewed to avoid populated areas and protected/sensitive environmental habitats.

At this time, based upon the criterion referenced hereinabove, it does not appear that a Certificate of Need is justified. This project should be carefully scrutinized without regard to timetable established by the Applicant. Much more review and analysis is required. Safety must always be the paramount priority.

David A. Baram
State Representative
15th Assembly District

20151015-5019

Catherine Masi, Roxbury, CT.

Not only is this proposal a threat to the environment, it is a gross injustice to the rights of private property owners. Private property ownership is the foundation for this country and these rights need to be protected ... period!

20151015-5020

Kathy Chapman, Mason, NH.

It's not right, nor is it legal, for the Federal Energy Regulatory Commission (FERC) and a private company to set a timeline for taking property from people by eminent domain and providing them no opportunity to mount a defense. If a project's scope changes, i.e. different people are affected than in the original proposal, then the scoping period should be extended, period.

I'm speaking, of course, of the imminent end of the scoping period (October 16, 2015) for the Northeast Direct Pipeline (NED) that is proposed to cut across and through 17 towns in southern New Hampshire. Because the pipeline route can change AFTER THE SCOPING PERIOD ENDS, the pipeline could be moved anywhere and the affected people would have had no chance to prepare for this event.

The way it is now, there is every incentive for the pipeline's proponent, Kinder-Morgan (KM) (a spin-off of Enron) and the like to do what has been done in the case of NED, i.e. a line was drawn across southern New Hampshire (when Massachusetts put up resistance to having the line drawn there) based on old maps. This became the proposed pipeline route -- through houses, schools, aquifers, and LCHIP properties. Clearly there was little, if any, work done by KM to prepare even a rudimentary site plan that would avoid even these most obvious of obstacles. By using very old maps, KM didn't give our area the dignity of even a decent first evaluation.

Last December, it became the problem of each and every individual in those 17 towns along that randomly-drawn line to defend his or her property. Over the months, people and towns have organized to raise a host of reasons that the pipeline shouldn't be built at all. The 17 towns and the people in them had very little time to come up to speed on what all this was to mean to them, but they knew a few things for certain: (1) a company with a lot of money was going to take their land, and (2) the federal government was going to stand behind the company. Could this get worse? YES!

Somehow, FERC's rules do not make any accommodation in dates when a project's scope changes. The town of Amherst has managed to have the pipeline shifted to Merrimack and Hollis, and yet the date that scoping ends remains the same. The good people of Merrimack and Hollis have had less than a month to react to this change.

The scoping period needs to be extended for every single move of the pipeline to train KM and others that a reasonable proposal needs to be presented, the people being impacted need to be given the time and consideration they deserve from an agency of the federal government. (Unfortunately, we have come to learn that FERC is not funded by our tax dollars at all, but instead is funded by the very people it regulates, for example, KM. Can corruption be far behind?)

In any case, the scoping period must be extended until the pipeline route is settled.

The 14th Amendment to the US Constitution says as much: it forbids states from denying any person “life, liberty or property, without due process of law” or to “deny to any person within its jurisdiction the equal protection of the laws.” Not only will the property owners such as those in Merrimack and Hollis have been denied property without due process of law, they have also been denied equal protection under the law because other similarly-situated property owners have been accorded more time to mount a defense against the taking by eminent domain of their property.

20151015-5021

John Leoutsacos, Temple, NH.

Why hasn't the route 90 (mass Pike) alternate route been thoroughly explored? It has been mentioned many times to Eric Tomasi in my presence, the last being September 28, 2015. In that meeting he acknowledged it but didn't appear to want to pursue it. That would be the cleanest, safest, shortest route with the least personal and environmental impact.

I believe you are aware of it but for some reason unknown to the citizens of southern New Hampshire, are unwilling to consider it a valid option.

20151015-5022

John Leoutsacos, Temple, NH.

On September 28 2015, in a meeting at the New Ipswich New Hampshire town hall, FERC representative Eric Tomasi stated that both he and his crew would be driving the previous proposed Massachusetts rte 2 path to gain perspective into it being an alternate route for the NED pipeline. To my knowledge, nothing more has come of this?

20151015-5023

John Leoutsacos, Temple, NH.

New Ipswich New Hampshire, does not want to become another Minisink New York!

Minisink

In March 2012, a 78-page report prepared by the staff of the Federal Energy Regulatory Commission (FERC) found the project “with appropriate mitigation, would not constitute a major federal action significantly affecting the quality of the human environment.”

“The most urgent problem in New York right now is the expansion of pipelines bringing Pennsylvania natural gas across New York to New England,” said David Carpenter, director of the Institute for Health and the Environment at the University at Albany, who spoke during a press conference in Albany at the state Capitol.

Unsafe emissions can occur up to a mile or more from the stations or other parts of pipeline infrastructure such as metering and regulating stations, Carpenter said. Such pipeline components also leak methane, which can convert to formaldehyde when exposed to sunlight.

Currently, air pollution emissions from natural gas pipelines are reported by energy companies, which project emissions based on formulas, but do not conduct continuous emissions testing.

The only way the above statement could be possible (and I believe it to be), is by a term called regulatory capture. FERC is an example of this term and needs to be held accountable because of it.

20151015-5054

October 12, 2015

Docket No. PF14-22-000

David and Jennifer Pychewicz

24 Crestwood Dr.

Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, DC 20426

North Reading, MA 01864

To the Federal Energy Regulatory Commission,

We are property owners concerned about the proposed Lynnfield lateral pipeline for the Northeast Energy Direct Project by Kinder Morgan. The planned pipeline would be cutting through our property adjacent to the existing powerlines. In addition to obvious safety concerns, we are worried about the impact of a lowered property value. Other foreseeable issues are restrictions on any planned future additions and improvements to the property due to the pipeline and the buffer zone. For example, the buffer zone may reach our existing swimming pool area. Crestwood Drive residents in particular, have nothing to gain from this pipeline, as the street does not have gas in the first place.

If the pipeline must be built at all, then it should be located along the other side of the power lines, at the edge of Cedar Swamp. This would at least minimize the effects on homeowners. It makes no sense to cut through private property and all that entails when there is another option available a few hundred feet away. In addition, it would be helpful if Kinder Morgan held more public hearings around North Reading or immediate surrounding towns affected by the pipeline in order to make it easier for citizens to have their voices heard.

Sincerely,

David and Jennifer Pychewicz

Kinder Morgan / Tennessee Gas Pipeline Co
Northeast Energy Direct
FERC Docket #PF14-22

IMPACT OF EXPANDING PIPELINE INFRASTRUCTURE ON JOB OPPORTUNITIES

As stated in the newly released study, "The Clean Energy Future: Protecting the Climate, Creating Jobs, Saving Money" (enclosed in this filing), far more jobs are created in the clean energy and energy efficiency fields than in fossil fuel industries. In recent discussions with union members who would gain temporary jobs during pipeline construction for the Northeast Energy Direct project, a couple of them have stated that their union LiUNA, also trains for these fields, so why not do both. The trouble is that energy dollars development dollars are not unlimited.

At this stage, investment in more fossil fuel infrastructure means that less will be available to put into clean energy and efficiency, thus gaining a few thousand jobs on the pipeline for a year or 18 months, but losing an opportunity to create tens if not hundreds of thousands of long-term job opportunities in clean energy and energy efficiency development. The job-stifling effect of fossil fuel infrastructure investment coupled with public social costs associated with health impacts for those living near compressor stations, new gas-burning electric plants and blow-down sites along a pipeline make further build-out of natural gas pipelines an economic burden that could flatten an otherwise growing regional economy.

We need to focus on developing jobs for the future, not jobs of the past. The numbers already show that it is the more prosperous path to take. Combined with the lack of environmental devastation to a region largely

reliant on tourism and agriculture, the “No Build” alternative is the only sensible choice for Northeast Energy Direct.

See full report attached in this filing

“The Clean Energy Future requires much larger numbers of workers, however, in energy efficiency programs, renewable energy production, and auto manufacturing (making electric cars). The net effect is an average gain, above the reference case, of more than 550,000 jobs per year from 2016 to 2050, as shown in Figure 2.

{figure 2 omitted, see below for full report}

Net job gains increase over time, starting at a little under 200,000 per year in 2016-2020, and rising to 800,000 per year in 2046-2050.

Four major categories of new jobs can be seen in the graph. Starting at once, hundreds of thousands of jobs are created by expanded energy efficiency programs. The existing electric system is inefficient, investing far too little in cost-effective efficiency programs. Rather than burning more fuel, it is often cheaper to install more insulation, better lighting, newer appliances and motors, and countless other energy-saving measures. A second wave of new employment arises in the 2020s, as renewable energy programs take off. Numerous workers are employed in producing, installing, and maintaining wind turbines, solar panels, and other renewable energy equipment, the core technologies of the Clean Energy Future.

Next, after about 2030, employment expands in the auto industry, as production of electric vehicles becomes essential to the later stages of the scenario. Finally, in the 2040s, jobs are created by net energy savings, which are spent on other purchases. (Each category combines direct, indirect, and induced employment. In auto production, for example, direct employment refers to jobs in the auto industry; indirect employment means jobs in industries that sell parts and supplies to auto companies; induced employment is created when auto workers and auto parts workers spend their paychecks, stimulating other industries.)

Net job creation in the Clean Energy Future, averaging 550,000 jobs per year for 35 years, may sound like a large number. It is, however, only about 0.3 percent of the expected size of the U.S. labor force from now through 2050. Still, it is enough to ensure that there are jobs available for workers displaced from coal and other non-renewable energy industries – as well as opportunities for many other workers to launch promising careers in construction, manufacturing, and other industries required for the transition to clean energy.”

RE: PF 14-22 Kinder Morgan Tennessee Gas Pipeline Northeast Energy Direct

Formal Complaint

I hereby request that FERC consider Kinder Morgan’s subsidiary Tennessee Gas Pipeline not in compliance with the requirement to provide federal in person public scoping sessions for the Northeast Energy Direct pipeline Project. In PA and NY, and specifically in my area, Bradford County PA, the federal public scoping session was held at Towanda PA prior to the issuance of a a major draft environmental resource report for its proposed Northeast Energy Direct pipeline project. This report consists of over 6500 pages of data in the form of 79 different volumes. It represents a revision of plans filed March 13.

I testified at the Towanda, PA hearing. I did not have the opportunity to see the documents that I was there to provide input on, as they had not been issued yet. This situation is also true for the other persons who provided comment in other locations in PA and NY, and those in the general public who may not have testified because they did not have access to this major revision to the report detailing the plans.

I hereby request that FERC should consider Kinder Morgan's federal public scoping sessions as incomplete and not in compliance with the letter or intent of federal public scoping sessions. You've got to have the scope published BEFORE the public scoping sessions in order to meet the intent of the sessions.

Kinder Morgan should be required to hold additional public scoping sessions in the areas where the sessions were held prior to the issuance of the environmental resource report revisions, and specifically, require Kinder Morgan to hold an additional public scoping session in Towanda PA.

I found it somewhat amusing that I was invited to the last scoping meeting which was held in New Hampshire. I feel that this invitation was specifically aimed at trying to prove (via a technicality) that those like myself who were shortchanged of a true opportunity to input in person had been invited to another session after the environmental resource report was issued. I do not feel that being free to attend a session approximately 6 hours of driving distance away meets the intent of providing an opportunity to the public to attend a scoping meeting. I feel that my rights, and the rights of the others in PA and NY who did testify before the environmental resource report was published, have been violated. In addition, the rights of other PA and NY residents who might have testified had the report been issued prior to their local sessions were also violated.

The only possible remedy is to hold more public scoping sessions for the areas who were deprived of a true opportunity to provide scoping input at a federal scoping session. Certainly we are aware of the extension of the timing for written input. I do not feel that the extension of this date for all input to be received remedies the situation totally, although it does help for those people who prefer the written input mode.

Kinder Morgan plans to submit final filings to FERC on November 20th. FERC should reject any such filings since Kinder Morgan has not provided the public with a true opportunity to provide in person scoping input based on their plan.

Thank you in advance for following the only legitimate course of action for FERC to take - that being summarily rejecting Kinder Morgan's final filings until the base requirement of obtaining in person public scoping input has been met in all areas affected by the Northeast Energy Direct pipeline project.

Alternatives

In Kinder Morgan's last (Jul 24th) filing they listed a number a different alternatives to their current plan in Resource Report 10. They gave a reason why they rejected each alternative. However many people don't agree with their reasoning. They ignore some of the advantages of the alternatives as well as ignoring some of the disadvantages of the current plan. Also it seems Kinder Morgan has neglected alternatives in general in favor of the "cheaper option". So I decided to write this letter to take a harder look at some of the alternatives from Resource Report 10.

No Build and System Alternatives

These two alternatives are functionally the same thing. Kinder Morgan does nothing leaving the other companies in the region to provide the needed gas. Kinder Morgan argues the environmental impact will be very nearly whether NED is built or not. Since other companies have to build infrastructure to compensate. However Kinder Morgan acknowledges that none of these pipelines are booked to capacity, including their own proposal. So they admit their own argument is incorrect. In fact all these pipelines would result in a huge excess in capacity for the foreseeable future. If all the current contract agreements were all with one pipeline the supply would be much closer to the demand. It seems their biggest reason for rejecting the No Build/Systems Alternatives is that they won't get a piece of the New England Energy pie.

With this in mind at least one (if not more) pipeline projects should be eliminated. Logically this should be the project that has the biggest negative impact. With the route changes in Kinder Morgan's Dec 2014 filing they claim their project is lower impact due to co-location with other easements. However if you look at the alignment sheets you can see much of the route they claim to be co-located aren't actually close enough to the other easements to be considered co-location. So the majority of their project is actually green field. Considering the other pipeline projects use their preexisting easements Kinder Morgan's project is clearly the most impactful one. And considering that the excess gas that will be available in New England from all these pipeline projects exceeds NED's capacity the No Build option seems like a better plan than their currently proposed plan.

Alternative Energy

Kinder Morgan rebuts each technology from almost every energy alternative on a case by case basis, for both "clean" and "dirty" solutions. They do this in order to avoid having to look at them as a whole. There are currently many other non-natural gas projects on the table. Together they could meet much if not all of the energy demand of New England. Considering them together rather than one at a time eliminates the need for NED. Additionally Kinder Morgan ignores emerging technologies that would be truly transformative like Grid Energy Storage, which would make all other technologies more reliable. A diversity of energy technologies is also a better more reliable solution than a one energy source solution.

Existing 200 Line Alternative

Kinder Morgan argues this alternative would have greater impact than the current route. Also the laterals would need to be longer and more disturbing. The impact during construction could very well be greater; however the lasting impact would be much lower. This is because Kinder Morgan would not need new permanent easements. There wouldn't have to be any additional permanently maintained ROWs. Also the Fitchburg Lateral could be completely eliminated since they already have a line connecting to their existing system going to Fitchburg. Worst case scenario they would have to upgrade it. However since the existing lateral to Fitchburg is not at capacity this probably would not be required either. With the exception of the West Nashua metering station the other laterals originate from or near their existing system. So the actual amount of rerouting would be minimal.

Kinder Morgan's competitor Spectra has chosen this solution for their projects and those projects are recognized as having lower impact to Kinder Morgan's project. Spectra's lines run through similar (if not denser) population areas as Kinder Morgan's 200 line. A glance over the FERC dockets show that the opposition to Spectra's projects is also much lower than to NED. You can only conclude Kinder Morgan rejected this alternative because it's more expensive. In spite of the fact that it's impact will be much smaller in the long run.

Massachusetts Route 2 Alternative

Kinder Morgan has similar arguments against this alternative as they do the Existing 200 Line Alternative, with the addition of working around traffic. Similarly the permanent impact to this alternative is much lower than the currently proposed NED route. Since the areas it's crossing are already permanently disturbed by Rt2. This alternative would also eliminate the Fitchburg lateral since this route would intersect their current lateral leading to Fitchburg. Worst case scenario here is they have to upgrade a small portion of their existing lateral. However as discussed before this would most likely not be required since that lateral is not at capacity. The West Nashua metering station could be connected through a lateral co-located with Rt13 which also intersects Rt2. As discussed before the other lateral would remain mostly undisturbed. As for the traffic during construction of the pipeline, it could be done at night as almost all major road construction is done today to avoid effecting traffic. This route is clearly a better alternative than the currently proposed NED route. Again the only real incentive for not choosing this plan is the cost to Kinder Morgan.

Fitchburg Lateral Alternative – Proposed Fitchburg Lateral

Kinder Morgan argues simply that construction complications of installing a pipeline in a highway ROW outweigh building the lateral on completely green field properties. The Rt 31 alternative, like the Rt2 alternative, has far less permanent impact than the currently proposed route. Kinder Morgan argues that it's more difficult to build near a road. However the Rt31 alternative would require much less green field construction on unaffected properties. Also, at least in Mason NH, Rt31 is the only place industrial construction is allowed is on the Rt31 corridor. So this alternative increases the potential for utilization of the Fitchburg lateral for future projects. Again the construction impacts could be mitigated by working at night.

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE, Room 1A
Washington, DC 20426

Kinder Morgan / Tennessee Gas Pipeline Co
Northeast Energy Direct
FERC Docket #PF14-22

*"In considering the impact of new construction projects on existing pipelines, the (FERC) Commission's goal is to appropriately consider the enhancement of competitive transportation alternatives, the possibility of overbuilding, the avoidance of unnecessary disruption of the environment, and the unneeded exercise of eminent domain."*¹

NORTHEAST ENERGY DIRECT PIPELINE IS NOT NEEDED:

THE DEFINITION OF OVERBUILD

As has been evidenced by the nearly 6,000 comments so far on this docket², the areas of concern are numerous and broad-based: schools, senior housing, etc within the blast radius; homes within the compressor station impact zones that are not "directly affected" by pipeline infrastructure entering their property, thus precluding any compensation while at the same time bearing the same impacts to home value and possible loss of insurance and/or mortgage; effects of blasting on water wells, the predominant source of water along much of the pipeline route; lack of specific information on horizontal drilling plans under major regional waterways; effects of methane released for pipeline systems on global climate - the list could go on for pages.

The environmental damage caused by hundreds of miles of green fields construction, hazards to drinking water, agricultural and conservation land are not warranted for a project tied to a shale play that is projected to start declining as early as next month³. As pointed out by Seeking Alpha, Marcellus well production declines faster than originally expected, and current drill rates are shortening the estimated life-expectancy of the shale play and dropping profitability to zero as soon as 2019.⁴

Specifying all of these individual areas of concern is of little consequence compared to the overriding fact that this pipeline is unnecessary to the energy needs of our region.

The need for more capacity driving this proposal has been cited as peak demand during cold weather when gas for heating and gas for electric generation compete for existing pipeline capacity. These conditions only happen for a few hours a day, on the coldest 10-27 days a year.⁵ The commonly used phrase "pipeline capacity constraint" has itself been misleading. It's been a crisis of peak demand prices on electric generators that have been forced to purchase gas capacity on the spot market, not actual physical pipeline capacity

shortfall. This peakdemand price crisis has been easily influenced by regional energy policy, and can be set to avoid these crises in the future. The last two winters have already shown us the difference.

One alarming document from ISO-NewEngland was a report to FERC on their Winter Reliability Program for 2013-2014. ISO-NE offered incentives to oil burning electric generation plants to purchase extra fuel ahead of the winter peak to cover the few peak demand days, when the need to generate was especially high. But they refused to do the same for natural gas powered plants, leaving them with no reserves for peak demand hours when electric and heating demands were both high. On page 7, paragraph 3 of this report, they stated the following:

“a solution that provided incentives to natural gas suppliers or generators to ensure incremental gas supply would affect wholesale electricity prices ... For example, if an ISO solution reduced the opportunity costs priced into the gas market during a time of high gas demand, this would lower gas prices and send the wrong signal about the relative scarcity of natural gas. These lower prices would also be reflected in the electricity market.” 6

This past winter, 2014-2015, ISO-NE caved to criticism and pressure and allowed the same incentives for gas-powered electric generation plants. The results? The “crisis” caused by capacity constraints during peak demand didn’t happen - at all.

» *See Conservation Law Foundation’s analysis* of this simple change in policy⁷, attached in this filing.

With “capacity constraint” already relieved by this one policy change, and demand for electricity remaining flat if not slightly declining⁸, even as the regional economy continues to grow, we have time to further increase efficiency and build out renewable sources and storage in anticipation of the scheduled closings of obsolete power generation plants.

» *See Acadia Center’s three-part series: “The Missing Energy Crisis”*, attached in this filing.

Other simple, “shovel-ready” energy conservation and generation projects such as requiring all leaks in existing gas infrastructure to be fixed, maximizing currently unused gas storage facilities, and restoring, modernizing and maximizing local hydro capacity at already existing dams can be implemented just as quickly as expansion of solar capacity on rooftops, brownfields and utility and transportation corridors (similar to solar fields currently going up along the Massachusetts Turnpike right of way⁹) and expansion of existing energy efficiency programs. All of these solutions are far less expensive to the ratepayers who would be taxed to pay for new pipeline capacity, and can be implemented and completed more quickly than the Northeast Energy Direct’s increasingly questionable November 2018 completion date

Even if the political will to implement enough of these solutions did not exist, studies on LNG solutions have shown that the delivery mechanisms and capacity exist to resolve any winter peak demand needs at less cost than a new pipeline¹⁰.

THE PEOPLE DEMAND BETTER SOLUTIONS

During Scoping Meetings held throughout the region where the pipeline would be built, FERC staff identified the desire for renewable energy among the chief themes of comments from the public. This will was already in place before these hearings, as evidenced by petitions circulating affected states and by countless letters to elected officials, letters to editors and op-eds in local press and by the following means:

COMMUNITY RESOLUTIONS TO BAN NEW GAS TRANSMISSION PIPELINES

The 77 communities that have passed resolutions to ban new gas transmission pipelines such as Northeast Energy Direct, and stand in favor of energy efficiency and renewable energy solutions are:

RENSSELAER COUNTY LEGISLATURE

The County Legislature also voted in three articles opposing the Kinder Morgan pipeline, adding additional opposition beyond the 77 communities

- Ashfield and Buckland, MA have also passed “Community Rights” resolutions, in response to FERC’s ability to override local and state regulation, and to grant eminent domain to private, for-profit corporations.
 - On May 5, 2015, the town of Berlin, MA passed an additional resolution to ban release of lands from Article 97 protection, and other lands for purposes of building pipelines and related infrastructure, in accordance with the Massachusetts State Constitution.
 - The towns of Mason, Rindge and Brookline, NH Select Boards voted to deny KinderMorgan and any affiliates from having access to Town owned properties.
 - The town of Rindge, NH voted to oppose taking of land for pipeline construction by eminent domain.
 - Mascenic and Conval School Districts in New Hampshire have voted to officially oppose the pipeline.
 - The towns of Peterborough and Salem New Hampshire have written letters of opposition to the pipeline.
- As many copies of officially passed resolutions as could be obtained by this date are enclosed with this filing.

— PETITIONS:

There have been numerous petitions against the Northeast Energy Direct pipeline and further fossil fuel expansion, and in favor of expanded energy efficiency and renewable energy development. The results of the one attached to this filing (See three documents with titles prefaced by “NED-PETITION”) are for the petition stated below. Started in February of 2014, it has garnered 13,822 signatures as of October 10, 2015, mostly in small towns along the pipeline route with populations in the hundreds or low thousands.

PETITION TEXT:

**Background for Petition To Ban Natural Gas Pipelines
and To Champion Sustainable Energy**

“Fracked gas” necessarily travels at high pressure, which increases the likelihood of leaks, ruptures and explosions causing damage to property and lives. Our existing natural gas infrastructure is in need of repair, not expansion: 2012 study identified 3,356 separate natural gas leaks under the streets of Boston alone. At least 99 billion cubic feet of natural gas was “lost and unaccounted for” in Massachusetts from 2000-2011; Massachusetts ratepayers paid between \$640 million and \$1.5 billion during that period for gas that never reached their homes and businesses.

The U.S. Department of Transportation reports over 990 “significant” natural gas transmission line accidents since 2000. Major effects of these accidents vary from collapsed structures, injuries, and sustained fire (in the case of explosions), to environmental contamination and health impacts from volatile chemical additives (in the case of non-exploding leaks).

High-pressure natural gas pipelines bisect family farms, protected wooded areas, wetlands, and wildlife habitat. They also negatively affect property values and aesthetics for countless parcels of land.

Beyond the inevitable local environmental impacts and potential for disaster, fracking can be devastating to the health of people who live in areas near gas extraction. Fracking uses hundreds of chemicals including EDCs (endocrine disrupting chemicals, which affect fertility and hormone regulation), known carcinogens, and neurotoxins. These chemicals are pumped into the ground, and have been found in the water supply near drilling sites.

On a global scale, natural gas contributes to climate change. Adding more natural gas to our energy production would increase greenhouse gas emissions and prevent us from meeting the reduced emission requirements under the GWSA. While natural gas has lower carbon dioxide emissions than other fossil fuels, leaks in extraction and transmission emit methane, which is a far more potent greenhouse gas than carbon dioxide. Natural gas is not a “clean energy” source.

More natural gas is not needed to meet our heating fuel needs, nor our electricity needs. In Massachusetts, natural gas accounts for 67 percent of the state’s electricity generation. As a starting point, natural gas currently used in electricity generation could be shifted over to heating uses, since it is easier to use non-fossil

fuel energy sources for electricity than heat. In a study projecting out to 2022, ISO-New England has projected that we already have enough infrastructure in place to meet future annual energy needs. Improvements in energy efficiency will help us to meet future needs.

Increasing small scale, “distributed energy” or on-site energy generation resources, such as rooftop wind and solar, is a more ecologically sound solution to provide energy beyond what improvements in efficiency will yield. Small scale projects would also create more long-term local jobs than massive pipeline projects, which are likely to involve out-of-state workers on a short-term basis.

- Close the Halliburton loophole and restore the EPA’s rightful authority to regulate hydraulic fracturing. Require the oil and gas industry to disclose the chemicals it uses: http://petitions.moveon.org/sign/peal-the-halliburton.fb51?source=s.fb&r_by=10732377

This level of opposition already shown by communities across the region, combined with the high numbers of landowners refusing to allow survey for the project, foretells of risk of a high dependence on eminent do-

main may be necessary to complete the project. This works against FERC's goals as stated at the beginning of this document.¹¹

Given the will of the people who would bear the cost, risk to health and safety and environmental damage, there is no other sensible approach to this pipeline proposal than the "No Build" Alternative.

Re: Tennessee Gas Pipeline Company, LLC
 Docket No. PF14-22-000
 Northeast Energy Direct Project

Dear Secretary Bose

I would like to submit the following comments for review for the EIS scoping for project PF14-22-000, the proposed Northeast Energy Direct (NED) project. I have a background in the education and natural resource planning fields, and my family has owned property in east Northfield, Massachusetts for twenty five years. I have many concerns about the proposed TGP's NED pipeline, and in particular, the environmental impacts of the proposed 41,000 HP compressor station on Gulf Road, which would be sited only two miles from a densely populated area of town. Our concerns include toxic air emissions, both intentional and unintentional, erosion and stream sedimentation, drinking water contamination, flooding, noise and vibration, leaks and fumes, forest fires, inadequate emergency response personnel, destruction of ecologically important wildlife habitat and conservation land, and lowered property values. Of particular concern to me are on the impacts that this proposed compressor station would have on the Millers Brook Watershed, and my comments are focused that. I respectfully request that Tennessee Gas Pipeline Company address the following concerns in their environmental impact statement.

Richard Wheatley, a spokesman for TGP's parent company Kinder Morgan, has stated that "the unmanned compressor stations, which operate around the clock, are typically located on sites that average about 25 to 30 acres." This is very concerning when taken into consideration with the geology of this site and the resi-

dences within close vicinity. Various reports done by the town point to the steepness of slopes in the uplands of east Northfield which are very vulnerable to erosion. The proposed site of this compressor station is a heavily forested and mountainous area in one of the highest elevations in the town. If built here, this compressor station would be perched at the top of a sensitive watershed at the headwaters of the Millers Brook, a state cold water fishery resource and one of the five sub watersheds of the Connecticut River in Northfield. The Massachusetts Division of Fisheries and Wildlife has identified cold water fisheries as important habitat for a number of cold water species, including trout. These are typically more sensitive than other species to alterations to stream flow, water quality and temperature within their aquatic habitat. The Millers Brook is a high quality water resource and town master plans have pointed to the need for its protection. Logging operations and storm water runoff along Gulf Road have caused some serious problems with erosion and sedimentation in this watershed, but the scale and magnitude of this compressor station facility would result in problems of a much larger scale to wildlife and to people living downhill and downstream.

The deforestation of ten or more acres, followed by blasting and trenching through waterways and the disturbance of the soils during construction, will lead to soil and debris being quickly washed away, and this will inevitably result in stream degradation. Once construction is complete and the vegetation and soils that are crucial for absorbing and slowing water flow and providing a pollution control function are removed, this will lead to even greater potential for flash flooding and contamination of ground and surface water. Both the quality and quantity of water will be affected, and stream beds will be silted in. Added to these concerns is the lower safety standards for this class of pipeline, increasing the risk for accidents. The disturbance and clearing of such a large tract of forested land could also permanently alter the hydrology and result in redirecting water and possibly drying out stream beds. According to the state geologist who I consulted with, it is important that spatial data and water well completion reports be looked at for towns effected by the pipeline. He advised that a comprehensive study of Mass GIS maps and the water well completion report database be undertaken and overlaid along the pipeline route, looking at hydrogeologic factors such as water level and depth to bedrock. To date, this has not been done.

Traffic and construction along Gulf Road would also seriously impact this waterway, and one of the branches of the Millers Brook flows downhill from the compressor station site along Gulf Road and then discharges into the Millers Brook less than a mile upstream of Pratt Hollow. The impact from storm water runoff from Gulf Road is a significant problem in this location. The building of a large compressor station will intensify the amount of runoff being discharged into the brook and increase the likelihood of flash flooding, endangering the residents living downstream from the compressor station.

The proposed site also lies within a town drinking water recharge zone, and well water contamination from normal operations, leaks, and application of chemicals at the site is a serious concern. The 2015 Northfield Water District Consumer Confidence Report states that “Water is a valuable resource for any community. If something threatens that resource, then the community is threatened.” The report states “There is no evidence of a confining (protective) clay layer in the vicinity of the well” in the area served by this water supply. It also states that “Wells located in an unconfined aquifer are considered to have a high vulnerability to potential contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration into the aquifer from the surface.” The compressor station site is within the recharge area for this public water supply. In addition, numerous private wells downstream and downhill are vulnerable to ground and surface water contamination.

In addition, the Millers Brook borders a number of residents’ homes where it meanders through the town, and the FEMA maps show that along this waterway from around Pratt Hollow Road down to Main Street is designated as a flood zone. The National Flood Insurance Program’s maps show 100 year flood plains occur along the Millers Brook from its confluence with the Connecticut River upstream to approximately one quarter mile past the intersection of Gulf and Alexander Hill Roads.

The impact to the flora and fauna need to be addressed in the EIS. The Millers Brook is listed by the state as upstream Forest Core Habitat and part of the extensive Connecticut River Core Habitat. It goes on to state that “Forest Cores are the best examples of large, intact forests which support many bird species sensitive to

the impacts of roads and development and help maintain ecological processes found only in unfragmented forest patches.” The 2012 Town Open Space Plan for Northfield also contains information on wetlands, geology, and listed rare, threatened and endangered species “along the banks of Millers Brook from its headwaters to approximately the intersection of Alexander Hill Road and Gulf Road, including tributaries along Alexander Hill Road and Gulf Road.”

In conclusion, the construction and operation of a compressor station in this location, only three miles from Main Street and the center of town, would be a serious threat to the community. I request that Tennessee Gas Pipeline Company fully address the concerns relating to the siting this compressor station in this environmentally sensitive area, and that the need for this pipeline and any alternatives be considered. In addition, please consider that scientists’ estimates of shale gas reserves are lower than industry analysts are projecting, and fracked gas, which is hugely damaging to the environment, is not a long term solution to our energy needs. Gambling with our precious water and other resources and putting our homes and communities at risk for a pipeline that is not needed does not make sense economically or environmentally. I believe that the evidence that has been carefully presented by many citizens proves that this pipeline is ill conceived, and this evidence has been very thorough and compelling. In a recent letter to federal regulators, the state Attorney General’s Office wrote that the proposed Northeast Energy Direct Pipeline “makes it more important than ever” that federal regulators conduct a comprehensive examination of the need for the project and of any and all alternatives to it. The letter also criticizes the state DPU’s review of long term agreements for Berkshire Gas, National Grid and Columbia Gas to buy gas from the NED pipeline. Also, former Attorney General Ann Berwick has said this pipeline is not needed and that it would actually have negative consequences for rate payers and for our energy future. More and more evidence keeps mounting on how ill conceived this project is. The Attorney General’s upcoming report should also shed more light on the “need” for this pipeline, and I urge you to consider its findings.

Thank you for this opportunity to comment and for your taking into consideration my concerns.

Regarding Northeast Direct Pipeline, Kinder Morgan/Tennessee Gas Pipeline L.L.C.
Project docket number (PF14-22)

Dear Ms. Bose,

I am writing in regards to the Lynnfield Lateral with great concerns regarding the proposed Kinder Morgan Pipeline. This pipeline will be the largest and high pressure pipeline Lynnfield has ever had installed through our town. In addition, the fracked gas will be under such high pressure, it will not be in a state to be delivered to our homes, but serve as a transport highway to an undisclosed demarcation point. Although Lynnfield Center Water District has done an outstanding job rerouting this 24” high pressure pipeline, it is still running dangerously close to our homes, through our protected wetlands and close to our water supply (which services approximately 9,700 residents of our town.) Despite the movement of the pipeline away from our water supply and the current route being within legal distance from our current and future wells, I

am opposed to this project for the following reasons:

- 1) At the drilling sites, I have read benzene is used in the fracking process. Benzene is a carcinogen and is reported to be filtered out before transport of the fracked gas. To date, I have not been able to receive information of how this filtration is done and the continuous monitoring process along the transport route.
- 2) I am concerned about the residents that have this high pressure pipeline running dangerously close to their homes. What monitoring systems will be installed to ensure their safety? If there is a leak or a natural shift in the land where this pipe is installed, what assurance do we have these families will be safe?
- 3) Shut off valves for this pipeline are said to be a mile or more apart. The burn off rate, in case of a disaster, could take an hour or more. I am very concerned about the destruction a high pressure line of this magnitude could have on our town.
- 4) The need for this fracked gas is in question. Lynnfield is one of the top communities with natural gas escaping our lower pressure pipelines. Many government officials are questioning this need and additional studies should be done before this project is approved.

Strong consideration for the safety and wellbeing of all the residents along this pipeline is imperative. It is my hope you do not support this pipeline project. Thank you for your time and consideration to this matter.

Regards,

Katy Shea

20151015-5097

Lisa D Oden, New Ipswich, NH.

I was in a meeting with Kinder Morgan and NH Farm Bureau. We asked Kinder Morgan where we could see a compressor station the size of the one slated for New Ipswich, that we wanted to go visit one. Kinder Morgan offered a site in Wellsboro, PA. It turned out that compressor station was 32,000 HP and not 41,000. We said we wanted to see one of equal size or larger. They did not provide us with a location, though we indicated we would travel anywhere in the US. In follow up email, they also understood that we wanted them to provide a location. They have not yet done so. This is disturbing. If I am to make realistic choices about my personal future, I want to see what kind of choice I'm making by visiting a compressor station of equal size or larger. This is not a transparent process and Kinder Morgan is not timely in its responses.

20151015-5098

Ashby Board of Health, Ashby, MA.

VIA ELECTRONIC FILING

Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission (FERC)

888 First Street, N.E.

Washington, DC 20426

RE: Tennessee Gas Pipeline Company, L.L.C., PF14-22-000

Dear Secretary Bose:

The Ashby Board of Health (ABOH) of the Town of Ashby MA, appreciates the opportunity to submit these comments regarding the Tennessee Gas Pipeline Company's (TGP) proposed Northeast Energy Direct pipeline (Project).

The original proposed pipeline route extended across the full width of Ashby. This route has been retained as an alternative route for the pipeline.

The proposed route and the route through Ashby target numerous small towns. These towns, like Ashby, are almost entirely served by private water supply wells, and the proposed project will alter hydrology

and present threats to water supply quality and quantity. Much of the route in Ashby is through shallow bedrock, so blasting will be required and will undoubtedly alter water quality and quantity in bedrock and surficial aquifers, as well as surface water characteristics and fisheries

There are no adequate safeguards in the construction protocols to ensure reasonable setbacks from wells, septic systems and houses. There are no adequate setbacks from cultural resources. The blast zone associated with an accident in Ashby encompasses the Town Hall, the elementary school, the grange, both churches, and the library.

The proposed project presents threats to public health associated with construction, operation and monitoring/maintenance of a large-diameter high-pressure pipeline in residential areas.

The Project is not consistent with regional and State energy and sustainability plans that call for an increase in energy efficiency and renewable energy to meet electricity and heating demands rather than an increase in fossil fuel use.

The project is unnecessary. Whatever natural gas demand exists can be met with existing pipelines, smaller scale expansions already proposed separately, conservation and LNG. FERC should consider all proposed expansions collectively, not each one separately as if the other proposed pipeline projects did not exist. Such evaluation would demonstrate that NED is unnecessary to meet regional demand. Most of the gas in the pipeline will be exported out of the US. Eminent domain cannot be used to take the land of US citizens to support the profits of a corporation that will be generated by selling gas to international customers.

We urge you to deny approval of the NED pipeline

Sincerely,

The Ashby Board of Health
Cedwyn Morgan, Scott Leclerc, William Stanwood
Members of the Ashby Board

20151015-5101

Sherry Peaslee, New Ipswich, NH.

As the owner of the property located at 55 Green Farm Road, New Ipswich NH 03071: , I am denying permission to the Tennessee Gas Pipeline Company, LLC (a Kinder Morgan Company), its representatives, contractors, sub-contractors, or associates to enter my land to perform surveys, or for any other purpose. Any physical entry onto my property will be considered unauthorized, and treated as trespass.

Sherry Peaslee
55 Green Farm Road, New Ipswich, NH 03071

20151015-5103

Morning Star Chenven, Erving, MA.

I am not going to give technical details about why this pipeline is not needed by the citizens of Massachusetts. There are many people who have articulated that well. 55 towns in my region and many more oppose the building of this pipeline.

I speak to you, members of FERC, as a person that could be your neighbor. A person who lives in the same human community that that we are all a part of.

Would you want a pipeline running through your land? through your home? Would you want to live close to a 90,000 horsepower compressor station?

Would you want to live in fear that your children might contract lung disease or tumors, that your water might become undrinkable, that you would have to move, but be unable to afford to move anywhere?

I don't think you want that for yourself or for your neighbors.

Tomorrow it could be you that gets a knock on the door saying your home is no longer your own.

Much has been spoken about the decisions that people faced when the Nazis came to town and started rounding up all the Jewish people.

They had to decide whether to turn their faces away and pretend not to see- or to go way out on a limb - and try and save someone.

I'm asking you to prevent this pipeline from coming through our beautiful community. I'm asking you to help save our home - our land, water, air, and peace of mind!

THIS IS YOUR CHOICE!

“If not us, then who?”

If not now, then when?”

20151015-5104

James R. Warnow, Allegany, NY.

I am retired and live in a high unemployment area with very high energy costs. The pipeline would help to create good paying jobs for the Unions. It would also help to lower energy costs for the area and the entire Northeast. It would also help to lower the taxes and would improve the quality of life for all of New York State. Thank you very much.

20151015-5106

Everett A. Shock, Wellsburg, NY.

We need pipeline for energy and jobs for local 785. Our economy is bad right now. We also have a Union of workers to do the job. We hope you will give your help to our area. Please.

20151015-5107

Derek Madison, Lisle, NY.

I think that we really need these jobs to stimulate our economy in a major way. Right now we don't have any good paying jobs out there for us to be able to do. This will also improve our tax base so that we can get some additional taxes coming in to the tax base. Please help us get this work.

20151015-5110

Washington, DC 20426

Comments of the Board of Selectmen, Town of Mason NH
Re: Tennessee Gas Pipeline Company, L.L.C. (“TGP”)
Docket No. PF14-22-000: Proposed Northeast Energy Direct (“NED”)

Dear Ms. Bose:

The Town of Mason, Board of Selectmen respectfully submits the Town's official comments related to the proposed NED and Fitchburg lateral pipeline. Our comments diligently address several areas of concern raised by the Residents, Board of Selectmen, Conservation Commission, Pipeline Advisory Committee and our Environmental Consultant.

Please feel free to contact the Board of Selectmen with any questions you may have.

Regards,

Bernard J O'Grady, Chairman

Louise M. Lavoie, Slectman

Charles V Moser, Selectman

General Request

1. In order to assess potential Affected Environments, the degree and severity of Environmental Consequences and proposed Mitigation (40 CFR 1508.20) actions for the proposed NED Pipeline, adequate detail is necessary (40 CFR 1501.2(b)). Therefore, special studies (40 CFR 1502.25), conducted by those with special expertise (40 CFR 1508.26) are necessary as part of the NEPA planning process for this project. To meet these requirements, please include as part of the Environmental Impact Statement:

- Quantitative Pipeline Risk Assessment (Department of Transportation);
- Social Impact Assessment;
- Engineering Study on Infrastructure Impact; (NH DOT regulations as condition of approval)
- Cultural Resource Surveys;
- Environmental Due Diligence Reports, including Phase I reports for any identified impacts;
- Wetland Delineations by Environmental Protection Agency (EPA) and Army Corps of Engineers 1987 manual which is the most common delineation standard that all NH Certified Wetland Scientists are required to know how to follow. We suggest requiring the ACOE. Standard, and requiring a NH Certified Wetland Scientist do the actual field work.
- Air quality Studies (EPA);
- Water quality Studies (EPA);
- Sole Source Aquifer Assessment, (EPA);
- Natural Resource Study; to include a Natural Resource Inventory
- Endangered Species Study (U.S. Fish and Wildlife Service & NH Natural Heritage Bureau) NHHNB is clearing house for vast majority of rare plant and animal species tracked by the State of NH including, rare natural communities which are tracked by NHHNB.

Geology and Soils

Forest

Productive forest soils may be impacted during the construction of the proposed pipeline. Please identify the areas of productive forest soils to be impacted and identify mitigation efforts in light of removing this resource for future use as productive soils for our forests.

Frozen Ground During Winter

Our soils in the winter are to know to experience various levels of freezing and thawing, which can affect a variety of types of infrastructure. Please provide information on how the proposed pipeline will be installed that will not be affected by periodic freezing and thawing.

Horizontal Directional Drilling (HOD)

Since HDD or other types of drilling may be used for pipeline installation under wetlands and stratified drift

aquifers please provide a thorough description of all drilling processes to be used, including the types of equipment, processes, and material used.

Steep Slopes

Please identify all steep slopes along the pathway of NED and the Fitchburg lateral and provide a mitigation plan for erosion control.

Farmland

1. Please assess the long-term impact on crop yield from soil disturbance and increased ground temperature in farmlands adjacent to pipeline.
2. Significant farmland soils may be impacted during the construction of the proposed pipeline. Please identify the areas of significant farmland soils to be impacted and identify mitigation efforts in light of removing this resource for future use as productive farmland.

Blasting

1. Please locate on a map all potential blasting areas and list the anticipated depths and composition of the explosive charges.
2. Please assess the affects and impacts of blasting to soils, vegetation, wildlife and local hydrology within 1500 feet of the centerline of blast site.
3. Please compare the technology of hammering versus blasting to trench for pipe in bedrock. Determine which method has the least risk to water quality and quantity, especially on the quality and stability of aquifers and water supplies.

Faults

Please explain the measures being taken to minimize the consequences to the covered segment of the pipeline from outside force damage due to future potential seismicity associated with the Campbell Hill Fault Zone.

Water Resources and Wetlands

Water Quality, Aquifers, Wetlands, Surface Water

1. We are requesting that private well owners within 1500 feet of the proposed NED and/or Fitchburg lateral pipeline have their wells tested at Kinder Morgan and their affiliates expense by a state certified laboratory for flow rate, general water quality parameters, dissolved metals, and oil and hazardous materials likely to be used in the installation, maintenance, and future monitoring/operation of the pipeline. Given the seasonal variations that affect groundwater hydrology in the Northeast, initial testing to establish background concentrations should include testing representative of all 4 seasons. Well testing should occur before, during and after construction.
2. Please identify the oil and hazardous materials likely to be used during the installation, operation, maintenance and monitoring of the pipeline. With regards to herbicide use along the pipeline route, please detail targeted species, the amount to be applied and the location and frequency of application. Please describe what steps will be taken to ensure that non-target species are protected and impacts to groundwater will be avoided.
3. Please develop a conceptual site model that portrays the current understanding of the hydrologic and geologic setting of the pipeline.
4. Please determine how bedrock aquifer characteristics such as storativity, transmissivity, hydraulic conductivity and fracture density may be affected by blasting.
5. Please determine how bedrock well characteristics such as flow (measured in gallons per minute), discoloration, recharge and water quality may be affected by blasting.

6. Please define required mitigation measures for the substantial loss of well water to residents that occurs as a result of blasting.
7. Please define required mitigation procedures if, after blasting, water begins to
 - a. taste different
 - b. my clothes start to stain
 - c. water-using appliances begin to clog
 - d. water becomes cloudy after blasting
 - e. sand deposits in drinking water
8. Please explain how impacts from the pipeline will remain below the NH State antidegradation thresholds (WQS regulation (40 CFR 131)).
9. In order to accurately assess the direct effects of hydrostatic water withdrawals and discharges, please evaluate the hydrogeologic dynamics (infiltration, aquifer communication and specific capacity) along the pipeline routes affected. For water withdrawals, please include estimates of drawdown and radius of drawdown and describe any potential impacts (water loss, water quality degradation, etc.) to private well owners. For discharges please include aquifer mounding calculations and breakout distance assessments, as applicable.
10. Please assess the wetland functions and values for all wetlands impacted by the construction of the pipeline using the Method for Inventorying and Evaluating Freshwater Wetlands in NH (Stone and Mitchell 2013). We ask that all impacted wetlands be fully restored to background conditions and that restoration plans be designed and implemented by restoration experts from the USDA Natural Resources Conservation Service

Storm Water Management

Since during the construction of the proposed pipeline the natural flow of storm waters will be rerouted please prepare a comprehensive Storm Water Management Plan showing proposed methods of protection for surface and ground water resources, including wetlands. This Plan should include how storm water will be stored/managed during and after construction.

Riparian Buffers

Loss of riparian buffers will result from the construction of the proposed pipeline. As such, please provide a detailed plan that includes specifics on riparian restoration planting and maintenance to ensure success of the restoration effort. Only native plants should be used for the riparian restoration.

Non-point Source Pollution

Pollutants and sediments introduced during and after construction will have detrimental effects on watersheds and their associated water bodies and wetlands. Please provide a Watershed Management Plan that identifies construction areas, staging areas, and access roads, and how each watershed will be protected from the introduction of pollutants and sediments.

Vernal Pools

Vernal pools should be mapped and verified using standards set forth in NH Administrative Rules Sections Env-Wt 101.106 Vernal Pool, Env-Wt 101.75 Primary Vernal Pool Indicators, and Env-Wt 101.86 Secondary Vernal Pool Indicators. All verified vernal pools should be mapped within 1,000 feet of all areas of disturbance, including pipeline installation, staging areas, and access roads. A construction schedule is requested to show seasons of activity and timeline for each phase of construction.

Wetlands Mapping

1. It is well known that the National Wetlands Inventory (NWI) is inadequate in its efforts to map all

wetlands along the route of the proposed pipeline. All wetlands along the proposed route should include a jurisdictional wetlands delineation.

2. Describe barrier construction techniques used to prevent cross-connection of separate aquifers / watersheds via axial leakage along trench fill.

Vegetation and Wildlife

1. Wildlife and plant surveys should be performed during all seasons of the year sufficient to understand the presence and distribution of all species and natural communities present that are tracked by the State of New Hampshire. These surveys should be performed in the field, by professionals with specific knowledge of, and experience with the species/natural communities in southern NH / northern MA. Additionally, a new request for data from the NH Natural Heritage Bureau should be submitted to determine what new records if any have been added since the last request.
2. Detailed information should be submitted on the potential direct and indirect impacts due to the proposed pipeline during construction, maintenance and monitoring/operation, and how these activities may impact these resources into the future.
3. All locations of invasive plants should be mapped within the vicinity of the proposed pipeline, including adjacent areas outside the right-of-way. Please describe steps to be taken to ensure that invasive species aren't introduced or spread during construction, including the removal of invasive plants during and after construction, as well as soils containing roots and seeds of invasive plants and to ensure invasive species are not established and are not present on or near the construction activity for a period of five years following the construction activities.
4. A plan should be developed to demonstrate how construction activities will avoid all direct and indirect impacts to NH State-listed species and natural communities. In the event that such impacts are completely unavoidable, design, implementation and monitoring of plant restoration activities should be performed by qualified professional botanists experienced in the restoration of rare plant populations and natural communities.
5. The cumulative impact on wildlife habitat and fisheries from the loss of mature forest cover along the proposed pipeline pathway should be assessed. This assessment should specifically include reference to the effects on coldwater trout populations in all streams located within 50 feet of the proposed pipeline maintenance corridor/right-ofway We .ask. that the mitigation by avoidance be the preferred mitigation strategy for potentially impacted cold water trout streams.
6. The construction and installation of the proposed pipeline will contribute further fragmentation of the landscape, affecting native plants and wildlife and promoting the introduction and spread of invasive species. Please prepare a plan that demonstrates how increased fragmentation will be minimized as a result of the pipeline.
7. Identify areas of wildlife corridors and prepare a plan that demonstrates how the pipeline construction will avoid disruption of these natural corridors.

Cultural Resources

1. Please require mitigation procedures for artifacts of the 18th and 19th century settlements such as stone walls, old cellar holes, wells, historic mill foundations and granite quarries, Native American settlements or burial grounds when they are encountered during construction.
2. Please describe means used to establish and record the precise location of boundary walls (which often define legal parcel boundaries in New England) prior to disturbance and to re-establish these legal boundary monuments after construction.

Land Use Recreation and Visual Resources

1. Please describe the mitigation measures to minimize the impacts to residents' quality of life from the

destruction of the vegetative visual buffer that currently separates many property owners from the existing power line right-of-way,

2. Several parcels crossed by the proposed route are conservation properties funded through state-sponsored funding programs (LCIP and LCHIP). State laws that authorize these programs specifically forbid activities such as pipeline construction within these properties (New Hampshire RSA 227-M:14 and RSA 162-C:10). We request that you mitigate the impacts to these properties via re-routing to avoid them.
3. The Mason RR Trail is proposed to be crossed by the main pipeline and by the Fitchburg lateral. Please describe how impacts to the trail from pipeline construction and operation will be mitigated, the trail restored, and/or equivalent land provided. This recreational trail was acquired with a grant from the Land and Water Conservation Fund, which requires that equivalent property be provided if there is any loss of recreational land.
4. Please require KM to place high-quality gates at all pipeline road crossings, unless specifically requested not to do so by landowners. Utility rights-of-way are vulnerable to unauthorized trail use by OHRVs causing erosion and sedimentation damage.

Socioeconomics

1. Please statistically assess the near and long-term impacts of pipeline rights-of-way on re-sale and investment value of real estate crossed by the pipeline .
2. Identify all potential impact to town infrastructure including roads, culvers and bridges. We request Kinder Morgan and their affiliates fund an independent engineering study to assess and baseline the current condition of roads and byways in the Town of Mason. The engineering study shall include an estimate of the daily traffic counts and vehicle weights both empty and loaded to capacity. The engineering study shall include a plan for Kinder Morgan and affiliates to restore road beds, surfaces, culverts and bridges impacted by construction and construction traffic.
3. Please provide a compensation plan for the full or partial loss of income from landowner sugar bush, orchard and forest resources as a result of both temporary and permanent pipeline construction activities.

Air Quality and Noise

1. Please assess the long-term impacts on residents' mental and physical health from noise and fugitive emissions at pipeline appurtenances and compressor stations. We request that the best available technology for noise reduction and containment be used such that nighttime noise levels are at or below historical ambient background levels of 35 dB.
2. Identify the number and locations of all blow down valves and pigging stations planned in the Town of Mason describing the processes and what substances will be discharged in the form of gas, liquid or solid. Provide a written plan on how these processes will be monitored, how frequently these processes will be monitored, how substances will be disposed of and what are the potential health risks to the local human, wildlife and plant populations
3. To maintain compliance with the National Ambient Air Quality Standards (NAAQS) and New Hampshire's Env-A 1002 regulations, we request that air quality monitoring be conducted during the implementation of the entire project. Specifically, monitoring should include a filter-based PM2.5 federal reference method (FRM) device; a beta attenuation monitor (BAM) PM10 (federal equivalent method) FEM monitor; periodic metals testing; and, a meteorological station for wind direction and wind speed. Further, we request that the best available technology for fugitive emissions reduction and containment be used.
4. To comply with the new federal rule to cut methane emissions by up to 45 percent of 2012 levels by 2025, please determine the expected methane emissions from all NED facilities and ensure that these

facilities use the best technology to minimize emissions.

Alternatives

1. Please consider requiring relocation of the proposed Fitchburg lateral to be co-located with existing right of ways State Route 31 or State Route 13 for the following reasons:
 - Less impact on private property
 - Less eminent domain
 - Less deforestation
 - Eliminate wetland impacts and aquifer and further maintenance-to wetlands
 - Less negative visual impact to landscape
2. In Resource Report 10, KM fails to address no-action alternatives for the proposed laterals. It asserts that these laterals “will accommodate delivery point requests of certain Project shippers.” But no shippers, nor the amounts they want delivered, are identified. Without this information, how can the need for each lateral be established? Please require that KM demonstrate the need for each lateral individually so that its public necessity can be determined.
3. Resource Report 10’s overview of alternative energy sources for the no-action alternative is seriously substandard. Please require KM to develop a meaningful analysis of energy alternatives to NED, with facts and figures on the projected contributions from the full diversity of energy sources now or soon to be available to New England, including energy efficiency, wind, solar, hydro, geothermal, and LNG. A comprehensive no-action alternative should quantify a diverse set of energy sources against the NED proposal, comparing benefits and costs over the project’s proposed lifetime.
4. NH’s 2014 10 Year Energy Strategy finds that “Energy efficiency is the cheapest, cleanest, most plentiful energy source. U (page 23) Yet RR10 dismisses energy conservation’s contribution to supply as “not feasible in the short-term.” (Page 10-3) without providing any evidence. An immediately implementable conservation measure to increase gas supply is to fix the numerous leaks that have been discovered throughout the distribution system. Please require KM to quantify the contribution to supply that would result from fixing natural gas pipeline leaks, using recently developed data for Massachusetts.

Cumulative Impacts

1. In order to continue to assess the cumulative impacts from the installation of the pipeline and confirm ongoing compliance with Federal and State soil gas and groundwater standards relative to potential future releases of oil and hazardous materials and/or flammable gasses for the protection of public health and safety, we are requesting follow up testing of soil gas and groundwater to be conducted over the useful lifetime of the pipeline. Please scientifically determine the frequency of such testing that would be protective of public health and safety via scientific methods that include factors related to the migration potential and velocity of oil and hazardous materials and/or flammable gasses in the subsurface.
2. To avoid segmented review and over-building, please combine the pipeline proposals from Kinder Morgan, Spectra Energy, Portland Natural Gas, and their various partners into a single regional Environmental Impact Statement and one coordinated FERC process. Taken together, these pipeline projects are proposing to double the amount of natural gas coming into New England, far beyond the most aggressive demand forecasts. Because these projects share a common geography and timing, the National Environmental Policy Act (NEPA) review requires such a comprehensive analysis, as stated in the Council on Environmental Quality’s (CEQ) guidance on programmatic NEPA reviews, issued December 18, 2014. Please undertake a combined NEPA review to determine which project, if any, would satisfy the need with the least impact to the environment and affected land owners.

Public Safety

- Please list the pollution likely to be generated by the proposed action. We request that pollution prevention be included in all alternatives, whenever feasible. Where actual pollution prevention methods cannot be instituted, recycling, energy recovery, treatment and disposal actions should be employed as much as practicable. (Pollution Prevention Act,1990)
- Please evaluate the vapor intrusion pathway for vapor forming chemicals and flammable gasses associated with the installation, maintenance and use of the pipeline.
- Explain how subsurface leaks of flammable gasses and/or oil and hazardous materials will impact soil gas and specify mitigation techniques to address this.
- Explain how subsurface leaks of oil and hazardous materials will impact identified wetland soils and biota and specify mitigation techniques to address this.
- Given the proximity of the pipeline to occupied structures, explain how (a) the installation of a pipeline does not create a critical exposure pathway (310 CMR 40.0006) to human receptors for vapor phase emissions of measurable concentrations of oil and hazardous materials in the living or working space of pre-school, daycare, school or occupied residential dwelling; or (b) ingestion, denmal absorption or inhalation of measurable concentrations of oil and hazardous materials from drinking water supply wells located at and servicing a pre-school, daycare, school or occupied residential dwelling.
- Identify and require mitigation plans for any potential condition of substantial release migration via the soil gas pathway.
- Define the procedure for mitigating imminent hazard releases.
- Please create a conceptual site model that includes the geologic and hydrologic factors that are anticipated to contribute to the cumulative risks associated with the installation, operation and maintenance of the NED and Fitchburg lateral pipeline. Please quantify those risks along the pipeline and present the data using a risk-based approach. Please include a similar risk assessment for all alternative routes.
- Please require appropriate security measures are planned and in place to prevent and deny Internet hackers from taking control of the direct and remote controlled computer systems at compressor stations and pipeline appurtenances along the pipeline.
- Please require the identification of an existing adequate alternative drinking water source that will meet the consumptive, hygiene, and firefighting requirements of the town's population for at least six months (49 CFR 195.6 (5)(c)), in the event of aquifer contamination from the NED or Fitchburg lateral pipeline.
- Please evaluate added costs to town for extra police work and training, etc. required by the presence of the pipeline, and describe how these costs will be repaid by the pipeline owner.
- Please require a comprehensive public safety plan is developed by Kinder Morgan and its affiliates for the Town of Mason and neighboring mutual aid towns which provides clear line of sight on emergency planning, training, preparedness, accountability for cost of training and acquiring necessary capital equipment to successfully respond to pipeline emergencies/failures.

Facts:

- Mason is a small town with a limited tax base, total operating expenses \$1.6M.
- The annual budget for our volunteer fire department is \$65,000.
- Town of Mason and surrounding towns with volunteer departments rely on availability of volunteers and mutual aid of nearby towns who also run with volunteers and have limited budgets.
- There is limited access to water, there are no pressurized hydrants, tanker shuttles are required to provide water supply to active scenes.

- There is limited accessibility to the proposed pipeline routes, especially back country land locked areas.
- The Town of Mason and surrounding mutual aid communities will suffer irreparable harm in the form of burdensome increased property taxes if forced to absorb the future cost of training and acquiring necessary public safety equipment to adequately support potential pipeline failures/emergencies.
- The Town of Mason property owners unaffected by direct impact on their property by the proposed NED and/or the Fitchburg Lateral pipeline will suffer undue harm by having to absorb additional property taxes as a result of impacted property owners demanding property tax abatements for devalued properties along NED and/or the Fitchburg lateral pipeline.

Request:

We are requesting Kinder Morgan and its affiliates provide a public safety plan for the Town of Mason and neighboring mutual aid towns.

- The public safety plan must address, but not be limited, to key points of concern.
- What is the emergency notification process for municipalities and the public?
- What is KM and its affiliates plan to respond to emergency situations (minutes, hours, days)?
- What are the evacuation plans for homeowners potentially blocked in on dead end roads, cui-de-sacs, etc., during a pipeline emergency?
- Who is responsible for providing resources to deal with pipeline emergencies?
- In event of a pipeline emergency where does KM and its affiliate's responsibility begin and end? Where does the Town of Mason pick up?
- In the the event of a pipeline emergency who shoulders the cost of services incurred by the Town of Mason? Are Kinder Morgan and its affiliates responsible?
- Who is responsible to fund/provide personnel training and equipment necessary or the Town of Mason to successfully respond to a pipeline emergency?

20151015-5113

Karl Klein, Angelica, NY.

Being a New York State Resident I favor this project as it will help the domestic energy and create new and more jobs. Ny state needs all the help it can get. please help. Thank you.

RE: Comments regarding the proposed Northeast Energy Direct project to construct and operate a natural gas pipeline through Western Massachusetts (Tennessee Gas Pipeline Company, L.L.C. under New Docket for Tennessee's Northeast Energy Direct Project under PF14-22.)

Berkshire County in Massachusetts is currently in the path of the proposed project. The population of Berkshires has continued to decline over a long period of time. This area was strongly supported for the about 100 years from a manufacturing that now is only very small fraction of what it was 30 years ago. I have 30 years of experience in the paper industry having been involved in producing United States Currency. As part of my duties over the years I was in charge of the planning, use and procurement of all types of power for Crane & Co. Crane at the time was the 2nd largest consumer of electricity for WMECo, a subsidiary of Northeast Utilities. Crane was also a major customer of Berkshire Gas Co. utilizing natural gas for both production and heating. A third major source of energy, steam, was from a local trash to energy plant created

in about 1981.

It is important to note a couple of significant points regarding manufacturing in Berkshire County and Crane energy usage over the past 35 years:

1. Since the early 1980's Crane was able to significantly reduce dependency on fossil fuel through the use of steam produced from local trash. This is a clear example of local efforts to reduce the use of fossil fuel and help the local economy. Today this is still the case. Since the early 1980s one of the few remaining manufactures in the area has continued to distance its need for fossil fuel based energy.
2. Historically Crane was serviced with interruptible gas from Berkshire Gas Co. Natural gas was used rather than oil, due to emissions restrictions. The gas supply could be cut off at any time to allow for residential heating use in preference to industrial use. This was typical in years prior to the mid 1990s during the colder periods of winter. Since the mid 1990s this stopped happening. And, in the early 2000s Crane was allowed to move to a quasi-fixed gas contract. These changes were due to the fact that the combined industrial and residential demand was decreasing: there was and is plenty of supply.
3. The large scale electrical generation facility located in Pittsfield MA required an increase in gas delivery. I believe this was constructed in the 1990's. Since opening, this facility has been extremely underutilized. This further points to the excess capacity locally and regionally as this power producer provides natural gas based electricity to ISO New England. Please verify the utilization of this facility and the amount of gas supply that is not used when due to low utilization. My guess is that this plant is uses the equivalent or potentially more than the combined regional domestic use. Since it barely runs, the capacity is already significantly more than is needed. And, when is called to operate by ISONE, it is typically on the hottest days of summer when the domestic demand is at the lowest.
4. Continued decline in Industrial base – the local economy will never see an increase in large industrial users and likely no significant residential demand. Please review the demographics and it will clearly indicate the reduced future need.

Due to the limiting process for these comments, here are summarized questions that I feel need to be fully addressed:

1. Concern regarding the protection of our air, water & food source – how will we be protected from ongoing emissions and guaranteed equitable compensation due to exposure of any type?
2. Concern over blasting to local foundations and drinking water wells – please address how nearby homeowners will be protected against damage caused by blasting.
3. Concern regarding intrusion into significant environmental areas – how will these areas such as Chalet Wildlife Management Area be protected in all phases of this project?
4. Economic feasibility & eminent domain – how is the general public protected from a private business setting rates for a non-public utility? Our electrical power lines are utilized by 99% or more of the people living in the areas in which they pass through. The local population in Berkshire County does not need the natural gas, will be exposed to its pollution and will reap no or little benefit from this energy source. A single payment to local communities is completely unacceptable as compensation. Please demand that a portion of ongoing gross revenue is paid to all municipalities that have to be exposed to this non-public utility. Eminent domain was designed to help all of us as citizens, and I believe this use, while allowed, was not the intent of these laws. The burden of ongoing fiscal responsibility to each municipality should clearly be on the proponent through the lifetime and until the final removal of infrastructure.
5. Pipeline removal – please have an escrow account established and fully funded prior to operation that allows for the full cost of removal. The amount needed should be periodically reviewed and adjusted as needed.

In conclusion, please explain how FERC (as is required by the US Government), with approval of this project, will clearly bring down carbon emissions to the levels prescribed by scientists that are necessary to avert catastrophic climate change. Further explain, with consideration to jurisprudence, how the US Govern-

ment and FERC can approve this project and at the same time clearly protect my right to a safe and healthy planet. We as citizens hold inalienable environmental rights to ensure the habitability of our community and are responsible for upholding the enduring natural endowment that demands we protect our environment for future generations. It is incumbent upon FERC to clearly provide proof that these rights are upheld.

Re: Northeast Energy Direct
Tennessee Gas Pipeline Company, LLC
Northeast Energy Direct Project FERC
Docket No. PF14-22-000

{note: careless mis-aligned scanning at FERC results in many OCR errors in following text }

Dear Sirs:

As the county Executive of Rensselaer County, New York, I have been and continue to be duty bound to preserve the health, safety and welfare of County residents who may be affected by the above-referenced project and to preserve the physical grounds of our County for the benefit of future generations. To that end, I have organized and overseen a large group of County workers who were assigned to perform due diligence on behalf of Rensselaer County to discern and discover what is being proposed by Tennessee Gas Pipeline Company, LLC, a wholly owned Subsidiary of Kinder Morgan, a Corporation having its offices in Houston, Texas.

The proposed location of a compressor station in Rensselaer County took our due diligence investigation to a higher level, as the potential effects of such a facility upon our population significantly escalates our already heightened concerns. To that end, the purpose of this correspondence is to focus in on potential issues so that your Commission may account for these when making its determination. The poignancy becomes even more crucial in light of the fact that during 2014, 283 “self-reported” pipeline incidents occurred nationwide and resulted in 17 deaths, 94 injuries and over \$270 million in property damage. In fact, over the past ten years, there has been an average of more than 310 incidents per year without any indication of significant efforts to reduce the number of incidents. Thus, it is crucial for the applicant to address all issues to the satisfaction of your Commission before construction begins, so that the potential damages and hazards are minimized.

Our County’s rural setting (population of approximately 160,000 people over 665 square miles) means that most of our affected residents and properties receive their potable water by water wells (artesian wells, spring boxes and drilled wells) serving both communities and single homeowners. Thus, potential contamination of sources of drinking water is a major concern. The applicant has been unwilling to disclose a complete list of the chemicals, compounds, potential contaminants, etc., that will be contained in the natural gas

to be transported through this proposed pipeline. Hence, our County and other local communities are unable to fully assess the impact of potential contamination that may occur if a leak were to happen.

Additionally, in light of the substantial ongoing rural residential development, it appears that the applicant looks solely at the status quo of development rather than the planning, already approved projects and partially developed projects that are in existence. Thus, we have a great concern that applicant may be myopic in its proposals regarding the depth and thickness of piping, location of shutoff valves and monitoring equipment that it proposes to use. This is further illustrated by the failure of Tennessee Gas Pipeline Company, Inc. to submit drawings for its compressor stations depicting the affected properties within a 1,000 foot radius of the station sites. This makes it much more difficult to fully assess and comment on this project as it would impact the current residents and render it impossible to assess the impact as the area grows, unless, by default the commission and applicant assume that little to no future growth would occur near the pipeline as a result of the pipeline being constructed.

Thus, to the degree possible, our County raises the following concerns regarding the possible gas line ..

1. Drinking Water (public and private): There is great potential impact to private wells (Le. artesian wells, spring boxes, drilled wells, etc.) from construction of the pipeline (maintaining safe setback distances during construction phase and temporary work areas) and related pyrotechnics (blasting). There appear to be no less than three miles of pipe section (spread throughout the County) which necessitate blasting in order to meet the minimum pipe depths (based on USGS mapping data). There could be impacts not only on private water supplies but also on the 15 public water supply wells within one half mile of the proposed pipeline. The proposal of Tennessee Gas Company, LLC for a well monitoring program for identified wells within 200 feet of proposed blasting is insufficient due to the geography and geology of the land.

In addition, the 10 mile distance between shutoff valves will allow for long periods of gas release exposing nearby water supplies to contamination, should the pipeline leak.

2. Compressor Station Z act (noise traffic, as and chemical release): Air Quality monitoring in the area of compressor station is of great concern as to its close proximity to a highly populated area. The New York State Department of Environmental Conservation (NYSDEC) regulations do not go far enough to sufficiently protect public health (infrequency of a monitoring program and reliance on “self-reporting”). Radon levels from compressor stations receiving predominantly Marcellus Shale unconventional natural gas have radon levels between 28.8 & 58.1 pCi/L. (From PA DEP report January 2015). Stricter oversight is necessary to assure the safety of those who reside in the area surrounding the proposed compressor station.

Noise pollution during operation of the compressor station is of great concern as those who reside in the vicinity of the proposed site have developed their homes to reflect the peace and quiet of a rural setting. This quiet atmosphere should continue after the compressor is constructed. The NYSDEC has set a limit of 55 decibels at the nearest receptor (no limits on site). The background in this area is below this limit (in the area of 35 to 40 decibels) and therefore this compressor station will significantly increase the ambient noise level, which does not factor in “blow down” events that are anticipated to be at higher sound levels. One alternative to reduce noise is for Tennessee Gas Pipeline Company, LLC to utilize electric turbine motors rather than gas powered power plants.

The rural setting of the proposed compressor requires that lighting be kept to an absolute minimum so residents of the surrounding properties is minimized. station site also that the impact on residents of the surrounding properties is minimized.

Facility operations: RR-9 Section 9.1.3.2, which discusses air dispersion modeling, fails to mention four important items. Firstly, air dispersion modeling for compressor stations in New York require the preparation and presentation of a modeling protocol to NYSDEC, and approval of such protocol by the State agency prior to performing dispersion modeling. Secondly, compliance with State and National Ambient Air Quality Standards (NAAQS) must be demonstrated on the entire property line for the compressor station, as well as on lands outside the station parcels.

Thirdly, in addition to the criteria pollutants mentioned in RR-9 Section 9.1.3.2 for air impact analysis, Hazardous Air Pollutants (HAPs) must be analyzed as part of the air permit application in New York. As part of a New York air permit application, Guideline Concentrations dispersion modeling must show compliance with Annual (AGC) and Short-Term Guideline Concentrations (SGC) air concentration limits for HAPs. As part of a Massachusetts air permit application, dispersion modeling must show compliance with Acceptable Ambient Level (AAL) and Threshold Exposure Limit (TEL) air concentration limits for HAPs. EPA's AP-42 emission factor database lists 11 HAPs emitted by a gas-fired turbine, including formaldehyde, PAH and benzene. The emissions inventory for stationary fuel combustion sources (turbines, gas heaters, emergency generators) must include a HAPs emissions inventory, and dispersion modeling needs to demonstrate compliance with the State HAPs limits.

Finally, since Rensselaer County is a Nonattainment Area for the 1997 federal ozone standard, any new major source of NO_x emissions (which may include the Market Path Mid Station 1 in the Town of Nassau, New York) is subject to the provisions of Non-Attainment New Source Review. If applicable, the applicant will have to demonstrate through air dispersion modeling that the cumulative impact of all stationary source NO_x emissions will comply with the EPA Significant Impact Level (SIL) of 1 µg/m³ for NO₂ on an annual basis to demonstrate that the facility will not contribute to an existing violation of the ozone regional air quality standard.

Construction: Section 9.1.4.1 of RR-9 states "Exhaust emissions from diesel and gasoline fueled construction equipment and vehicle engines will be minimized by federal design standards imposed at the time of manufacture". That provision is inadequate since the Project could simply use old construction equipment and off-road vehicles with minimal emission controls. The Project should be required to meet current EPA Tier 2, 3 or 4 emission standards for new equipment, as applicable for each type of construction equipment. In addition, the Project should be required to install diesel particulate filters on all diesel-powered construction equipment to minimize inhalable PM.

Noise: Facility Operations Section 9.2.1.2.2 of RR-9 states:

"There are no known noise regulations in the State of New York that are applicable to the Project. The NYSDEC produced an environmental guidance document called 'Assessing and Mitigating Noise Impacts' in February 2001. The document does not set any environmental noise goals or limits."

Rensselaer County disagrees with this characterization of the DEC's Program Policy DEP-OO-1, "Assessing and Mitigating Noise Impacts," which does set noise goals, and which states (Policy p. 4) that "In the review of an application for a permit, the Department of Environmental Conservation is to evaluate the potential for adverse impacts of sound generated and emanating to receptors outside of the facility or property." The Policy requires measurement of ambient (Leq) sound levels at adjacent residential parcels (Policy pp. 11-13), and states that in a non-industrial setting, such as the residences surrounding a compressor station, that the new sound level should not exceed the ambient level by more than 6 dBA at the receptor (Policy p. 14). The Policy goal of ambient + 6 dBA applies to noise from the Market Path Mid Station 1 in the Town of Nassau, New York.

Section 9.2.2.6 of RR-9 lists existing nighttime sound levels of 43.7 dBA to 51.0 dBA, which are unusually high for a rural area. The reference to wind-generated noise in Section 9.2.2.6.1 suggests the measurements were taken on a windy night, and thus do not represent the lowest nighttime ambient sound levels for the Market Path Mid Station 1 in the Town of Nassau, New York. In addition, measurements were made in the month of May when (noise from wildlife native to the area is at its peak, and thus these measurements do not represent the quietest nighttime conditions. The sound level measurements must be retaken on a night with a more typical noise level.

Finally, as required, the applicant and to implement all source at the facility, part of the noise analysis for a new facility, DEP or DEC to perform a Best Available Noise Control Analysis (BANCA) cost feasible sound mitigation measures for each noise

Section 9.2.2.7 of RR-9 only lists existing Leq sound levels, which cannot be used in the DEP Noise Policy

impact analysis. One week of continuous 1- hour L90 measurements must be taken at each of the three nearby residential properties (NSA-1 through NSA-3) during a week with calm winds to document the lowest I-hour L90 level at each receptor.

Construction: Section 9.2.4 of RR-9 states that “[c]onstruction equipment will be operated on an as-needed basis and mostly during daylight hours.” Whereas construction activity can create high levels of noise, the Project should commit to only daytime construction, or if construction is done after 7:00 p.m., that any construction activity must meet the operational noise limits (FERC, NYS DEC). Do we want to reference rna at all?

3. Public Safety (emergency delineates what should be addressed by both and FERC. resEonse) : The following list delineates what should be addressed by both Tennessee Gas Pipeline Company, LLC and FERC. The current project plan depicting a 10 mile distance between shut off valves on the pipeline is insufficient for fire and EMS personnel to respond and assist those in the area of any mishap.

Further, none of the’ mutual aid fire departments or ambulance squads in the area of the project are sufficiently trained or equipped for natural gas related problems that may arise in and about the project site.

Tennessee Gas Pipeline Company, LLC intends to utilize pyrotechnics (dynamite related blasting operations) in construction of the pipeline. These must meet OSHA and NFPA regulations including placards and proper storage of blasting materials. Notification must be made to the local fire departments and ambulance squads.

Clearly, trenching for natural gas piping will be utilized. It is necessary for Tennessee Gas Pipeline Company, LLC to follow the OSHA regulations to include a plan for trench rescue and name a trench rescue team. In addition, confined space work must follow the OSHA regulations to include a plan for a rescue team. There are two teams in the greater capital district, to wit: Colonie Village Fire Department and the NYS-PFPC: NY Task Force 2 regional team. In either case, it would take between two and three hours for either to respond.

The compressor station site plan must include a plan to warn the population in the zone of danger. Tennessee Gas Pipeline, LLC has neither proposed nor proffered such aO plan. It is also necessary for it to provide information to the local responders during all phases of the construction and operation of the compressor site. Safe storage of welding supplies during construction must follow NFPA.

Location, placarding and notification made to the local responders.

All excavation work must use the “Dig Safely New York” system at 1- 800-962-7962, before any work is done. There are a number of incidences where problems including personal injuries, occurred because this was not done.

Outreach for NY Alert must be made to the community. This includes mailings to residences and businesses in a one mile radius from the pipeline to insure all telephone and cellular telephones of the community will receive warnings and evacuation notices. This should be coordinated so that it is facilitated by the Rensselaer County Bureau of Public Safety which operates the local E 911 system. Local fire departments in municipalities crossed by the pipeline rely on a volunteer call force. This can create difficulty in gathering a sufficient number of firefighters for all emergencies. Because these firefighters have “day jobs,” they often don’t have time during the day to participate in trainings and exercises to keep up their skills. Purchasing large pieces of firefighting apparatus to fight even routine fires for small, rural towns is proportionately more expensive than in larger cities because the same base level of equipment is needed regardless of population size, but the tax base in a rural town is smaller. Thus, it”is requested that Tennessee Gas Pipeline Company, LLC provide 1) a time frame for completing a plan for multi-year training and exercises for local first responders, which include provisions for offering trainings in the evenings and on weekends so volunteers may participate. The training should include training on the proper use of gas monitoring equipment; 2) ~ list of specialized apparatus, equipment, and personal protective equipment, that local fire departments will need if the pipeline is permitted by FERC and constructed; 3) a list of all substances that will potentially be

transmitted through the pipeline and the Material Safety Data Sheets for those substances. TGP should be required by FERC to notify municipal officials and local fire departments when pipeline contents change so they will have up to the minute information on what hazards they may need to respond to; 4} Provide information on what methods will be used to ensure that the actual rights of way are delineated on the ground once the pipeline is constructed if approved by FERC; 5) provide information on the proposed spacing of the valves . and whether they will be operated remotely or will require TGP staff to physically close them on-site; and 6) provide information on how long it takes to stop a leak based on the proposed spacing and method of operation (e.g. remote or on-site) of the valves and how long it will take for all of the gas to evacuate from the pipe and dissipate to safe levels under different atmospheric conditions.

Tennessee Gas Pipeline Company, LLC should share its knowledge and information regarding the amount of fire protection, water resources that are available, as in most. areas surrounding the pipeline there is no public water supply. There has been no contact by Tennessee Gas Pipeline Company, LLC other than the minimum necessary in an attempt to placate those who may oppose the project. Costs as stated above must be estimated and underwritten by this company.

4. Water Resources (wetlands, water crossings) and Erosion Control:

There are several areas where temporary workspace, access roads, pipe yards, etc. are located within wetlands. This should not be allowed to minimize the impacts on these protected areas, which was noted in both the reports of the u.s. EPA and the u.s. A.C.O.E.

The proposed Environmental Impact Statement (EIS) filed by Tennessee Gas Pipeline Company, LLC contains incomplete soil data. U.S.D.A. soil maps only identify soil conditions down to a maximum depth of 5 feet. Given the 30" main (which may be increased in size to the original 36" diameter initially proposed), the minimum depth of the trench will need to be 4.5' deep. This is based on two feet of cover. The standard cover is to be three feet and therefore a trench depth of 5.5' would be required. For road crossings and agricultural areas (which there are significant portions of this project) a minimum of 5' cover is required. This would require a trench depth of 7.5'. The EIS needs to better identify minimum cover throughout the project to assure this is being followed and then better identify soil conditions and determine method of trenching to be utilized. This is vital in order to accurately determine environmental impacts. In addition, the EIS fails to map and depict all private wells. As a result FERC will be unable to examine the potential impact upon drinking water supplies.

Mapping of private wells in the EIS is incomplete and does not allow for adequate examination as to potential impacts of drinking water supplies. The EIS needs to better identify all drinking water supplies and show locations so that potential impacts can be determined based on construction methods being utilized in the immediate area as well as soil and ground water conditions in this same area. Related to that is the fact that throughout this project area there are a number of known groundwater aquifers that will be transected by this project. This report does not identify or characterize these resources. It is necessary to identify and characterize (consolidated/unconsolidated, depth ...) all potentially affected aquifers in order to determine risk of contamination and further identify mitigation measures to assure the protection of the potable water sources.

Significant concern exists for the protection of the Hudson River.

Chemical contamination from the boring process must be addressed by the EIS, as the boring location and the resulting slurry will be between two valuable cultural and natural resources within Rensselaer County (Schodack Island State Park and the Papscaene Island Natural preserve), given the tidal nature of the River in this area impacts to both of these natural resources needs to be addressed.

The impact of stream crossings also affects the Hudson river. The EIS must specify surface water crossings as open trenching is the chosen construction technique. This would be a significant impact not only to the local water body but in some cases these water bodies are tributaries to the Hudson River (either directly or indirectly). Disruption of the water body or the immediate banks should be avoided (US Army Corps of Engineers have also indicated their concern of open trenching of streams in previous comments to FERC) .

The apparent testing technique for the finished pipeline will be by hydrostatic pressure that requires the use of a tremendous amount of water (approximately 14,700 gallons per 100 feet of pipe). The ars must address where this water will come from as well as discharge of this water. Will this water be discharged directly to the environment and if so how, and are there water quality concerns (chemical contamination from the construction and coating process) and potential erosion.

5. Transportation/Traffic: The construction of the Northeast Energy Direct Project has the potential to negatively impact the Rensselaer County highway infrastructure. Potential impacts to roads, bridges and culverts include damage caused by the movement of heavy trucks and equipment along State, County and local roads. Statistically, trucks on the nation's highways cause more damage to roads and bridges than passenger cars. One 80,000 pound truck is equivalent to 9600 cars. Most county roads in Southern Rensselaer County experience traffic counts of less than 1000 cars per day. The construction activities will be spread across the southern portion of the County through the Towns of Schodack, Nassau and Stephentown. Access to construction sites including the pipe installation and the compressor station will require the use of the eXisting transportation network and temporary roads.

The following locally numbered routes under the jurisdiction of the Rensselaer County Highway Department are crossed by the pipeline or are contiguous to the construction of the pipeline:

- County Route 33 - East Road (Town of Stephentown)
- County Route 31 - West Road (Town of Stephentown)
- County Route 26 - Garfield Road (Town of Stephentown)
- County Route 23 - South Road (Town of Stephentown)
- County Route' 21 - Dunham Hollow Road (Town of Nassau)
- County Route 18 - Hoags Corners Road (Town of Nassau)
- County Route 15 - Nassau-Averill Park Road (Town of Nassau)
- County Route 7 - East Schodack Road (Town of Schodack)
- County Route 4 - Van Hoesen Road (Town of Schodack)
- County Route 6 - Maple Hill Road (Town of Schodack)
- County Route 8 - Stoney Point Road (Town of Schodack)

The condition ratings of Rensselaer County highways and bridges vary across the county. Each year the County Highway Department assigns numerical values to each roadway segment. These ratings represent the observed condition of the pavement. The numerical ratings range from 10 down to 1. A 10 represents a pavement in excellent condition and a 1 represents a pavement in extremely poor condi'tion. Most roads in the project area are rated in the middle range between 5 and 8. Most roads are posted with a weight limit of 10 tons and travel by heavy or oversize vehicles on these roads is restricted. Weight exc l.us i on permits are granted on a case by case basis. The additional truck traffic on County roads would have a significant impact on the integrity of the pavements and accelerate their deterioration. Other factors which need to be considered are the safety, geometry and environmental considerations. Many rural county roads have sharp horizontal and vertical curves with limited sight distance. Roadway widths generally range from 20-22 feet with narrow or no shoulders. County roads are classified as collector roads and are not meant for high traffic volumes with a high percentage of trucks. County roads become increasing difficult to navigate during the winter months due to ice and snow conditions. Recent winters have taken a toll on county roads with extreme freeze thaw cycles on roads with poor soils as a foundation. Trucks travelling on thawing roads in the spring cause exponential damage to susceptible rquadways.

The condition rating of all bridges is determined by biennial inspections conducted by NYSDOT. Bridges with a span of twenty feet and over are inspected. Bridges are rated 1-7 with most County bridges falling into the 4-6 range. A bridge rated 4 is considered structurally deficient and one rated 6 is in good condition. Weight restrictions on bridges are based on the biennial inspections and are legally enforceable. Proposed transport routes may need to be altered to avoid bridge structures with weight restrictions. The county roads listed above with weight restricted bridges are CR 26 - Garfield Road, CR 33 _ East Road and CR 21 - Dunham Hollow Road.

Structures less than twenty feet in length, are considered large culverts and are inspected by the municipality having maintenance jurisdiction on a periodic basis. The County rating system for large culverts is somewhat different than for bridges. Culverts are rated good, fair or poor and evaluated for maintenance treatment based on these ratings. There are several large culverts in the fair or poor category that would be negatively impacted by increased truck traffic.

Roughly one third of the county's roads, bridges and culverts are in less than good condition. Available funding at the Federal and State level has significantly diminished in the last few years and is not expected to increase over the next several years. Increased costs to build and maintain roads and bridges have significantly impacted Local governments' ability to keep up with maintenance. The NED project will have a significant impact on the condition of roads and bridges further exacerbating the problem of keeping up with maintaining roads and bridges to make them safe for the residents of the area.

Several years ago, our County instituted a policy to seek compensation from users of its roads for damage caused by unusual and extraordinary use. We expect that in light of its location this project will require heavy and extreme truck and equipment traffic to cause substantial damage to our County roads would be unduly burdensome for the residents and taxpayers to bear the cost of damage to highways that were not designed to withstand this unanticipated use. Part of the plan to be submitted by Tennessee Gas Pipeline Company must be to hold the County residents and taxpayers harmless from this unexpected use and expense.

Quality of Life: This project is proposed to intersect the southern end of the Rensselaer plateau. While it is co-located within an existing utility ROW the increased land that will be required will have a significant impact. For purposes of this document I refer to four separate reports specific to these impacts completed by Dr. David Hunt (1/25/2015, 3/12/2015, 3/21/2015, and most recent one for the Town of Nassau NRC)

6. Rensselaer Plateau: Rensselaer County is home to the Rensselaer

Plateau The Rensselaer Plateau is one of the largest and most ecologically intact native habitats in New York State. The preservation of this landscape for future generations is the vision of the Rensselaer Plateau Alliance. The Plateau covers about 118,000 acres in the towns of Berlin, Brunswick, Grafton, Hoosick, Nassau, Petersburg, Pittstown, Poestenkill, Sand Lake, Stephentown and the Village of East Nassau. The ecologically significant site was noted as a success story by the USDA for the conservation efforts taking place. The proposed pipeline would cross directly through the lower portion of the designated area.

Ecosystem evaluations have been conducted by Dr. David Hunt for both the Towns of Nassau and Stephentown. Of specific concern is the potential impact that this project will have to the Rensselaer Plateau. The Rensselaer Plateau is New York's fifth-largest contiguous forest. The EIS should consider alternate routes that will avoid this ecologically sensitive and culturally important area.

Closing: In addition to the comments submitted herein, our County has participated in the Pipeline Working Group. Through the coordination of the Berkshire Regional Planning Commission, the Pipeline Working Group, which consists of representatives from the City of Pittsfield, Massachusetts, the Towns of Cheshire, Dalton, Hinsdale, Lanesborough, Lenox, Pittsfield, Richmond, Washington and Windsor, Massachusetts, the Dalton Fire District, the Lanesborough Village Fire and Water District, Rensselaer County, New York, and the Towns of Nassau, Stephentown, and Schodack, New York, has identified common impacts and requested mitigation measures related to the proposed pipeline. Those items are specified in comments submitted by the Berkshire Regional Planning Commission on or about October 15, 2015, which comments our County endorses and incorporates herein by reference.

FERC and Tennessee Gas Pipeline Company, LLC must address each of the concerns specified above before the NED is to be considered for approval. In light of the substantial financial mandates imposed upon our County by the State of New York, only 10 cents of each local tax dollar are available to spend on County programs. In addition, the statutory tax cap which according the Comptroller of the State of New York is being reduced from two percent to less than one percent, will bar any unforeseen County expenses as a result of the

Tennessee Gas Pipeline Company proposed project and may result in a violation of the tax cap ceiling. That violation has the potential of causing an inability of taxpayers to receive deserved State tax refunds.

Thank you for your consideration.

Respectfully Submitted,

RENSSELAER COUNTY, NEW YORK

Kathleen M. Jimino

County Executive

20151015-5124

Kurt Pecor, Addison, NY.

Im all for the pipeline so jobs are made for my Union brothers and sisters. we really need these jobs bad. Please allow us to get this work for all of us who are hurting right now in NYs. Thank you.

20151015-5125

Eric Zaenglein, Amherst, NH.

How is this project — in any way — either a public benefit or public necessity for New Hampshire? The answer is, it is not. Every single town that is effected by this abomination, that only makes Kinder Morgan richer and destroys forever our way of life, has demonstrated the adverse effects to their public and private lands, environment, safety, emergency response abilities and lifestyle. Every single town has voted against this proposal at their town meetings which for reason no longer matters. We are a state that is proud of our local government and believes we control our own destiny. Apparently not in the case of blatant robbery by Kinder Morgan. There is no question about the negative impact this “project” will have on the state of New Hampshire, nor is there any question about the opposition the people of this state have made clear over and over. What more do you need to make the only responsible decision? Deny the permit.

20151015-5127

Cody Odell, Canisteo, NY.

Create jobs for our hall, it will also create income for our small towns that are suffering. it will also create more jobs for people around our area for the natural gas companies..

July 14, 2015

Re: Tennessee Gas Pipeline Company, LLC
Docket No. PF14-22-000
Northeast Energy Direct Project

To Secretary Bose:

We are physicians practicing in the Commonwealth of Massachusetts. We would like to submit comments for the EIS scoping for project PF14-22-000, the proposed Northeast Energy Direct (NED) project. We are especially concerned about the effects that the NED project would have on local and regional air quality if approved, and subsequently on the health of adults and children in the Commonwealth as well as the rest of New England and New York state.

Compressor stations are well known to release multiple pollutants including carbon monoxide, nitrogen and sulfur oxides, volatile organic compounds, and particulate matter, some of which are also ozone precursors.

Unfortunately, even below National Ambient Air Quality Standards, these pollutants exert toxic effects:

Particulate matter: Particulate matter has been associated with a wide variety of adverse health outcomes. In one multi-city study, mortality (deaths) from cardiopulmonary and respiratory causes increased up to 5.3% following days with particulate matter increases of 10 µg/m³ (1). In another study, asthma diagnoses in children were 10-12% higher after days with a 10 µg/m³ increase in particulate matter (2). An evaluation of particulate matter in the eastern US identified 2100 premature deaths attributed to particulate matter in one summer alone (3).

Volatile organic compounds: Benzene and formaldehyde are two of many volatile organic compounds associated with the fracking process. Both are known carcinogens according to the EPA (see IRIS database). Both have been detected in air samples near pipeline infrastructure. Benzene was measured 270 meters from a pigging launch facility, at levels that increased cancer (leukemia) risk. Formaldehyde was measured at between 230-790 meters away from several compressor stations, at levels that increased squamous cell cancer risk and in some cases exceeded acute toxic exposure limits (4). Benzene levels near condensate tanks with VOC emissions have been measured as high as 1100 parts per billion (5), which is especially concerning considering that long term exposures to less than 1 ppb of benzene increase leukemia rates (6).

Radon: Radon is a radioactive gas naturally co-occurring with methane in shale plays such as the Marcellus shale, where gas for the NED pipeline would likely originate. Radon is the most frequent cause of lung cancer, after tobacco smoke. Produced waste water from fracking wells contains >500 times the federal drinking water limit of the radon precursor radium. The mean radon level in gas produced from a sampling of Marcellus shale fracked wells was measured at 1369 Bq/m³, far above the EPA action level of 148 Bq/ m³ (reviewed in 7). Proximity to fracking wells in the Marcellus shale is also associated with increased indoor radon levels, with radon increases of 2.8% for every well within 20 km (7).

Fetal effects: Air pollution also affects fetal growth. One systematic review of 62 studies found the odds of premature birth and low birth weight increased between 3%-10% for small changes in carbon monoxide and particulate matter concentrations (8).

While fracking products are summarily described as “natural gas”, they actually contain hazardous components either as by-products of the fracking process, co-occurring substances such as radon, or fracked gas combustion products such as particular matter, nitrogen oxides, and carbon monoxide.

This brief review only highlights a very limited sample of peer-reviewed studies documenting the health risks associated with the fracked gas that would be transported by the proposed pipeline, released as fugitive emissions, and emitted as combustion products from compressor stations. Given the risk these air pollutants pose to human health, I am requesting that Tennessee Gas include the following in their Environmental Impact Statement:

1 Modeling.

Modeling of compressor emission distributions should be performed with AEROMOD and account for the unique topography of the pipeline route. The modeling should include a maximum capacity scenario that assumes compressor stations are operated at the maximum permitted capacity. This would enable evaluation of the range of possible emissions exposure in surrounding communities, since compressor station emissions are clearly variable over time (data obtained from MA Dept of Environmental Protection).

Modeling should also take into account local topography and inversions. Nitrogen oxide peaks are known to occur during inversion events (9), and are likely to concentrate other air pollutants as well. For example, the compressor station being planned for Northfield, MA would place it at a high elevation where its emissions could become trapped in lower lying areas nearby during inversion events. Concentrated emissions would subsequently increase the exposure risk for nearby communities. The EIS therefore needs to provide data that address inversions, either through measurements or modeling.

2 Radon.

Since radon is known to co-occur with methane produced through fracking, the EIS needs to identify the sources of gas that would be transported through the proposed pipeline. The EIS then needs to provide measurements of radon, either from wells or collection pipeline systems, for those potential sources of fracked gas. Finally, the EIS needs to provide estimates or measurements of radon within homes that receive gas from these sources.

3 Baseline local air quality measurements.

Regional air quality monitors are wholly inadequate to understand air pollutant concentrations within communities that are tens of miles away. Emissions with significant effects on individual, community, and public health can dilute substantially between the time of exposure and their detection at a regional air quality monitor. Therefore, the EIS should include actual baseline air quality measurements in communities surrounding proposed pipeline infrastructure sites prior to construction. These data would be used to evaluate the existing air pollutant exposure burden and be used for post-construction comparisons if the project is approved.

Monitoring should be done at a minimum for total VOCs, particulate matter (coarse and fine), carbon monoxide, and nitrogen oxides since these have well established health impacts and are clearly documented as compressor station emissions. The EIS should provide the rationale for its monitoring approach, but should minimally include multiple monitoring sites near each of the proposed infrastructure sites (especially compressor stations) due to variation in prevailing winds. Furthermore, pollutant concentrations vary by season so measurements should be collected during winter and summer.

4 Emissions from metering and regulating stations, condensate tanks, and pigging facilities.

Please provide detailed descriptions of the proposed locations for the above facilities, as well as relevant technical details such as pressures, storage volumes, frequency of monitoring, type of monitoring, details and frequency of maintenance, etc. Please include references, documentation, and/or data related to measurements of volatile organic compounds (VOC) and radon near these infrastructure sites. Please provide an estimated range of anticipated VOC and radon emissions, as well as modeling to predict anticipated exposures among nearby communities. Given that radon and many VOC compounds are known carcinogens, please be sure to include these details in the EIS.

Summary

These are substantial requests, but the data requested are necessary to adequately understand the health risks from the proposed pipeline and its associated infrastructure. We can only make decisions about approving this and similar projects when we understand the actual need for them compared to alternative options, their effects on health, and their effects on climate change and the environment.

John and Constance C. Kieley, Temple, NH.
Secretary Kimberly D. Bose
FERC
888 First St, NE, Room 1A
Washington, DC 20426
Docket PF 14-22

Dear Ms. Bose;

We are residents of Temple, N.H. and are extremely concerned about the KNOWN HEALTH EFFECTS of the compressor station planned for New Ipswich which would be approximately one-quarter mile from our town's Elementary School and in close proximity to many of our town's residents.

While that compressor station is now officially planned to be 41,000 HP, Kinder Morgan has repeatedly said in recent weeks that they are considering increasing its size to the original 80,000 HP.

In 2012 FERC was asked to consider a 12,260 HP compressor station in the town of Minisink NY which is very similar in population and geography as the Temple/New Ipswich area. There were warnings then that, if built, there would be severe human health consequences. The FERC Commissioners were split in their decision but, in the end, it was approved, built and put into operation. Today ninety percent of residents within three miles of this facility are experiencing health problems associated with the emissions from this facility.

Frankly, we hope that FERC has learned an important lesson from Minisink. The compressor station in New Ipswich would be seven to thirteen times the size of the one in MINisink, emitting up to 400,000 tons of toxins, VOC's and green house gases a year thus causing a tremendous degradation of human health over a much wider area.

Kinder Morgan is obviously expert in convincing elected and appointed officials as well as the general public that this pipeline is needed domestically and that it will lower domestic energy costs. The local distribution companies attempting to show need have a financial interest in this pipeline and thus a conflict. Similarly, studies by the Department of Energy have consistently showed that this export project will drive up the price of energy domestically.

This project is bad for New Hampshire and the United States. We urge you to deny this application.

Sincerely;

John and Constance C. Kieley
37 Holt Lane
Temple, N.H. 03084

20151015-5133

Clinton H. Stewart, Endwell, NY.

I live locally and this pipeline represents good paying jobs. It will help meet the energy demands with domestic energy. Union members are a highly skilled and trained workforce that we need on our jobs in this state more often. these are good paying jobs and we need them as much as possible.

20151015-5134

Wessley Corby, Elmira, NY.

it is good to hear that the projects sponsor Kinder Morgan signed with LIUNA and that Union help will be used exclusively. 344 miles makes a lot of Union jobs. It is sure to help many families pay for food fuel and taxes. I support this project and hope that it starts soon. Thank you.

20151015-5136

Savino Ferrara, Ithaca, NY.

I am in Favor of this project because this area needs fobs and our Union is highly recommended to train for this job. We want to help our local Union People. Hopefully we can get these jobs and get going on this project.

20151015-5138

October 15, 2015

To the FERC Committee,

My name is Jarrod D. Cronin. I am a resident of Merrimack, NH and I staunchly opposed to Kinder Morgan’s proposed pipeline Docket PF14-22-000. The proposed route results in a disruption and risk to the local water quality and conservation land.

Additionally, the route is slated to bring a substantial amount of Natural Gas to a region where projected demand does not appear to support the need for additional infrastructure. As Elisa Wood so effectively points out in her August 18, 2015 article “Energy Efficiency Instead of a New Natural Gas Pipeline for New England?”[1] on EnergyEfficiencyMarkets.com, the projected demand simply is not there. The vast majority of New Hampshire and New England in general is not serviced by Natural Gas. Additionally, the region is seeing a big shift towards alternative energy sources. With this in mind, I hope take these facts, along with the potential impact to our water and conservation areas, into consideration and deny Kinder Morgan’s request under Docket PF14-22-000

Respectfully,

Jarrod D. Cronin

Nancy Engel

Subject: Review of Tennessee Gas Proposed Pipeline Construction

Docket Number PF14-22-000

Date: 14 October 2015

These comments reflect the views of the Conservation Board of the Town of Berne, and not necessarily the Town Board, or the Planning Board. A copy of this report has been provided to those boards.

Introduction

The Tennessee Gas Company, Inc. proposes to add a natural gas pipeline to an existing pipeline right-of-way in the Town of Berne. This is part of a much larger project, which extends natural gas transport from Pennsylvania to New Hampshire.

Conservation Board Review***On-site evaluations***

The Town of Berne Conservation Board (CB) did a number of site visits, walking most, but not all, of the length of the pipeline ROW in the Town (Figures 1 and 2). These site visits are summarized below.

4 May 2015

Members of the CB visited the DEC-recognized wetland AL-26, north of Warner's Lake on 5/4/15 (Figure 3). This wetland had a Great Blue Heron rookery, and a variety of other wildlife observed, including a Great Horned Owl, hunting at the water's edge, near where the pipeline crosses. The pipeline goes under the water in the southern third or so of the wetland (Figure 4).

11 May 2015

Members of the CB walked the section of the pipeline to the west of Pitcher Lane, almost as far as the DEC-designated wetland AL-27 (aka "Lake South America") (Figure 5). The terrain is a series of ridges and swales, with wetlands of varying sizes in the swales. Several of these wetlands are drainages, with running water draining to the southwest, toward the Fox Creek.

A section of the existing pipeline had been repaired earlier in the year (as was learned from one landowner). This repair took place in one of the swales, which contained a wetland, and was bordered on either side by steep slopes. The repaired pipeline was covered with a type of articulated mat (Figure 7), evidently to keep erosion in the drainage from exposing the pipe again. Berms that had been constructed originally to prevent erosion on the slopes next to the swale had been destroyed (leveled) during the repair process, potentially exposing that slope to erosion (Figure 6).

25 May 2015

Members of the CB walked the section of the pipeline from Route 157 to the DEC-designated wetland AL-27 (Lake South America"), and then walked into the wetland itself. Although the surface of the wetland appears dry, there is fairly deep water less than 6" below the surface. This -26-acre wetland appears to be a bog; although the wetland itself is not within the pipeline ROW it is directly adjacent to it. The wetland represents a major water detention area for the Fox Creek watershed.

3 July 2015

Members of the CB walked along the pipeline ROW from Long Road, west to within about 0.25 miles of Saw Mill Road. Again, the terrain is a ridge-and-swale type, with wetlands within each swale.

3 September 2014

The CB did a site review in September of 2014 for a proposed subdivision on Saw Mill Road. The following is excerpted from the memo for that review:

"A gas pipeline runs through the lot on the northern side. The field has typical old-field vegetation, with goldenrod (*Solidago*), the invasive species knapweed (*Centauria*), and native bee balm (*Monarda*) dominant."

Review of Environmental Documents filed with FERC

The CB obtained the environmental review documents prepared for the entire pipeline project, via the website at:

http://elibraryJerc.gov/idmws/file_list.asp?accession_num=20150724-5061

Several copies of the relevant documents (more than 1 Gb) were made on DVD, one of which was left at the Berne Town Hall.

Wetlands Inventory Maps

The Tennessee Gas documents include detailed maps superimposed on aerial photographs marked “VolIII-Appendix F-Aerial Alignment Schohairie and Albany Counties.pdf”. These mark the wetlands we found in the ridge-and-swale terrain, and they give an idea about the plans for staging areas, temporary workspaces, etc ..

The document titled, “VolIII-Appendix K-Environmental Construction Plan for New York.pdf” contains some information about the plans for crossing waterbodies and wetlands.

Water Use and water discharge

The document titled, “RR2 Water Use And Quality.pdf” does not contain sufficient information concerning the use of water during the pipe-stringing phase of the operation; the table titled “Potential Sources of Hydrostatic Pressure Test Water for the Project” has only “TBD” in the Manifold Discharge Location and Water Quantity columns. We echo the FERC Staff comments regarding the lack of sufficient information about important aspects of this project.

Erosion Control

The document titled, “Vol_II-Appendix HUpland Erosion Control Revegetation Maintenance Plan.pdf” has information about the practices and standards that the company says they are going to employ.

Conservation Board Concerns

The Conservation Board has concerns about several environmental aspects of this project. We appreciate that many of these concerns are addressed in a generic way by the plans outlined in the environmental review documents. However, the CB also echoes the comments by the FERC staff, where there was insufficient detail provided.

1. Wetlands

Much of the pipeline ROW in Berne is in the Fox Creek watershed. Our onsite observations, the maps of wetlands and hydric soils constructed by Mr. Joe Cleveland (Figure 10), and the Tennessee Gas maps all indicate the presence of wetlands in the swales along the pipeline. Several of these wetlands are connected to surface drainage toward the southwest, i.e. toward the Fox Creek itself.

Wetlands and hydric soils play a key role in detaining or retaining water and mitigating floods, such as those that occurred after Tropical Storm Irene. Loss of wetland is known to exacerbate flooding; conversely, where wetlands have been maintained or restored, the severity of flooding is reduced. The CB is strongly advocating a position consistent with federal wetlands policy, that there be no net loss of area or function of wetlands in the Town.

The CB is concerned about chemicals used in construction of the pipeline, and the possible contamination of wetlands thereby. There is not enough information in the documentation provided by TG concerning the disposal of waste materials.

2 Erosion Control

As noted above, some erosion-control berms were already destroyed in the process of repairing the pipeline last winter, around Milepost 10.5. It is vitally important that erosion control be implemented on the steep slopes in the ridge-and-swale system.

3. Habitat/Species of special concern

The DEC-recognized wetland (A1-26) to the west of Route 157 was observed on 5 May to contain a Great Blue Heron rookery. This species is dependent on wetlands for feeding, and on relatively undisturbed areas

for breeding.

We also observed a number of other aquatic and upland birds (e.g. sapsuckers) nesting in the area. This wetland is a significant ecological site in addition to playing an important part in the hydrology of the area, being a water source for Warner's Lake.

To the west of Pitcher Lane, the ridges had tall grasses by the date of our visit on 5/11/15. Bobolinks were nesting and singing in these areas. This species is in decline in North America, chiefly due to loss of nesting habitats.

The New York Natural Heritage program did not list any species of concern in this area.

4. Invasive Species

Movement of soil by equipment poses the risk of introduction or distribution of invasive species. A list of invasives in NYS has been updated by the DEC: http://www.dec.ny.gov/docs/lands_forests_pdf/islist.pdf

Invasive species often out-compete native species, cause habitat degradation and loss, and may cause crop damage and livestock disease.

5. Karst

The area of the pipeline ROW in the Town is known to be an area of karst, where underground drainage is important. This poses a significant risk of the contamination of groundwater from any spills, in addition to contamination of surface water, where groundwater re-emerges (resurgence).

Recommendations

The CB's goal is to protect, and require the restoration of, wetlands and related ecosystems. Our best judgment is that there will be substantial impacts to the ridge-and-swale system; the aggregation of these impacts is likely to affect the many ecosystem services that derive from these systems.

1. The CB recommends that a landscape-level or watershed-level approach be taken to impacts, particularly when it comes to a) the impact on flood resilience, b) impacts on water quality of the whole watershed and c) mitigation and restoration of any impacts.
2. The CB recommends that Tennessee gas must provide a detailed plan for water use and wastewater disposal in their environmental review. We concur with the FERC staff comments that there are too many places where "TBD" appears instead of the needed information.
3. Further, we recommend that impacts be viewed cumulatively, instead of as occurring to individual elements of the watershed.
4. The CB recommends that habitat that has been disturbed during construction (e.g. grasslands on ridges) be restored following construction.
5. Last, we recommend that long-term monitoring of a designated set of reference sites within the Fox Creek watershed be undertaken. The Conservation Board should help determine the reference sites. Student interns identified by the Town could do the monitoring. We believe they should be paid for by Tennessee Gas as part of its impact mitigation activities. The following areas of concern should be monitored:
 - a. Water quality: pre-and post- construction water quality monitoring in Warner's Lake and Fox Creek should be done. We would expect a baseline assessment prior to construction and monitoring monthly for the first two years.
 - b. Revegetation: The success of revegetation efforts should be monitored.
 - c. Water detention/retention capacity: any alteration of flood storage capacity-not just in wetlands but in riparian settings as well--should be examined with care, through long-term monitoring. One or more stream-gauging stations should be installed in the watershed.
 - d. Erosion control on steeper slopes of the ridge-and-swale terrain. Given that we observed that erosion mitigation standards were already violated in the last few months, following a repair in the existing pipeline, it is imperative to have independent monitoring.

A. List of Birds observed on May 11

Oriole
Bobolink
Red - winged Blackbird
Yellowthroat
Ovenbird
Catbird
Song sparrow
Chipping sparrow
Rose breasted grosbeak
Flicker
Cardinal
Robin
Wood thrush
Red-eyed vireo
American crow
Wild turkey

B. Birds and mammals observed on May 4

Great Horned Owl
Great Blue Heron
Common Merganser
Yellow-bellied Sapsucker
Beaver

20151015-5145**Town of Pelham, NH Conservation Commission, Pelham, NH.**

Pelham Conservation Commission
6 Village Green
Pelham, NH 03076-3723

The Town of Pelham requests that the formal environmental scoping comment period shall not close prior to the final filing of the Northeast Energy Direct project by Tennessee Gas Pipeline Company / Kinder Morgan. The Pelham Conservation Commission has hired an environmental consultant to do a comprehensive study to investigate land that will in any way be impacted or affected by this project. This study will give the town of Pelham an Environmental Impact Statement (EIS). In order to have a complete and accurate EIS prepared to help the Federal Energy Regulatory Commission understand the environmental impact to the town of Pelham, and to make appropriate comments for the scoping period to which Tennessee Gas must respond, we must have an exact location for the pipeline route through town. We understand that such a location will not be accurate until Tennessee Gas Pipeline Co. / Kinder Morgan has submitted their final filing of the project sometime in October or November. Therefore, as stated above, the town of Pelham requests that the scoping comment period does not close before the final filing of the project with your agency. As a result of the final filing, more precise maps will be available to the consultant as a basis for the study. We also request that the scoping comment period must be extended to allow another cycle of the seasons for time to evaluate the area and to perform studies for a thorough analysis of impact to the environment by this project in the town of Pelham.

Scoping comments by the Winchester Board of Selectmen and the Winchester Conservation Commission related to proposed Alternate Routes in Winchester, NH for the proposed Kinder Morgan natural gas pipeline. FERC PFI4-22-000

Conveyance

Comments to be filed electronically with copies to Kinder Morgan and the US Army Corps of Engineers.

Communications

All communications related to this filing should be directed to:

Roberta Fraser, Chairman
Winchester Board of Selectmen
1 Richmond Road
Winchester, NH 03470
Phone - 603 2394951
Email- swalker@winchester.nh.gov

Background

The Town of Winchester filed Scoping comments before the original 9/1/15 deadline. At that time one proposed pipeline route through Winchester, NH had been filed with PERC by Kinder Morgan (KM.) The town's previous filing to FERC recounted the history of meetings between the town and representatives from KM. Although a route had been filed with the Town of Winchester in November 2014 and with FERC in December 2014, Kinder Morgan responded to concerns expressed at a public meeting between town residents and Kinder Morgan representatives. On July 1, 2015 KM proposed a new route crossing the Winchester stratified drift aquifer further east of the original route. However, KM declared the original route was still considered an alternative route.

When KM met with town representatives to discuss the first revised route, a discussion ensued concerning the impact of both the original route and the revised route on town owned, deed conserved land known as Pulpit Falls and Pulpit Rock. The meeting is described as follows: [http://www.sentinel-source.com/news-local/kinder-morgan-reroutes-pipeline-path-in-winchester/rarticle-1923c480-026b-S2c2-904b-aec04673bb48.html](http://www.sentinel-source.com/news/local/kinder-morgan-reroutes-pipeline-path-in-winchester/rarticle-1923c480-026b-S2c2-904b-aec04673bb48.html) Subsequent to this meeting the Board of Selectmen and Winchester Conservation Commission (WCC) escorted representatives of Kinder Morgan through the Pulpit Falls area on July 30, 2015.

As a result of the site visit to Pulpit Rock and Pulpit Falls, Kinder Morgan notified the town on 8/25/15 of another revised route. This new route avoids town owned, deed conserved land (originally the first point of entry of the proposed pipeline in NH) and enters NH further east of both Pulpit Rock and nearby Bent Pond. The town did not receive the new route notification in time to include the route in its scoping document. The third route filed with the town is described in the Keene Sentinel as follows: <http://www.sentinel-source.com/news/local/proposed-pipeline-route-moves-again-in-winchester/article-5d090022-b770-S06d-8eld-3ac620fb02dS.html>

Neither of the revised routes is filed with FERC. Kinder Morgan has told town representatives all three routes filed with the town are considered alternatives.

Questions for FERC and Kinder Morgan

Why are the revised routes not filed with PERC?

Does FERC allow pipeline companies to select and keep on record multiple pipeline routes?

Is Kinder Morgan requesting to survey all properties on all routes?

Is the most recent route filed with the town on 8/25/15 the Kinder Morgan preferred route? Is it the FERC preferred route?

If multiple routes are allowed, how many routes are allowed? Should all property owners be prepared to be on an alternative route? Does FERC consider the community impact of multiple routes?

Does the number of routes considered raise the burden of proving need for the pipeline?

Does FERC consider the cost to landowners of defending against an eminent domain taking, especially when there are multiple routes? If so, does FERC take into account the financial, social and psychological costs to landowners of being included in such routes?

Does FERC consider the neighbor versus neighbor impact of alternative routes?

Will FERC require an analysis of threatened and endangered plants and animals on all routes?

Will FERC require an in-depth study of Native American habitat and archeology on all routes?

Will FERC examine the routes KM filed with the Town of Winchester even if KM does not file the revised routes with FERC?

If PERC allows multiple routes, will FERC consider the geography and natural resources of Winchester and propose a shorter route to Dracut MA that does not cross through Winchester, NH - - the most western location on the proposed pipeline route in NH?

Respectfully submitted,

Roberta Fraser, Chairman

Winchester Board of Selectmen
Gustave Ruth, Chairman
Winchester Conservation Commission

The Winchester Conservation Commission submitted a Scoping document on September 1 st, 2015. At recent meetings it was determined that there were additional issues of concern and comments that we would like to place under consideration. Members of the Conservation Commission and the Chairperson of the Board of Selectmen attended the Scoping meeting in Rindge NH held in October of 2015. The Chairperson of the Conservation Commission spoke to address issues pertinent to Winchester. Each of the speakers from towns along the proposed route presented concerns that also are pertinent to Winchester. The Conservation Commission and the Town of Winchester remain vehemently opposed to the proposed NED pipeline. The Town of Winchester has recently joined a Municipal Coalition of Town Officials and their representatives in order to further support the opposition effort. The Conservation Commission also voted to support a comprehensive document compiled by all of the Conservation Commissions along the proposed pipeline route. The document was submitted to PERC and both state and federal officials.

To further document the concerns of the Winchester Conservation Commission we would like for PERC to address the questions/concerns listed below:

1. Has there or will there be extensive research and concrete steps to study scientific information on fault lines on the Proposed route and what would be the steps taken by Tennessee Gas and Kinder Morgan should there be an event related to a seismic occurrence? Multiple fault lines exist in the proposed area which periodically experience seismic activity.

2. What specific research has been done in the area of Pulpit Falls regarding documented Native American settlements, meeting sites and artifacts found in the geological substrates as previously presented by the Conservation Commission as well as the Town of Northfield?
3. What compensation/technical support will be provided to the Town of Winchester or property owners should there be contamination of the town aquifer or town and private wells either during construction or during the life of the pipeline?
- 4.. We are asking that Kinder Morgan/Tennessee Gas provide a specific emergency management plan for any event occurring as a result of the construction or accident related to the pipeline once completed as well as a plan for security along the route.
5. What financial assistance/technical support will be provided to fund Winchester's small volunteer emergency and fire squads and what steps/plans will be taken to provide an evacuation route should there be an event that closes a major road in Winchester?
6. In view of the fact that Winchester has been presented with at least three proposed routes will the Town be given additional time for comments? Also, when will there be final maps showing landing sites and additional maintenance stations along the route as these will require additional land acquisition and present different environmental impact concerns. This will introduce the need for further response from property owners and the Town.
7. Winchester was recently presented with the current Draft: Comprehensive Conservation Plan and Environmental Impact Statement of the Silvio O Conte National Wildlife refuge. Members of the Winchester Conservation Commission attended a recent open house presenting the new draft. The Winchester Conservation Commission and the Town of Winchester had voted to support the plan for the Refuge when an initial draft was presented several years ago. We would ask that PERC review the current Draft to study the area noted as the Sprague Brook Conservation Focal Area as the proposed pipeline route passes through the area in question. It may be seen in Map 12 of the Draft Summary. This area is one of the key focal areas of interest for the Refuge for conservation and protection. Detailed information is available as to the reasons this area has a high priority in the new Plan for protection or acquisition.
8. As previously stated we are also very concerned that there have been multiple routes presented to Winchester yet are aware of only one being officially submitted to PERC. We would ask that PERC delay the scoping deadline in order for Winchester to address the potential concerns and issues raised by the various routes presented. All of the routes cross our aquifer and threaten the town water supply and present concerns for the property owners along each of the various routes. Each of the proposed routes present issues in common but have unique areas of major concern as well as impact different property owners. An additional period of time would be required for the Town and the individual property owners to address the possible impact of each of the routes presented.

Winchester remains firm in the belief that there is NO NEED for the proposed pipeline to be constructed in Southern New Hampshire, that it is a pipeline for export only and provides NO economic benefits to Southern New Hampshire. There is deep concern for the future of natural gas as an energy source given the emerging negative research on fracking. This presents the realistic possibility that the pipeline would have been constructed through our state only to be decommissioned or be considered for an alternate unacceptable use. The minimal supply of additional gas currently in discussion can easily be met by extending existing lines. The State of NH has energy plans in place which strive to use alternate energy sources that include ' hydropower, solar and proposals to build windmill farms. These incentives and proposals will more than make up for the electrical shortfalls with no fossil fuel carbon emissions.

In conclusion, the Winchester Conservation Commission remains committed to our mission statement to protect our natural resources and will continue to work diligently with our Town and neighboring towns to oppose the proposed pipeline in Southern New Hampshire.

Gustave Ruth

20151015-5148

EJ Perry, Temple, NH.

Re: PF14-22-000

After months of reading and listening, checking websites and conducting research, attending meetings, and talking with residents of towns in the Monadnock region - it appears there is no valid reason for the proposed NED pipeline through the southern part of NH to be approved. It would not benefit anyone living in this area or even the state of New Hampshire.

The gas would not serve this region.

It would not reduce our energy costs.

All the propaganda from Kinder Morgan spokespeople cannot disguise the fact that most of the gas would be for export.

There are multiple negative aspect to consider:

- o documented health concerns (verified by multiple studies)
- o safety concerns with a huge, unmanned compressor station
- o noise and light pollution, and view-scape corruption
- o damage to property values and the land itself
- o the possibility of contamination to wetlands, aquifers and private wells
- o insufficient emergency personnel and equipment to respond to a catastrophic disaster

The biggest insult to all of us who live here would be the use of eminent domain to acquire easements, solely to benefit a for-profit company. Big money business would win. We, the people, would lose.

It is beautiful here, pristine even. The magnitude of what we stand to lose is egregious and unacceptable.

To allow this project to go forward would be a travesty. Please review the evidence and be brave enough to reject the application.

20151015-5155

Dennis Gauvin, New Ipswich, NH.

While that compressor station planned for New Ipswich is to be 41,000 HP, Kinder Morgan may revert to the original 80,000 HP when all is said and done.

In 2012 FERC was asked to consider a 12,260 HP compressor station in the town of Minisink NY which is very similar in population and geography as the Temple/New Ipswich/Greenville area. There were warnings then that, there could be human health consequences. The FERC Commissioners were split in their decision with member LaFleur and chairman Wellinghoff dissenting. As can be seen from the links in the document below, the health problems were realized with the emissions from this facility.

We sincerely hope that FERC has learned an important lesson from Minisink as the station in New Ipswich would be thirteen times the size of the one in MINisink, emitting 400,000 tons of toxins, VOC's and green house gases a year over a much wider area. Please study the document below.

Not the Next Minisink!

Although this is not a KM/TGP project, the story mirrors what is about to happen to New Ipswich, Temple and Greenville.

Minisink is a town located in southwest Orange County, New York northeast of the New Jersey border between the Town of Greenville and the Town of Warwick. The population was 4,490 at the 2010 census.

On 7/17/2012 FERC voted 3-2 in favor of Minisink project. The then chairman of FERC Jon Wellinghoff and member Cheryl A. LaFleur dissented on reasons that the existing Wagoner alternative would be a better choice for the community and that air quality would suffer. <http://www.minisinkmatters.org/?p=147#comment-44>

Construction begins on 10/1/12. On 10/8/12 the US Court of Appeals issues a temporary stay on the project, halting construction. It was soon lifted and construction continued. Two 5 minute videos here show the frustration of residents. http://www.stopmcs.org/?page_id=383

The Millennium pipeline & 12,000 HP compressor station is completed in 2013. Shortly after the compressor went into operation, many nearby residents reported health issues such as, nosebleeds, headaches, asthma, rashes etc. <http://www.utne.com/environment/gas-compressors-and-nose-bleeds-zm0z15fzsau.aspx>

A brief on 7/19/13 was filed to the US Court of Appeals DC Circuit. The Initial Brief seeks reversal of the FERC Order and the deconstruction of the Minisink Compressor Station. <http://www.stopmcs.org/?p=1072>

Between 10/19/14 and 12/17/14, health consultant Dr. David Brown with the Southwest Pennsylvania Environmental Health Project (SWPA-EHP) conducted a 2 month study of air contaminants and health symptoms. 35 residents participated, they all lived within 1 mile of the compressor station. The main concern of data gathered was higher than normal elevations of fine particulate matter or PM 2.5. This pollutant has long been known to cause health issues in high amounts. During the air monitoring period, elevations were 17-20 micrograms per cubic meter, 3 times the national average of 6.3 and well above the EPA limit of 12. Multiple episodes of peaks as high as 426 were also recorded. One home had a 24 hr. period with an average of 64. VOC's were also captured in the canisters. <http://www.environmentalhealthproject.org/wp-content/uploads/2015/06/Summary-of-Minisink-Results.Public.pdf>

FLIR infrared video of Minisink Compressor Station emission <https://www.youtube.com/watch?v=RYdrSeUSxg>

A very comprehensive report by SWPA-EHP on Compressor Stations and Health Impacts <http://www.environmentalhealthproject.org/wp-content/uploads/2012/03/Compressor-station-emissions-and-health-impacts-02.24.2015.pdf>

A June 2015 study by Harvard shows health risks with PM 2.5 above 6. Each increase of 1 microgram per cubic meter increases the mortality rate by 1% for people over 65. <http://www.hsph.harvard.edu/news/press-releases/air-pollution-below-epa-standards-linked-with-higher-death-rates/>

In addition, a 12/14 Harvard study states - High PM 2.5 levels in the 3rd trimester of pregnancy double the risk of newborn autism. <http://www.hsph.harvard.edu/news/press-releases/fine-particulate-air-pollution-linked-with-increased-autism-risk/>

“Even in a big city like NY you wouldn’t see these peaks in particulate matter nor have the same chemicals in the air” said Dr. Brown. To attain permits, the pipeline companies use analysts who manipulate projected emissions levels to make them acceptable by the EPA standards, Brown says. Those standards are also weakened by industry lawsuits when the EPA tries to tighten them. “They delude themselves about emissions safety”, says Brown. <http://www.utne.com/environment/gas-compressors-and-nose-bleeds-zm0z15fzsau.aspx>

Wilma Subra’s presentation on Potential Environmental and Human Health Impacts associated with the Minisink Compressor Station shows clearly the dangers posed to the communities of New Ipswich, Temple and Greenville if a station 4 times as large is built! <http://www.catskillcitizens.org/learnmore/subraminisink.pdf>

On 5/1/14 an alarm sounds at compressor station as residents head to court in Washington. <http://www.stopmcs.org/?p=1185>

On 7/7/14 residents are warned that compressor station venting will occur & to be careful outside <http://www.minisinkmatters.org/?p=242>

On 8/15/14 the appeal is denied <http://caselaw.findlaw.com/us-dc-circuit/1675630.html>

On 9/8/14 a gas leak alarm has emergency responders waiting an hour for company officials to arrive <http://www.minisinkmatters.org/?p=263>

In 2015 a gas power plant is to be built 7 miles away from Minisink in Wawayanda NY by Competitive Power Ventures. <http://www.utne.com/environment/effects-of-air-pollution-zm0z15fzsau.aspx?PageId=3#ArticleContent>

Competitive Power Ventures purchased emission reduction credits from other companies hundreds of miles away who are not using their permitted amounts. <http://www.catskillcitizens.org/learnmore/subraminisink.pdf>

Local residents sue to block construction of the power plant. <http://midhudsonnews.com/News/2015>

20151015-5156

Denise Greenleaf, Merrimack, NH.

Kinder Morgan must not be allowed to build a fracked gas pipeline in NH. Their proposed line through Merrimack, NH is going through our aquifer, through protected lands, and through historic areas.

Fracked gas is not needed in NH, therefore it will be exported to foreign countries. Eminent domain for private gain is illegal! NH should not have to be decimated to line Kinder Morgan wallets, even though they pay your salaries.

Everyone knows that FERC is biased for the people they are supposed to protect us from. This system is corrupt and should be investigated.

No gas pipeline in NH, now or ever! Merrimack's route is through solid granite in some areas. The ulterior motives of Kinder Morgan are known in this area, and that is to expand their operations into the land currently owned by Anheuser Busch.

Kinder Morgan's safety records are atrocious!

VOTE NO TO FRACKED GAS IN NH. Have a backbone and some morals!

20151015-5158

Kathleen Manfre, Peterborough, NH.

To Whom It May Concern,

I am writing as a citizen of the beautiful "Green" state of New Hampshire. I have been going to meetings and hearing about the proposed gas pipeline that is to impact many small towns in Southern NH. I am vehemently opposed to such a project which will assuredly destroy the beautiful conservation lands, farms, neighborhoods, ridgelines, and small towns of this state. How can the government take away property when there is no real public benefit or need?

I am angry at the idea that yet another corporation feels it can move right in and take over the southern part of our state with an extremely DANGEROUS project that will, without a doubt, have catastrophic results!! This simply is evident in the FACT that there is clearly no sufficient infrastructure or manpower to be able to handle an emergency....not to mention the immoral placement of an enormous compressor station built so near to an elementary school. Kathleen Manfre

20151015-5159

Terry Nord, Rensselaer, NY.

On behalf of Save Burden Lake I request that the EIS address the points made by Dr. Sheila Bushkin at a Health Forum held on 9/30/15. Dr. Bushkin and her team of Concerned Physicians from NY along with Dr. David Carpenter have studied the health impacts in fracked gas infrastructure. We would like the EIS to address all of the material presented by Dr. Bushkin. Compressor stations are not appropriate to locate in residential areas. If this is permitted, we would ask for application of all known mitigation technology, including but not limited to electric motors, recapturing emissions, sound barriers, higher grade pipes and

welds. We would ask for rerouting the pipeline along highway options and moving the compressor stations away from residential/recreational areas.

Please use the following link for Dr. Bushkin's presentation.

<https://vimeo.com/142327653>

In addition, we would like the EIS to address the concerns of Dr. David Carpenter whose reputation is well known to FERC.

See Dr. Carpenter's comments at the following link.

20151015-5165

Amy Cabana, Temple, NH.

GOOD DAY, Based on my knowledge of how the federal government works, you are employed by us, the people of the United States of America, and your job is to hear us, the people of Southern NH. I'll refrain from the emotional rhetoric, as I know that while it is important to us, it is not necessarily germane to your decision making process. I'm sure you are aware that one of the proposed compressor stations is a 1/2 mile from the Temple Elementary School, and I'm sure you know our volunteer fire departments are ill-equipped to handle even a small "accident". I know you will take into consideration the quality of life we enjoy here - the fresh air, the clean water, the solitude, the peace and the conservation land we so diligently put aside for future generations to enjoy. I know you will consider all of this, because you represent us, the people. This is not the least expensive place to live, and not the easiest, but it is ours, and we love it.

I am far from the most knowledgeable person on this subject, and have relied on the efforts and dedication of others to gather information, and I have tried to look at both sides of this issue. Based on my understanding, there is a perceived "need" for energy in this region, and the term "energy crisis" has been bandied about as justification for this pipeline proposal. One does not have to dig too deeply to find out that this is a fabricated need by those who will benefit financially from it, and not an actual one. One also doesn't need to look too hard to find out that the vast majority of the natural gas this pipeline will move will not be used in New England, but rather shipped off shore. The one company that has "signed up" to utilize a very marginal amount of the gas is - wait for it - affiliated with Kinder Morgan. I guess if you can't legitimately find a need, if you have enough money you can create one.

I'm not sure what Kinder Morgan thought they would find here, but we are not the semi educated back woods hicks they might have expected. We are country folk, for sure, because we choose to be. I could say thank you to Kinder Morgan, for this issue has united and galvanized a large population that might otherwise not have come together. I think they have underestimated how fiercely we love this place we live, and how fervently we will fight to protect it. We live here for a reason, and if anything, this proposal has given us great motivation to pursue alternative and renewable energy resources, to reduce our energy consumption, to buy more energy efficient products. We, as a nation, should be moving in this direction, not increasing our reliance on fossil fuels. I believe it is your job to facilitate that process.

I challenge you to give us a year. To let us show you through nothing but our concerted efforts that we can in fact reduce our energy consumption, that we can pursue other options, that we can live comfortably without having our homes and communities pillaged and plundered by deceitful and greedy corporations. I will leave you tonight with a quote by Margaret Mead - "never doubt that a small group of thoughtful committed citizens can make a difference, indeed, it's the only thing that ever has". You, my friends, have run into a group of very committed citizens, and as our state motto suggests, we will indeed, live pipeline free, or die trying. All of us here, and especially the children of the Temple Elementary School, thank you for your thoughtful and rational consideration as you deny this proposal.

Arnold Piacentini

October 15, 2015

Ms. Kimberly Bose, Secretary
 Federal Energy Regulatory Commission (FERC)
 888 First Street NE, Room 1A
 Washington, DC 20426

via: Electronic Submission

Re: Public Comment Period: Kinder Morgan (KMI)/Tennessee Gas Pipeline (TGP) Northeast Energy Direct (NED) proposal;
 FERC Docket Number: PF-22.

Dear Ms. Bose;

My name is Arnold Piacentini from Richmond, MA. I hold three degrees in Chemical Engineering and worked for the petrochemicals industry in several responsible forward-looking technical and commercial positions. I have 6 grandchildren, the 3 oldest of whom are granddaughters of child bearing age. My work is on a pro bono basis and aimed at helping younger and future generations.

In addition, I live in Richmond, MA where 3 TGP pipelines enter MA from New York. There is a gas hub in Richmond where passer-byes occasionally get a whiff of gas.

INTRODUCTION

Please accept and take seriously the following comments and do not be offended by their occasional bluntness. This is a serious problem. Also, please see that this document is widely circulated within FERC.

Before discussing the case against the above-referenced proposal, and indeed all other such infrastructure proposals, I would like to take a step back and to consider some background. FERC has hired hundreds of young people who may not have knowledge of the derivation of law and disastrous public policy that resulted from it. These have in turn created the unprecedented contentious situation between the citizens of our country and the most powerful Federal agency in the U.S. government. Commissioner Cheryl LaFleur acknowledged this 'situation' in her January comments to the Washington press.

A dichotomy has been created between the various States, and regional entities who feel an obligation to serve 'their regulator' FERC and their constituency, the people. A similar dichotomy exists with the people's representatives, Congress, which has passed some very poorly conceived laws. This dichotomy extends to the White House which has embraced a policy that derives from these poor laws. Citizens from all walks of life, economic strata and geographical areas are in opposition to this public policy and the laws behind it.

Many brave citizens have just completed on September 25th at their personal peril and extreme discomfort a hunger strike of from several to as many as 18 days outside of your offices. They are trying to gain the attention of FERC, the Secretary of Energy, the White House and Congress and many other government entities. Other citizens are chaining themselves to heavy machinery or devising "tree-sits" at great peril to themselves and/or undertaking other nonviolent direct action and in the process are being subjected to arrests and legal proceedings.

In my opinion the objective of these citizens and of the multitudes that write to FERC daily is to **demand that FERC cease the issuance of all new permits and revamp its procedures to be in alignment with the real needs of society.** I will provide my personal opinions of such driving forces and needs, much of this **in the context of the big picture that FERC appears to be ignoring.**

HINDSIGHT ... DICK CHENEY'S "ENERGY TASK FORCE"

A thorough discussion of this subject can be found in the literature (1). In retrospect it is clear that while the headline was to develop a National Energy Policy, the result was defined in private by Cheney and other federal agencies in concert with representatives of the fossil fuel industry. Of the 105 recommendations only 7 dealt with renewable energy (RE) sources.

The 2005 Energy Policy Act passed by Congress in essence made the minutes of all of the various closed-door meetings public. The Act contains a plethora of provisions. Most infamous among these are that this bill exempted fluids used in the natural gas extraction process of hydraulic fracturing from protections under the Clean Air Act, Clean Water Act, Safe Drinking Water Act, and CERCLA (2). It created a loophole that exempts companies drilling for natural gas from disclosing the chemicals involved in fracking operations that would normally be required under federal clean water laws — see exemptions for hydraulic fracturing under United States federal law. The loophole is commonly known as the “Halliburton loophole” since former Halliburton CEO Dick Cheney was reportedly instrumental in its passage.

Thus, emanated the birth of high-volume horizontal fracking (HVHF).

Prior to that the Oil & Gas Industry had been exempted in 1988 from the Resource Conservation and Recovery Act, known as RCRA, and in 1986 from the Community Right to Know Act. For this industry alone, chemicals such as benzene, toluene and xylenes are NOT hazardous materials!

So, you may ask why belabor these points? The existence of these exemptions is clear evidence that HVHF cannot be done in compliance with these environmental protection laws. It is also clear evidence of a major subsidy given by Congress on behalf of the society that it is supposed to represent to the profits of the fossil fuel industry including fracking and fracking-related industries, including fracked gas pipeline infrastructures.

ARE INHERENTLY CRIMINAL ACTS LESS SO BECAUSE OF THIS BAD LAW?

“Criminal law is the body of law that relates to crime. It regulates social conduct and prescribes whatever is threatening, harmful, or otherwise endangering to the property, health, safety, and moral welfare of people. It includes the punishment of people who violate these laws.” (30)

So, does the existence of a bad law make such acts as denying human and other life clean air, clean water and safe drinking water less criminal, less heinous? In my opinion, no. A bad law does not make an inherently criminal act either civilized or ethical.

The existence of this law and of the other exemptions granted to the Oil & Gas Industry have created the tragic circumstance in which our country finds itself ... citizenry of all ages on behalf of themselves and future generations are pitted against their own government and the elected officials who are supposed to be serving their needs.

It's time for our government and society to reject the corrupt and twisted principles of one discredited man in cohort with self-interested unprincipled representatives of a dying industry.

I ask that FERC act in a civilized and ethical manner and ignore the existence of this bad law as one of several reasons for not permitting these proposed fracked gas infrastructure projects, including the NED.

ENERGY SECURITY: The facts are in: peak oil is behind us; peak natural gas is behind us; peak economically-recoverable coal is behind us (46); **the cost to maintain our aged nuclear power plants is now uneconomic (47); and peak fracked gas is upon us (48).**

Many shales have peaked. Recoverable oil from the Monterey shale was downgraded by 96% last year. Most gas shales are estimated by knowledgeable sources to be over rated in their potential. Marcellus is forecast to peak in 2016; all others have already peaked. I believe that the decline in production from gas shales will be much greater than the EIA forecasts.

Such forecasts do not take into account the change in the economic and technical facts of the practice known as high volume horizontal fracking (HVHF). It is via fracking that feedstock for these proposed infrastruc-

tures would be produced. Fracking has already spread to every part of our country including New England (NE). The concentration of fracked gas in our gas distribution systems has grown to about 40% nationally, and to about 60% here in New England.

FRACKING HAS FAILED ECONOMICALLY AND TECHNICALLY

A few short years ago MLPs (Master Limited Partnerships) and equity interests in fracking companies were the darling of Wall Street. These MLPs have become toxic; investors are shunning them. Equity interests have endured significant declines in price. The debt for some of the largest fracking companies ranges from 90% to 200% of equity (4).

This occurred before the drop in crude oil prices last fall. For the 4-year period 2010 through 2013, for a universe of 20 shale operators, capital expenditures totaled 226.956 \$B while **free** cash flow totaled -79.016 \$B. The drop in crude oil prices has of course exacerbated this situation. It will take years, from 7 to 20, for some of the large drillers to pay off their long-term debt using 100% of Net Income.

Technically, about 70% of new shale production is going to offset rapidly declining production from existing wells in all major shales, including the Marcellus. **Given the financial condition of the drillers, it is logical to expect a decrease in new well count and, therefore, a decrease in production.**

Also, fracking bans are beginning to be put into effect, e.g. by the States of New York and Maryland, and by other communities across the country. Citizenry are demanding that this practice be stopped permanently. See also Reference (43).

The shale bubble is bursting. Capital destruction is underway. Contagion has spread to MLPs for pipeline companies; these, too, are being shunned by investors. KMI announced in 2014 dissolution of their MLP. Once burned, will high net worth investors again be lured by Wall Street to invest in this dying strategy? I think not.

Further, Forbes reported late last month that banks are seeking regulatory relief as their loans to oil and gas interests fall into distressed quality. Noteworthy is that Chesapeake has put their Utica shale interests up for sale.

One last point, late last month it was also reported by the worldwide fossil fuel divestment movement that so far 400 organizations have pledged to divest a total of \$2.6 trillion of fossil fuel investments. This is just the tip of the iceberg.

FERC should pay attention to all of these trends and adjust their policy to their reality.

EDCs show interest in increasing their dependence on fracked gas because they have been told by gas industry lobbyists that it will increase reliability and lower costs. ISO-NE seems likewise concerned with reliability. This metastasis of pipeline infrastructure of which the NED is just one example has emanated from a **supply-push scenario from the Marcellus shale that is now very much in jeopardy.**

EDCs, the New England (NE) States' Departments of Energy, ISO-NE and others are looking in the wrong place for reliability. FERC is leading them in the wrong direction.

Further, the claim by industry lobbyists and their parroting aides in various government agencies that more pipeline capacity would lessen the perturbations in price that seem to happen regularly at the height of the winter months has no basis in fact. A similar pattern occurs in Pennsylvania where no reasonable person could claim that there is insufficient pipeline capacity. It would be revealing if the States' Attorney General Offices (AGOs) would do some investigative work on the real cause of these price irregularities. Isn't this also one of FERC's responsibilities?

Kinder Morgan, Spectra Energy, Berkshire Gas, Columbia Gas, Boston Gas and many others with the help of self-serving gas industry lobbyists have tried to spin this into a demand-pull scenario for New England. Nothing could be further from the truth as subsequently discussed.

The other critical issue of the true cost of fracked gas will be subsequently addressed both in the context of costs and personal burdens transferred to society and the consequences of climate disruption.

IN OUR NEW PARADIGM RENEWABLES BEAT SUBSIDIZED FOSSIL FUELS

Many existing gas-fired plants are operating at low capacity levels (45). As energy efficiency (EE) programs and renewables energy (RE) investments are made, domestic energy demand will decrease further. **We are now entering a new paradigm where the cost of renewable energy sources from onshore wind and solar PV are lower than (subsidized) fossil fuel sources** (3, 44). This is where the New England and other states should focus their efforts. NE will need expansive EE and RE investment programs to replace its coal and nuclear dependence and to thereby reduce its cost of generating electricity. Why isn't FERC driving this?

It would probably be necessary to use some of the subsidies granted to fossil fuels to help get the offshore wind industry off the ground. Potential here is vast.

As touched on subsequently, if these various pipeline projects are built, and the operators are able to economically export liquefied fracked gas, as they dream of doing, the demand may increase just as the supply is diminishing, causing an increase in prices. The last time natural gas prices spiked 10-15 years ago dozens of the gas-fired power plants that had been built during the prior five to ten years were shuttered.

However, **the export strategy does not compute**. The US is a net importer of LNG. A study done by me has concluded that exported liquefied fracked gas is the marginal cost source on the world market. **Why has FERC not analyzed the export strategy?** Instead FERC approves unneeded LNG terminals such as Cove Point and dangerous salt cavern projects such as Seneca Lake!

In my opinion FERC and the public policy that is so dependent on fracking and gas overlooks the big picture. In so doing, our government is putting the energy security of our country at risk. To put energy security at risk is to put economic security at risk.

RELIABLE FRACKED GAS MODEL INDESPENSABLE TO SOUND ENERGY POLICY

The Massachusetts Attorney General's Office (AGO) is leading a regional study of needs and alternatives. The key to a reliable study whether it be done by the AGO, FERC or States' departments of energy resources is to use a reliable fracked gas cost model. This would be a gas model that includes what are sometimes euphemistically referred to as "externalities", also called "life cycle costs". I prefer to call them "**all of the costs transferred to society**". These costs are subsequently discussed qualitatively.

To arrive at a reliable regional long-term strategic plan quantification should be an input. The IMF has provided a study format (31). **For the United States in 2015, total fossil fuel subsidies have been calculated in post-tax dollars as \$699.18 B, equivalent to 3.824% of GDP, equivalent to \$2,176.53 per capita**. See also reference (38). It's necessary to input accurate comprehensive fracked gas costs into the model used for all studies used to define future energy policy.

It is their life cycle costs that are driving us away from coal and oil. We cannot allow ourselves to ignore these costs for fracked gas and build gas-fired plants. Otherwise, **we will** worsen the current situation and create a dire situation for younger and future generations.

Burning fracked gas is worse than burning coal from a greenhouse house gas (GHG) emissions consideration. From a toxicological viewpoint, one set of contaminants replaces another. Worse we are methodically distributing these contaminants into our water, air and soil. What madness! The public policy based on a bad law, the Halliburton loophole, is a tragic failure.

REGIONAL STRATEGIC ENERGY PLAN

The Massachusetts' AGO's study will help define the regional path forward with regard to energy (6) (7). While there has been a dearth of strategic thinking up to now, this study offers the hope of a sane path forward. The Low Demand Study issued in early January has been dismissed as not applicable.

USE EXISTING LNG IMPORT CAPACITY TO BRIDGE TO EE AND RE

My opinions can be succinctly stated, as follows. The LNG import facilities that are integral to the Algon-

quin system have served well to satisfy peak needs (8, 49), and can continue to do so provided that ISO-NE continues to include this flexibility in their winter reliability program, as was done this past season. Any justified minor debottlenecks should be implemented as a matter of normal business practices.

The region should continue to use this flexibility to implement a longer-term plan that meets the objectives set out in the AGO study outline. The decrease in crude oil prices widens the window of opportunity.

As the next logical step in our energy policy I favor both utility scale and distributed projects in solar and wind, both onshore and offshore. The unique opportunities in large-scale hydro sound interesting. The highly profitable energy efficiency strategy has significant potential to reduce future energy demand, to provide clean, local, reliable jobs and to stimulate the regional economy. Certainly, resiliency and security are integral components to a viable plan.

The lowest cost energy source in the US today is onshore wind. Advances in the manufacture of solar panels are driving costs down rapidly (3); solar PV costs should match those of onshore wind by about the end of 2016. Meanwhile Tesla is reported to be making advances in battery storage technology (3). The future is upon us.

As overall energy demand is reduced by energy efficiency programs and as more energy is generated from renewables, gas supplies from generation would be released for other uses, should some users such as LDCs wish to use them.

There are those who say that renewables will not serve mankind's needs forever (25). This is a valid point. I suggest that **we view renewable sources of energy as the bridge towards the next generation of energy.** This document is not the venue to discuss innovative technologies; but, there will be alternatives to both fossils and renewables available to us longer term.

CASE AGAINST FRACKED GAS INFRASTRUCTURE

The case against fracked gas and infrastructure including the NED is elementary and comprehensive. It is at the expense of public safety, public health, private and public property, economic livelihood and stable climate. And, we do not need it, and further it represents yet another shift of wealth in the wrong direction. What we do need now is to fix gas leaks and to invest heavily in energy efficiency projects and renewables' sources.

PUBLIC SAFETY

As part of the deregulated environment, corporations are allowed to write their own rules. Recall what this policy brought to us in the BP Gulf of Mexico spill.

The net result of this is that all pipelines are buried just 36 inches deep irrespective of the depth of the extreme frost zone. In rural areas, these companies allow themselves to use the cheapest pipe, i.e. the thinnest pipe, and to space the shut-off valves, used in the event of a breach, as much as 10-12 miles apart. When there is a breach, it's necessary to vent to the atmosphere more than the equivalent amount of inventory, as it takes time for the valves to be closed. If the release is ignited, the resulting explosion and fire would be spectacular and devastating.

PHMSA, a division of the DOT, compiles self-reported industry data (9). The average for the 9- year and 9-month period ending September 30, 2014 shows a significant incident rate of about 1 per week for gas transmission lines. For all pipelines, gas and liquid, transmission and distribution, the average is 4.5 per week. This rate is significantly higher than the prior ten-year period, as are damages from such incidents. Clearly, the pipeline industry in its current unregulated state is out of control, and DOT seems impotent to influence safety and left only to reporting. See Reference (42).

KINDER MORGAN TRACK RECORD IS POOR

It's worthwhile to remember that the Northeast Energy Direct project is being directed by Kinder Morgan, the parent of Tennessee Gas Pipeline Company. KMI's track record in environmental and regulatory matters has been documented in the press. It is an understatement to describe it as poor. The company has been con-

victed of felony charges and agreed to settle disputes regarding labor laws. A partial summary of their track record has been documented in reference (5), as follows:

Quote ... Kinder Morgan's safety record is far from stellar, both in our region and elsewhere. Residents of Sandisfield experienced a terrifying incident in 1981 when a boulder dislodged by blasting ruptured an existing pipeline, leading to a major gas leak and evacuation of hundreds of residents. As one Sandisfield resident wrote in the April 2014 Sandisfield Times:

“During blasting... a huge boulder flew into the air and landed on the operating first line, which was ruptured! At 760 PSI, a volcano of natural gas shot into the atmosphere. A crewmember told a reporter that if that gas had ignited, “it would have been like an atomic bomb.”... Families in north Sandisfield, Tolland, and Otis were evacuated. We were told to run for our lives leaving behind everything, including farm animals. Later, probably in the 1990s, TGP approached us to ask permission to install a “cathodic protection unit”... We were told that this measure was necessary because errors in the installation of the initial pipeline caused frost-heaving rocks to rub against the pipe.”

The pipelines proposed by KM will transport fracked gas at 1,450 psi, and therefore ruptures and explosions of these high-pressure pipelines would result in accidents of significantly higher magnitude.

One would be naïve to expect an accident never to happen. However, leaks, ruptures or explosions are all scenarios that happen regularly on similar high-pressure pipelines throughout the country.[1] According to reports from the U.S. Dept. of Transportation's Pipelines and Hazardous Materials Safety Administration (PHMSA) compiled on Wikipedia's Kinder Morgan page[2], throughout the U.S. since 2003, Kinder Morgan and its subsidiaries' pipelines have been responsible for at least 180 spills, evacuations, explosions, fires, and fatalities in 24 states.[3] The details of these events are horrific, and are certainly not scenarios we wish to see reenacted in the Berkshires.

In 2009, Kinder Morgan was cited by the PHMSA for violating safety standards regarding the distance between a natural gas pipeline and a “high consequence area” such as a school or hospital; the pipeline was too close for safe operation in case of a leak.[4]

In 2011, PHMSA cited Kinder Morgan for the following safety violations:

- Failing to maintain update maps showing pipeline locations,
- Failing to test pipeline safety devices,
- Failing to maintain proper firefighting equipment,
- Failing to inspect its pipelines as required, and
- Failing to adequately monitor pipes' corrosion levels.[5]

In 2013, the headline “Wall Street Worries about Kinder Morgan's Safety Record: BC pipeline operator slashes and defers maintenance spending” (referring to KMI operations in British Columbia) was a concern to anyone who lived or worked near a Kinder Morgan pipeline.[6]

The Wall Street Journal asked, “Is Kinder Morgan Scrimping on its Pipelines?” after an investment analyst charged the company with starving its pipelines of routine maintenance spending in order to return more cash to investors.[7] Deferred maintenance may account for the high number of Kinder Morgan pipeline accidents in the last decade.

Close examination of PHMSA's incident reports for Kinder Morgan's onshore gas transmission pipelines shows that faulty infrastructure causes 45% of onshore gas transmission pipeline significant leaks. Failure of the pipe, a cracked weld, and faulty pipeline equipment together account for 28.3% of pipeline leaks, and corrosion of the pipe causes 16.8%.[8]

Unquote. In my opinion, KMI is not the kind of company that we want to operate in New England and New York.

PRIVATE AND PUBLIC PROPERTY AND ECONOMIC LIVELIHOOD

Research has shown that, compared to neighborhoods with similar housing and demographic characteristics, neighborhoods within two miles of power plants experienced 3 to 7% decreases in housing values and rents with evidence of larger decreases within one mile and for large capacity plants (45).

The effect on values in proximity to compressor stations are much higher. For example, Homeowners living near the Millennium Pipeline Company's 15,000 horsepower compressor station on Hungry Hill Road in Hancock, New York have seen the value of their homes decline by as much as 50 percent since the industrial facility was constructed in the midst of what used to be a quiet, rural community (50).

The pipeline companies in the process that is set forth for them by FERC seek to receive a certificate of public convenience and necessity. With this and the various State permits, they are given the right of eminent domain. So, private citizens face losing the use of a part of their property. For this, they receive a modest one-time payment. Property values can be wiped out. The stigma effect decreases valuations of neighboring properties.

In a recent court case, a landowner was awarded a total of \$2.1 million for an easement that had been originally valued at \$79,979. The jury revalued the easement to \$282,500 and added an additional \$1,350,410 for diminishment of the remaining property value (51).

In addition, depending on whether they granted the easement they may also have liability. An industry consultant points out that pipelines are not usually mentioned as a hazard in homeowners' policies. That implies lack of coverage.

And, there may be jeopardy to one's mortgage. Fine print in some mortgagor paperwork requires a homeowner to inform them should a pipeline enter the picture.

Here in Massachusetts (MA), the proposed Kinder Morgan/Tennessee Gas Pipeline Northeast Energy Direct (NED) project would cross many miles of state conservation land, protected by MA Constitution, Article 97, put aside for future generations to enjoy.

Tourism, the arts, second home ownership and dependent businesses make up an important part of New England's economy. These activities are threatened by this fracked gas mania. Small scale agriculture, often organic in nature, is attracting many young people as a livelihood. Farmers' livelihood and our food supply is jeopardized by the specter of a toxic ecosystem and climate disruption.

PUBLIC HEALTH

Incredible decisions by FERC and the pipeline industry impact public health:

- To permit the construction of compressor stations and other pipeline infrastructure in the midst of population centers and, thereby, expose the populace to a constant dosage of radioactive and toxic chemicals.
- To ignore the distribution of these radioactive and toxic chemicals through the burner tip of the kitchen cooker and basement heater.
- To create **sacrifice zones** at the sources of the shale gas that deny our species and other life the basics of clear air, clean water and safe drinking water is unethical, uncivilized and criminal in nature.

Sacrifice zones are already growing around compressor stations, and, if this policy is left unchecked they will eventually extend over the entire ecosystem. The continuous emissions will become integral to our ecosystem.

Fracking has already spread to every part of our country including MA and NE. The concentration of fracked gas in our gas distribution systems has grown to about 40% nationally, and to about 60% here in New England.

- Compressor stations are sources of many releases of fracked gas either through purposeful releases such as "blowdowns" or accidental releases, such as releases from valves and gaskets weakened by corrosion and thermal stress. **The Interstate Natural Gas Association of America lists 21 sources of fugitive gas leaks including metering stations and pigging operations (10).**

- Gas turbines drive most of the compressors used; these run at varying degrees of inefficiency; 40% is considered to be a “high” efficiency for the 30,000 HP Titan 250 turbine/compressor systems that are currently favored by the pipeline industry for huge projects such as the Kinder Morgan NED. Smaller compressors have lower efficiency. Low efficiency results in significant quantities of energy being released to the atmosphere that is paid for by the consumer. Other releases include c2 to c4 hydrocarbons and products of combustion such as carbon monoxide, carbon dioxide, formaldehyde, sulfur oxides, and vast amounts of nitrous oxides.
- **The proposed NED project as currently envisioned will emit hundreds of tons per year of radioactive and toxic chemicals, emissions that a Kinder Morgan manager called “air” in a Richmond “information” session (37).** Nitrous oxide and sulfur oxide both cause adverse respiratory ailments and increased asthma symptoms. Formaldehyde causes eye and nose irritations, and is considered a carcinogen. There are many mechanisms for its formation.

It is the likely cause of nose bleeds experienced by children living near the Minisink compressor station. In a small study of 20 children from 10 families, 6 children were found to be suffering from nose bleeds (11). 7 of the 10 families have now moved, and many other families are trying to do so; these citizens are not being compensated for having their lives turned upside-down. A continuing citizen-lead study is encountering resistance (36).

Citizens living near compressor stations have repeatedly exhibited acute symptoms such as nose bleeds, sore throats, rashes, headaches, dizziness, nausea, depression, drowsiness, irregular heartbeat and the list goes on. Children and the elderly are especially vulnerable, as are people suffering from COPD and other respiratory ailments (24). A friend who lives in proximity to the Southeast Compressor Station in West Chester County has had her health negatively impacted and her life put at risk. Spectra refuses to provide notification of the regular unscheduled blowdowns (39).

Wilma Subra reports that 90% of individuals living and working within 2-3 miles of compressor stations report experiencing odor events and health impacts (12). Wilma is a MacArthur fellow and held positions in the EPA National Advisor Council for two decades.

Also released are residual fracking chemicals (so-called VOCs or volatile organic compounds), which are unburned in the process. These chemicals are known carcinogens such as benzene and naphthalene, neurotoxins such as toluene, ethylbenzene and xylenes, and endocrine disruptors. Dozens of chemicals have been detected in fracking fluids, in the drilling fields and around compressor stations. Dr. Carpenter and his colleagues have also documented the presence of these chemicals in one of the earliest peer-reviewed studies (13).

Chronic health effects are numerous and dire, if not deadly. 61% of health impacts are associated with chemicals present in the air in excess of Short and Long Term Health Screening Levels as reported by Wilma Subra.

Their synergistic effects with other compounds, resulting in increased toxicity, have neither been studied nor addressed in the regulatory process. For example, ground level ozone, produced by the interaction of nitrous oxide and VOCs, impacts the respiratory system, lung function and cardiovascular system, and reduces crop yields by as much as 30% (14).

There have now been upwards of 600 peer-reviewed studies that document the presence of toxic chemicals and adverse health effects in proximity to the drilling fields. Mutagenic, teratogenic and carcinogenic effects are being documented (35). Remember Love Canal.

Medical professionals in Pennsylvania and Texas have been hit with gag orders.

The fracking companies have hidden behind the exemptions and refused to identify the chemicals they use. In a recent court case, the Department of the Interior was ruled against in their suit to force disclosure (33). The “Frac Act” that would have forced disclosure and other procedures is lying dormant in committee (34). Why the big secret ... EPA, FERC, Congress, Gas Industry, Independent

Petroleum Association of America?

Hydrogeologists have opined that fracking technology that uses upwards of 500 chemicals does not make sense. The number of fracking related chemicals is staggering, about 750 according to the Congressional report. Personally, I find it implausible that HVHF constitutes a studied coherent ‘technology’ as has been touted. Imagine the logistics of preparing a cocktail with hundreds of chemicals, and then adjusting it as “produced water” is used instead of fresh.

Further, there is hearsay and speculation that unscrupulous companies may use their exemptions to hide the practice of injecting toxic chemical waste, and, perhaps, are paid to dispose of hazardous materials from other industries. Personally, I find such speculation plausible when I recall various Superfund sites. I live a few miles from the GE PCB Superfund site in Pittsfield, MA. Citizen groups, the EPA, FERC and the States’ departments of environmental conservation and public health need to do vigilant investigative and monitoring work on all of this.

Clearly our water resources are at risk and in many instances have already been poisoned. In my opinion it is also likely that the VOCs emitted by compressor stations contain trace quantities of both naturally occurring and man-made toxic chemicals from HVHF. Trace quantities add up to thousands of tons per year.

Further sources of toxic materials result from use of lubricants and corrosion inhibitors. Corrosion inhibitors are injected to scavenge for hydrogen sulfide. Pigging operations discharge sludge created from this. Such sludge would most likely also contain highly radioactive compounds, as well as heavy metals. Condensate from compressor stations also contains these chemicals. Is handling and disposition of sludge and condensate monitored?

PCBs are present in the Algonquin pipeline system, presumably only from historic use (32). This system is PCB-regulated. Due to the interactions of pipelines in the complex NE transmission and distribution systems, FERC should investigate whether the NED is at risk of contamination.

- Compressor stations are also sources of noise and light pollution. Noise levels often exceed OSHA guides for safety; decibels levels exceeding 90 have been measured at the fence-line. This in combination with 24-7 lighting interferes with routine human living practices. Compressor stations are an obnoxious neighbor and can destroy the quality of life of people in their vicinity.
- Radon is a component of shale gas. Radon concentration in Marcellus shale gas is significantly higher than in gas from all other shale deposits. The radium content of Marcellus shale measures about 3.5 times higher than the US average. Radon is the progeny of radium.

Radon has a short half-life (about 3.8 days), long enough to be emitted as airborne releases in the transmission and distribution pipeline systems. It is the second leading cause of lung cancer in the U.S. – the first cause for non-smokers (16).

When Radon decays, it decays to and is precipitated as Polonium, a deadly radioactive element with a half-life of about 6 months. When Polonium decays, its progeny is lead. We are well aware of the hazards of lead in the environment. Laws are in effect which regulate lead in gasoline and paint. The final dispositions of these compounds have not been studied.

In addition, radium can form other radioactive compounds that have a long half-life, measured in decades or longer. It is supposed that such radioactive solids accumulate as part of the sludge that is removed in pigging. Their disposition has likewise not been studied. Laws are in effect that regulate releases of radioactive materials to air and the environment. In May a study was published that shows high radioactivity in fracking waste water.

- Given the enormous quantities of fracked gas containing VOCs, products of combustion, and radioactive materials that are released to the atmosphere by compressor station and other operations, it is highly likely that these toxic materials would accumulate in water bodies and ground water. Humans, fish, birds and other wildlife would be endangered. The safeness of drinking water would be jeopardized.

dized. The maintenance of organic-type farming is highly problematical. Kinder Morgan has stated that their expectation for the NED is that, ultimately, compressor stations could be 20 miles apart (20)!

- Natural and fracked gas is piped into large population centers where distribution systems may be 60-70 years old (15). Consequently, leaks of methane and all of its contaminants abound. This same fracked gas also exits the burner tips of cooking stoves and heating units in the homes of residents at the receiving end of the pipeline infrastructure. This will increase health care costs and reduce quality of lives, as well as life expectancy.

The States' Departments of Environmental Conservation and Public Health do not test for any emissions including of these compounds, relying on "data" provided by industry operators in their own self-reporting. Industry operators serve their own interests with no regulatory oversight. They just estimate nitrous oxide and a few other emissions based on throughput.

New York State's (NYS) Department of Health (DOH) concluded "Until the science provides sufficient information to determine the level of risk to public health from HVHF to all New Yorkers and whether the risks can be managed, DOH recommends that HVHF should not proceed in NYS." (19)

I believe that this exact statement can be made and position taken relative to the effects of fracked gas pipeline infrastructures. We should cease building them.

Medical professionals have a similar view. The American Medical Association has called for a freeze on issuing infrastructure permits until an official Health Impact Assessment is conducted on the full life cycle of shale gas development. And a Medical Society of the State of New York (MSSNY) Resolution calls for governmental assessment of health and environmental harms and risks from pipelines (39) (40). Concerned Health Professionals of New York and Physicians for Social Responsibility have expressed a similar view in a recent letter to Governor Cuomo (41).

METHANE EMISSIONS ARE VAST AND NOT ACCOUNTED FOR

- The public policy of replacing coal and heating oils with fracked gas was developed with the intent of reducing carbon dioxide emissions and other contaminants. The policy has proved to be a complete and tragic failure. By doing so, we are actually accelerating global climate change because of the vast quantities of methane being released to the atmosphere when fracked gas is extracted, transported, and stored. We are replacing one set of toxic contaminants with another set of toxic contaminants. Burning fracked gas will prove to be more detrimental than burning coal.
- Methane is the main component of natural and fracked gas. Methane is a far more potent contributor to the greenhouse gas (GHG) effect than carbon dioxide on the order of 70-86 times more potent over 25 years, 25-32 times over 100 years, and 5 times over 500 years.
- Methane is leaked throughout the entire process of drilling wells, hydro fracturing, and gathering, processing, transporting, and distributing fracked gas to end uses. The liquefaction and shipment of natural and fracked gas releases further significant quantities, as gas is purposely vented in order to cool the remaining inventory.
- Many fracking wells are poorly constructed and maintained. Almost all wells leak and/or will leak methane from a 'low' level of 3% to a high level of 20+%. Many wells that have been taken out of production in Pennsylvania and also in Colorado are being left uncapped and continue to vent methane into the atmosphere.
- In addition, the vibrations from the drilling and fracking processes loosen the earth around the well-head hole; these fissures provide further routes for methane leakage.
- DPU has commissioned its own exhaustive study of LAUF gas (29) and is well aware of Senator Markey's study of gas leaks in MA (17) and Harvard's in the greater Boston area. Also, consider reference (18), "A Bridge Too Far, The Climate Case against Natural Gas in MA".

- Let us recall that nitrous oxide is a very potent GHG, 298 times carbon dioxide, staying in the atmosphere for 114 years (27).

The gas model has grossly underestimated the contribution to GHG emissions from the wellhead to the burner tip. Leaks abound. The subject of lost and unaccounted for (LAUF) gas could fill several pages. Why have FERC in conjunction with the EPA not adequately addressed this critical issue?

CLIMATE DISRUPTION:

To ignore the realities of climate disruption, caused by the enormous releases of methane and nitrous oxide from this fracked gas mania, especially on younger and future generations is careless, negligent and a potentially fatal act to the species.

To ignore the real and enormous benefits to economic activity and job creation by fixing gas leaks and by investing in energy efficiency and renewable sources is totally inexcusable.

REALITY OF GLOBAL CLIMATE CHANGE REPORTED

Two reports were issued in 2014 that confirm the reality of global climate change. The World Bank study ranks 136 cities likely to experience damage by flooding. In the top 10 were 5 US cities: Miami is ranked #2, New York #3, New Orleans #4, Tampa #7, and Boston #8. **Aggregate world-wide damages from rising sea levels could climb to \$1 trillion per year by 2050. Damages from other manifestations of climate change such as droughts, wild fires, violent storms, etc., are not included in this estimate. Nor has the toll on life, human and otherwise, been described.**

The United Nations study concludes that climate change is irreversible.

Just weeks after the largest climate mobilization ever, the People's Climate March in September 2014, the world's two biggest polluters at that time -- the United States and China -- announced their most ambitious climate action yet.

The **Clean Power Plan**, released in August 2015, by President Obama and EPA Administrator Gina McCarthy **mandated steep reductions in GHG emissions from U.S. power plants.** A combination of provisions changed from the draft plan issued last year provide an incentive for States to favorably implement renewable energy programs over fracked gas power plants. **This plan does not allow new gas-fired power plants, defined as any with a construction start-date after January 8, 2014, to qualify as a means to comply with this new law aimed to address global warming pollution.**

It's time for FERC, ISO-NE and the NE States, to integrate the realities and implications of climate disruption into their decision making.

FERC

FERC acts with powers taken from the Federal Power Act and the Natural Gas Act. You take from this the power to regulate prices and infrastructure. **You are required to comply with NEPA, the National Environmental Protection Act.**

FERC'S JURISDICTION IS LEGALLY CHALLENGABLE

The Natural Gas Act does not include fracking and fracked gas. The process of extraction, the resulting product and the environmental effects are quite different and distinguishable from those for conventional natural gas.

Commissioner LaFleur's comment to the Washington Press to the effect that FERC is not the EPA supports my belief. FERC is not empowered to regulate the environment. By proliferating infrastructure **FERC IS regulating the environment, albeit in a disastrously negative way.**

FERC should recuse itself from further decisions on pipeline infrastructures on this basis alone.

THERE IS NO NEED FOR THE NED

New England has met its needs by using the existing LNG import capacity and can continue to do so (4, 49). Meanwhile energy efficiency and renewables investments are steadily decreasing energy demand. This will release gas pipeline capacity for LDCs.

The new cost paradigm makes onshore wind and solar PV less costly than fracked gas.

The US is a net importer of LNG. Exported liquefied fracked gas is the marginal cost source on the world market.

Investing in gas pipelines now would be a gross misallocation of capital and an insult of the highest order to democracy and to all but the wealthiest citizens who would benefit financially by this further transfer of costs to society.

FERC'S MOST EFFICIENT ACTION WOULD BE TO CANCEL THIS PROJECT NOW

By cancelling the ill-conceived NED proposal now FERC would save FERC, KMI, hundreds of environmental protection and grass roots organizations and thousands of citizen-activists years of time, manpower and funds.

Should FERC continue the dance, it must comply with Court decisions and NEPA.

SEGMENTATION

The June 6, 2014 D.C. Court of Appeals faulted FERC (28) for allowing the use of segmentation by pipeline companies. This is the process by which they purposely progress a big project in so-called "small" increments, sometimes taking the position that the impact is small and, therefore, requires only an EA, an Economic Assessment, rather than an EIS. Sometimes, the pipeline companies ask for an expedited review that would require no environmental study. Kinder Morgan had the audacity to do so on the so-called Connecticut Expansion Project, CP14-529, an illegal segment of their originally proposed Northeast Expansion Project.

Kinder Morgan has recently decreased the size of the NED by eliminating a couple of laterals, reducing the diameter from 36" to 30" and staging their compressor stations. Simultaneously, their Public Relations Manager has warned that the decrease could be temporary. KMI seems to taking a cue from gas industry lobbyists and consultants that the NED is a "scalable" project. To me this is a code phrase for segmentable. Further, last year their Project Manager stated that the NED could have compressor stations every 20 miles (20).

According to the D.C. Circuit ruling, FERC should require a complete EIS for the potential project scope.

NEPA REQUIRES ALL AND CUMULATIVE ENVIRONMENTAL EFFECTS FROM THE WELL-HEAD TO THE DISTRIBUTION POINTS OVER THE LIFE OF THE PROJECT

Though FERC may not be the EPA, it is subject to NEPA. The EIS should include the following costs that the NED proposal would transfer to society:

- o Total methane, nitrous oxide and other GHGs released to the atmosphere;
 - The impact of this amount on global climate disruption
 - The cost to recover from and remediate this impact
- o Total amount of carcinogens, neurotoxins, endocrine disruptors and all other toxins by identity of chemical compounds;
 - The total costs of the adherent effect on public health in deaths, illnesses, healthcare costs, lost work time and related social costs
- o Total costs of environmental consequences due to losses in economic activity, damages to ecosystems, water sources, farms and food supply
- o Total ecosystem capital used and, therefore, unavailable for future generations

- o Total decreases in real estate values to citizens, communities and the States
- o Total damages to community infrastructure

FERC must also consider the cumulative impacts of related pipeline proposals.

FERC should refer to the foregoing discussions and References (31) and (38) to start the calculation.

FERC PROCEDURES ARE NEGLIGENT

After studying FERC's procedures I have come to the conclusion that FERC along with the industries that it serves have been negligent, and, perhaps, criminally so, in many aspects of how it progresses proposed projects.

There are engineering improvements that could be made to the design of these infrastructures that would reduce the impact on human and other life; these have been totally ignored by FERC and the industry. **Your joint optimum has been the lowest direct cost at the greatest expense to society. Change your methods. FERC must include the No-Build Option in their methodology.**

THE ALTERNATIVE IS CLEAN, RENEWABLE ENERGY, THE NEW ECONOMY AND JOB GROWTH

Should there be any doubt that **such sweet alternatives exist**, I will just summarize this subject here.

- A GIS-based study, geographical information study, assembled by the Frontier Group focused on renewable energy (RE) sources from solar and wind. The objective was to determine the glaring and large sources of renewable energy (21).

The result is stunning. **New England can meet its energy needs multiple times over:** Maine by a factor of 153 just via Offshore Wind, MA by a factor of 16 via Rooftop PV, Other Solar and Wind and CT by a factor of 1.8 via solar PV and offshore wind. **Overall, the NE factor is over 200!**

Third party studies not GIS-based including a wind study by ISO-NE conclude that high RE scenarios are achievable. This is with existing technology and at reasonable cost. Needless, to say, barriers exist and trade-offs would be required. The decisions we make now will determine when we get there.

- PERI, the Political and Economic Research Institute at U Mass completed last year a **very detailed and in-depth study** (22). This resulted in a model for how the US could transition to the NEW Economy to meet 2030 GHG emissions reductions.

The report is over 400 pages long. So, I will again have to cut to the chase.

PERI's Conclusions:

- **“Can we control climate change? Yes**
- **What will it take? Becoming 30% more energy efficient, and using renewables for 22% of our remaining energy need.**
- **What will it cost? \$200 billion per year (1.2% of current GDP).**
- **Who Pays? 25% government, 75% individuals and businesses.**
- **Who benefits? People who live on earth.**
- **What happens to employment? 2.7 million NET new jobs created.**
- **Do we have to go back to a horse-and-buggy economy? No.**

Changing our behaviors will of course improve environmental outcomes. We can continue to have improved standards of living by using energy more wisely.”

And conversion to an energy efficient and renewables based policy will increase job growth and stimulate the economy!

- o For example, PERI's model creates 3.1 times as many NET new jobs than investments in fossil

fuels.

- o Investing in the new economy creates from 3 to 7 times as many NET new jobs than peak jobs in building pipelines, and these jobs are mostly local; they are clean, ethical and steady.
- o Other metrics from PERI's work: investments in wind and solar create about twice the number of jobs per unit of investment than fossil fuels and/or pipelines. The metric for transportation and energy efficiency is +/- 4 times as many.

Here is an alternative presentation of some of the same data, a tabulation that has been reproduced from material provided by the Energy Justice Network, <http://www.energyjustice.net/files/md/PGgasplants.pdf> that shows the following:

Natural (i.e. Fracked) Gas = Fewest Jobs

	Jobs per \$1 million Invested	Jobs per \$1 million output
Mass Transit	22.3	11
Biomass	17.4	7.4
Building Retrofits	16.7	7
Solar	13.7	5.4
Wind	13.3	4.6
Smart Grid	12.5	4.3
Coal	6.9	1.9
Oil	5.2	0.8
“Natural” Gas	5.2	0.8

Unions are leading their membership in the wrong direction. They should partner with climate action advocates to lobby for higher capital allocations towards investments in energy efficiency, transportation and renewable energy sources. And, FERC should be driving this.

Should there be any doubt that we are at a turning point in our energy policy, energy, i.e. fossil, stocks have been steadily declining since June 2014. In the past year, as crude prices have fallen more than 55 percent, the nine biggest Western oil companies have shed a combined \$400 billion in market cap as of about mid-August, according to data pulled by FactSet (26). This trend is likely to continue.

IN CONCLUSION

The KMI/TGP NED is not in the public interest:

- **Gas model excludes significant costs and personal burdens transferred to society;**
- **Demand-pull scenario is a mirage;**
- **Supply-push scenario is rapidly disappearing;**
- **Alternatives are available and attractively priced;**
- **Citizens do not want it!**

By ignoring the big picture FERC is putting our country's energy security at risk. To put energy security at risk is to put economic security at risk.

Again, I ask that FERC cancel further consideration of the NED proposal.

Thank you for the opportunity to comment.

Do not hesitate to contact me with any questions, comments or requests for referenced documents.

Sincerely,

Arnold Piacentini, Pro Se

Arnold Piacentini, BS, MS and PhD in Chemical Engineering

20151015-5173

Mary Tyler-Wall, Temple, NH.

Dear FERC, INSTALLING a compressor station which emits hundreds of thousands of tons of toxins annually in a beautiful rural neighborhood next to an elementary school is a TERRIBLE IDEA. Please require them to install the compressor station in an area already zoned industrial.

Thank you,

Mary Tyler-Wall

20151015-5178

Wendy Drouin, Temple, NH.

Allowing a compressor station emitting hundreds of thousands of tons of toxins annually next to an elementary school is just inconceivable! Something tells me, if your children or grandchildren went to Temple Elementary School, this compressor station and pipeline would not be approved. People's health and livelihoods are at stake. This is not a pipeline for the good of NH it is a pipeline for corporate greed. Eminent domain is supposed to be reserved for public good, not lining private pockets. Between noise, light and air pollution I am not sure how in good conscience say "Sure let's ruin THOSE people's lives. The end does not justify the means.

Thank you for your time and attention to this matter.

Sincerely,

Wendy Drouin

RE: PROPOSED NORTHEAST ENERGY DIRECT (NED) PIPELINE PROJECT, TENNESSEE GAS PIPELINE LLC/KINDER MORGAN (FERC DOCKET NO. PF14-22-000)

Dear Secretary Bose:

We have been following the Kinder Morgan/Tennessee Gas Pipeline proposed project with great interest. On behalf of the Town of Bloomfield, I am writing to request an extension on the October 16th deadline to accept pre-application comments in an effort to determine the answers to a number of questions concerning the pipeline that have yet to be fully answered by Kinder Morgan/Tennessee Gas Pipeline, the pipeline's prospective customers, and state and federal regulatory parties.

Before making a decision on whether to support/support with conditions or oppose/oppose with conditions the installation of the pipeline, the Bloomfield Town Council by unanimous vote felt clarification was needed on a number of issues and that the comment period should be extended. These include:

- The ability of local service providers (Connecticut Natural Gas in Bloomfield) to access additional gas supplies and if so what effect that would have on gas prices in Bloomfield;
- The ability of many Bloomfield residents to have gas delivered to their homes through the expansion of the local gas distribution system if additional gas supplies become available, which many of our residents desire and have advocated for somewhat aggressively within the past year in an effort to lower their energy bills;
- Safety issues concerning both the existing pipeline and the proposed pipeline (specifically Kinder-Morgan's safety record);
- The issues raised by the Hartford Metropolitan District Commission and our water supply (unresolved alternative route location for the pipeline if it is to proceed in a different location);
- Potential impacts on property owned by Bloomfield's Wintonbury Land Trust, the Town of Bloomfield-owned Wintonbury Hills Golf Course, etc.;
- Issues related to property restoration and right-of-way acquisition should the pipeline project proceed;
- The degree to which the additional resources have been promised or contracted for by companies outside the New England area and/or outside the United States;
- The percentage of new resources guaranteed to be available to New England, Connecticut and Bloomfield proposed customers;
- And finally the anticipated "life" of the gas sources providing the additional gas.

I understand there have been several meetings at which time some questions were answered; however, this has only heightened the need for more information before a reasonable, educated position can be taken by the Town. Further, these meetings were held within a short period of time without adequate notice and without input from the elected or appropriate leaders of all affected communities.

Lastly, I am requesting that no regulations be promulgated or published until after the comment period and all our questions are answered.

Sincerely,

Sydney T. Schulman
Mayor - Town of Bloomfield

20151015-5182

Sarah Ganong, New Haven, CT.

Dear FERC,

Drinking water reservoirs need healthy lands around them to filter and protect the water our families use. Clear-cutting and digging a trench 90 feet wide, 5.5 feet deep, and 5.7 miles long through land that protects my drinking water and that of hundreds of thousands of my neighbors is a bad idea! Natural gas pipelines nationwide have suffered alarming failures that pollute water and soil, and put people at risk. Kinder Morgan should find another place for its pipeline—or better yet, invest in renewables and stop wasting money on outdated fossil fuel infrastructure.

Sincerely yours,

Sarah Ganong
Connecticut

20151015-5186

kaela law, nh, NH.

Good Afternoon,

I live in the town of Pelham, NH along the Northeast Energy Direct Pipeline route. Coincidentally I also live along the Merrimack Valley Reliability Project's route. In fact, there is a stake in the ground right at the edge of my 1 acre property delineating the placement of a new transmission tower to hold the overhead wires. Right now I am sitting with a comprehensive paper copy of the Merrimack Valley Reliability Project's maps across my lap and the Northeast Energy Direct's project maps up on my computer screen via the Nashua Regional Planning Commission website. Both maps show a line in the EXACT SAME LOCATIONS. I repeat these maps are telling me that the pipeline and the new series of transmission towers will sit right on top of each other. It can't be both, so which project maps are accurate and which are inaccurate? Please have TGP / Kinder Morgan address the Merrimack Valley Reliability Project in their response to our scoping comments. It is unreasonable to expect the Town of Pelham can prepare accurate scoping comments when we still do not have an accurate picture of where this pipeline will be sited. Given that National Grid has presented before the Conservation Commission and is already working with NHDES on mitigation within our town, the Merrimack Valley Reliability Project's timeline is much further advanced than the Northeast Energy Direct's and so I believe that TGP / Kinder Morgan has failed to show the town of Pelham how it is proposing to site their pipeline around the M.V.R.P. Again, please have TGP / Kinder Morgan address the following in their response to our scoping comments: An updated map showing a more accurate pipeline route through the town of Pelham. Additionally please extend the scoping comment period for the town of Pelham at least 60 days after such time that we have the appropriate maps.

Here is a link that explains the Merrimack Valley Reliability Project. http://www.ma-nhsolution.com/merrimack_valley_reliability_project - At the very least I expect FERC to make a few phone calls to National Grid / Eversource to receive more in depth knowledge about the Merrimack Valley Reliability Project.

Shannon Baxevanis – Stakeholder Relations email: Shannon.baxevanis@nationalgrid.com 781-907-3289

To measure environmental impacts of the Northeast Energy Direct pipeline without factoring in the Merrimack Valley Reliability Project would leave you with an incomplete report, and that will not stand.

Additionally the Northeast Energy Direct Pipeline, as it is being presented to us right now, carves through Pelham's Aquifer Conservation District. Other towns in New Hampshire with Aquifer/Groundwater Conservation District zoning include Winchester, Rindge, Wilton, Milford, Brookline, Hollis, Merrimack, Litchfield, Windham and Pelham. Please have Kinder Morgan address these in their response to our scoping concerns.

20151015-5187

Matthew Cabana, Temple, NH.

To whom it may concern:

I am writing to you on behalf of my family and neighbors in the South West corner of the State of NH.

I have attended all of the scoping meetings to date. I am in awe at the lack of oversight that we have seen with this project to date. This project will tear a scar through untouched wilderness and overrun multiple conservation areas that were to remain untouched for eternity. All this for a project that is designed to export natural gas out of our country. It is an unheard of taking by eminent domain for private use.

Please look closely at the aquifer surrounding the area of the proposed compressor station in New Ipswich, NH. This land already has a documented presence of lead and any disturbance of the soils will affect not only the local wells, but the local water supply for the town of Greenville, NH.

Please also note that this compressor station is located within 1/4 mile of our Elementary School which also doubles as the Towns emergency shelter. Should there be an incident at the compressor station, it would effectively block our emergency services from the rest of our town.

There are so many reasons to say no to this project, it defies belief that it is still being considered. Please use great care and diligence when reviewing this application and strike it down.

Please look at the inequity of opinions for and against this project. Thank you for your time and consideration.

20151015-5189

KAthleen Gauvin, New Ipswich, NH.

WATER SUPPLIES

Most of the towns along the NED have no public water and thus all homeowners and businesses have their own private wells. As private wells depend on aquifers from which to extract their water and in that aquifers can be damaged and contaminated when blasting is done, I request that blasting be eliminated from the planned construction along the NED route.

I would also request that the wells along the pipeline be tested for water quality and quantity pre-construction and post construction. This testing shall be conducted by an independent company and results shall be made public. The wells within 500 feet of construction as well as compressor stations must be tested for water quality and quantity pre-construction and post construction.

In addition I request that prior to permitting an independent hydro geological study be conducted so that aquifers can be identified. Any impact to these aquifers during pipeline construction as well as in the area of compressor stations will be irreversible.

The springs along the pipeline route and compressor stations will undoubtedly be affected as well. These springs are requested to be studied prior and post construction by an independent hydro geologist company. Any impact to these springs during pipeline construction as well as in the area of compressor stations will be irreversible.

Please EXPLICITLY define in your reports how compromised aquifers, private citizen's wells, and municipal reservoirs will be restored as by all research I have conducted and read states that once ruined the water supplies are never reversed.

Once our water supplies are contaminated, it appears that you would offer us water tanks known as pigs. How can you guarantee that this type of water supply would work for us in the winter temperatures that we experience in Massachusetts and New Hampshire?

It is clear that this pipeline project and compressor stations located along the route was plunked down without forethought of our non-typical conditions.

We will not have any benefit from this project that will ruin water supplies. Who will insure that this doesn't

happen? Sadly, I don't see that Kinder Morgan/Tennessee Gas has ANYONE IN MIND but themselves and their profit. TO THINK THAT THIS HAPPENS IN THE UNITED STATES OF AMERICA! FERC, KINDER MORGAN AND TENNESSEE GAS SHOULD BE ASHAMED, BUT CLEARLY THEY HAVE NO SOULS, NO MORALITY, NO THOUGHT FOR THE EVIL THEY CREATE!

20151015-5191

David Johnson, Hamden, CT.

Dear FERC,

Drinking water reservoirs need healthy lands around them to filter and protect the water our families use. Clear-cutting and digging a trench 90 feet wide, 5.5 feet deep, and 5.7 miles long through land that protects my drinking water and that of hundreds of thousands of my neighbors is a bad idea! Natural gas pipelines nationwide have suffered alarming failures that pollute water and soil, and put people at risk. Kinder Morgan should find another place for its pipeline—or better yet, invest in renewables and stop wasting money on outdated fossil fuel infrastructure.

Sincerely yours,

David Johnson

Attilio Qualtieri, Lynnfield, MA.

To: FERC

Re: Tennessee Gas Pipeline, L.L.C (Kinder Morgan Pipeline)

I am writing this letter in strong opposition of the Kinder Morgan/Tennessee Gas pipeline which is aiming to come into the Northeast. Regardless of my own interests or those of my family, neighbors or the environment, this pipeline is just plain wrong in principle and does not meaningfully benefit the people of New England from a supply perspective – and especially as current gas lines are not nearly being used to capacity.

In my opinion (though based on facts), this project is clearly not about providing natural gas to the New England region, as Kinder Morgan suggests. If this were the case, why would the 24” pipeline plan to head from Dracut, MA to the coastline? Kinder Morgan will spin this in whatever way they can, but I ask that diligence be undertaken in approaching this firm, which is led by a former Enron executive (Richard Kinder).

To that end, how can the firm be trusted? Trust is an important consideration in this process, I would assume. Beyond their leadership, they have a very poor performance record with safety and soundness of pipelines. This particular project puts the health and well-being of U.S. citizens at risk and must be weighed accordingly. This is not a small endeavor; this is a major, high-pressure gas pipeline!!

Please look closely and ask important questions of Kinder Morgan. This pipeline is inevitably for export and to pad the pockets of a firm that is already 700-800x the size of my town of Lynnfield, MA, and with a considerable greater degree of influence. If it is not for public use, eminent domain cannot be enacted.

All told, there is no need for a Lynnfield Lateral from Dracut, MA to the shoreline. The lateral only serves the purpose of providing gas to the shoreline to export for cash. It's not for natural gas capacity.

Please place the concerns of myself, my neighbors, our state, our country and our environment ahead of a corporation looking to increase its profit margins.

Sincerely, AJ Qualtieri

20151015-5194

Patricia Lage, New Ipswich, NH.

My name is Patricia Lage and my family moved to New Ipswich, NH in 1987 to be in a quiet, rural area away from noise, pollution and congestion. We chose New Ipswich and the Monadnock area because it had little industry and had historical homes and natural beauty. The NED pipeline and compressor station will ruin New Ipswich and the Monadnock region as we know it. Our home will be within 1 mile of the proposed compressor station and we will be exposed to carcinogens and pollution. Residents of New Ipswich and the surrounding towns rely on private wells and this pipeline puts our water supply at risk. Fumes from blow downs will impact our bodies. Our health will be compromised by the pollution from the compressor station and pipeline. The Temple Elementary School is located within the incineration zone. Should our children be exposed to toxic releases and the possibility of an explosion as they attend school? There are many organic produce and livestock farmers in close proximity to the proposed compressor station and pipeline that will be affected by air, water, noise and light pollution. We have recreational areas such as the Windblown Cross Country Skiing area that will be torn up with this pipeline. Our streams, ponds, lakes and brooks and associated wildlife will be put at risk. We have a very limited economy in New Ipswich and in the surrounding rural towns which depend on the clean air and water and the natural beauty of the area. The NED project has the potential to destroy all of it.

When I first saw signs opposing the pipeline in Groton and Dunstable Massachusetts I said “thank God New Ipswich is not being railroaded with this pipeline”. Now low and behold, the wealthier towns in Massachusetts have fought and pushed this pipeline out of their towns and onto the less wealthier towns in Southern, NH. This is so unfair. We do not have any infrastructure to provide this fracked gas as a heating alternative to our town’s residents and will not benefit from this gas, so why should we be burdened with the pollution and the destruction of our property values to benefit towns and cities that will use gas from this pipeline?

Another issue is the amount of granite ledge which runs thru southern NH. There will have to be much more blasting during construction to put a pipeline thru the Monadnock region. This will have an increased risk to our private wells, our only water supply. Shouldn’t an alternative path be chosen to minimize risk?

Also, we are a small town with a volunteer fire and emergency management department. Our town budget is already strained and property taxes are so high that we cannot increase these services to handle a potential fire or explosion that will be possible if the gas pipeline and compressor station are placed in our town. We do not have the personnel, training, or the equipment to fight a potential catastrophic event. We do not even have 24 hour police coverage in our town. Will Kinder Morgan be responsible to police the compressor station 24/7 to keep a potential terrorist or vandals from wreaking havoc here? Also, we have a limited road network and the path of this pipeline crosses our major roads. If an explosion occurs in the areas of these road crossings we may have no alternative route for travel. We only have a very small hospital in Peterborough, NH which patients will be cut off from if Route 124 is compromised by an explosion.

Please consider how our lives and the lives of our children will be irreparably harmed if this pipeline and compressor station are allowed to be built in our town. Please protect our families from this monster. Just say NO to the NED pipeline!

Thank you for considering our concerns,

Patricia Lage

Re: Tennessee Gas Pipeline, LLC. , Northeast Energy Direct Project; Docket No. PF14-22-000 Scoping Comments

Dear Ms. Bose;

On behalf of The Trustees, please include this addendum with our August 26, 2015 comments on the Notice of Intent to Prepare an Environmental Impact Statement for the Planned Northeast Energy Direct Project (NED). The NED project, as currently proposed, crosses The Trustees 3,200 acre Notchview Reservation in Windsor, MA and a 41,000 horsepower compressor station is proposed nearby. I have attached a view shed analysis for the proposed compressor station which illustrates that a significant portion of our Reservation, which draws over 12,000 visitors per year, is likely to be impacted. The analysis also demonstrates likely impact on adjacent public and private lands.

I request that view shed analyses be required, using tree cover and building and lighting specifics, which are not currently available. I also note that the bulk of visitors to Notchview Reservation, a Nordic ski destination, are in the winter.

Thank you for your consideration.

Sincerely,

Barbara Erickson

re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000

Dear Secretary Bose:

We have not allowed Kinder Morgan to access our property and are sending them a letter officially denying permission. While we understand that FERC would prefer us to have granted permission to survey, we have a number of independent reasons for our decision. They are as follows:

- **The public need for the entire proposed Northeast Energy Direct project and the proposed “Fitchburg Lateral” which would affect our property, has not been demonstrated.**
- A cursory search of public records would show that this is an unsuitable area to cross. Our property, part of the Squannassit Area of Critical Environmental Concern, includes a Priority Habitat of Rare and Endangered species identified by the Natural Heritage and Endangered Species Program, and is part of the BioMap2 Critical Natural Landscapes.
- We have recently submitted a Forest Management Plan to protect the forest land under M.G.L. ch. 61 § 1 et seq. Our forest management plan has gone to great lengths to protect the ecological significance of our land. **There is no way to guarantee that Kinder Morgan would treat the land with the same respect –indeed, we do not see how such a project ever could.**
- **The proposed land surveying risks opening corridors for other trespassers, including ATV and other motorized vehicle traffic. Kinder Morgan appears to make no guarantee that their crews would be mindful and respectful of our wishes to protect our property, and has shown that it cannot be trusted when it comes to mitigation of such risks.** (See, e.g., James O’Neill, Gas Pipeline Left a Barren Swath, BERGEN CTY. RECORD, March 3, 2014, at 101, noting numerous erosion and revegetation problems in a New Jersey Kinder Morgan project; Bob Ortega, Controversy Coming Down the Pipeline, ARIZONA REPUBLIC, May 5, 2014 at A1, noting similar issues with Kinder Morgan pipelines in other parts of the county. The entire energy industry has shown that it cannot keep land protected after installation, especially from ATV traffic. See, e.g., Jeff Clark, The ATV Menace, DOWNEAST MAGAZINE, May 2003, noting that a Portland, Maine utility company has spent over \$100,000 a year to repair ATV damage, but “Wooden gates are chainsawed. Metal gates are torched. [The company has] hired private security firms [and] brought in heavy equipment to build boulder barricades. Without exception ATVers have gone over, around, or through them.”)
- **Finally, we have serious concerns about whether Kinder Morgan is truly interested in mitigating any potential impacts or is only looking to maximize profits.** We asked the land agent and pipeline engineer who visited our neighborhood in late June why Kinder Morgan would not just bring the proposed 12-inch line down the road in the existing roadway rather than cutting a 100-foot wide swath across the forested portions of seven private parcels in an ACEC, crossing mapped protected species habitat, and permanently removing trees atop an esker which provide essential shade to the cold water fishery stream that runs along the base of the esker. The only answer they could give is that they would have to use Class 4 pipe under the roadway, increasing their costs.

I hope FERC now understands why we will not allow Kinder Morgan access to our property. Thank you for the opportunity to share this information with you.

Sincerely,

Carolyn Sellars

Townsend, MA

20151015-5213

Jonathan Crowley, Shelburne Falls,, MA.

I am against the TGP Northeast Energy Direct pipeline. The proposed path would run through some of the states' most sensitive eco-systems including conservation lands, wildlife reserves, state parks as well as farmland, towns and even crossing over or under the Connecticut River.

This project, aside from causing environmental disruption during the construction phase, would post many hazards if there are leaks, ruptures or explosions – all scenarios that happen regularly on similar high-pressure pipelines throughout the country. A large pipeline that runs at high pressure has a large “impact radius“, in which substantial damage to structures is unavoidable.

For this reason, I urge you to stop progress on this proposal.

20151015-5225

Re- Natural Gas Expansion Plan

The Winton bury Land Trust (WLT) attended the Kinder Morgan Information session concerning the proposed Tennessee Gas Pipeline Project running through our Speer Preserve in Bloomfield.

The WLT recognizes the need to provide adequate gas demand in our region, and at first commended the efforts of Kinder Morgan to share some of the existing gas ROW where the proposed pipeline will run parallel to the existing pipe. Then we were told they will require an additional 35' ROW adjacent to their existing 30' ROW at the Speer Preserve.

This is where the Land taking proposal begins to break down. The original pipe was installed in a 30' ROW, yet an adjacent new pipe will require not 20 additional feet but 35', so where is the shared ROW? Add to this, they further informed us a lay down area of an additional 40' is required, clear cutting our forest for the entire 390' length of the preserve.

They tell us a tree replacement program will be instituted, but we have to believe only young saplings will be planted where 150' yr. Old hardwoods now stand, leaving the Land Trust with a de-faced forest, additional stewardship, and severe invasive species battles for years to come.

In summary of our understanding of the total impact of land taking for this proposed pipeline, the WLT will end up with a clear cut swath through our preserve of 75'+ the existing ROW of 30', totaling 105' across by 390 feet long.

We urge the PURA to consider imposing much stricter land taking criteria if this pipeline project is approved as a necessary public utility.

Thank You for your consideration,

Dale Bertoldi,

President, Wintonbury Land Trust

20151015-5226

shannon johnson, averill park, NY.

Dear FERC,

Please conduct a LONG TERM double-blind, non-partisan, study with scientists NOT directly working for

the energy industry on all health effects -- to humans and the entire ecosystem -- of a compressor station on inhabitants within a 10 mile radius of pipelines and especially a compressor station.

Please do not grant license to TNGP / Kinder Morgan to build a 41K HP compressor station until these studies are concluded and it has been proven beyond any reasonable doubt that there will be NO health effects of compressor stations and/or pipelines on our landscape and all inhabitants.

Please review these materials https://youtu.be/RPyXaAwHM_8 and <http://is.gd/NWFjAr> and base your long-term studies on these concerns and findings.

Thank you,
shannon johnson

Re: Docket No. PF14-22, TGP Northeast Energy Direct

Dear Secretary Bose:

Senator Rosenberg, first and foremost, I want to thank you for representing us at FERC and hearing our comments for the scope of the Environmental Impact Study tonight. I have already submitted written comments to FERC and gave oral presentations at 2 other FERC scoping sessions. I've also submitted oral and written comments to the Energy Facilities Siting Board. In essence they have all had the same theme which can be summarized as follows;

- Studies have clearly identified carbon neutral and other renewable or alternative energy solutions that can meet our energy needs instead of a natural gas pipeline.
- Should a natural gas solution be deemed necessary, it can be done with improvements to existing infrastructure or LNG storage.
- Either of these alternatives are clearly less impactful on our environment and serve us better in terms of meeting the goals of our Global Warming Solutions Act.
- Please consider a "No Action" alternative. Natural Gas is not a bridge fuel to renewables. Once we commit to this infrastructure, we're stuck with it while the gas industry rides out their "Boom and Bust" export business. We should be keeping the gas here for our future generations.

I've also commented to FERC on the negative impacts this pipeline will have on landowners. In essence they can be summarized as follows;

- Increased risk to health and safety
- Depreciated property values
- Decreased property resale options
- Increases property liability
- Continued tax liability for land that can't be built on
- Increased energy costs once the gas hits Europe
- The imposed cost of a tariff on our utility bills for building the pipeline
- Loss of future home-business income.

These items can all be clearly defined in terms of their qualitative and quantitative negative impacts. So, I ask that this Environmental Impact Study demonstrate how these negative impacts relate to benefit by con-

ducting a comparative study. In fact, please define benefit. I have not heard any benefit mentioned other than “we need the gas” and “it provides jobs”. And consider please, that these impacts mentioned are just the tip of the iceberg. If such a comparative study is done, it would have to be cumulative and include all the different kinds of impacted landowners like Conservation Land Trusts, Conserved Article 97 Land, and State Forests to name a few.

Also, I’d like to mention how I have been personally impacted so far. I have had to put major life decisions on hold because I don’t know anymore the future outcome or potential of my one and only asset, my home and possibly my future business. I feel like I’ve lost a year and a half of my life while having to learn about this pipeline and stand against it. This time has been sacrificed for things I’d prefer doing like gardening, reading to my grandchildren or focusing on professional development to name a just few. It has been extremely stressful and has truly impacted the quality of my life as well as my health. Tell me Senator Rosenberg, how do you think FERC should quantify this in that study?

Through August, there have been 5,411 comments made to FERC on this NED project. Only 426 of those have been in support of this pipeline. So please, Senator Rosenberg, let FERC know that our country is supposed to be governed by the people and for the people, not by corporate lobbyists and that we the people have spoken.

Thanks you,

Polly Ryan

Plainfield MA, 01070

20151015-5228

Jill Connolly, Temple, NH.

Compressor station emitting hundreds of thousands of tons of toxins annually next to an elementary school is a really bad idea. We live in a rural town so our kids can have clean fresh air. Having this next to our school not only is dangerous for there health but worries me greatly if there is an accident at the compressor station.

20151015-5229

THE EDWARD L. ROSE CONSERVANCY
P. O. Box 8.
Montrose, PA 18801

October 15, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Room 1A
Washington, DC 20426

RE: Tennessee Gas Pipeline Company, L.L.C., Docket # PF14-22-000

Dear Secretary Bose:

The Edward L. Rose Conservancy is a nationally accredited land trust working in northeastern Pennsylvania and the Southern Tier of New York to protect land, conserve natural resources, and preserve scenic beauty. The Conservancy owns property near the proposed Northeast Energy Direct (NED) pipeline corridor in Susquehanna County, Pennsylvania, and also holds conservation easements on private lands in the region.

The NED corridor, as currently proposed, bisects protected lands and ecologically important areas, and fragments intact forest habitats. We urge that every effort be made to avoid placement of new pipeline on permanently protected lands owned by state, federal, or municipal governments, private land trusts, and on private

lands with conservation easements. We also recommend selecting project alternatives that avoid impacts to the habitat of rare, threatened, and endangered species in the area (e.g., the northern long-eared bat), as well as wetlands and water resources, and other sensitive natural features. In addition, we strongly encourage co-locating the pipeline with existing pipelines, roadways, or other disturbed areas to minimize further fragmentation of forests in the region and reduce cumulative impacts to forest habitats and associated species.

Thank you very much for considering these comments.

Sincerely,

Patty Bloomer, President

20151015-5234

Roberta Flashman, Ashby, MA.

Dear Ms. Bose:

Thank you for taking comments on the scope of the Environmental Impact Study to be prepared by Kinder Morgan for their proposed Northeast Energy Direct Project (NED). I am a resident of Ashby, MA and have lived here for over 28 years. I have been a member of the Ashby Conservation Commission for 27 years.

Many others with far more expertise than I have already made comments about the use of fossil fuels and their impact on Climate Change and how this project only continues down that road. Others have commented on the need to study impact of the proposed pipeline on wetlands and streams that it may cross. Still others have commented on the need to study the impact of Compressor noise and light on surrounding wildlife and not so wild life (humans).

What I have not seen suggested for inclusion in the study is the alternate route and all of its resources that could be impacted. The route has been changed from a route through northern Massachusetts towns to a route through southern New Hampshire towns. The reason given for the change in preferred route was a “discovery” of an existing power line right-of-way that paralleled the proposed route through Massachusetts. I suspect that Kinder Morgan/Tennessee Gas Pipeline, LLC thought there might be less local opposition to this route. However, there has been mighty opposition to the New Hampshire route. In addition, although following the route of the power lines, the new route is still on green fields: the pipeline cannot share the cleared right-of-way under the power line.

I request that the FERC open the scope of the Environment Impact Statement to include all wetlands and streams and protected open space in the towns of northern Massachusetts which are situated along the 1st pipeline route. The rationale for this request is my concern that there may be yet another change in the route of the pipeline, back to the original route, which would result in inadequate time for an Environmental Impact Statement to be compiled for these areas.

For the Town of Ashby, these streams include all tributaries to Willard Brook and Trap Falls Brook. Protected lands include Willard Brook State Park, the Lyman property and the Wiita Conservation Area. Additionally, the original route went directly through a very large, significant wetland known as “The Great Swamp”, which is located just to the east of Main St. and just south of the center of town. Another impact that should be studied is the proximity of the pipeline and any associated blasting to the one public water source in town located just behind the Ashby Elementary School. And, lastly, the impact of a 100ft (minimum) swath across the town, wider than any road or power line clearing in town, will have on wildlife and human life, both of which are used to the quiet and relative isolation of a small New England town.

I also join the many commenters in questioning whether a new pipeline is the most permanent or lowest-cost solution to the natural gas energy supply constraints in the northeast, and hope that a rigorous alternatives analysis can answer that question. If the NED project is necessary, I urge FERC to use the Environmental Impact Study to require landscape-level considerations for avoidance (i.e., additional re-routing of the pipeline around the most critical habitats), minimization of environmental impacts through use of best practices, and identification of the most ecologically meaningful compensatory mitigation for impacts that

are unavoidable.

Sincerely,
Roberta Flashman

20151015-5236

Joan Pack, Northfield, MA.

My home sits on land that has been preserved forever as wetlands under the Wetlands Reserve Program (WRP). The land is "...protected, restored and enhanced wetlands.... with the goal of achieving the greatest wetland functions and optimum wildlife habitat on every acre enrolled in WRP."

I care about this land. That's why I bought it, just four months ago. My home has 29 solar panels that provide 90% of the energy I need to live here - in New England, in the Northeast - year round. I do not need fossil fuels to function comfortably. The gentleman who re-built this 1790's house made it energy efficient from the inside out, and he cared for the land such that the wildlife in the area could also live in comfort.

The pipeline and the gas it will carry is not needed here. It is not wanted here. We live a simple life. Our heads are not buried in the sand. Instead they are searching for ways to improve lives without polluting the Earth. It is more than possible.

That is where our human energies should be directed. Alternatives. Clean. Safe. Forward thinking. Long range.

Please, no pipeline, no fracked gas, no KM in Massachusetts.

20151015-5238

michael barrett, Temple, NH.

Dear Mr. Tomasi,

The proposed location of compressor station causes many more substantial health and safety concerns than other locations. The proposed compressor station is too close to an elementary school, Temple's only emergency shelter, a religious facility, endangered horses, an elderly housing complex, and a town's drinking-supply reservoir. The school, emergency shelter (the same facility), the religious center and the reservoir are all located within one half mile or so from the proposed location. The endangered Newfoundland ponies and the elderly housing facilities are about one mile or less from the compressor station. The elderly complex includes disabled adults. In aggregate, the proposed location of the compressor station creates an extremely elevated set of environmental and safety risks that must be mitigated. The proposed environmental assessment by the applicant is incomplete and does not adequately protect the school's students and teachers, the sisters, the elderly, the ponies, or the drinking water. The proposed location is the worst possible location for this area. A relocation of four miles in either direction creates many fewer hazards so the proposed location should be rejected.

Furthermore, the proposed compressor location is a tract of land that borders both route 45 and Hadley Highway which also creates a serious and unique hazard to the residents of Temple. In the event of a mishap, the possibility that the two roads adjacent to the compressor station may be rendered impassable which will result in the physical separation of the Temple Police staff from the Town and delay the rendering of any assistance. The applicant does not mention or include any information that recognizes the Temple Police Station is located in Greenville, NH and that the police staff would have to transit either Route 45 or Hadley Highway to fulfill their duties as Temple's first responders.

Many studies indicate that location of a compressor station located two miles and less from humans, plants and animals creates an unhealthy condition. In order to mitigate the hazard I respectfully request the following:

1. Replace the gas compressors with a set of all-electric compressors, and
2. Ensure all blow-down gasses are captured and not emitted into the surrounding environment,
3. If 1 and 2 above are not acceptable, I request the relocation of the proposed compressor station so that it is at least 4 miles away from any school, any endangered ponies, any religious center, any elderly complexes and any town reservoir. The four miles is a distance that is twice as far measured distance wherein the adverse health effects have been previously documented.

Other considerations

The applicant's environmental assessment irresponsibly appears to be based primarily on the use of desk-top mapping system and the knowledge of an existing power-line route. It ignores and does not adequately address the proximity to the school (and emergency shelter), the religious center, the habitat for some local blanding's turtles, the Newfoundland ponies, the elderly complex, and the reservoir. There are several highways, e.g., Route 2 and I-90, located south of the proposed compressor station which appear to have many areas that can support a compressor station adjacent to them. The careful selection of a compressor station along either of these highways would not threaten any students, elderly complexes, endangered ponies, religious centers, and a town's only drinking-water supply. Alternative locations have not been adequately offered or documented within the applicant's environmental report. Please be advised that the Newfoundland breed has been brought almost to the point of extinction already and there are reportedly less than 250 breeding capable left on earth. This proposed compressor station must be either converted to an all-electric operation or be relocated at least four miles from the aforementioned and existing structures and breads mentioned above.

Finally, the need for the pipeline appears unsubstantiated when one considers the previously approved Algonquin line to supply needed gas to New England. The Algonquin owners indicate that they already serve 70% of New England's electricity generators. Furthermore, the applicant currently lacks any sizable demand from electricity generators. Therefore the construction of another and redundant pipeline, and their associated compressor stations, creates many hazards and associated environmental degradation may be unwarranted. The applicant's apparent lack of thoroughness and demonstrated ignorance of the local environmental impacts is a ground for rejection of the proposed New Ipswich, NH compressor station.

Respectfully Submitted

20151015-5241

Re: Docket No. PF14-22, TGP Northeast Energy Direct

Dear Secretary Bose:

First, I'd like to reiterate that I too feel these scoping hearings are being conducted prematurely, especially in light of Kinder Morgan (KM) having only just released their second 6,500 page resource report which still has over 10,000 To Be Determined (TBD) in it. As a directly impacted landowner on the proposed path, my continual experience to date has been to be under or misinformed of the projects' details, making it very hard to comment effectively this evening on the scope of the Environmental Impact Study (EIS). Please know that I have attended 5 of KMs' open houses, 2 of their presentations and, I've read their first resource report and still don't have answers to questions that concern me.

In terms of the scope of this EIS, I'd like you to please conduct an objective study, meaning one not funded by the gas industry, using established reproducible scientific methods to determine the cumulative methane emissions the entire US gas industry will produce over the next ten years and determine the impact of these emissions on global warming. To evaluate this properly, you'd have to first determine the amount of natural

gas available for extraction in the shale regions and then how much of it is anticipated to be drilled over this ten year period. Clearly, one cannot debate that the extracted gas's inevitable destination will be in our atmosphere regardless of whether those emissions occur here or in Europe.

The reason I am requesting this research is because scientist have determined that methane is 84 times more potent a greenhouse gas than carbon dioxide over a 20 year span (1). And according to the Union of Concerned Scientist who published the Climate Deception Dossiers, there has been "a coordinated campaign underwritten by the world's major fossil fuel companies and their allies to spread climate misinformation and block climate action" (2). I'm also requesting that this study get peer reviewed and then published so we can see the data. And, until it's available to us, I suggest a moratorium on all FERC permits for any new gas infrastructure.

While the moratorium is in effect, the gas industry should be required to do repairs to existing infrastructure so there is no more gas is lost in transmission. According to the Environmental Defense Fund enough natural gas is lost each year to fuel 6 million homes. This is the equivalent annual emissions of 117 million cars or roughly half the cars in the United States (1).

It's time for FERC to reveal the science on this subject before we are all FERC'ing fracked.

Thank you for this consideration. Polly Ryan, 11 Windsor Avenue, Plainfield MA

Re: Docket No. PF14-22, TGP Northeast Energy Direct and the Scope of the Environmental Impact Study

Dear Secretary Bose:

These written comments are being submitted to more fully address the oral comments I made at the scoping meeting held in Pittsfield MA on July 28th, 2015.

My objective is to make a case for the study proposed in those comments concerning the cumulative effects of methane emissions over the next 10 years from the entire US gas industry on global warming.

The gas industry is responsible for 40% of methane emissions in the US (1, 2). Methane is 84 times more potent a gas than CO₂ over a 20 year period (3, 4). It's an undeniable fact that when gas is extracted from the earth its' ultimate destination is in our atmosphere. If a study were conducted to determine the amount of gas the entire US industry plans to drill over the next 10 years, one could then extrapolate potential methane emissions and correlate that to its' impact on global warming.

According to the Union of Concerned Scientist, the gas industry understands the impact of methane on global warming. These Concerned Scientists published the Climate Deception Dossiers and in it claim there has been "a coordinated campaign underwritten by the world's major fossil fuel companies and their allies to spread climate misinformation and block climate action" (5). Clearly, the gas industry does not have humanity's best interest in mind and prioritizes profits over anyone's wellbeing. However, FERC has a responsibility to evaluate whether projects they permit are for the publics' convenience and necessity. FERC therefore has a responsibility to convey any perceived conveniences and necessities society stands to gain from consuming gas extracted by the industry and quantifiably show how these conveniences and necessi-

ties stand to improve our lives compared to catastrophic climate events that result from global warming. Tara Lohan, who has been writing about energy and the environment for years, comments in her article published by The Nation “The fact that we should be moving to more renewable energy and using less oil is no secret. Scientists have repeatedly warned that if we continue to burn fossil fuels with our current abandon, we risk catastrophic climate impacts, some of which we are already beginning to see. Instead, they caution, much of our oil, gas, and coal reserves should stay in the ground” (6).

Removing oil, gas and coal from the ground at a more measured and slower rate while supplementing our energy needs with alternative renewables ensures our long term energy security for future generations.

Arguments are still being made by some that renewables are not a viable energy solution compared to fossil fuels. Yet countries like Denmark aim to burn no fossil fuels what so ever by 2050. Currently 40% of their electric grid is powered by wind and they expect to be at 50% by 2020. Germany is right behind Denmark in that 30% of their electric generation is from a combination of wind and solar (8).

In the Energy Policy Forum, Deborah Lawrence states that your own agency (FERC) reported in 2015 that “total new generating capacity additions in January and February amounted to 89% renewables, 11% natural gas. March was even stronger with about 94% of new capacity coming from renewables.” (7). FERC obviously cannot deny where our energy market is trending.

The real issue with transitioning to renewable is expressed well by Justin Gillis in a New York Times article where he points out “as more of these types of power sources push their way onto the electric grid, they cause power prices to crash at what used to be the most profitable times of day.

That can render conventional power plants, operating on gas or coal or uranium, uneconomical to run. Yet those plants are needed to supply backup power for times when the wind is not blowing and the sun is not shining”.

Our energy issues are not based on an actual need for fossil fuel or because they are cheaper to consume compared to renewables. Our energy issues are really about reliability. In this capacity, fossil fuels have a role to play in our overall reliance and dependability of the energy portfolio. And tempered as such, considerations as to their impacts on our climate is of vital importance given that a renewables transition will have a much more beneficial outcome where global warming is concerned.

I conclude my oral comment by suggesting a moratorium on all new natural gas infrastructure permits while this study is conducted. We need to determine the cumulative impacts of future drilling on global warming before the gas is extracted from the ground because once extracted it’s inevitable destination is the atmosphere.

I suggest repairs to existing gas infrastructure as a bridge to our energy reliability issues in the meantime. It has been well documented that repairs to existing gas infrastructure would compensate for the gas supplied by new infrastructure. According to the Environmental Defense Fund enough natural gas is lost each year to fuel 6 million homes. This is the equivalent annual emissions of 117 million cars or roughly half the cars in the United States (8). And fixing the leaks will in itself alleviate the global warming crisis by reducing unnecessary methane emissions while saving consumers millions of dollars on wasted unconsumed gas.

Re: Docket No. PF14-22, TGP Northeast Energy Direct

Dear Secretary Bose:

I am an impacted landowner in Plainfield MA on the Northeast Energy Direct Project. The following comments refer to concerns I'd like addressed in the scope of the Environmental Impact Study.

Health Concerns - the following symptoms have been extensively documented by researcher for people exposed to chemical used in the gas fracking operations "burning eyes, sore throats, stomach pain and nausea, headaches, and tingling or numbness in extremities" (1). Air emissions recorded at compressor stations, metering stations, processing plants, and shut off valves have revealed chemicals that are known carcinogens, endocrine inhibitors and, neurotoxins (1).

For the EIS, please conduct a literature review on the compounds researcher have recorded at the above mentioned types of gas infrastructures and a literature review on associated health issues for the stakeholder's reference. Please have TGP conduct initial air and water (wells in addition to all water crossings) quality tests where any infrastructure is proposed along the NED route, including at regular intervals where the pipe is sited. Please have them consider a means for continued monitoring during online operations. Please employ all means possible to minimize gas emissions, noise and light pollution at compressor station, meter stations and valve locations. Please enclose all compressor stations in a buildings and require scrubbing filters on exhaust and blow down valves.

For your convenience, I've sited some pertinent literature for starting the literature review (2,3,4,5,6,7,8,9, 10.11).

Safety concerns - Myself and many others in my community are in what the gas industry has termed The High consequence Area (12). Please have TGP share their insurance certificates so stakeholders are informed of typical compensation for their lives and homes. Please have them outline in detail the terms for compensation. Please consider using class 4 pipe where any pipelines are sited within High consequence Area perimeters of habited structures.

Please consider placing Main Line Valves (MLV) every 2.5 miles. In the July RR section 1.1.2.2.3, MLV's are described as integral to the safety of pipelines and according to USDOT regulations must be placed at a minimum of every 10 miles for class 1 pipe. However, the distance between the Windsor MA MLV and the Conway MLV is approximately 15 miles. Our emergency responders in these rural areas are all volunteer and we do not have the equipment needed to contain catastrophic pipeline accidents. More closely placed

valves that can be manually operated will reduce the blow down volume and minimize potential risk. Please have TGP specify how routine blow downs will be released in proximity to utility lines without hazard under all weather conditions including high winds.

In the General Project description section of the July resource report (RR 1.0), co-located pipeline is described as generally located 5' outside the existing power corridor. The permanent easement is described to be 50' wide with 20' overlapping into the utility corridor. The most recent survey request letter I received from Kinder Morgan has a map of where the pipe centerline is proposed on my property. It appears to be co-located to the existing utility corridor as described in RR section 1.0. The Franklin Regional County of Governments hosted a pipeline workshop where an environmental engineer from Boscardin Consulting Engineers, Inc. reviewed specifics details about pipeline construction. He was surprised to hear that TGP plans to co-locate the pipe close to utility corridors and described it as not safe. He suggested a minimum distance of 1000' from the utility corridor. Please determine the soundness of TGP company's co-locations plans with documented research as to its safety for stakeholders to review.

The total NED project length is estimated to be 418 miles (July RR table 1.1-1) with 7 construction spreads proposed across its entire length (July RR 1.3.4). In section 1.3.5 of the RR, TGP suggests 1 qualified full time Environmental Inspector (EI) per construction spread. These Inspectors oversee all construction along a 60 mile corridor including that of compressor station and meter stations. Each spread may have anywhere from 500 to 1,200 construction workers. In my judgement this is not sufficient. Please consider a minimum of 6 qualified full time EI's per spread.

Please have TGP be specific about areas that require blasting and elaborate on mitigation and compensation plans for any consequential damages to properties or persons. Please determine the type of blasting material that will be used and whether any will contain perchlorate products that may contaminate drinking water supplies. Please have TGP specify the length of time required to blast through each town, the daily hours blasting will be conducted and how they plan to mitigate noise and dust pollution on impacted communities. Please confirm that TGP will relocate landowners to hotels, as stated in RR 1, if noise and dust levels cannot be tolerated.

In section 1.4.1 of the RR, please elaborate on "pipeline and aboveground facilities will be patrolled on a routine basis". Specify in detail the frequency of patrols. Please specify what "routine maintenance" is and at what frequency and for what length of time they are planned for. Please specify the frequency of regularly checked gas-leak surveys and their reporting criteria.

Impacted Property Owner concerns -

- Property value may be depreciated
- Some mortgage contracts do not allow explosives on lands they lien
- I may be held liable for fires or accidents from pipeline explosion
- KM plans to only compensate property owner monetarily based on the following formula. \$/inch of pipe circumference x number of feet crossed through the easement. (in my case \$1 x 30 x 50 = \$1,800)
- We continue to pay taxes on the easement
- We can't use the easement for growing trees or building anything on anymore
- We will be financing the cost of building the pipeline on our utility bills through an imposed tariff
- All mature trees will be cut in the easement.

Please outline standard compensation for landowner easements and timbers removed from properties.

Please research in communities where equivalent pipelines exist the impacts they've had real estate values for our reference. Specify which mortgage companies have terms concerning explosives in their mortgage contracts and detail those terms for our reference. Please have Kinder Morgan produce and publish their insurance liability certificates and include their coverage amounts for catastrophic events. Please determine

which homeowner insurance underwriters plan to elevate their insurance premiums for homes in proximity to pipelines and outline in detail the anticipated premium increase and exact conditions of clauses pertaining to explosives on properties.

For your reference, I conducted a quick Google search that substantiates property owner issues and concerns;

<http://spectrabusters.org/2014/11/116/why-accepting-a-natural-gas-easement-is-a-bad-deal>

<http://www.mineralrightsforum.com/profiles/blogs/pipeline-easement-and-right-of-way-agreements-alandowner-s-list>

<http://www.farmanddairv.com/top-stories/read-this-before-you-sign-that-pipeline-easement-lease/49966.html> <http://extension.psu.edu/natural-resources/natural-gas/news/2010/04/pipelineinfo>

<http://www.truth-out.org/buzzflash/commentary/standing-tall-for-landowner-rights-vs-oil-pipelines/17980-standing-tall-for-landowner-rights-vs-oil-pipelines>

<http://www.ufsrw.com/>

<http://www.law360.com/articles/522523/pipeline-giants-lose-ground-in-fight-over-easement-values>

Please have Kinder Morgan include in the RR a section that details the specific mitigating circumstances they've negotiated and provided impacted landowners along existing permitted and equivalent projects to date that address any and all of these concerns.

Local community requests for rural communities such as Plainfield -

Requests:

- Identify all private wells and septic systems that will be impacted by construction in our community.
- Conduct baseline tests of the water in all residential wells within ~ mile radius of pipeline center and continue to monitor wells yearly thereafter to insure public's health and safety where water contamination is concerned.
- Do the same for streams, rivers and ponds affected along path, establish baseline water quality before construction and monitor periodically during and annually after construction.
- All wells have specific flow rates (gpm). Please detail mitigation procedures for diminished flow rates should springs and streams be rerouted during pipeline construction, as a result of blasted ledge, or any other construction procedures that disrupts the present geologic surficial water patterns to wells. Please also define mitigation procedures for overall diminished well integrity as a result of any construction or blasting procedures or accidents.
- Plainfield is downwind of the compressor station proposed for Windsor. Conduct baseline air quality test and regularly monitor air quality once the pipeline is online by a contracted objective 3rd party source. Should air quality deteriorate due to compressor off gassing, please describe a detailed plan for mitigation.
- Sound will travel from the compressor station downwind as well, please conduct baseline sound tests before the compressor goes online and describe specifically how noise will be mitigated so as to not surpass the pre-compressor sound levels.
- Please provide a detailed assessment of all the timber that will be cut throughout our town and calculate compensation fees to all impacted landowners.
- Plainfield's Fire Department is entirely volunteer. It does not have the resources or man power to deal with a significant pipeline accident. We rely on local ponds for water in any fire incident. Document the High Consequence Area and its' impact radius through Plainfield. Please have KM describe in detail how they plan to respond to a major explosions and how they plan to provide us the necessary resources and skills needed for such an event. Mainline valves are only required every 10 miles. Please conduct a quantitative risk assessment of the impact that a significant incident of this nature

will have on our community with shutoff valves at these intervals. Document how much gas would have to burn off and for how long. Please conduct a comparative study of a significant event of this nature when shut off valves are located at shorter intervals and evaluate whether there would be a diminished impact. Please identify exactly where all shutoff valves are and whether they will be manually or remotely operated. Please determine the inspection cycle for methane leaks and pipeline integrity once the pipeline is in use. Please provide a list of chemicals in the gas other than methane and their Material Safety Data Sheets so our volunteers know what hazardous material they will have to deal with.

- Our community is winter sport orientated, please provide detailed restrictions imposed on these activities in pipeline easements and the reasons why they are a liability to the community. How does KM plan to enforce these restrictions and assure our communities continued safety in these easements?
- Have KM provide a quantitative tax assessment of actual revenues our town will accrue over time (so as to accommodate for depreciated infrastructure values) based on actual revenues collected in similar communities as ours and who also have similar existing pipeline infrastructure. This tax assessment should also include changes in property tax revenues that occur as a result of land value changes incurred by impacted landowners.

Construction requests:

- Provide a timeline for each phase of the pipeline construction in Plainfield and their expected start and finish dates. Indicate the number of vehicles as well as heavy and small equipment utilized in each phase of construction. Determine the number, size and locations of every TWS needed in town. Determine locations of all temporary and permanent access roads. Describe typical compensation for these access roads and easements on private properties.
- Clearly define all permanent above ground infrastructures associated with the pipeline and their exact locations in Plainfield. Detail how much of it needs to be kept accessible yet protected from vandalism or terrorism. Please describe how KM plans to keep this infrastructure protected from vandalism or terrorism. Please describe mitigation should a terrorist or vandalism event happens.
- Specifically and clearly identify areas that require blasting and the directly impact residents. Identify the blasting methods, types of materials used and the hours blasting will be conducted. Determine the length of time it will take to blast through the 5.5 mile distance the pipeline travels through our town. Describe mitigations that will be taken should noise levels adversely affects property owners. Determine the rock throw area and seismic impacts to affected properties. Describe mitigation scenarios for accidents and damages to properties. Require that contracted blasting firms not use perchlorate products that can adversely affect drinking water supplies.
- Where hydrostatic testing is concerned please indicate what permits are needed and from which agencies for water acquisition? Please determine where the water will come from and how much is needed. How does KM plan to restore original water levels to ponds and streams it draws from for this purpose? How will water quality of ponds and streams be monitored during this testing? What contaminants will be in the water after testing is completed (ie. biocides or chemical deposited on pipe surfaces during manufacturing? Where and how will contaminated wastewater be disposed of?
- Where pipeline cross roads in our town, please indicate the specific technique that will be used to bury the pipe at these crossing.
- Heavy equipment traffic on town roads - Please detail mitigation methods for road damages due to heavy equipment traffic and any bond negotiations that can be made in advance of construction to insure the costs of repairs will be met.
- Evaluate compressor integrity relative to the potential seismic activity in Windsor given there is an earthquake fault line in this town.
- Determine geologic hazards (natural, physical conditions that can result in damage to land and struc-

tures or injury to people) such as seismicity (e.g., earthquakes, surface faults, soil liquefaction), landslides, flash flooding, and ground subsidence that might affect pipe integrity and consequently pose potential safety risks to abutters along the NED route.

- Abandonment - How will abandonment be mitigated? Evaluate long term effects of abandonment on impacted communities?

Thank you for these considerations,

Polly Ryan

Re: Docket No. PF14-22, TGP Northeast Energy Direct

Dear Secretary Bose:

First, I'd like to ask that FERC extend the comment period and reschedule scoping meetings given KM (Kinder Morgan) has just released a second resource report for an entirely newly designed project. And, to hold these meetings in locations convenient to impacted stakeholders.

From an impacted landowners' point of view, my comments tonight address my experience of the FERC process. My hope is to convey that it is designed to be in the public's inconvenience and is not for our necessity.

In February of 2014, I received a letter from KM (Kinder Morgan) requesting to survey my land. I did not receive any details from them otherwise until they invited me to open houses a year later. Fortunately, my community came together and educated itself on the NED project. We asked KM to do a presentation in our town. Many of us were left with unanswered questions. I attended 5 open houses and on questions like health and safety was shuffle around the room to different experts only in the end to still not have my questions answered.

What I have learned is that;

- My property value may be depreciated
- Some mortgage contracts do not allow explosives on lien lands
- I may be held liable for fires or accidents from pipeline explosion
- KM plans to only compensate me \$1,800
- I'll continue to pay taxes on the easement
- I can't use the easement for growing trees or building anything anymore
- And I may have to finance this pipeline with a tariff on my utility bill

All in all, my one and only asset, and the home I built with my own 2 hands, is rendered worthless. I'll have to abandon it because of health and safety issues ... penny less.

On the other hand KM hugely benefits from gas sales in Europe. It won't even cost them to build the pipeline and FERC has provided them every necessity needed to meet their permit and construction deadlines. I suppose that is because your institution is financed by gas permit fees.

Natural Gas is not a bridge fuel to renewables. The gas industry will exploit our entire US gas resources over the next 10 years for profit if FERC permits it! Natural gas is the gas industry's drug to riches and FERC is their enabler.

It is not in our national interest to support this boom and bust business. Our future generations need this gas here in the US. So I ask tonight that you please do your job by evaluating the true public necessities and conveniences and please ... stop enabling this industry to, in the end, frack us all.

Thank you for this consideration. Polly Ryan, 11 Windsor Avenue, Plainfield MA

Re: Docket No. PF14-22, TGP Northeast Energy Direct Concerning the Environmental Impact Study

Dear Secretary Bose:

Please take into consideration the comments I submitted to the Massachusetts Energy Facilities Siting Board below:

Energy Facilities Siting Board
One South Station
Boston, MA 02110

8-5-15

Dear Stephen August;

Thank you EFSB for the opportunity to speak tonight. My name is Polly Ryan and I am an impacted land-owner from Plainfield, MA. I oppose the NED projects, FERC docket #PF14-22, and not just because it's going through my backyard. It's my opinion it shouldn't go through anyone's.

The project is going through green fields, Article 97 and other conserved lands, protected forests, endangered habitats, water reserves and wetlands ... all properties the Common Wealth and its' citizens have work hard to preserve and protect. This should not be undone or jeopardized. In addition, this list of properties doesn't even include businesses, farms, and private properties that may be taken by eminent domain, which the Common Wealth should also consider.

The question for us all tonight really is, under what circumstances would this NED be justified as being in the publics' convenience and necessity? Is this project worth this huge sacrifice of Massachusetts's natural resources? Must we make this sacrifice because we need the gas in this region and there are no viable alternatives to our energy needs? I believe the need does not exist and therefore this sacrifice is not in our best interest. I know I'm not alone in that assessment. I plan to submit written comments detailing supporting evidence for this which I can't possibly convey in just the 3 minutes allowed here. But let me just say briefly on this front that the NED project is being way overbuilt and the fact is that only a 1/4 of the gas will be utilized in New England while the rest is destined for Europe.

From a broader perspective, that is the real issue for me on several fronts. The first being global warming. We are proud of the fact that the Massachusetts legislature has implemented the Global Warming Solutions Act and we want to see this achieved. Methane is 84 times more potent a gas than CO2 over a 20 year period (1, 2,3). Regardless of where this gas is going to serve customers, its' ultimate destination is in our atmosphere. If we don't take action on this front, Boston will be under water. How can we possibly justify that as being in our public convenience and necessity? Another front is national security. There is lots of scientific evidence that indicates the amount of gas in shale regions is a lot less than predicted initially. Is it in our national interest to send this gas to Europe and not save this resource for our future generations? And finally, the bottom line for everybody ... will bringing gas in this region lower energy costs for Massachusetts residents? I think not if the gas is really destined for Europe. The price of gas will no longer be based on our national market prices, but on global market prices, and gas is 3 times more expensive in Europe than here. The utility companies will have fixed gas prices thanks to their contracts with Kinder Morgan but they will charge consumers the market price regardless of that. And consumers may even have to absorb the cost of this NED project with an implemented tariff on our utility bills while Kinder Morgan and these utility companies rake in huge profits. That's just seems criminal to me.

Again, there is lots of supporting research that's already been done for all the arguments against this NED project and our Attorney General's office is in the process of possibly contributing to that list. I will provide references for these arguments in my written comments (see below). I believe we shouldn't rush into decisions of this magnitude for Kinder Morgan's convenience and necessity and we need TIME to consider ours! Please ask FERC to issue a new Notice of Intent for the Environmental Impact Study comment period so we have sufficient time to read the latest resource report. I also ask that you comment on the segmen-

tation of the Connecticut Expansion project. I too feel it is part of the same expansion plan as NED, and should be reviewed by FERC as a single project. I also ask that you not just comment to FERC but intervene on our behalf if FERC doesn't address issues we've raised with you. And in conclusion, I ask that the benefits of a "no-action" alternative be thoroughly considered in favor of carbon neutral alternatives.

Thank you for this consideration.

Polly Ryan
11 Windsor Avenue
Plainfield, MA 01070

Dear Stephen August;

8-10-15

Above, are the oral comments I made at the Greenfield Community College Energy Facilities Siting Board meeting on 8-5-15. This portion of my written comments includes supporting evidence for the generalized statements above.

The effect that methane has on our atmosphere in comparison to CO₂ came from a study the Environmental Defence Fund initiated with over 100 other universities interested in determining "how much methane is lost across today's U.S. natural gas supply chain" (1). The gas industry is responsible for 30% of our overall methane emissions in the US. According to the Environmental Defense Fund, enough natural gas is lost each year to fuel 6 million homes. This is the equivalent annual emissions of 117 million cars or roughly half the cars in the United States (1).

If our country or even just our state were to implement already established technologies to reduce methane loss throughout the gas industry's acquisition and transportation process, there would be no need what so ever for the any new gas infrastructure in our region let alone the NED project.

"The amount of methane leaking from natural gas pipelines, storage facilities, and other sources in the Boston area is as much as three times greater than previously estimated - a loss that contributes to the region's high energy costs and adds potent greenhouse gases to the atmosphere, according to a new study by scientists at Harvard University ... The study, which will be published Thursday in the Proceedings of the National Academy of Sciences, relied on measurements from September 2012 to August 2013 taken by laser spectrometers at Copley Square, Boston University, Nahant, and the Harvard Forest in Petersham. The instruments found about 300,000 metric tons of natural gas leaks - about 2.7 percent of all natural gas delivered to the region" (4).

Supporting evidence for the final destination of most of the gas from the NED project comes from a report by David Gilbert Keith, a member of Deerfield's Energy Resources Committee and an independent environmental researcher. He concludes that most of the gas will likely be liquefied and exported. He based his findings on an analysis of data from the federal Energy Information Agency (5).

National Grids own projections for Kinder Morgan's pipeline is that it will bring in 15 times more gas than is needed in the region (6).

So we have gas leaking into our atmosphere in sufficient quantities to compensate for the NED supply and the NED's ultimate gas capacity is way greater than what is supposedly needed in our region. How can the EFSB justify siting the NED project anywhere based on this evidence alone? Note, the key words above are gas capacity supposedly needed!

Plenty of evidence exist to support that there is in fact no need at all and that an impression of need has been created by Kinder Morgan and utility companies just to justify this project.

Presently our grid has a capacity for 37,000 megawatts per day (6). Our all-time peak demand occurred in the summer of 2006 when we reached 28,130 megawatts (6). This amounts to 8,870 megawatts of surplus supply during our most demanding energy period on record. ISO New England requires a surplus buffer of 2,450 megawatts at any given time (6). In addition, there are 10 to 20 times per month when New England in experiencing a "Minimum Generation Emergency Warning" when ISO NE has to coordinate power plant

shut downs throughout the region to save money (6). I don't understand how this equates the 0.6 billion cubic feet of gas that NESCOE, ISO NE, Kinder Morgan and our Governors are saying is needed in our region to solve our energy shortage crisis. Kinder Morgan and our N. E. Governors justification is based primarily on the 700 megawatts loss that was supplied to the grid by the coal and oil plants that shutdown. Let me illustrate the math for you of that 700 megawatt loss. A 2,450 buffer plus a 700 loss amounts to 3150 megawatts. We in fact have a buffer of 8,870 megawatts at our most demanding energy moment on record. It appears to me there is no need at all!!!

Let's for argument sake say we have a 700 megawatt NEED for gas capacity in this region. Is the NED project the only alternative??

Massachusetts gas needs are based on supposed winter peak capacity constraints. These can also be resolved with existing LNG facility storage solutions rather than new, costly, massive pipeline infrastructure. Distrigas alone could resolve peak demand constraints simply by importing 2 11z to 3 extra tankers of gas per year. If we consider the storage of more LNG and factor in ALL renewable resources, not just those that are subsidized or part of energy programs, we have a viable, cheap, immediate, less impactful alternative to the supposed need!

Heating needs are increasingly being met with thermal solar, geothermal, and high efficiency heat pumps. Our Green Communities Act, once fully implemented, will in its' first six years the program, reduce total annual energy consumed in Massachusetts by up to 3.6 TWh. Peak summer demand will be reduced by 614 MW (7).

The only comments this siting board has heard, to my knowledge, in favor of this project are those by union members concerned for jobs. Good paying jobs exist in the renewable energy industry. And, according to Paul Cicio's testimony to the Senate Committee on Energy and Natural Resources concerning the "LNG Permitting Certainty and Transparency Act", US jobs in manufacturing will be threatened by the increased gas prices the market will command once our gas is exported to Europe (8).

There's a lot to consider in truly evaluating our energy needs and how to supply it. Relative to the impact the NED project has on my land, my community and, my children's future health and safety, I think a better solution is to fix leaking gas infrastructure (which would save ratepayers 1.5 billion dollars!) and keep up with our conservation initiatives by investing in renewable, carbon neutral, energy systems. We will meet our Global Solutions Warming Act legislation simply by increase solar capacity in our state by 10% each year, the already projected trajectory for this industry, and by 2018, the same year NED may go on line, we will have our entire energy deficit loss compensated for from the shutdown of the oil and coal plants (6).

Like I said in my oral comment, the ultimate destination for all drilled gas is our atmosphere regardless of who the customers are. Is it truly in our public convenience and necessity to have Boston under water?? Given all these arguments, it's my opinion that the EFSB should consider our real public convenience and necessity by choosing the "no-action" option to the NED project in focus on carbon neutral alternatives.

Again, thank you for this consideration,

Polly Ryan

Re: Docket No. PF14-22, TGP Northeast Energy Direct

Dear Secretary Bose:

The comments below reflect those of concerned citizen residing in Plainfield wishing to address the scope of the Environmental Impact Study on the Northeast Energy Direct Project docket number PF14-22-000

Please know we are a "Right to Farm" community meaning we have adapted general bylaws that outline our support for farming within our town. These bylaws are in place so people moving into our town understand that farming is central to our economic and cultural activities. Many of our residents for this reason have placed land they own in an Agricultural Preservation Restriction (APR) program administered by our state for the purpose of "preserving and protecting agricultural land, including designated farmland soils, which are a finite natural resource, from being built upon for non-agricultural purposes or used for any activity detrimental to agriculture and to maintain APR land values at a level that can be supported by the land's agricultural uses and potential" (1).

It was with great dismay that we learned the Tennessee Gas Pipeline company is proposing to place a Contractor Yard on one of the most prized agricultural properties in our town which also happens to be in the APR program. The property is a 300 acre parcel, located at 166 Main Street, and is owned by the Waryjasz family.

In the July Resource Report section 1.2.4 it states contactor yards will be used for equipment and storing pipe, materials and, staging. In addition it may house temporary field offices and serve as a pipe preparation/field assembly area. Equipment is not defined nor are materials.

Our concern is that heavy machinery traffic and pipes places on this land will compact the soil. Mitigation methods for compaction in the ROW involve the use of a Para till and this technique can potentially loosen soils to depths that result in subsoils mixing with topsoil. In addition to soil compaction, the integrity of the clay structure in these soils may be compromised diminishing its' potential for nutrient retention. There are no remediation methods for repairing the integrity of clay once it's damaged.

Since materials are not defined we have no way to know if any of these are hazardous and could potentially risk soil contamination. There is minimal documentation on blasting in the resource report but we all know the proposed route crosses many areas of solid ledge where blasting is inevitable. We presume materials to include blasting compounds which may contain perchlorate products known to contaminate drinking water. There will be inevitable soil contamination from oil and hydraulic fluid leaks from machinery.

This land parcel also abuts Plainfield's federally registered historic district and includes the Waryjasz family's home which was built in 1793.

Our request to FERC is that an alternative site be considered for this contractor yard.

Thank you for this consideration,

The Plainfield Pipeline Opposition group
Committee Chairs; Polly Ryan, Jane Crosby, Chris Stockman

20151015-5242

Tracy McGraw, Merrimack, NH.

Dear FERC,

I know that you have received many comments and complaints. So, please let me start by saying that WE DON'T WANT THIS PIPELINE. Many people have given you reasons, but here are some additional ones. When Kinder Morgan presented at the latest town council meeting, they lied about their specific involvement in our town, promised that they spoke with affected parties (but they only spoke with some), promised not to "ram this down our throats", and refused to answer questions directly. They waited until the last minute to show proposed new routes, which they admitted having for 2 weeks. They gave Merrimack barely a week to respond and post to this site, while at the same time promising that we could post later, after the deadline.

They have acted unprofessionally, have misrepresented their actions, and artfully dodged all questions.

Their initial plan was to co-locate, but that's been thrown out. They said the only reason to put this in Merrimack was for the co-location. Now, there is no reason. They said they can't place it in the roadway medians because of vibration, but they are putting it along the roads and vibration is still an issue. This is just an example of the misrepresentations.

Credibility is everything. Kinder Morgan and their agents have none as it relates to the residents and businesses affected.

It seems that KM's intent is to force this pipeline onto the towns that have the lesser population and therefore, less funds to fight it. We may be a small town, but we love our town, and will fight as long and as possible to avert what will be a disaster.

Please do not approve this pipeline. It hurts significantly more than any possible positive outcome.

20151015-5243

Northern Middlesex Council of Governments

October 15, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE
Washington, DC 20426

Re: Northeast Energy Direct Project, Docket No. PF 14-22-000

Dear Secretary Bose:

The Northern Middlesex Council of Governments (NMCOG) is hereby providing comments on the proposed Northeast Energy Direct (NED) pipeline project (PF14-22-000). NMCOG is a Massachusetts Regional Planning Agency serving nine communities in Northern Middlesex County, including two communities (Dracut and Tewksbury) on the preferred route, and three others (Dunstable, Pepperell, and Tyngsborough) located along an alternate route. Through construction of the preferred route, the Town of Dracut would be severely impacted with nine miles of new pipeline, three metering stations and a compressor station.

NMCOG has actively participated in the FERC process and assisted in the formation of the Northeast Municipal Gas Pipeline Coalition (NMGPC). Our agency and the communities that we represent have significant concerns about impacts of the NED pipeline project, including the direct impacts on public and private

drinking water supplies, permanently protected open space, farmland, rare and endangered species habitat, public infrastructure, and cultural and historic resources. The short- and long-term impacts of this proposed project on our communities and the region are quite profound.

We ask that FERC thoroughly evaluate the need for this pipeline, particularly given the other options that are available to address New England's energy needs. Even with the recently announced reduction in pipeline size to 30 inches and 1.3 Bcf/day, only 38% of the capacity is committed. If a larger 36-inch pipeline with a capacity of 2.2 Bcf/day were permitted, only 23% of the capacity would be committed. We are very concerned that electric ratepayers will be asked to pay for a pipeline that is likely not needed through a tariff. Furthermore, if gas is exported through the NED pipeline, we are likely to see a steep rise in gas prices in New England, given the higher prices commanded in the global market.

Given the claims made by Kinder Morgan regarding the need and demand for additional natural gas in New England, additional information should be provided in the Draft Environmental Impact Statement (DEIS) regarding end users of the gas being delivered through the pipeline, and a breakdown of uses, e.g. electricity generation, home heating, industrial uses, should be outlined. The local distribution companies should be identified, along with a list of communities that would receive the additional gas being delivered.

We are awaiting the release of an independent study being undertaken through the office of Attorney General Maura Healey. The study will assess electricity reliability and energy needs through the year 2030. This study will outline the options for meeting those needs in the most cost-effective manner possible. We hope that FERC will fully consider the findings of this report and explore more reasonable alternatives to meeting natural gas demand in New England, including energy conservation, renewable energy production, LNG storage, expansion of existing gas pipelines, and improved operational efficiencies along other pipelines to recapture leaked gas.

The DEIS should include updated aerial mapping showing all properties and resource areas that will be impacted by the proposed project. The exact location of the pipeline and all ancillary above and below ground infrastructure should be shown on the maps. All locations where clearing and excavation will be necessary should be shown on the maps, including locations where existing power line rights-of-way may be utilized.

The Merrimack River serves as the drinking water supply for many of the communities located throughout the Merrimack Valley. As articulated several times at the FERC Scoping meetings, there are serious concerns regarding the impact of horizontal directional drilling on the quality of our drinking water supply. Will the pipeline under the River be enclosed in a sleeve in the event that a leak should occur?

Additional information should be provided regarding the layout of the compressor stations, the emissions that will be generated, the location of sensitive receptors, visual impacts, and the potential impacts to groundwater and private wells. The mitigation proposed to address anticipated noise, light, odor, water quality and air quality impacts should be outlined. Information on releases/blowdowns should also be provided. The proponent should outline how this project will comply with the Massachusetts Global Warming Solutions Act and assess how it will impact the state's Greenhouse Gas reduction goals.

To date, the information submitted by Kinder Morgan through the pre-filing process has been woefully inadequate and has lacked sufficient detail to allow for meaningful public comment. There are thousands of data points in the Resource Reports released on July 24th that are missing and listed as "TBD". It is our hope that future environmental documents will be substantially complete and provide adequate detail to allow residents and municipalities to thoroughly understand the impacts of the proposed project.

NMCOG has partnered with other Regional Planning Agencies in Massachusetts and New Hampshire to collectively compile and submit detailed comments under separate cover. The comments have already been transmitted to FERC by the Franklin Regional Council of Governments and focused on the following:

- Protection of Water Resources (public and private drinking water supplies, rivers, lakes, ponds and wetlands);
- Protection of Air Quality and the project's impact on the state's climate goals;

- Public Safety;
- Protection of Critical Habitat for Rare and Endangered Species;
- Minimizing and Mitigating Noise Impacts;
- Minimizing and Mitigating Impacts on Public Infrastructure including Roads, Bridges, Culverts and Electric Transmission Lines;
- Addressing Impacts on Private and Public Property, including property values;
- Avoiding Impacts on Permanently Protected Open Space and respecting Article 97 of the Massachusetts Constitution;
- Avoiding Impacts on Historic and Archaeological Resources;
- Addressing Economic Impacts on Recreation and Tourism, and on Natural Resource Based Businesses, such as Agriculture and Forestry; and
- Addressing Fiscal Impacts on local communities.

Thank you for the opportunity to comment on the proposed NED pipeline project. Please feel free to contact me directly should you have any questions regarding NMCOG's comments or require additional information.

Sincerely,

Beverly Woods
Executive Director

Sten Caspersson, Bloomfield, CT.
FERC Input

I am dismayed and concerned that the new 24" pipeline will be placed on land owned by the Metropolitan District Commission (MDC), which is the municipal water provider for the Greater Hartford region. The new 24" pipeline, to be added to an existing 16" pipeline (which has been there since 1952, and was subject to less stringent siting criteria than today), will directly impact the MDC's Class I and Class II watershed lands, and therefore potentially impact our water quality, as well as impacting the New England National Scenic Trail, and sensitive habitats for the blue-winged warbler and other species.

Certainly there must be concern for the safety and quality of the MDC water supply to the Hartford area. There is no risk free construction and operation outcome. To cross Class I and II watershed properties without evaluating if this would have been allowed in 1952 with current regulations and restrictions imposed is a grave injustice. If the 16" pipeline would not meet today's siting criteria, then the 24" pipeline should not be allowed to utilize the current MDC easement, as a matter of convenience.

The new pipeline would cross 5.7 miles of MDC land and with a width of 90 feet, would disturb over 62 acres. Of course, there will also be many impacts for landowners along the course of the pipeline as well.

With respect to crossing Wintonbury Land Trust (WLT) property in Bloomfield, the original pipe was installed in a 30' right of way (ROW), yet an adjacent new pipe will require not 20 additional feet but 35', so where is the "shared" ROW? We also understand that a lay down area of an additional 25' is required,

therefore clear cutting our mature forest for the entire 390' length of our preserve.

Our understanding of the total impact of land taking for this proposed pipeline is that the WLT will end up with a clear cut swath through our preserve of 60'+ the existing ROW of 30', totaling 90' across by 390 feet long.

We urge FERC to consider imposing much stricter land taking criteria if this pipeline project is approved as a necessary public utility.

In addition, it has been necessary for concerned citizens to do considerable research and ask many questions to adequately understand this project. An item not clearly addressed is what alternate route(s) exist for the 24" pipeline around the MDC property?

I urge FERC to delay this project until all valid concerns are adequately addressed.

Sten Caspersson

Concerned Citizen

Wintonbury Land Trust Member

20151015-5255

Carol DiPirro, Merrimack, NH.

Hi,

I am writing to please grant an extension to the FERC filing period for the residents of Merrimack NH. Kinder Morgan attended a town meeting in Merrimack, NH on 10/8/15 and we were prepared to discuss the published route through Merrimack. KM presented a new route that night after talking with two major businesses in town. They made some adjustments that addressed some of the businesses concerns but are still running this pipeline at the edge of protected water, that is critical to the town, nearer to some neighborhoods. We are extremely concerned about our town drinking water. HOW is drinking water not important? Meanwhile, I am very concerned by the FERC process. It seems like you approve and "segment" all these pipelines that are connected and never really look at the big picture.

The President of the United States and countries around the world are looking to reduce the effects of climate change!

Well methane is a powerful greenhouse gas. How is it that these pipelines keep getting approved when they are releasing methane at metering and compressor stations? And this is happening all along the way from PA, not to mention all the unattended leaks in MA and NH which I already submitted. The cost of renewable energy is coming down. Please leave that gas in the ground. I understand that burning this fracked gas is than burning coal!! There are existing pipelines that are not running to capacity. Use those, find the leaks and stand with the WORLD to help fight climate change.

Kinder Morgan has a list of safety violations.

On another note, fall is a beautiful time in New England and it brings many tourists. Taking down swaths of trees will hurt our tourism economy.

They are now talking about a metering station in Merrimack, NH as well. I am terrified. I already have asthma. There are planned releases and I keep reading about "fugitive emissions". How can this be allowed. Methane will leak into the atmosphere, planned or not from Pennsylvania to Dracut. Is the legacy of a government agency to pollute our air in the northeast and increase the impact of climate change.

And then Kinder Morgan mislead the people by saying "it could reduce costs by 25-35%" and they do not discuss the cost the people will bear to build this ridiculously oversized pipeline.

Please say no- STOP NED!!!

Sincerely,

Carol DiPirro

20151015-5257

Heather Hollenbeck, Temple, NH.

NED includes a proposed 41,000 horsepower compressor station planned to be built less than 1/2 mile from my son's elementary school. I have yet to hear anyone say that pollutants from this station will NOT effect the air quality at the school.

This process is incredibly unfair. What is the point of asking lay people to point out environmental concerns? Yes, I am concerned about the environmental effects this project will have on our town, but how is it fair to expect the people that do not have degrees in biology, chemical or environmental sciences to tell YOU what the effects might be? Why doesn't that burden fall squarely on Kinder Morgan?

Please do not approve this project!

20151015-5265

NASHUA RIVER WATERSHED ASSOCIATION

Protecting our water, our land, our communities

October 15, 2015

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE Room 1 A
Washington, DC 20426

re: Tennessee Gas Pipeline Company, L.L.C; No. PF14-22

Dear Secretary Bose:

The Nashua River Watershed Association (NRWA), founded in 1969, is an environmental nonprofit whose mission is to work for a healthy ecosystem with clean water and open spaces for human and wildlife communities, where people work together to sustain mutual economic and environmental well-being in the Nashua Riverwatershed. The NRWA serves as an educator, steward, advocate, and technical provider for 32 communities in central Massachusetts (MA) and southern New Hampshire (NH). Our service area includes towns on the currently proposed routes for the Northeast Energy Direct project (NED) - Brookline, Greenville, Mason & Milford N H, and Townsend & lunenburg MA. Our service area also includes MA towns on the originally planned route - Ashburnham, Ashby, Townsend, Pepperell, Groton & Dunstable.

The NRWA submits these comments on the proposed Kinder Morgan Tennessee Gas Pipeline (TGP) North-east Energy Direct (NED) pipeline project (PFI4-22). As a participating member of Northeast Energy Solutions (NEES) we have actively participated in this FERC process. NEES is a coalition of non-profit organizations and other stakeholders working to identify the best solutions for proposed energy projects in our region. The many documents pertaining to NED and its inherent deficiencies that have been filed by NEES's attorney, Vincent DeVito of Bowditch and Dewey, can be found on-line at www.neenergysolutions.org.

Given that natural resources in our service area would be negatively impacted in both the short and long-term, the NRWA has substantial apprehension concerning environmental and other impacts of the proposed NED project: notably water resources including drinking water supplies, vernal pools and cold water fisheries.

In 2001, the NRWA commissioned the Ecological Extension Services (EES) of MassAudubon to undertake a watershed wide ecological inventory intended to identify the most important areas for wildlife habitat protection in the watershed and propose habitat protection focus areas. It resulted in a report, Focus Areas for Wildlife Habitat Protection in the Nashua River Watershed, based on a scientific "Reserve Design Theory" and the "Core-Corridor-Buffer" model (NRCS Chapter 5: Planning & Design Principles (www.nrcs.usda.gov/internetI.FSE DOCUMENTS! nrcs144p2 015046 .pdO) which states that "biodiversity at multiple levels will best be maintained in a system of large, undisturbed core areas, surrounded by buffer zones of limited disturbance, and connected by functional corridors for wildlife dispersal" (Noss et al. 1999). large, road less

core areas provide habitat for species that are extremely sensitive to human disturbance and serve as “biological fortresses” against invasion of exotic species (Continental Conservation: Scientific Foundations of Regional Reserve Networks, Soule, 1999).

The EES report identified three types of focus areas: large, medium and small. At over 12,000 acres the “Badger Hill/Spaulding Brook” -located in the Brookline, Mason, Milford, Wilton four corners - was the second largest of all the focus areas. The currently proposed NED route would cross through the very heart of this focus area for nearly five miles. The July 2015 . Resource Report submitted by Kinder Morgan to FERC does not acknowledge the impact of the proposed project on such focus areas.

The currently proposed Fitchburg lateral would also create a greenfields clear cut - over 1 Y2 miles of this same “Badger Hill/Spaulding Brook” focus area. Habitat fragmentation is one of the region’s most significant threats to wildlife habitat integrity. Despite its name, NED’s proposed co-location along existing electric powerlines will nonetheless result in a near doubling of the size of the right of way: our region on a whole needs more intact interior forest not more development-created edge habitat (“Biodiversity and Interior Habitats: The Need to Minimize Edge Effects” www.for.gov.bc.ca/hfd/pubs/docs/en/en21.pdf). Further impacts caused by forest clearing include erosion and sedimentation impacts on water quality and fisheries, increased stormwater runoff, nutrient loading to water bodies, and estimated increase in water temperature in cold water fisheries.

Once the proposed Fitchburg lateral leaves Mason, NH and enters into MA it would pass through more than 3.5 miles of Willard Brook State Forest which was identified as another focus area in the EES “Wildlife Habitat Protection” report. The impact to this specific permanently protected open space is a major concern of ours and this property is only one of several negatively impacted conserved areas in the Nahua River watershed. As importantly, NED passes through more than 6 miles of the Squannassit Area of Critical Environmental Concern. As you know, the ACEC program is under EOEEA, and ACECs are places in Massachusetts that receive special recognition because of their quality, uniqueness, and significance and create a framework for stewardship of critical resources and ecosystems. Furthermore, the several tributaries to the Squannacook River that the pipeline will cross are designated as Outstanding Resource Waters pursuant to the Massachusetts Rivers Sanctuary Act.

As originally proposed in our service area, NED’s main pipeline crossed over 2 miles in 8 medium or high-yield aquifers, 21 permanently protected conservation areas, 25 wetlands and 27 streams, 3 % miles of MA BioMap2 areas, 6 Priority Habitats of Rare Species areas, and 8 miles of the two Squannassit & Petapawag Areas of Critical Environmental Concern (ACECs).

The NED proposed routes (both originally and currently proposed) through our service area are, in our opinion, unnecessary, misguided, unwise and would undoubtedly result in significant irreversible, detrimental environmental impacts to terrestrial and hydrological resources including groundwater aquifer recharge areas.

If the project is deemed necessary, alternative routes that are co-located along existing highway rights of way such as Route 2, Route 31 or Interstate 90, or along existing gas pipeline systems, should be prioritized for study as the preferred pipeline and lateral routes rather than “greenfield” settings or transmission lines that cross environmentally sensitive areas. We have taken note of a suggested alternative route for the Fitchburg lateral, as outlined in Carolyn Sellars letter to FERC on October 1, 2015, and feel that merits exploration and assessment if the Fitchburg lateral is deemed necessary.

However, in our opinion, evidence is lacking that justifies any of the routes proposed to date. We feel that a consolidated review of all the current proposals for bringing more natural gas into New England makes sense. We ask that FERC review in one process all the current proposals. We believe that the project itself can be avoided once all options are more fully explored.

Thank you for this opportunity to comment.

Sincerely,

Lucy Wallace
NRWA Board President

Re: Docket No. PF14-22-000 Northeast Energy Direct Project, Tennessee Gas Pipeline Company, L.L.C.

Dear Ms. Bose:

As a 50 year resident in the state of NH, I am asking you to please consider and respect the information and concerns of those who have intelligently opposed the construction of a pipeline through southern NH. I know you are well aware of the negative impacts that threaten our health and environment. I don't believe that I would say anything different than what has already been said.

There has been a tremendous amount of opposition for the pipeline through southern NH. It includes reports and statistics and requests by concerned parties. The data shows that our community will be at a terrible risk of pollution. Wetlands, rivers, forests, parks, bodies of water, homes, wildlife and air will be harmed or destroyed.

There are many more important things in life than money. There is nothing more valuable than peace, health and safety in the community where one resides. If you would consider your own life and that of your dearest family members, I trust we would be in agreement as to what the wisest choice is, regarding all that the proposed pipeline puts at risk. To put it simply, I appeal to you to do unto others as you would have them do unto you.

I request that FERC take a stand in support of our communities by approving projects that are in line with the local, state, and federal energy policies. Foster the development of clean energy in NH and throughout this nation.

Respectfully,

Grace Shaw and family

20151015-5267

Robert Morisse, Bloomfield, CT.

I attended a poorly advertised public hearing in the West Hartford, CT Town Hall on October 7, 2015 where Kinder Morgan presented its plans to expand the Tennessee Gas Pipeline in Connecticut. In spite of many comments from the public, representatives of Kinder Morgan took no notes to record the concerns raised by the public – leading me to believe that this meeting was a sham and nothing said at the meeting was going to change anything submitted by Kinder Morgan to FERC.

Therefore, I believe it is important for FERC to understand why I and almost everyone else at the public meeting PLUS a growing group of people in Bloomfield are against this project.

1) There was no evidence presented of a quantifiable demand for additional gas in CT. I understand that 2 companies in CT would like more gas so they can try and sell more gas and make more money. I don't think a project of this size and expense should be undertaken just to provide the potential for 2 companies to make more money.

2) The proposed route of the pipeline would take it across land owned by the Metropolitan Water District (MDC) on land designated by the State of Connecticut as Class I and Class II land. The MDC CEO Scott Jellison sent a letter (June 26, 2015) to the Secretary of FERC expressing concern that the expansion would

“potentially disturb a large area (250 acres or more) on MDC property and encompass a distance of approximately 5 miles running north and south, carving through the watersheds of MDC Reservoirs 2,3,5 and 6. The property that would be potentially impacted is highly regulated by the State Department of Public Safety in order to safeguard the water supply.”

a. The following comes from the Rivers Alliance of Connecticut:

i. Connecticut law provides the highest protections in the nation for drinking water. First, no water body that has received a waste discharge can be used for public supply of potable water. Second, water utility land hydrologically linked to drinking-water reservoirs must be kept as natural open space and cannot be disturbed in any way other than certain limited permitted actions necessary to maintain operations. By statute the protected lands are termed Class I (closest to the source) and Class II (also impacts the source).

ii. Protection of Class I and II lands is the highest priority in our state water policy. To violate this protection would set a precedent that would put at risk Connecticut’s drinking water sources. The state’s standards for drinking water are uniquely high (only Rhode Island has similar standards). These high standards are increasingly justified as science reports document the myriad new pharmaceuticals, plastics, pesticides and other toxins in ordinary wastewater. Existing treatment methods cannot adequately define or manage this array of toxins.

3) The proposed pipeline expansion should not be approved because of Kinder Morgan’s poor safety record.

a. (Sources: www.pushbackthepipeline.org and Wikipedia – Kinder Morgan)

i. In 2011 the Pipeline and Hazardous Materials Safety Administration (PHMSA) cited Kinder Morgan for these safety violations:

1. Failing to maintain update maps showing pipeline locations
2. Failing to test pipeline safety devices
3. Failure to maintain proper firefighting equipment
4. Failing to inspect its pipelines as required
5. Failure to adequately monitor pips’ corrosion levels

ii. In 2013, the investment research firm Hedgeye Risk Management released a report claiming that Kinder Morgan’s business strategy is to starve its pipelines and related infrastructure of routine maintenance to maximize profit.

iii. In Texas from 2003 to 2014, Kinder Morgan experienced 36 “significant incidents”, resulting in fatalities or hospitalization fires, explosions or spills.

iv. Throughout the US since 2003, Kinder Morgan and its subsidiaries pipelines have been responsible for at least 180 spills, evacuations, explosions, fires and fatalities in 24 states. A list of individual accidents is available on Wikipedia – Kinder Morgan.

4) Constructing the proposed gas pipeline across Class I and Class II land, (going through the watersheds of MDC reservoirs 2, 3, 5 and 6) combined with the rate of accidents puts the drinking water supplied by MDC at great risk. One accident could seriously jeopardize the drinking water of approximately 400,000 people that are served by the MDC.

20151015-5268

Rachel Harrigan, Branford, CT.

Dear FERC,

Drinking water reservoirs need healthy lands around them to filter and protect the water our families use.

Clear-cutting and digging a trench 90 feet wide, 5.5 feet deep, and 5.7 miles long through land that protects my drinking water and that of hundreds of thousands of my neighbors is not the solution. Natural gas pipelines nationwide suffer alarming failures that pollute water and soil, and put people at risk. Kinder Morgan should find another place for its pipeline—or better yet, invest in renewables and stop wasting money on outdated fossil fuel infrastructure.

Sincerely yours,

Rachel H Harrigan

20151015-5269

Ginnie Gavrin, Marlborough, NH.

I have grave concerns about the NED pipeline plan currently under consideration for southern New Hampshire.

The use of eminent domain to force land to be turned over from citizens to a private company for their for-profit use is unconscionable. The underlying assumption that gas requirements will grow to such an extent that the citizens of New Hampshire must sacrifice their environment and their land is a false assumption. In this period of questioning the efficacy and necessity of this pipeline as the best way to meet future energy needs, I am hoping that the downsides of this proposal will receive the attention they deserve.

The gas that will run through the pipeline will likely be shipped overseas and not be available to increase gas capacity in New Hampshire even though our environment may be irreparably damaged by the construction and operation of the pipeline. Natural gas production and transport are not a “bridge” to a cleaner environment. Fracked gas comes with huge costs to the areas where it is drilled, including the large amount of methane released in the process. Increasing our reliance on natural gas does not guarantee that our energy costs will not go up. Price fluctuations are determined by multiple factors and cannot be controlled locally.

Preservation of New Hampshire’s pristine water must receive adequate protection for generations to come. Kinder Morgan cannot guarantee their pipeline will provide that protection. As we have seen in other parts of the country in recent months — high pressure, high capacity pipelines do explode, spill, and leak.

I am asking that you approach this matter with an open mind and please listen to those most affected. It is on your shoulders to bear in mind the future generations and the very high price they may pay if we underestimate the dangers associated with this choice.

20151015-5270

Shirley, Brookline, NH.

I am **VEHEMENTLY OPPOSED** to the granting of the filing for this pipeline to be routed through Southern NH towns, who will receive absolutely **NO** benefit from this project. This plan will threaten the ecology of 400 acres of conservation land (and that is just in Brookline, NH). The devastation far outweighs the practical benefits of this nearly obsolete form of energy. There have been over 100 permits for solar energy applied for in our town in the last month. **THAT** is what we should be doing with the billions of dollars proposed, rather than putting our citizens at risk for illness, danger and death in granting Kinder Morgan this permit. Kinder Morgan have overstated their safety records and denied accidents. Let it be known the majority of the townspeople affected by this project **DO NOT WANT THIS PROJECT, DO NOT WANT KINDER MORGAN AND DO NOT WANT THE HEADACHES THIS WILL IMPOSE UPON US**. I am one of many who refuse to be bullied in to accepting this horrific option. Please FERC if the majority of the citizens this effects are opposed how can you approve and if you do we will be **DEMANDING** answers. We will hold you and KM accountable should this project be approved. the burde of proof is on **YOU**, not the citizens of NH.

20151015-5271

John Constantine, Hollis, NH.

This pipeline is not wanted or needed by the residents of New Hampshire that is being asked to carry the infrastructure.

A great deal of this gas isn't even destined for New England, but rather export.

Please consider this pipeline in conjunction with the other energy projects in the region.

Please consider this pipeline in conjunction with the energy plans that have been independently developed by the states the pipeline will impact.

Please do not approve this project, it is the wrong investment for the region.

Please do not approve this project, it is the wrong investment for the nation. As other nations are modernizing their infrastructure for renewables, the US seems intent on doubling down on fossil fuels in the name of dollars.

Please look a few minutes into the future and see that this is going the wrong direction.

20151015-5272

Willow Sirch, Hamden, CT.

Dear FERC,

For generations, Connecticut has relied upon pristine open space around its drinking water reservoirs to filter and protect the water our families use. Clear-cutting and digging a 6-mile-long 90-foot-wide through lands that protect our drinking water is an ill-conceived idea. No doubt the people who came up with it do not reside in Connecticut. All around our country, natural gas pipelines have experienced alarming failures that pollute water and soil, and put our children at risk. I urge you not to let Connecticut become the next site of such a serious threat.

Moreover, electric vehicles are poised to make fossil fuels for transportation far less viable than they have been for the past 50 years. Investing huge amounts of money on outdated fossil fuel technologies is a waste.

Thank you for the opportunity to express my opinion on this matter.

Sincerely,

Willow Sirch

RE: Northeast Energy Direct - PF14-22-000

NATHANIEL W. KARNS, A.I.C.P.

Executive Director

Dear Secretary Bose:

The Berkshire Regional Planning Commission (BRPC) respectfully submits the attached comments in relation to the Federal Energy Regulatory Commission Environmental Impact Statement Scoping for the proposed Northeast Energy Direct (NED) Project (PF14-22-000). These comments are submitted on behalf of the City of Pittsfield, Massachusetts, the Towns of Cheshire, Dalton, Hinsdale, Lanesborough, Lenox, Richmond, Washington and Windsor, Massachusetts, the Dalton Fire District, the Lanesborough Village Fire and Water District, Rensselaer County, New York (Rensco), and the Towns of Nassau, Stephentown, and Schodack, New York.

It is without question that the NED Project would have significant impacts on the natural resources, public infrastructure, socio-economics, and public health and safety within the region. The impacted communities within both Berkshire County, Massachusetts, and Rensselaer County, New York, without exception, have voiced their strong opposition to the NED Project. BRPC and Rensco have not analyzed the need for additional energy within the region or alternative energy sources. BRPC and Rensco do not have the technical expertise to weigh in on this issue and recognize that others with more expertise can make such arguments. These comments are intended to provide a greater understanding with regard to our region along with considerations that should be incorporated into the EIS, as well as mitigation measures for both the construction and operation of the pipeline should the project move forward.

The Berkshire region, with a population of 128,7151, consists of thirty towns and two cities located in western Massachusetts on the border of New York State. The Berkshires is a true region, well defined by physical features, geographic relationships, political boundaries, historical traditions and social organizations. Two major rivers drain the region, the Hoosic in the north and the Housatonic in the south, and the pipeline would impact both of their headwaters. Their adjacent valley lands contain the majority of the region's development and population. The region also includes small portions of the Deerfield, Westfield, and Hudson River watersheds, all of which would be impacted by the pipeline.

The Berkshire region is fortunate to have a wealth of valuable natural resources—the largest intact forests in southern New England, river valleys, clean upland streams, and abundant wetlands. These are important natural resources both ecologically and to support our tourism industry which is a critical component of the regional economy. The destruction of natural resources and fragmentation of open space inevitably degrades our landscape, and lessens economic and social values.

Rensselaer County, New York has a population of approximately 153,000 residing over 665 beautiful picturesque square miles. The quality of life as portrayed in the fourteen towns, six villages, and two cities, lends to the air of spirit and togetherness symbolic of what life should be about. The county slogan, “Life Looks Good From Here” is consistent with Rensselaer's identity. Rensselaer County strives to be an excellent place to live, to work, to shop, and to raise a family, while balancing economic, educational, and recreational opportunities.

The attached comments detail our concerns along with requested mitigation measures should the project be constructed. The comments include the following sections:

- Public Safety and Health
- Transportation and Local Infrastructure
- Compressor Stations
- Drinking Water
- Rivers, Streams, Waterbodies, and Wetlands
- Invasive Plants
- Special Species Status and Special Interest Areas
- Socio-Economic and Fiscal Issues
- Impacts to Property Owners

Key concerns and considerations include the following:

- The pipeline should avoid drinking water supply areas;
- Compressor Stations should be located within industrial areas;
- The municipalities should not incur any cost as a consequence of the project for local review processes, repair of infrastructure, emergency response or any other cost associated with the permitting, construction, or operation of the pipeline.
- Directly impacted property owners should not incur any cost as a consequence of the project during acquisition, construction or operations and should be fully compensated for unavoidable costs and impacts.

Thank you for your careful consideration of these comments.

Sincerely,

Nathaniel W. Karns, AICP
Executive Director

20151015-5285

James Tyler-Wall, Temple, NH.

Dear Sirs,

Please be advised I am completely against allowing Kinder Morgan to build a compressor station in New Ipswich, NH. The proposed site is next to an Elementary School and will emit tons of toxins annually. Please do not allow this to be approved and built.

Sincerely,

James Tyler-Wall

20151015-5286

Margaret Ford, Nassau, NY.

Dear FERC:

I have been reading many of the comments submitted on the NED pipeline and it boils down to this: citizens for the most part are against this pipeline proposal and have submitted valid reasons for their opposition. As an abutter I am directly affected by this taking of my property. In addition, The siting of the Nassau compressor station is an affront to towns and villages who have enacted zoning to maintain their rural character. The taking of private property for private wealth creation is an abomination which we should not have to endure. You have heard the people and yet the cards are stacked against citizen's property rights and environmental efficacy. There are so many comments on potential problems with this project that finding it is a "public necessity" would be ridiculous since there still has not been a demonstrable need for additional capacity. Impacted states have been moving towards more renewable power to help with anticipated shortfalls. We all know that the endgame is EXPORT. This is in no way a "public necessity"! I urge you to break with your mission of approving all pipeline projects and only approve those which truly are for "public necessity". (That would be the US public if that is not obvious.)

Sincerely,

Margaret M. Ford

Ms. Kimberly D. Bose, Secretary

Federal Energy Regulatory Commission

888 First Street NE

Washington, DC 20426

RE: Northeast Energy Direct Project, Docket N. PF-14-22-000

Dear Ms. Bose:

Enclosed is a copy of the Ecological Assessment of the Society for the Protection of New Hampshire Forest's Bockes and Heald Reservations. As noted in our July 30 testimony regarding the Northeast Energy Direct Project, three of our forest reservation parcels are located in the route of the NED: the 55 acre Heald Tract parcels in Greenville, New Hampshire and Mason, and the 45 acre Bockes Forest in Hudson, New

Hampshire.

We have two reasons for providing FERC with this information. First, we want to insure the agency understands how the NED project will result in environmental impacts to conservation lands in New Hampshire. Second, we believe FERC must direct the applicant to undertake a comprehensive landscape analysis and field survey on the natural resources, including conservation properties, within the project corridor similar to the one performed on the Bockes and Heald tracts.

The need for this comprehensive approach is highlighted in the September 4 letter from Carol Henderson at the NH Fish and Game Department who noted the Department could not yet determine the potential impacts on many species within NH that may be impacted within the project areas. She further noted that without actual ground surveys, including the information from the finalized wildlife surveys, it is not possible to measure the amount of potential impacts to fish and wildlife species and their associated habitats.

It should be concerning to FERC that the New Hampshire state agency responsible for the protection, conservation and management of the State's fish, wildlife and marine resources and their habitats has had difficulty accessing the necessary information to appropriately analyze any potential environmental impacts of the NED project. We would therefore again request FERC to direct the applicant to undertake a complete ecological assessment of the approximately 40 conservation properties along the project route.

Thank you again for this additional opportunity to comment on this project.

Matt Leahy, Public Policy Manager
Society for the Protection of New Hampshire Forests
mleahy@forestsociety.org

**Rapid Ecological Assessment of Bockes and Heald Reservations
and Identification of Potential Impacts from Proposed
Northeast Direct Pipeline**

Kane Conservation, 9/2015

Background and Introduction

The Society for the Protection of New Hampshire Forests (the "SPNHF") has secured the services of Kane Conservation for the purpose of conducting landscape analysis and field surveys for portions of the Bockes Reservation in Hudson, NH and the Heald Reservation in Mason/Greenville, NH (the "Properties") that are situated along the proposed route of the Northeast Direct natural gas pipeline (the "NED"). The area studied is the actual proposed route of the Wright Dracut pipeline route plus a 200 foot buffer on both sides of these routes (the "Study Area"). The Wright Dracut route is currently planned to be located at the southern edge of an existing cleared power line corridor on both properties. The resources pertinent to this study are plants and plant communities, wildlife species, wildlife habitat and wetlands. The prime purpose was to locate potentially significant features which might warrant a more full documentation, and have some legal status for protection and consideration in the pipeline licensing process. This report summarizes the findings of this assessment..

RE: Northeast Energy Direct - Docket No. PF14-22-000

Dear Secretary Bose:

The Town of Lanesborough submits the following comments on the proposed Kinder Morgan Tennessee Gas Pipeline (TGP) Northeast Energy Direct (NED) pipeline project (PF14- 22). The proposed NED project would have significant impacts on the natural resources, public infrastructure, socio-economics, and public health and safety within the region. The proposed NED project crosses through the Town of Lanesborough and would impact the town. Through the coordination of the Berkshire Regional Planning Commission, the Town of Lanesborough has joined with the City of Pittsfield, Massachusetts, the Towns of Cheshire, Dalton, Hinsdale, Lanesborough, Lenox, Pittsfield, Richmond, Washington and Windsor, Massachusetts, the Dalton Fire District, the Lanesborough Village Fire and Water District, Rensselaer County, New York, and the Towns of Nassau, Stephentown, and Schodack, New York to identify common impacts and requested mitigation measures. Those items are specified in comments submitted by the Berkshire Regional Planning Commission, letter dated October 15, 2015. The Town of Lanesborough endorses and incorporated herein by reference, the comments submitted by the Berkshire Regional Planning Commission.

Sincerely,

Paul Sieloff
Town Administrator

Lanesborough Conservation Commission
PO BOX 1492

RE: Tennessee Gas Pipeline Company, LLC

Proposed Northeast Energy Direct Project, FERC Docket No. PFI4-22-000

Dear Secretary Bose,

The Town of Lanesborough Conservation Commission is submitting written comments to express our concern regarding potential impacts to resource areas due to the proposed expansion of the natural gas pipeline. The Lanesborough Conservation Commission is responsible for safeguarding the Town's natural resources through the administration of the Wetland Protection Act. Some of the Conservation Commission's jurisdiction overlaps with interests that are subject to review under several federal laws including the Clean Water Act, Clean Air Act, and Endangered Species Act. The Commission also reviews projects that require review by the Massachusetts Natural Heritage and Endangered Species Program.

The proposed pipeline expansion will impact approximately 19 property owners. The impacted proper-

ties include lands that are owned by the Town of Lanesborough for the preservation of natural resources and protection of the Town wells, state owned properties for the protection of sensitive areas and endangered species habitat, State forests, and local farms. At least one of the farms that will potentially be impacted has an Agricultural Protection Restriction on file. Some of the areas within the scope of the study area are identified as Priority Habitats under BioMap II and Areas of Critical Environmental Concern.

If built, the pipeline would cross many streams, protected wetland areas, and natural ponds. The Commission is concerned about the potential loss of resource areas protected under the Wetlands Protection Act and the possible impact to wildlife due to the loss of critical habitat for amphibians, native birds, and larger mammals that thrive in our area. At this time, we have not been able to assess the potential impact to certified vernal pools located along the route. Additionally, the Commission is concerned that the post-construction right of way will negatively impact native plants and create a pathway for invasive species to gain a stronger foothold in sensitive areas.

The Commission has heard concerns from residents regarding the proposed pipeline project. Residents have raised concerns regarding the material being used to construct the pipeline and question why a lesser grade of steel would be used in our area. Concerns have also been voiced regarding the perceived safety of the pipeline, especially when our first responders and fire department are comprised of volunteers. Other issues raised before the Commission have included concerns regarding potential impacts to water quality, impacts to groundwater, questions regarding possible impacts to the Town water supply, potential impacts to private wells, possible air pollution, and construction impacts to our local infrastructure

Previous construction projects in our town have required blasting and other invasive construction practices due to the presence bedrock. Installation of a 4" waterline and local shopping area were both delayed due to the geologic profile of the area. Procedures to address any needed dewatering due to high groundwater or construction during storm events have not been discussed. The project will be reviewed in regards to the Massachusetts Stormwater Standards to ensure that water quality is not negatively impacted during or after construction. We would recommend that a full geotechnical survey be completed to fully assess the scope of work required to complete the proposed work.

The Commission has attended public meetings held by Kinder Morgan/Tennessee Gas, Berkshire Regional Planning Commission, and FERC to inform ourselves about this project. The Town of Lanesborough is working with the local regional planning commission to examine the potential impacts to our area. We expect that the applicant will be able to explain how they sought to first avoid areas protected under the Wetlands Protection Act before taking steps to minimize and mitigate the impacts of the proposed work. Unfortunately, the documents released so far by KinderMorganiTennessee Gas have information gaps that are hampering the Commission's ability to offer more specific comments. Location and size of temporary access roads, crossings, and other construction related impacts are missing. Of note, the plans do not identify the location of the proposed staging areas that will be needed throughout construction. The staging areas will result in additional impacts that will need to be considered when evaluating the full scope of the proposed project. Systems for cleaning and maintaining equipment and storage of stockpiled material will be included in our review due to the potential for contaminated material to enter waterways and other sensitive areas.

The proposed pipeline expansion would result in considerable land disturbance. If the project moves forward, ensuring that the project is closely monitored throughout all stages of the construction process will be a priority for the Commission, including monitoring for compliance with all permits and, if issued, enforcement orders. The Commission will also want to evaluate the operation and maintenance plan to guarantee that KinderMorgan/Tennessee Gas will continue to operate in compliance with all permits and regulations once construction has been completed.

The Lanesborough Conservation Commission is deeply concerned about the potential permanent impact a project of this size and scope will have on our town and the surrounding communities. We look forward to the opportunity to continue to monitor the progress of this potential project and review the work for compliance with the Wetlands Protection Act if approved to move forward.

In light of the above, the Lanesborough Conservation Commission requests to be included in the environmental mailing list for this project. We intend to become an Intervenor to the project and ask to be kept informed about the application process.

On behalf of the Lanesborough Conservation Commission,

Stacy Parsons
Chair, Lanesborough Conservation Commission

CC: Governor Charlie Baker

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000
Northeast Energy Direct Project

Monthly Status Report –September 2015

Dear Ms. Bose:

Tennessee Gas Pipeline Company, L.L.C. (“Tennessee”) is filing with the Federal Energy Regulatory Commission (“Commission”) in Docket No. PF14-22-000 its monthly pre-filing status report for the above-referenced project. The enclosed status report covers the period September 1 through September 30, 2015.

In accordance with the Commission’s filing requirements, Tennessee is submitting this filing with the Commission’s Secretary through the eFiling system. Tennessee is also providing complete copies of this filing to the Office of Energy Projects (“OEP”). Any questions concerning the enclosed filing should be addressed to Ms. Jacquelyne Rocan at (713) 420-4544 or to Ms. Shannon Miller at (713) 420-4038.

Respectfully submitted,
TENNESSEE GAS PIPELINE COMPANY, L.L.C.
By: /s/ J. Curtis Moffatt
J. Curtis Moffatt
Deputy General Counsel and Vice President
Gas Group Legal

Mr. Eric Tomasi

**Tennessee Gas Pipeline Company, L.L.C. (“Tennessee”)
 Northeast Energy Direct (“NED”) Project, Docket No. PF14-22-000
 Pre-Filing Monthly Activity Report
 (Reporting Period: September 1, 2015 through September 30, 2015)**

Public Outreach

Tennessee provided the following NED Project notifications:

- o Mailed copies of a compressor station newsletter to landowners in the vicinity of the proposed compressor stations.
- o On September 9, 2015, Tennessee provided Massachusetts, New Hampshire and Connecticut stakeholders with the Tennessee press release and copy of the study by ICF International regarding the New England energy market outlook.
- o Tennessee provided New York stakeholders with the Tennessee press release announcing executed agreements with producers, local distribution companies (“LDCs”), and a New York end-use market participant on September 29, 2015.
- o On September 30, 2015, Tennessee provided applicable Connecticut media contacts with the details of its October 7, 2015 public presentation in West Hartford, Connecticut.

Tennessee conducted the following public community meetings:

- o September 9, 2015: New Ipswich, New Hampshire
- o September 10, 2015: Fitzwilliam, New Hampshire
- o September 15, 2015: Milford, New Hampshire
- o September 16, 2015: Salem, New Hampshire
- o September 17, 2015: Merrimack, New Hampshire

Environmental

Tennessee continued to work on revising Resource Reports 1 through 13 for the final Environmental Report, to be included with the certificate application filing.

- Tennessee continued field surveys during the reporting period, including cultural, environmental, and threatened and endangered species surveys. Tennessee continues to develop survey protocols and prepare for additional threatened and endangered species surveys throughout the Project area as survey protocols are finalized.
- As of September 30, 2015, biological surveys have taken place over approximately 104.17 miles, or 61 percent, of the NED Project Supply Path component route, and approximately 93.48 miles, or 37 percent, of the NED Project Market Path component route. In addition, cultural resource surveys have taken place over approximately 97.81 miles, or 57 percent, of the NED Project Supply Path component route, and approximately 52.17 miles, or 21 percent, of the NED Project Market Path component route. Table 1 below summarizes the completion status of environmental and cultural surveys.

Table 1: Civil, Biological, and Cultural Surveys Performed

Segment	Survey Area* (miles)	Survey Completed (miles)		
		Civil**	Environmental	Cultural
NED West (Supply Path)	171	C: 95.9 D: 89.0	104.17	97.81
NED East (Market Path)	248	C: 80.8 D: 76.5	93.48	52.17

	C: 42%		
<u>% Complete</u>	D: 40%	48%	36%

*The total survey area in Table 1 does not correlate precisely to proposed total length of pipeline for the NED Project. This number represents the survey area for the proposed pipeline and for evaluation of route alternatives.

** “C” represents center line staking. “D” represents completed civil detail survey.

Project Meetings

- Tennessee held a pre-application meeting with the Bradford and Susquehanna Conservation Districts in Pennsylvania on September 9, 2015.
- Tennessee held a pre-application meeting with the Pennsylvania Department of Environmental Protection and Army Corps of Engineers, Baltimore District on September 10, 2015.
- Tennessee attended a meeting with the New Hampshire Department of Transportation regarding state and federal road crossing permit requirements on September 15, 2015.
- Tennessee attended a meeting with the New Hampshire Public Utilities Commission on September 16, 2015.
- Tennessee met with the New Hampshire Farm Bureau on September 17, 2015.
- Tennessee participated in a safety meeting at the Narragansett Indian Reservation on September 24, 2015.
- The Commission conducted a scoping meeting in Rindge, New Hampshire on September 29, 2015.
- Tennessee met with the Army Corps of Engineers, New York District on September 30, 2015 to discuss the format and content of the Individual Section 404 Permit application.

Right-of-Way

- Tennessee has obtained survey permission for approximately 39% of the NED Project Market Path component area, and approximately 55% of the NED Project Supply Path component area.
- Title work is approximately 95% completed for the NED Project Market Path component area and approximately 98% completed for the NED Supply Path component area.

Tennessee has received 258 calls as of the date of this report on the toll-free phone number established for the Project.

Tennessee is continuing to assemble permit application criteria for federal, state, county, and town road permit applications.

Tennessee is continuing to communicate with and seek survey permission from affected landowners.

Engineering

- Tennessee continues to evaluate the proposed route for the Project. Deviations to the proposed route are being reviewed to accommodate construction constraints, and requests from landowners, towns, and applicable regulatory agencies. For deviations that Tennessee has adopted, these revisions to the proposed route will be reflected in the final Environmental Report to be submitted with the certificate application filing. Tennessee anticipates that it will continue to review requests for deviations, and that any additional adjustments to the route that Tennessee determines are appropriate will be filed with the Commission in supplemental filings, as well as with other appropriate permitting agencies.
- Tennessee continues to evaluate the proposed major river crossings, including potential Horizontal Directional Drill (“HDD”) locations. Tennessee is conducting environmental surveys where access is available at these potential locations, and will seek appropriate permits, as needed, for geotechnical investigations.

Tennessee contracted for aerial photography of the proposed primary route for the Project and for several

alternative routes that were discussed in the draft Resource Report 10 submitted on March 13, 2015. The primary route was flown to a one-mile corridor and the imagery continues to be processed. LiDAR information as well as high resolution photography has been acquired and is currently being processed, and will be included in the final Environmental Report to be submitted with the certificate application filing. It is anticipated that additional areas where re-routes have occurred, as identified in the July 24, 2015 second draft Environmental Report, will be flown in the fall 2015 after the leaves are off the trees.

Compressor station layouts are being developed and will be provided in the certificate application filing. Tennessee is continuing to work on scheduling for geotechnical investigations for structural and permeability analysis at the sites of the proposed compressor stations.

Environmental field surveys for the sites of the proposed meter stations have been initiated where site permissions have been obtained. Permissions have been received for eight meter stations.

- Tennessee field engineers continued to identify available access roads, contractor yards, and other areas proposed for use during construction. An updated list will be provided in the certificate application filing.
- Survey activities, including identifying and staking the centerline along all routes on accessible land, continued during the reporting period. Work being performed includes staking and detailed survey along the pipeline route and surveys of supporting sites such as contractor yards and compressor stations. Tennessee continues to conduct survey activities on additional available areas where survey access has been granted.
- Tennessee continued discussions with electric utility companies regarding the co-location of proposed Project facilities with existing utility corridors. Eversource and National Grid provided Tennessee with property information for their facilities and have entered into an agreement with Tennessee to allow for surveys to be conducted on their property. These surveys were initiated during the reporting period and are continuing.
- Preliminary construction spreads have been determined.
- A preliminary hydrostatic test plan has been developed, including depicting potential water supplies and discharge locations. Tennessee will be meeting with jurisdictional agencies to review areas and gain feedback.
- Residential figures were provided based on public information for residences within 50 feet of the proposed workspace with the July 24, 2015 second draft Environmental Report. These drawings are being updated, utilizing the flown imagery for structure locations, and will be included with the final Environmental Report to be included with the certificate application filing.
- Based on discussions with the New York State Department of Environmental Conservation (“NYS-DEC”), an updated template used for a waterbody crossing analysis is being developed.
- Tennessee has developed routing for an I-88 alternative in New York. This route was reviewed for constructability issues and will be presented in the Resource Report 10 included in the final Environmental Report. Mapping has been developed to illustrate this route and NYSDEC was briefly introduced to the routing. A follow up meeting is being scheduled. The route will also be presented to the New York State Department of Transportation to provide feedback.
- Aboveground appurtenance drawings are being developed for metering, main line valve, and launcher/receiver sites. These drawings will be provided during the certificate application.

20151015-5305

LCHIP

Land & Community Heritage
Investment Program

October 15, 2015

Ms. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, DC 20426

RE: Northeast Energy Direct Project, Tennessee Gas Pipeline Company, L.L.C.
Docket No. PF 14-22-000

Dear Ms. Bose:

The Land and Community Heritage Investment Program (LCHIP) appreciates the opportunity to provide comments on the Northeast Energy Direct Project (NED)(Docket #PF 14-22).

In 2000, the New Hampshire's General Court established LCHIP (not to be confused with the similarly named Land Conservation Investment Program "LCIP") as an independent state authority. LCHIP provides matching grants to New Hampshire municipalities and non-profits to protect and preserve the state's most important natural, cultural and historic resources. Its legislatively mandated mission is to ensure the perpetual contribution of these resources to the state's economy, environment and quality of life. Since its inception, LCHIP has provided \$36 million of state money to support 341 grants for land conservation and historic preservation. LCHIP holds interests on behalf of the state of New Hampshire in 120 land conservation projects protecting 268,000 acres. The properties conserved through LCHIP include some of the most pristine lands in the state, as well as important open space parcels in densely populated areas of the state. The program enjoys robust public and legislative support.

The current NED proposal crosses land protected with assistance from LCHIP in the Towns of Mason and Hudson. Interest in lands acquired through LCHIP is held in public trust: State law (RSA 227:M14) specifies that the sale, transfer, conveyance, or release of any resource asset from public trust is prohibited (except for minor modifications to state highways after an extensive review process). In addition, both of these properties were acquired through "bargain sales" wherein the landowner donated a portion of the value of the property to the project. This kind of acquisition may trigger the creation of a charitable trust which comes under further jurisdiction of the Charitable Trusts Unit of the state Department of Justice.

We understand that Kinder Morgan (KM) has developed alternative routes that reduce or avoid impact on other conservation lands in the towns of Amherst and Brookline. We respectfully request that alternative analyses also be performed to avoid/minimize impacts to the lands protected with assistance from LCHIP.

Obviously, any analysis of the impact of the proposed project hinges on the presentation to FERC and other concerned parties of complete and accurate information about all relevant protected conservation lands. The Draft Environment Impact Statement (EIS) and the Environmental Resource Reports (EER) must show the location of all conserved properties with relation to both temporary and permanent impacts of the proposal along the full length of the proposed pipeline. To that end, I am including maps showing the land protected with assistance from LCHIP that is impacted by the current proposed pipeline route location as we understand it. If the proposed route alignment changes, we are willing to provide information about other properties conserved with LCHIP assistance if needed.

The LCHIP-assisted parcels and all of the conservation lands in New Hampshire were protected at substantial cost and effort by citizens because the resources on them include significant environmental, ecological, cultural or other values. The overarching question about the impact of this proposed project on conserved land is whether there actually is a need for additional gas pipeline capacity in the region and if so, what pipeline alignment best minimizes adverse impacts on conservation lands and the communities that host them. Meeting energy needs through increased efficiency in use of existing supplies has no negative impact on conservation lands.

We feel that the EIS and the EER should include an assessment of:

- alternatives that reduce or avoid impacts on LCHIP and other protected lands and their important resources;

- the impact of a no-build alternative;
- The overall impact of and need for this pipeline in the context of the several varied energy proposals currently under review for the region.

Thank you for your consideration of these comments.

Sincerely,

Dorothy T. Taylor,
Executive Director

Re: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000, Northeast Energy Direct Project

Dear Ms. Bose,

The Wild & Scenic Westfield River Committee thanks you for the opportunity to provide comments on the Notice of Intent to Prepare an Environmental Impact Statement (EIS) for the Planned Northeast Energy Direct (NED) Project. Over 78 miles of the Westfield River's three major tributaries and headwater streams are designated as part of the National Wild & Scenic River system. The proposed pipeline project will cross the East Branch of the Westfield River and approximately 20 of its headwater tributaries. In addition, one of the proposed Compressor Stations is situated in close proximity to Westfield Brook – one of the important headwater tributaries supporting the state endangered Lake Chub which is only found in the upper reaches of the Westfield River in Massachusetts.

Our Committee, comprised of representatives from 10 communities, non-profit conservation organizations, regional planning commissions, state and federal agencies, works to preserve, protect and enhance the outstanding natural resources of the Westfield River Watershed in concert with local communities. Through a partnership model, the Committee supports an active corps of volunteers, professional planners, government officials and nonprofit organizations on conservation efforts in the region, particularly as it pertains to the National Wild & Scenic Westfield River designation.

The Westfield River and its tributaries support the top representation of fluvial, coldwater fish communities¹ in Massachusetts and one of the best opportunities for river conservation in Southern New England. The Wild & Scenic designation recognizes the river's nationally and regionally significant "outstandingly remarkable values", including extraordinary scenic and historic resources, supreme whitewater boating and fishing opportunities, large intact forests, outstanding biodiversity and exemplary natural communities. (National Park Service Wild & Scenic Eligibility Findings, 1993 and 2004)^{2,3}

The Committee has concerns about potential impacts to the National Wild & Scenic River and its headwater tributaries from the pipeline, compressor station and associated infrastructure and work resulting from the proposed project. We seek additional details and information as part of the Draft Environmental Impact Statement (EIS) to determine the extent of effects on the “Outstandingly Remarkable Values” for which the river was designated.

Outstandingly Remarkable Values

The Wild & Scenic Rivers Act (Public Law 90-542) states, in Section 1(b) of the Act:

“It is hereby declared to be the policy of the United States that certain selected rivers of the Nation which, with their immediate environments, possess outstandingly remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural, or other similar values, shall be preserved in free-flowing condition, and that they and their immediate environments shall be protected for the benefit and enjoyment of present and future generations.”

Section 7(a) of the Wild & Scenic Rivers Act specifies that, “no department or agency of the United States shall assist by loan, grant, license, or otherwise in the construction of any water resources project that would have a direct adverse effect on the values for which such river was established.” In the case of the Westfield River, the National Park Service conducts Section 7(a) reviews of projects in consultation with the Wild & Scenic Westfield River Committee.

Based on our analysis of the static maps and local knowledge of topography and hydrology, we believe the proposed pipeline will cross or closely parallel over 21 intermittent and perennial stream segments in the headwaters of the East Branch of the Westfield River. These include:

- Unnamed Tributary to East Branch (Windsor)
- Shaw Brook (Windsor)
- Westfield Brook (Windsor)
- Unnamed Tributary to Westfield Brook (Windsor)
- Bartlett Brook (Plainfield)
- Unnamed Tributary to East Branch (Plainfield)
- Mill Brook (Plainfield)
- Meadow Brook (Plainfield)
- North Branch of Swift River (Plainfield)
- Unnamed Tributaries to Meadow Brook (Plainfield)
- Unnamed Tributaries to Bartlett Brook (Plainfield)
- Unnamed Tributary to North Branch of Swift River (Plainfield)
- Swift River (Ashfield)
- Billings Brook (Ashfield)
- Ford Brook (Ashfield)
- Unnamed Tributary to Swift River (Ashfield)

Based on Table 2.2-6 Waterbodies Associated With the Project in Massachusetts, the proponent only identified 18 pipeline-stream segment crossings. In addition, the included 3 proposed stream crossings to carry access roads to the project. FERC should require the proponent to provide GIS-based mapping as part of the Draft EIS so a thorough analysis of impacts to streams, critical habitats and outstandingly remarkable values can be conducted. Further, based on the static maps, it is unclear how closely the proposed pipeline will follow the existing electric transmission corridor right-of-way (ROW). Based on the filings, it appears the ROW will be expanded and/or a new ROW constructed adjacent to the existing ROW. Regardless, there will be potential impacts at all of these river and stream crossings.

The Draft EIS should provide an in-depth and complete analysis of the impacts during and post construction of the project to the outstandingly remarkable values for which the Wild & Scenic Westfield River and its surrounding environs were designated. These values include, but are not limited to:

- Water Quality
- Recreation
- Scenic
- Historic
- Fish and Wildlife
- Cultural
- Geologic

Analysis should include not only the footprint of the proposed project, but impacts associated with construction access via local roads. For instance, truck traffic and traffic control will have impacts on the scenic and aesthetic surroundings, as well as potentially increase the likelihood for accidents while traversing roads leading to these sensitive areas.

The following are examples of some of the Outstandingly Remarkable Values found within 5 miles of the proposed project:

Fish & Wildlife

Lake Chub (*Couesius plumbeus*): The Massachusetts Natural Heritage and Endangered Species Program list Lake Chub as a state endangered species. The only population in Massachusetts is found in the upper reaches of the Westfield River system and represents the southernmost range limit of the species.

Eastern Brook Trout (*Salvelinus fontinalis*): According to the Eastern Brook Trout Joint Venture⁴, catchment-scale study, a majority of the Westfield River watershed is considered to have intact populations of wild brook trout. The Massachusetts Wildlife Action Plan⁵ identifies Brook Trout as one of the key species in greatest need of conservation based on trout being fluvial specialists, pollution intolerant, and part of the coldwater complex of species. Habitat fragmentation was identified as one of the major impacts to brook trout and other coldwater species, especially when populations are isolated and fluvial fish are less able to cope with environmental extremes. Any activities which decrease water quality, increase temperature or cause siltation of spawning habitat are detrimental to this sensitive species. Some populations rely on springs as refuge areas during the warmest periods of the year; if the flow of such springs is altered or reduced, it may result in the loss of the population.

Coldwater Habitat: The Massachusetts Department of Fish & Game (MA DFG) has designated the East Branch of the Westfield River and many of its tributaries as high quality coldwater streams. These streams provide critical habitat to coldwater species such as Eastern brook trout (*Salvelinus fontinalis*), slimy sculpin (*Cottus cognatus*) and the state-endangered Lake Chub (*Couesius plumbeus*). The largely forested landscape of the upper Westfield River watershed provide shade cover and reduce thermal impacts from solar radiation heating, as well as inputs of large woody habitat and organic material to feed the stream aquatic biota.

BioMap2 Aquatic Core Habitat: Many of the streams crossed or in proximity to the proposed project in this region fall within BioMap 2 Aquatic Core Habitat – intact river corridors within which important physical and ecological processes of the rivers or streams occur. In addition, the river corridors are surrounded by BioMap2 Core Natural Landscapes – large natural Landscape Blocks that provide habitat for wide-ranging native species, support intact ecological processes, maintain connectivity among habitats, and enhance ecological resilience, as well as buffering land around aquatic Core Habitats to help ensure their long-term integrity.

Scenic & Recreational

Bryant Mountain and Deer Hill: Steep, wooded hills enclose much of the valley and create strong visual images, particularly in the northwest corner of the town of Cummington where Bryant Mountain and Deer Hill face each other across the river; spectacular during the fall foliage season. The Route 9 Corridor bisects this region, paralleling the river for much of its length, and would be one of the main routes for truck and vehicular traffic accessing the pipeline and Compressor Station locations.

Windsor Jamb State Forest: Includes 2540 acres of protected land. Hiking, cross-country skiing and snowmobiling are allowed on numerous trails and old roads. The East Branch of the Westfield River traverses the State Forest upstream of the proposed pipeline. It is accessed via River Road which parallels the river in close proximity for several miles upstream of the proposed pipeline crossing.

Notchview Reservation: Over 3108 acres of protected land owned by The Trustees of Reservation. The Reservation provides Nature trails, fishing, picnicking, hiking, cross-country skiing opportunities. The pipeline will cross the protected lands corridor which drains to the National Wild & Scenic River segment.

Upper Westfield River Wildlife Management Area: Approximately 315 acres of protected land owned and managed by the Massachusetts Division of Fisheries and Wildlife for wildlife, hunting and fishing. The pipeline will cross the Wild & Scenic Westfield River at this location.

Historic

William Cullen Bryant Homestead: National Historic Landmark on 207 Acres owned by The Trustees of Reservations overlooking the Westfield River valley. The homestead and surrounding area inspired many of William Cullen Bryant's poetry. The view shed from the homestead is minimally changed since the time of William Cullen Bryant.

West Cummington Village: The village includes historic evidence of the former Paper and Tannery mills and old historic buildings. The village's well system is located adjacent between River Road and the East Branch of the Westfield River downstream of the proposed pipeline crossing.

Recommendations for Draft Environmental Impact Statement

The Committee recommends the proponent provide the additional details requested above, as well as further outline measures they will take to avoid, minimize and offset impacts and effects from the proposed project. We are most concerned about:

- Pipeline Stream Crossing Construction Methods
- Clearing
- Land Disturbance
- Introduction of Invasives
- Scenic Resources and Visual Impacts
- Noise
- Encroachment into or Fragmentation of Habitat Areas

We strongly encourage the Commission to identify potential, direct, indirect and cumulative impacts of the project, especially for the resource areas and values identified above. The Commission should require avoidance measures where possible and mitigation measures where avoidance is not feasible.

The Commission should require an evaluation of the proposed methods and determine if the use of HDD, conventional bore and Direct Pipe methods for each stream crossing is feasible, and where they are not feasible provide justification of why one of the alternative methods – wet open cut, dry crossing methods, etc. – is proposed instead. The evaluation should include protective measures to limit runoff of sediment and other fluids into streams, as well as contingency plans if the proposed method fails and results in discharge of materials into the stream. Aesthetic and view shed impacts along the stream corridors should also be considered. If feasible, the methods should avoid and minimize disturbance in the stream and within 200 feet of

the stream.

We recommend field reconnaissance include a hydraulic analysis of each crossing to ensure the pipeline is buried deep enough to remain undisturbed by scour and deposition processes and accounts for any expected horizontal and vertical adjustment of the stream profile. Hydraulic analysis should be based off the NOAA Atlas 14 Volume 10: Precipitation-Frequency Atlas of the United States, Northeastern States (September 2015).⁷

Site specific erosion control and sediment management plans should be provided for each stream crossing. The plans should include site specific terrain and topography, as well as erosion and stormwater measures and a maintenance plan to ensure they are working properly.

The proponents should provide a Stream Restoration Plan for each crossing. The restored stream channel should be similar in the width, depth, slope and substrate to the upstream and downstream reaches and resemble pre-construction conditions.

We want to better understand the water needs and sources of water for this project area. If water is used from streams what measures will be taken to avoid damage to aquatic life, and prevent wastewater from re-entering stream before being properly filtered. The impacts of hydrostatic testing – pressure testing of the pipeline – on aquatic life (both fish and invertebrates) should be determined for all streams. Water withdrawals from hydrostatic testing may result in adverse impacts to stream temperature and water levels, which are critical for fish and other aquatic life. Discharge of hydrostatic testing water can also result in elevated water temperatures and sediment loads.

We strongly urge the Commission to require pre-construction monitoring to establish a baseline on existing conditions of the streams and their surround habitats. A monitoring plan should be in place during and post construction activities and consider the short and long-term impacts to the stream system and its surrounding habitat.

The upper parts of the Westfield River watershed are one of the least developed regions in Massachusetts. The topology and underlying geology are one of the main reasons many industries have not built and developed in the region. The Commission may want to require a hydrologic study for the pipeline and Compressor Station to better understand the impacts from drilling, runoff, bedrock geology, and conditions which may result by removing vegetation and exposing soils, especially on steep slopes and approaches draining to river, wetland and stream segments.

The Committee requests more details on the proposed right-of-way at the stream crossings, including distance from existing corridor and width of clearing. A Vegetation Management Plan should include an invasive management plan which monitors post-construction, but also establishes a baseline of conditions prior to construction.

Access roads, construction staging areas and appurtenance facilitates should be better geographically located to determine proximity and potential for impacts to the river and its “Outstandingly Remarkable Values.” Further, the Proponent should clarify whether the proposed construction activities will be temporary or permanent in nature. For example, Table 2.2-6 Waterbodies Associated With the Project in Massachusetts notes an access road will cross Bartlett Brook in Plainfield (42° 30’ 45.513” N, 72° 57’ 4.385” W) and the length is only 3-feet wide across the stream. If this is a permanent crossing, then it will need to follow the Massachusetts Stream Crossing Standards as outlined by the Army Corp of Engineers General Permit for Massachusetts⁸ and the Massachusetts Department of Environmental Protection’s Wetlands Protection Act (310 CMR 10.00)⁹. This would require the crossing to be 1.2x bankfull width. Based on the USGS Streamstats¹⁰ Flow Regression Equations, the estimated bankfull width of this stream crossing is 8.51 feet, thus the crossing should be 10.2 feet in width. As a result the crossing widths as reported in Table 2.2-6 Waterbodies Associated With the Project in Massachusetts would be substantially underestimated.

Future Consultation

As required by the National Wild & Scenic Rivers Act, FERC will be required to consult with the Secretary

of Interior through the National Park Service. The Commission should strongly encourage the Proponent to seek early and frequent consultation with the National Park Service and the Wild & Scenic Westfield River Committee.

Thank you for your full consideration of our comments.

Sincerely,

Robert Thompson, Chair

Re: Northeast Energy Direct Project, Kinder Morgan Pipeline
Docket No. PF 14-22-000

Dear Ms. Bose:

Thank you for the opportunity to comment on the NED project (Docket No. PF 14-22-000). I am writing as a landowner of approximately 90 acres situated in or near the path of the proposed project in Hudson, NH. The family farm where I presently reside has been owned/occupied by members of my family since approximately 1870. Located on this land is farmland of statewide significance (CpB) and farmland of local

importance (StB). There are 13.6 acres of CpB, Chatfield-Hollis-Canton complex, 3 to 8 percent slopes on my property, according to our Custom Soil Resource Report for Hillsborough County, NH, Eastern Part; by the United States Department of Agriculture and the Natural Resources Conservation Service. See attached map. A significant portion of the CpB farmland will be forever impaired if the pipeline is allowed to pass through my property. There are also 9.8 acres of farmland of local importance, StB, on my property that will be affected by the proposed pipeline. A significant portion of the StB farmland will be forever impaired if the pipeline is allowed to pass through my property. How will the landowner, state of NH and local entities be reimbursed for this forever diminishment of a shrinking resource? How will similar land be created by the proposed NED project and where will it be located? Will the pipeline pollutants and/or installation and maintenance of the proposed pipeline impact the “organic” nature of my crops?

Secondly, I am concerned about the vernal ponds and the habitats they provide for flora and fauna on my property in and near the path of the proposed NED pipeline. Two watersheds will be impacted by this proposed project, namely the Robinson Pond watershed and the Beaver Brook watershed. How will these resources be assessed and protected during and after construction of a large pipeline?

Thirdly, I am concerned about the pollinator habitat that will be interrupted at best and permanently ruined if the pipeline is allowed to pass through my property. My farmland is part of the million pollinator garden challenge. As you may be aware pollinators are extremely important at a time when some pollinators are vanishing. The plants on my land provide continuous sources of pollen throughout the growing season. Razing five or more acres of my property will certainly have an impact on the pollinators. Who will study the impact the proposed pipeline will have on the many pollinators, plants and animals currently calling my property home?

Fourthly, I have noticed what appear to be New England cottontails on my property. The New England cottontail, the only indigenous rabbit of New England, has less than a fifth of the range it had in the 1900s, according to newenglandcottontail.org. Although they may not be on the endangered species list at this writing, permanently removing a significant portion of their habitat, young forests, will not be in their favor. Will you require the NED project to maintain critical habitats already in place on my property, or will you allow them to change the land? Will the indigenous plants and animals be able to return once the land has been excavated and/or blasted to accommodate a thirty-inch diameter pipeline, or will the soil be forever different?

Fifthly, why would you allow a for-profit company to have access to my land by eminent domain? I am told that NH generates more power than it consumes and is a power exporter, so how can allowing NED access to my property at a less than non-pipeline-impacted market values be fair to landowners (myself and others nearby) within the incineration zone? What about the potential impact of a gas leak to all homes within the incineration zone? NED isn't approaching those homeowners for access, but a pipeline leak has the potential to access their properties and cause significant damage to them.

Sixthly, who will be responsible for monitoring the pipeline/NED for the possibility of pollutants escaping the pipeline during routine maintenance? Who will be responsible for cleanup of the pipeline when its functional life has ended? Who will pay to train the emergency response teams needed in the communities impacted by the pipeline?

Sincerely,

Lavinia Miller

Re: Scoping comments responding to the Notice of Intent to Prepare an Environmental Impact Statement for the proposed Northeast Energy Direct project (FERC pre-filing: Tennessee Gas Pipeline Company, L.L.C., Docket No. PF14-22-000)

Dear Ms. Bose:

These are the comments of the Massachusetts Association of Conservation Commissions (MACC) on the scope for the Environmental Impact Statement (EIS) for the proposed so-called Northeast Energy Direct natural gas pipeline project of Kinder Morgan's Tennessee Gas Pipeline Company. These comments are for the portion of the project in the state of Massachusetts.

MACC, established in 1961 and incorporated in 1978, is the professional association of Massachusetts conservation commissions. The conservation commission in each of the 351 cities and towns in Massachusetts is an integral part of its municipal government. Conservation commissions are the municipal government wetlands, wildlife, and open space boards. They exercise the police power, home rule power, and public ownership of conservation, park, and natural resource properties as well as public easements, land restrictions, and other rights. Conservation commissions protect conservation lands and other natural resources in their communities under the Massachusetts Conservation Act (G.L. c.40, § 8c). Notably, conservation commissions administer and enforce the Massachusetts Wetlands Protection Act (G.L. c.131, § 40) and municipal home-rule wetlands laws and regulations. Most projects in or near wetlands require a permit (Order of Conditions) issued by the local conservation commission before work can be performed and the work must be consistent with the conditions of the permit and state and local wetlands protection requirements. Most conservation commissions also manage municipally-owned conservation lands; some hold conservation restrictions or easements on other parcels.

Massachusetts conservation commissions in the municipalities that will be affected by the NED project have been closely following the FERC pre-filing process. The proposed pipeline would be subject to their jurisdiction under the Massachusetts Wetlands Protection Act as well as under municipal wetlands laws. Some own or manage properties through which the pipeline would pass. Many attended the project open houses earlier this year. Many participated in the recent scoping meetings. Many will comment to FERC on the scope for the EIS, either directly or as a part of the comments of their city or town.

On July 2, 2015, we wrote to you, asking that the comment period be extended to allow for adequate time to review Kinder Morgan's extensive multi-volume Resource Reports, which it filed in late July, and because the comment period would occur while many people would be on summer vacation. We appreciate that FERC extended the comment period to October 16, 2015. We think FERC's extension of the comment period is consistent with and required by the Council on Environmental Quality (CEQ) regulations that call for flexibility in setting time limits appropriate to the action, 40 CFR 1501.8, considering the large scope of the project, the potential for environmental harm, Kinder Morgan's altering the proposal and not providing

important information about aspects of its proposal, the voluminous materials that require review, and the significant controversy the pipeline has engendered. We would also expect FERC to provide adequate time, at least four months, and preferably six months, to review and comment on the Draft Environmental Impact Statement.

The pipeline as proposed would cross through large numbers and many acres of wetlands, rivers, streams, and other wetland and water resource areas; large numbers and many acres of conservation lands, including lands purchased with public funds and protected as open space conservation lands by Article 97 of the Massachusetts Constitution; public drinking water supply protection areas and areas that affect residential drinking water wells; working productive farms; forests; lands protected from development by state-authorized conservation restrictions; valuable wildlife habitats; scenic vistas; and more. If constructed as proposed, there would be an underground 30 inch diameter high pressure pipeline and a surface level permanent fifty foot wide swath cut through ecologically sensitive lands on which trees could not grow and structures not be built. We are concerned that Kinder Morgan's preferred path for its large and long gas pipeline, cutting through so much protected conservation lands, will be counter-productive to the continued acquisition and preservation of important conservation areas.

We describe below state and local laws and policies on land use that are relevant to the environmental impact assessment because, as required by 40 CFR 1502.16, the EIS must include a discussion of possible conflicts between the proposed action and the objectives of federal, state, regional, and local land use plans, policies, and controls. That assessment is especially critical for this project, which may allow for federal preemption of state and local requirements. We would expect the EIS to assess the impact of preemption, mitigation for preemption, as well as alternatives to exercising preemption. In addition, the analysis of alternative routes must compare the impacts of the routes on state and local plans, policies, and controls.

Protecting Wetlands

The Massachusetts Wetlands Protection Act, MGL c.131 § 40 (WPA), adopted in 1972, was the first comprehensive wetlands protection law in the United States. It remains among the strongest and most effective such laws in the nation.

The WPA regulates activity that would remove, fill, dredge, or alter a wetland resource area. Areas subject to protection under the WPA are: 1) any bank, freshwater wetland, coastal wetland, beach, dune, flat, marsh, or swamp, providing that it borders on the ocean or on an estuary, creek, river, stream, pond, or lake; and 2) land under any of the water bodies noted above, land subject to tidal action, land subject to coastal storm flowage, land subject to flooding, and riverfront area. Activities in those area are regulated to contribute to these interests: protection of public and private water supply, protection of ground water supply, flood control, storm damage prevention, prevention of pollution, protection of land containing shellfish, protection of fisheries, and protection of wildlife habitat.

In comparison to section 404 of the federal Clean Water Act, which requires a permit to discharge dredged or fill materials into Waters of the United States, the WPA is much more comprehensive in the types of activities it regulates, the areas it protects, and the protections it affords to wetlands.

Municipal conservation commissions in each of the 351 cities and towns of Massachusetts administer the WPA through local permits. The Massachusetts Department of Environmental Protection (MA DEP) promulgates WPA regulations, adopts WPA policy and guidance, and decides appeals of municipal decisions made under the WPA. Both MA DEP and conservation commissions have the authority to take enforcement action to ensure compliance with the WPA. In short, the WPA is a state law that relies on municipal conservation commissions to implement and enforce the law, subject to review by MA DEP.

In addition to administering the WPA, municipalities in Massachusetts may adopt local wetland protection ordinances or bylaws that are stricter than the WPA, providing more protection to wetlands and wetland resources. A majority of Massachusetts cities and towns have adopted their own wetland ordinances or bylaws, also administered by their conservation commissions through local permitting.

Protecting Conservation Lands

In 1972 Massachusetts added Article 97 to the Massachusetts Constitution, providing the people with “the right to clean air and water, freedom from excessive and unnecessary noise, and the natural, scenic, historic, and esthetic qualities of their environment; and the protection of the people in their right to the conservation, development and utilization of the agricultural, mineral, forest, water, air and other natural resources is hereby declared to be a public purpose.” Article 97 authorizes the state to purchase conservation lands and easements to accomplish those purposes and requires the “Lands and easements taken or acquired for such purposes shall not be used for other purposes or otherwise disposed of except by laws enacted by a two thirds vote, taken by yeas and nays, of each branch of the general court.” Those lands may be owned by the state or its political subdivisions. The state’s Article 97 Land Disposition Policy is no net loss of Article 97 lands and that land be removed from Article 97 protection only in extraordinary circumstances.¹ Land disposition includes a change in use, in addition to transfer or conveyance of the property, by deed, easement or lease. *Id.* Easements required by the project for crossing Article 97 land would be a change in use requiring a two thirds vote in favor by both the Massachusetts Senate and Massachusetts House of Representatives.

Massachusetts also designates lands as Areas of Critical Environmental Concern (ACEC) for special recognition because of the quality, uniqueness, and significance of their natural and cultural resources. 301 CMR 12.00. Those areas are worthy of a high level of concern and protection; activities in or impacting the areas must be carried out to minimize adverse effects. *Id.*

Massachusetts also authorizes conservation and agricultural restrictions to be placed on land to maintain such lands in conservation or agricultural use. MGL c.184, §§ 31-33. Those conservation restrictions are most often deeded by land owners and held by conservation commissions or land trusts. The restrictions can be for a specified number of years or in perpetuity. The Department of Public Utilities can authorize a taking of an easement for the purpose of utilities services under specified conditions on lands with restrictions established under MGL c.184, §§ 31-33.

In addition, conservation lands in Massachusetts have been purchased with grants from the federal Land and Water Conservation Fund (LWCF). Those state assistance grants have supported hundreds of projects across Massachusetts’ state and local parks, including trails, watershed lands, and scenic views. According to the U.S. Department of Interior, as of October 13, 2015, there have been 452 LWCF grants in Massachusetts for projects totaling 25,164.48 acres.² Those areas are protected from development under the federal program.

Protecting Drinking Water Supplies

Massachusetts has primacy for and thus administers and enforces the federal Safe Drinking Water Act (SDWA) in Massachusetts. To continue to do so, it must regularly demonstrate to the federal Environmental Protection Agency that it has state regulations at least as stringent as those promulgated by EPA under the SDWA to protect the drinking water of public water supplies.

Public potable water supplies in Massachusetts include surface water sources and ground water sources. Some systems are all groundwater, others are all surface water, and others are a combination. All those systems are subject to state regulation under the SDWA.

Groundwater supplies are protected by the Massachusetts Wellhead Protection Program, which assists communities in preventing contaminants from entering their public drinking water supply wells. The law establishes three zones of protection. Zone I, the closest protective radius around a well or wellfield, must be owned or controlled through a conservation restriction by the public water supplier and may be used only for water supply purposes. Zone II, the next area out, must have various prohibitions and restrictions on buildings and activities in the zone. Zone III, the area beyond zone II, is an area from which surface or ground water drains into zone II; it does not have state protection but can have local protection. Wellhead protection areas are used where zones have not been established. More than 120 communities in Massachusetts have adopted water supply protection laws and regulations to implement the state requirements. Some also protect more water supply areas, including Zone III.

Surface water supplies are protected through watershed management. The Massachusetts Watershed Protection Act protects the reservoirs (Quabbin and Wachusett) that provide water for the Massachusetts Water Resources Authority drinking water system.³ It established requirements for the watersheds of the reservoirs, including buffer zones, prohibitions on activities, acquisition of land, and assistance to watershed communities. Over 85% of the watershed lands that surround the reservoirs are covered in forest and wetlands. About 75% of the total watershed land cannot be built on.

The Watershed Protection Act also authorized the MA Department of Conservation and Recreation, in consultation with MA DEP, to establish requirements for the protection of the other surface water reservoirs. Those reservoirs are also protected through land management and protection requirements.

More than 400,000 people in Massachusetts rely on private wells for potable water. Those wells are not subject to SDWA requirements. The state has adopted requirements for well drilling and guidelines for private well design, construction, repair, and maintenance. The federal clean water act, state WPA, and state septic system regulations provide protections for private drinking water by regulating pollution discharges to surface water, protecting wetlands, managing storm water, and regulating the design, construction, and siting of septic systems. Municipalities have the authority to adopt local laws on maintenance of private water supplies. MGL c.40, § 21. Local boards of health use their powers to issue health regulations for private water supplies in their communities.

Protecting Endangered Species

The Massachusetts Endangered Species Act, MGL c.131A, protects both species and their habitats. Species (animals and plants) may be listed as endangered, threatened, or of special concern. Priority habitats of rare species are designated. With some exceptions, alteration of a priority habitat may be done only with the approval of the director of the Division of Fisheries and Wildlife that the alteration will not reduce the viability of the habitat to support the endangered or threatened species population involved.

BioMap2: Conserving the Biodiversity of Massachusetts in a Changing World

BioMap 2 is “a biodiversity conservation plan for Massachusetts” (quoting from the introduction) and can be used as a prioritization tool to help maximize biodiversity protection.⁴ It combines thirty years of rigorously documented rare species and natural community data with special data identifying wildlife species and habitats, and is integrated with an assessment of large, well-connected, and intact ecosystems and landscapes across Massachusetts, incorporating concepts of ecosystem resilience. BioMap 2 identifies 1,242,000 acres of Core Habitat, key areas that are critical for the long-term persistence of rare species and other species of conservation concern as well as a wide diversity of natural communities and intact ecosystems across Massachusetts. It also identifies 1,783,000 acres of Critical Natural Landscape, large natural landscape blocks that provide habitat for wide-ranging native species, support intact ecological processes, maintain connectivity among habitats, and enhance ecological resilience, as well as buffering land around coastal, wetland, and aquatic Core Habitats to help ensure their long-term integrity. BioMap 2 explains that, “protection and stewardship of BioMap 2 Core Habitat and Critical Natural Landscape is essential to safeguard the diversity of species and their habitats, intact ecosystems, and resilient natural landscapes across Massachusetts.”

Requirements for the EIS

The EIS must rigorously explore and objectively assess the environmental impacts of Kinder Morgan’s proposed action, and all reasonable alternatives to the proposed action, including the no action alternative, as required by the CEQ’s regulations. 40 CFR 15.02.14. Such alternatives analysis is the “heart of the environmental impact statement.” Id. It must be done in a comparative form to provide a clear choice among the alternatives and must include a discussion of direct effects and their significance; indirect effects and their significance; possible conflicts between the proposed action and the objectives of federal, state, regional, and local land use plans, policies, and controls for the area; the environmental effects of the alternatives and the proposed action; energy requirements and conservation potential of various alternatives and mitigation measures; natural or depletable resource requirements and conservation potential of various alternatives and

mitigation measures; historic and cultural resources; and the means to mitigate impacts. 40 CFR 1502.16. Our comments are based on those regulatory standards.

As noted earlier in this letter, the proposed route of the pipeline would cut through conservation lands, including Article 97 lands, wetlands, and public and private drinking water supply areas. The Massachusetts land and water protection programs we discuss above must be incorporated into the EIS's: 1) analysis of impacts when comparing route alternatives, including the no build option, 2) discussion of conflicts between the proposed pipeline route and the objectives of state and local land use plans, policies, and controls for the project area, and 3) determination of what mitigation is needed and appropriate. It should also aid in determining whether the pipeline route could be modified to avoid the impacts. There should be discussion of options and impacts if legislative approval is not granted for easements on Article 97 lands. Further, land purchased with state LWCF grants are not subject to federal preemption and so must be identified and alternatives discussed.

Especially important for analysis would be the impact of the reduced protection of natural resources that would occur with preemption of state and local wetlands protections, drinking water supply protections, Article 97 protections, conservation restrictions, and habitat protections. The EIS must compare impacts with preemption to impacts without preemption. In addition, the EIS should state whether the drinking water supply protections can be preempted, considering those protections are the implementation of the federal Safe Drinking Water Act program delegated to the state. It is our opinion that FERC's preemption authority would not extend to preempting federal requirements of the Safe Drinking Water Act as implemented by Massachusetts under the delegated program.

Massachusetts has two tools that may be employed in the EIS analysis. One, mentioned above, is BioMap2, which explains that the protection and stewardship of the Core Habitats and Critical Natural Landscapes it lists are essential to safeguard the diversity of species and their habitats, intact ecosystems, and resilient natural landscapes across Massachusetts. The EIS should list and discuss each Core Habitat and Critical Natural Landscape through which the pipeline preferred and alternative routes would cut, including the impact of pipeline construction, restoration of the landscape, and long-term maintenance of the easement on the values of each parcel so affected, as well as mitigation options.

The other tool that may be employed in determining and reporting on the impact of the pipeline routes on the ecological value of the lands and waters the pipeline would cross is the Conservation Assessment and Priority System (CAPS) developed at the University of Massachusetts.⁵ CAPS is an ecosystem-based approach for assessing the ecological integrity of lands and waters and subsequently identifying and prioritizing land for habitat and biodiversity conservation. It defines ecological integrity as the ability of an area to support biodiversity and the ecosystem processes necessary to sustain biodiversity over the long term. CAPS is a computer software program that offers an approach to prioritizing land for conservation, based on the assessment of ecological integrity for various ecological communities (e.g., forest, shrub swamp, headwater stream) within an area. CAPS combines principles of landscape ecology and conservation biology with the capacity of modern computers to compile spatial data and characterize landscape patterns. This process results in establishing an Index of Ecological Integrity for each point in the landscape based on models constructed separately for each ecological community. The approach is landscape-oriented and focused on a comprehensive valuation of the entire landscape. It attempts to combine many complex spatial relationships in the landscape that drive ecological processes, including population persistence and community dynamics. The CAPS approach seeks to evaluate the ecological integrity of the entire landscape mosaic, not just the rare species and community locations. It assumes that by conserving intact, ecologically-defined communities of high integrity, we can conserve most species and the ecological processes that shape and maintain ecosystems over time.

The EIS should also perform the analysis of impacts of each of the reasonable pipeline routes as was conducted by researchers at the University of Massachusetts Center for Agriculture, Food, and the Environment on the Project proponent's preferred route.⁶ That report employs a methodology that can be used to compare the various routes. That comparison can be a starting point for a more detailed analysis of impacts on each

parcel and the overall ecology of the area.

To facilitate analysis and review, the EIS should:

- Indicate and show on maps the location of each Article 97 land that the pipeline, including laterals, would cross.
- Indicate and show on maps the location of each parcel purchased with funds from the federal Land and Water Conservation Fund that the pipeline, including laterals, would cross.
- Indicate and show on maps the location of each Area of Critical Environmental Concern that the pipeline, including laterals, would cross.
- Indicate and show on maps the location of each wetland and wetland resource area, including the type of wetland resource per the WPA (e.g., bordering vegetated wetland, vernal pool) that the pipeline, including laterals, would cross. Each of those wetlands should be delineated and described.
- Indicate and show on maps the location of each Core Habitat and Critical Natural Landscape that the pipeline, including laterals, would cross.
- Indicate and show on maps the location of each land with a conservation or agricultural restriction that the pipeline, including laterals, would cross.
- Indicate and show on maps each Zone I, Zone II, Zone III, wellhead protection area, reservoir, and other public drinking water supply through which the pipeline, including laterals, would cross, and each in which the project would come within 100 yards of crossing.
- Indicate and show on maps the locations of contaminated sites that the pipeline, including the laterals, would cross.
- Indicate and show on maps each Priority Habitat that the pipeline, including laterals, would cross.
- Indicate and show on maps each cold water fishery that the pipeline, including laterals, would cross.
- Indicate and show on maps each environmental justice community through which the pipeline, including laterals, would cross.
- Visual resources throughout the route.
- Recreational resources throughout the route.
- Cultural resources throughout the route, including historic sites and buildings.
- For each of the above areas, an analysis of alternative routes and siting that would avoid those areas.
- For each area where the pipeline would be located adjacent to, and parallel with, existing utility corridors, a description of any widening or additional right of way that would be required and the location of that widening or additional right of way.

Information must be provided for each compressor station that would include the information provided for the pipeline and laterals as listed above. Other information required for each compressor station must include:

- The size and footprint of the station.
- Power to be used.
- The size and location of the parcel on which each would be located.
- The route of utilities to and from the station.
- An acoustical analysis of compressor station operation, including the level of noise the station would generate at the source, at the borders of the parcel, and at the nearest sensitive receptors, both average and highest amounts. Also, noise impacts on flora and fauna at the compressor parcel, noise mitigation measures, and a comparison to MA DEP noise standards.
- Expected air emissions data from each station, including a listing of pollutants, yearly average and highest hourly and daily amounts, frequency of emissions, including blowdowns/blowoffs, how

they would affect the concentration of priority pollutants in the ambient air at the site as compared to the National Ambient Air Quality Standards (NAAQS), and in comparison to the Prevention of Significant Deterioration increments, and the impact of its emission of toxic pollutants not subject to NAAQS. It should also quantify its expected methane emissions.

The impact of the project should be analyzed and described for each of the bulleted items, and mitigation options discussed and chosen.

Recognizing that city and town governments, not counties, are the primary local government in Massachusetts, we request that the EIS include a map of each municipality that the pipeline, including laterals, would cross, showing the precise proposed location of the pipeline, lateral, compressor station, etc., in that municipality, as well as the location of the lands and waters noted above. Similarly, charts, graphs, and other details that are provided should be at the municipal as well as county and state level.

There should be a description of the construction techniques that will be used throughout the route, and how they compare to other options that would decrease environmental impacts. Any proposed deviation from Massachusetts WPA requirements, storm water management standards, and erosion control standards related to construction should be discussed and explained.

The proposed pipeline would cross many streams, rivers, and wetlands. Each of those crossings will have environmental impacts on the resource crossed. The EIS must list each water body (river, stream, lake, pond, pool) and wetland that each pipeline route would cross, which construction technique is proposed to be used, and an evaluation of the impacts of horizontal directional drilling as compared to the use of conventional backhoe equipment. Horizontal directional drilling for each crossing, where feasible, would have fewer environmental impacts than would use of conventional backhoe equipment. For example, trenching through a wetland would have much greater environmental impacts on flora and fauna during construction, would require more ecological restoration, and would allow invasive, non-native, and unwanted species to take hold and proliferate. It is our preference that horizontal directional drilling be used wherever feasible when crossing a water body or wetland to mitigate impacts.

The cumulative effect on vegetation and wildlife during construction and restoration must be thoroughly addressed as they relate to the ecosystems through which the pipeline would pass, including forests, shrub lands, waterbodies, wetlands, and wildlife habitats. Construction impacts and inappropriate or ineffective restoration can cause or result in the introduction and proliferation of invasive, non-native, and unwanted species. A restoration plan should be adopted and implemented, with input and approval by the local municipality, to assure vegetation and habitat restoration. The type of habitat should not be altered; replanting should be with native trees and shrubs under a formal restoration plan. There must be regular third-party monitoring of the restoration paid for through a fund established by Kinder Morgan Tennessee Gas Pipeline. Long term maintenance must include a regular schedule of invasive species control.

The descriptions and analyses in the EIS must improve upon the bean counting Kinder Morgan resorted to in its Resource Reports. The EIS must discuss and analyze the ecological quality, value, and services of the lands and waters the pipeline would cross. It is not acceptable under NEPA to do little more than count and compare numbers of acres, streams, or wetlands the pipeline would cross, as was done in the Resource Report. For example, crossing a stream on the I-90 (Massachusetts Turnpike) right-of-way would have much less ecological impact than would crossing a similar stream in a pristine area yet the Resource Reports failed to recognize that essential difference and assigned each stream crossing equal weight regardless of the true nature of the impact. The EIS must include an analysis of the current ecological qualities, values, and services of the lands and waters the pipeline would cross and the impacts expected on those ecological qualities, values, and services.

The proposed pipeline's potential adverse impact on public and private drinking water supplies could be significant. In addition to the devastating impact a pipeline failure would have, the longer term impacts of an underground gas pipeline on groundwater flow must be analyzed. That would require a hydrogeological analysis be done wherever the pipeline would cross Zones I, II, or III, wellhead protection areas, and sources

of private drinking water. The purpose of the analysis would be to determine if the pipeline would have any potential impact on the quality, quantity, or availability of those groundwater sources to be used for potable water, or reserved for future use. There must also be a description of potential impacts on surface water drinking sources that may be affected by the pipeline, including wherever the pipeline would be within the watershed of a reservoir or within three miles of a potable water intake structure. Mitigation measures that will be employed should be described.

The proposed pipeline would greatly increase the amount of fossil fuel that could be burned in the region. The environmental impacts, including the increased emission of greenhouse gases that would result from adding more than 1 billion cubic feet per day of natural gas to the region, must be described, assessed, and compared to the federal Clean Power Plan, the Massachusetts Global Warming Solutions Act, and the Regional Greenhouse Gas Initiative requirements and policies. Because coal-fired electric generating facilities in Massachusetts have closed or are in the process of closing, it cannot be claimed that the pipeline would replace coal with gas. With the announcement that the nuclear power generating facility in Plymouth, MA, will close within two years, the environmental impact of bringing more natural gas into the region, as compared to providing electric generating capacity with hydro, wind, and solar must be described and assessed. Of special importance would be an analysis of whether renewable energy would be the replacement for the nuclear plant if the project were not constructed. In addition, the environmental impacts of connecting the project in Dracut to existing pipeline infrastructure to allow export to Canada and beyond must be assessed; that assessment must include

the environmental impacts of export to Canada and overseas, including increases in greenhouse gas emissions from those areas.

The Union of Concerned Scientists (UCS) recently released a report identifying Massachusetts as a state that is putting its electric consumers at financial risk because of an overreliance on natural gas.⁷ The report appears to contradict Kinder Morgan's claim that the pipeline would reduce electric rates. The EIS should assess how the project would affect the financial risk identified by the UCS report, and the resulting environmental impacts.

The proposed pipeline is a major project that will have significant short and long term impacts on the environment. Those impacts will be exacerbated by the amount of wetlands, rivers and streams, conservation lands, and other protected lands the pipeline will cross and by the additional amount of fossil fuel brought into and through the region. The EIS must provide the information and analyses necessary to evaluate the proposed preferred route and alternatives, the no build option, as well as proposed mitigation measures.

Thank you for the opportunity to comment.

Sincerely,

Eugene B. Benson

RE: Tennessee Gas Pipeline Company, LLC (NED Project)
Docket Number: PF14-22

Dear Secretary,

I would like to respectfully submit the attached press release and news article recently issued regarding Merrimack Village District (MVD) water quality. As you can see from the writings, MVD water is of the highest quality and to jeopardize such a valuable resource by allowing a pipeline through our wellhead protection area is a risk not worth taking.

I would like to quote Andrew Madison from the Granite State Rural Water Association from the attached press release:

“Clean, safe drinking water is something we often take for granted, but a lot of hard work and dedication on the part of drinking water professional goes into providing the public with this resource. “

As with previous correspondence, this submission is to reinforce the MVD’s opposition to the NED project. I appreciate you taking the time to review the attachments. Should you have any questions or would like to speak with me about MVD’s concerns I can be reached at (603) 424-9241 x103.

Sincerely,

Ronald Miner, Jr.

Merrimack Village District wins Drinking Water Taste Test Contest

Newbury, NH- Granite State Rural Water Association held its second annual Drinking Water Taste Test contest on September 15, 2015. Merrimack Village District’s public drinking water system was declared the winner. Orford Village District’s public drinking water system was selected as runner-up. The contest was held during Granite State Rural Water Association’s annual conference, known as the Operator Field Day and Exhibit Show at Mount Sunapee Resort in Newbury, NH. Eastern Analytical Inc. of Concord, NH generously sponsored the event. Merrimack Village District qualifies to participate in the Great American Taste Test, a national contest held by National Rural Water Association each year in February, in Washington D.C.

Seventeen public drinking water systems from across New Hampshire entered the contest. Samples were judged on taste, aroma and clarity by a panel of distinguished experts representing NH Department of Environmental Services, US Environmental Protection Agency, and US Department of Agriculture's Rural Development Agency.

"The Drinking Water Taste Test is a fun way to highlight the importance of this natural resource. It's a great way to share with the public the important role that drinking water utilities play in terms of public health and safety" said GSRWA Executive Director Jennifer Palmiotto. According to contest organizer and GSRWA Sourcewater Specialist, Andrew Madison, "Clean, safe drinking water is something we often take for granted, but a lot of hard work and dedication on the part of drinking water professionals goes into providing the public with this resource." "MVD works hard every day to supply clean, quality, and great-tasting drinking water so we're very pleased to be voted 'Best Tasting Water'" said Ron Miner, Superintendent of Merrimack Village District's water system.

This year's Operator Field Day provided training opportunities for drinking water system operators with a focus on energy efficiency. Water professionals from NH Department of Environmental Services, Ever-source Energy, municipal water supplies, and companies gave presentations on how water and wastewater utilities can increase their energy efficiency. There were over 50 exhibits where vendors displayed the latest products and services for the drinking water and waste water industry.

Granite State Rural Water Association is the New Hampshire state affiliate of the National Rural Water Association and provides training, technical assistance, and legislative representation for drinking water and wastewater utilities throughout the state. For more information on the Drinking Water Taste Test please contact Andrew Madison at amadisongranitestatewater.org.

Merrimack's water supply voted tastiest statewide

By TINA FORBES

Staff Writer

You may think the water coming out of the tap is all the same. You probably don't think about it much at all, but Ron Miner does, and it's earned the Merrimack Village District Water Works a little recognition and a trip to Washington, D.C. - although flying it there is out of the question.

After a taste test of New Hampshire tap water last week, Merrimack Village District Water Works placed first for best public water of 17 contestants from around the state. "MVD works hard every day to supply clean, quality and great-tasting drinking water, so we're very pleased to be voted 'Best Tasting Water' Miner, superintendent of Merrimack Village District, said in a Sept. 17 press statement.

By winning the contest, Merrimack Village District qualified to participate in the Great American Taste Test, an annual national contest held by National Rural Water Association in February, in Washington, D.C.

MVD manager fill Lavoie said they plan to send a representative with water samples to D.C. for the contest. "It's going to be exciting," she said.

Lavoie said because of restrictions on carrying water by plane, they might have to find an alternate route.

"We probably have to travel by train," she said.

For the New Hampshire contest, water samples were judged on taste, smell and clarity by a panel of experts from the state Department of Environmental Services, U.S. Environmental Protection Agency and the U.S. Department of Agriculture's Rural Development Agency.

"The 'Drinking Water Taste Test's a fun way to highlight the importance of this natural resource. It's a great

way to share with the public the important role that drinking water utilities play in terms of public health and safety,” said Jennifer Palmiotto, executive director of the Granite State Rural Water Association. The GSRW hosted the competition Sept. 15 during the group’s annual conference at Mount Sunapee Resort in Newbury. The Orford Village District public drinking water system placed second in the drinking water contest. It was the second Drinking Water Taste test hosted by the GSRWA.

“Clean, safe drinking water is something we often take for granted, but a lot of hard work and dedication on the part of drinking water professionals goes into providing the public with this resource,” said GSRWA sourcewater specialist and contest organizer Andrew Madison.

Merrimack Village District provides water for 87 percent of Merrimack, which has a population of about 25,500 people. In 2014, MVD pumped a total of 801,546,900 gallons of water for the year.

Granite State Rural Water Association is the New Hampshire affiliate of the National Rural Water Association. The group provides training, technical assistance and legislative aid for drinking water and wastewater utilities in the state.

Re: Tennessee Pipeline LLC

Docket #4-22-000 Proposed Northeast Energy Direct -NED

Dear Members of the Federal Energy Regulatory Commission,

After in-depth research and careful consideration, the Peterborough Select Board has voted unanimously to join in solidarity with our neighbors to oppose the proposed Northeast Energy Direct / Morgan natural gas pipeline. We are writing to explain our reasoning for this decision and ask you to:

- stand with us by voicing our opposition to the pipeline .
- Issue a challenge to all businesses and municipalities in New Hampshire to ramp up their efforts with conservation, energy efficiency and lead us all on a path towards a renewable and sustainable future

Peterborough: The Greenest Town in New Hampshire

The Town of Peterborough, NH has a reputation for being a leader in renewable energy uses and conservation methods within its municipal facilities. The wheels were put in motion on a path towards energy conser-

vation and enhanced use of renewables in 1996. In 2007, after having incorporated the use of solar, biomass and “green” purchasing policies, the Select Board asked for more and issued a 5% Carbon Emissions Reduction Challenge to town administration. By 2011 the town had reduced its Green House Gas Emissions by 22% across all eleven municipal buildings. 2013 brought the upgrade to 100% purchasing of wind power. In September 2014 Our Town was awarded the EPA’s Green Power Leadership Award among the likes of such well respected institutions as Herman Miller, Inc, REI, Steelcase, Inc. Trek Bicycle Corporation and the City of Houston, TX, to name a few (<http://www.epa.gov/gm:npower/awards/winners.htm>). We are currently constructing a one megawatt solar array at our waste water treatment facility, the biggest in the state of New Hampshire. We have accomplished this with overwhelming support from voters in town. We continually avoid spending tens of thousands of taxpayer dollars with this complete energy plan. Being recognized for our forward thinking and setting this precedent in our great state, we feel comfortable touting ourselves as “The Greenest Town in New Hampshire”.

No Need for Expansion into Natural Gas

Peterborough’s intuition with conservation and conversion to renewables has not only been profitable and sustainable, but it is living proof that the need for expansion into natural gas is unnecessary. There is no documented proof of the need for this “fossil fuel” now in New Hampshire, nor will there be if our healthier, environmentally friendlier path is taken. We have laid the groundwork. Our model is easy to duplicate and in fact we have been called upon by other municipalities as well as meeting with climate change and renewable energy specialists from around the world for insight into the process. We are convinced that the real discussion should be one directed towards smart conservation, fiscally responsible energy efficiency and “focus on locally sourced renewables”.

Potential Devastation of Natural Resources

Peterborough’s Conservation Commission unanimously voted to join forces with conservation commissions state wide in signing a letter opposing this proposed pipeline. The compelling evidence regarding the potential devastation of natural landscapes, wetlands, habitats and drinking water from wells, was paramount to their decision to sign.

Violation of Trust: Confiscation of Conservation Easements

Perhaps more importantly, the danger of the Violation of Trust in which generous citizens have consigned their land convinced the group that this taking of private land for corporate profit was unacceptable.

Safety, Health and Wellbeing

The uncertainty of the safety of said pipeline draws concern for the health and wellbeing of our partner towns directly effected as it snakes its way through forests, over hills and through valleys. According to multiple studies, the large volumes of hazardous toxins that will regularly be released from the compressor station planned for New Ipswich can impair the health of citizens throughout the area. Siting this facility so close to the Temple Elementary School further demonstrates this company’s disregard for public health. If an emergency were to occur, Peterborough’s response would be certain. However we have a volunteer Fire Department, as do these other towns, and the cost for training and special equipment needed to handle such an occurrence would place an unfair burden on our already budget conscious departments region wide.

Thank: you for your careful consideration on this difficult matter.

Respectfully,

The Peterborough Select Board

888 First Street, NE, Room 1A
Washington, DC 20426

re: Kinder Morgan proposed pipeline

Dear: Secretary Bose,

I would like to thank you for the opportunity to present our concerns regarding the proposed Kinder Morgan gas pipeline routing. The Housatonic Valley Association (HVA) is dedicated solely to protecting the environmental health of the 2,000 squaremile watershed of the Housatonic River and tributaries. HVA is a watershed conservation organization whose mission is to protect the natural character and environmental health of the entire Housatonic River Watershed for this and future generations. Our river stewardship concerns encompasses all 150 miles of the Housatonic River mainstem and the 2,000 acres of watershed land.

Our obvious concern is over the potential negative environmental impact the gas pipeline will have on the headwaters of the Housatonic River Watershed. The intrusion of this gas pipeline during construction and the possibility of major environmental damage over its lifetime if installed, is a major cause of anxiety.

As EPA states, "headwater streams, are critical to the health of the entire river network and downstream communities. Headwater streams trap floodwaters, recharge groundwater supplies, remove pollution, provide fish and wildlife habitat, and sustain the health of downstream rivers, and lakes. Because small streams and streams that flow for only part of the year are the source of the nation's fresh waters, changes that harm these headwaters affect streams, lakes and rivers downstream. These streams also play a critical role in maintaining the quality and supply of our drinking water, ensure a continual flow of water to surface waters, and help recharge underground aquifers".

Therefore the area in question for this pipeline is a concern over the environmental integrity of this relatively undeveloped area in the Berkshires. Also, not only would there be environment impacts, but also since this area is prime hunting, fishing and tourism destination due to the pristine nature, it is also important for our local economy The area in question in the Housatonic Watershed is a pristine area that is enjoyed and utilized for its present conditions and should be protected from unnecessary, potential harmful development.

We also have very strong concerns over the possibility that this project may not need to abide by existing federal, state and local laws that are in effect to ensure protection of our environment fmm degradation by damaging development projects. In particular, this development project should follow the mandatory requirements of the Federal Clean Water Act, and the Massachusetts Wetlands Protection Act, and all local laws required by municipalities such as the Scenic Mountain Act and any Storm water town By-laws.

This pipeline will have a definite environmental cost should it be allowed to be constructed. At this time, the benefits of installing this pipeline does not seem to outweigh these environmental costs. The bottom line is that we feel that the need for this pipeline has not been proven, and that the environmental and recreational cost of this project does not outweigh the benefits to the public. Therefore, we have strong reservations

about the need and environmental cost of this development.

Sincerely,

Dennis Regan
Berkshire Director

Washington DC 20426

Docket #PF 14-22 (Northeast Energy Direct)

Dear Secretary Bose,

Thank you for extending the Public Comment phase of this process. I appreciate your willingness to give the public additional time to voice our concerns. Kinder Morgan's posture throughout the proceedings has been as if it is just a formality for FERC to grant approval for their proposed pipeline. They have not felt the need to submit accurate or complete information to the Commission in their filings, and they have been less than forthcoming about notifying the officials here about changes to the proposed route through Richmond (New Hampshire) and elsewhere. Here are several points that I would like to bring to the Commission's attention.

Winchester/Richmond NH Town Line

Beginning with the first submission by Kinder Morgan modifying the NED route to the "New Hampshire Powerline alternate", right up until the present, the town line between Winchester and Richmond, New Hampshire is wrong. (Hatch Mott MacDonald plats accompanying the December 2014 filing and a subsequent Revision dated August 21, 2015). I would like to emphasize that it is not wrong by an insignificant amount. It is plotted about 900 feet west of its actual location. Being that the two towns were incorporated in 1753 and 1752 respectively, the town line has been a matter of public knowledge for quite some time. Every ten years representatives from each town walk the town line(s) to verify it and to refresh the markers, pins and blazes on the trees, which are all clearly visible in the vicinity of the proposed route, both on Rte 119 and on the Mountain Turnpike Road. The TIL as plotted by Hatch Mott MacDonald is to the West of Stone Mountain Road, off Mountain Turnpike Road. (yellow highlight) On Rte 119 the real TIL is at the west end of the turnout, just as the road straightens. (orange highlight - approximate) As can be seen, that is a considerable discrepancy. If this engineering firm can't even correctly plot a town line that has been in existence for over 250 years, it calls into question everything else that they have generated for Kinder Morgan. It also begs the question: Does anyone at Kinder Morgan or Hatch Mott MacDonald know where the route really is supposed to go?

FERC File 20141208-521729960502

"DRAFT ENVIRONMENTAL REPORT RESOURCE REPORT I, GENERAL PROJECT DESCRIPTION"

Another glaring omission is the use of "TBD", in the text and tables, rather than providing the information. On Page 8, the text provides a list of looping & co-location of the proposed pipeline.

"The proposed Project involves the following facilities:

- Approximately 32 miles of pipeline looping on Tennessee's 300 Line in Pennsylvania;
- Approximately 135 miles of new pipeline proposed to be generally co-located with the Constitution Pipeline Project proposed by Constitution Pipeline Company, LLC ("Constitution")³ in Pennsylvania and

New York (extending from Tennessee's existing 300 Line near Auburn Center, Pennsylvania to Wright, New York);

- Approximately 53 miles of pipeline generally co-located with Tennessee's existing 200 Line and an existing utility corridor in New York;
- Approximately 64 miles of pipeline generally co-located with an existing utility corridor in Massachusetts;
- Approximately 71 miles of pipeline generally co-located with an existing utility corridor in New Hampshire (extending southeast to Dracut, Massachusetts)"

Table 1.1-2 "Areas of pipeline looping and co-location of pipeline facilities" page 27, summarizes this information in table form.

Every single one of those areas where the proposed pipeline is looping or co-located with another line or utility corridor, there are detailed project plans and other resources which show slope, depth to bedrock, soil, terrain, etc. Yet when you scroll forward to the section on "rugged topography" Pages 67- 70, the tables are all filled in with TBD.

Table 1.3-2 Steep Slopes (15 - 30%) crossed by the project.

Table 1.3.3 Steep Slopes (>30%) crossed by the project.

Table 1.3-4 Steep Side Slopes (15-30%)

Table 1.3-5 Steep Side Slopes (>30%)

TBD for PA, NY, MA & NH in all 4 tables.

As special construction techniques for both Steep Slopes & Steep Side Slopes, and A TWS requirements for Steep Side Slopes over 30%, this is very relevant information to have when evaluating the merits of this route. All it takes to figure out slope percentages is a topographic map, a calculator and a ruler. You would think with the technology available and the resources mentioned above, Kinder Morgan's engineering department should be able to do likewise. It again speaks to the assumption that FERC is going to rubber stamp this application and neither FERC nor the public have a need to know that information. This very cavalier attitude to details can and has been the cause of various "incidents" involving Kinder Morgan's pipelines, which have resulted in loss of life and property.

Depth of Pipe Burial

My third concern is the stated intent to bury the pipe no more than 3 feet deep. Anyone who drove over any secondary road in New England last winter got to experience first hand what frost action can do. Given that when the route is not going through bedrock, it is going through unconsolidated glacial till, the pipe will be subjected to freeze/thaw activity if not below the frost line. As a safety issue, there are compelling reasons to bury the pipe below the frost line.

The burden of proof for all the many questions and concerns should be on Kinder Morgan, not on the people whose property is going to be stolen from them; not on the endangered and protected species; not on the municipalities that will have to pick up the tab for a devalued tax base and the extra expense of equipment and training to respond to a gas pipeline "incident"; and not on the quality of life and the natural beauty of the States that the line will traverse.

I am very heartened that FERC has given us this extra time to voice our concerns. It signals to me that this is going to be an open, deliberative, thorough and fair process. I appreciate the efforts of all the many staff members working on this docket.

Sincerely,

Jennie L. Hill

Docket PPF14-22-00
(Northeast Energy Direct)

Dear Secretary Bose,

Attached is a letter I sent to the New Hampshire Fish tk Game Executive Director requesting that they send comments regarding a Canadian Lynx that has been seen with some regularity in the vicinity of the proposed pipeline route through Winchester, Richmond dt Fitzwilliam, New Hampshire. At this point, they do not have “hard” evidence of the existance of this protected species in the area, however I saw it, as have a number of other people in the area. I am monitoring this (as well as carrying my camera with me at all times.) I ask that the record show that there have been sightings of this animal and that the environmental review process take that into account. In the interest of the animal’s safety, I ask that this commuunication be treated as privileged and not be open for public view.

Thank you for your assistance with this matter.

Best regards,

Jennie L. Hill

New Hampshire Fish Jk Game Commission
Glenn Normandeau, Executive Director
11 Hazen Drive
Concord, NH 03301

RE: Kinder Morgan NED Proposed Pipeline, FERC Docket 1 PF14-22

Dear Mr. Normandeau,

I was privileged to see a Canada Lynx in January 2015 crossing Forest Lake Road in Winchester, New Hampshiie at the power lines, approx. I to 2 miles from the proposed route of the pipeline. My brother, Jon Hill saw the lynx in July on Cross Road in Richmond, less than a mile from the proposed route. A neighbor, Earl Hammond saw the lynx three weeks in a row in the spring on Richmond Road in Fitzwilliam, again near the proposed pipeline. He said his brother had informal confirmation from local Fish 1sGame personnel that there was a lynx in the area. At the FERC Scoping Meeting in Rindge on September 29, 2015, a Fitzwilliam resident who lives in the path of the proposed pipeline, in remarks to FERC said he had seen “moose and Canadian lynx” on his property. One of the FERC people said this is the type of information they need for their enironmental review, but that as reported above it is hearsay; that what is needed are pictures, scat

or some hard evidence and especially that (NH) Fish & Game file a comment verifying the presence of lynx and other threatened and endangered species to them. I understand that it can be filed as “privileged” information, for FERC access only, thereby protecting the endangered species. I am hopeful that you have already given this information to FERC.

I am especially concerned about the impact of this proposed project on all living species in its path, not the least of which are the human residents. There are so many ways that it has already negatively affected the lives of those in its path, as well as “collateral damage” that directly affects the hunting and fishing community of New Hampshire. A 2000 acre tract of land near my home was posted this summer to keep Kinder Morgan personnel and contractors off the property. Unfortunately it applies to everyone, including all the people who have used it for recreational use, hunting & fishing for generations. We look forward to seeing “old friends”, hunters who have been coming from Massachusetts to hunt in these woods every fall for as long as I have lived in Richmond. Those yellow signs that have popped up all over southern New Hampshire are going to cost the State a lot of hunting license revenue, once out of state hunters find that they can no longer hunt in their old haunts.

I appreciate your stewardship of the wildlife and open space of New Hampshire. If my testimony can be of any value in this matter, please feel free to contact me.

Best regards,

Jennie L Hill

Re: Tennessee Gas Pipeline Company, LLC
Docket No. PF14-22-000
Northeast Energy Direct Project

Dear Secretary Bose:

I would like to submit the following comments for review for the EIS scoping for project PF14-22-000, the proposed Northeast Energy Direct (NED) project. I have a background in the education and natural resource planning fields, and my family has owned property in east Northfield, Massachusetts for twenty five years. I have many concerns about the proposed TGP's NED pipeline, and in particular, the environmental impacts of the proposed 41,000 HP compressor station on Gulf Road, which would be sited only two miles from a densely populated area of town. Our concerns include toxic air emissions, both intentional and unintentional, erosion and stream sedimentation, drinking water contamination, flooding, noise and vibration, leaks and fumes, forest fires, inadequate emergency response personnel, destruction of ecologically important wildlife habitat and conservation land, and lowered property values. Of particular concern to me are the impacts that this proposed compressor station would have on the Mifflin Brook Watershed, and my comments are focused there. I respectfully request that Tennessee Gas Pipeline Company address the following concerns in their environmental impact statement

Richard Wheafey, a spokesman for TGP's parent company Kinder Morgan, has stated that “The unmanned compressor stations, which operate around the clock, are typically located on sites that average about 25 to 30

acres.” This is very concerning when taken into consideration with the geology of this site and the residences within dose vicinity. Various reports done by the town point to the steepness of slopes in the uplands of east Northfield which are very vulnerable to erosion. The proposed site of this compressor slabon is a heavily forested and mountainous area in one of the highest elevations in the town. If built here, this compressor slafion would be perched at the top of a sensitive watershed at the headwaters of the Mifieis Brook, a state cold water fishery resource and one of the five sub watersheds of the Connecticut River in Norlhfield. The Massachusetts Division of Fisheries and Wikf life has identified cold water fisheries as important habitat for a number of cold water species, including trout. These are typically more sensitive than other species to alterations to stream flow, water quality and temperature within their aquatic habitat. The Millers Brook is a high quality water resource and town master plans have pointed to the need for its protection. Logging operations and storm water runoff along Gulf Road have caused some serious problems with erosion sedimentation in this watershed, but the scale and magnitude of this compressor station facility would result in problems of a much larger scale to wildlife and to people living downhill and downstream.

The deforestation of ten or more acres, followed by blasting and trenching th h waterways and the disturbance of the soils during construcion, will lead to soil and debris being qu’ashed away, and this will inevitably result in stream degradation. Once construcion is complete and the vegetabon and soils that are crucial for absorbing slowing water flow and providing a pollution control function are removed, this will lead to even greater pohvÅial for flash fkeding and conhmination of ground and surface waler. Both the quality and quantity of water will be affected, and stream beds will be silted in. Added to these concerns is the lower standais for this dass of pipeline, increasing the risk for accidents. The disturbance and dearing of such a large tract of forested land could also permanently alter the hyd and result in redirecting water and possibly drying out sream beds. According to the state geologist who I consulted with, it is important that spatial data and water well completion reports be hoked at for towns effected by the pipeline. He advised that a comprehensive study of Mass GIS maps and the water well completion report database be undertaken and overlaid along the pipeline route, looking at hydrogeologic factors such as water level and depth to bed-rock. To date, this has not been done.

Traflic and construction along Gulf Road would also seriously impact this waterway, and one of the branches of the Millers Brook flows downhill from the compressor station site akxig Gulf Road and then discharges into the Millers Brook less than a mile upstream of Pratt Hoikiw. The impact from shorm water runoff from Gulf Road is a signiflicant problem in this kication. The buikfing of a large compressor skttion will intensify the amount of runoff being tfischarged into the brook and increase the likelihood of flash fkeding, endangering the residents living downstream from the compressor station.

The proposed site also lies within a town drinking water recharge zone, and well water contamination from normal operations, leaks, and application of chemicals at the sits is a serious concern. The 2015 Northfield Water District Consumer Confkference Report states that ‘Water is a valuable resource for any community. If something threatens that resource, then the community is threatened.’ The report states ‘‘Tfitxe is no evidence of a confining (protective) day layer in the vicinity of the well’’ in the area served Qthis water supply. It also states that Wells loaded in an unconfined aquifer are considered to have a high vulrierability to potential contamination due to the absence of hydropeoigic banter (i.e. clay) that can prevent contaminant migrabon into the aquifer from the surface.’he compressor station site is within the recharge area for this public water supply. In addition, numerous private wells downstream and downhill are vulnerable to ground and surfTMacewater contsmination.

In addition, the Millers Brook borders a number af residents’omes where it meanders through the town, and the FEMA maps show that along this waterway from around Pratt Hollow Road down to Main Street is designated as a flood zone. The National Rood Insurance Program’s maps show 100year flood plains occur along the Millers Brook from its confluence with the Connecticut River upstream to approximately one quarter mile past the intersection of Gulf and Alexander Hill Roads.

The impact to the flora and fauna need to be addressed in the EIS. The Millers and Roaring Brooks are listed by the slate as upstream Forest Core Habitat and part of the extensive Connecticut River Core Habitat. It

goes on to slate that “Forest Cores are the best examples of large, intact forests which support many bird species sensitive to the impacts of roads and development and help maintain ecological processes found only in unfragmented forest patches.” The 2012 Town Open Space Plan for Northfield also contains information on wetlands, geology, and listed rare, threatened and endangered species “along the banks of Millers Brook from its headwaters to approximately the intersection of Alexander Hill Road and Gulf Road, including tributaries along Alexander Hill Road and Gulf Road.”

In conclusion, the construction and operation of a compressor station in this location, only three miles from Main Street and the center of town, would be a serious threat to the community. I request that Tennessee Gas Pipeline Company fully address the concerns relating to the siting this compressor station in this environmentally sensitive area, and that the need for this pipeline and any alternatives be considered. In addition, please consider that scientists’ estimates of shale gas reserves are lower than industry analysts are projecting, and fracked gas, which is hugely damaging to the environment, is not a long term solution to our energy needs. Gambling with our precious water and other resources and putting our homes and communities at risk for a pipeline that is not needed does not make sense economically or environmentally. I believe that the evidence that has been carefully presented by many citizens proves that this pipeline is if conceived, and this evidence has been very thorough and compelling. In a recent letter to federal regulators, the state Attorney General’s Office wrote that the proposed Northeast Energy Direct Pipeline “makes it more important than ever” that federal regulators conduct a comprehensive examination of the need for the project and of any and all alternatives to it. The IEFAR also criticizes the state DPU’s review of long term agreements for Berkshire Gas, National Grid and Columbia Gas to buy gas from the NED pipeline. Also, former Attorney General Ann Berwick has said this pipeline is not needed and that it would actually have negative consequences for rate payers and for our energy future. More and more evidence keeps mounting on how ill conceived this project is. The Conservation Law Foundation’s lawsuit and the Attorney General’s upcoming report should also shed more light on the “need” for this pipeline, and I urge you to consider its findings.

Thank you for this opportunity to comment and for your taking into consideration my concerns.

Martha Rullman

RE: Docket #PF 14-22

Dear Ms. Secretary,

My name is Josiah Barthelmess, I live in New Ipswich, directly across the street from the proposed compressor station. Hi Mr. Tomasi, it’s been awhile, but I am back. Sorry I have to keep following you from town to town at scoping meetings, but FERC refused to hold a meeting in my town even after the Governor’s request - so here I am once again. I would like to introduce you to a few people I have brought with me. These are just a few of the Kids of the Pipeline Resistance. I told you our numbers were growing. Look at our faces each and everyone. We are just a small number of the kids who will be greatly affected by your decisions.

We don’t own property, or have any money, we are not old enough to vote. But we have heart, and we have voices, and we will be heard.

We learn in school that all people have the right to life, liberty, and the pursuit of happiness. All three of these are under fire right now. How was your kid's summer compared to mine Mr. Tomasi? Have they had to fear they would lose their home, or have you had to tell them they have to move because this area will be unhealthy to live in. Do you have stranger's trespassing on your land and out-of-state contractors racing up and down your road daily? How about hearing from good friends and neighbors at the local soccer game asking you why bother, they've already been told it's "a done deal". This has become our reality, and it is unacceptable. My generation is having to grow up quicker than intended and we have Kinder Morgan to thank for that.

Let's talk about the environment where us kids live, and how it will change if this compressor station comes in. We will no longer see the stars or hear the birds chirping when we play out in our yards. Our parents chose Southern New Hampshire to raise us, away from the city, pollution and noise. If FERC approves this pipeline, we along with hundreds of other children will be breathing in methane, formaldehyde, and benzene - just to name a few of the poisonous emissions. You are more concerned with the wild animals, than the actual people who will live in this toxic environment. We will no longer be able to drink the fresh water from our wells, instead Kinder Morgan told us you'll truck in water. I know my teachers will be upset with that one if I don't shower. After all I am an 11 year old boy.

Studies are coming forth regarding the effects of living near compressor stations. Bloody noses, migraine headaches, skin rashes, respiratory issues just to name a few. This is what you are bringing to the town of New Ipswich, this is what you are bringing to hundreds of children. And do you expect my generation to thank you for the promises of lower energy costs at the sacrifice of our health. You are asking New Hampshire to take one for the team, to sacrifice the health of the children for corporate greed, with the smoke screen its for the Energy Crisis in New England. You are chancing our health and our lives and we are not pleased.

Ferc please take into consideration the intensive studies that are being done regarding children who grew up living near a compressor station. We need to slow this project down, instead of barreling forward. Bad decisions are often made during a so called crisis, and those decisions will effect generations to come. FERC needs to make every TBD by Kinder Morgan - answered and accounted for before your decision is made. If I filled in a job application with TBD's, I would either be asked to answer them directly or better yet, my application would be thrown out, and I wouldn't get the job. Kinder Morgan needs to answer all TBD's to even be considered getting the job, or better yet, I have a better idea throw the application away.

I don't see any Kinder Morgan executives or any of the people who hold the decision of whether this pipeline goes in, such as Ferc's board, moving your families and children to live across the street from a compressor station. Maybe if those people who make the decisions were to live within a half mile of a 40,000 horsepower compressor station, it would give more credit to you saying they are safe and environmentally OK. As long as it isn't your health and the environment in which you live in, you can say whatever you want. Would you sacrifice the health of your own family and children? You probably wouldn't take that chance. Yet here we are ... standing before you, Kids of Southern New Hampshire, the Kidz of the Pipeline Resistance, asking you why we don't matter? Is it because we are just a number and not a face? We are here to put a face to that number. We are just as important as your own children and I am here to say we do matter.

Thank you for your time.

Comments RE: Tennessee Gas Pipeline Company, Docket No. PF14-22-000, Northeast Energy Direct Project

- Improper Segmentation - customers listed in the CT Expansion Project (FERC Docket No. CP14-529-000) are also listed in the NED FERC Docket (PF14-22-000), specifically Connecticut Natural Gas and The Southern Connecticut Gas Company in the amount of 35,000 Dekatherms/day and 10,000 Dekatherms/day respectively. This equates to approximately 8.5% of the NED total consisting of approximately 524,363 Dekatherms/day per the current count.

The environmental impact of the CT Expansion Project must be considered as part of the NED Environmental Impact Statement (EIS), reference NED Resource Report 1- Page 1-10 Section 1.1.1 Purpose and Need: “Connecticut Natural Gas, Southern Connecticut Gas Corporation” , or these amounts removed from the NED commitment total.

- TWS/ATWS - NED Resource Report 1- Page 1-44 Section 1.2 Land Requirements & Table 1.2-1, indicates that this “temporary” space is almost three times (2.77 to be exact) the space proposed for the permanent Right-of-Way (ROW), specifically 8,799.99 acres versus 2,329.04 acres for the total project, and similarly in Massachusetts almost three times (2.72 to be exact) the space proposed for the permanent ROW, specifically 2,450.23 acres versus 659.01 acres. The New Hampshire numbers are also approximately 3 times (2.85 to be exact) the space proposed or 1,379.60 acres versus 482.59 acres.

The use of the Temporary Work Space and Additional Temporary Work Space must be considered in the environmental impact as permanent impact, particularly when related to clear cutting of mature forests and re-growth.

- The basic question “How does FERC consider environmental impacts relative to need as projected into the future?” was raised at the August 12th FERC Scoping Session in Lunenburg. The FERC representative, who is responsible for generating the NED EIS, responded that he could not answer this question as it would involve other sections of FERC beyond his area of expertise.

The point is that the energy landscape has changed dramatically over just the past five years and shows no signs of slowing for the foreseeable future. How are these rapid changes in renewable technologies when projected forward 5,10,15 and 20 years, factored into the assessment of need and environmental impact? Massachusetts specifically already has unused infrastructure that was commissioned in 2008 and 2010 respectively (Northeast Gateway and Neptune deepwater ports), and cannot afford additional overbuild at the expense of the environment, homeowners and ratepayers.

- In May of this year, ISO-New England stated in an update “When the EE savings are factored into the region’s load forecast, energy usage is expected to remain flat, with an average annual growth rate of 0.0%, rather than the 1.0 % projected in the baseline load forecast” 1. In a more recent draft report, that number has gone even lower (i.e. negative) for the next ten years.

Since Kinder-Morgan has substantially modified their NED route several times with regard to laterals, such as the elimination of the Keene Lateral and more recently the Worcester Lateral “due to lack of customers”, this proposal is clearly a solution in search of a perceived problem. Based on available information as per the examples above, the perceived problem does not exist now, and is less likely to exist in the foreseeable future.

- The New England region is host to several types of viable alternative renewable energy resources in-

cluding, but not limited to, on-shore and off-shore wind, solar, domestic hydro and imported hydro, hydro-kinetic and others.

Accurate and fair consideration of these renewable energy resources today, as well as their projected impact 5, 10, 15 and 20 years from now, will result in the only feasible response to this NED proposal, which is the No Build Alternative.

Respectfully Submitted,

Kenneth W. Berthiaume

20151016-4004

Good evening Mr. Tomasi,

My name is Lou Chatel I have lived in New England all of my life with the last 23 years in New Ipswich. I suspect you've heard lots of pros and cons about pipelines in general and more than likely what I say today, may sound familiar to you as well.

But, perhaps, someone will say one thing that may capture your attention long enough to give you reason to deny Kinder Morgan's profit line in NH. It will destroy our communities, the environment and the very essence of what this State IS and what it stands for.

Other than big business profit, I've heard that our demand for energy is what's driving this pipeline of destruction.

However, I've also heard and read enough stories that say we are actually using less energy now than in recent years. I know I am. I've also read that the cost of energy is the lowest it's been since 2004.

Perhaps smarter technology, more efficient equipment or maybe it is just everyone being more conscious and less wasteful is the reason why we are using less energy. All of this makes me ask, is this a need or a want?

Unfortunately, I suspect Kinder Morgan wants the revenue that it will bring to them despite the cost to the residents of N H.

With all the known health and environmental hazards, I'd rather pay more to avoid what you and the federal government already knows. Pipelines are dangerous and unhealthy. Thousands of our residents will be affected for generations to come.

Cigarette smoking is banned just about everywhere but in this case, polluting the air, water and ruining the environment is acceptable'

How is this the right thing to do?

Would you want your family to live next to a 40,000 or 80,000 hp compressor?

We totally destroyed Hiroshima with the atomic bomb and with the grace of God, they rebuilt.

911 affected the entire world in so many ways and we are only just starting to rebuild.

If this pipeline goes through NH, we will never be able to rebuild. In fact, the devastation will likely out last most of us here today. We owe our children's future a better option.

I read this pipeline will affect:

40 conservation lands,
Cut through 17 towns

Cross through 71 miles of our beautiful state,

155 wetlands,

Go under 116 bodies of water, including 8 rivers

8 miles of state forests or parks and sadly 822 households will be affected

These households contain our families and everything we've worked for. Unfortunately they are all at risk and will be negatively affected because of big business greed and the lack of respect for the people of NH.

NH will never be the same because of this pipeline for profit. Haven't we suffered enough? We all deserve better than this. Tell them, to find a better option.

My last hero was my younger brother Bob who died last September. He was a firefighter and paramedic who dedicated his life to safety and to serving all of those in his community of Pelham NH

Mr. Tomasi, will you and your agency be heroes to the entire state of NH?

We need, no, we beg you, to support this beautiful state and deny anyone's ability to ever put a pipeline in NH.

And if you can't, will you help us look for someone that can save NH?

Thank you.

20151016-4005

Kathy Chapman

Mason, NH 03048

Thank you for the opportunity to bring forward concerns about the proposed NED pipeline.

Somehow, FERC's rules do not make any accommodation in dates when a project's scope changes. Some cases have ruled that an agency cannot react to every change in plans after an EIS has been completed, but the NED proposal is not at that point and yet, when the project was moved from Massachusetts to New Hampshire, no extra time was given, the people of New Hampshire had to scramble around to understand what was happening to them, and here we are.

Now, the town of Amherst has managed to have the pipeline shifted to Merrimack and Hollis, and yet the date that scoping ends remains the same. The good people of Merrimack and Hollis have less than a month to react to this change. The response from KM/TGP at last week's open house in Milford? Merrimack and Hollis should have been working with KM/TGP all along.

Wait a second! That assumes that (a) there is some benefit to working with KM/TGP, and (b) that it is in general right that people who are living their daily lives should have to respond to a threat on a timeline that they have nothing to say about. Let's take these things one at a time.

But first, why is this a concern to me, a citizen whose land is not currently intersected or bisected by the pipeline route? Because if KM/TGP under the eyes of FERC can move the pipeline less than a month before scoping ends to other towns affecting possibly hundreds of people adversely, what is to stop them from moving the pipelines in Mason over to my property at any time if they can get my neighbors to agree it's a good idea?

So let's go back to the original questions. (a) What is the benefit to me of working with KM/TGP? Of giving KM/TGP access rights to my property, for example, if my property were along the pipeline route. Oh that's simple, TGP says. At the Milford Open House, I have video recording (with permission) of TGP's answer to this question. TGP says that the benefit to me is that I can get the pipeline moved off of my property if it's in my way. On the surface that sounds great, but a short few steps into the thought process begs the question about where the pipeline will go if not on my property.

So again I ask, what is the benefit to me of working with KM/TGP? I can either agree to have the pipeline

on my property, reducing my property value and increasing my concern over safety issues, or I can carry around guilt for the rest of my life for getting the pipe moved to my neighbor.

This seems like a threat to me, I am being threatened by a private company that gives me an untenable choice for a decision for which I get absolutely no benefit. Oh no, TGP says at last week's Open House, the benefit you get is that you can turn your lights on! Excuse me? Yes, according to Allen Fore, I will unequivocally save 40% on my electric bills! How did this happen?

Today, as it stands, KM/TGP have NO electricity generating customers, not a single one. The theory is that if, 2-3 years from now, there is more gas, and if 2-3 years from now, the electric generators need gas on those particular days in winter, and if the other 4 gas pipeline projects have not already met any possible gas needs there are, then my electric rates might be reduced? Well this is happy news for sure, considering that I, and most people New Hampshire, don't heat with electricity (they heat with oil, wood, and propane, mostly), and pay the 4th lowest cost for natural gas in the country, and pay the average rate for electricity in the country. Lower my cost to heat my home, which is, on average, 79% of the energy cost of a person in New Hampshire, and maybe you'll have my attention.

So I ask, why can the US federal government in the name of FERC allow a private company to threaten a private citizen when that person has done them no wrong, in fact has had no interface with them at all until they showed up needing to build a pipeline to benefit the private company and their shareholders?

In New Hampshire, under RSA 631 :4, a person (now that a corporation is a person, this law applies) is guilty of criminal threatening when:

(c) The person threatens to commit any crime against the property of another with a purpose to coerce or terrorize any person; or

Is laying a potentially lethal pipe through my property, taking out my trees, possibly my livelihood, against my will, a crime against my property? If not, then what is it?

With respect to my second question, the answer is simple. It's not right, nor should it be legal, for FERC or a private company to set a timeline for taking property from people and providing them no opportunity to mount a defense. If a project's scope changes, i.e, different people are affected than in the original proposal, then the scoping period should be extended, period. The way it is now, there is every incentive for KM and the like to just put a line on a map any old where and then let the chips fall because it doesn't matter. Clearly from the KM Resource Reports, there was little if any work done to prepare even a rudimentary site plan that would avoid even the most obvious of obstacles -- schools, aquifers, homes, . . . These aren't wild accusations. By using very old maps, KM didn't give our area the dignity of even a decent first evaluation. Then we, the victims, get blamed for not providing access to our property? We had no time to come up to speed on what all this means, but we knew one thing for certain. A company with a lot of money was going to take our land and the federal government was going to stand behind them. Blind rage has ensued, and that is not an unexpected result.

The scoping period needs to be extended for every single move of the pipeline to train KNI and others that a reasonable proposal needs to be presented, the people being impacted need to be given the time and consideration they deserve from an agency of the federal government. Oh yes, I am well aware that FERC is not funded by my tax dollars, but that is not something that exonerates FERC from behaving properly to affected landowners because right out of the gate, the fact the FERC is funded by the very folks it regulates smells of corruption. In this case FERC must keep its nose particularly clean. EXTEND THE SCOPING PERIOD.

RE: Docket #PF 14-22-000

I am filing this comment in reference to Kinder Morgan Tennessee Gas Pipeline Company's Northeast Energy Direct Project, Docket No PF 14-22-000.

I am filing this comment in reference to Kinder Morgan Tennessee Gas Pipeline Company's Northeast Energy Direct Project, Docket No PF 14-22-000. Thank you for the opportunity to share my opinion of this project.

A few months ago, after researching the reason for several "No Pipeline" signs in my neighborhood, I discovered that one of the largest compressor stations in the nation is proposed for installation within 1 mile of my family's home. This project, if approved, will poison my children. This may sound like an overreaction; a worried mother blowing circumstances out of proportion, but I assure you this is neither of those things.

This project has potentially devastating impacts on the environment, wildlife, and the quality of life for New Ipswich residents. While these are all valuable, worthy concerns, the focus of my research and energy has been on one pivotal question: "What impact does living in the proximity of a natural gas compressor station have on my young children?" The answer to this question, as evidenced below, is a disturbing and frightening reality for my children and the hundreds of other children living, playing, and schooling near the New Ipswich compressor station.

As you may know, natural gas production relies on the use of a variety of chemicals (over 600 of them) in the creation and operation of well pads, processing plants, fracking sites, and compressor stations (Steinzor, 2013, Bamberger & Oswald, 2012). Exposure to these carcinogens is linked to short and long term health effects in both animals and humans (Steinzor, 2013). Short term health impacts of the lengthy chemical list, (particularly methylene chloride) include burning eyes, skin irritation, headaches, coughing, nosebleeds, and decreased visual, auditory, and motor control, all of which generally subside after exposure (SWPA, 2015, Steinzor, 2013). Long term exposure, however, has permanent damaging effects on the human nervous system and is linked to liver and lung cancer in animals (SWPA, 2015). A Pennsylvania study of residents living near compressor stations much smaller than the one proposed for New Ipswich, cited joint pain, forgetfulness, headaches, and nosebleeds (Brown, Lewis, & Weinberger, 2015). These statistics have me gravely concerned for the health and welfare of my children, especially in light of Southwest Pennsylvania Environmental Health's (2015) note that, "Children and pregnant women are especially sensitive to pollution" (p. 12) and the fact that the pipe used near my home is of very low grade because we are in a 'low incidence' area. Why are my children less valuable than those living in the city?

Bill Thomas of Kinder Morgan reported to me that the New Ipswich compressor station will release 32 tons of NO. toxins per year (not including leaks or blowdowns, which, according to Mr. Thomas, are never regulated) (B. Thomas, personal communication, September 9, 2015). This statistic assumes that the compressor station will emit toxins at a constant rate. It assumes that the compressor will emit pollutants at an equal concentration. It assumes that all pollutants travel in the same manner. My research tells me, though, that these assumptions are not in fact the case. In reality, emissions from compressor stations vary based on operations. In reality, wind speed, wind direction, and cloud cover determine the location and speed of spreading pollution (Brown, Lewis, & Weinberger, 2015). In reality, homes surrounding compressor stations report emission instances that exceed EPA regulations (SWPA, 2015). In reality, this yearly average measurement (while deemed acceptable) is an incomplete and inappropriate picture of the actual toxic exposure my children will receive (SWPA, 2015).

The Institute of Medicine at the National Academies of Science (Steinzor, 2013) note that, "Public health was not brought into discussions about shale gas extraction at earlier stages; in consequence, the health system finds itself lacking critical information about environmental and public health impacts of the technologies and unable to address concerns by regulators, communities, and workers" (p.55). Until this crucial missing information is made evident, I refuse to stand by and let Kinder Morgan poison my children. Assumptions and generalities are not enough regarding their safety. I need specific answers to my questions:

How much will my household be exposed to on a given day? How high will toxin exposure levels climb? What is the maximum duration of exposure to methane and ethane my children can expect? What effects will surges in toxicity have on my children? Natural gas companies don't have the answers. They don't even know the extent of the harm this project will cause my children.

My children are wild and messy. They can be noisy, impatient, and impolite. But they are curious. They forgive easily. They are tolerant and accepting. They are fun loving and carefree. They are spontaneous and flexible. They are scientists and artists. They are my biggest worry and greatest joy, and they are NOT disposable.

Finally, I would like to leave you with this. Last week, the Pope addressed Congress. Among other things, he told members, "remember the Golden Rule: Do unto others as you would have them do unto you" (Pope Francis, 2015). So I ask you this: If your nieces and nephews lived near this compressor station - If your children and grandchildren were exposed to these toxins on a daily basis - What would your decision be then?

Thank you,

Carolyn Cormier

RE: Docket #PF 14-22-000

I am filing this comment in reference to Kinder Morgan Tennessee Gas Pipeline Company's Northeast Energy Direct Project, Docket No PF 14-22-000. My name is Mackenzie Cormier. I live in New Ipswich, near the proposed compressor station.

A few months ago, I started asking my mom about the pipeline. I saw signs in our neighborhood and wondered what it was all about. My mom told me about the pipeline and the compressor station and about all the chemicals used in making natural gas. She said that the chemicals would be released into the air near our house during blow downs. In school I learned all about habitats and ecosystems. I am worried that the chemicals, noise, and light from the compressor will hurt the ecosystem near my house. I play in a stream behind my house and am worried that the water will be contaminated because of the blow downs.

I am confused about why Kinder Morgan is allowed to pollute our environment like this. If people get caught littering by throwing trash out of their cars, they get fined almost \$300. So, why is Kinder Morgan allowed to pollute the environment and put people in danger?

I'm also worried about breathing in the chemicals that come out of the compressor station during blow-downs. I don't like standing near people smoking cigarettes because it makes my eyes itch and makes me cough. I know that lawmakers made it illegal to smoke in a car with kids in it and that second hand smoke is more harmful to kids than it is adults. Many of the chemicals that are in cigarettes will be sent into the air near my house during blowdowns, so living near the compressor station will be a lot like living with second hand smoke everyday.

If you let Kinder Morgan start this project, chemicals will get into our air and wells and my family might get sick. I'm worried about my brother, Parker, because he is only 4 and I know that chemicals aren't good for kids. Please do not let this happen.

Dorothy Crawford
PO Box 127
Fitzwilliam NH 03447
Docket PF 14-22

My husband and I have been residents of Rockwood Pond Rd in Fitzwilliam for 8 years. Like many of our neighbors, we are semi-retired and chose this area for its peace, quiet, and natural beauty. This pipeline, if built, will go a long way towards destroying all that

According to your maps, our house is in the burn zone should an explosion occur which at least would give us time to get out. Our town fire chief has been told in one of her trainings, that if there's an explosion we are supposed to let it burn until Kinder Morgan detects the source of the problem. Is that true?

Some other questions we have ...

According to your maps, Rockwood Pond Rd (which is a dirt road with little traffic, is the access point to the construction that would take place across the Fitzwilliam rail trail, a short distance from many of our homes.

- How many trucks per day would be using this road?
- How long would the construction last?
- Whose job is it to maintain the road for such heavy traffic and restore the staging area when construction is complete ~

Since the top of 30" pipeline must be buried several feet below the ground, we understand that will require a significant amount of blasting. We are the granite state after all.

- Over what period of time would the blasting take place? How many explosions per day can be expected?
- What is the decibel level? How would wildlife be affected? How would human life be protected?
- How would the sound levels be monitored? Who would address the complaints.
- The Troy Mills superfund site is just a few feet away from the proposed route of the pipeline, The site continues to be monitored to this day. Who would oversee this area during construction to make sure that none of the buried toxins are disturbed?

According to Kinder Morgan's Integrated Vegetation Management Plan (2011-2016) a number of herbicides and pesticides are to be used on a continuing basis for controlling growth around the pipeline. Many of these

chemicals are highly toxic and known carcinogens. They are listed in my written statement along with their known side effects.

- Who would be in charge of testing and ensuring these chemicals do not spread through runoff into land that is being farmed or used for back yard gardens?
- How would Kinder Morgan prevent these chemicals from leeching into our aquifers, ponds, and wells? How will complaints be addressed?
- How would the effect on wildlife and native plants be monitored?
- Will we need to have all of our wells tested prior to construction so that we have a baseline in case of contamination?

Finally, it is my understanding that FERC has never turned down a gas pipeline proposal. Is that true? If so what would it take to turn down this one? We believe this project has set a record for comments on your website. The only positive comments I have heard at any of the meetings I have attended are from out of state construction workers hoping to be hired on. Please tell us that thousands of us who have spent the last nine months protesting this pipeline are not just toiling in vain.

FERC, just say NO!!

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
Washington DC

Re: PF14-22-000

The question before FERC is: Is the NED pipeline as proposed by Kinder Morgan a necessity or simply the desire of a business to grow and profit?

To answer this question, I would ask that FERC address the following:

1. Given the current economic well being of New Hampshire as evidenced by the 7th highest per capita income (www.247wallst.com) in America, the lowest poverty rate in America (www.247wallst.com) and

the 4th lowest unemployment rate in America(Bureau of Labor Statistic, 8/2015), specifically why is NED a necessity? Moreover how specifically (not in vague “trickle down” theory) will the NED pipeline benefit NH residents in terms of income growth, reduction in our poverty rate, and long term reduction in our unemployment rate? Please explain this given that other states with more pipelines e.g. Texas, Tennessee, and Pennsylvania all have lower per capita income, higher poverty rates, and higher unemployment.

2. Given that the NED has been proposed as a regional solution to New England’s energy needs, how is considering the NED pipeline in isolation without considering the region’s other current and proposed pipelines not “segmentation”? - a process that FERC is not supposed to engage in.

3. Please clarify the amount of gas that is required for the NED pipeline to carry to meet the threshold for necessity in New England, and why that threshold cannot be met in by one, or a combination of, the following ways:

- Maximize the current, various gas delivery systems already in place. Specifically, the use of two off shore LNG energy bridge terminals that sit underutilized. Two LNG terminals supported by FERC in the past; two LNG terminals that may very well be solutions that ISO New England could accept to meet our region’s need for fuel assurance and reliability.
- The repair of existing pipelines. In the Boston area alone leaking pipelines account for an approximately 15 billion cu.ft./year loss of gas (Harvard’s School of Engineering and Applied Sciences as reported in the Athol Daily News, 1/23/2015). Also please clarify what steps have been taken to determine the overall loss of gas in the New England pipeline system; the impact of this loss on the environment; and why capturing this gas is not considered as a means to meet New England’s need for natural gas.
- The upgrade of the existing pipeline infrastructure. Even Kinder Morgan seems to agree that this is a possible solution - Resource Report 10 - Alternatives, July 2015, p. 10-2 states “ ... without the proposed project, other natural gas transmission companies will be required to increase their capacity and construct new facilities to meet the existing and growing demand for the additional transport capacity.”

4. Given that FERC is funded by the fees of gas pipeline applications, please explain what policies, procedures, and independent oversight was in place during the NED pipeline application process to prevent, what appears to be a blatant conflict of interest from clouding FERC’s judgment.

Finally the question remains - Is the NED pipeline as proposed by Kinder Morgan a necessity or simply the desire of a business to grow and profit? An impartial review of the information before FERC makes the answer clear. There is no need for this pipeline. It is simply the desire of a business to grow and profit. To grow, to profit, to make a living are not a bad things in and of themselves- until, in order to make that profit or to make that living, you take a person’s property against their will (eminent domain); destroy their environment, cause them to be sick, jeopardize the safety of their community, and place the cost of that profit on the backs of people who will never benefit - simply for the convenience of a private corporation.

Sincerely,

Erik Durmer, NH Citizen

A Balanced Evaluation of the NED Project Please

Delivered by W. Dell/lis Eklof at FERC Scoping Session PF14-22-000, September 29, 2015

First, let me introduce myself. I am a retired PhD energy economist and consultant. Most of my 45-year career in the energy industry was spent advising corporations and government agencies on energy markets and energy infrastructure development.

I have read and analyzed hundreds of pages of documents on all sides of the NED debate. I won’t go into

details here, but I will try to put this huge body of information into perspective.

I see the originators of these studies and arguments over NED falling into one of three groups:

- Organizations that stand to reap huge financial gains from the construction of this pipeline.
- Organizations that will profit from this pipeline not being constructed.
- Groups and individuals who question the need for the project and view the construction of this pipeline as having hugely detrimental impacts on our environment and their quality of life.

We are being told by the first group that the NED project will avert an “energy crisis” in New England, reduce our electricity bills, promote our region’s economic development, create jobs, and help make America energy independent. This group generally consists of Kinder Morgan and its paid lobbyists, shale gas producers for obvious reasons, gas utilities eager to expand their customer bases, electric power generators for whom managing a gas-based generation system is far easier than a more diverse and environmentally beneficial renewable energy portfolio, and unfortunately our politicians who stand to benefit from tax revenues, political contributions, and the support of voters who buy into the propipeline rhetoric.

Unfortunately this first group has the most money and resources to promote their agenda and sell their siren song.

The second group includes LNG importers and renewable energy producers and their suppliers, all of which seek to profit from growth in their business activities.

The final group spans a broad range of environmental groups, naturalists, conservationists, and home owners who, despite their extremely limited funding, have mounted significant resistance to the NED project.

Naturally, the studies carried out by the first group and its surrogates universally conclude that the NED project is needed and will greatly benefit New England residents without undue environmental impacts.

But there are two studies I would like to cite specifically. The first was completed in August 2014 by the Bostonbased economic consulting firm Energyzt Advisors, LLC and funded by the owners of the Everett LNG terminal - clearly a member of my second group. That study concluded that existing natural gas infrastructure, along with planned and approved pipeline expansions and renewable energy projects, would be adequate to meet New England energy needs for at least the next decade. It further concluded that if NED is built, there is a real risk that New England electricity rate payers will end up subsidizing the use of the pipeline for exporting gas to Canada and beyond.

The second study I would like to mention was titled “New England’s Energy Future: The Study That Hasn’t Been Done.” I did this study in August 2014, and in it I reached the same basic conclusions as the Energyzt study a year later, a study in which I had no part.

So here we are with carefully crafted so-called facts about the benefits of the NED project to New Englanders being put forth and widely publicized by profit-seeking constituents with large public relations budgets, contrary studies from a much smaller group of corporate opponents, and many individual voices and non-profit organizations opposing NED on a number of grounds ranging from the environmental impacts to questions on the validity of long-term forecasts of abundant supplies of low-cost natural gas.

We can only hope that the Commissioners at FERC can set aside their historic bias toward energy supply infrastructure development and take a more balanced view of the NED project’s overstated benefits and underestimated risks, costs, and environmental impacts.

Dennis Eklof, 31 Ames Road, Groton, MA 01450

Re: Kinder Morgan - Northeast Energy Direct Project Docket No: PF 14-22-000

My name is Susan Emerson. and I am the New Hampshire State Representative for Cheshire District 11. I represent two of the communities on the path of this proposed pipeline. I am here to give voice to the overwhelming opposition to this project in both Fitzwilliam and Rindge.

You are no doubt aware of the high rate of refusal to survey access in these towns and across most of New Hampshire. I am blessed with intelligent and well informed constituents and this project is not welcome here for excellent reasons that you have received in the thousands upon thousands of comments submitted on Docket Number PF 14-22-000.

This project offers nothing of value to my district but it carries so much liability that it is my duty, as its elected representative to oppose it.

While I am aware of the FERC's constraints, there is no good reason that the FERC should approve every large-scale commercial energy project that comes before it. Denial of Kinder Morgan's application for the Northeast Energy Direct project would be a good first step in regaining some of the public trust that your commission has clearly lost.

I urge the Federal Energy Regulatory Commission to reject Kinder Morgan's application for this unwanted and unnecessary project.

Thank you,

Susan Emerson
State Representative
Cheshire 11

Purpose and Scope of Study

At the Town Forum of 2006, residents of Fitzwilliam selected a new Natural Resources Inventory as a first step in developing a plan to preserve the rural features of the town. The plan was a top priority.

Steeply rising population figures at the end of the 20th century and development in neighboring towns warn that we must have a vision of what we want to preserve and take action to insure that what we love about Fitzwilliam endures.

A Natural Resources Inventory begins as a listing and mapping of the natural features of the town, including wetlands, aquifers, soils, wildlife, habitats, views, and conservation lands. These data provide a basis for natural resources conservation, and they can be used by the town to evaluate the environmental value of various parcels, aid in land-use decisions, and protect essential surface waters, aquifers, and soils. The goals of this report are (1) to define and record the town's natural resources and (2) to outline a plan for their protection.

Fitzwilliam's ecosystems were here long before humans arrived. The town will likely grow, but by planning growth in areas that do not heavily impact natural resources, soil and water are protected for future generations. In the process, the natural beauty of Fitzwilliam will be preserved while retaining a healthy environment and a vital community.

ACKNOWLEDGEMENTS

This Open Space Plan would not have been possible without the Fitzwilliam citizens who attended and contributed to the Fitzwilliam By Design forum back in 2006, attended the multitude of smaller presentations made before various town organizations since then, or completed the open space surveys. Your interest and input were integral to our efforts.

We also wish to acknowledge the professional support provided by the Monadnock Community Conservation Partnership (MCCP), a program of the Monadnock Conservancy, and staff members Pete Throop and Rick Brackett. Without them it's likely this project would have taken much longer.

We also appreciate the assistance of Amanda Stone from the UNH Cooperative Extension Service and Lindsey Webb from NH Fish & Game for their assistance in helping us to understand and interpret natural resources data and maps. Frank Bateman provided the cover design and cover photo for this Plan. The photo was taken from Route 12 at the bridge over Scott Brook looking northeast.

We also want to thank the NH Charitable Foundation for financial support that enabled us to utilize the expertise of the MCCP. This project was also supported by funding from the Fitzwilliam Conservation Fund and the citizens of the town who have repeatedly expressed their support for open space in Fitzwilliam. Thank you.

Members of the Open Space Committee

Buzz Bemis
Carol Breault
Skip Hagstrom
Robyn Hannett
Jean Ibelle
Paul Kotila
Charlie Massin

BACKGROUND AND CONTEXT

Introduction

Open space has been directly linked to the quality of life by the residents of Fitzwilliam at a variety of forums, town meetings, and in surveys. It, therefore, becomes important for the town to undertake open space planning to define specifically the types of spaces and resources that contribute to this important community characteristic. This planning effort will then, in turn, provide guidance for the Open Space Committee, the Conservation Commission, and other town boards on how and where to focus future open space protection efforts.

Open space protection can take many forms. Traditionally, such protection has been synonymous with land conservation through purchase for town forests or parks or the establishment of conservation easements on private property (for more information on land conservation see Appendix B). While these individual actions remain important open space protection tools, more recent initiatives in many areas have taken a more holistic approach to maintaining open space.

These initiatives often provide public events, activities, and educational opportunities that focus on open space resources in a community and thus often build a more meaningful relationship between the community and its resources. These activities often take place under the guidance of an Open Space Committee, and that has been the case in Fitzwilliam over the past year and a half. Once formed, open space committees can become a significant local resource for community conservation initiatives, including aiding landowners in

the identification of land management strategies and resources available for protecting open space.

This Open Space Plan is Fitzwilliam's first step in undertaking a comprehensive strategy for protecting open space in town. It explains the mechanisms by which information was collected, summarizes that information, and makes recommendations for actions to be taken over the next few years. Focus Areas are identified to assist the Open Space Committee in directing its efforts and make the most effective use of limited resources. These areas are lands specifically identified as important to town residents, contain specific natural resources that are limited in some way, contain many resources in one location, and/or serve as important connecting corridors for recreation or wildlife. Identification of Focus Areas is not intended to exclude conservation activities in other parts of town or otherwise limit the work of the Committee.

The goals that the Open Space Committee commits itself to are outlined in the Recommendations section of the Plan. They were developed to provide the Committee with direction and to keep the Committee active in the community. Action steps are built into the goals in order to provide a framework for accomplishing the goals. Goals and action steps will evolve as the Committee refines its work and Committee membership changes. Specific strategies for protection of open space are also found in this section.

Over time, the Open Space Plan will be updated, including reviews of the focus areas and goals. As open space is protected or lost to development, shifts in the plan and the Committee's focus will occur. As the needs of the community change, so will the focus of the plan. As a general guideline, the useful life of a plan like this is approximately 5 years. If the goals and focus areas seem to be shifting drastically, it may be necessary to update the Plan before 5 years are up.

Purposes
